The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

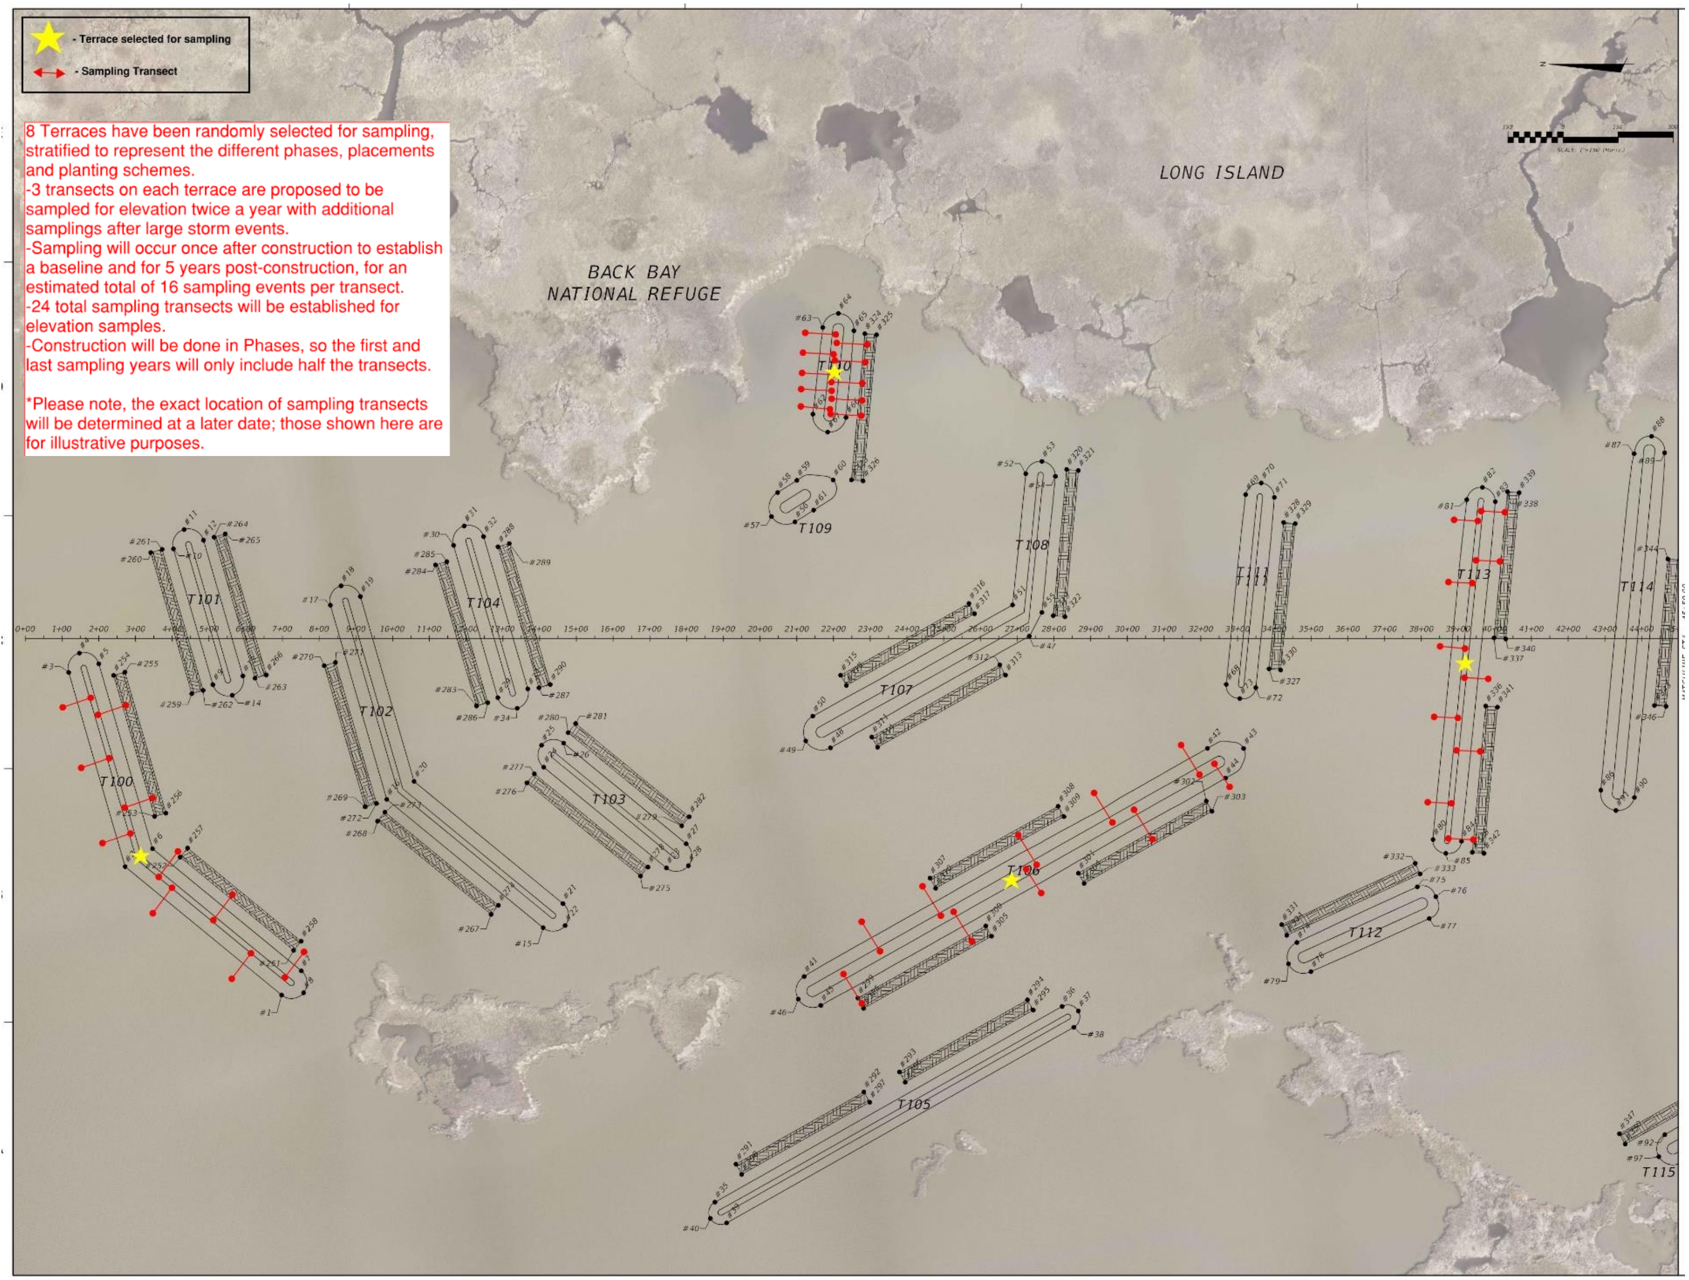

Figure 3: Monitoring design site plan – North Terraces

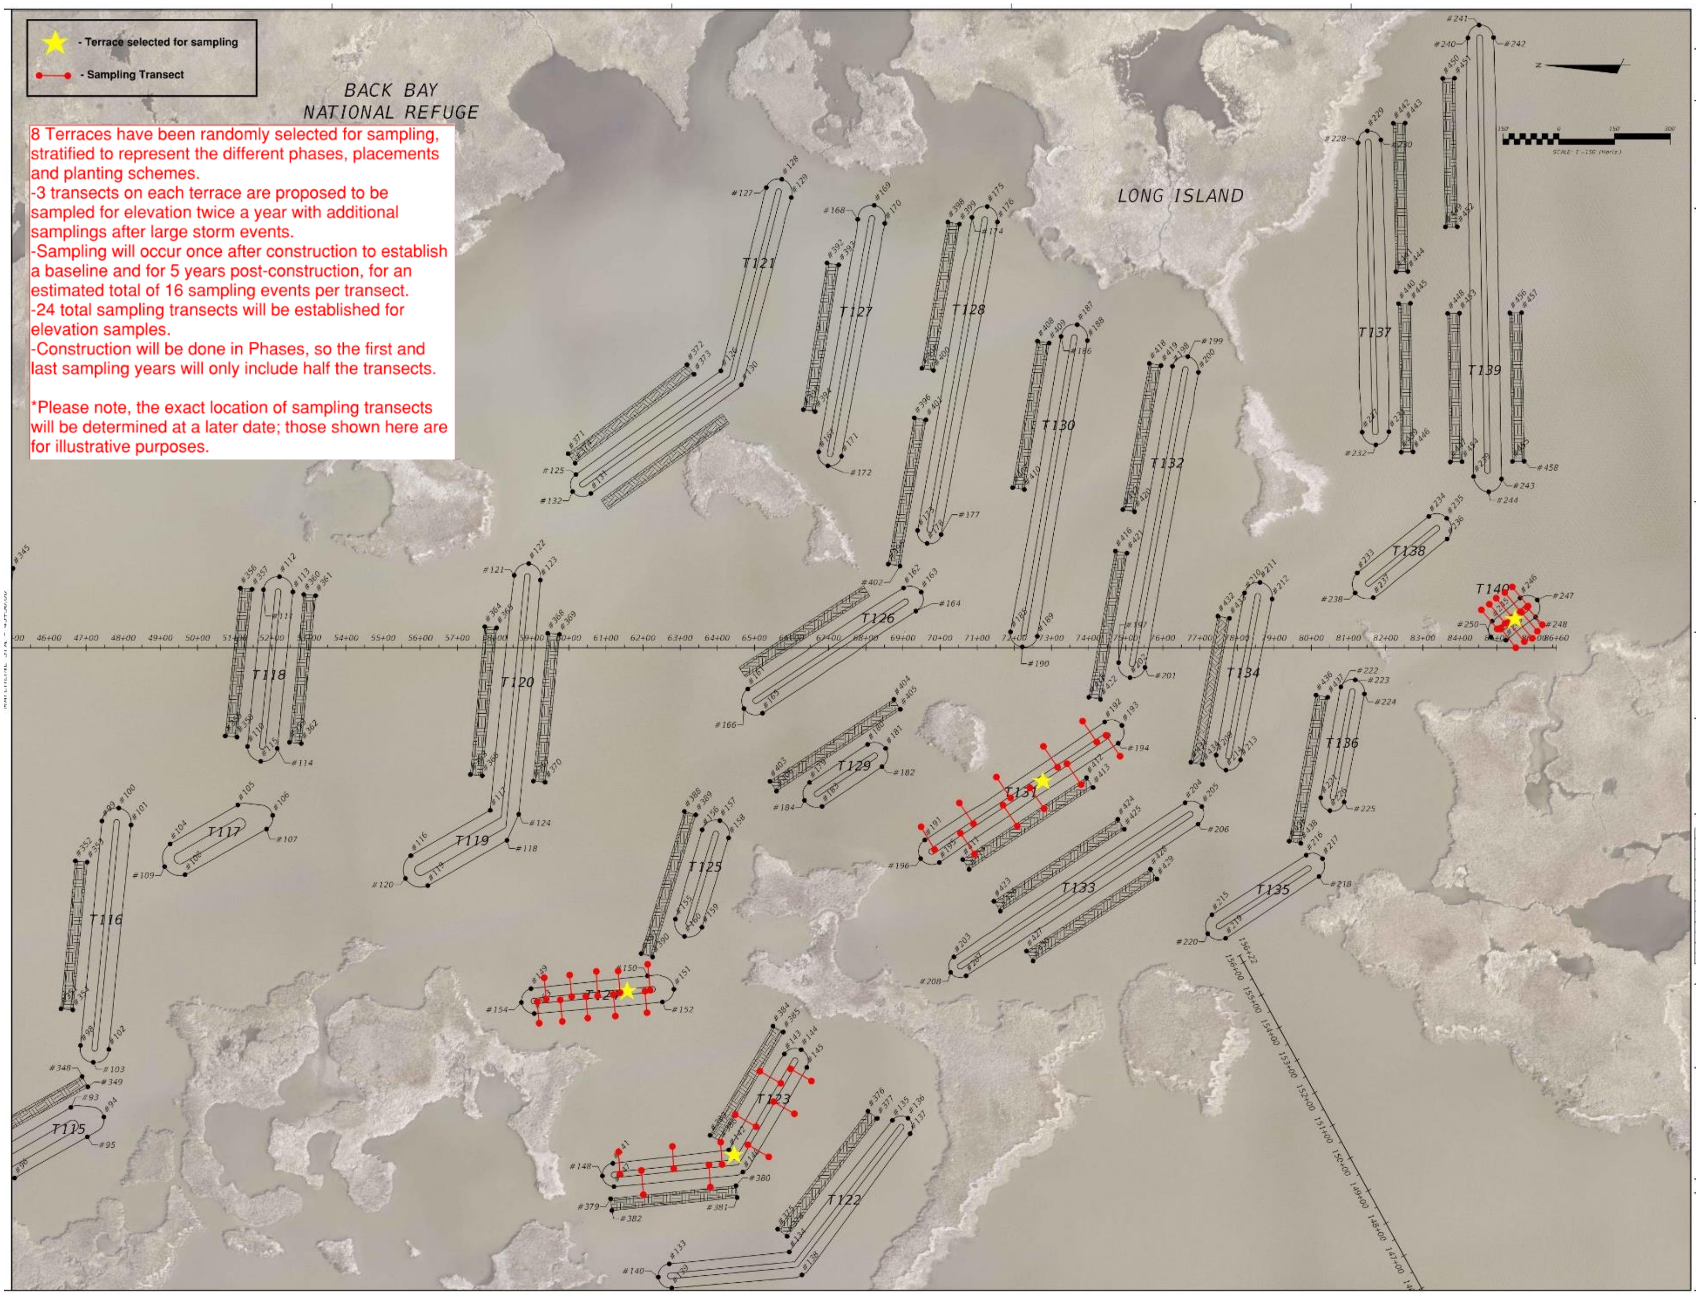

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

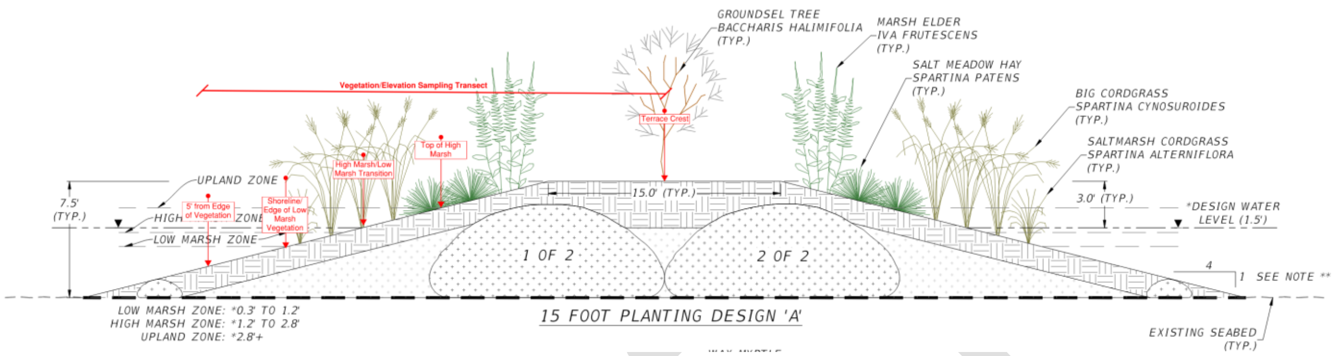

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

Email Address: CBodnar@vbgov.com

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - o Policy management and/or development.
  - o Stakeholder engagement and strategies.

☐ Other: ______________________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ___________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) ___________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

Additional Information for Loan Requests
Requested Loan Security: _______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: ____________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? _______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name:
Community Flood Preparedness Fund &
Resilient Virginia Revolving Loan Fund
Detailed Budget Narrative
Period of Performance: June 2024 through June 2027
Submission Date: November 12, 2023

	Grand Total State Funding Request	$ 5,000,000
	Grand Total Local Share of Project	$ 38,356,966
National Fish and Wildlife Foundation Grants	Federal Funding (if applicable)	$ 10,021,524
	Project Grand Total	$ 53,378,490
	Locality Cost Match	% 71.85

Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

[3] Office of Governor Ralph S. Northam Commonwealth of Virginia. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

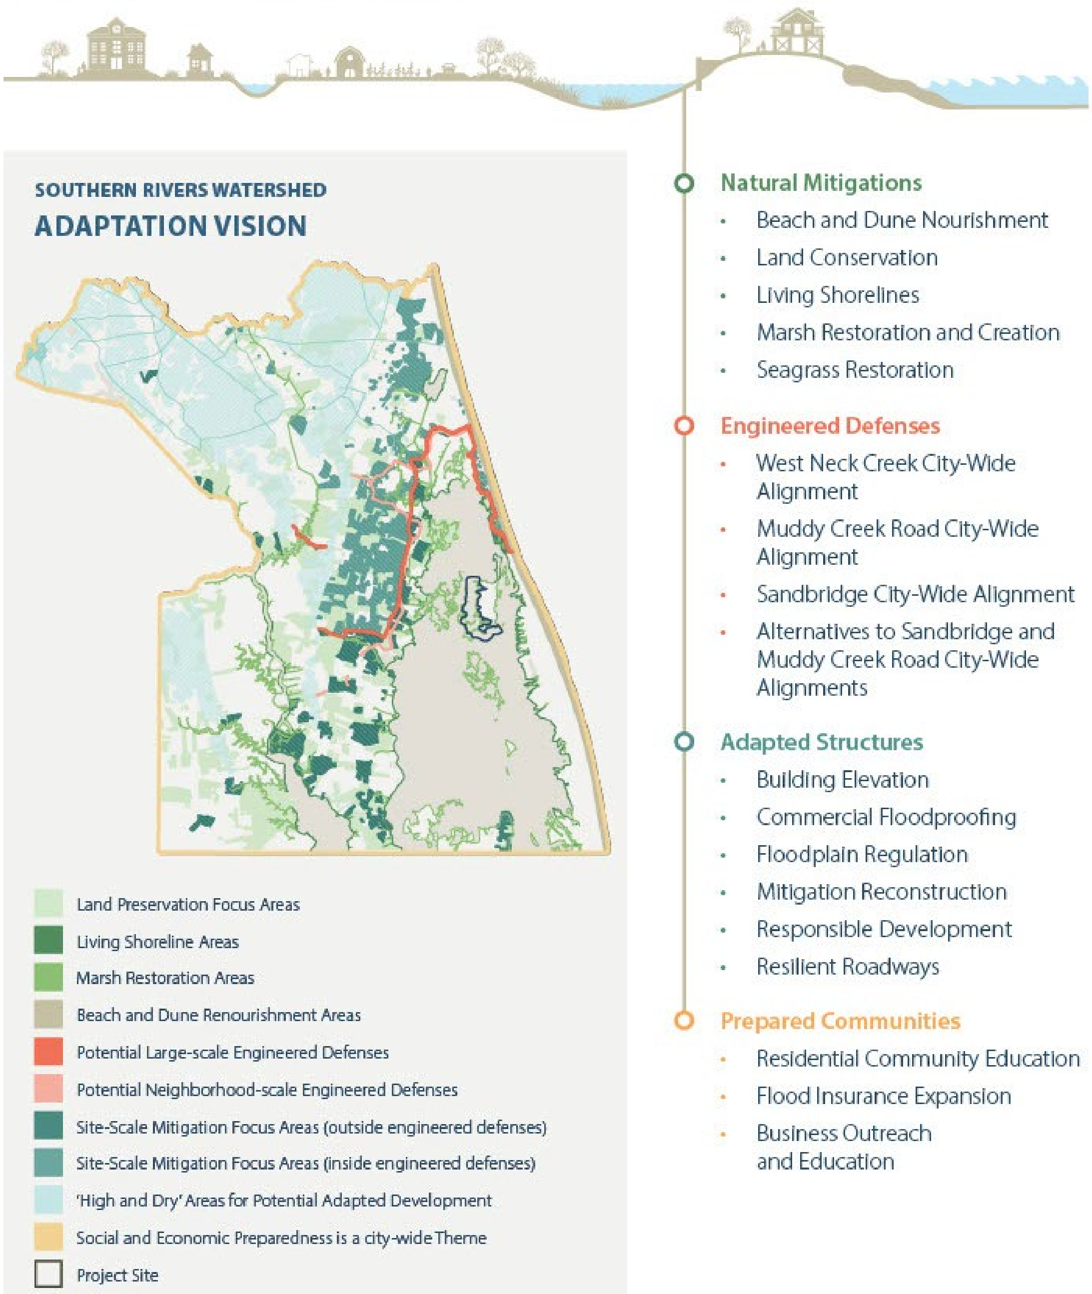

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

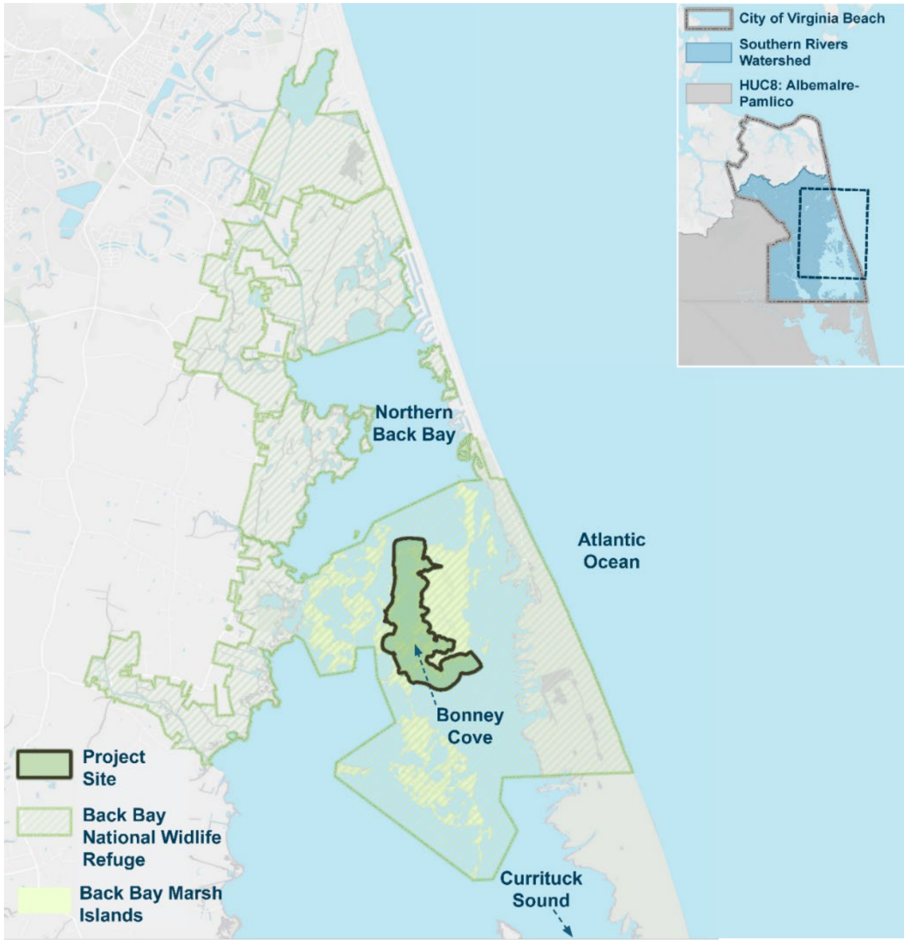

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

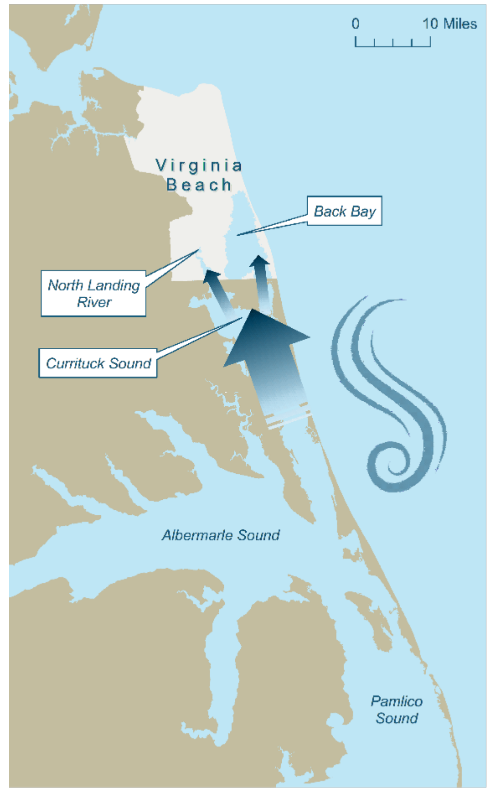

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

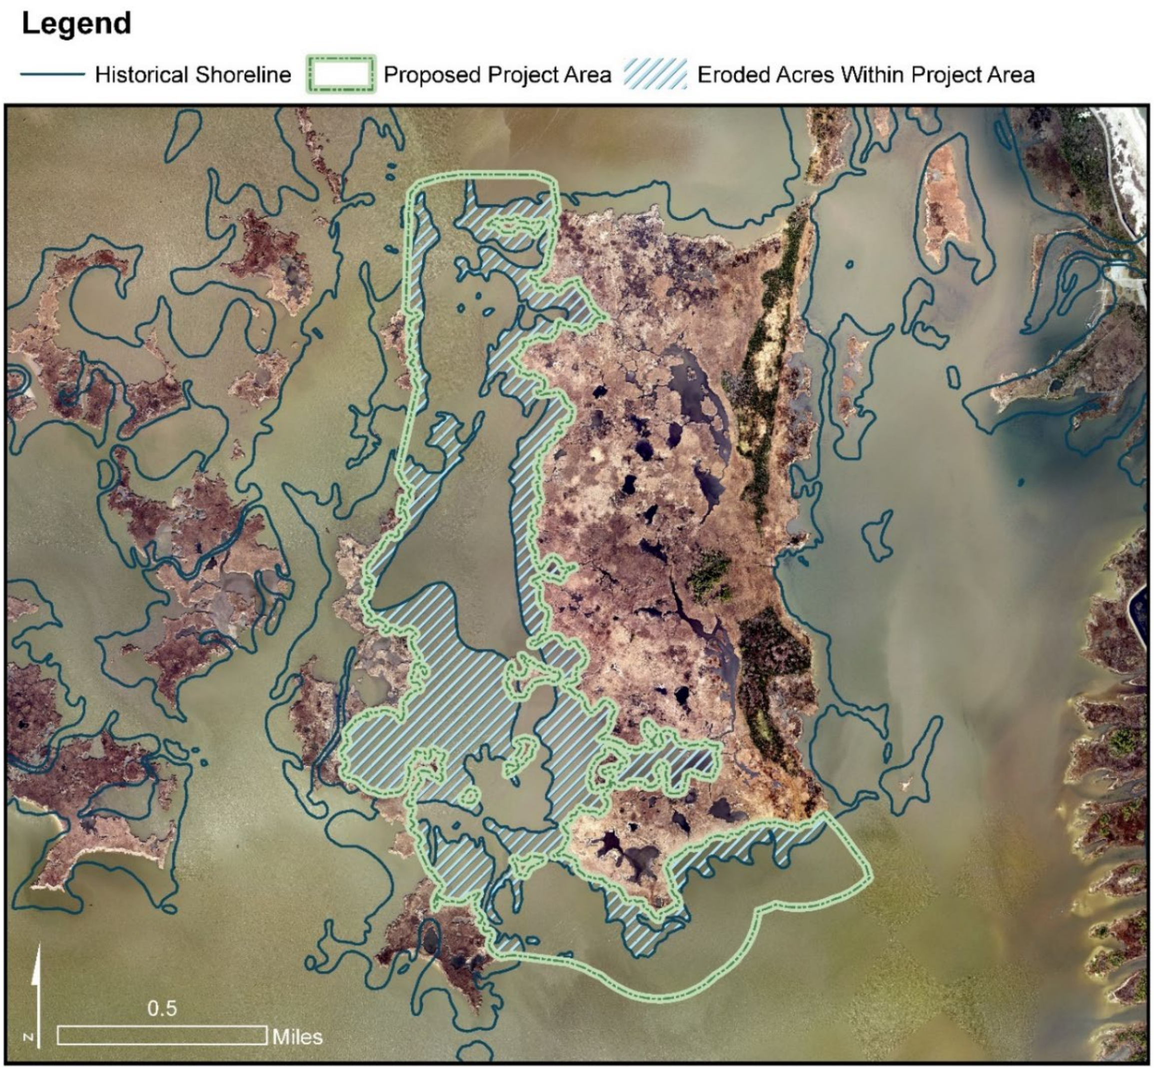

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

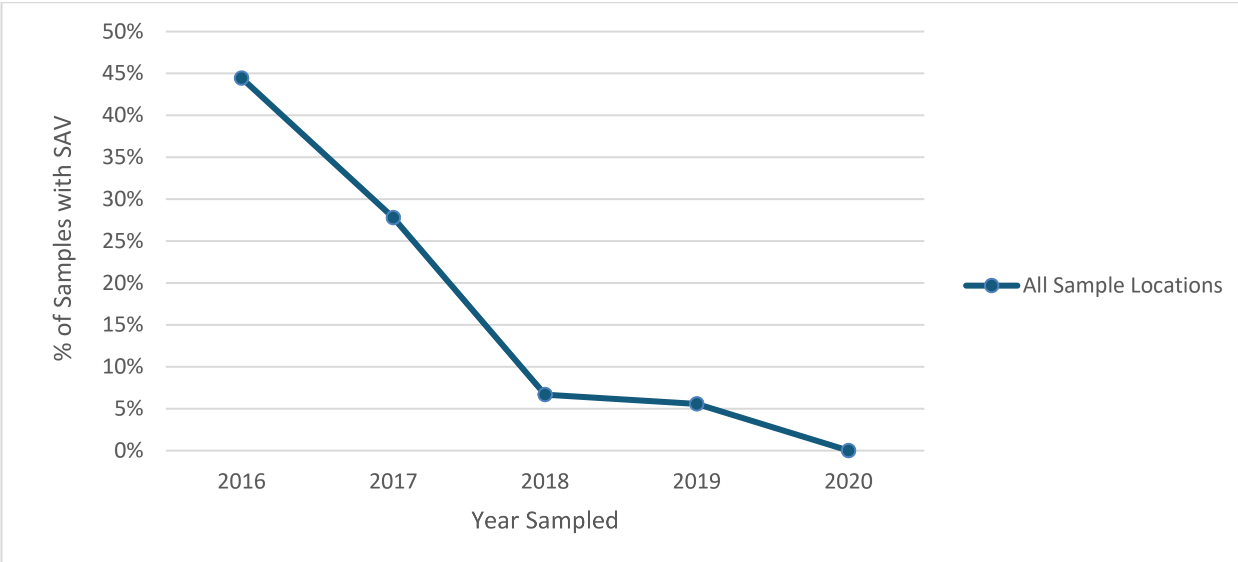

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

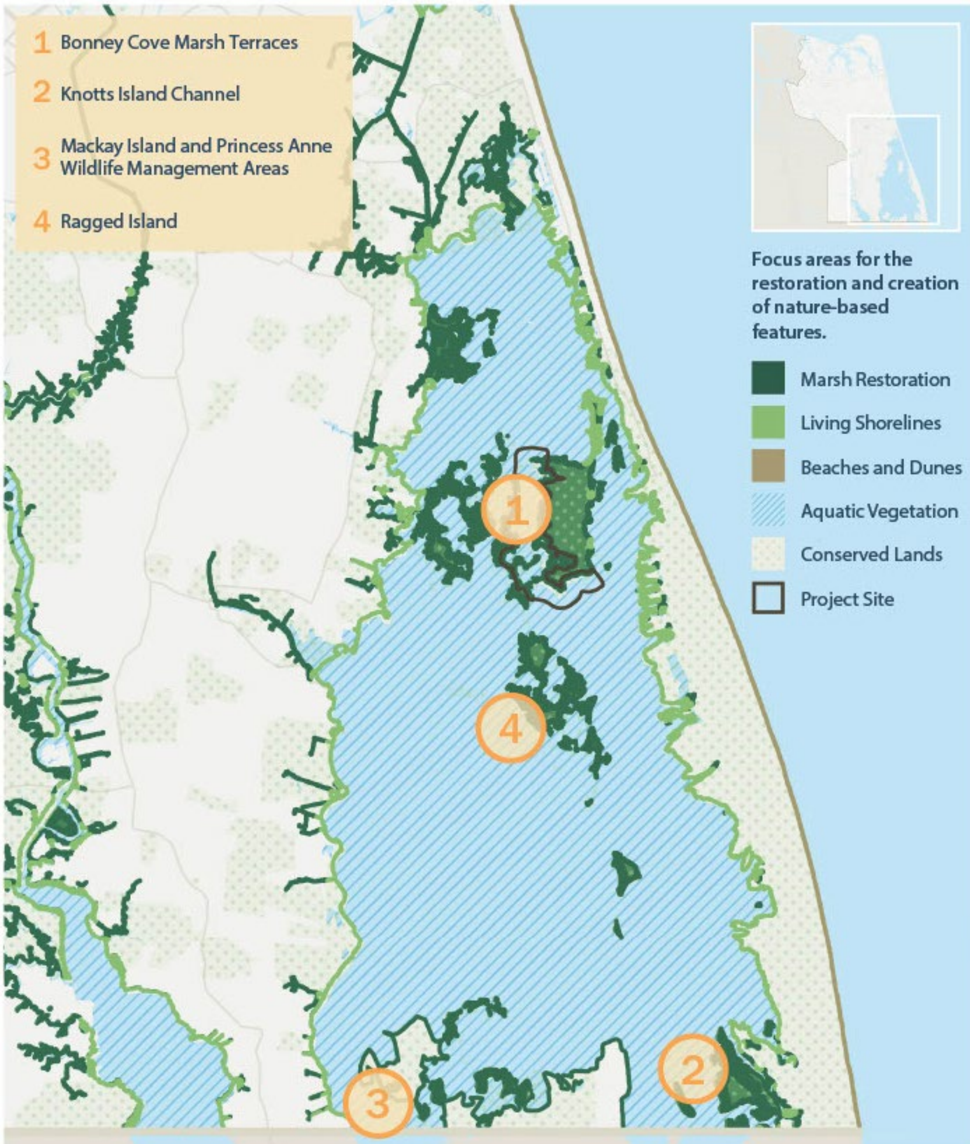

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

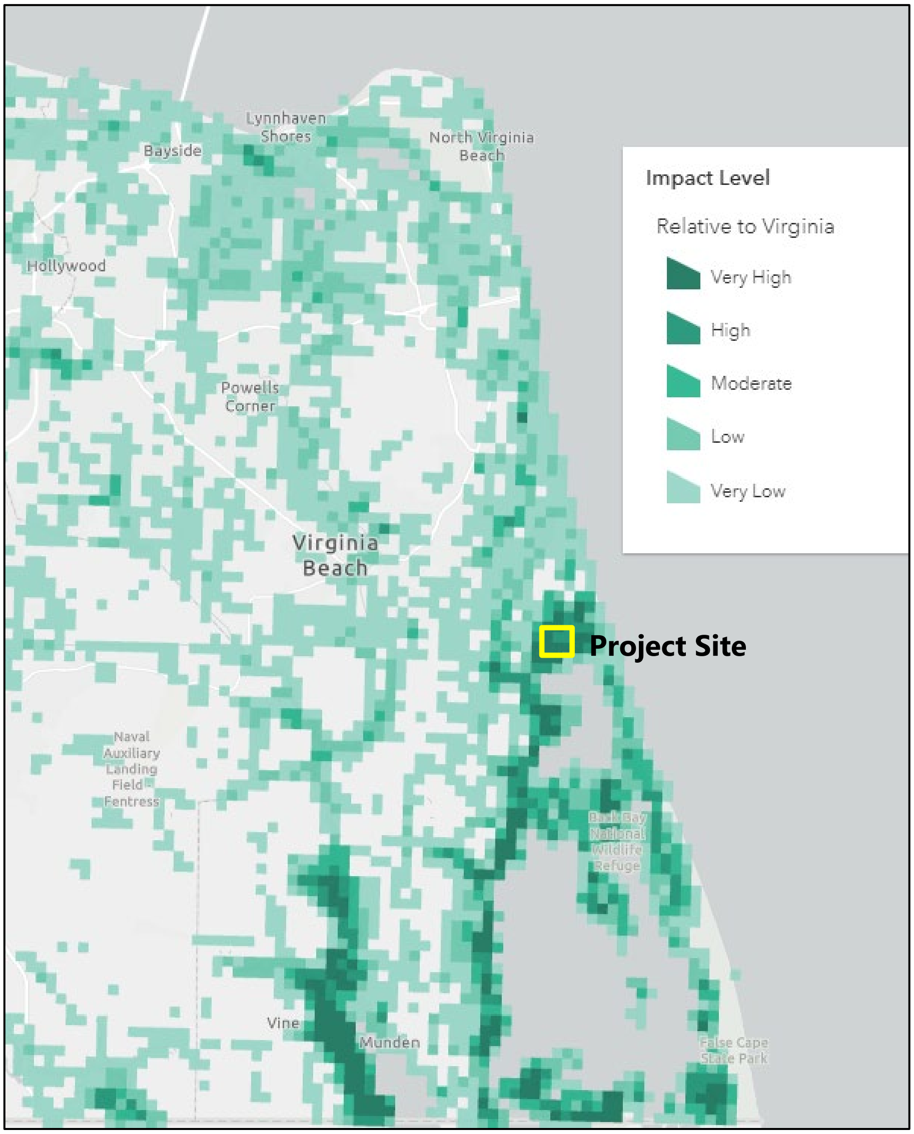

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

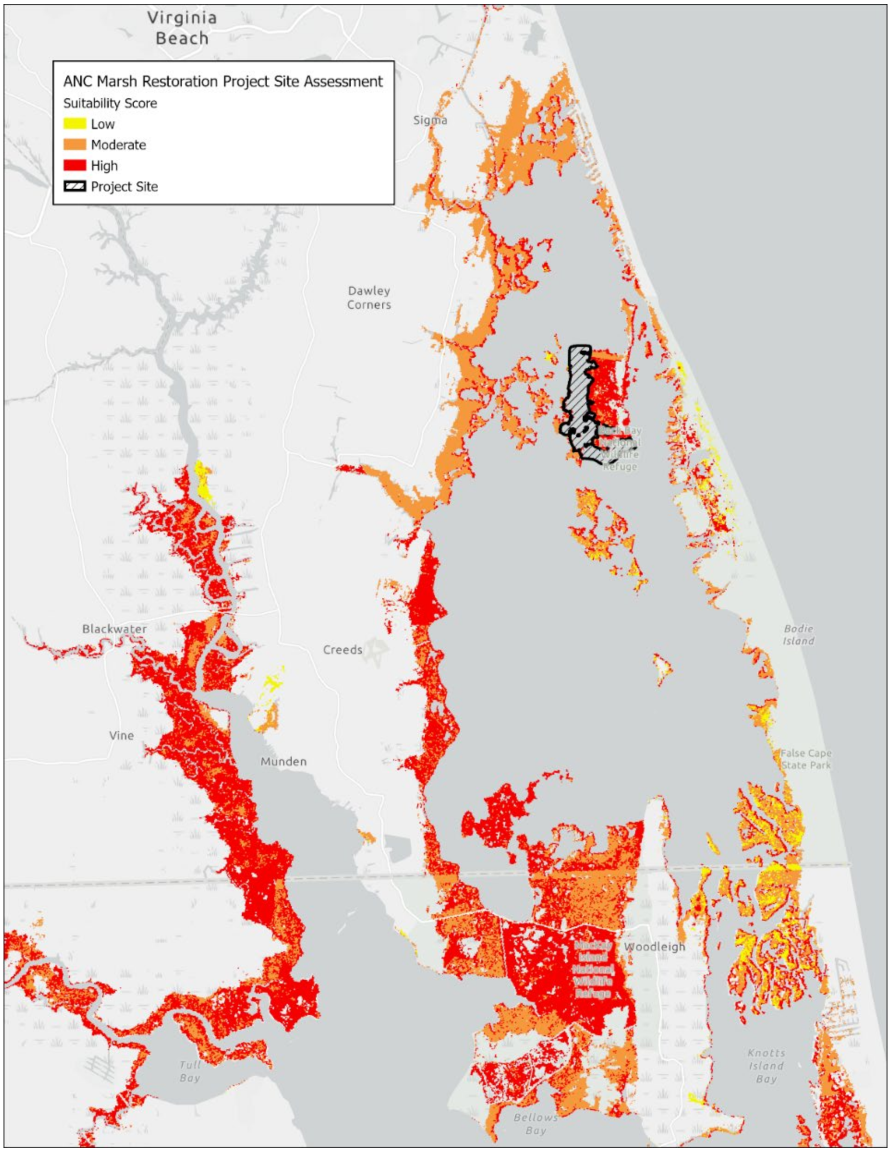

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

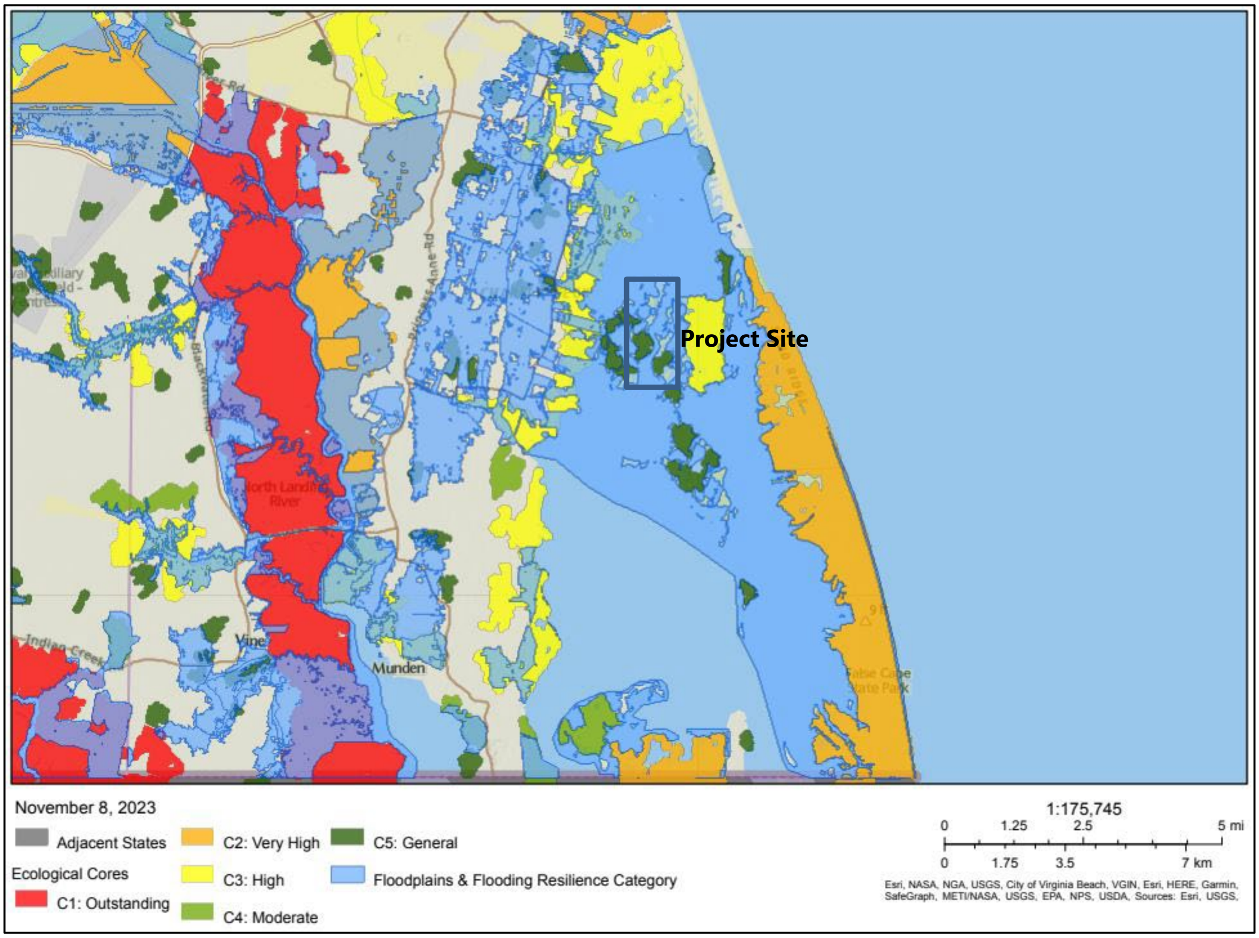

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

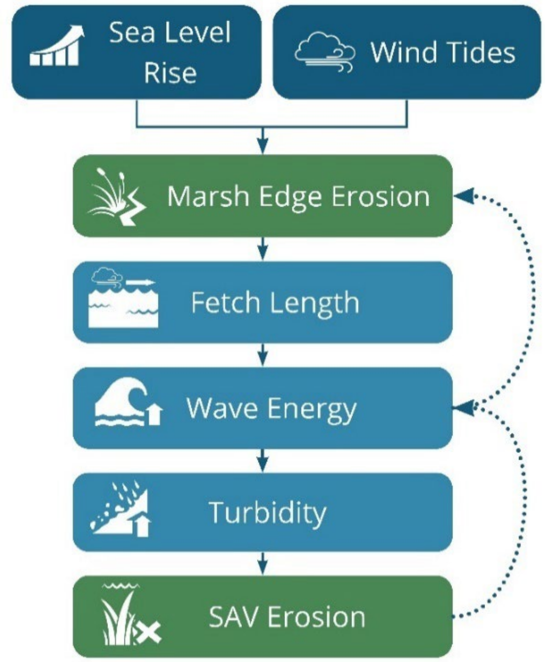

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

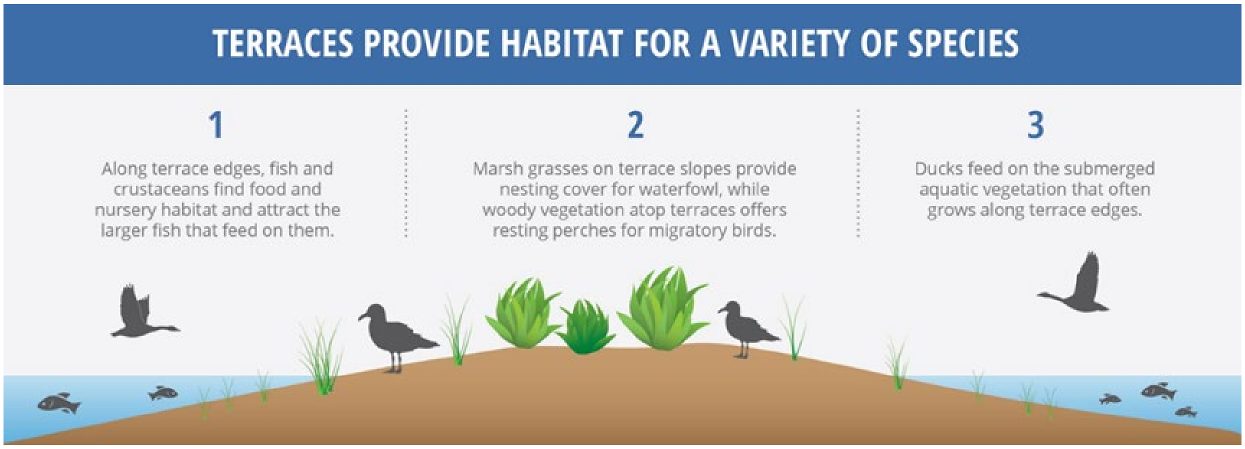

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

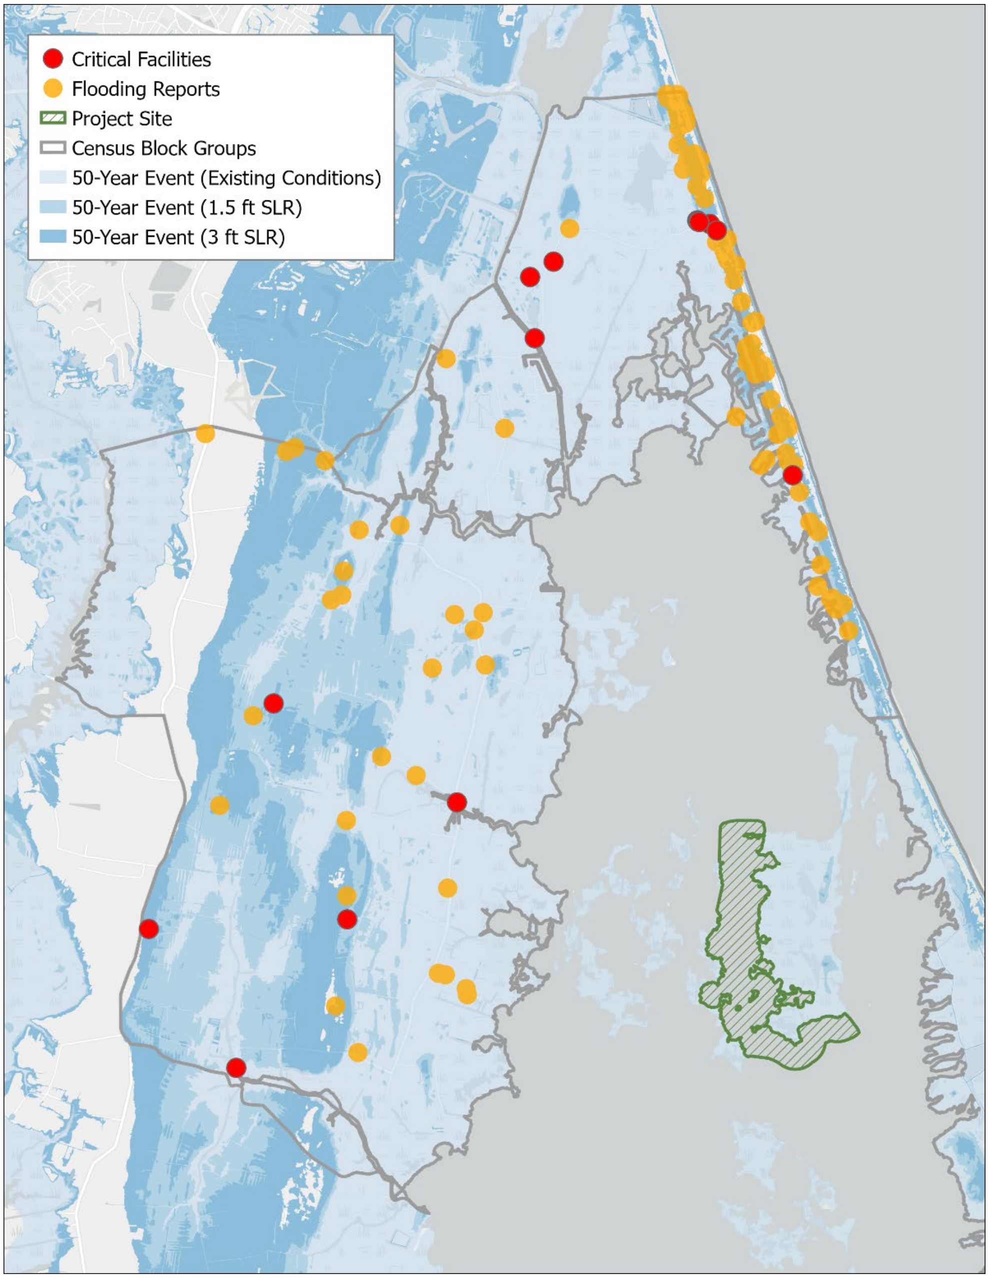

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the S*upporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

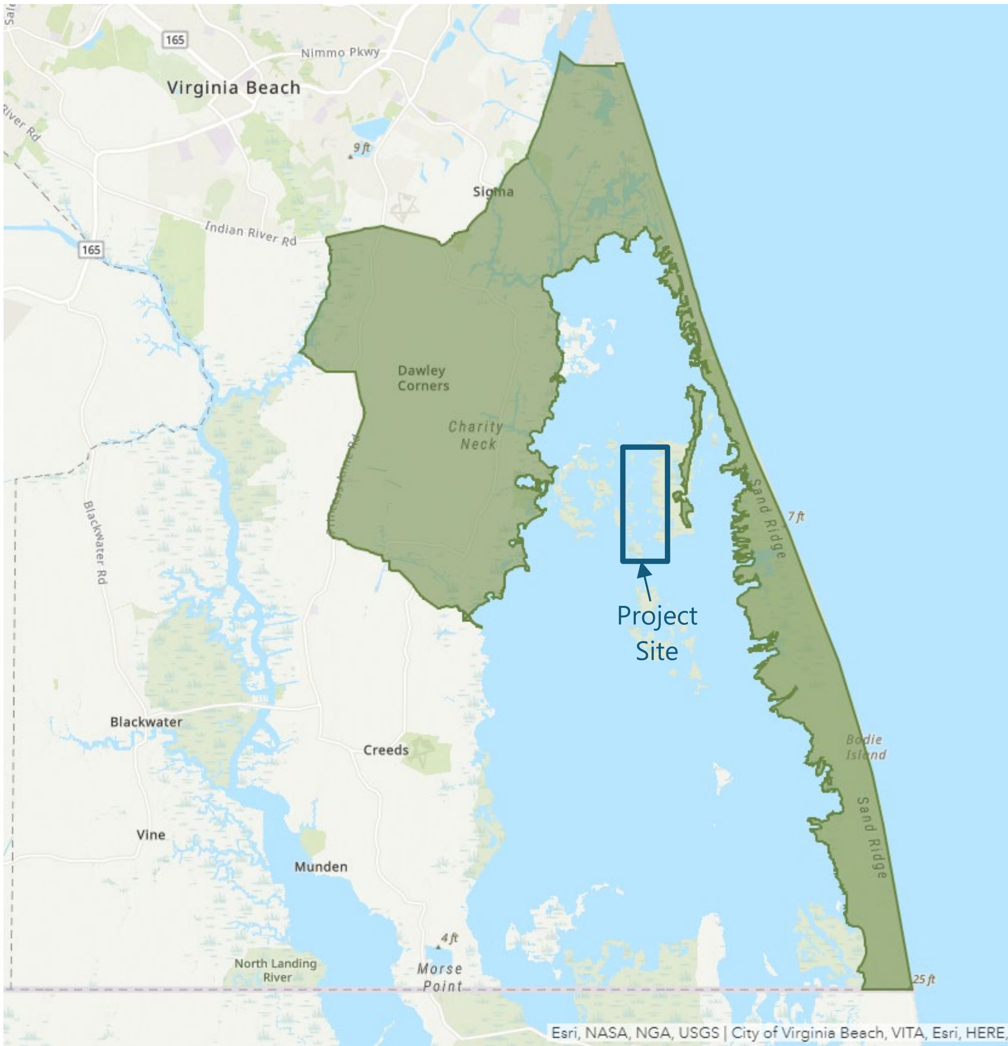

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

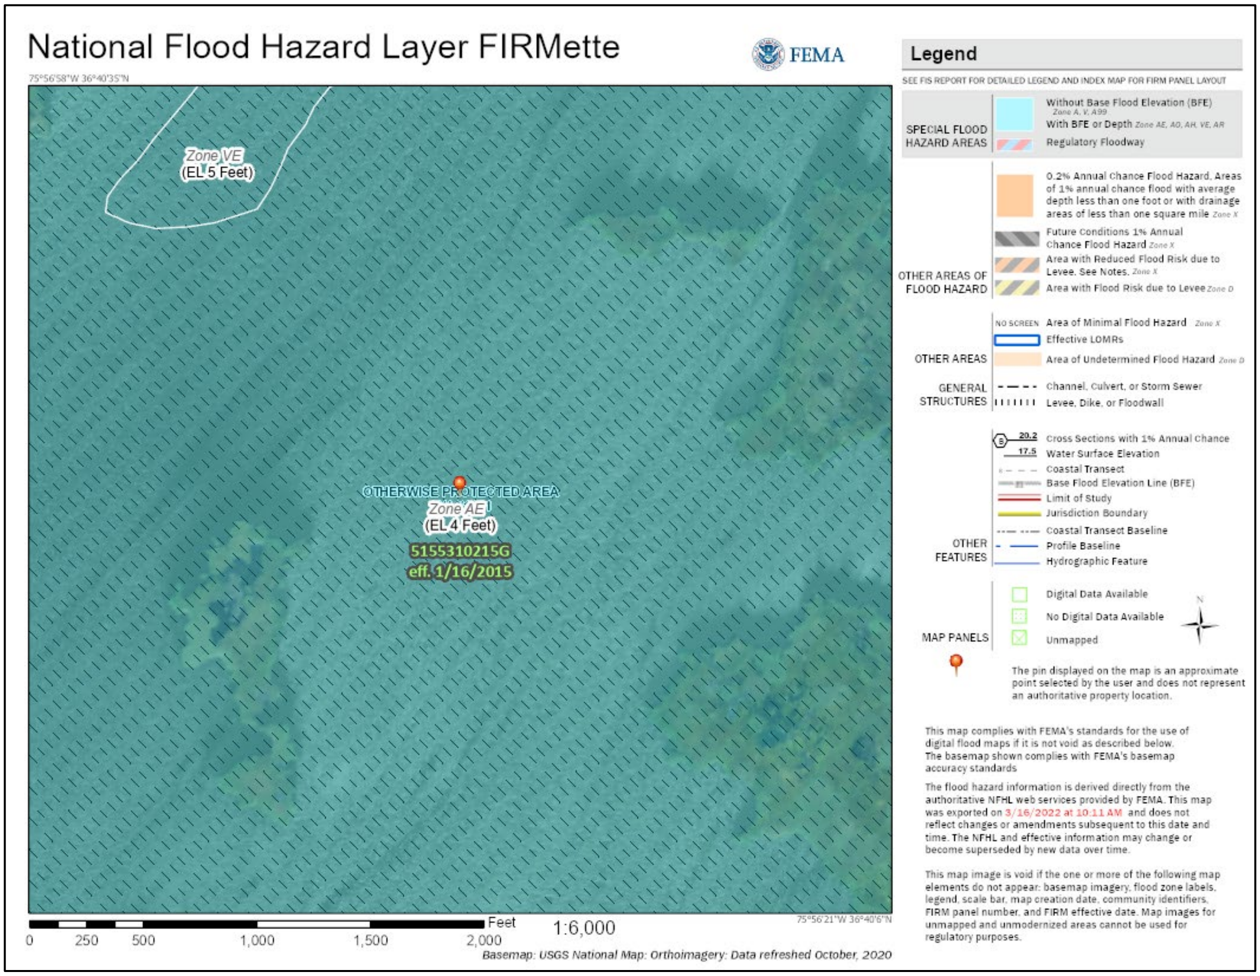

Figure 15: FIRMette for the project area (northern boundary).

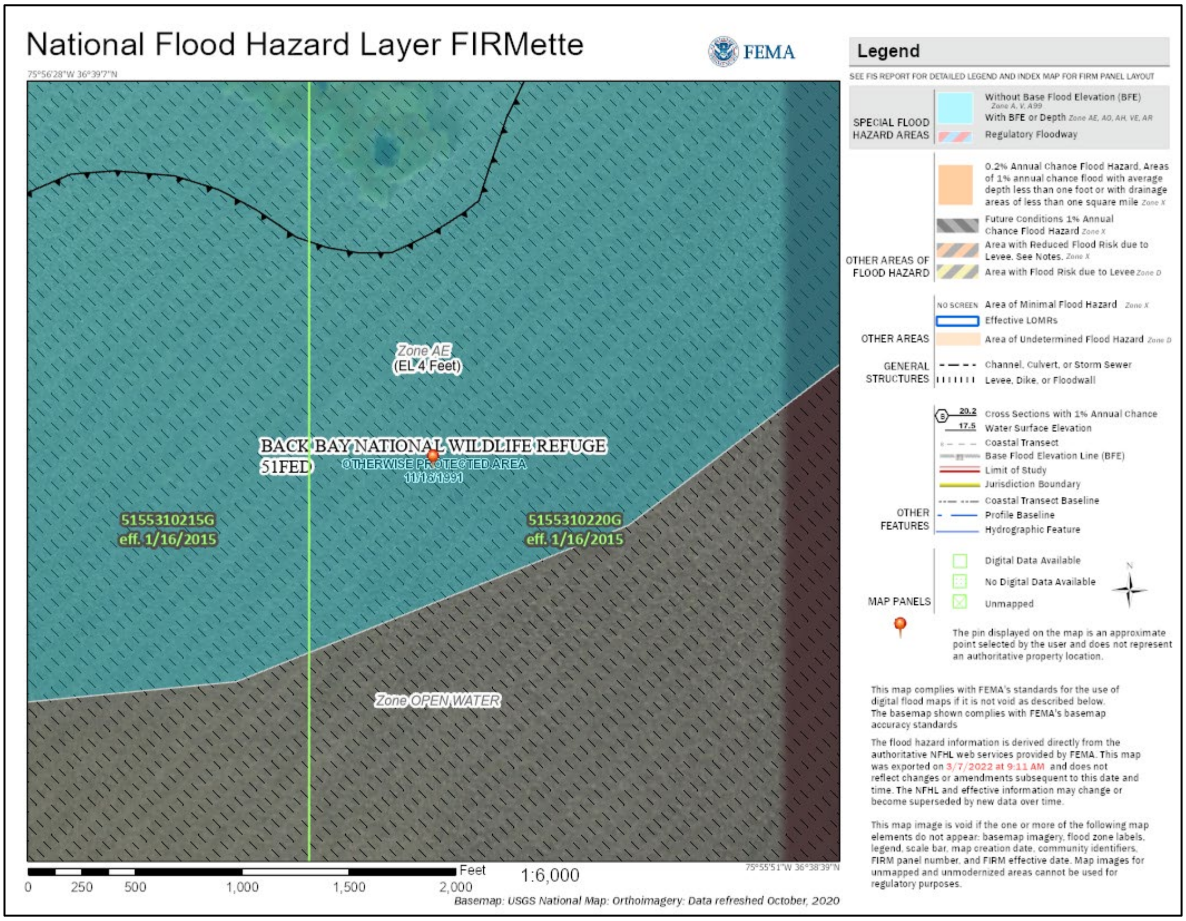

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

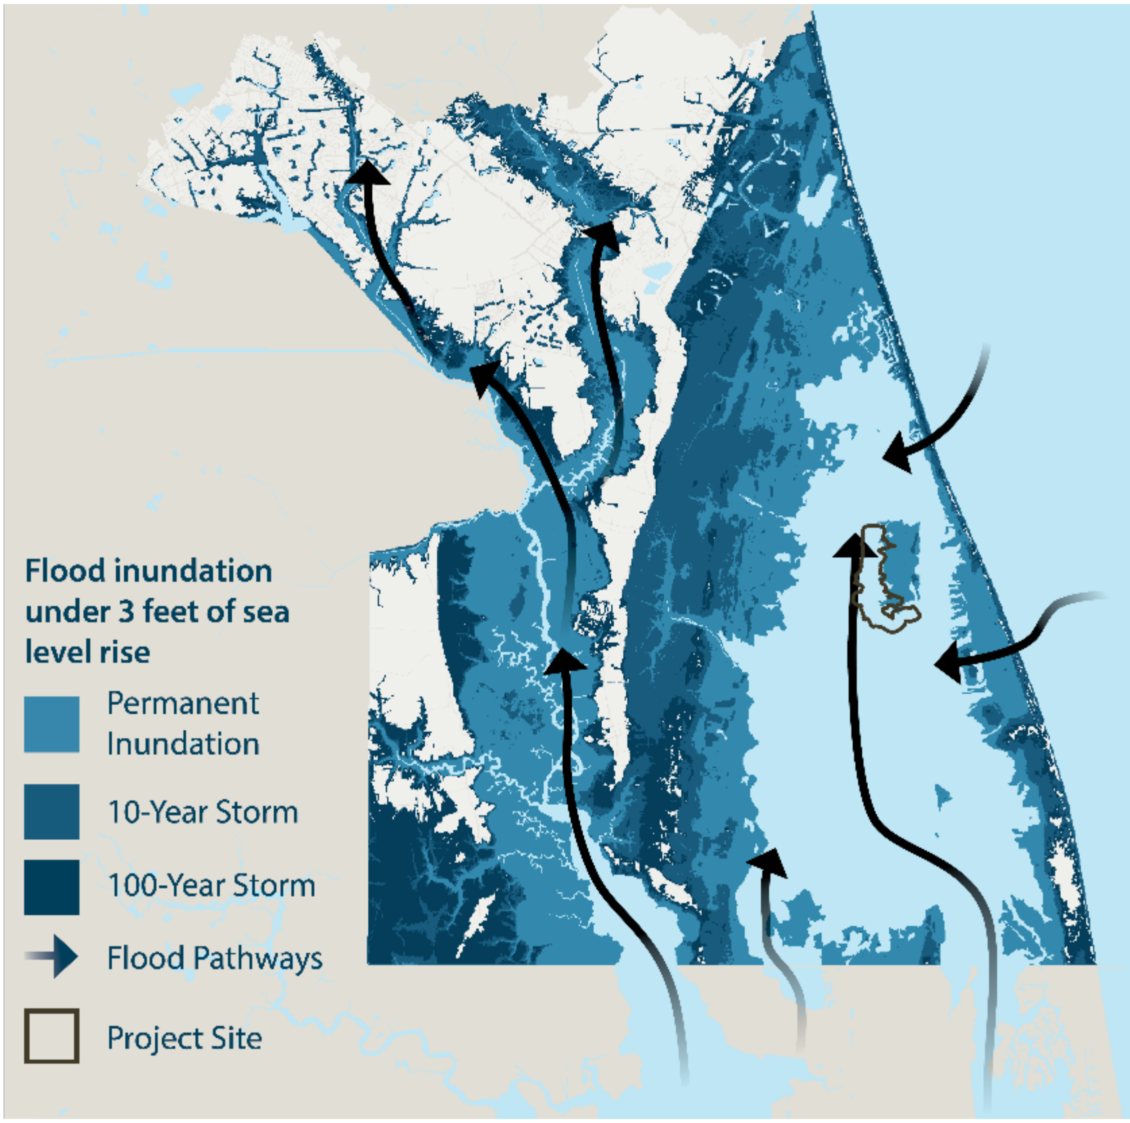

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

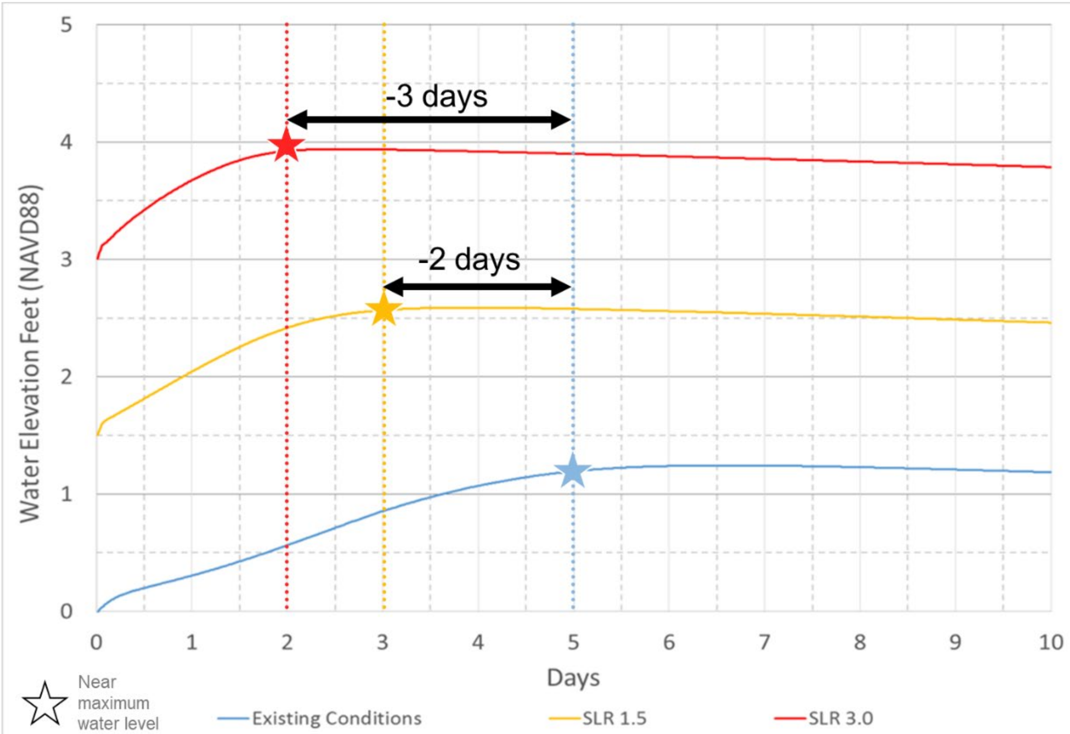

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

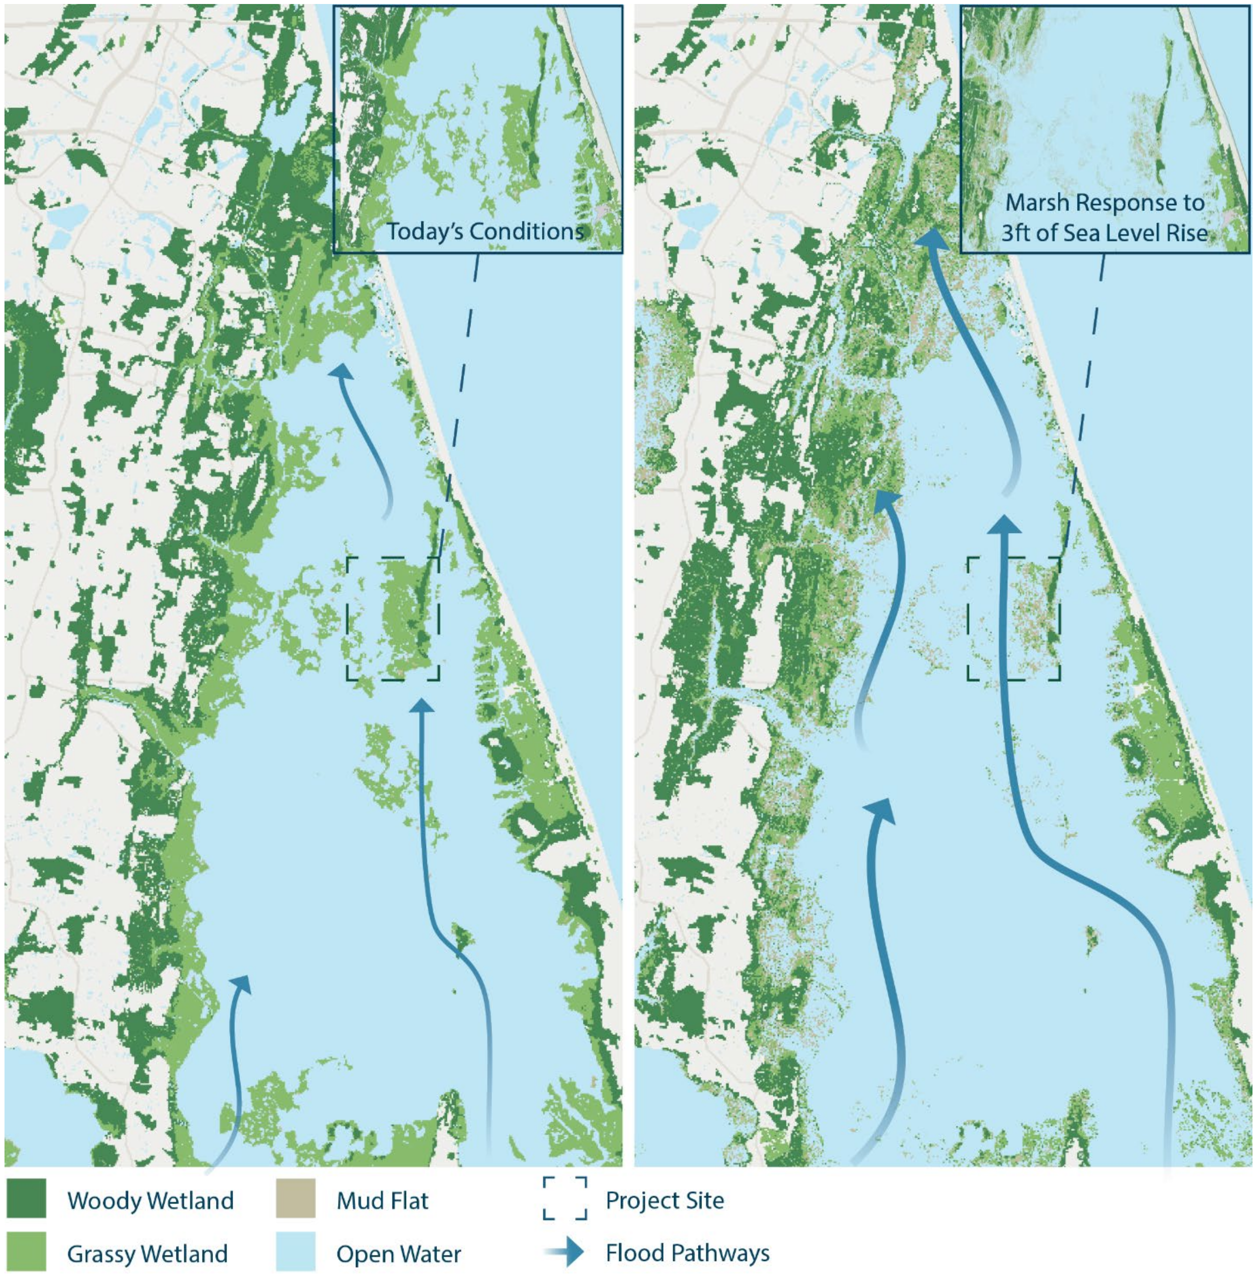

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

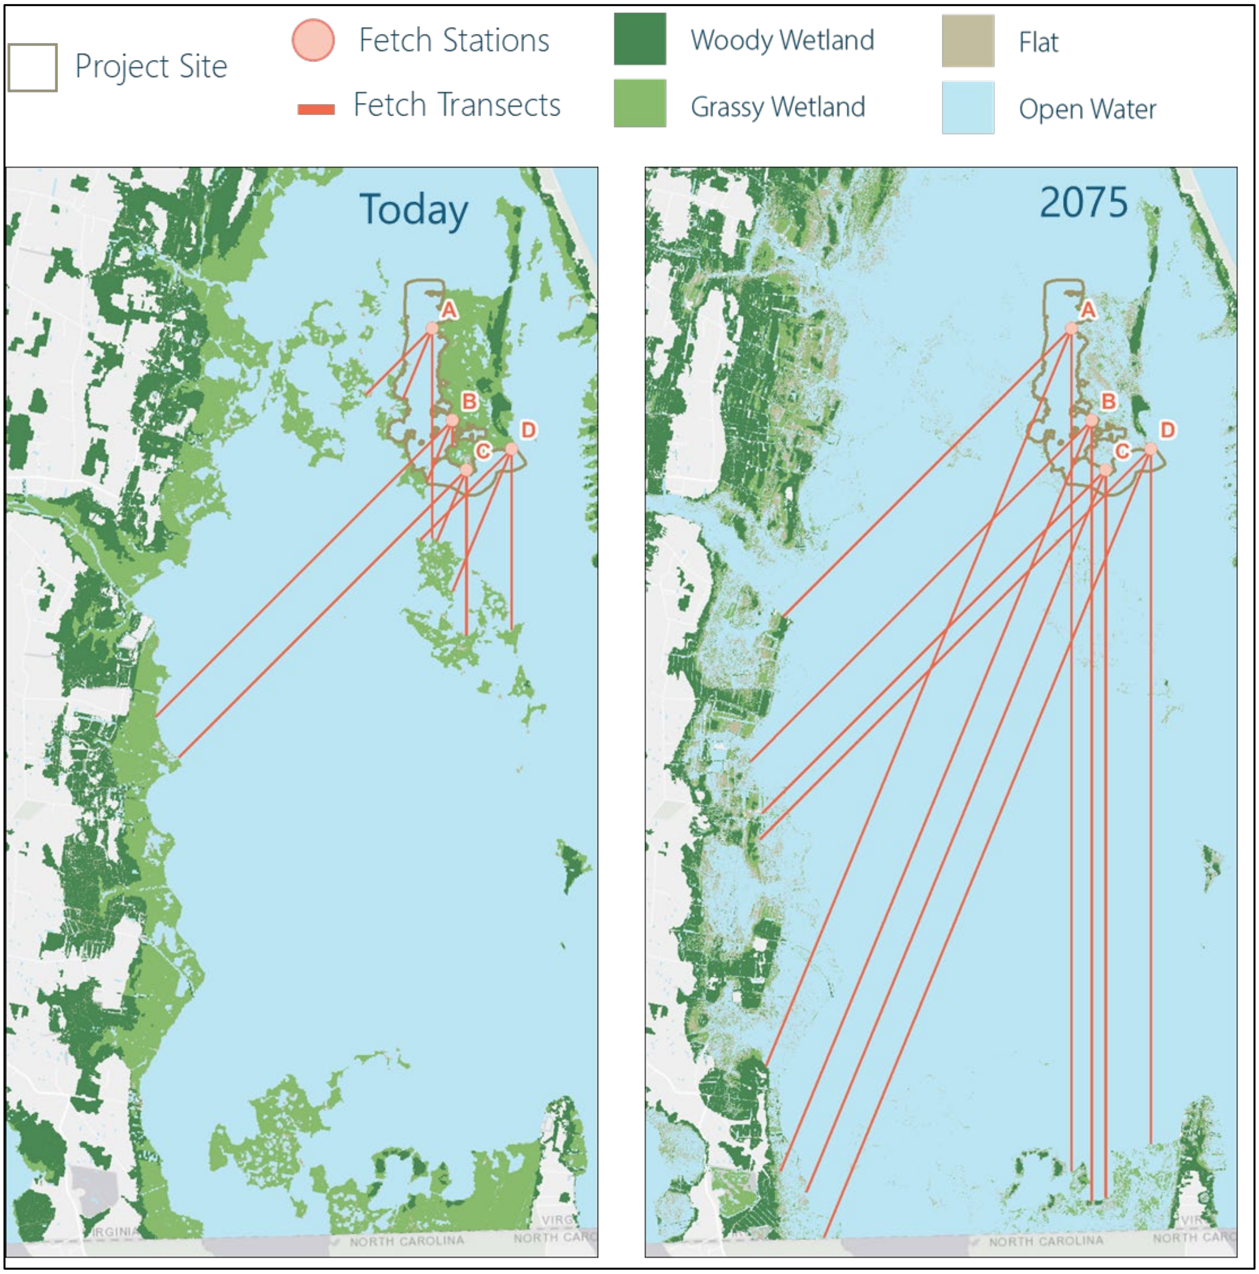

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

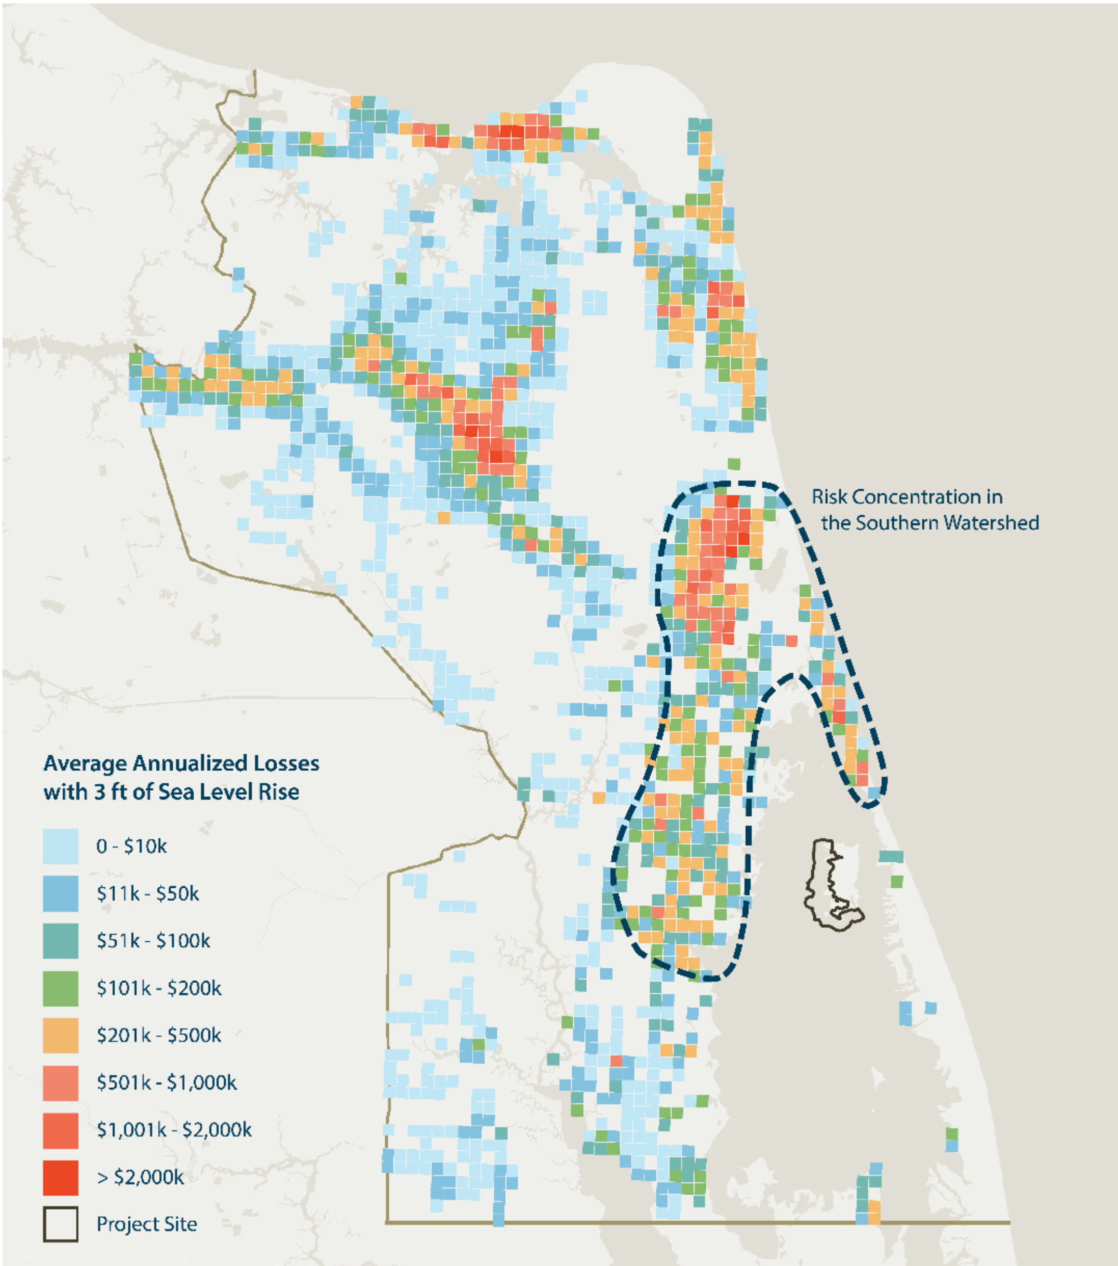

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

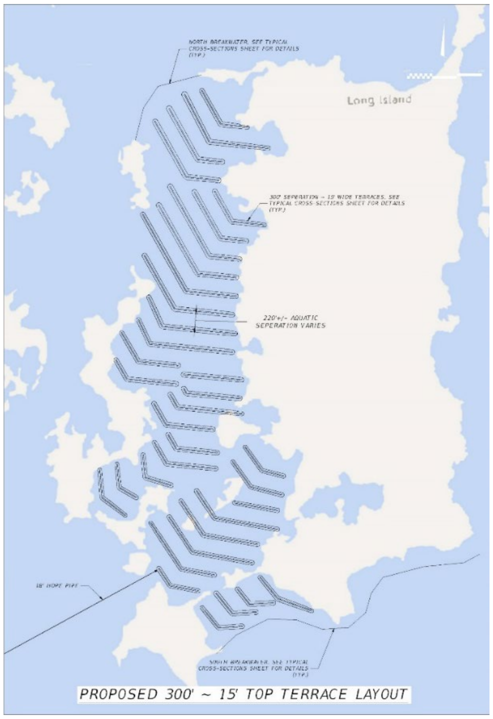

Figure 22: Alternative 2a.

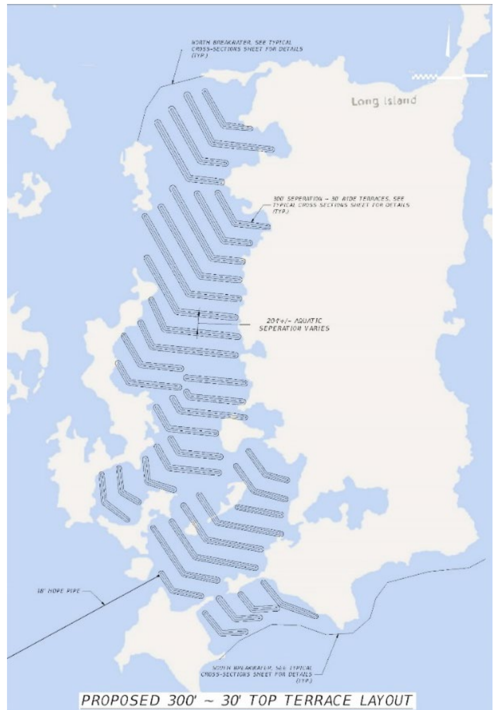

Figure 23: Alternative 2b.

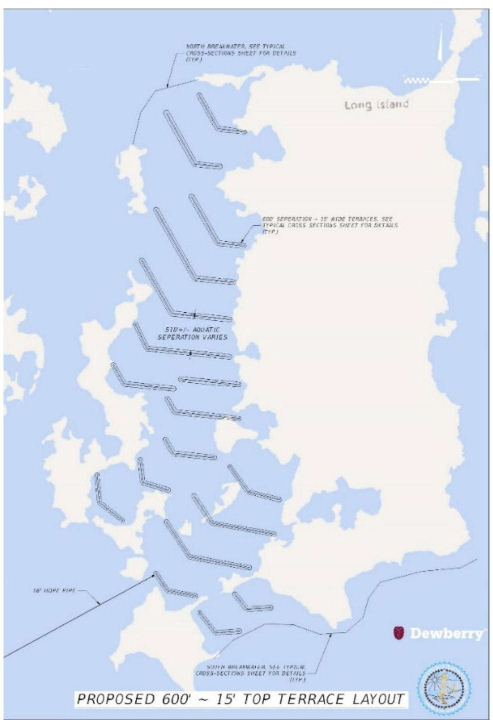

Figure 24: Alternative 2c.

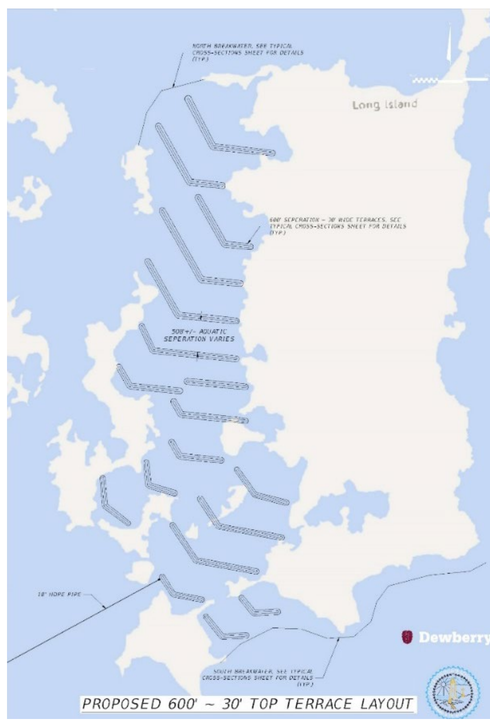

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

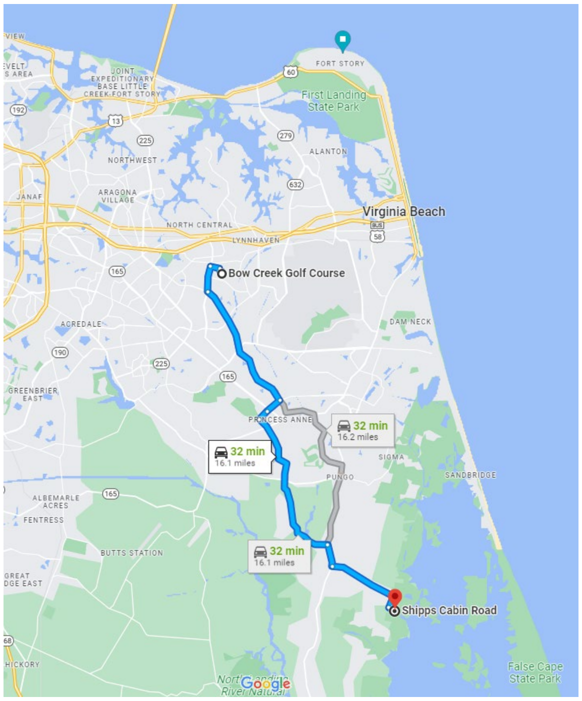

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

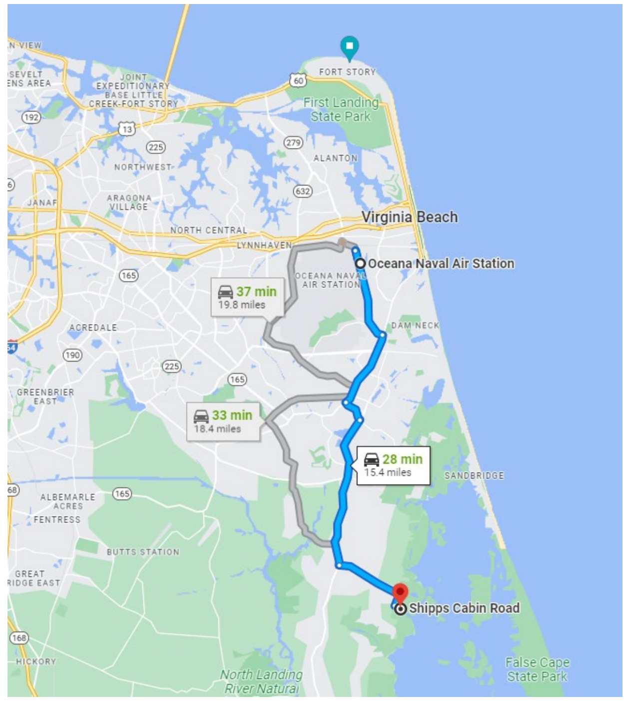

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

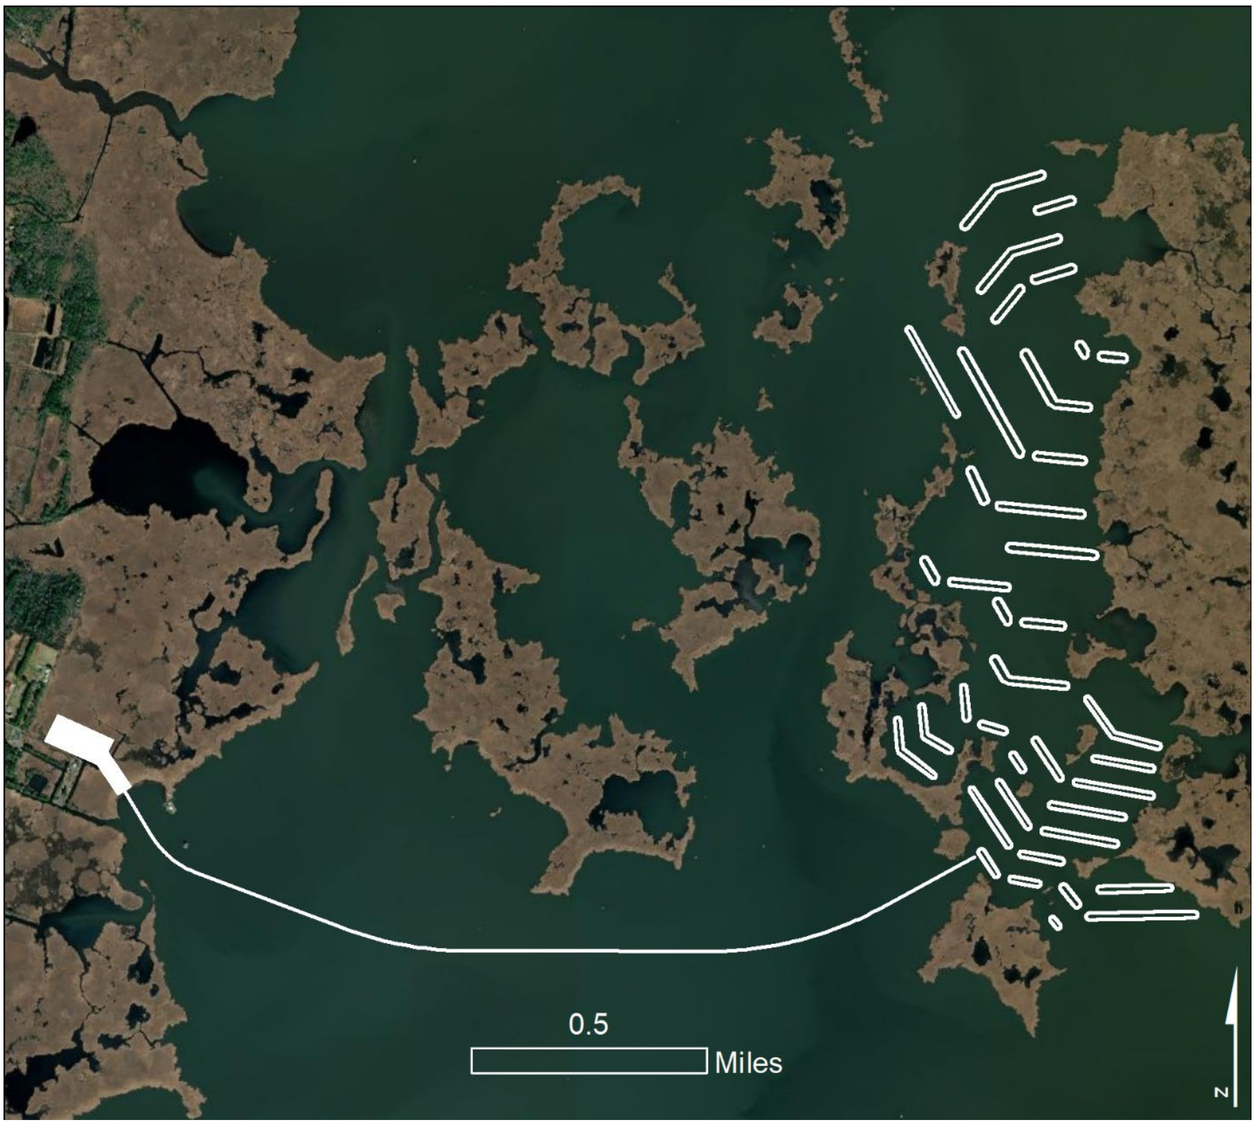

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

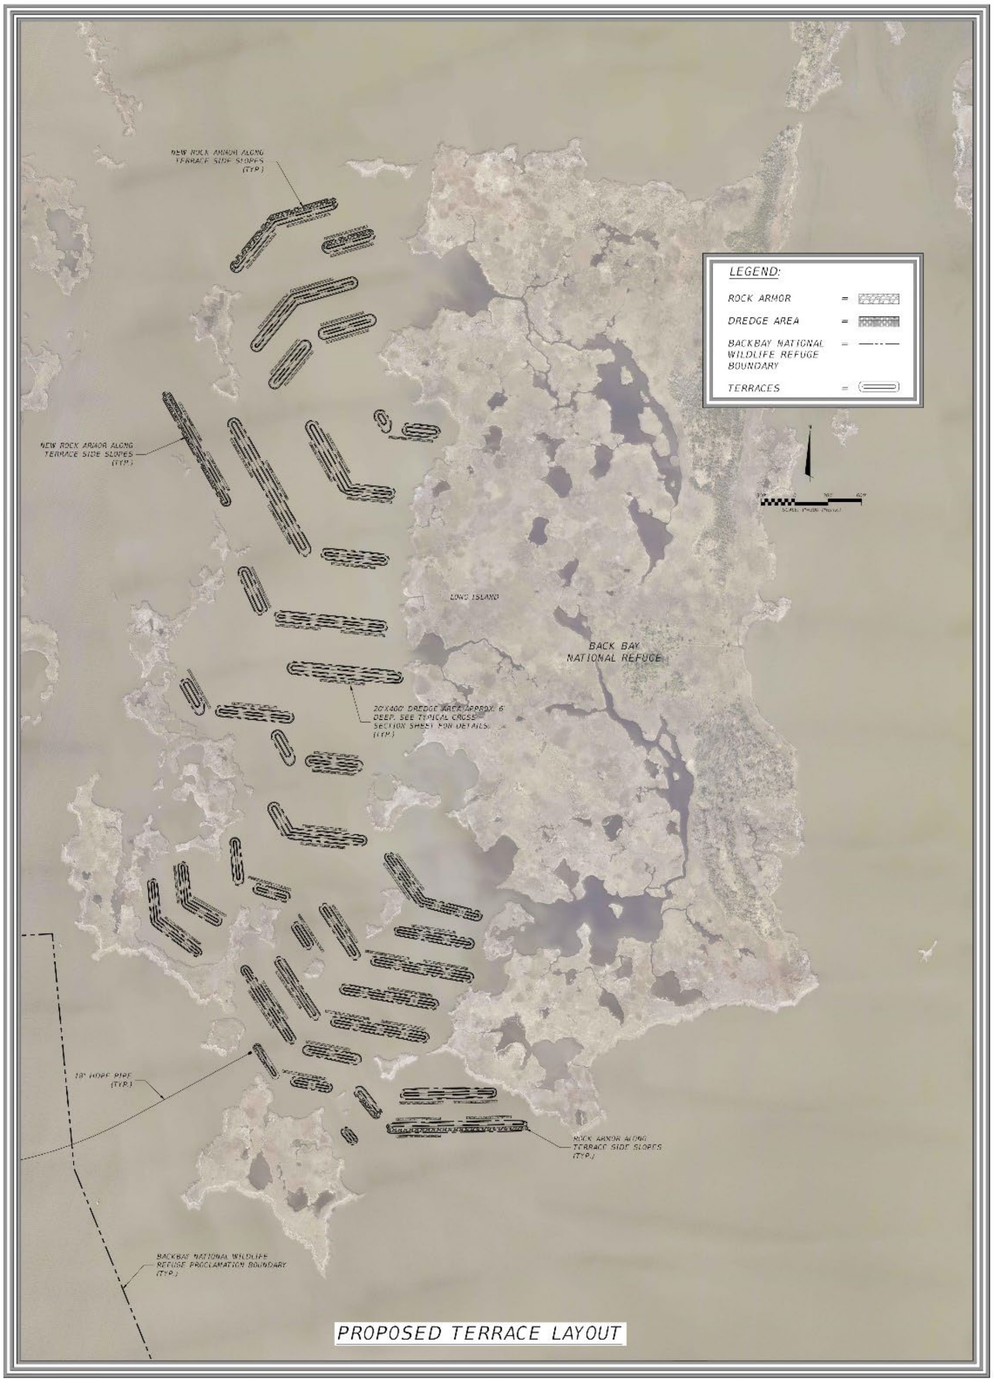

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

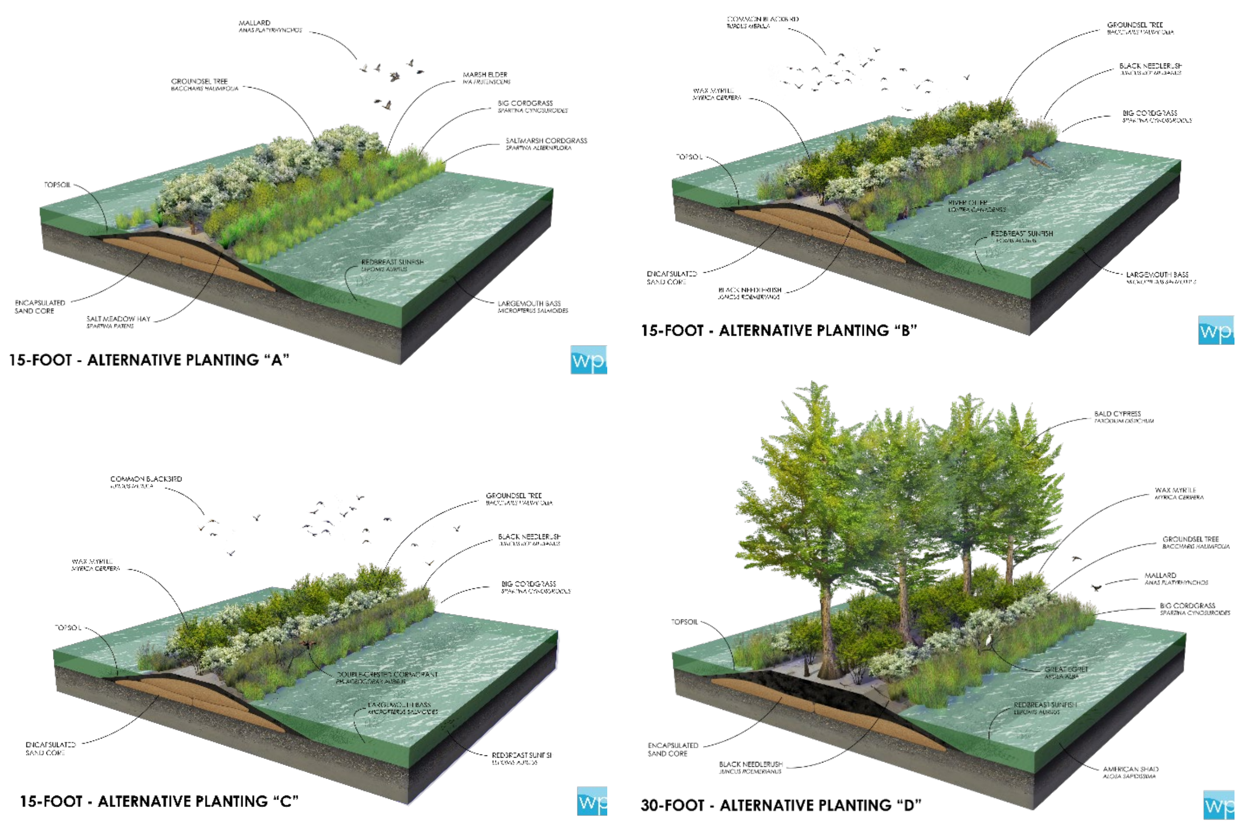

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

- Construction of Marsh Terraces #120 – 134

- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

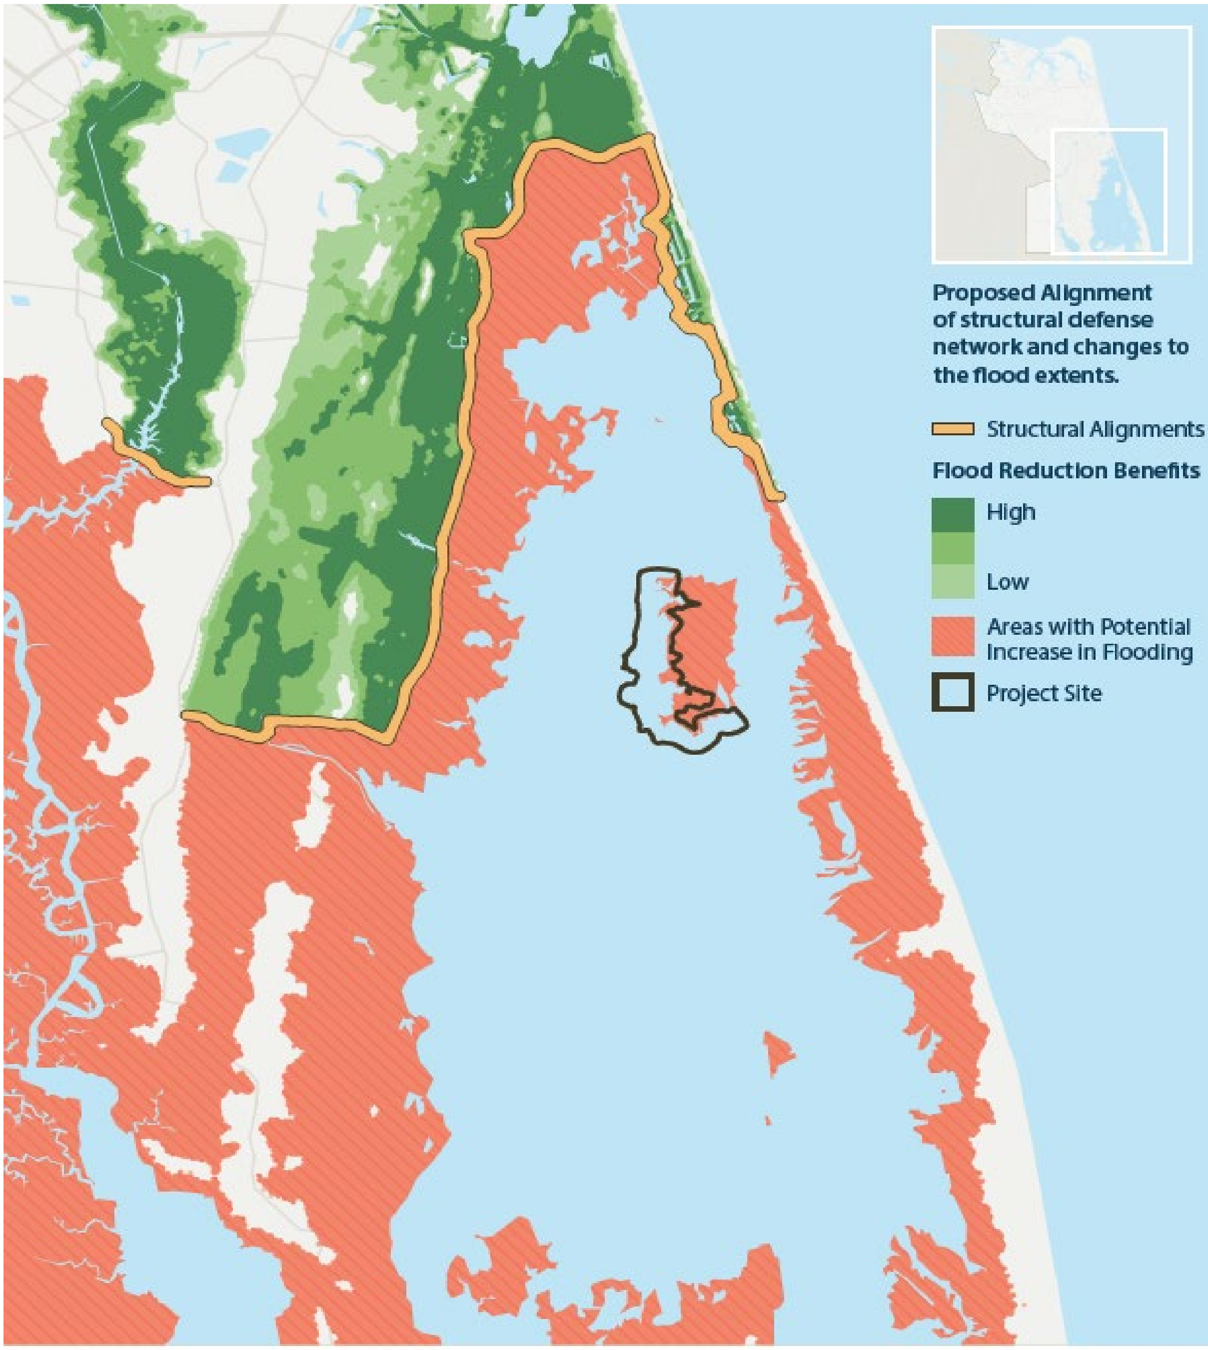

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Virginia Beach, VA 23452

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Jared Brandwein

FISH AND WILDLIFE SERVICE

Back Bay National Wildlife Refuge
1324 Sandpiper Road
Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed

Megan Reed

Albemarle-Pamlico
National Estuary Partnership

*Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.*

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ <u>15.2-984</u>.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;

3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~<u>D</u>irectors of ~~p~~<u>P</u>lanning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ <u>VA USBC § 104 and § 115</u>. <u>Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.</u>

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ <u>Department of Planning and Community Development</u>.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ <u>floodplain administrator or his designee</u>.

The duties and responsibilities of the ~~department of public works~~ <u>floodplain administrator of his designee</u> shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

<u>H.</u> <u>Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;</u>

<u>I.</u> <u>Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;</u>

<u>J.</u> <u>Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;</u>

<u>K.</u> <u>Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;</u>

<u>L.</u> <u>Granting administrative variances pursuant to section 6.1 of this ordinance;</u>

<u>M.</u> <u>Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;</u>

<u>N.</u> <u>Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;</u>

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ Reserved.

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

<u>10.</u> <u>For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.</u>

<u>11.</u> <u>Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.</u>

<u>12.</u> <u>The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.</u>

~~B.~~ ~~In all SFHAs, the following additional provisions shall apply:~~

~~1.~~ ~~Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2.~~ ~~The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C.~~ ~~The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1.~~ ~~Public and private outdoor recreational facilities;~~

~~2.~~ ~~Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3.~~ ~~Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

    a. ~~Only one (1) such stand shall be permitted per lot;~~

    b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

    c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

C. ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

   a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

   b. Comply with the Public Works Design Standards Manual; and

   c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

Attachment 6: Copy of Monitoring/Maintenance Plan

[DRAFT] Annual Monitoring Plan and Post-Construction Monitoring Report

Marsh Restoration in Back Bay, Virginia Beach, VA

Prepared by: Dewberry Engineers, Inc.

[July 6, 2023]

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

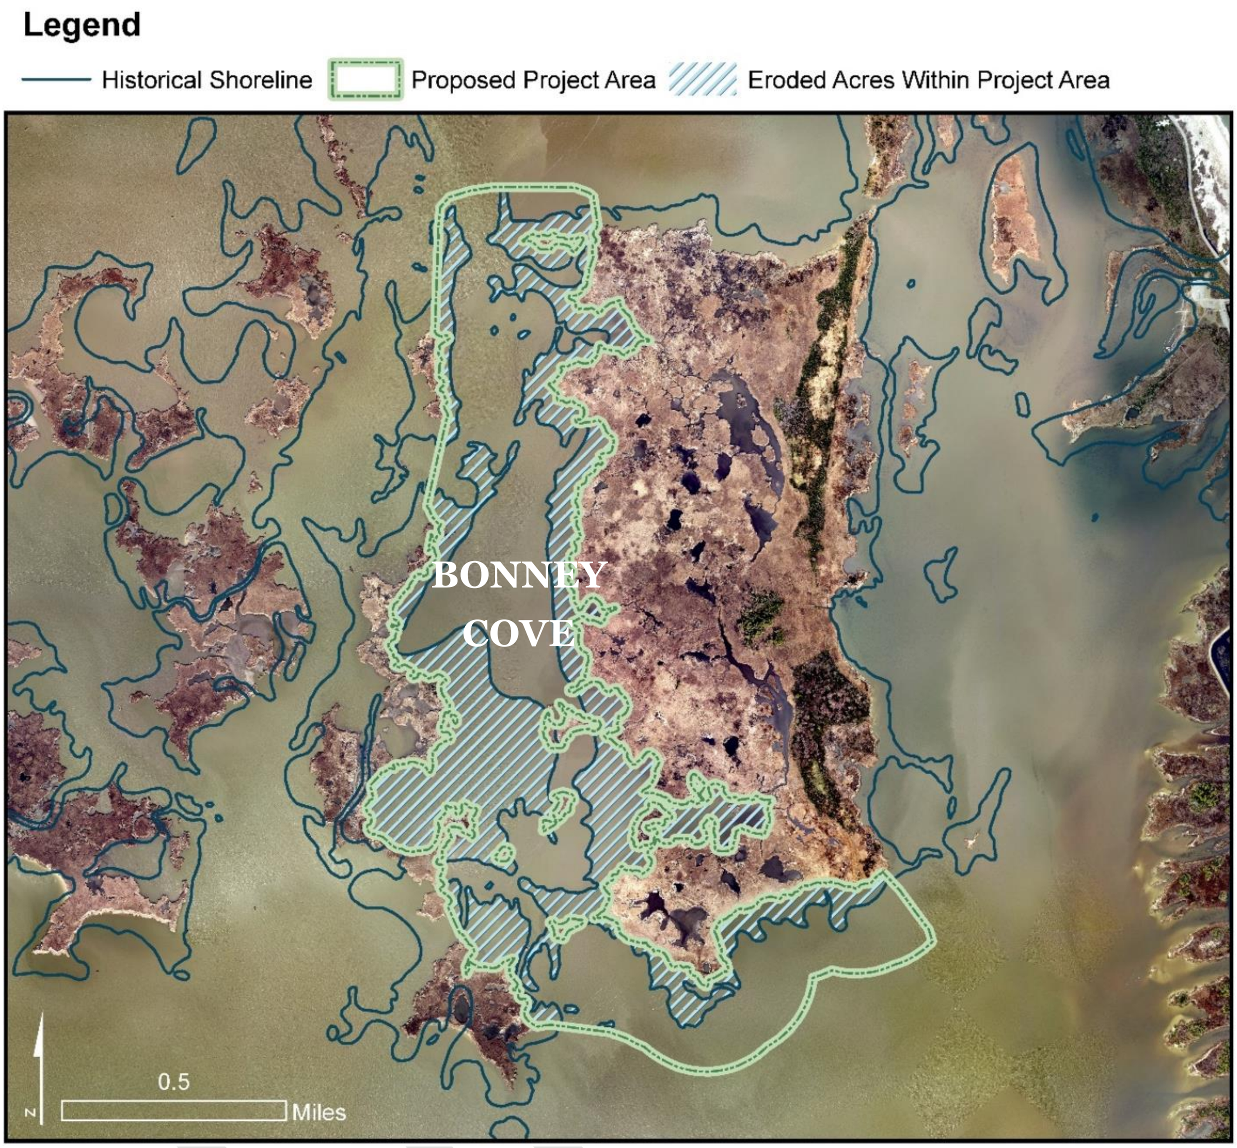

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats.   Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

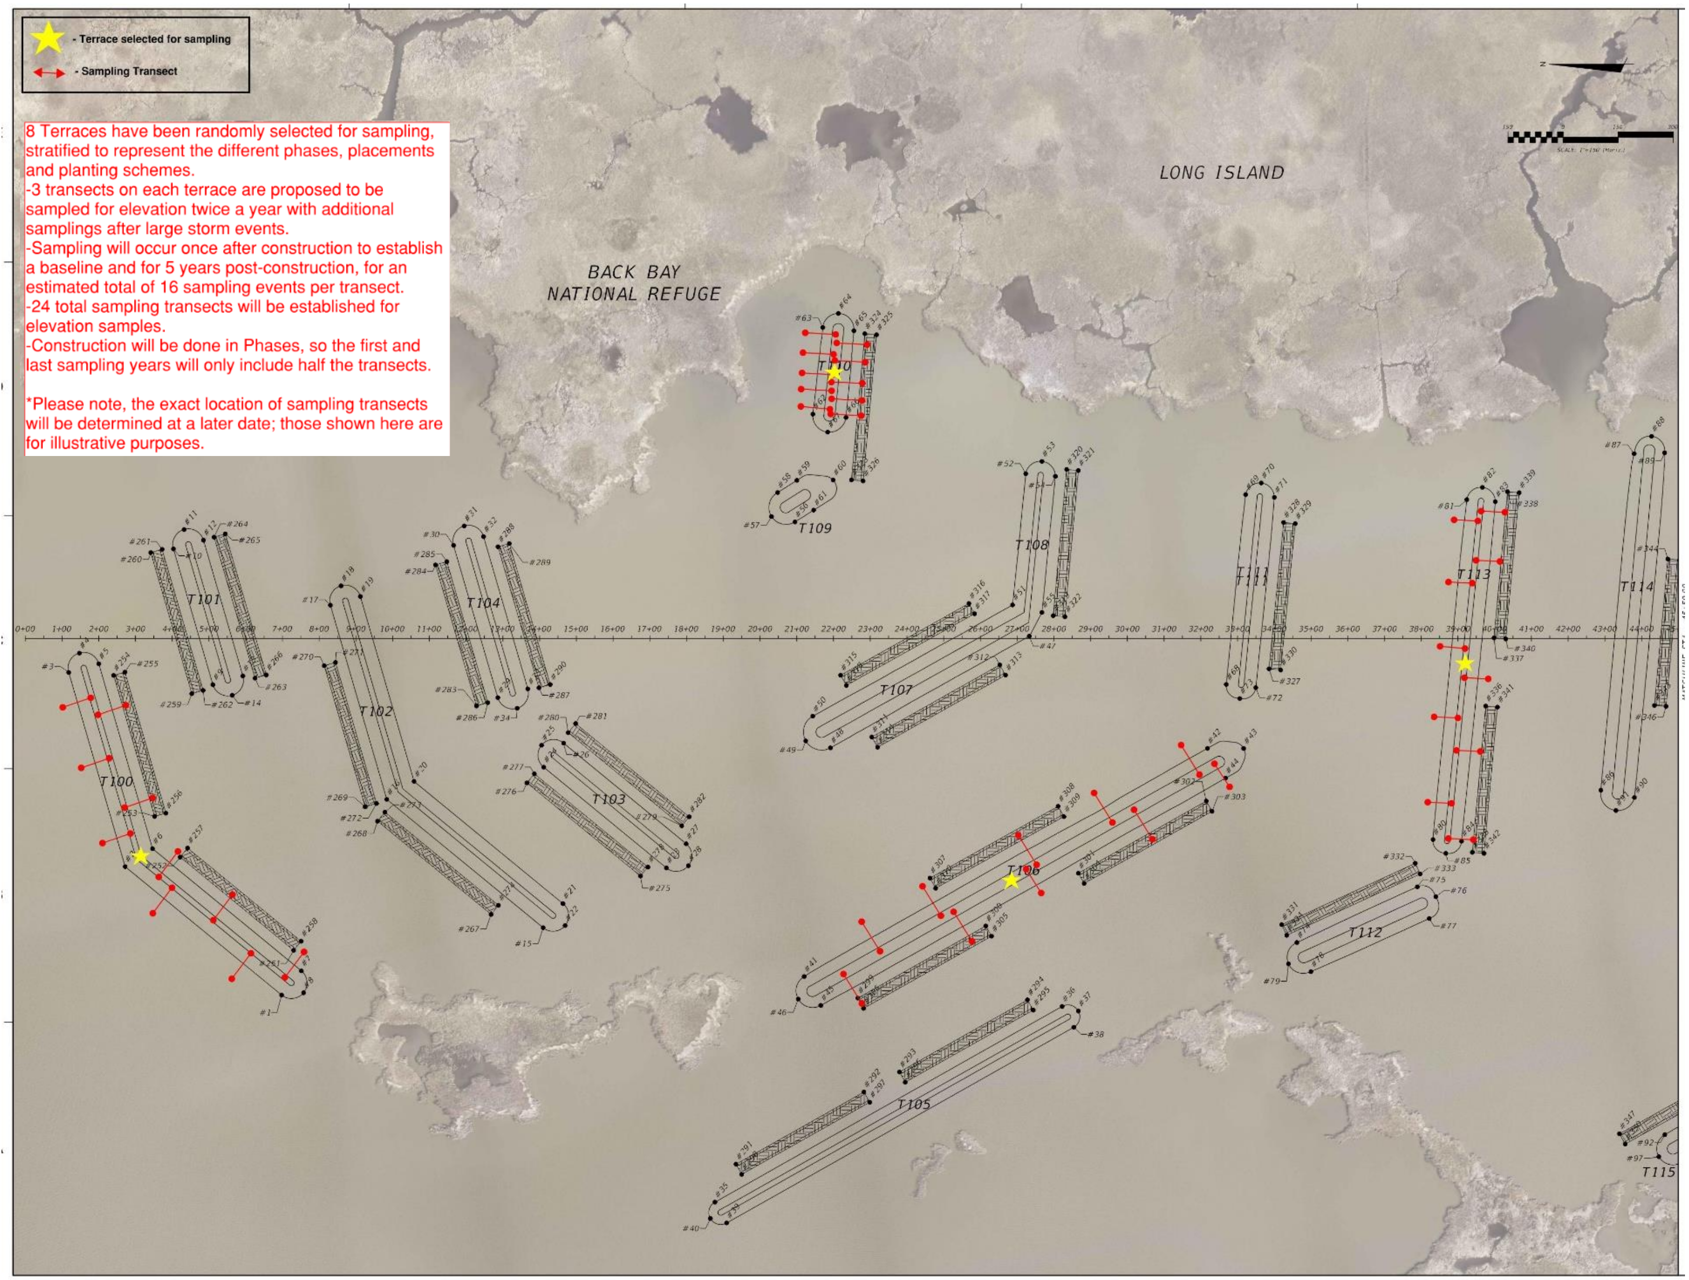

Figure 3: Monitoring design site plan – North Terraces

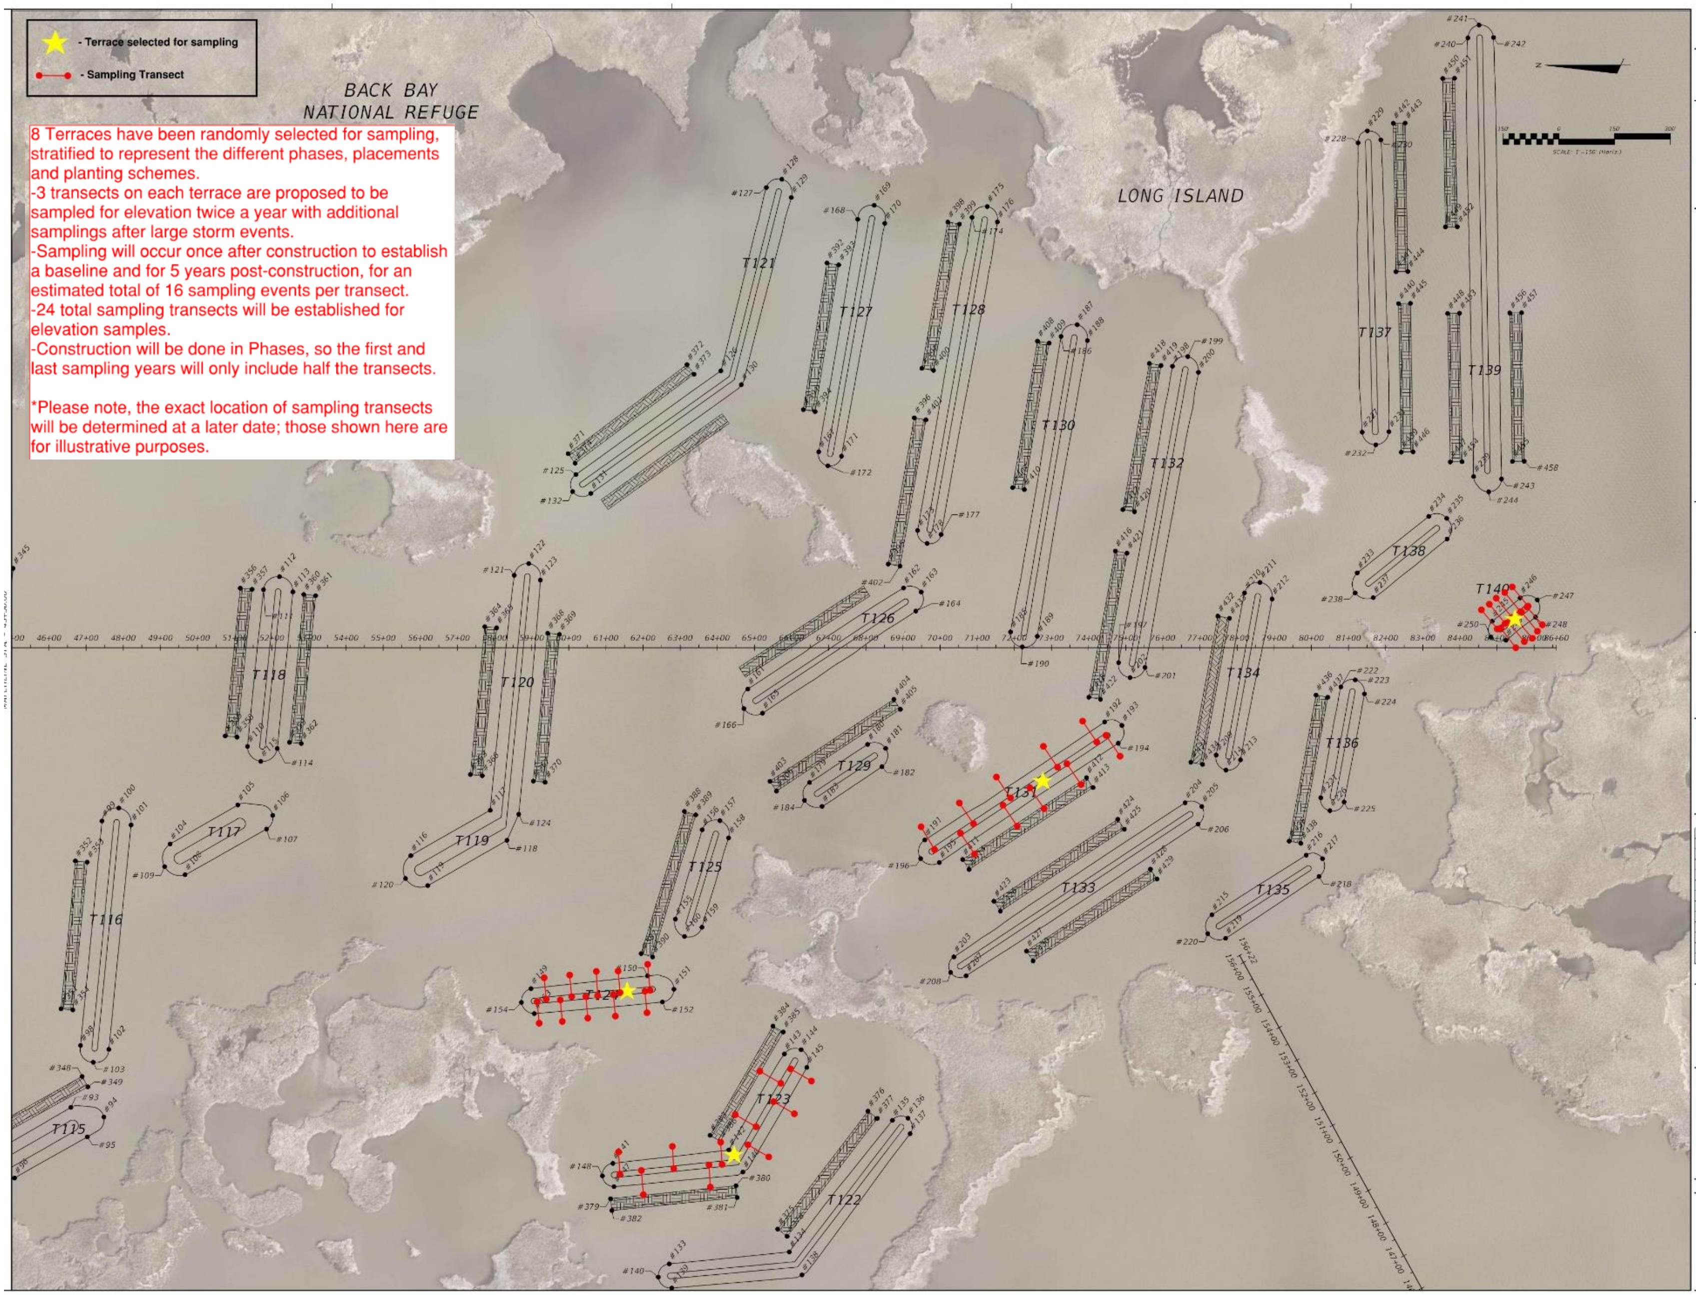

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

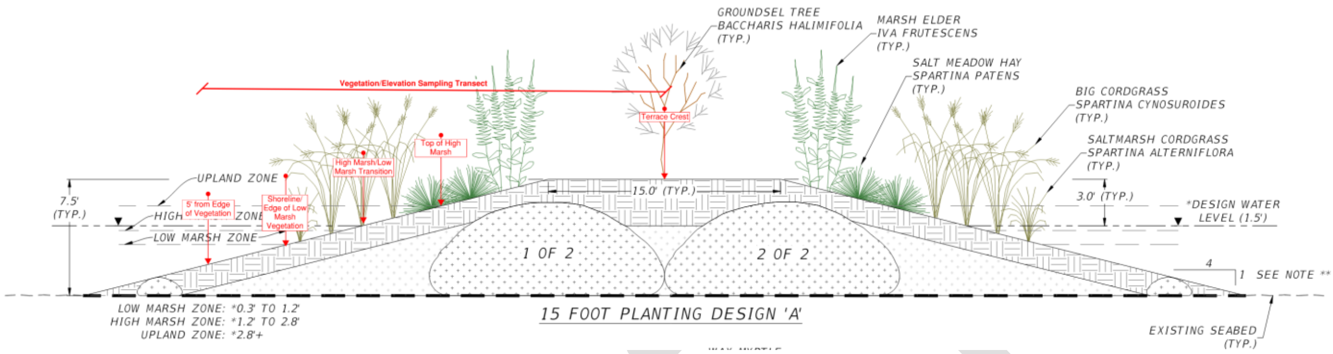

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ____

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ___________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) __________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: ______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: __________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name:
Community Flood Preparedness Fund &
Resilient Virginia Revolving Loan Fund
Detailed Budget Narrative
Period of Performance: June 2024 through June 2027
Submission Date: November 12, 2023

	Grand Total State Funding Request	$ 5,000,000
	Grand Total Local Share of Project	$ 38,356,966
National Fish and Wildlife Foundation Grants	Federal Funding (if applicable)	$ 10,021,524
	Project Grand Total	$ 53,378,490
	Locality Cost Match	% 71.85

Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

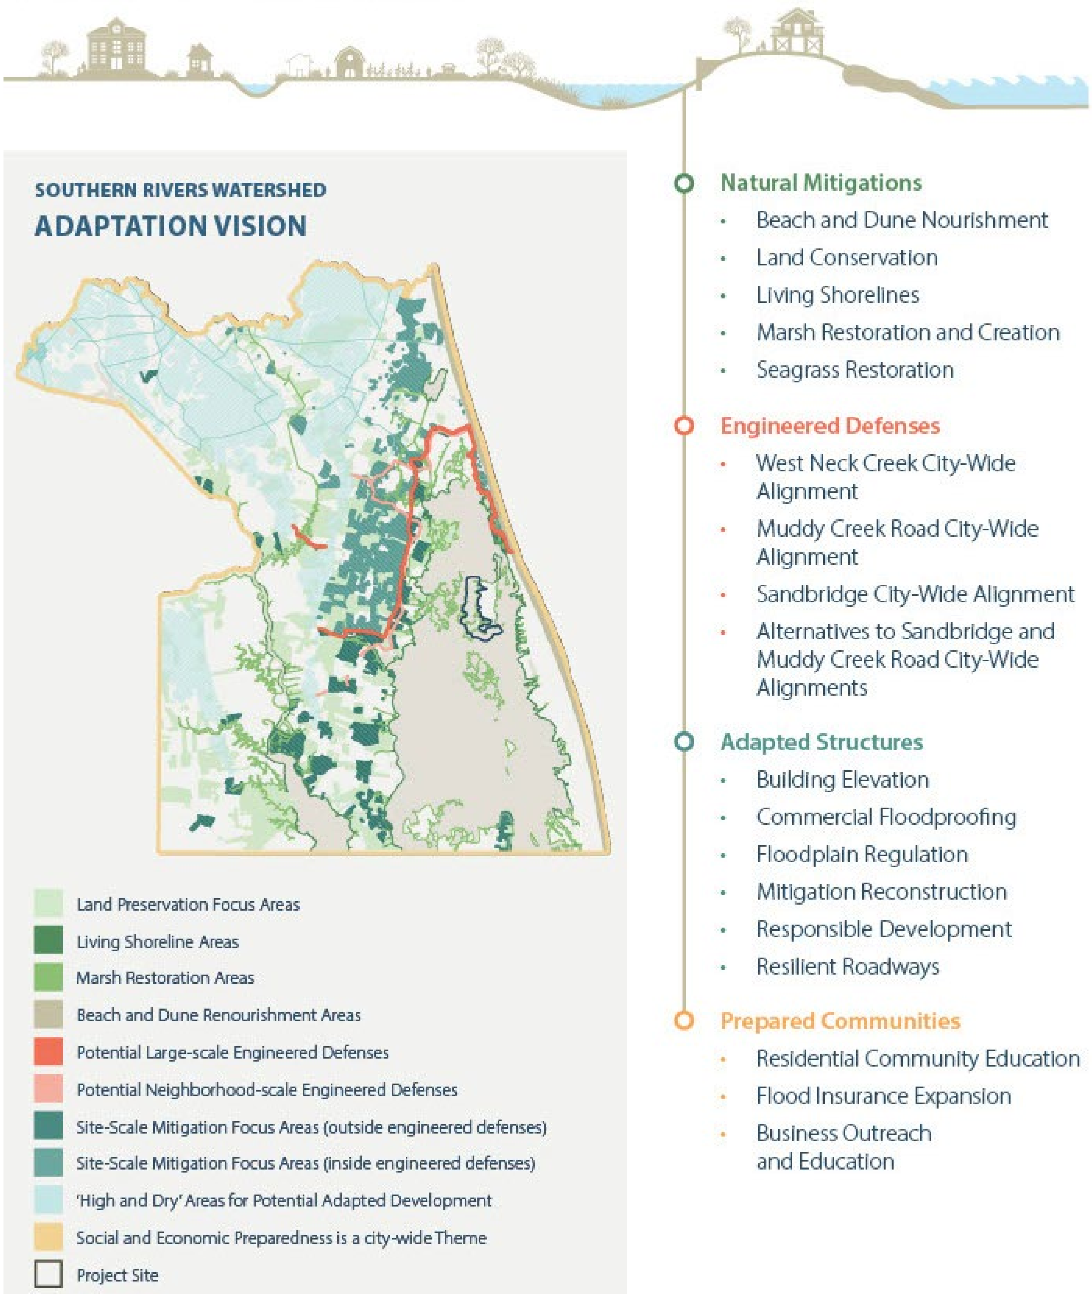

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

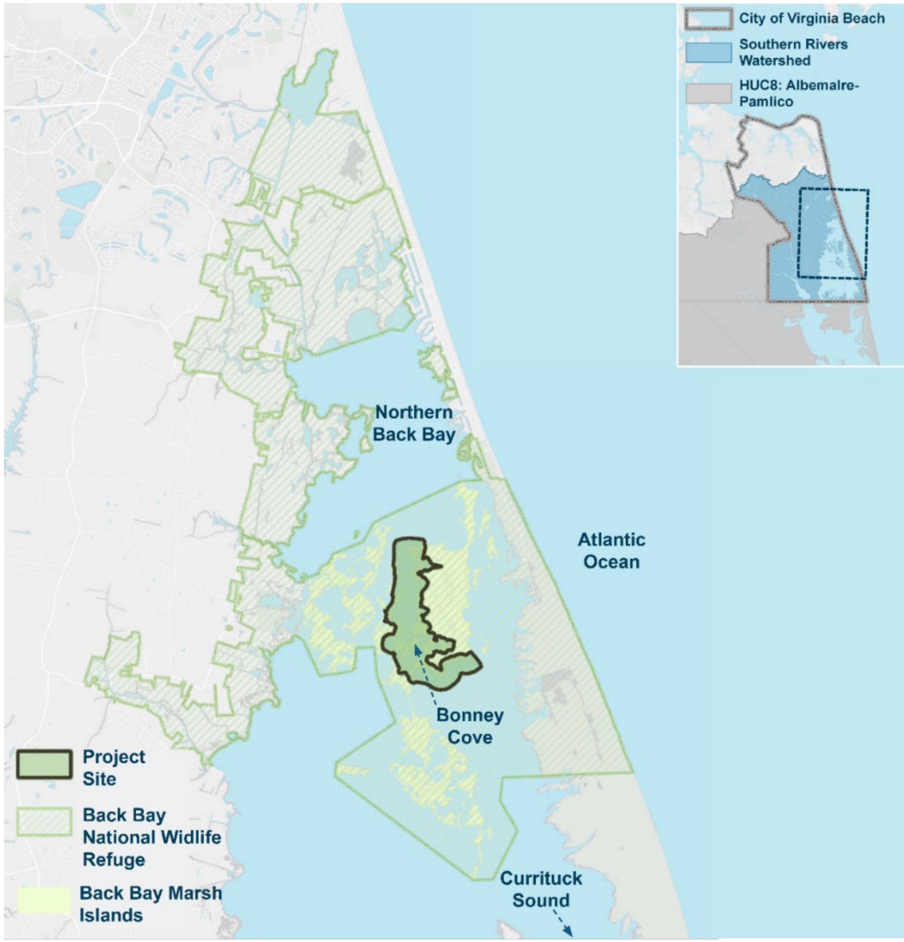

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

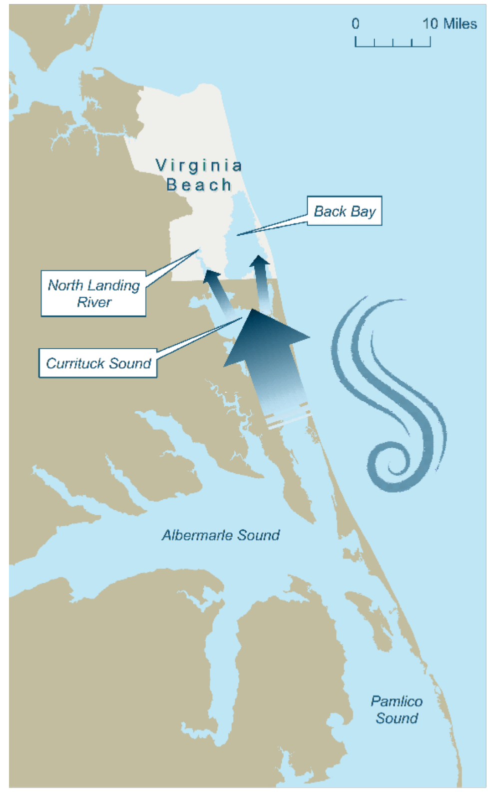

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

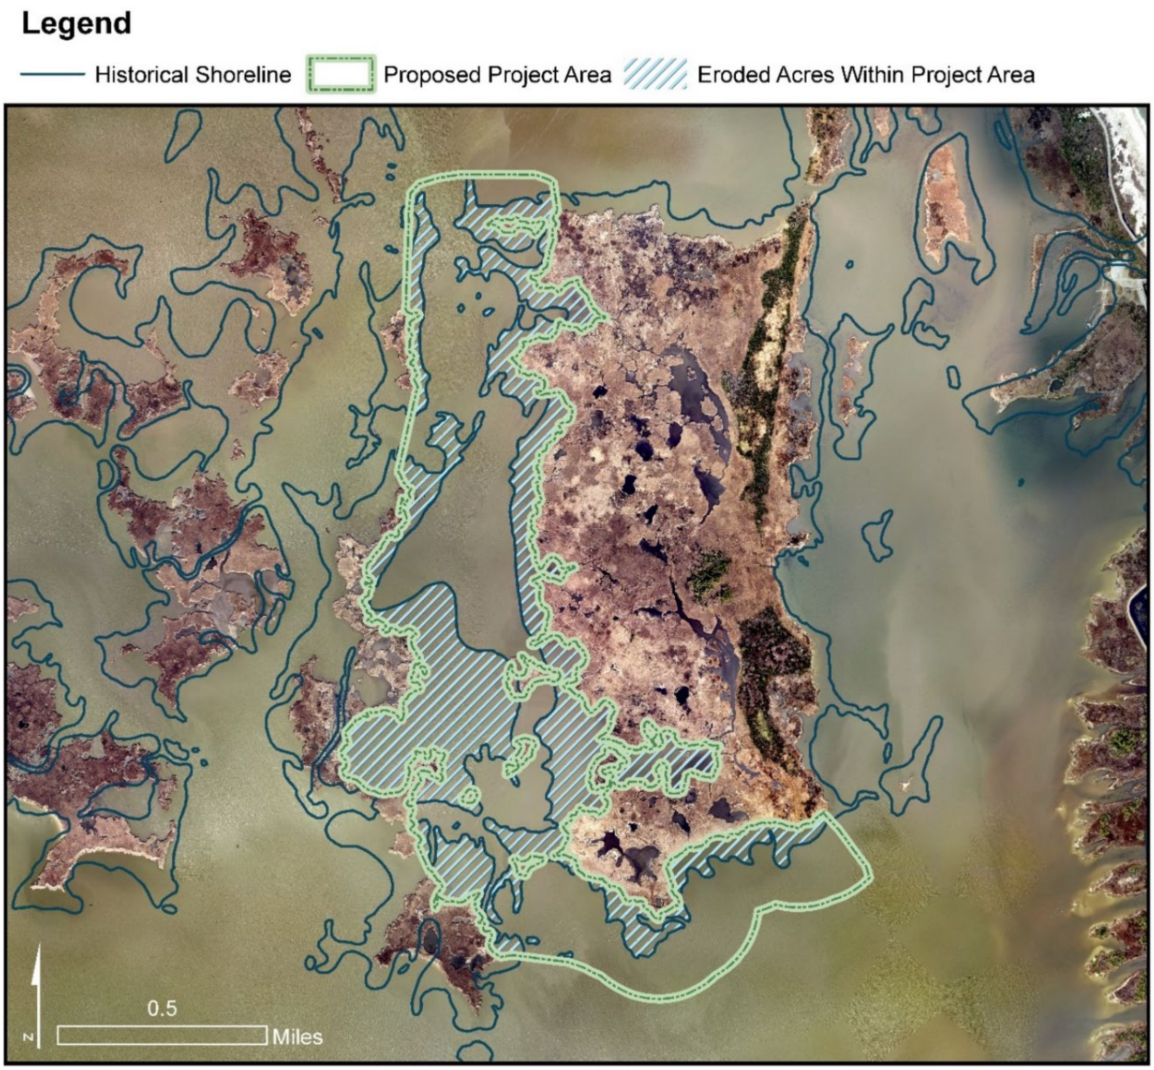

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

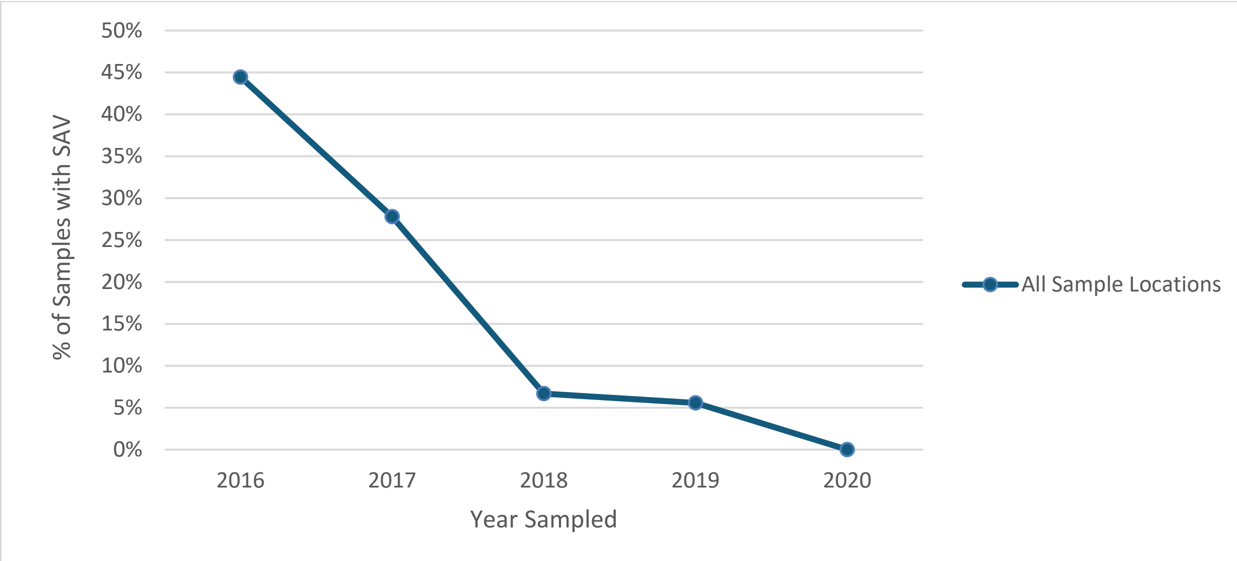

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

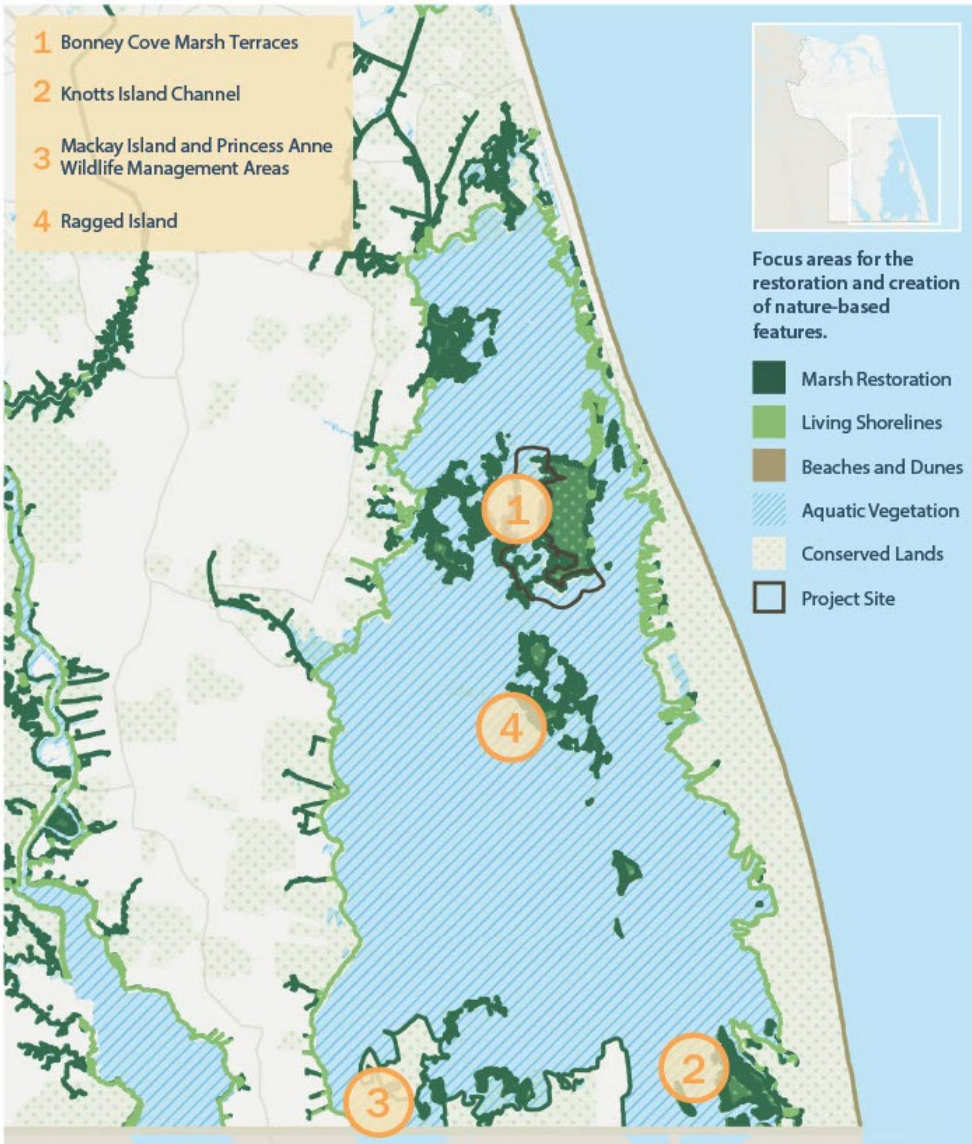

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

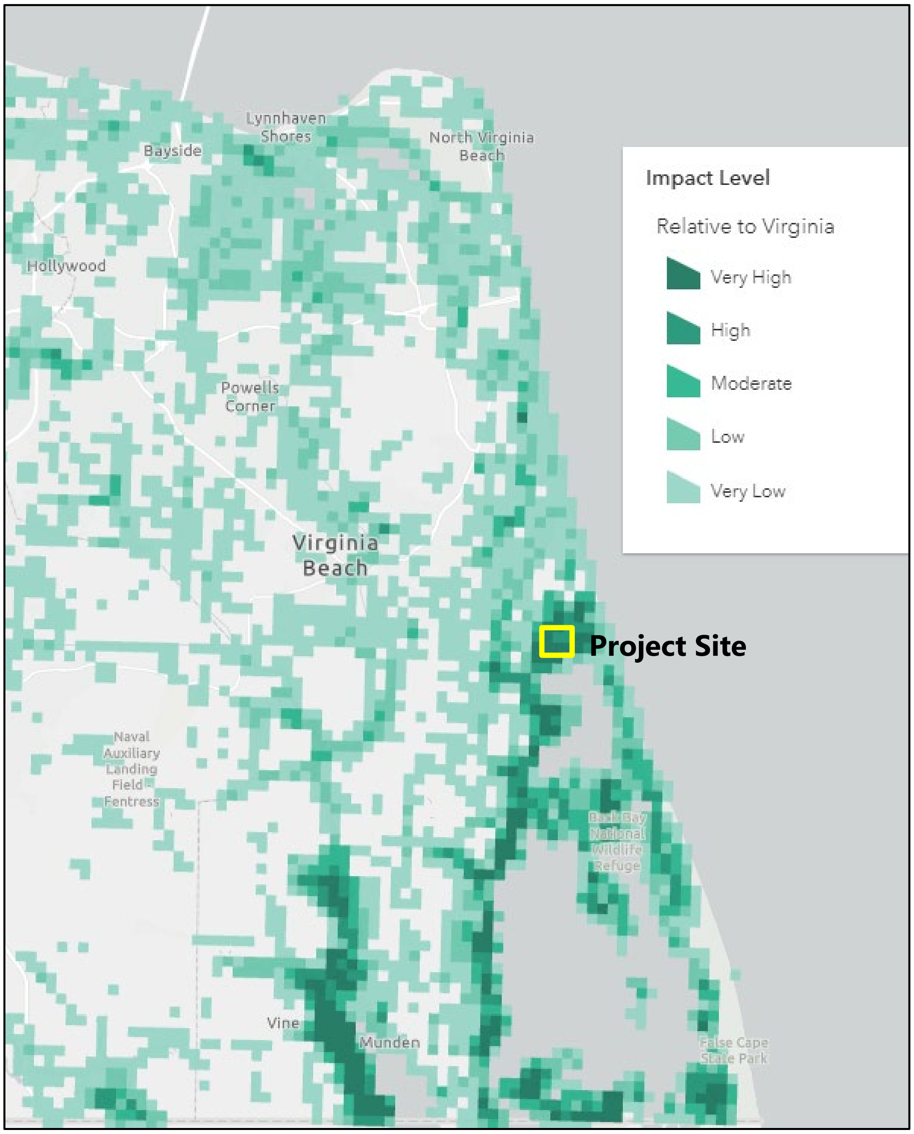

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

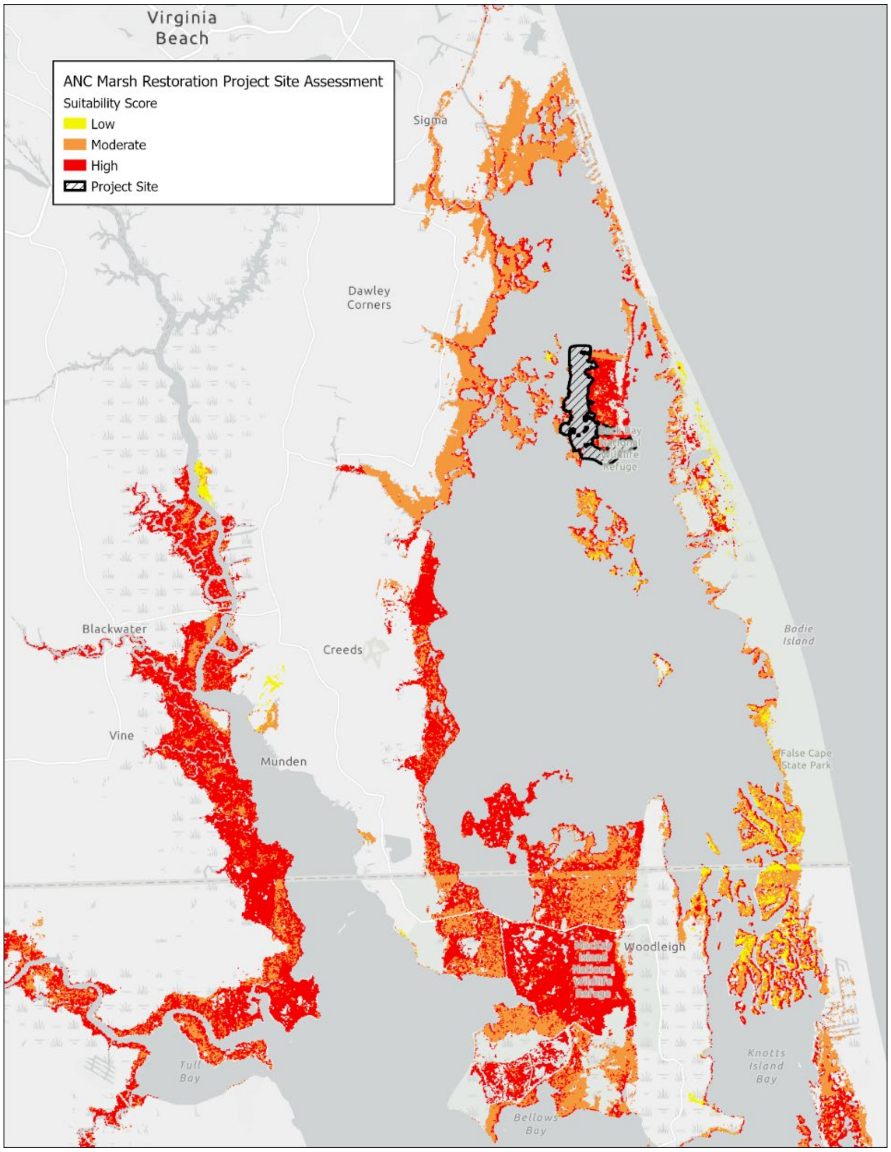

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

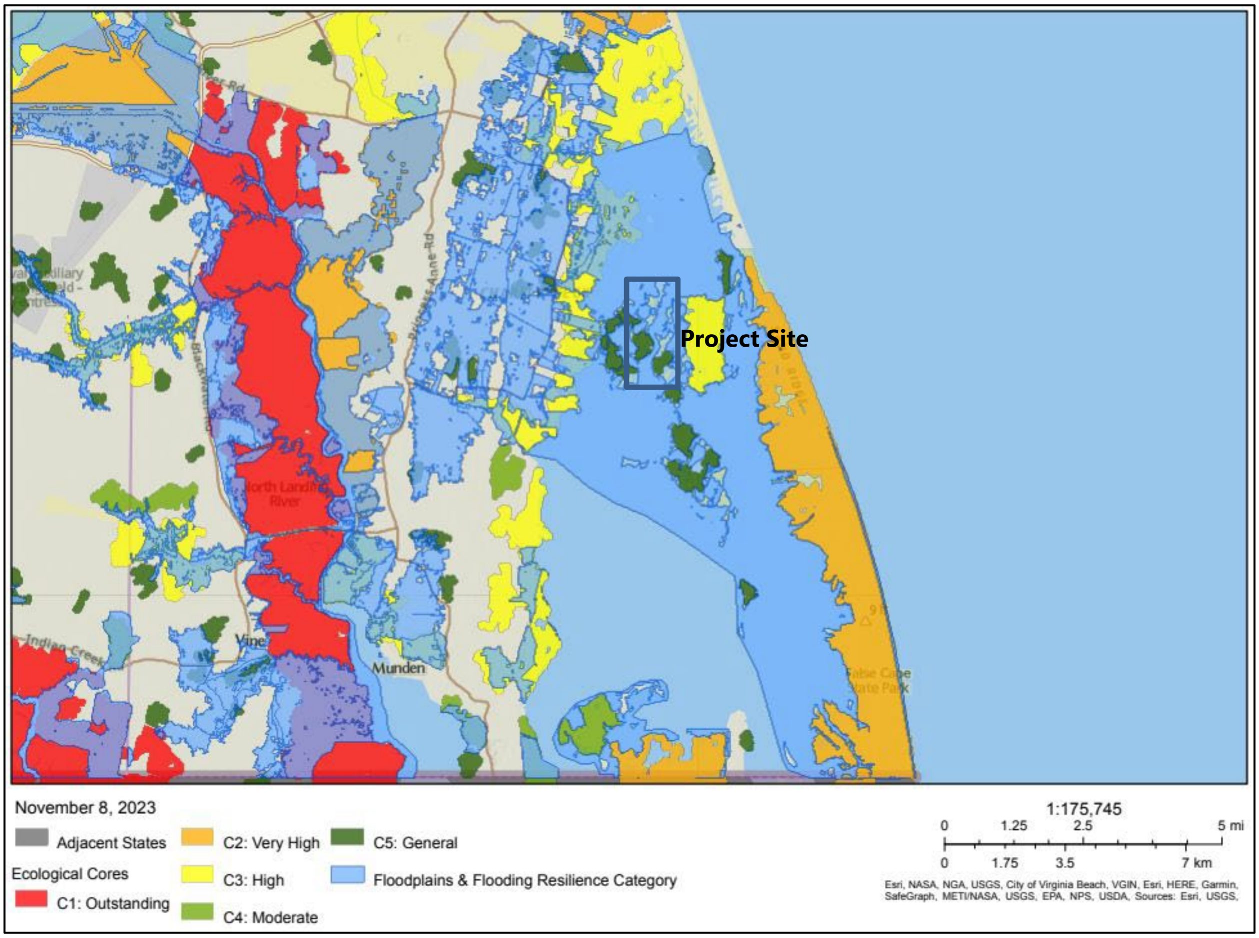

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

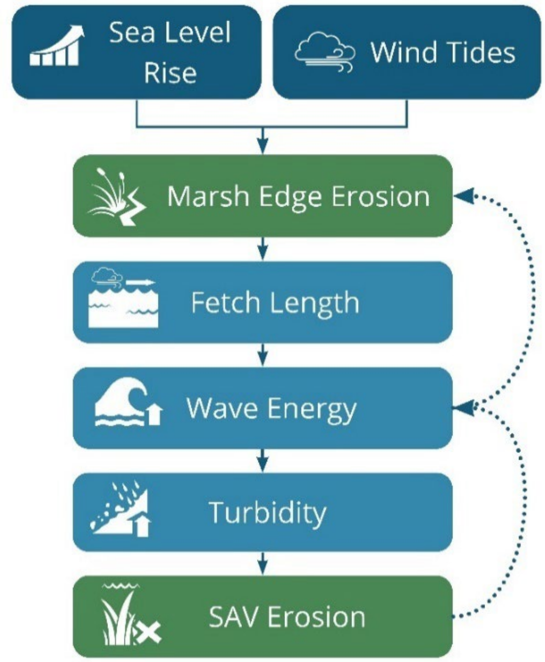

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

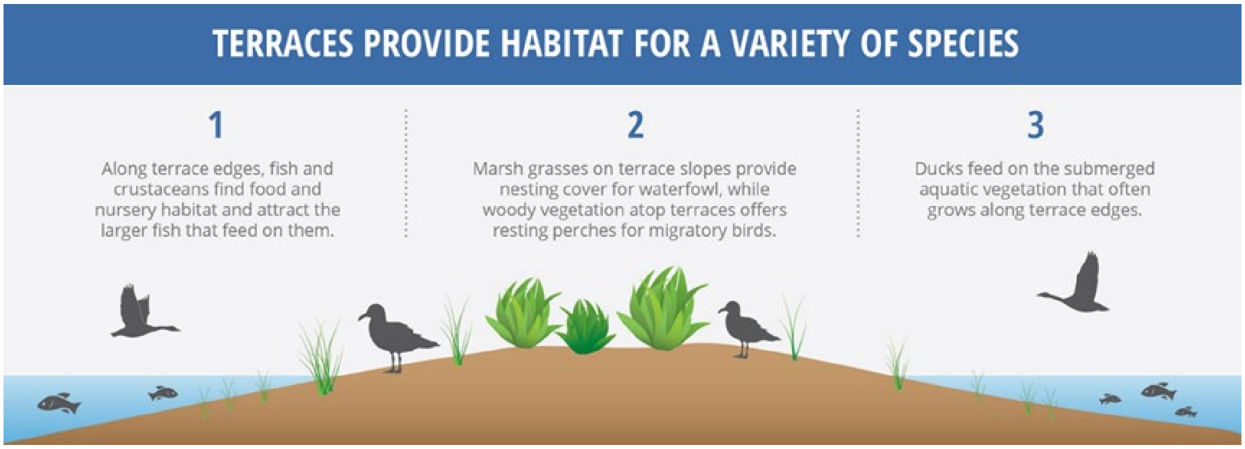

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

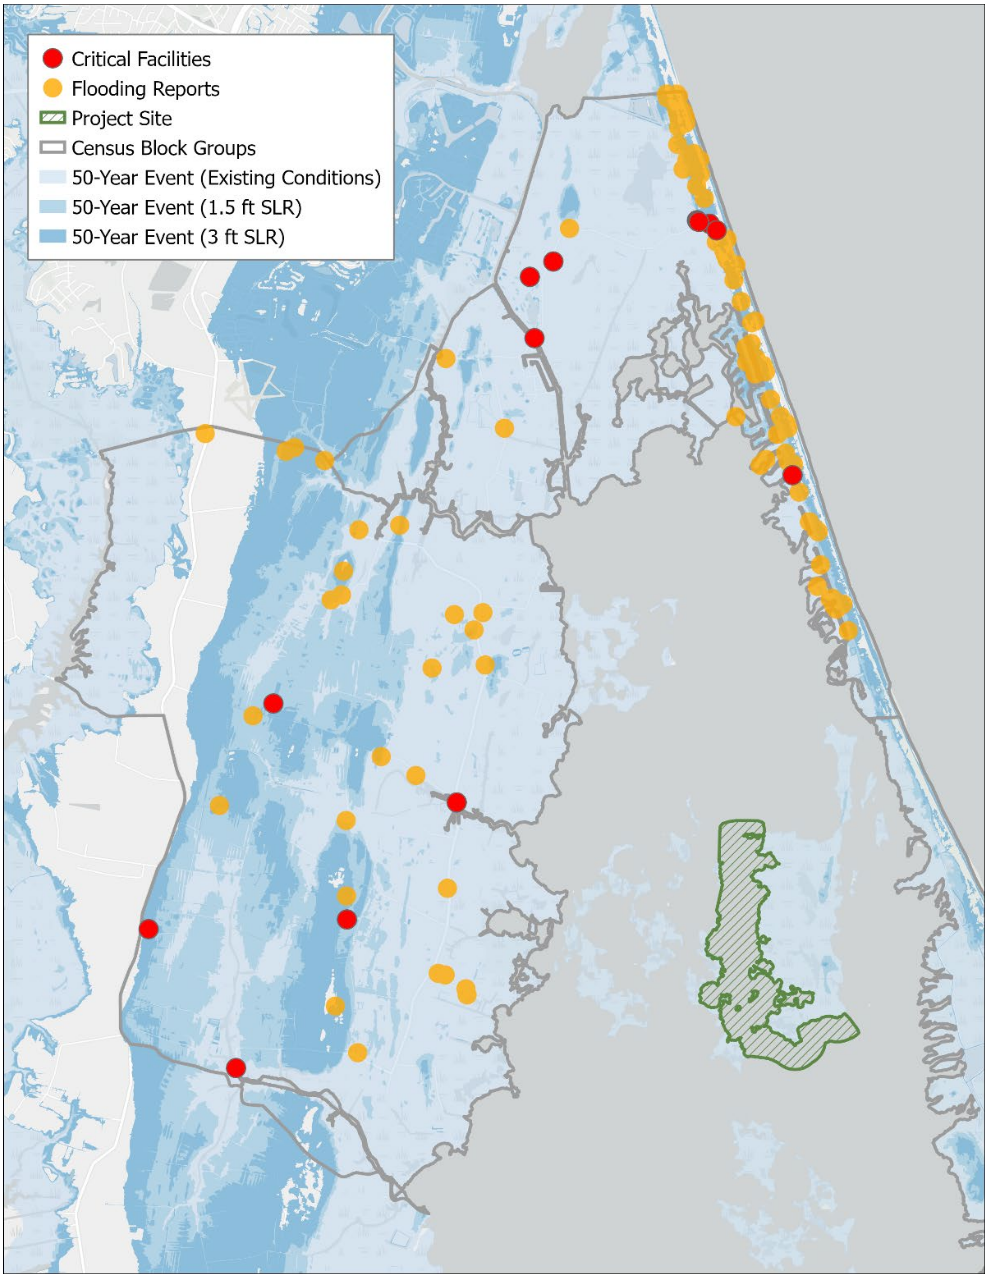

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

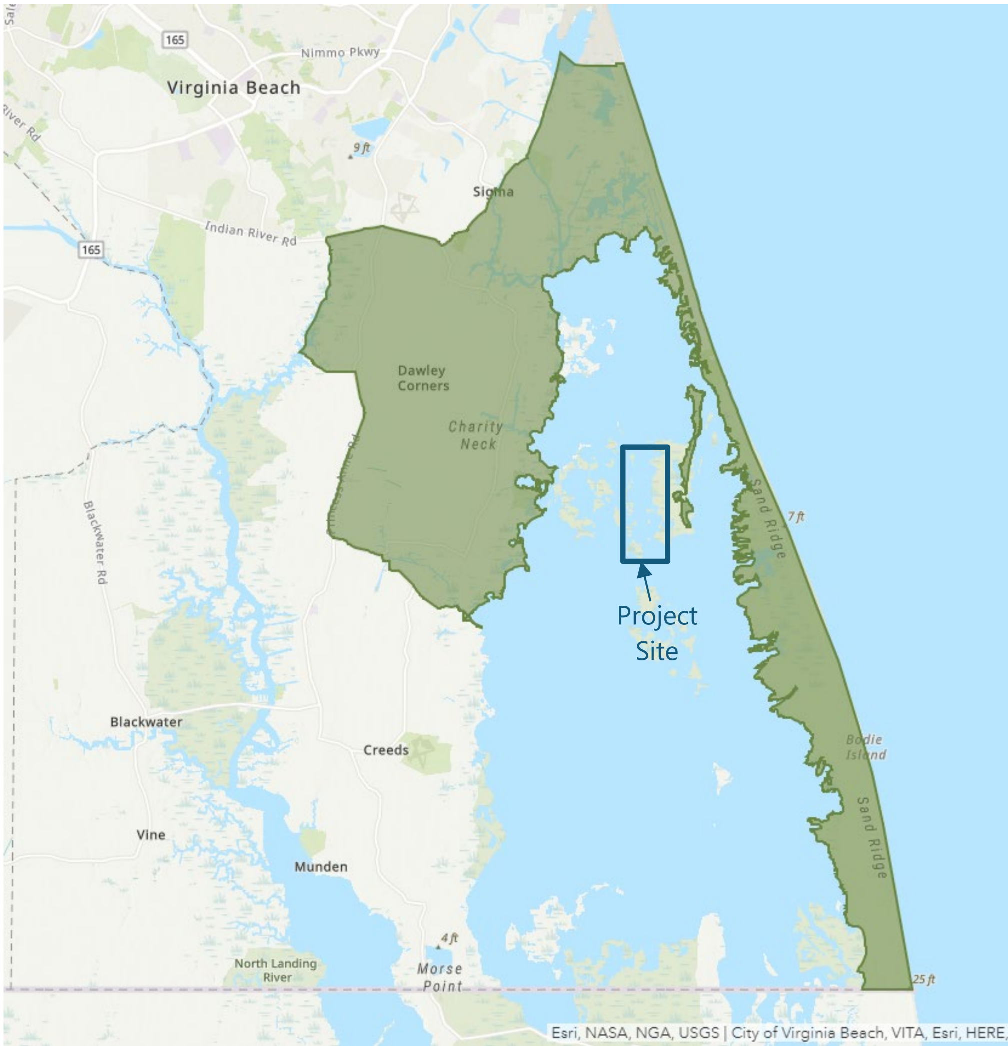

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

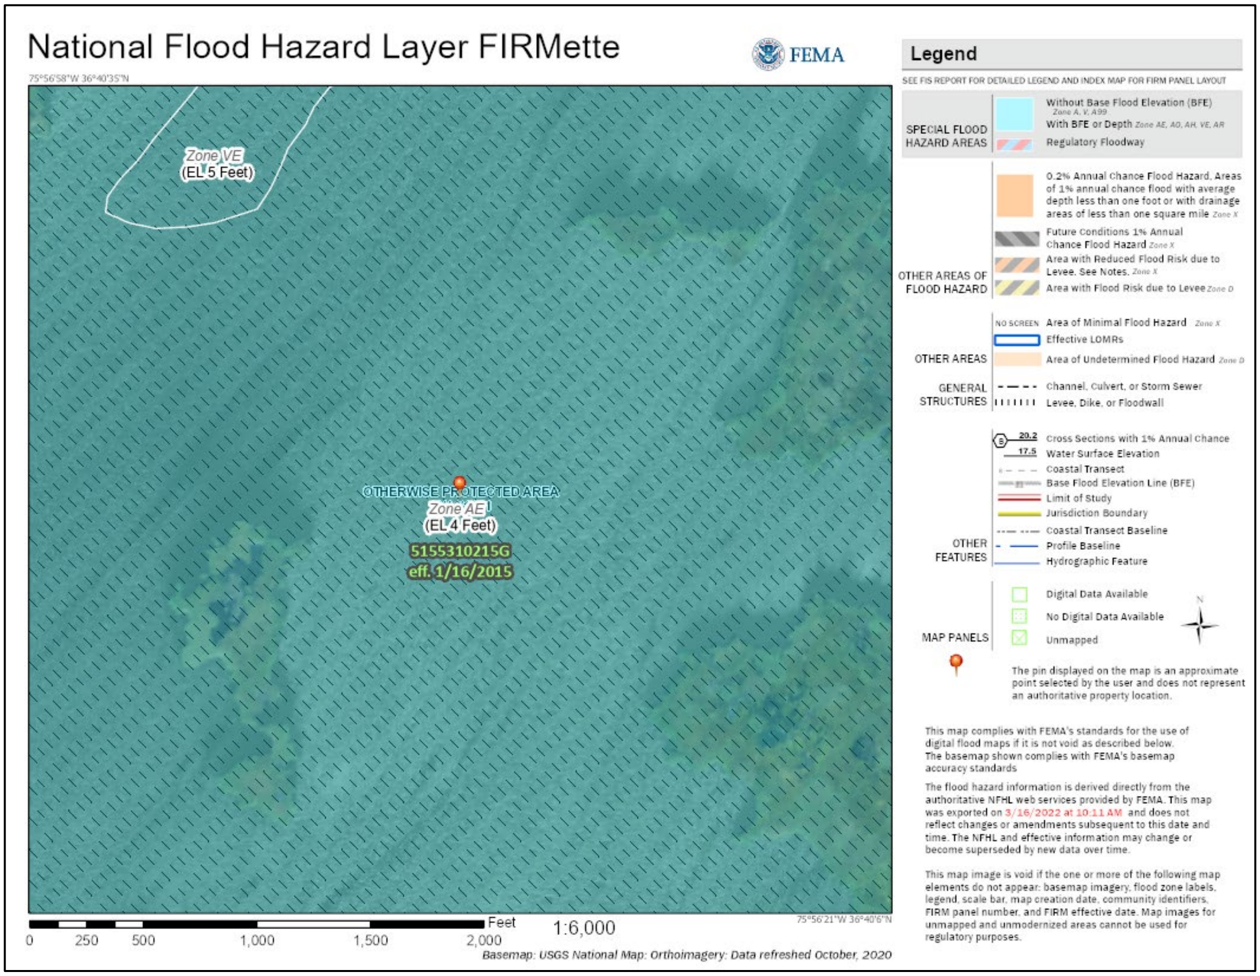

Figure 15: FIRMette for the project area (northern boundary).

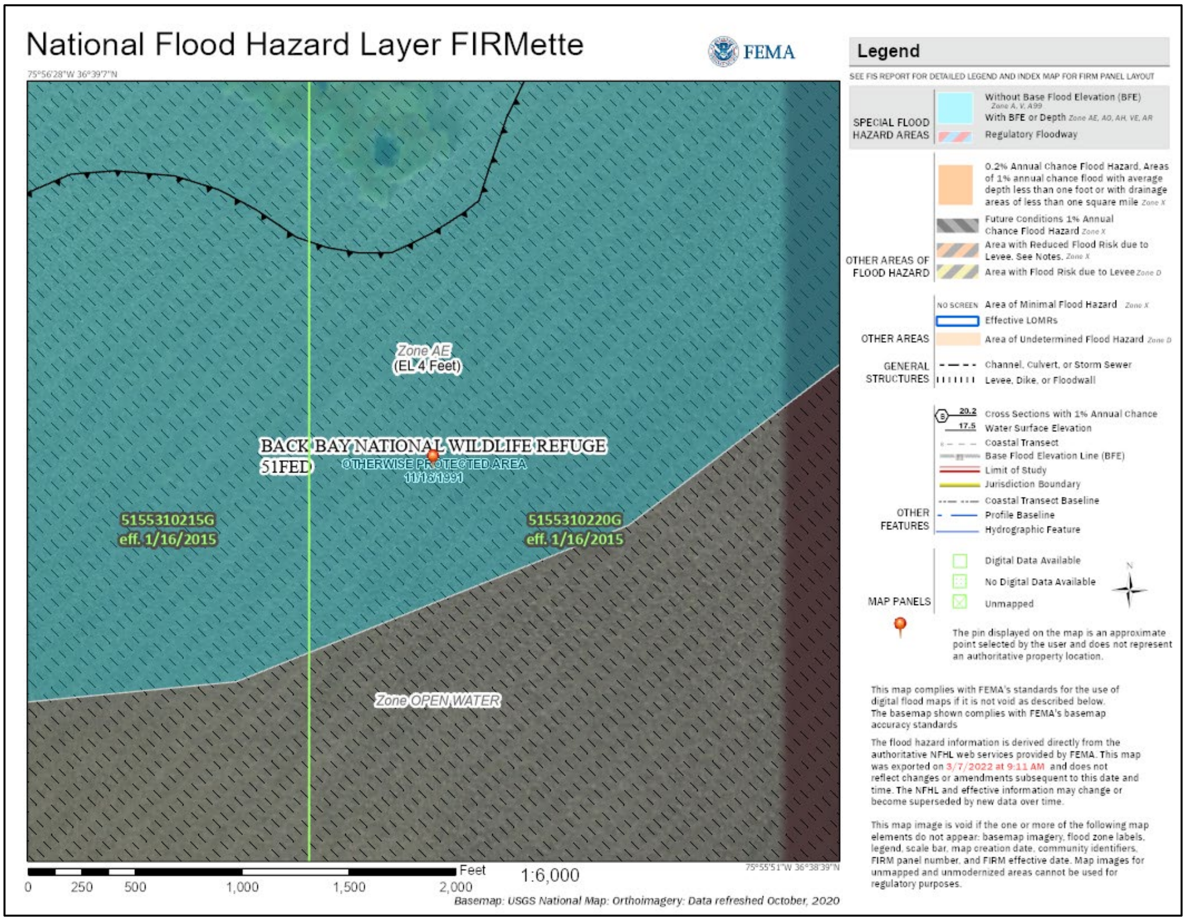

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

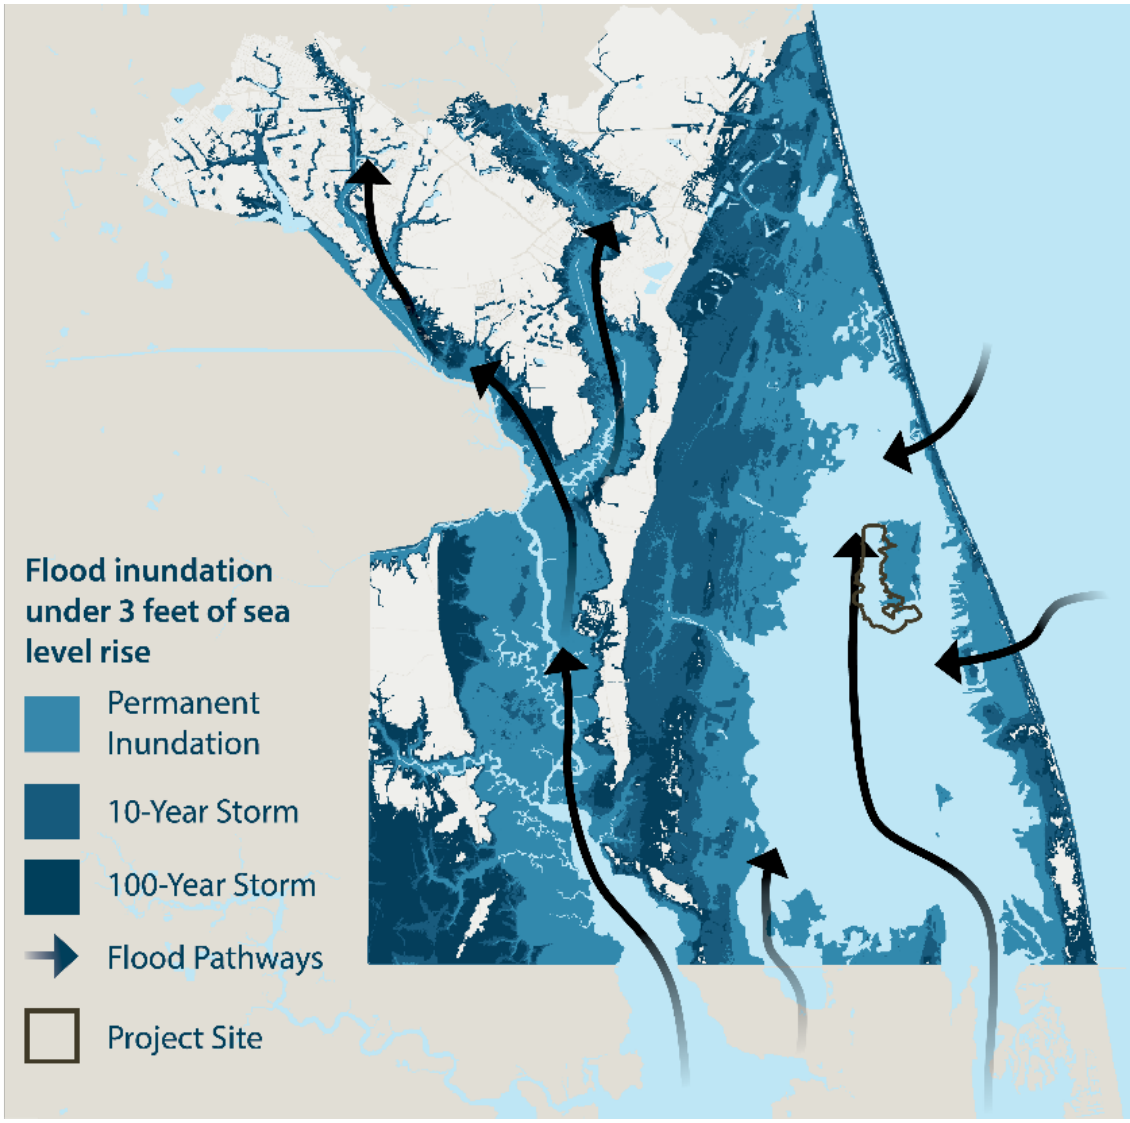

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

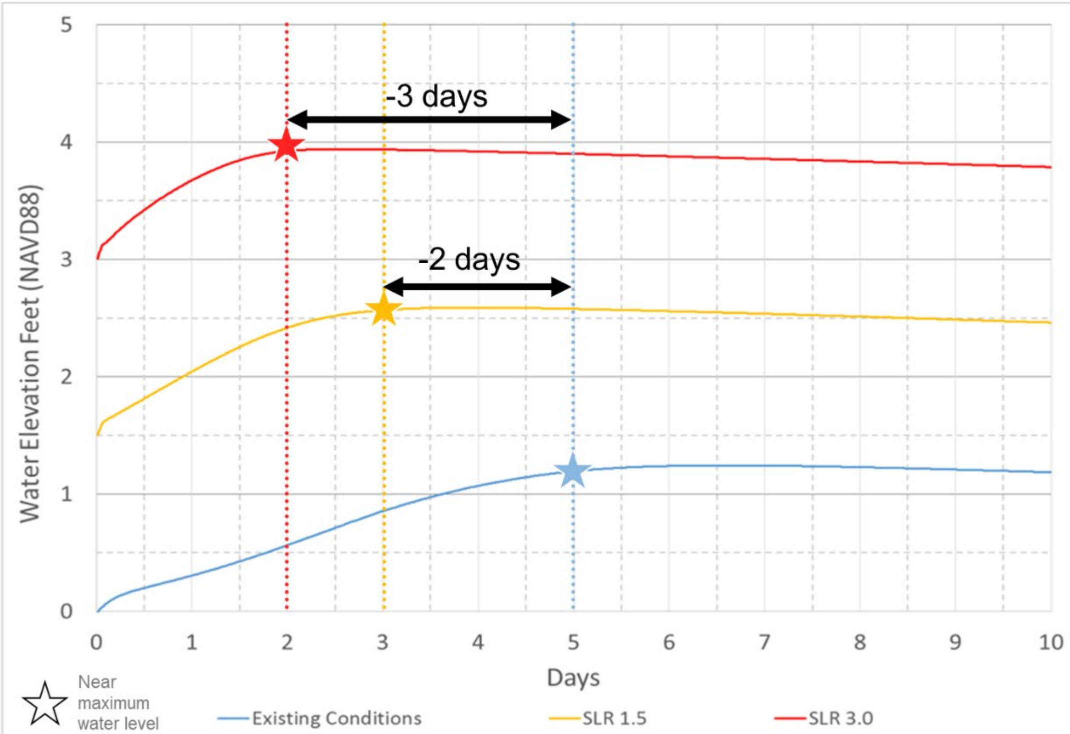

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

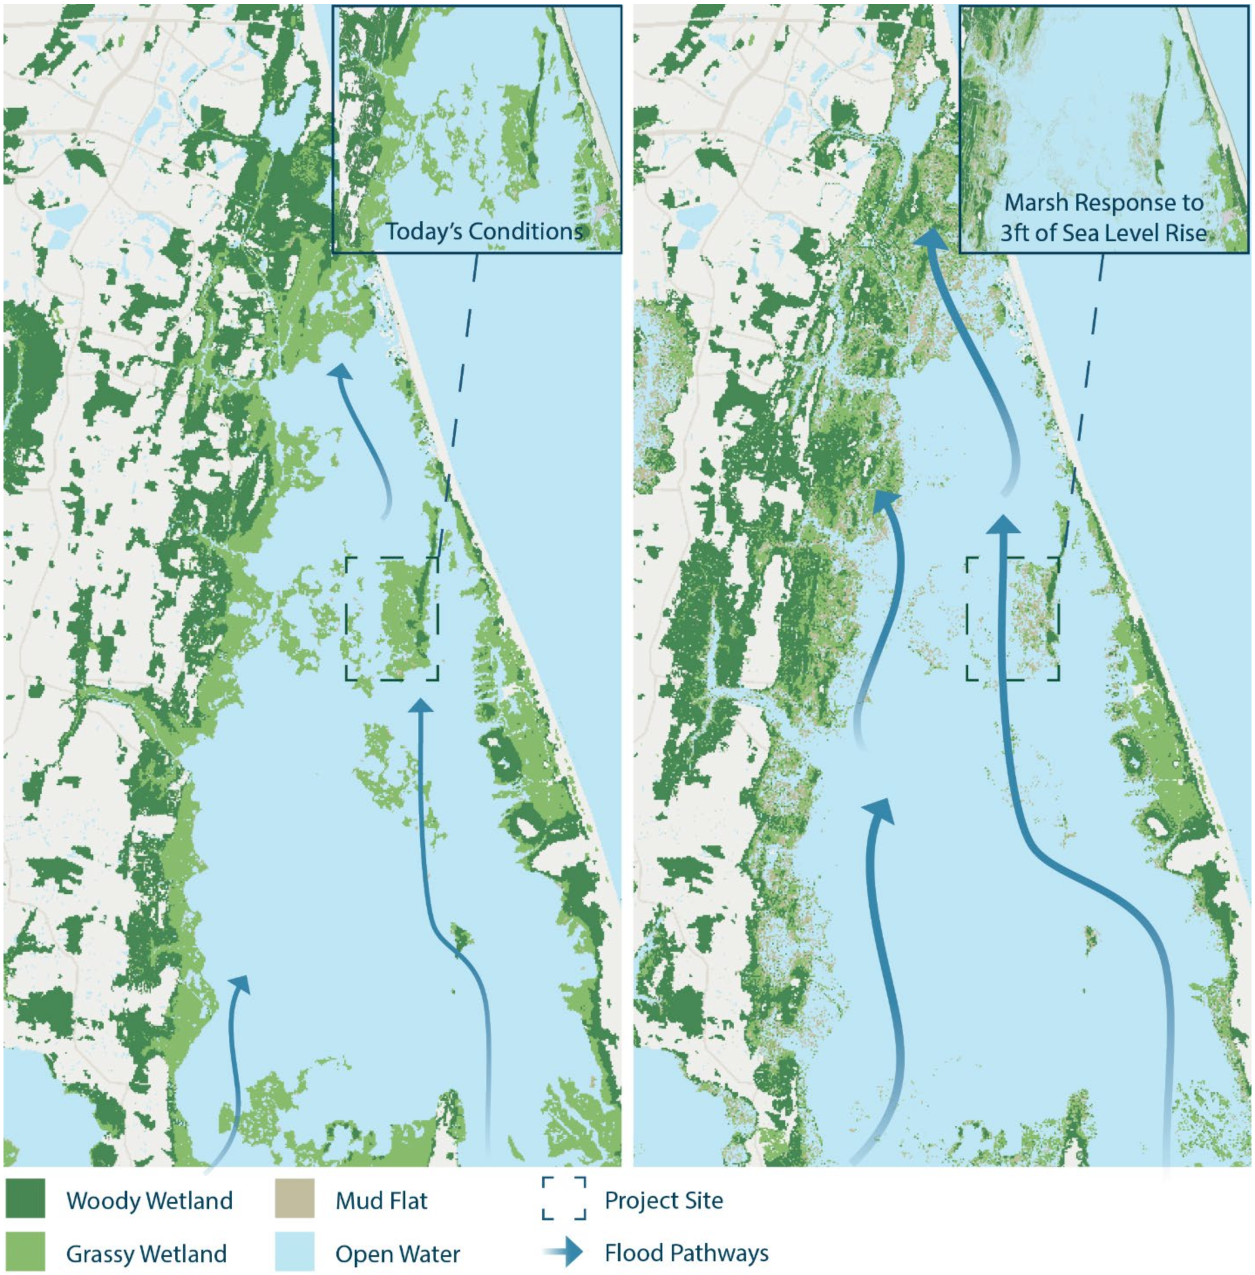

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

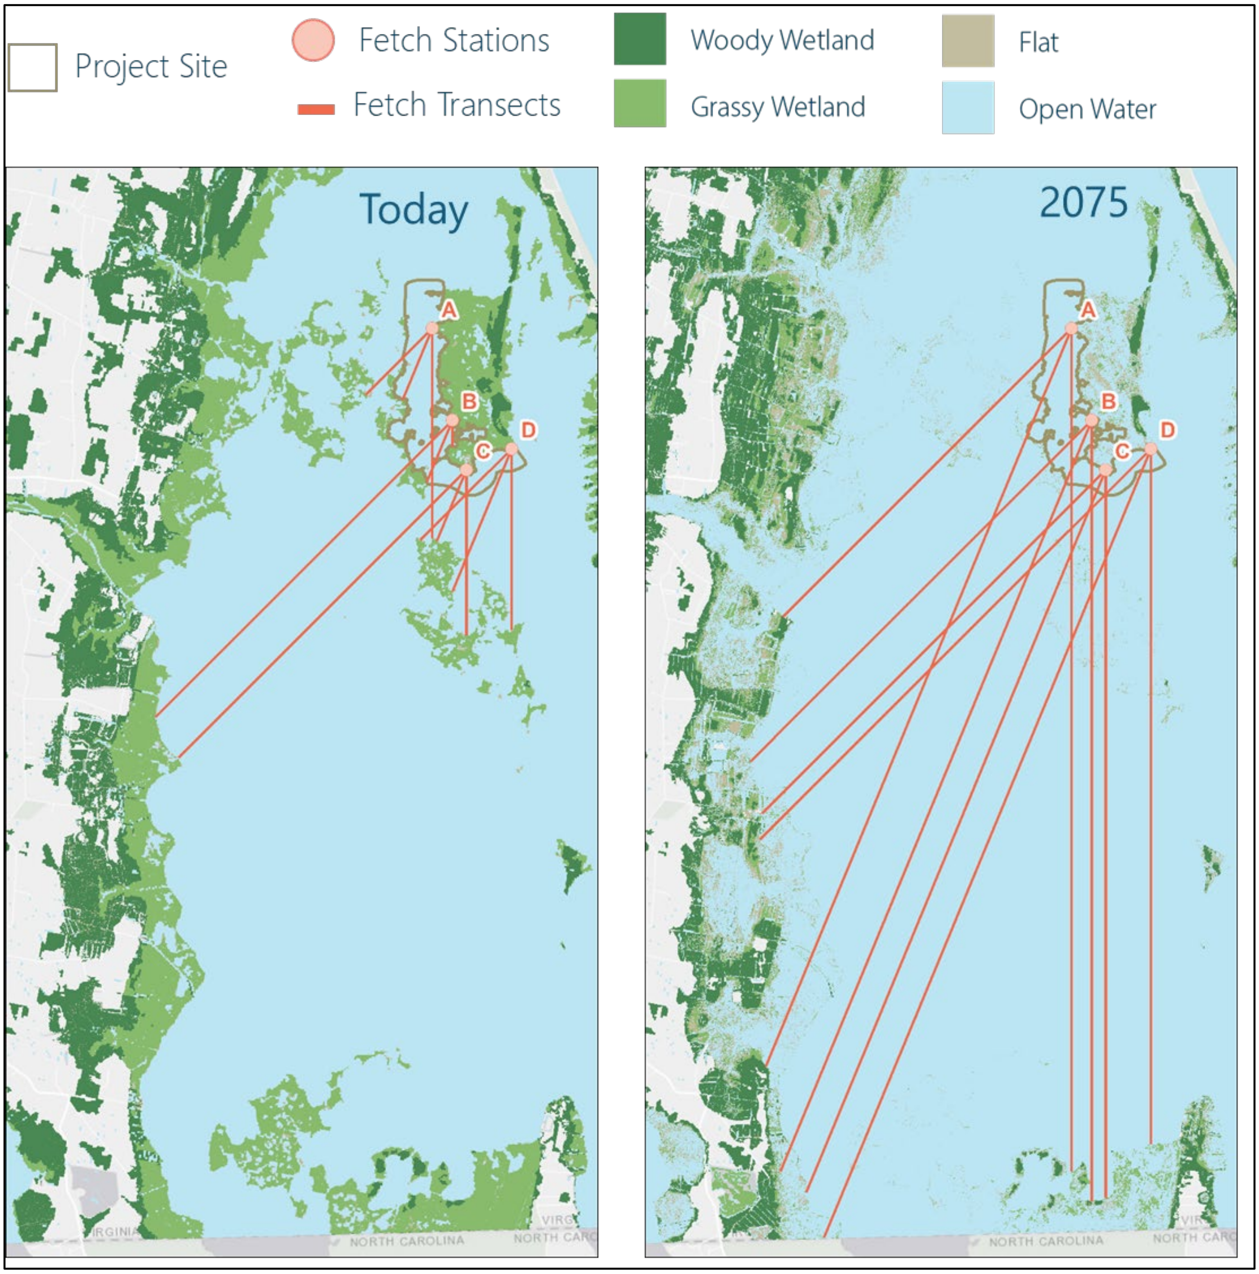

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

---

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

---

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

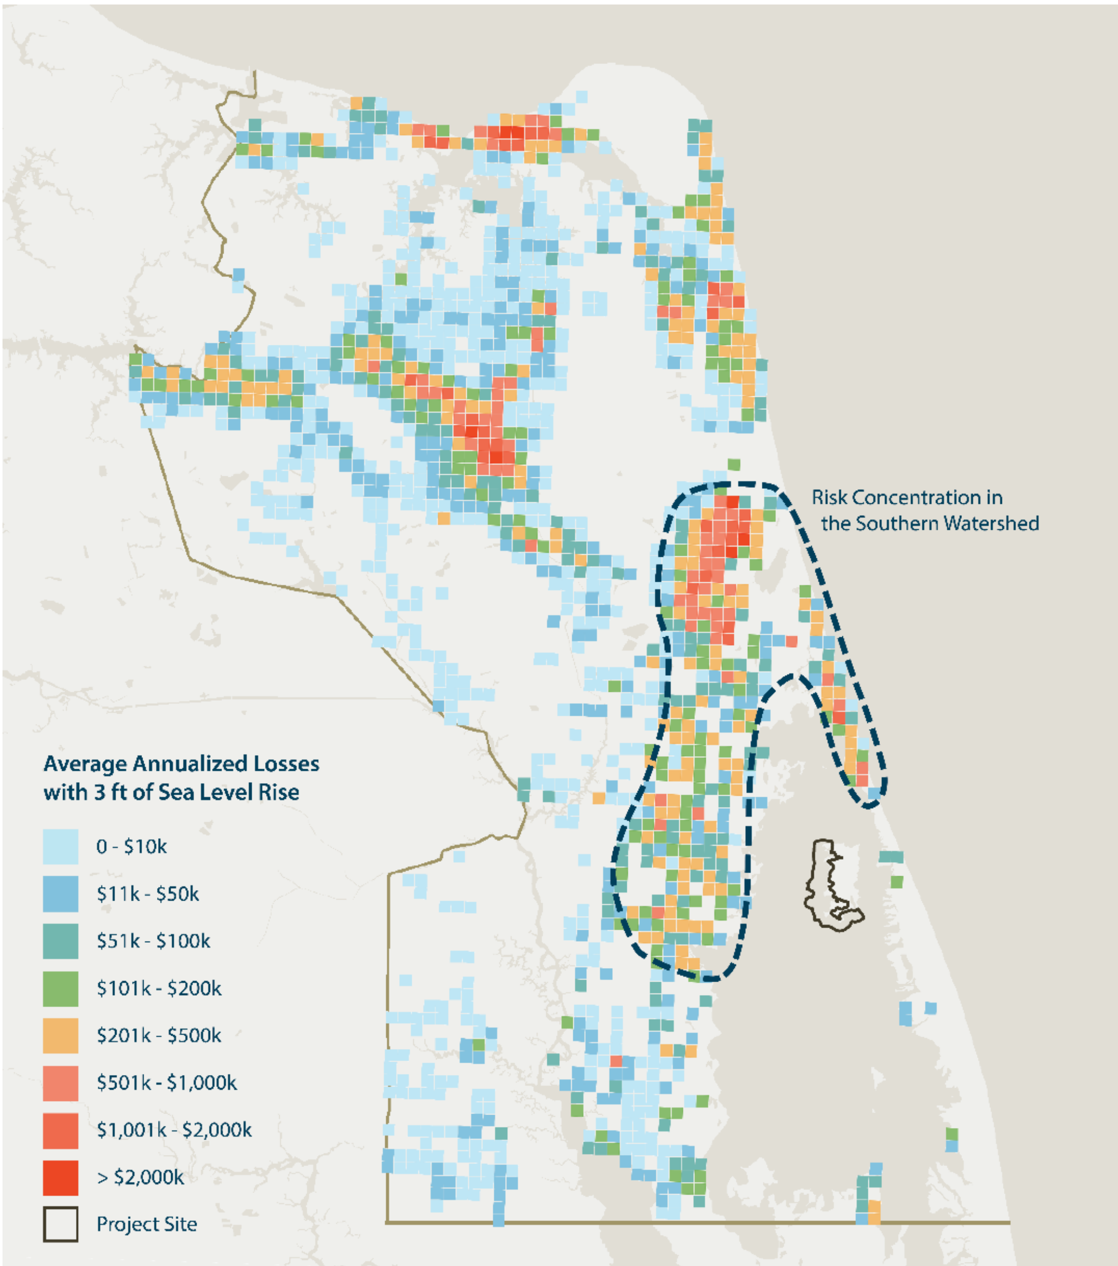

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.

Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

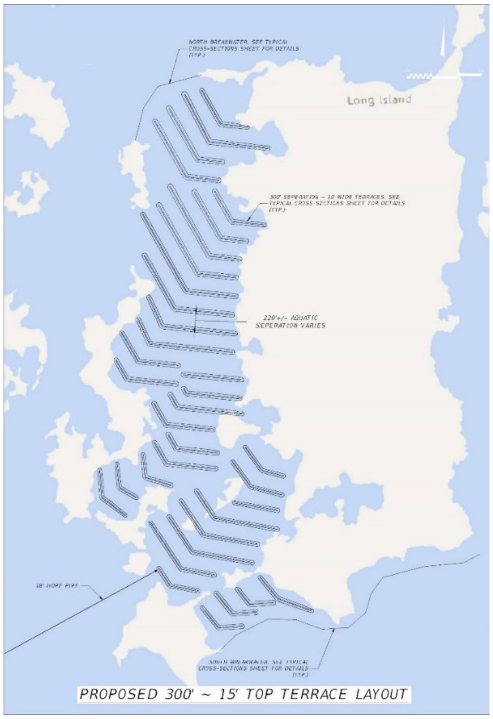

Figure 22: Alternative 2a.

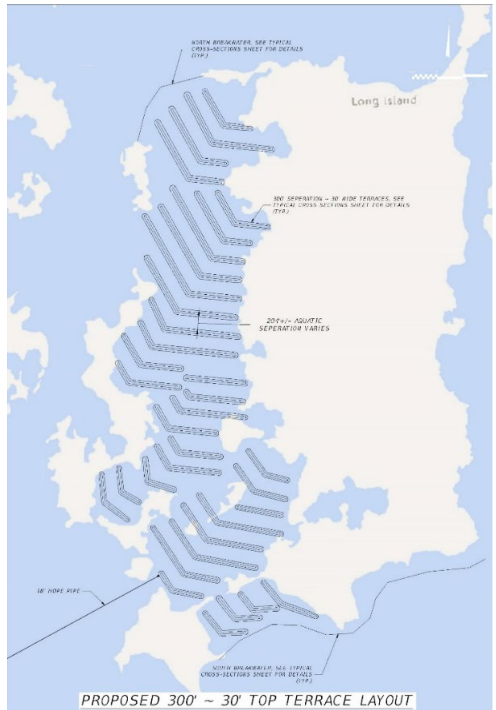

Figure 23: Alternative 2b.

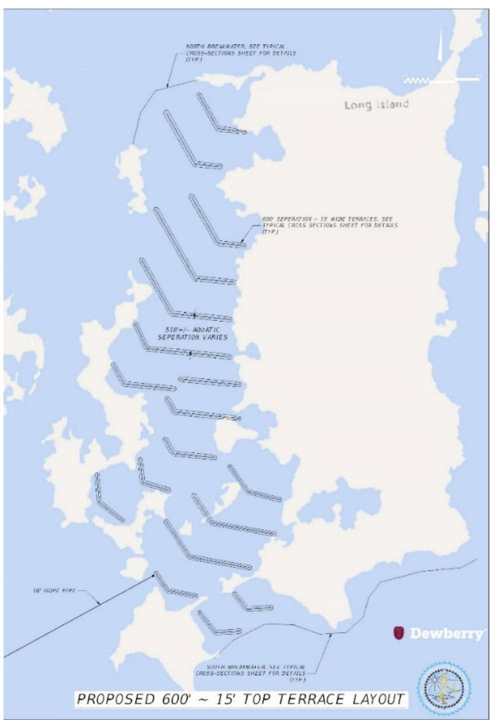

Figure 24: Alternative 2c.

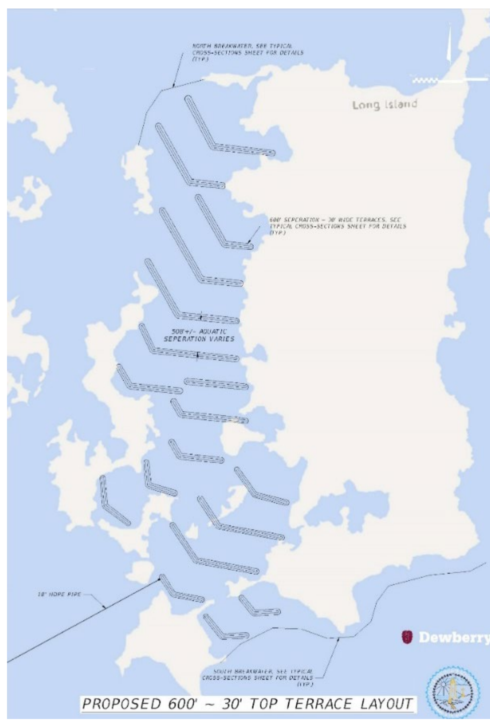

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

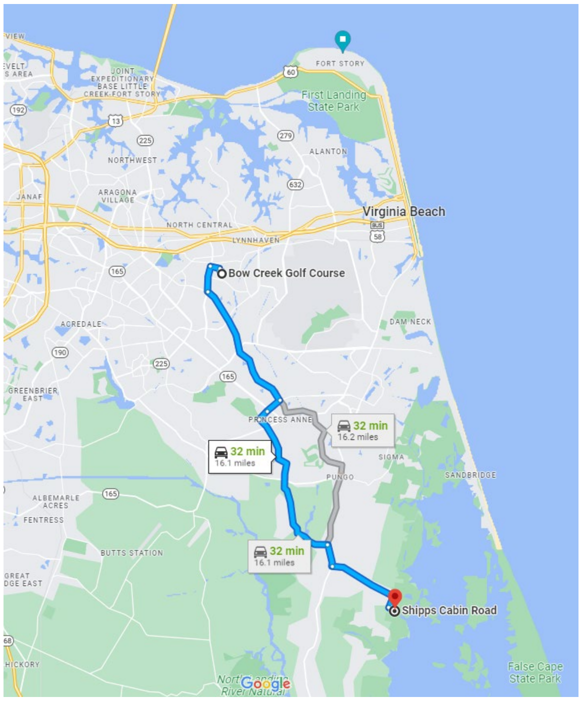

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

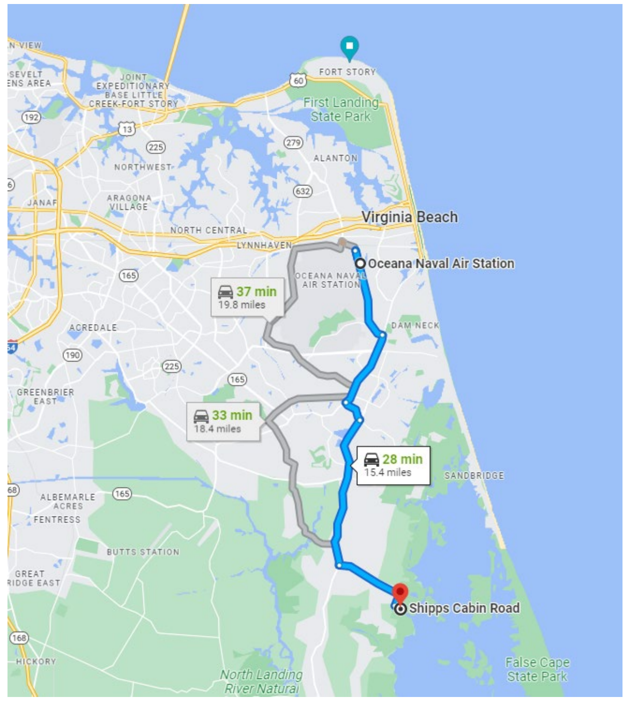

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

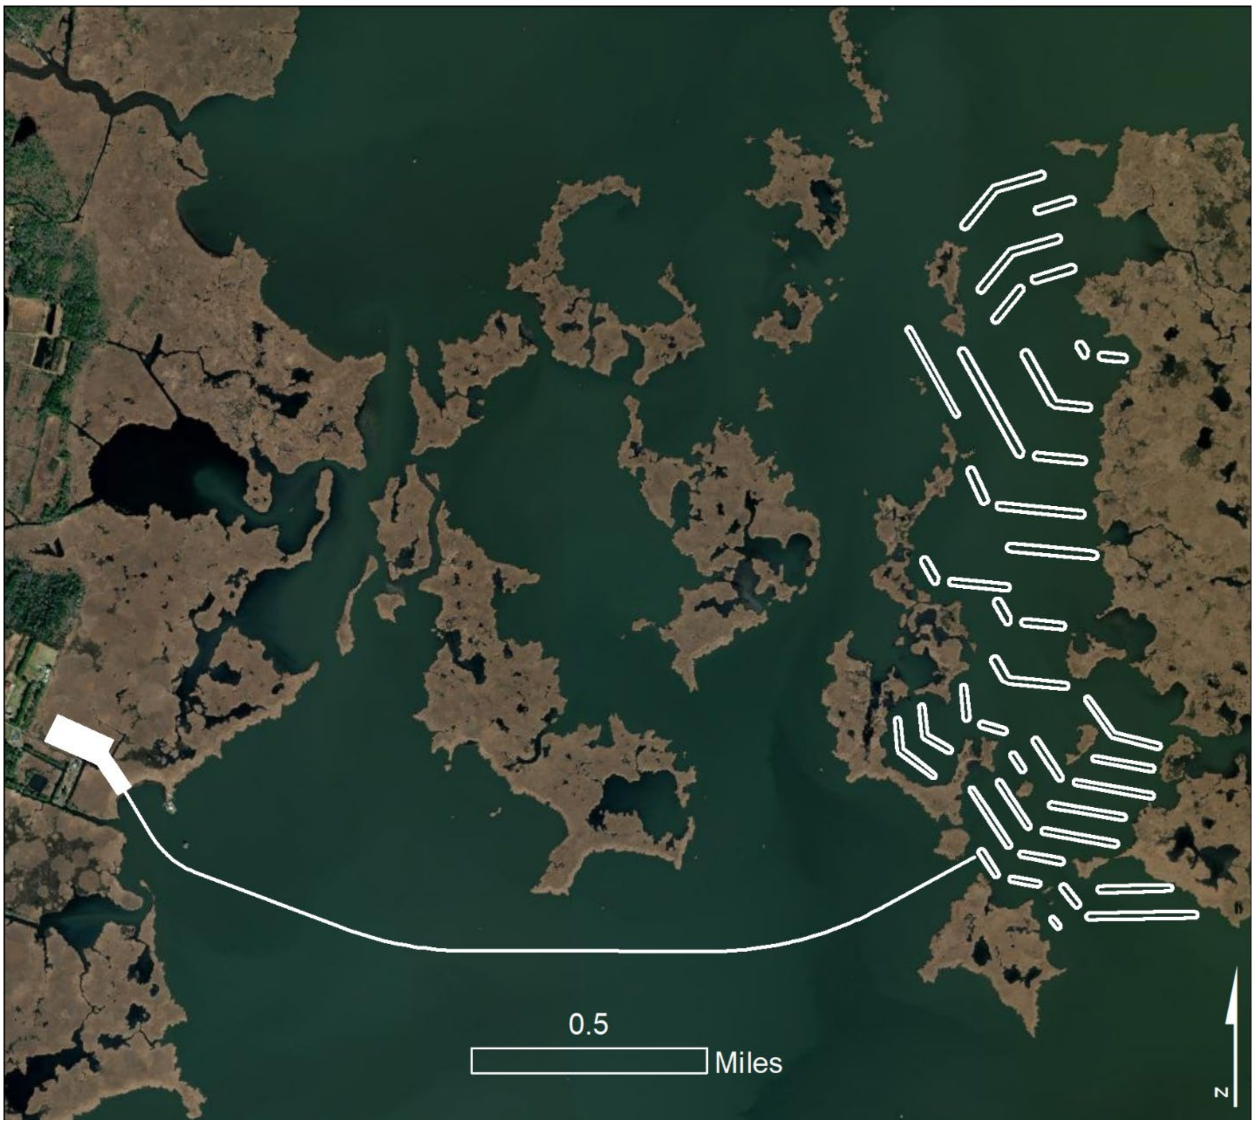

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

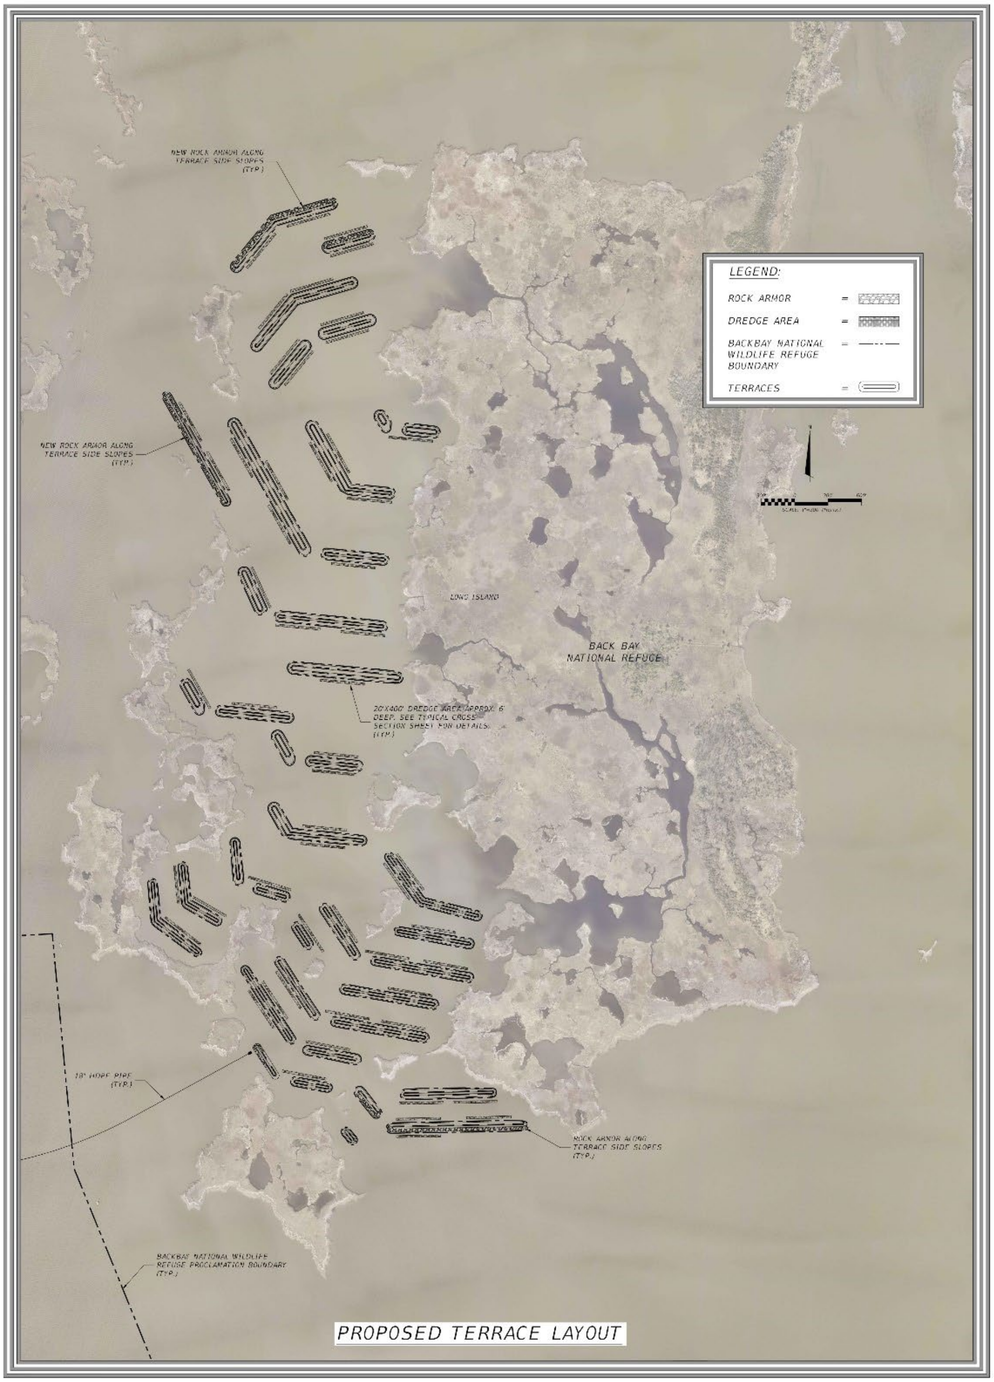

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

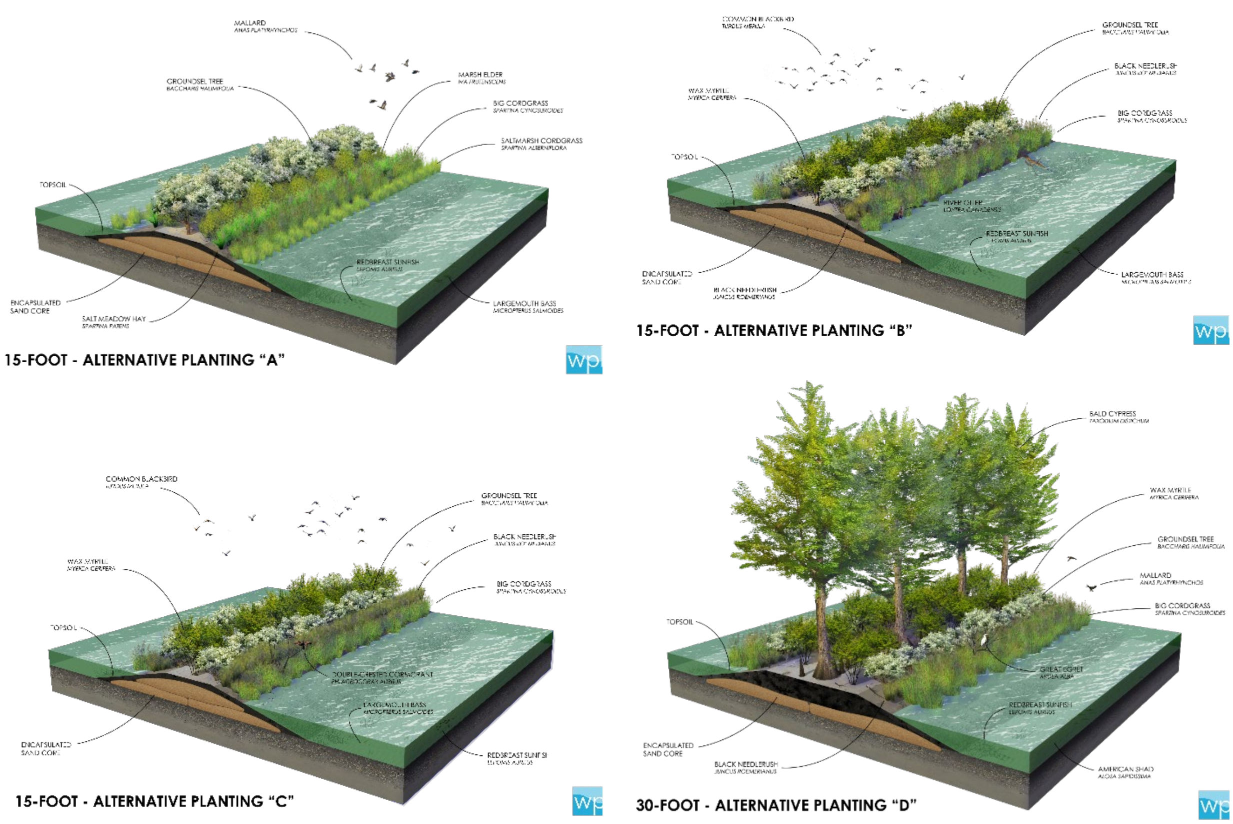

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities
CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the: o Virginia Beach City Council o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase. • City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.
REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to: o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan. o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound. • Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to: o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures. o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee . o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation. • Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
    - 100% Final PS&E
    - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
    - Final Bid Coordination/Acceptance
    - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
    - Mobilization for Shipps Cabin Road Construction Staging Area
    - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
    - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
    - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
    - Completion of Marsh Terrace Material Production
    - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
    - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
    - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
    - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
    - Construction of Marsh Terraces #115 – 119
    - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
    - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

  - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

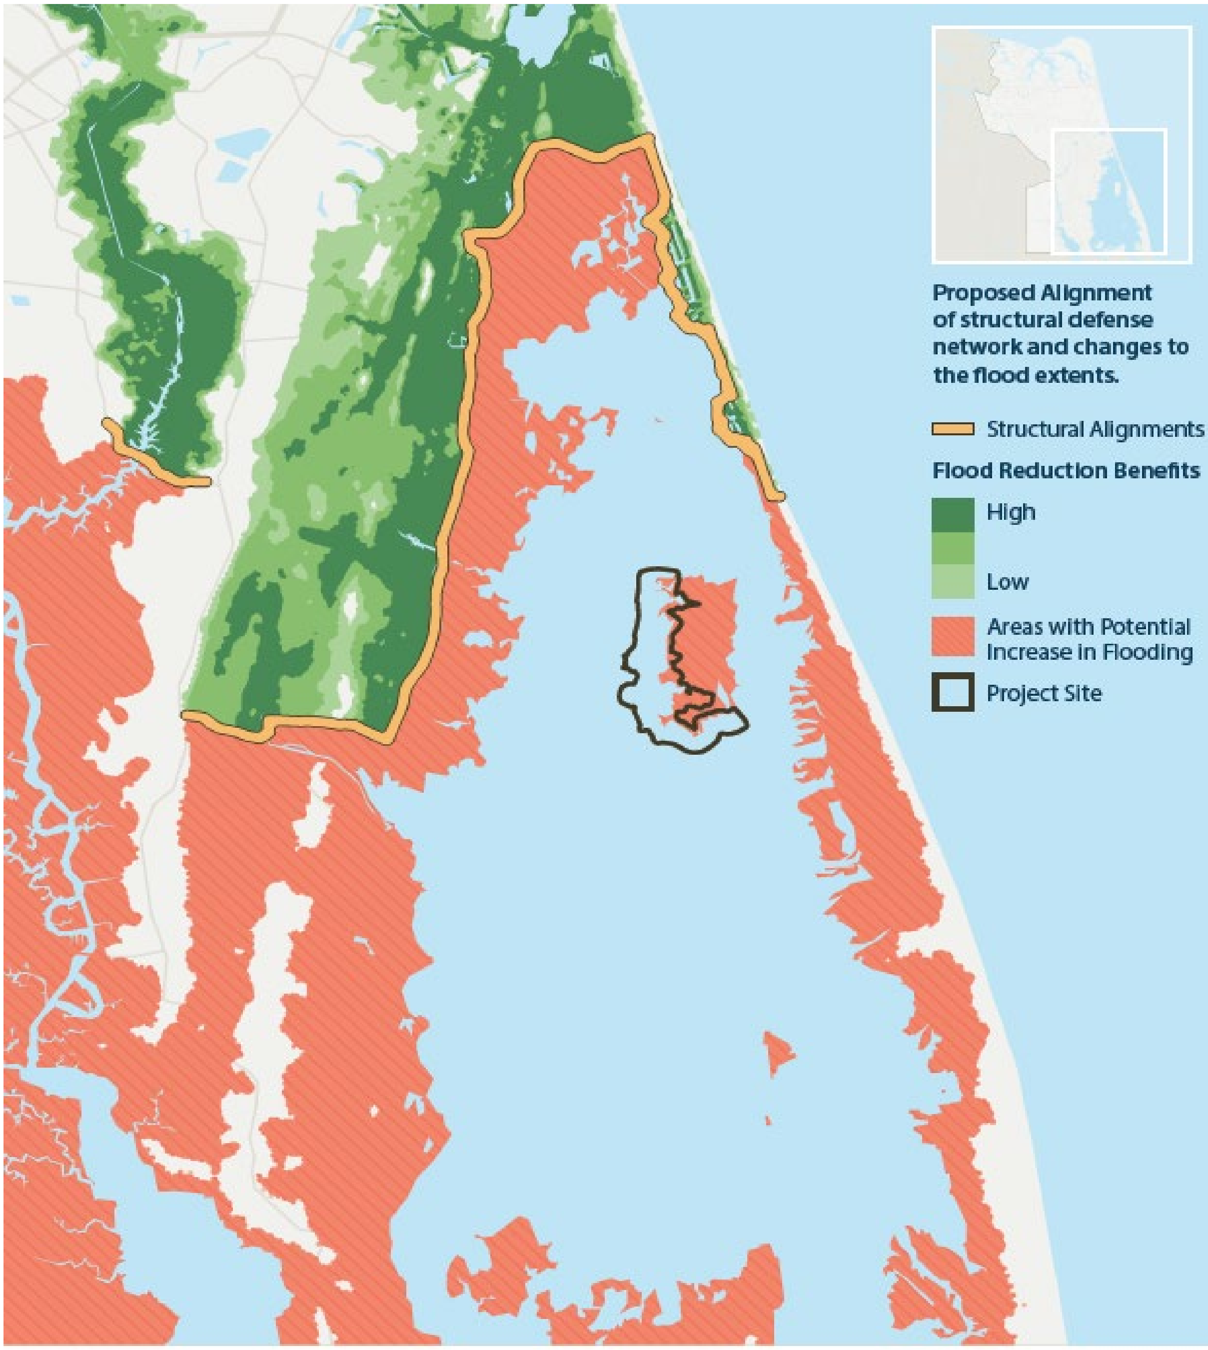

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Whitney McNamara, CFM

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed

Megan Reed
Refuge Manager

National Estuary Partnership

*Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.*

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Director

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

<u>H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;</u>

<u>I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;</u>

<u>J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;</u>

<u>K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;</u>

<u>L. Granting administrative variances pursuant to section 6.1 of this ordinance;</u>

<u>M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;</u>

<u>N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;</u>

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A.~~ ~~Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B.~~ ~~Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C.~~ ~~Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D.~~ ~~Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E.~~ ~~Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F.~~ ~~Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G.~~ ~~Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H.~~ ~~Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I.~~ ~~Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J.~~ ~~Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K.~~ ~~Administering the requirements related to proposed work on existing buildings:~~

~~1.~~ ~~Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~

~~2.~~ ~~Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ Reserved.

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A.~~ ~~Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B.~~ ~~It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ <u>a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area</u>.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision <u>through the application for a Floodplain Variance outlined in Section VI of this ordinance</u>.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ <u>Planning and Community Development</u>, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C. The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1. Public and private outdoor recreational facilities;~~

~~2. Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3. Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

    a. ~~Only one (1) such stand shall be permitted per lot;~~

    b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

    c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C. When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

   a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

   b. Comply with the Public Works Design Standards Manual; and

   c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

Attachment 6: Copy of Monitoring/Maintenance Plan

[DRAFT] Annual Monitoring Plan and Post-Construction Monitoring Report

Marsh Restoration in Back Bay, Virginia Beach, VA

Prepared by: Dewberry Engineers, Inc.

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

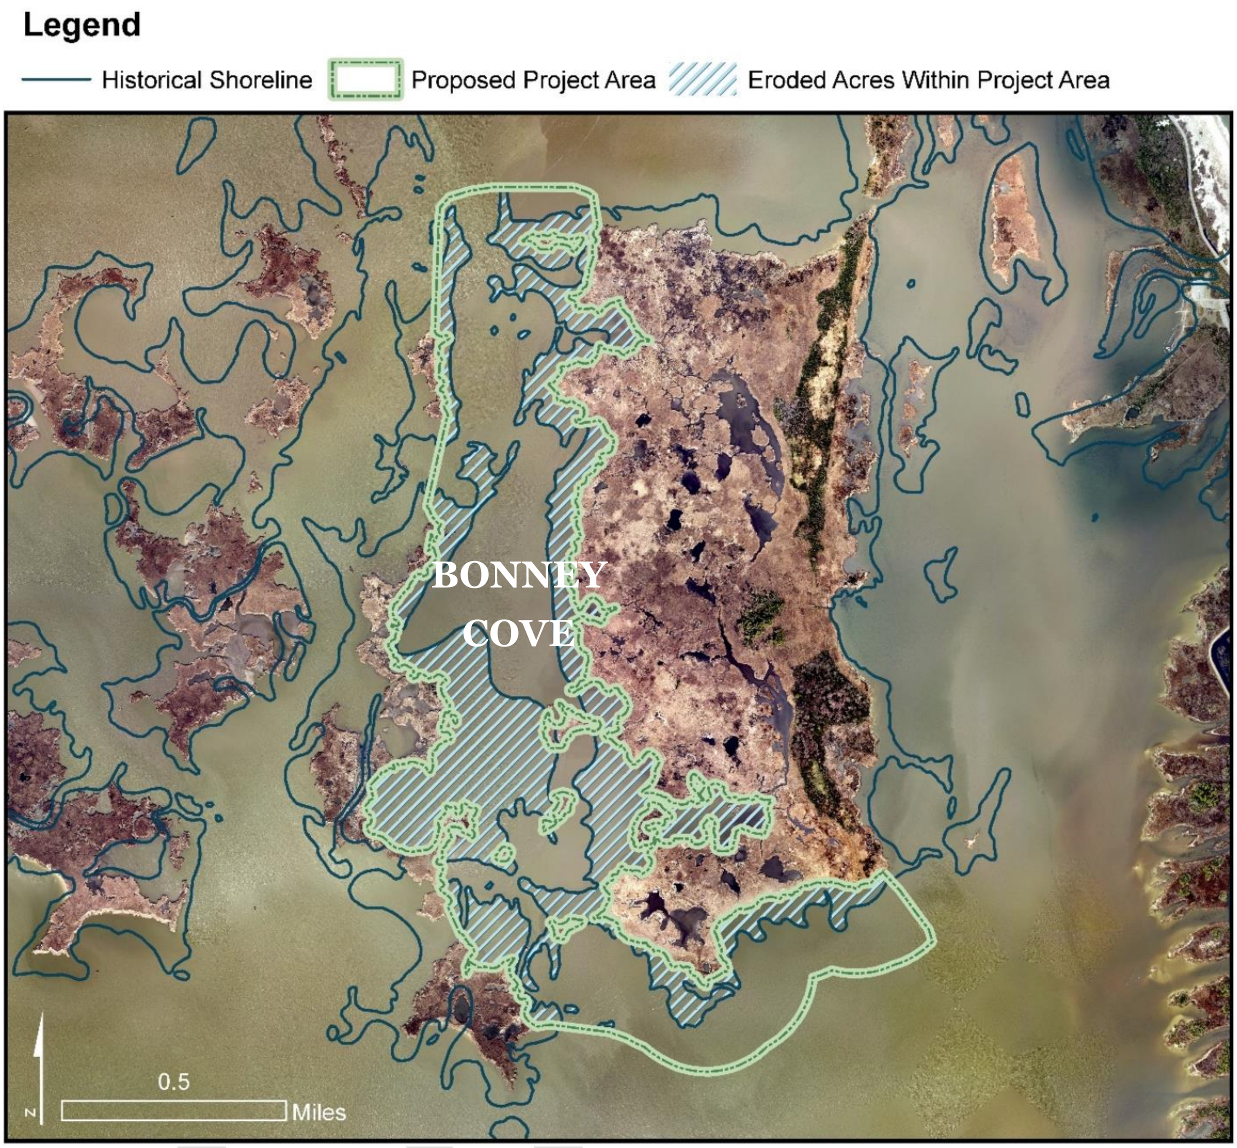

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

---

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

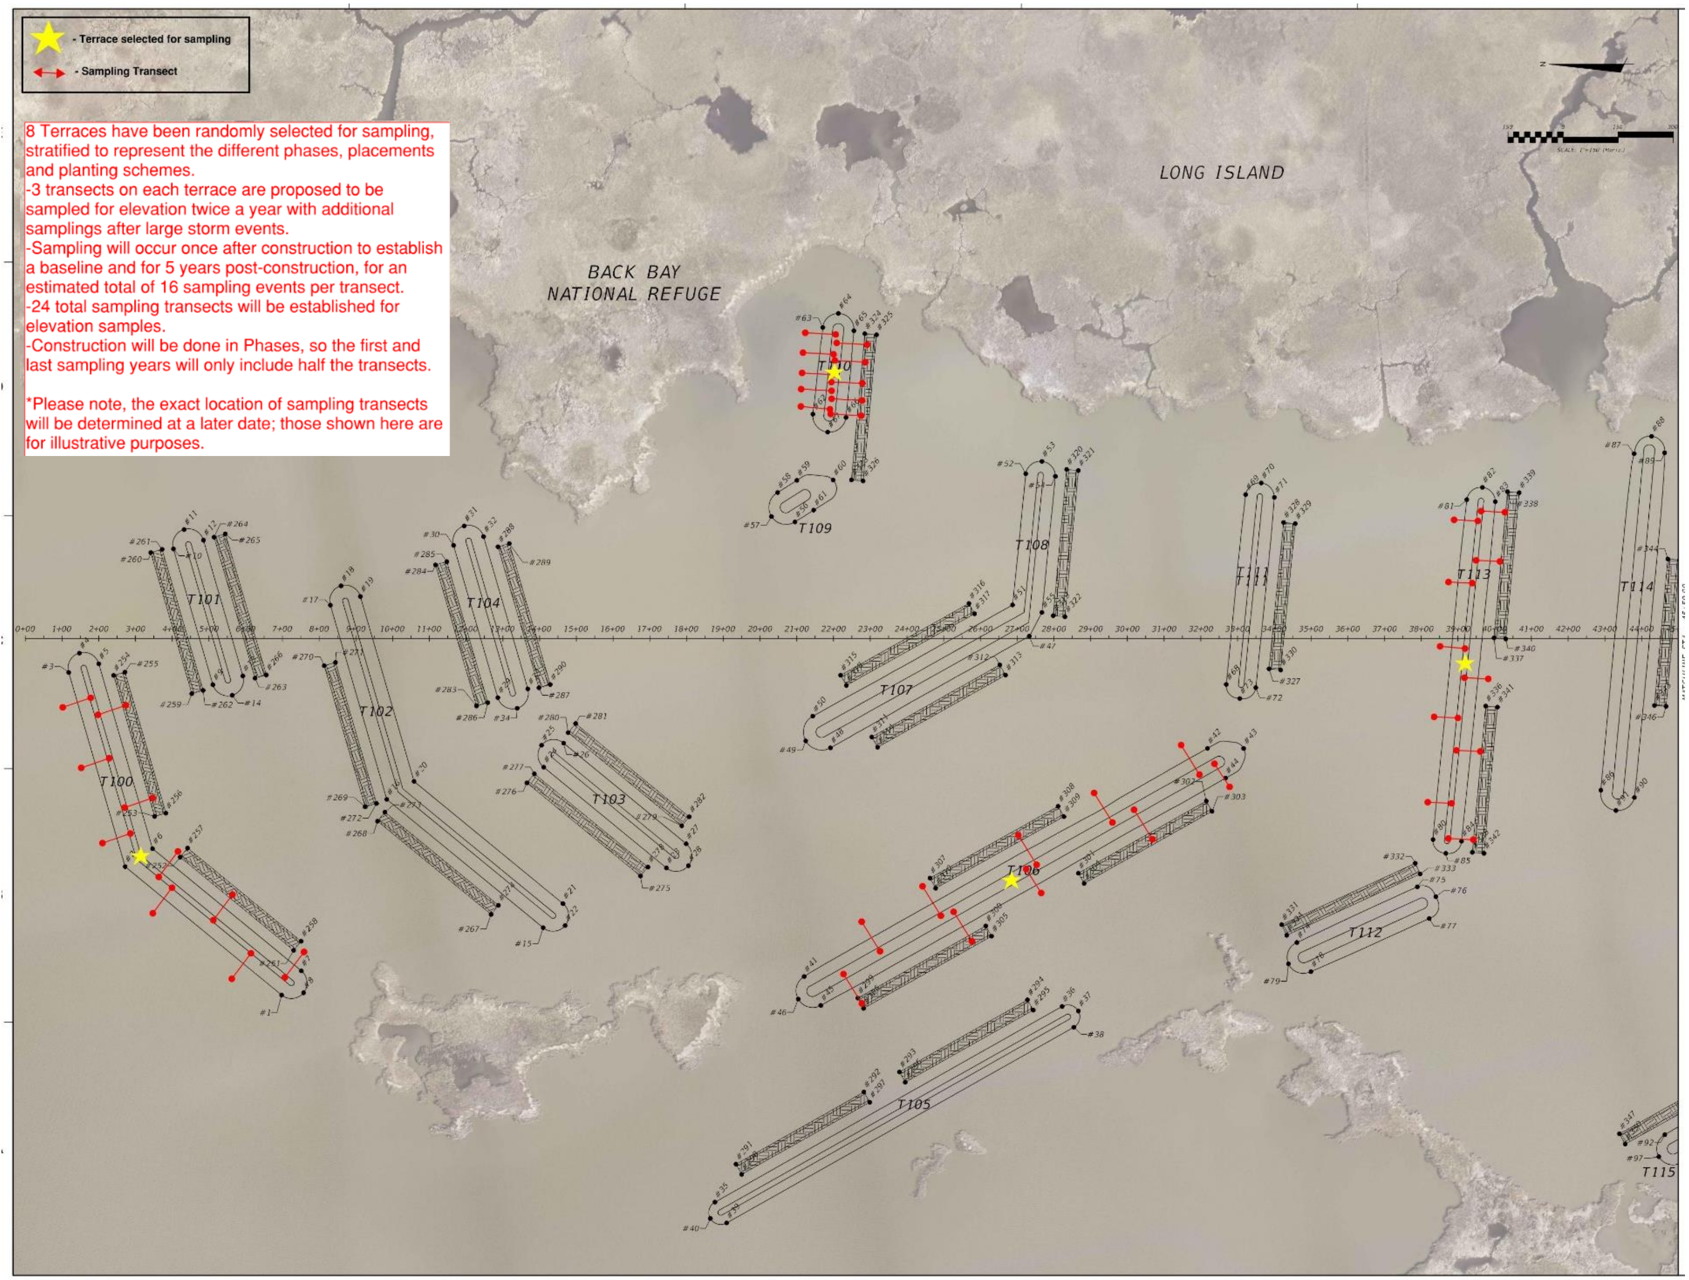

Figure 3: Monitoring design site plan – North Terraces

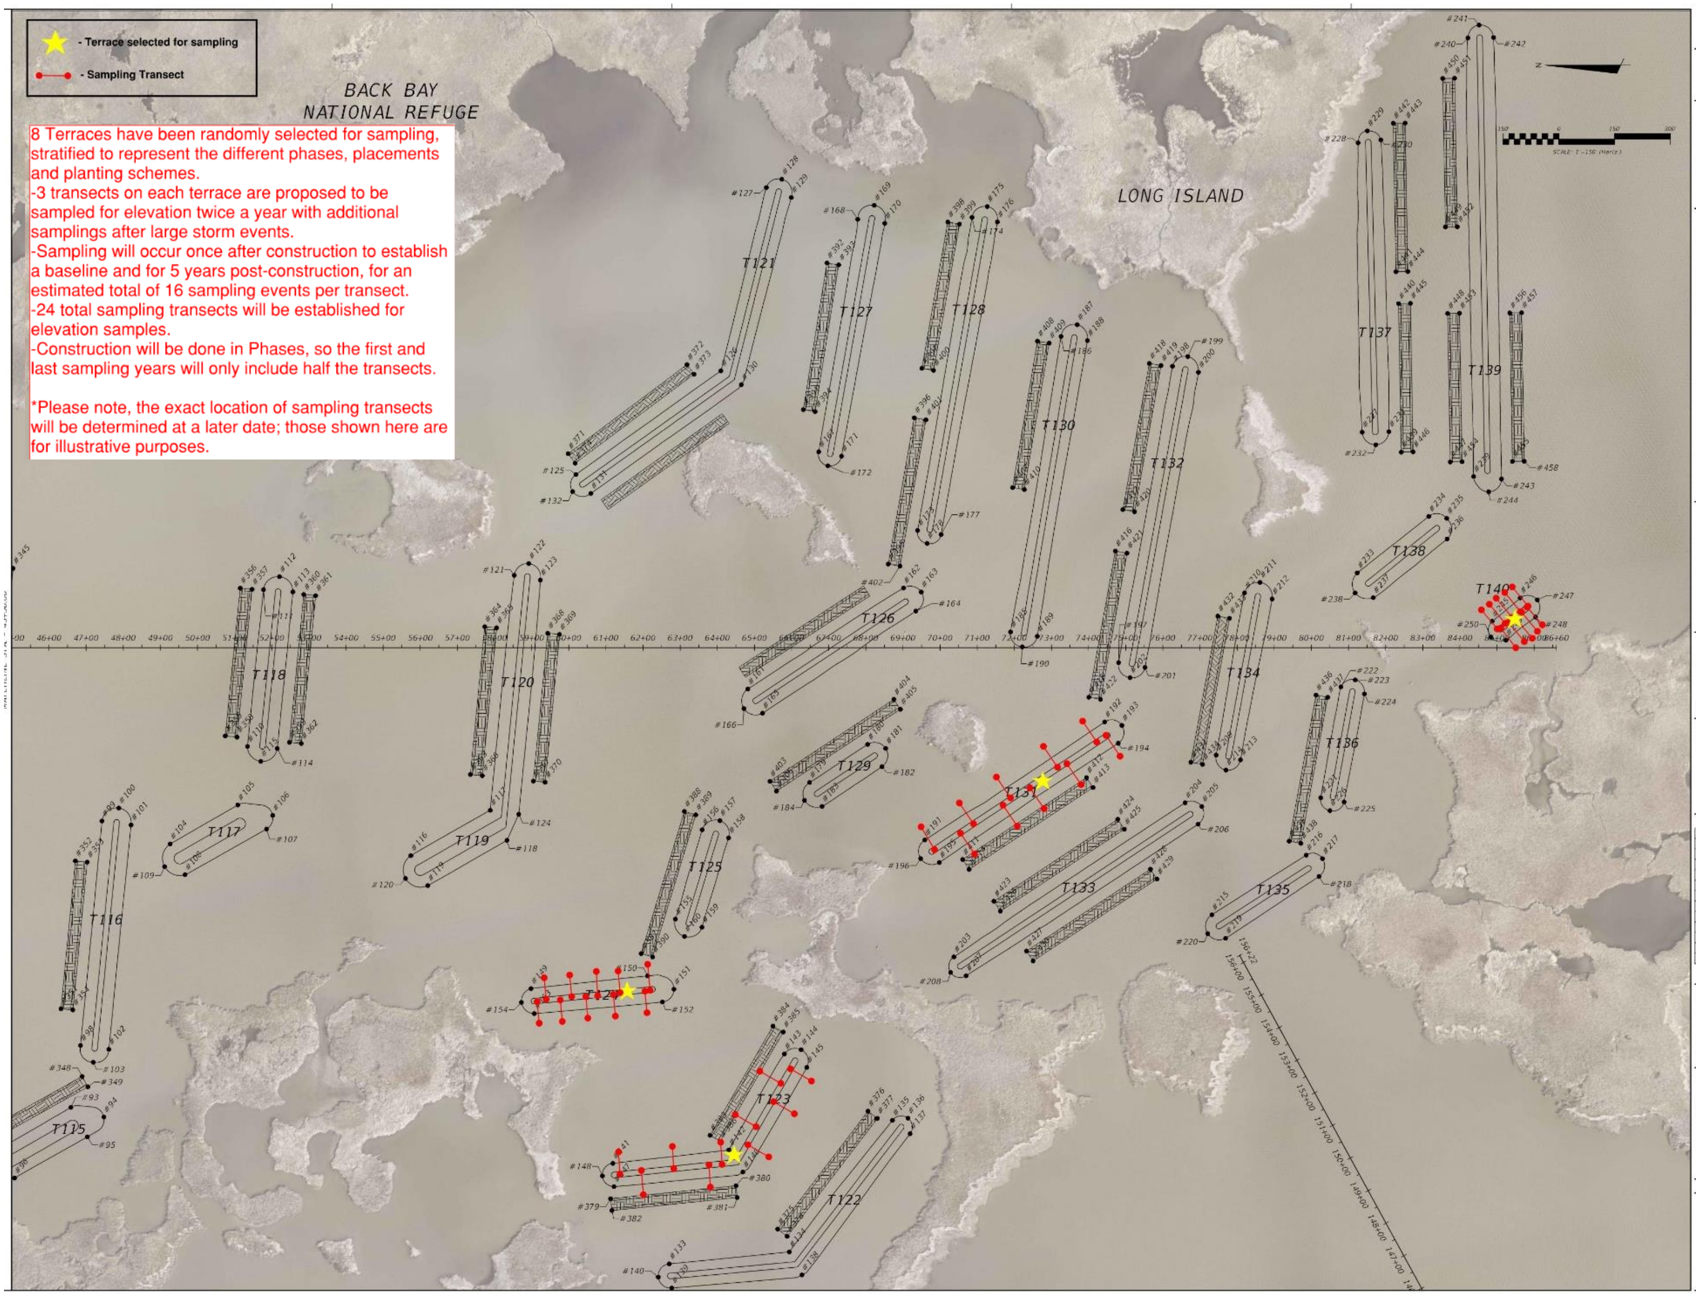

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

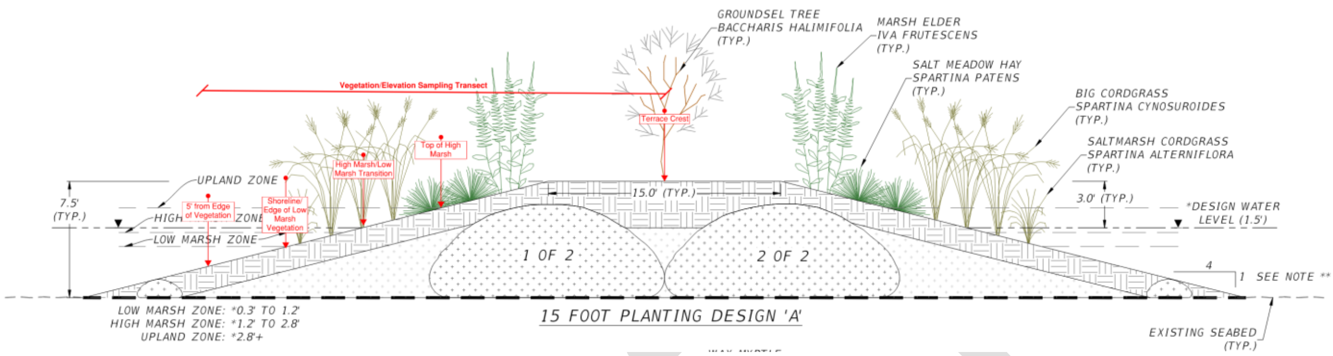

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

- ☐ Floodplain Staff Capacity.
- ☐ Resilience Plan Development
  - ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  - ☐ Resource assessments, planning, strategies, and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.
- ☐ Other: ____________________

Study Grants (Check All that Apply)

- ☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ___________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) __________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

Additional Information for Loan Requests

Requested Loan Security: ______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: __________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______ (If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted (Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023									
								Grand Total State Funding Request	$ 5,000,000
								Grand Total Local Share of Project	$ 38,356,966
		National Fish and Wildlife Foundation Grants						Federal Funding (if applicable)	$ 10,021,524
								Project Grand Total	$ 53,378,490
								Locality Cost Match	% 71.85
Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

[3] Office of Governor Ralph S. Northam Commonwealth of Virginia. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

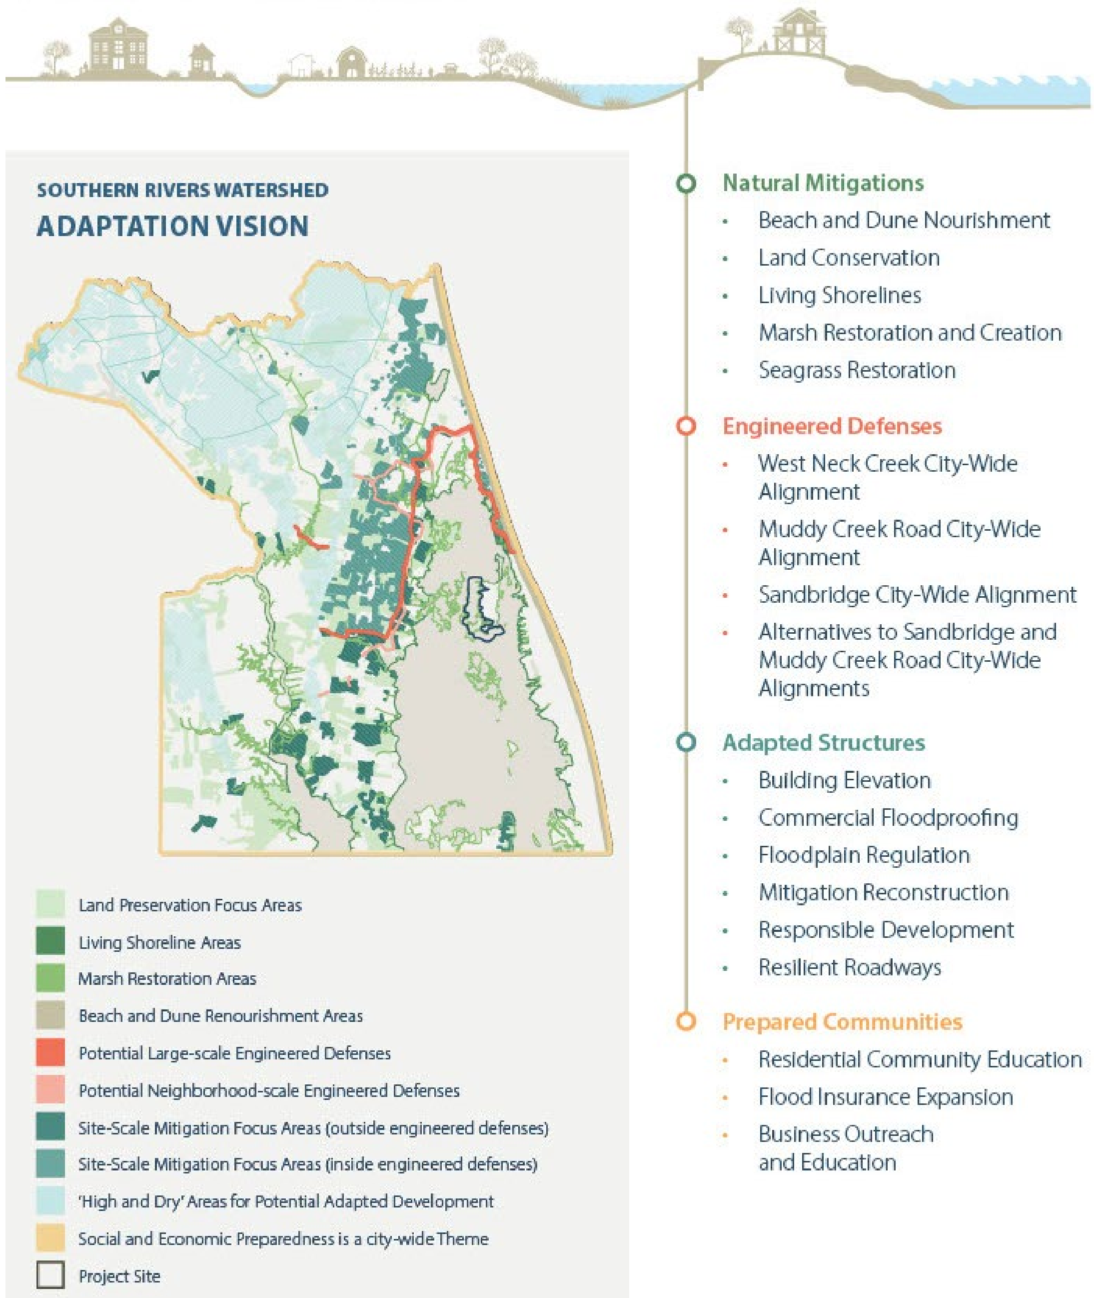

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

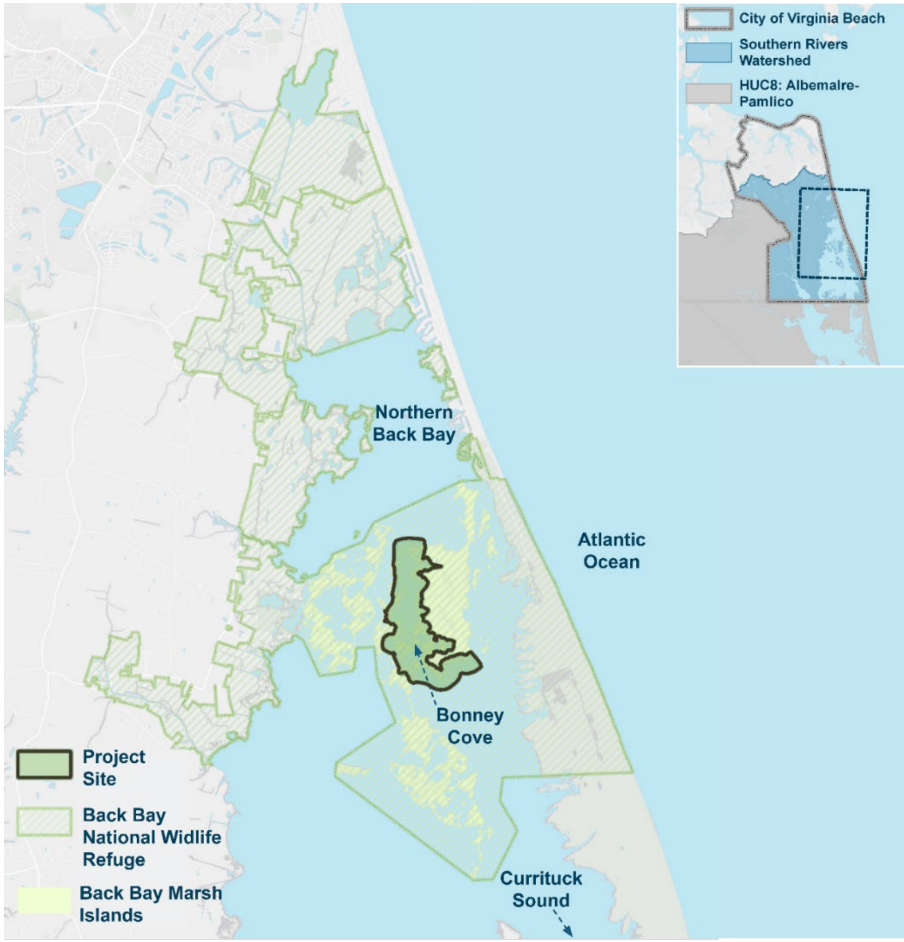

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

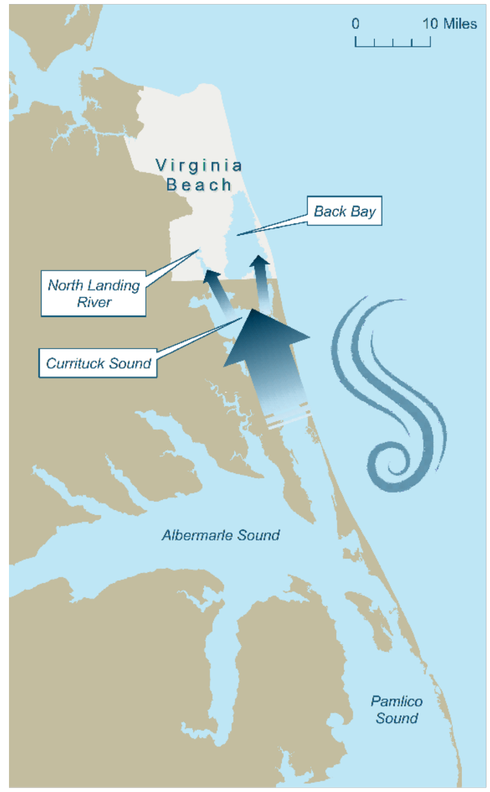

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

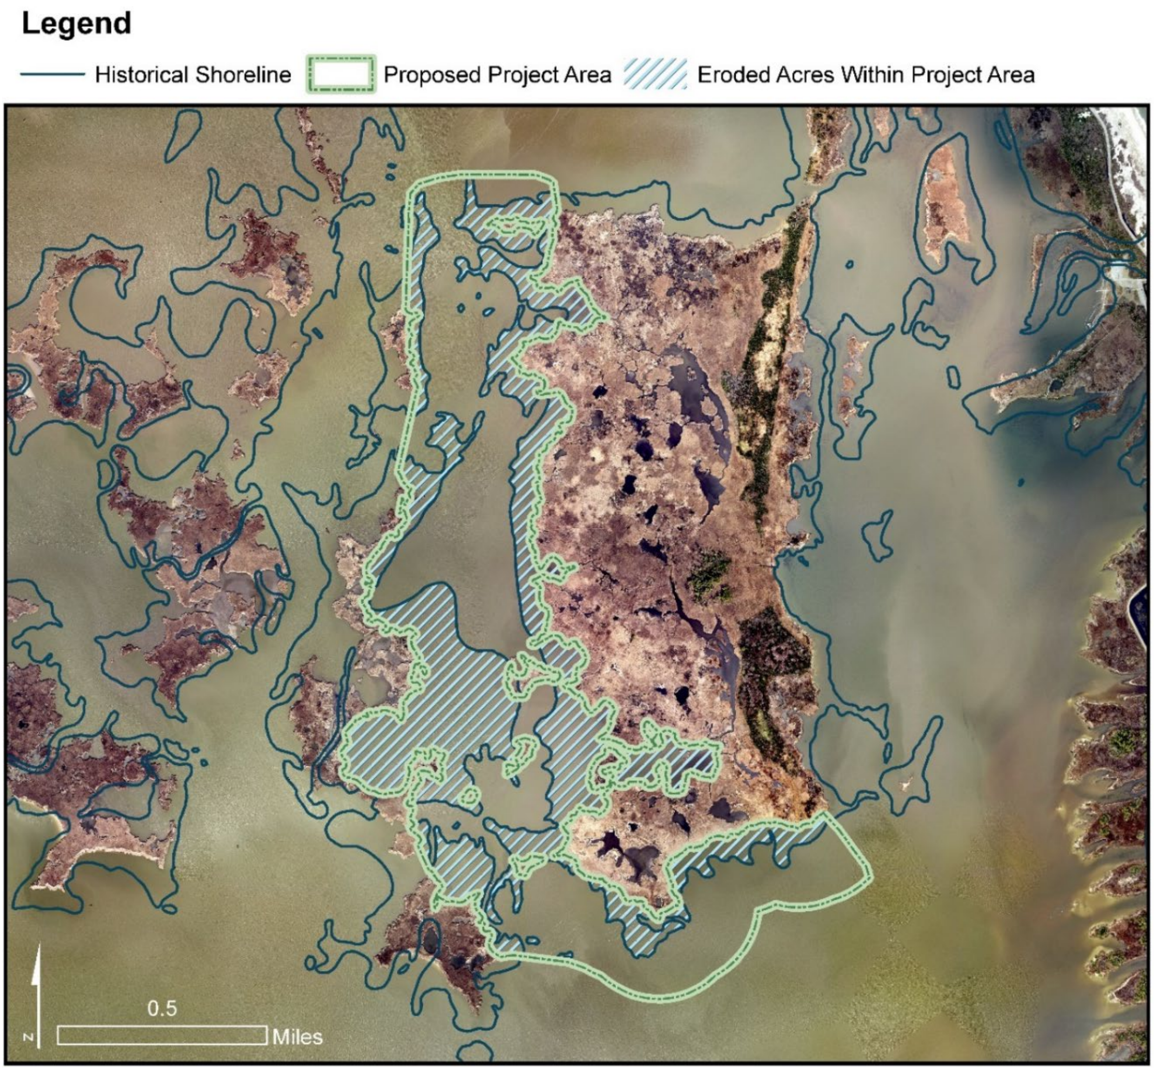

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

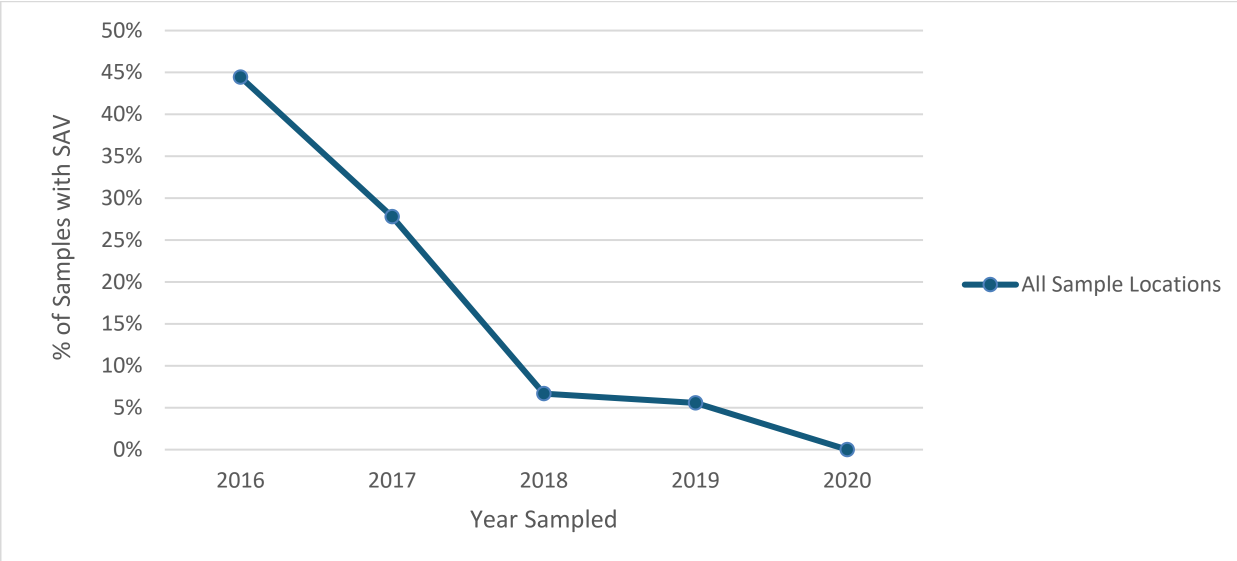

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

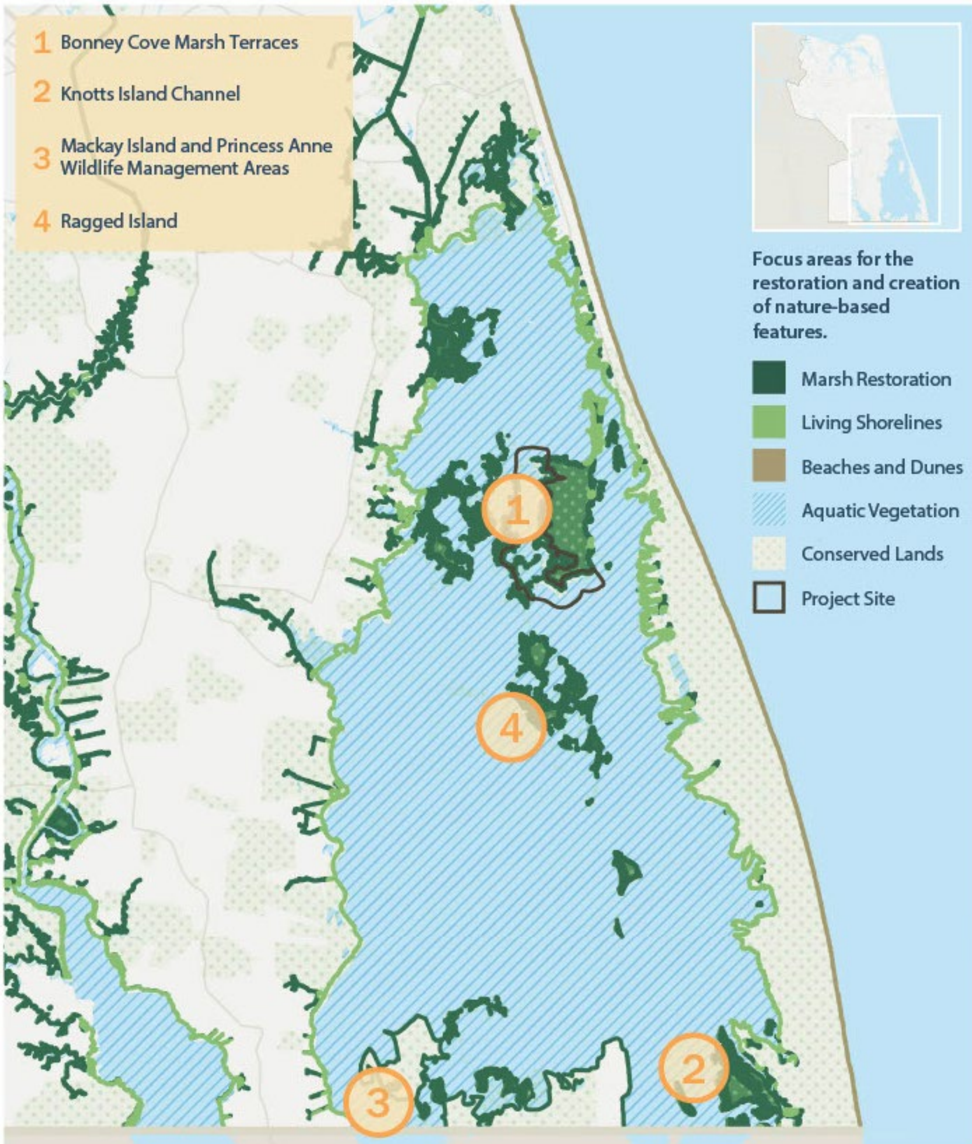

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

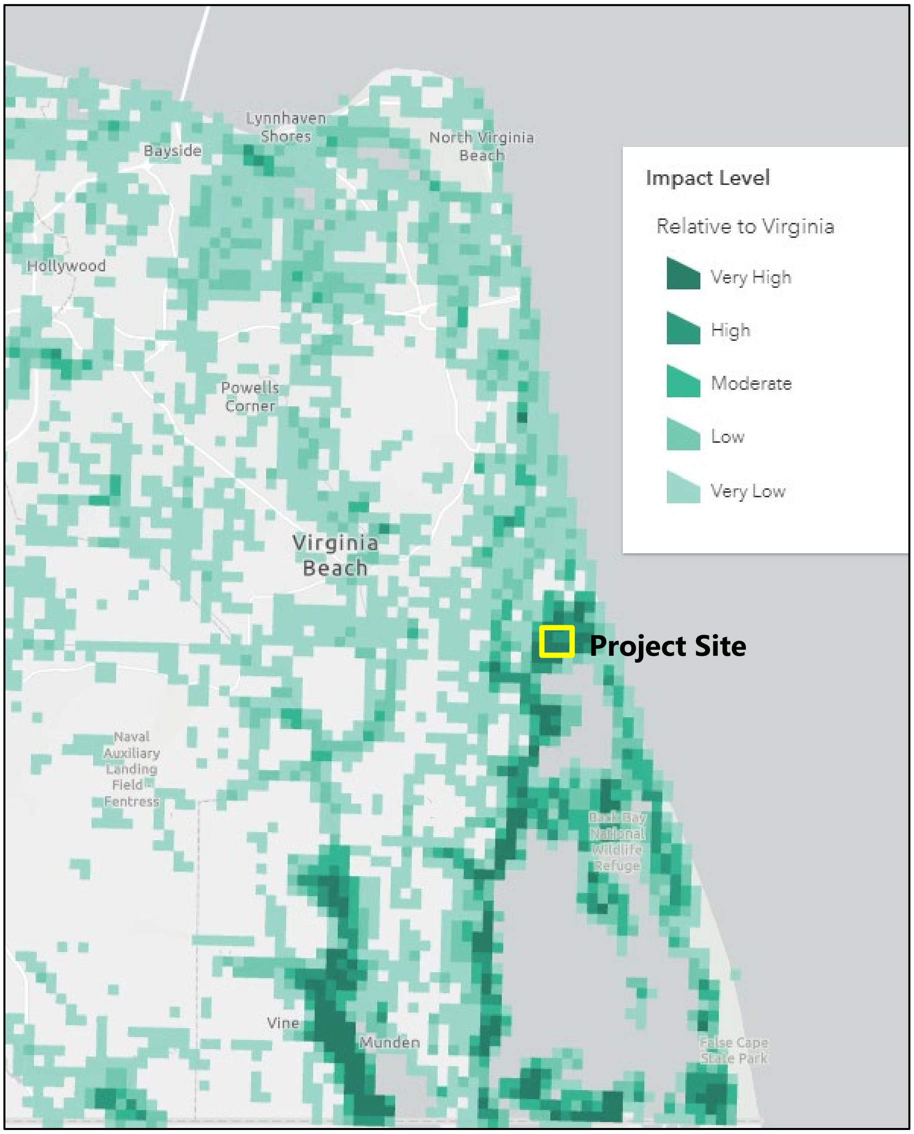

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

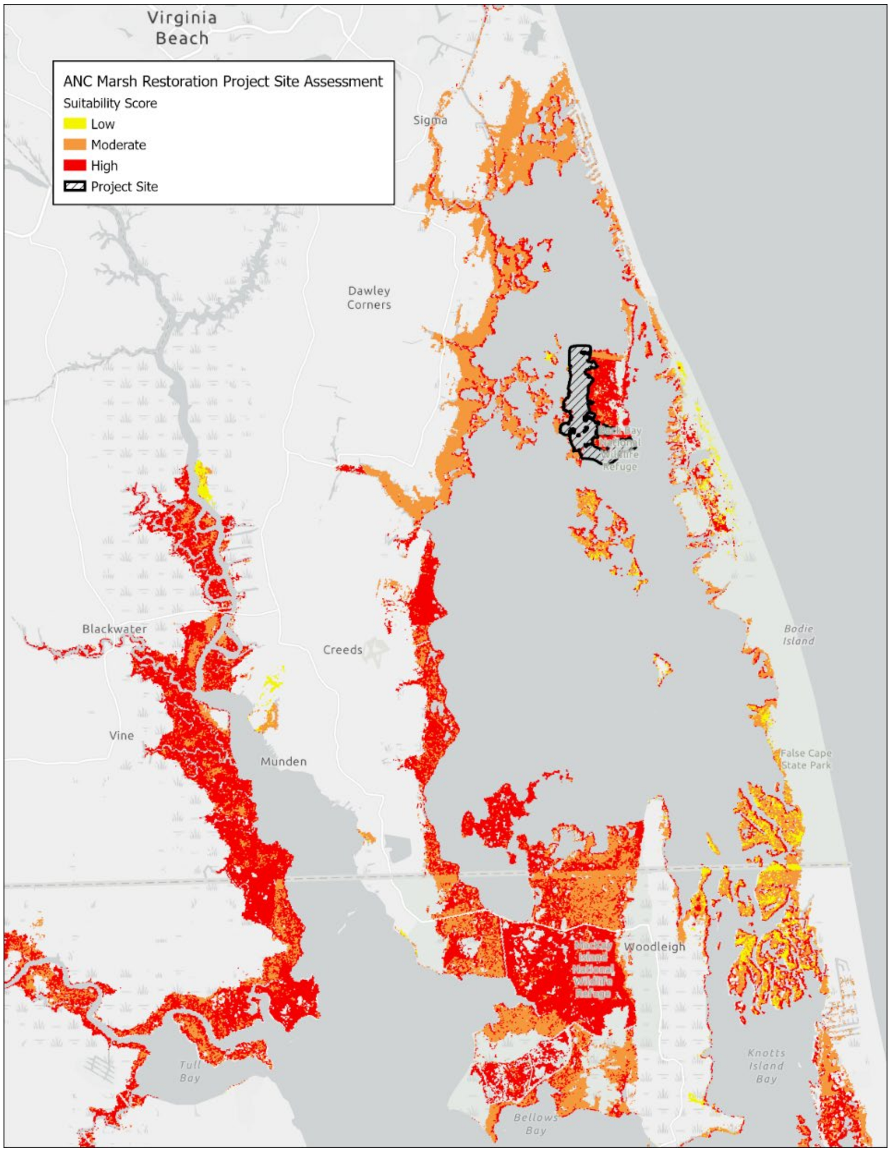

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

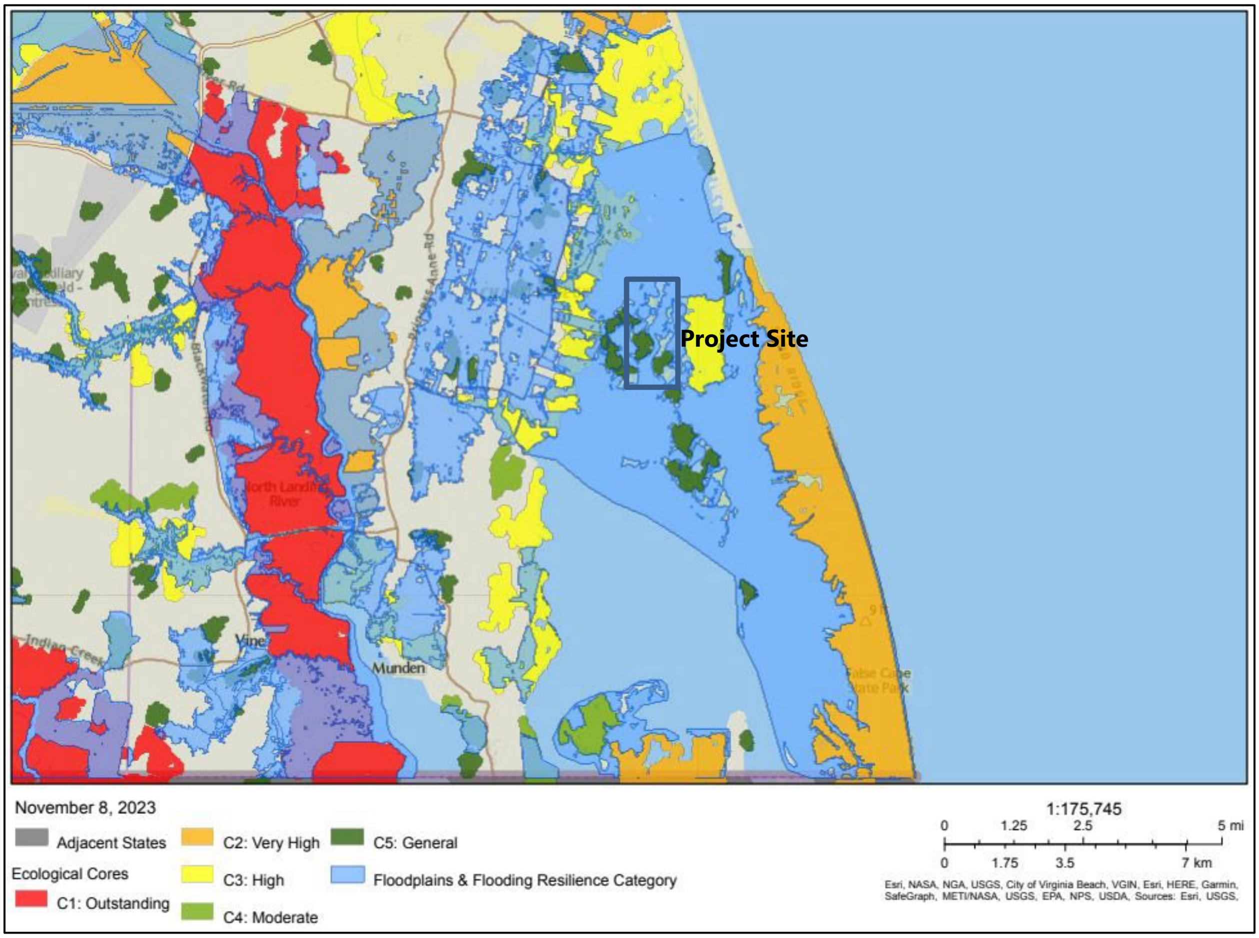

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

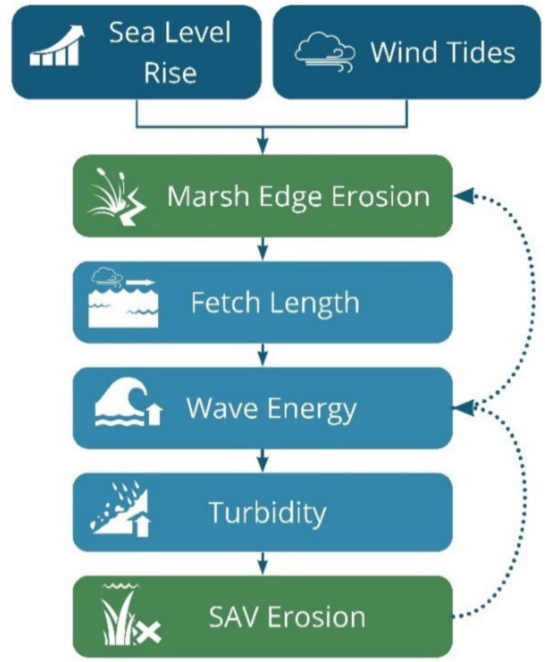

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

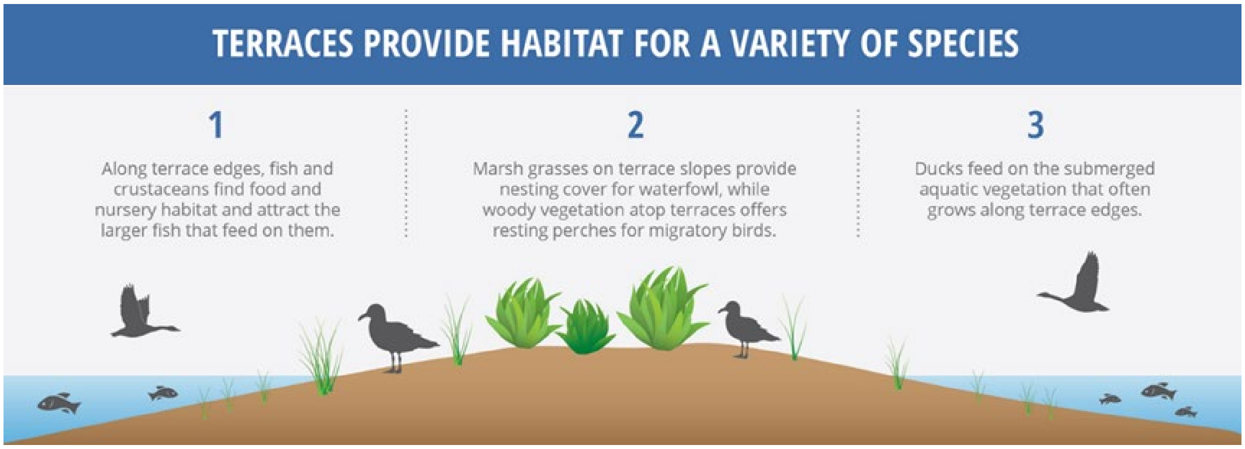

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

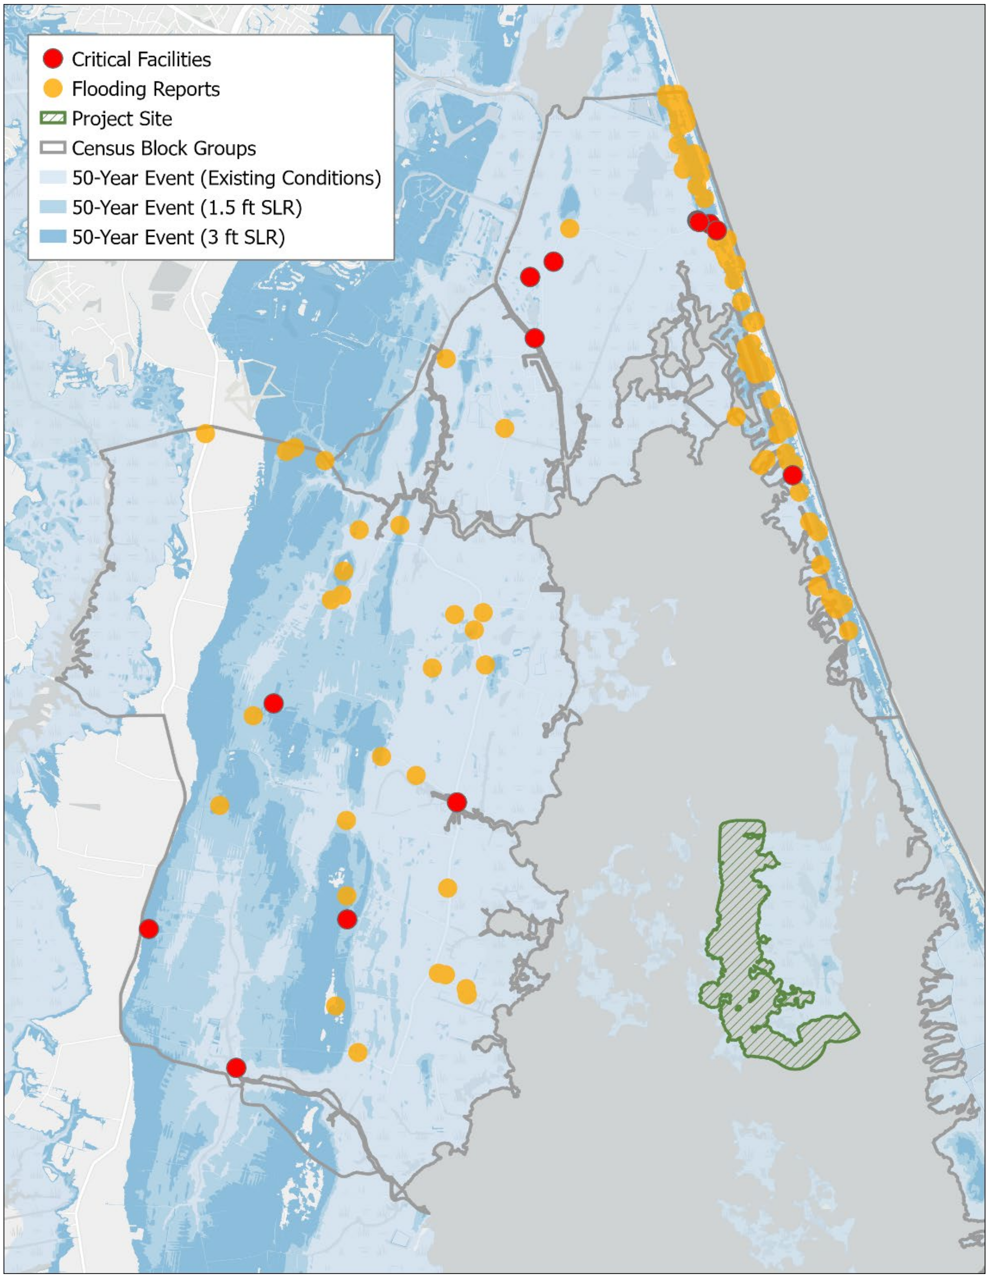

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the S*upporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

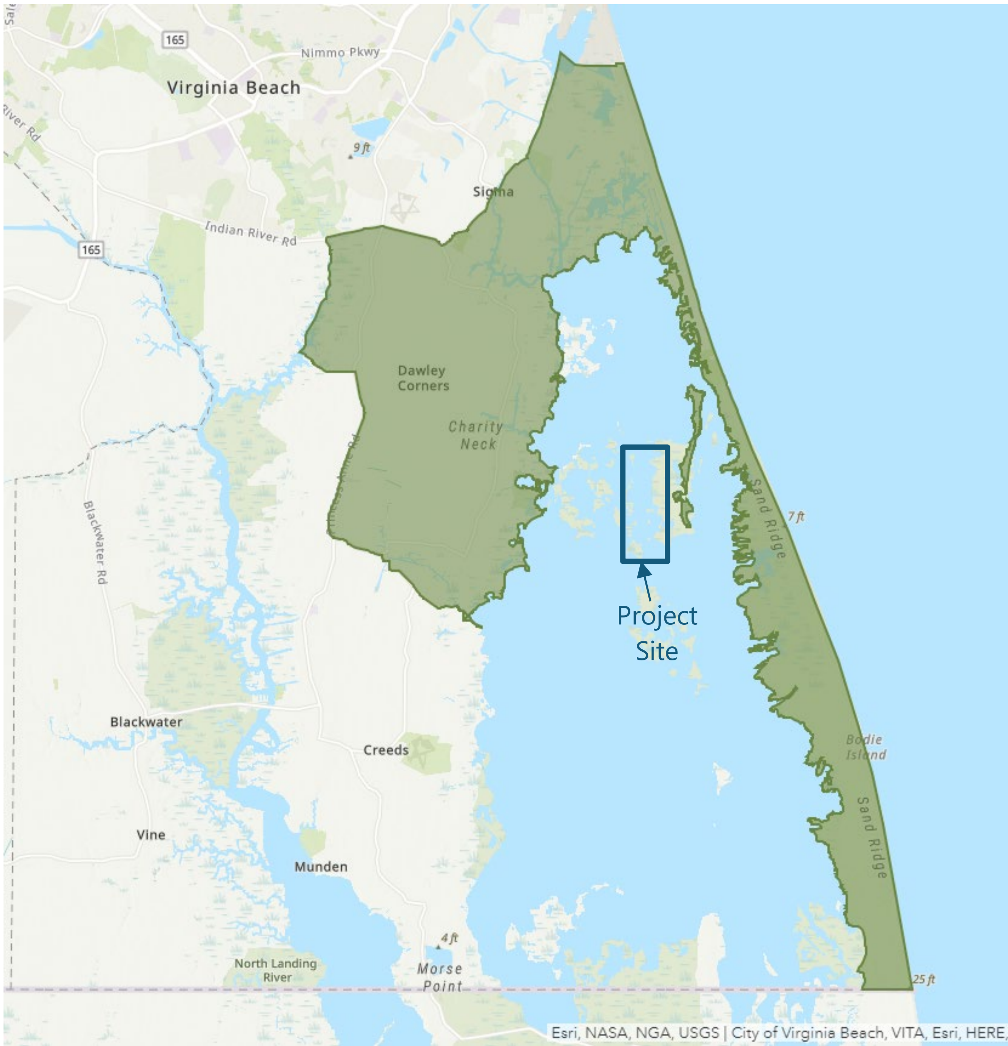

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

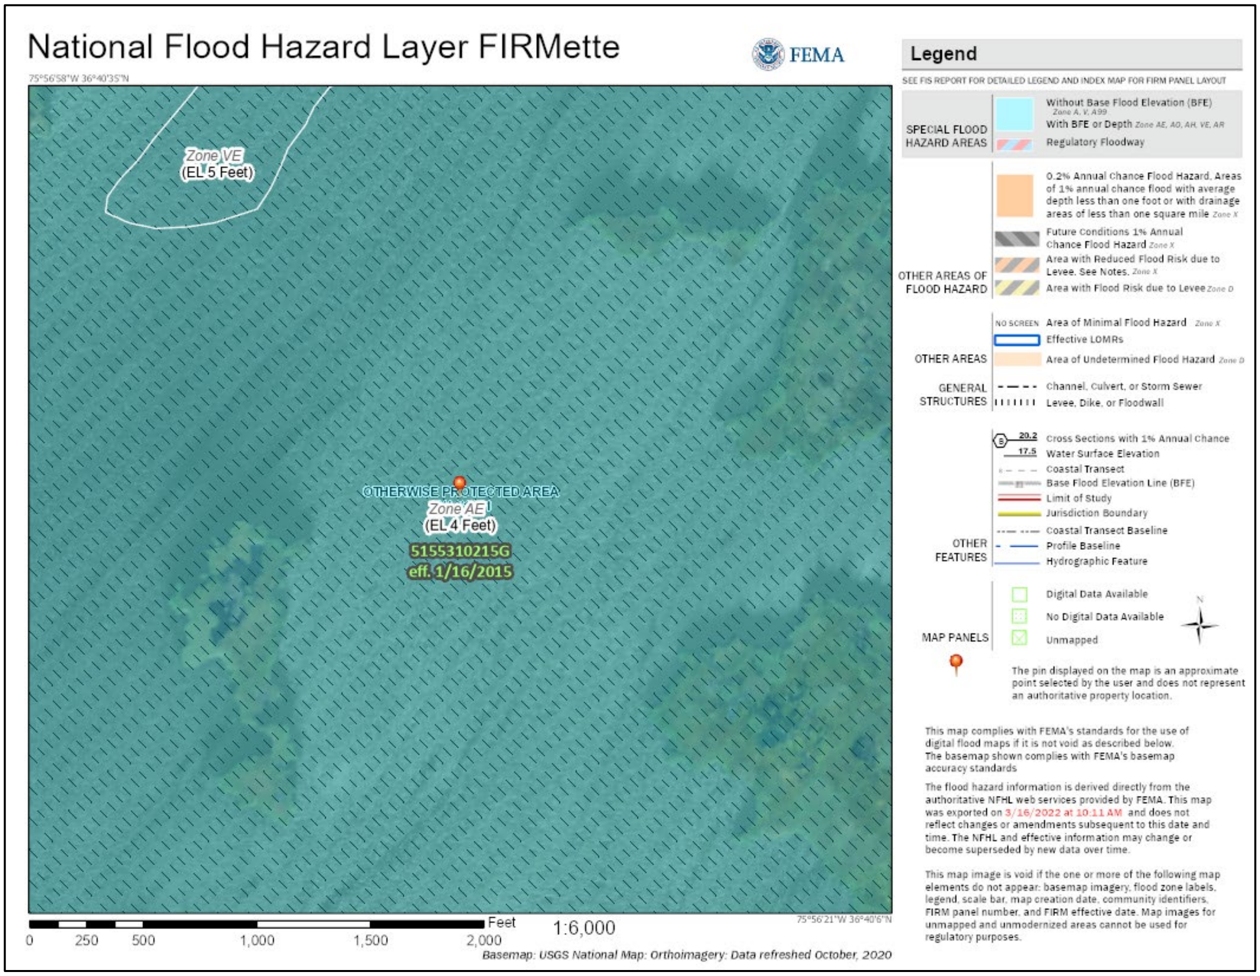

Figure 15: FIRMette for the project area (northern boundary).

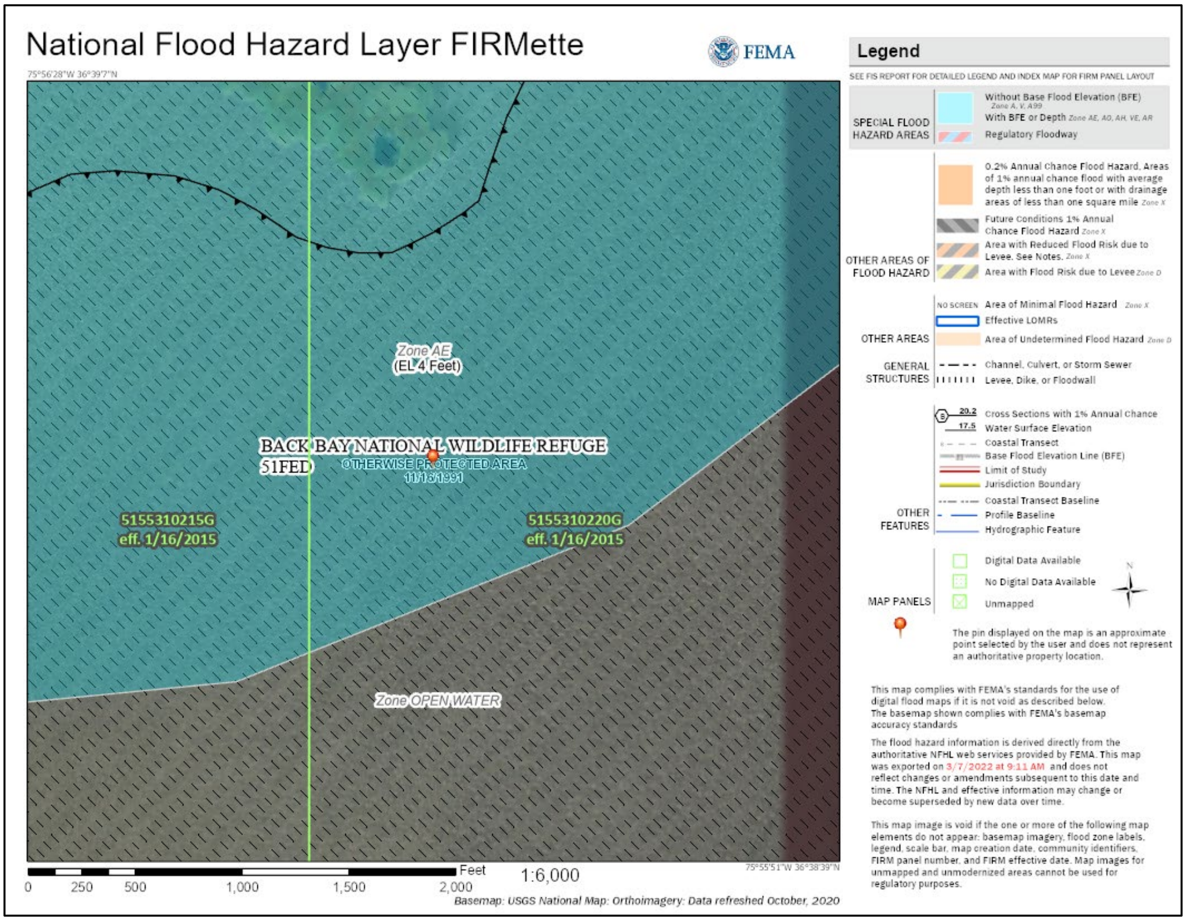

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

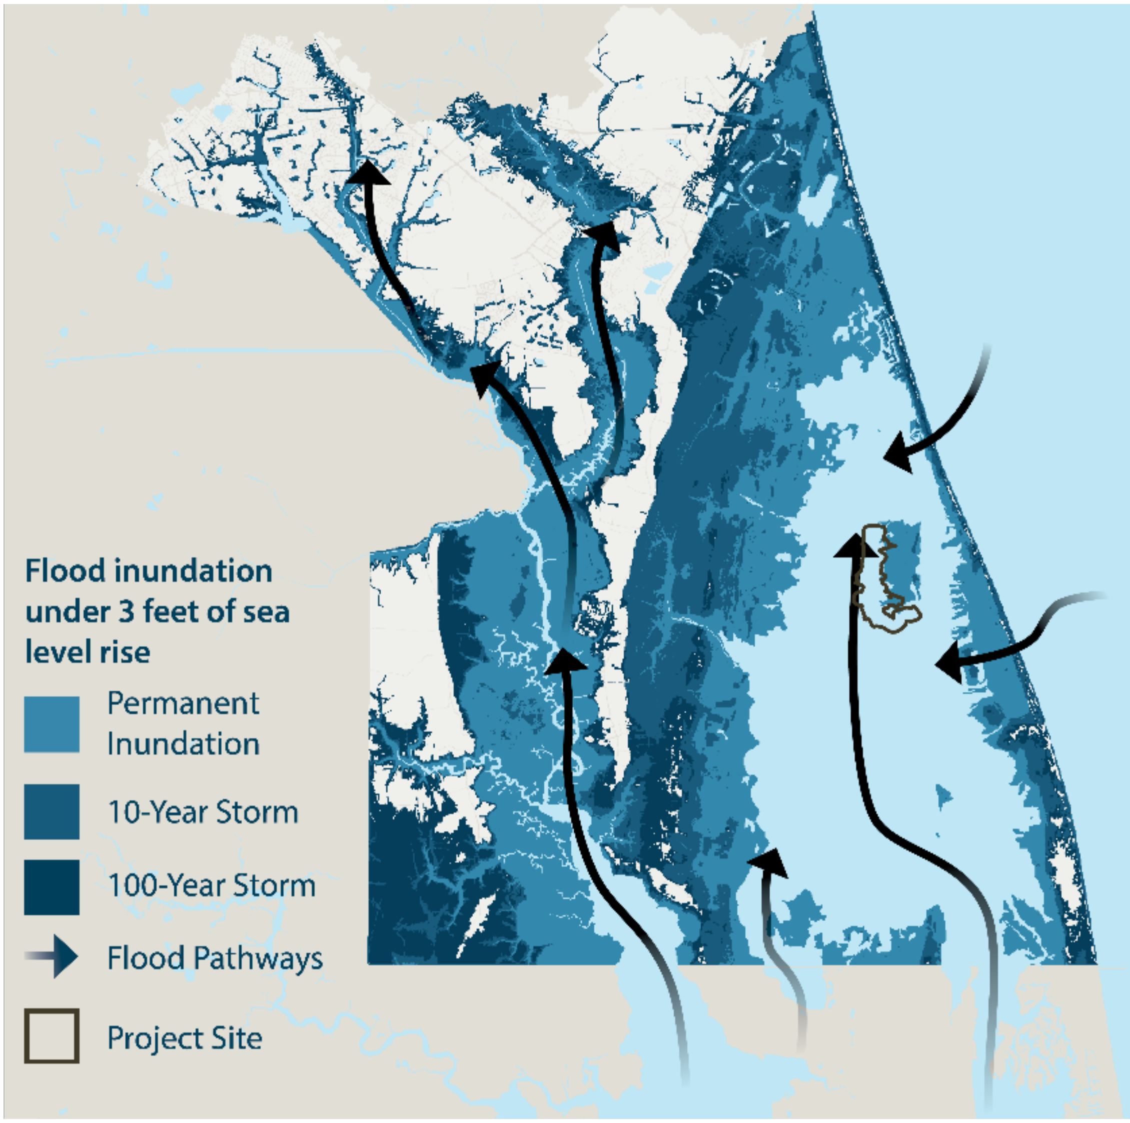

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

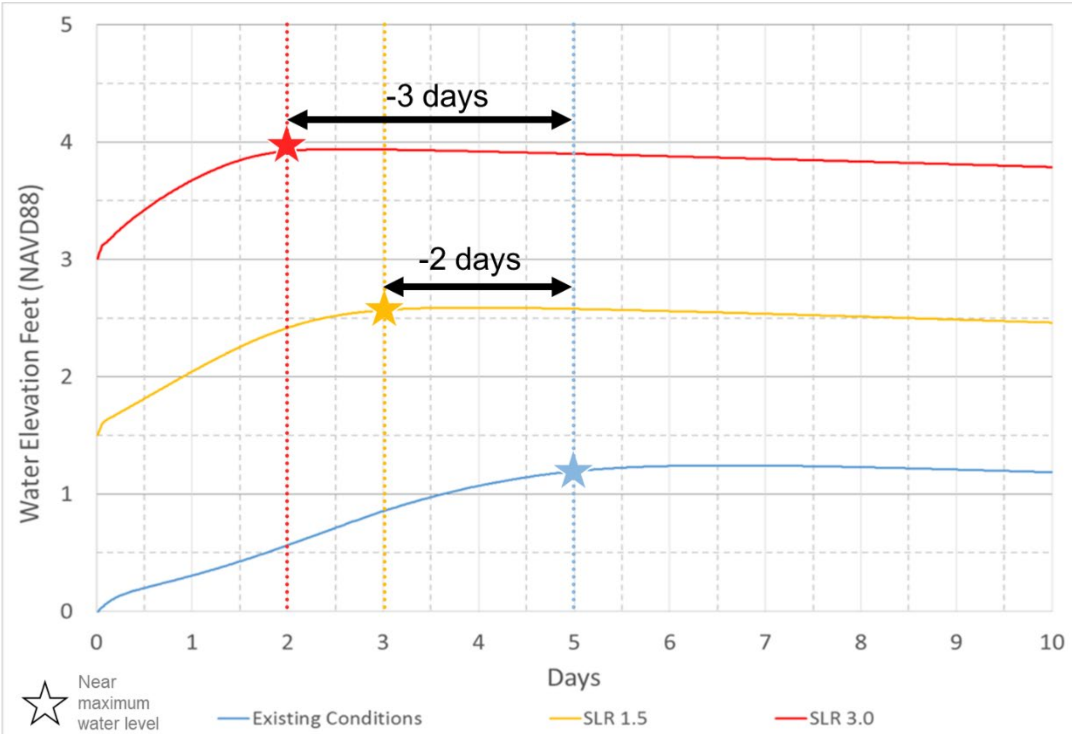

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

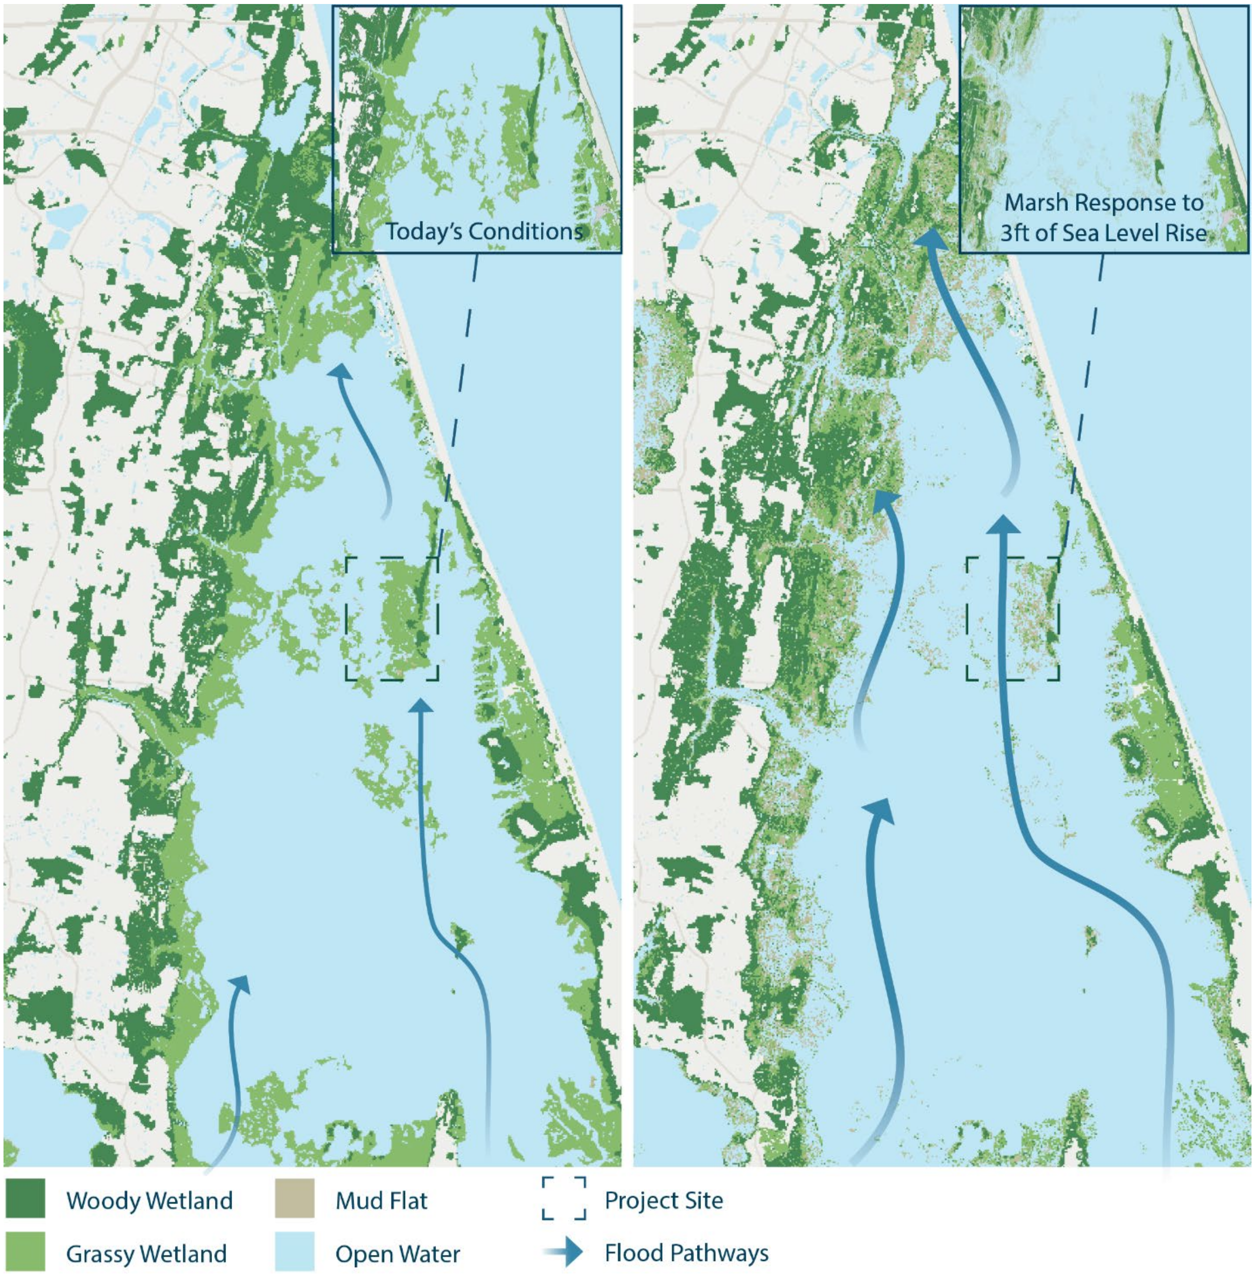

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

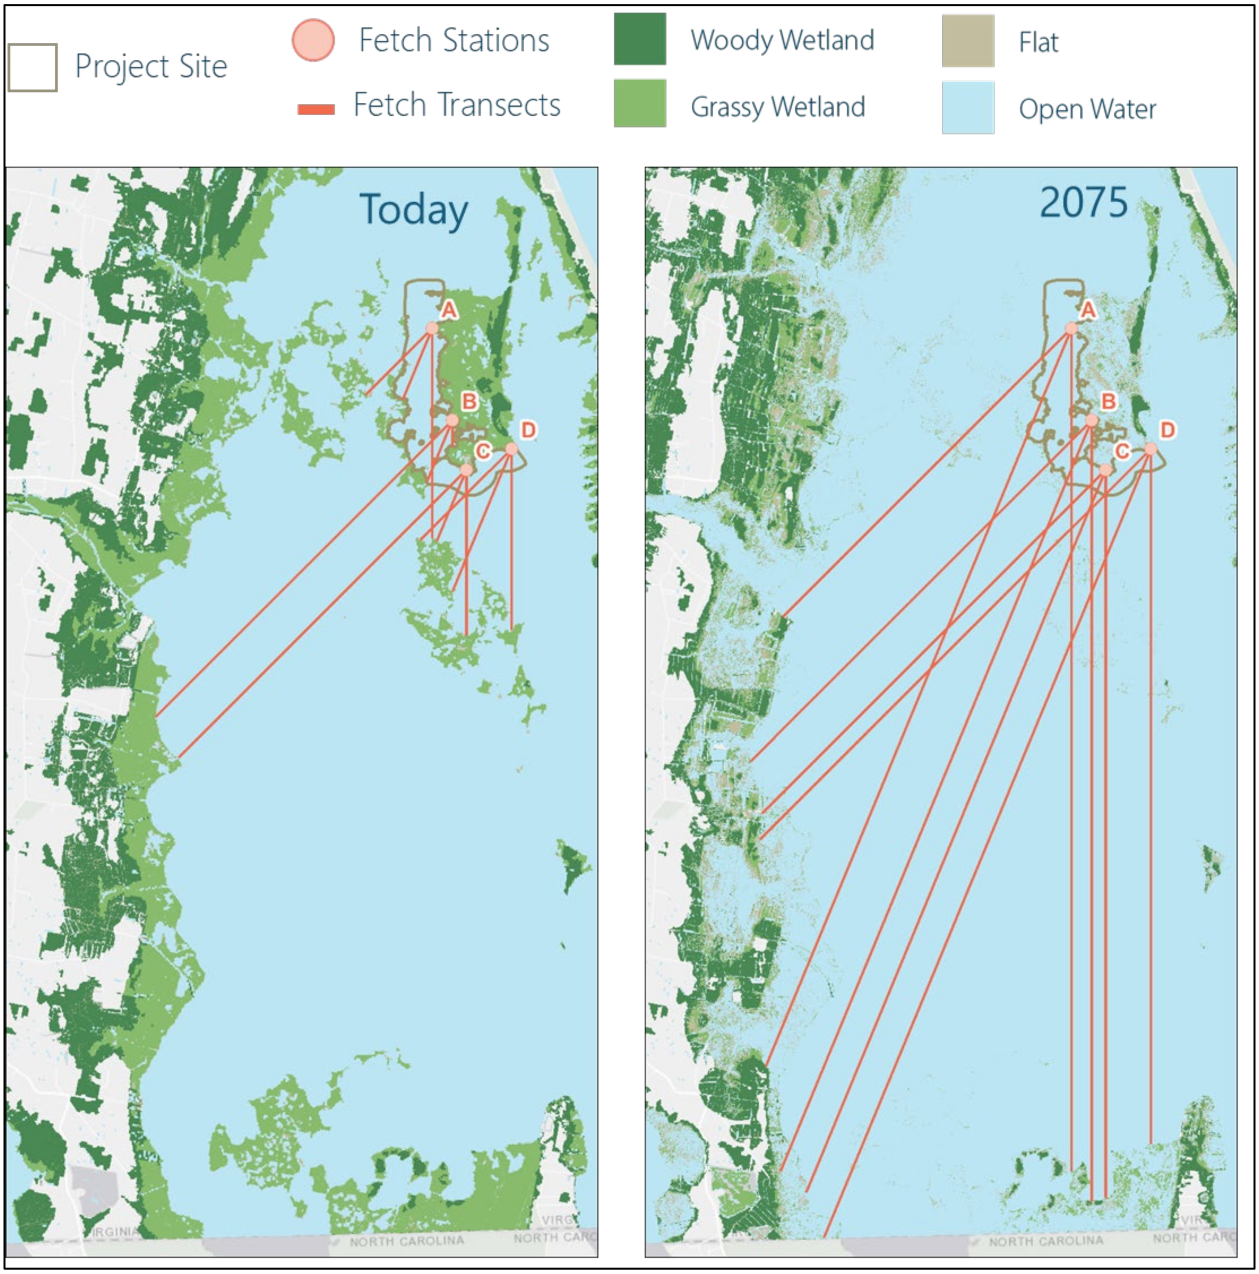

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

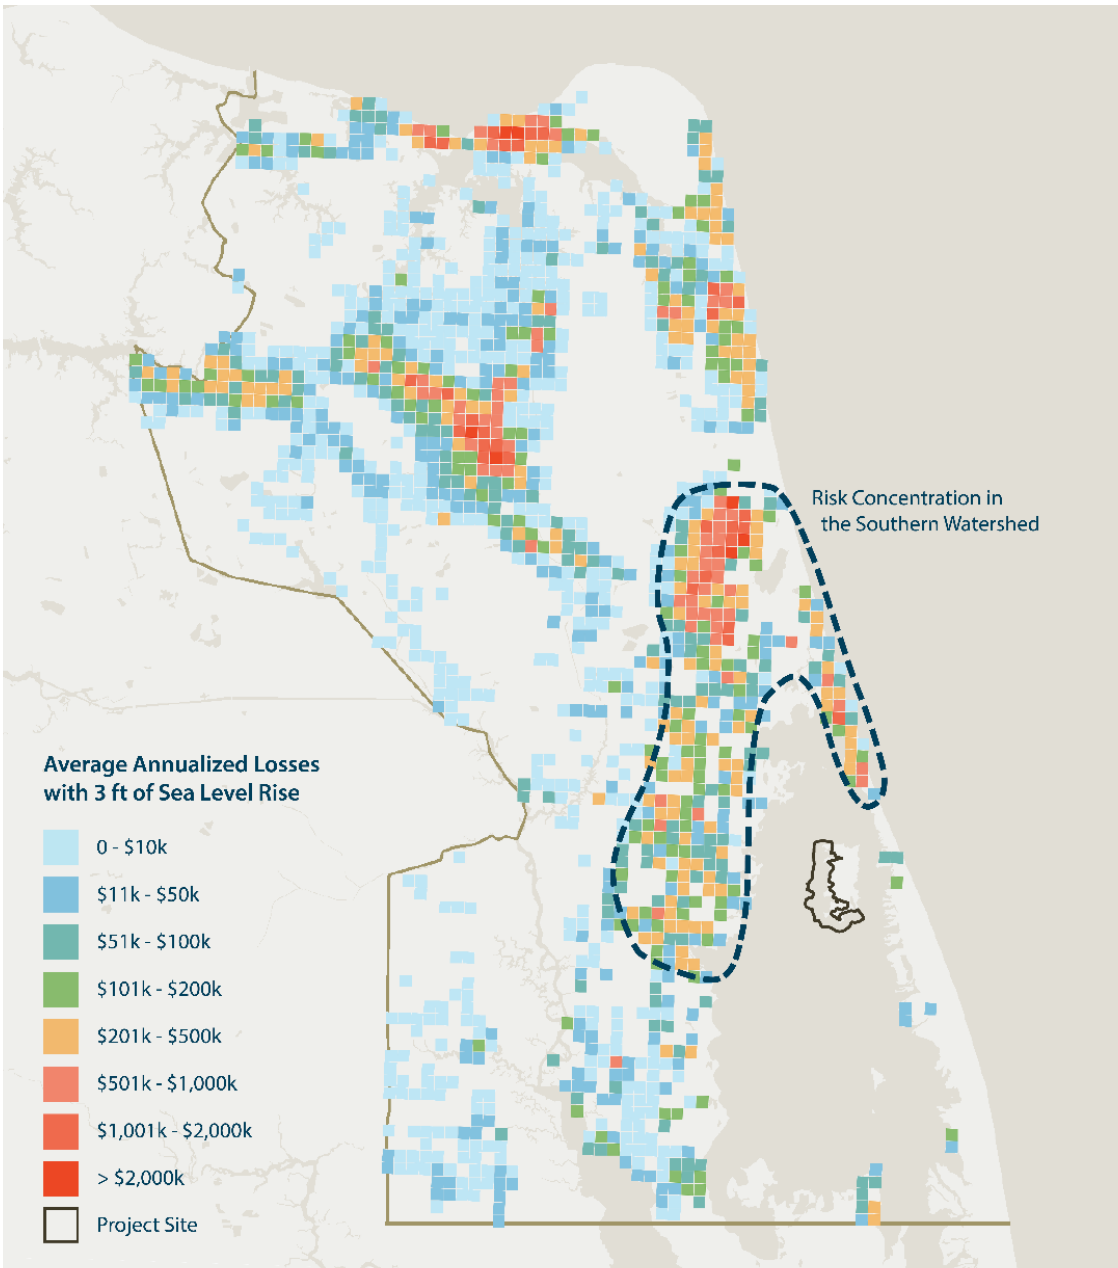

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

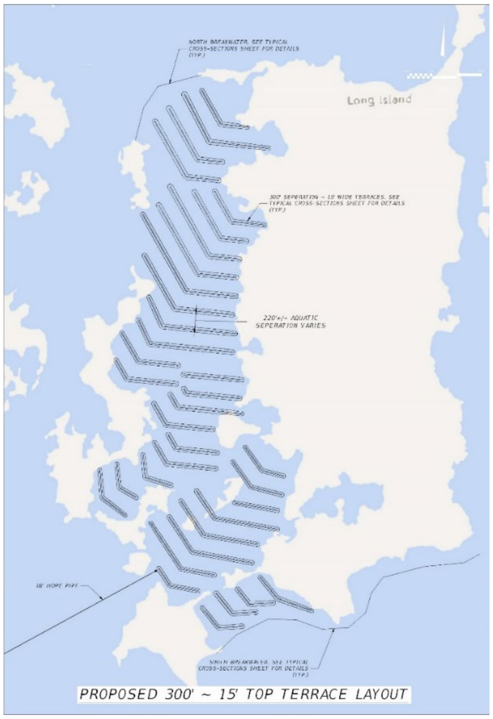

Figure 22: Alternative 2a.

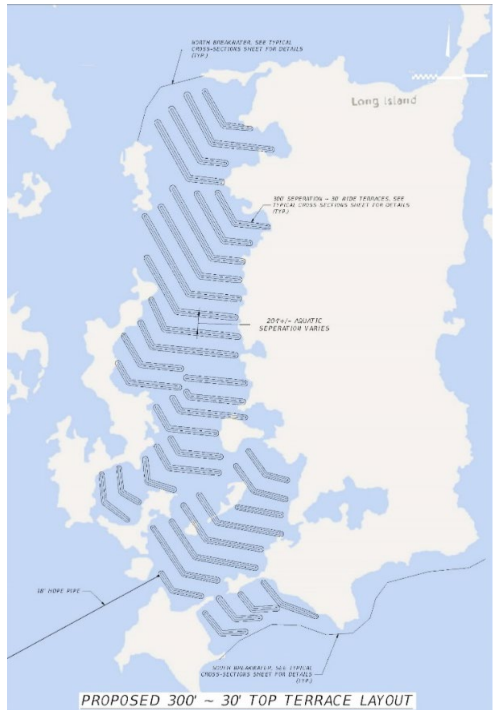

Figure 23: Alternative 2b.

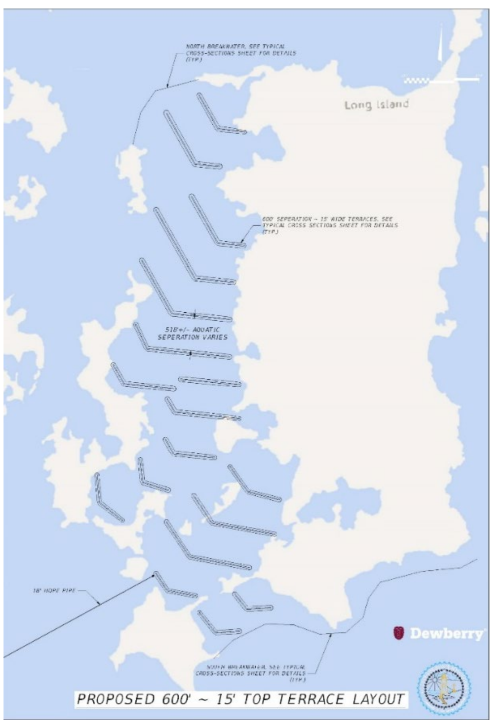

Figure 24: Alternative 2c.

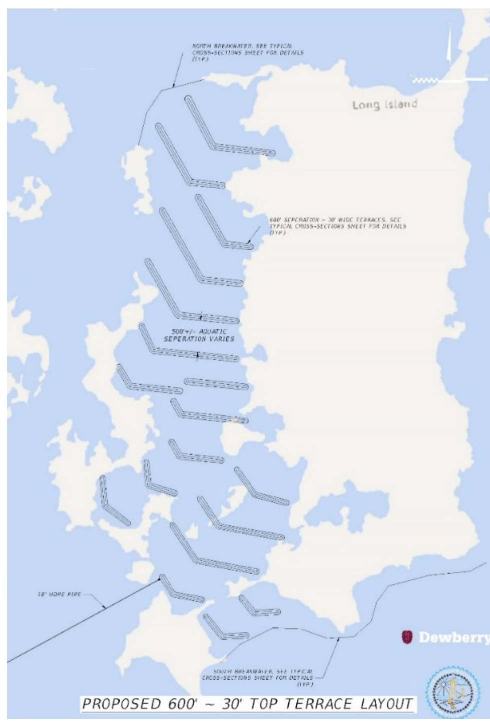

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

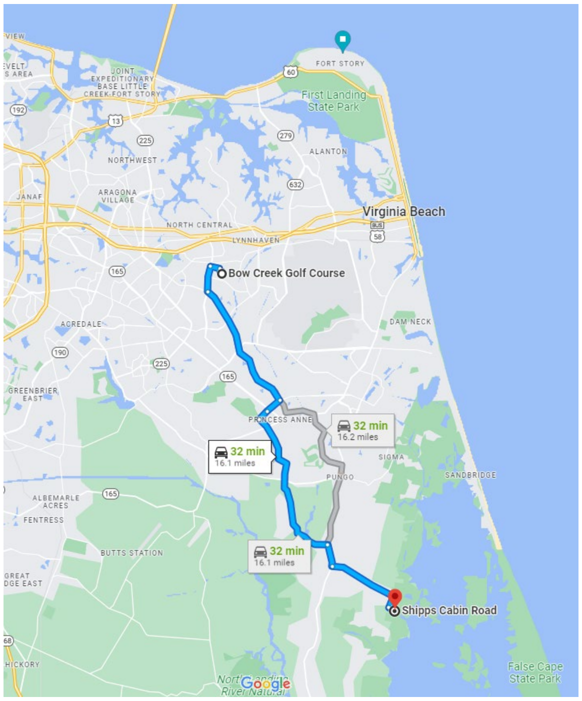

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

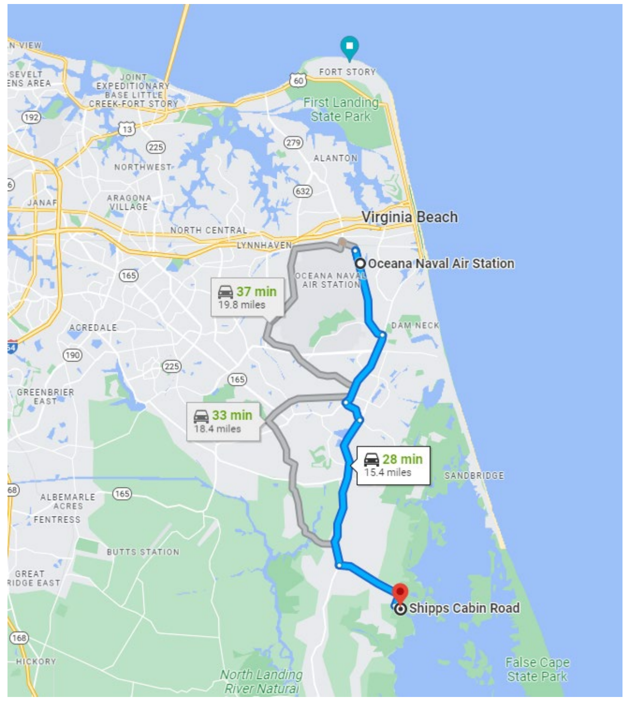

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

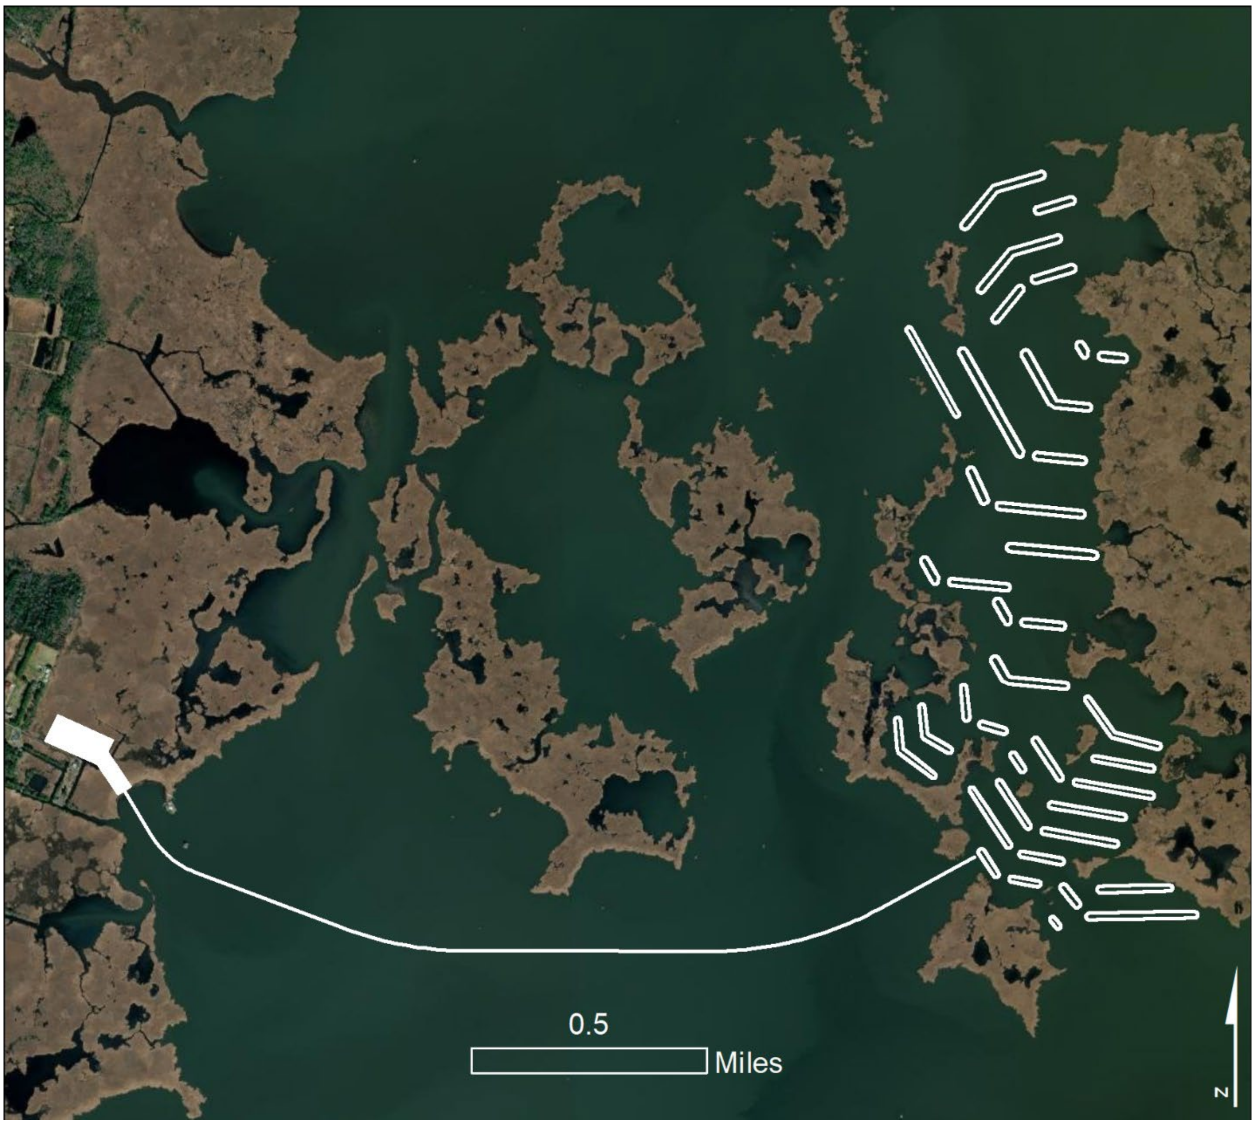

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

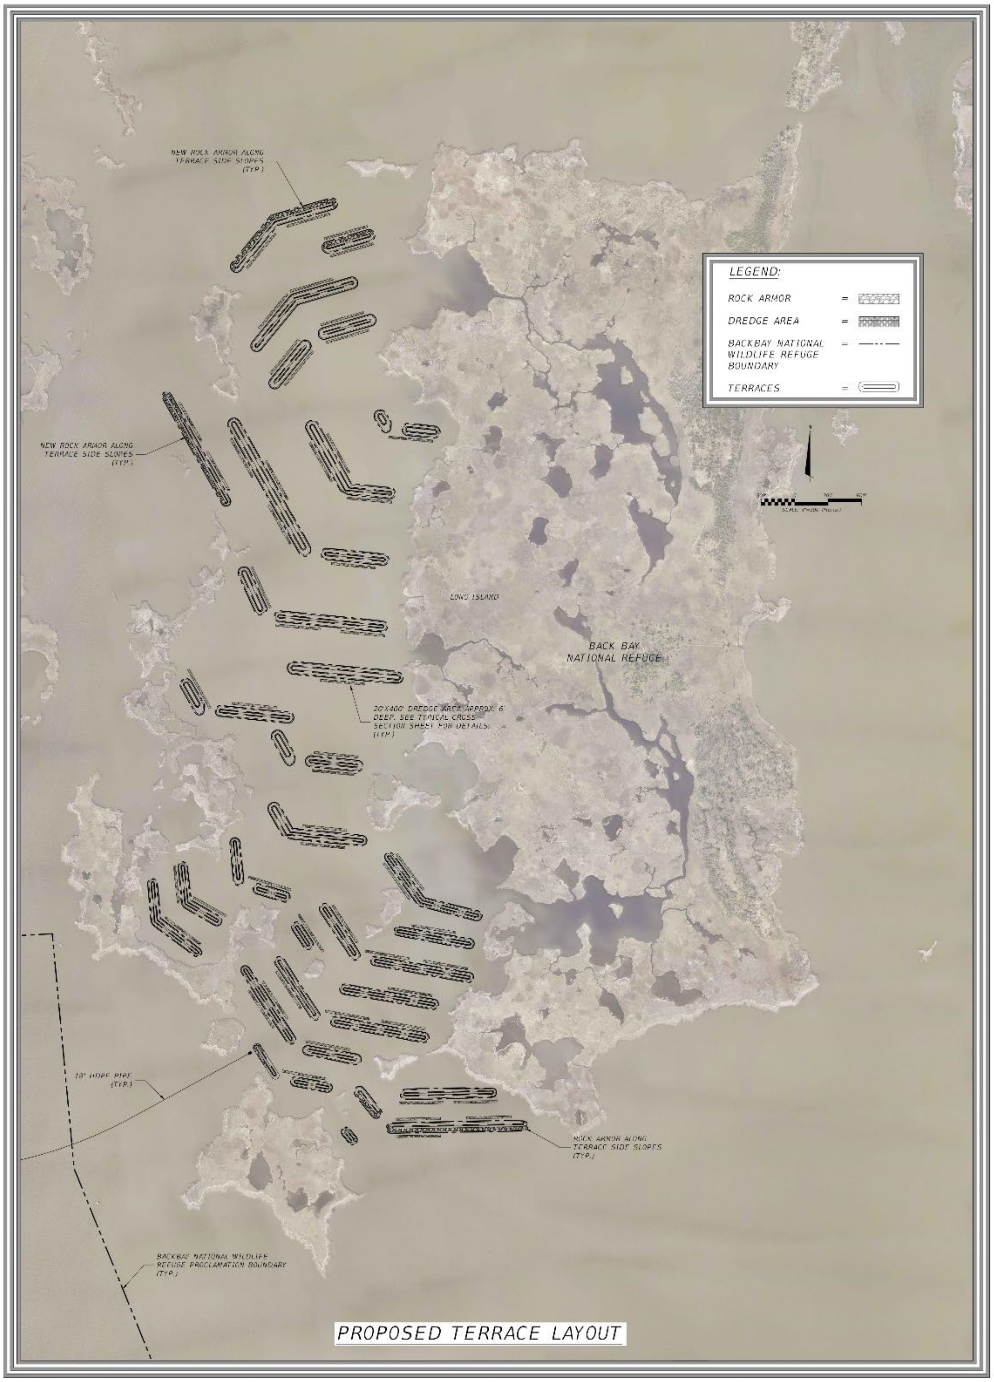

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

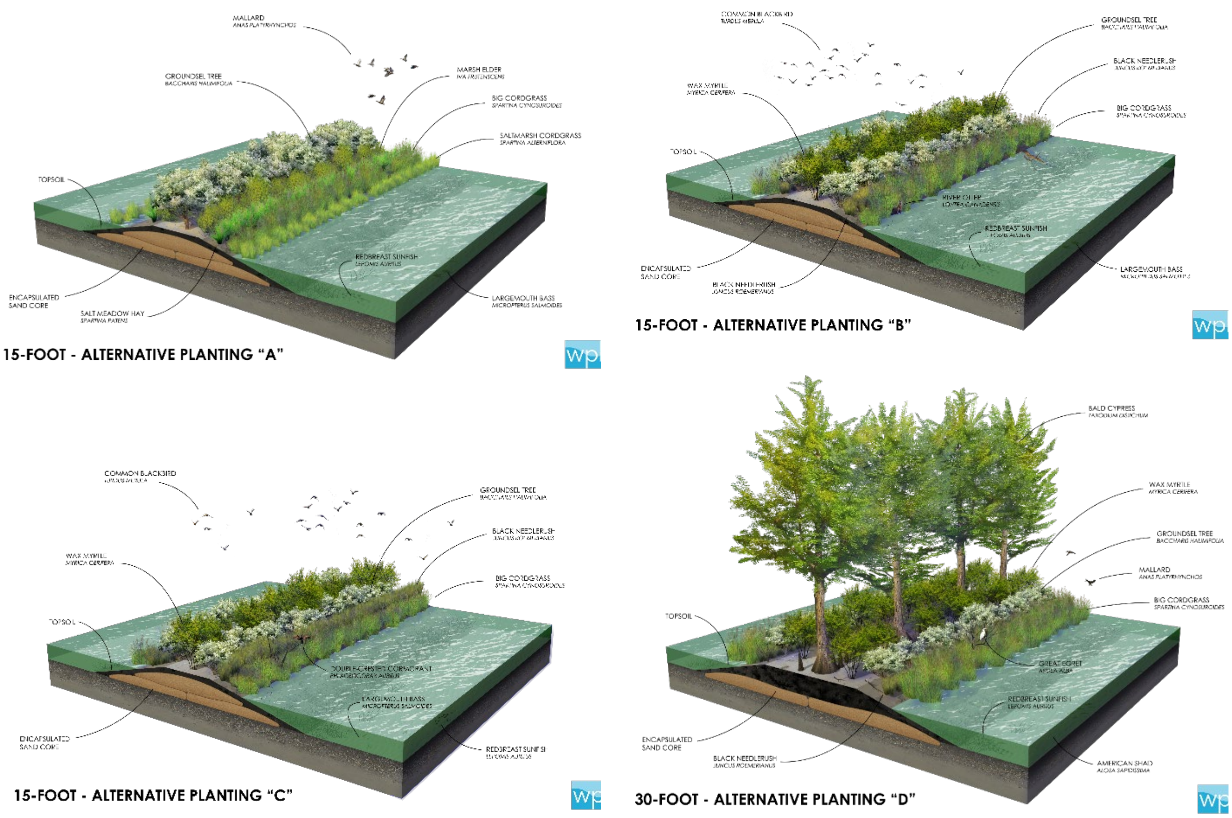

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

  - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

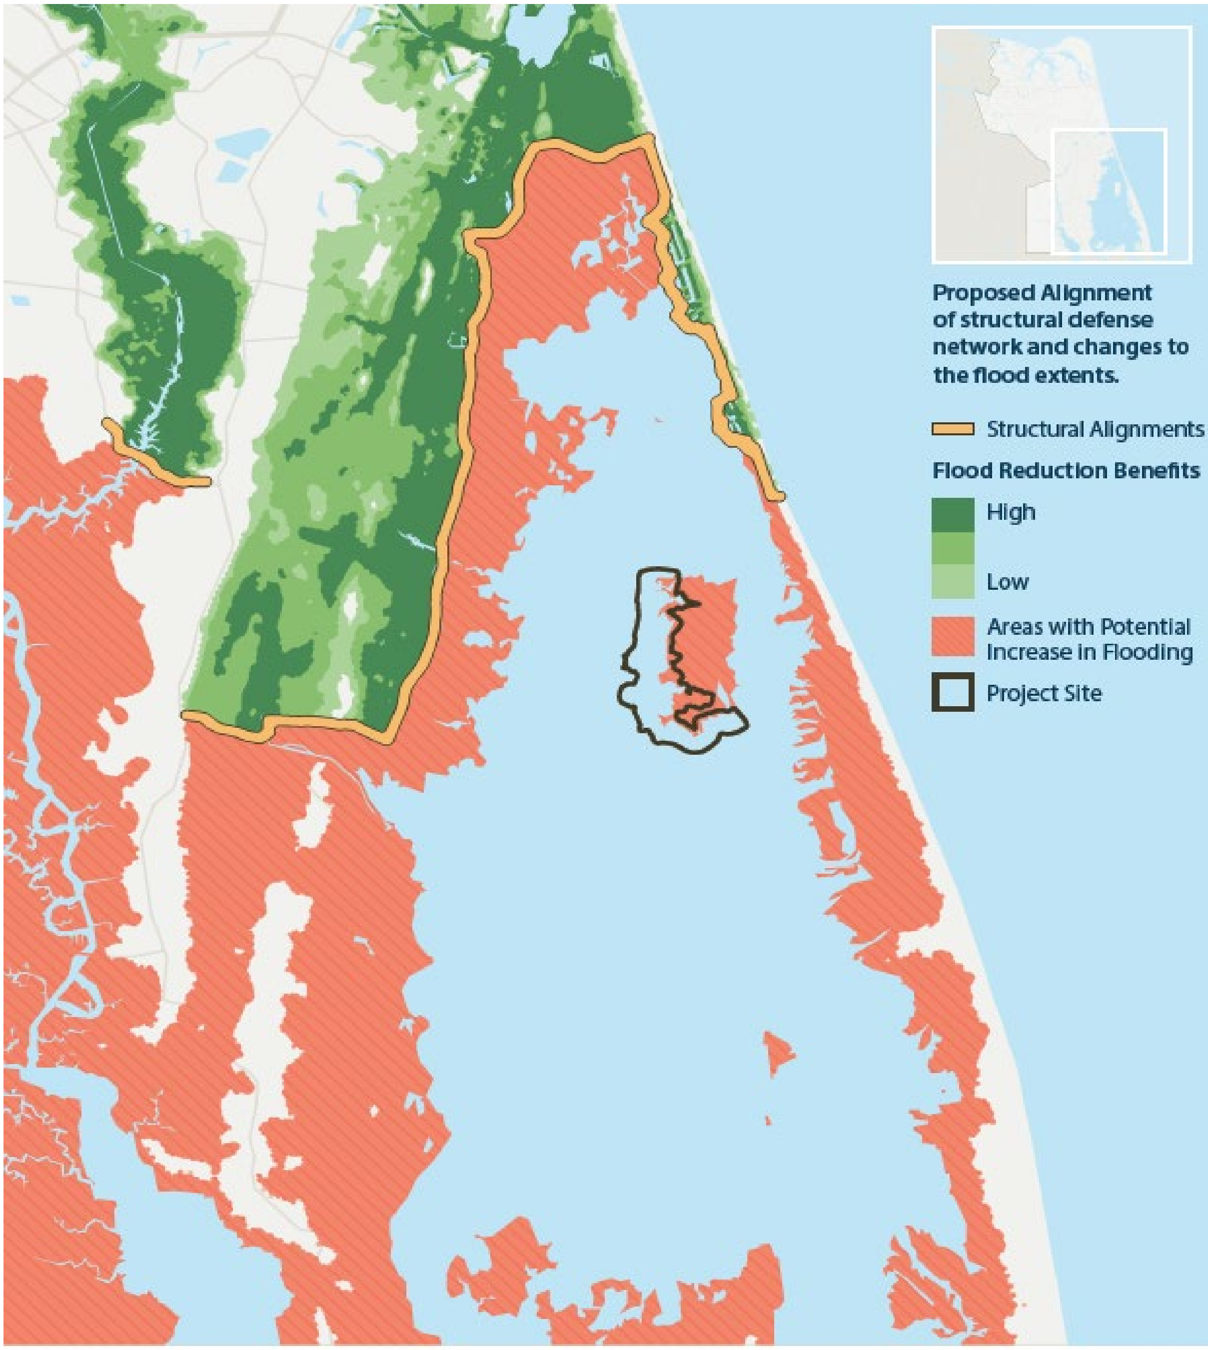

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

FISH AND WILDLIFE SERVICE

Back Bay National Wildlife Refuge
1324 Sandpiper Road
Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed

Megan Reed
Refuge Manager

National Estuary Partnership

Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

William L. Crowell, Jr., Ph.D., AICP, CEE
Director

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A.~~ ~~Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B.~~ ~~Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C.~~ ~~Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D.~~ ~~Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E.~~ ~~Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F.~~ ~~Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G.~~ ~~Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H.~~ ~~Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ <u>Reserved.</u>

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO,~~ ~~f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C.~~ ~~The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1.~~ ~~Public and private outdoor recreational facilities;~~

~~2.~~ ~~Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3.~~ ~~Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

   a. ~~Only one (1) such stand shall be permitted per lot;~~

   b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

   c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

   1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

   2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

C. ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

   a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~,~~ ~~given the preliminary nature of the floodplain study~~;

   b. Comply with the Public Works Design Standards Manual; and

   c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

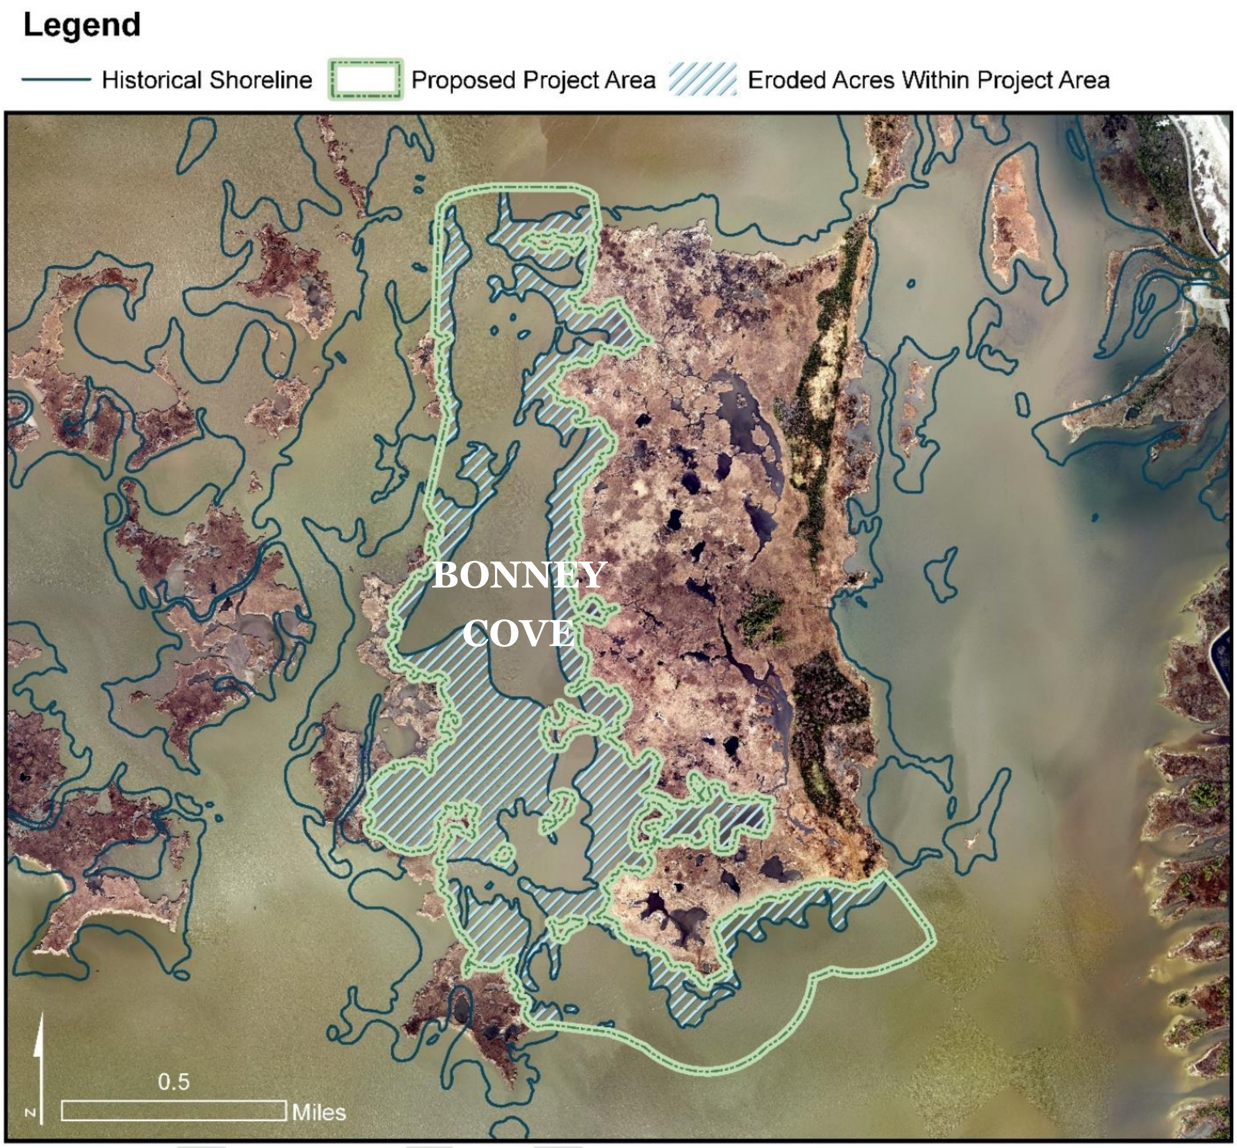

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay’s shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats.   Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

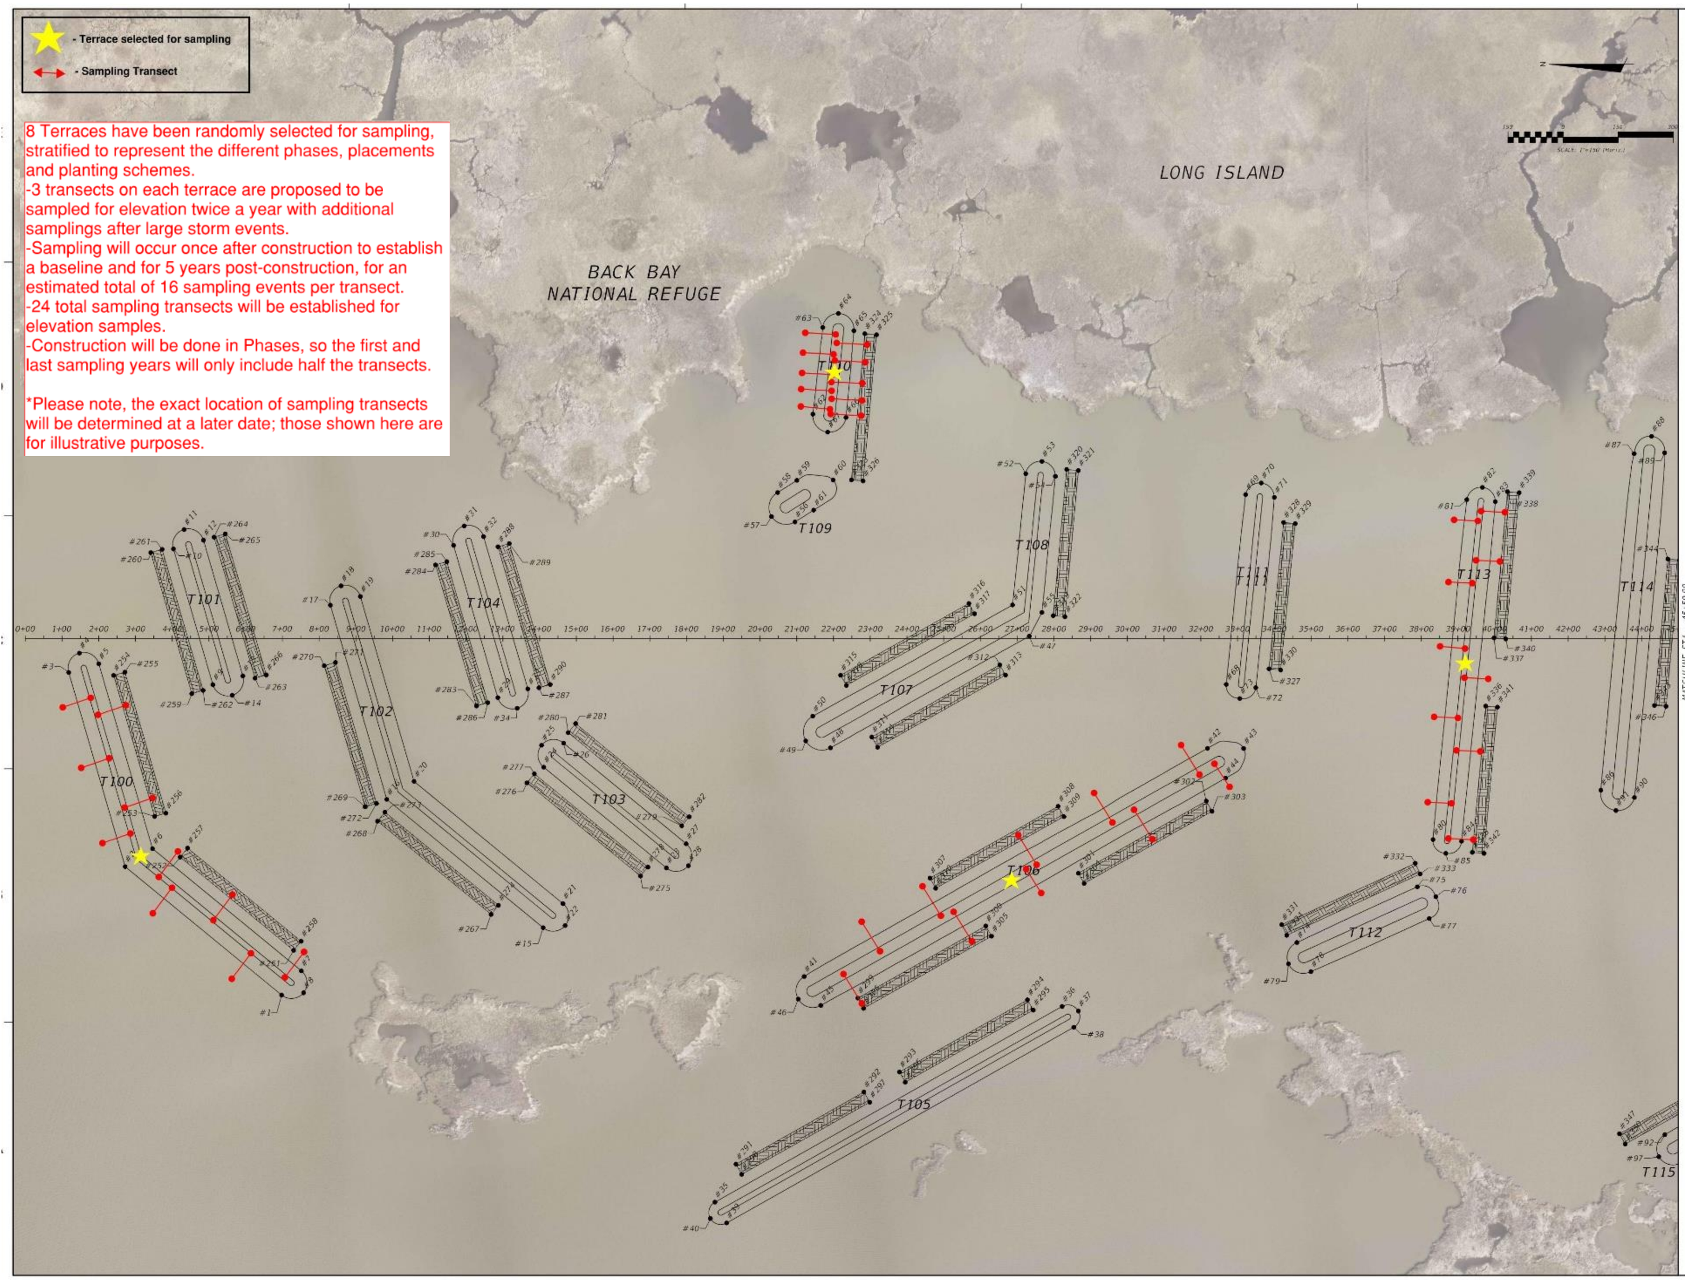

Figure 3: Monitoring design site plan – North Terraces

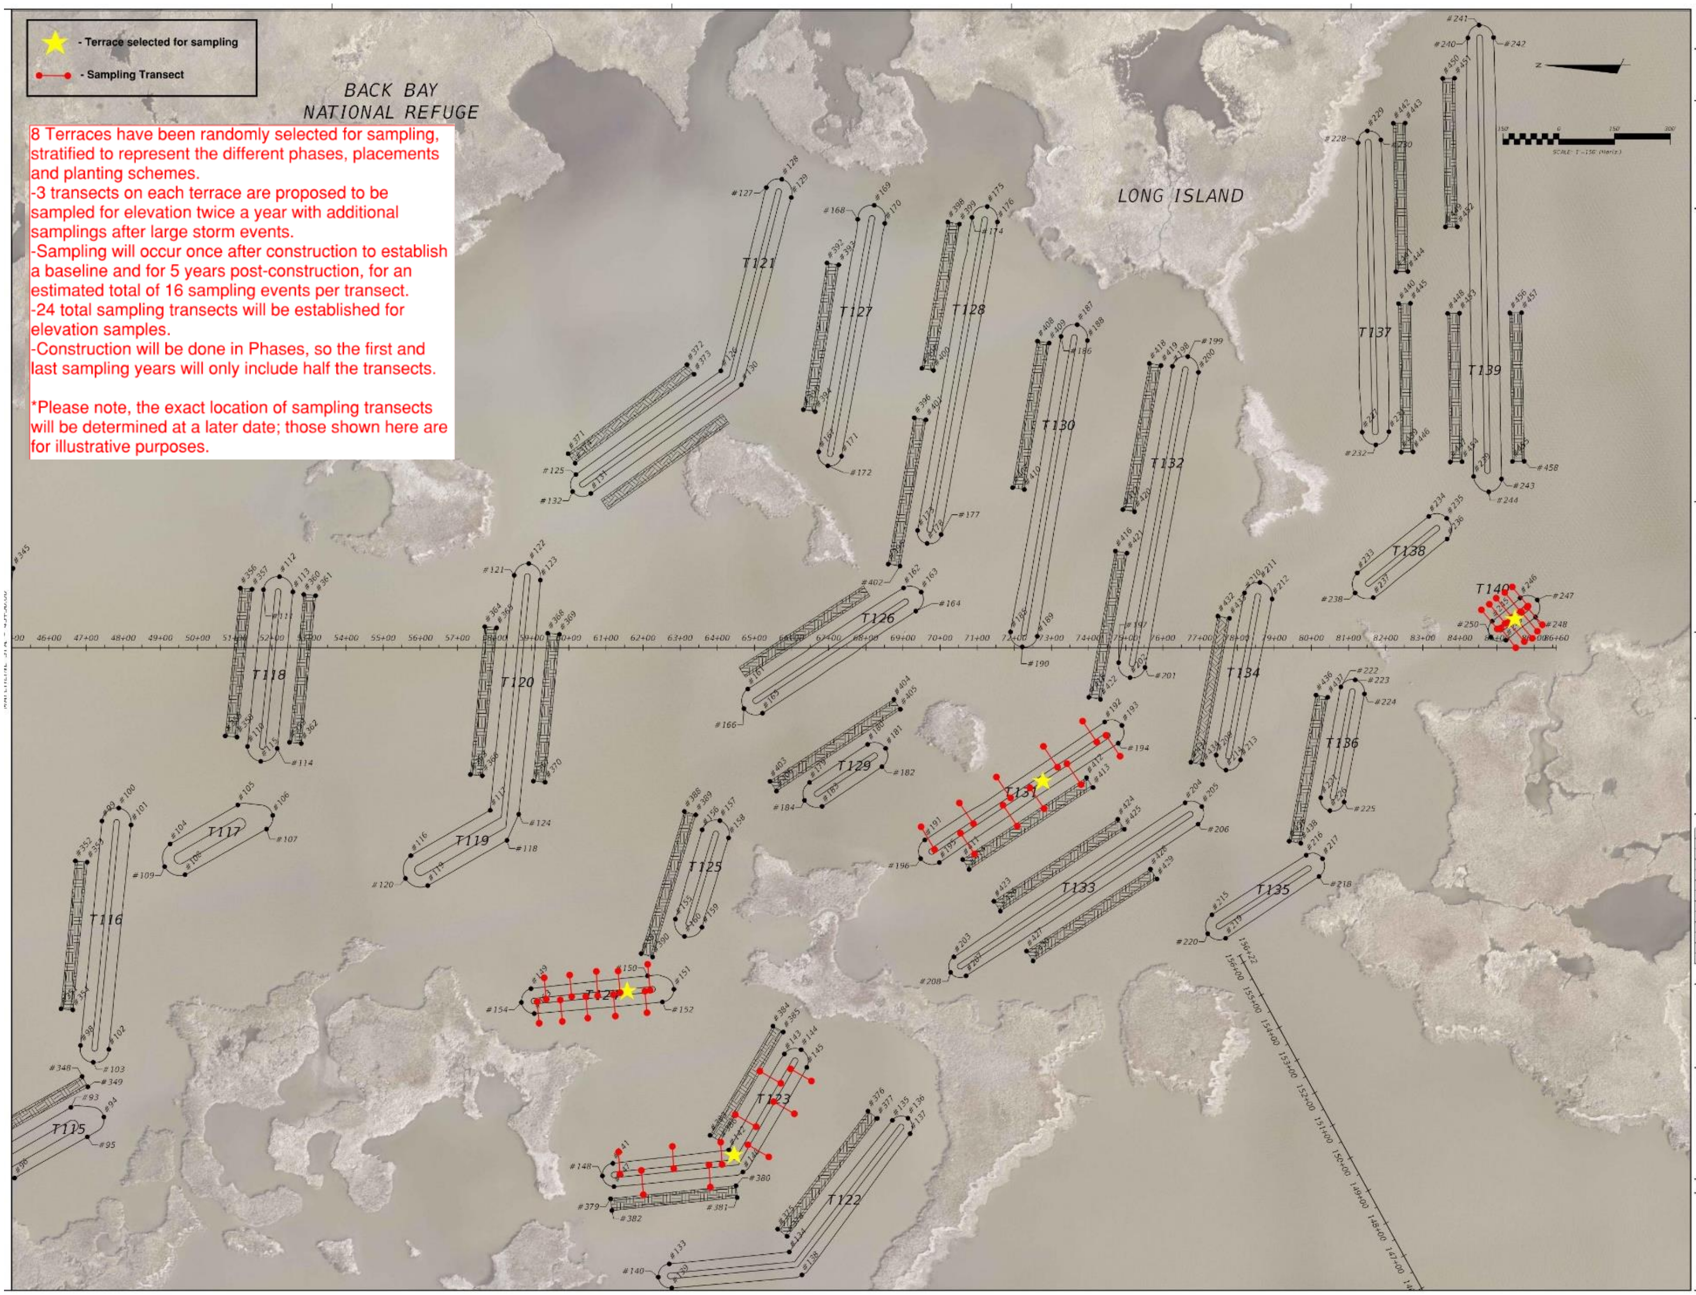

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

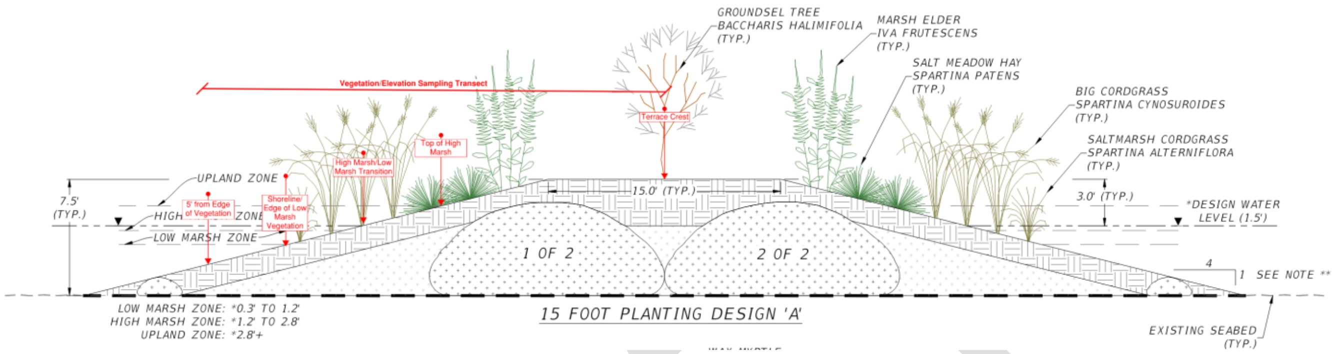

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

MONITORING RESULTS

Table 2: Low Marsh Vegetation Percent Cover Monitoring Results (Example Table – Terrace 1).

City: Virginia Beach **State:** Virginia **Zip:** 23452

Telephone Number: (757) 385-8430 **Cell Phone Number:** (____) ______________

Email Address: CBodnar@vbgov.com

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ______________________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ____________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) __________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: ______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: __________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023	
Grand Total State Funding Request	$ 5,000,000
Grand Total Local Share of Project	$ 38,356,966
National Fish and Wildlife Foundation Grants Federal Funding (if applicable)	$ 10,021,524
Project Grand Total	$ 53,378,490
Locality Cost Match	% 71.85

Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

[3] Office of Governor Ralph S. Northam Commonwealth of Virginia. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

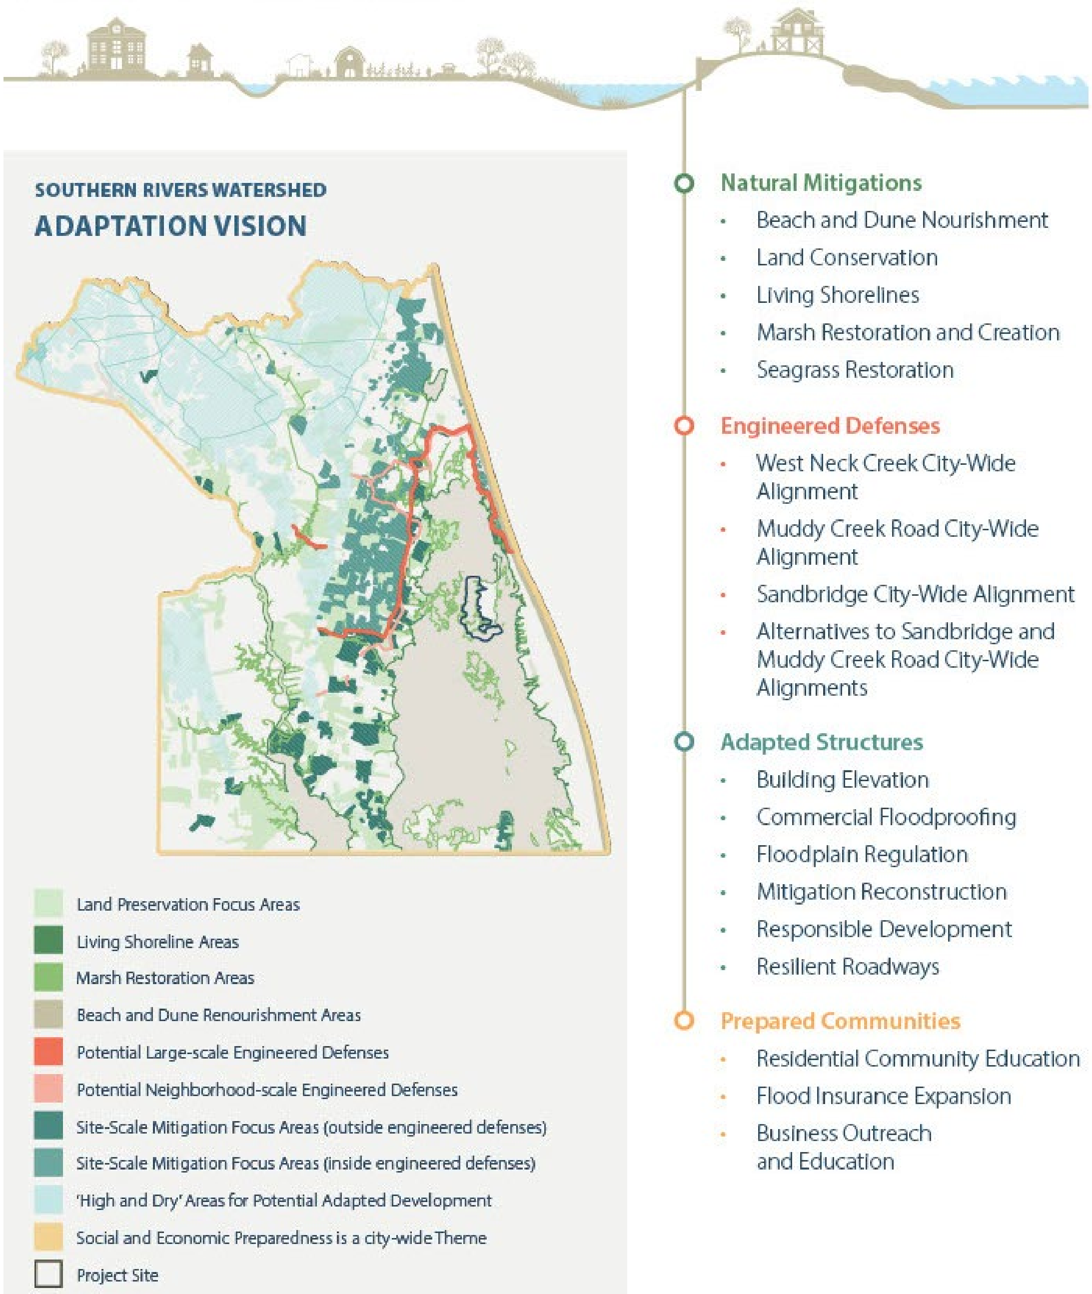

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

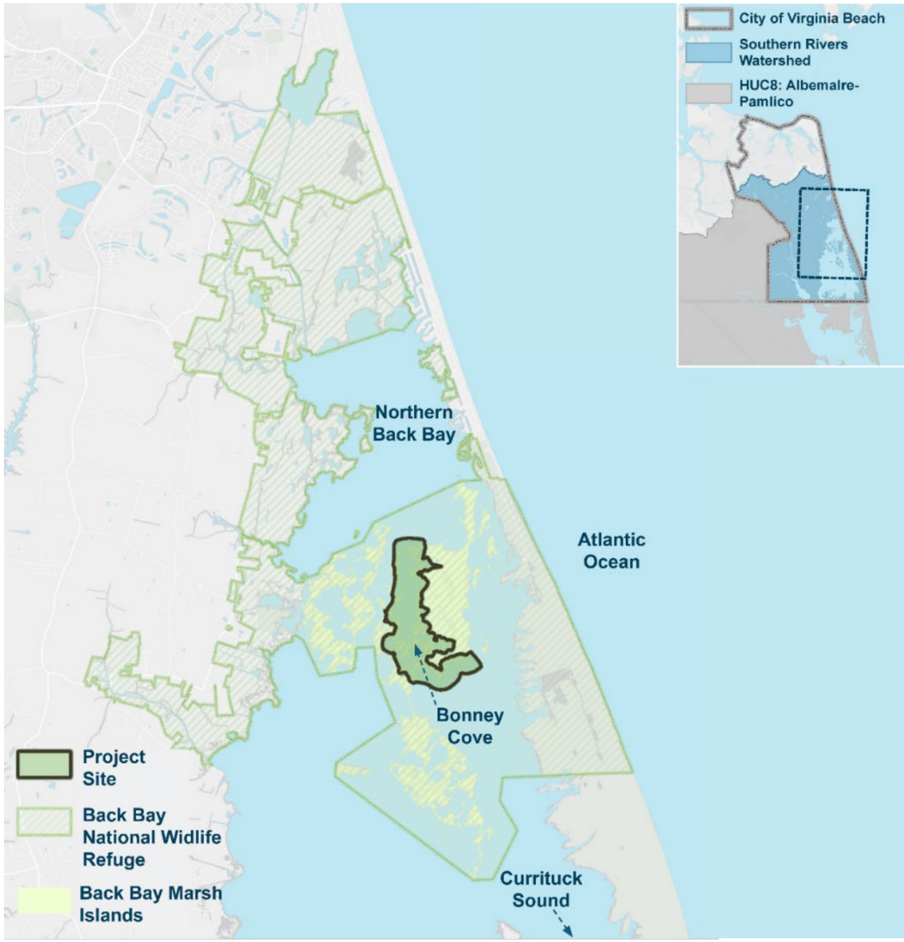

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

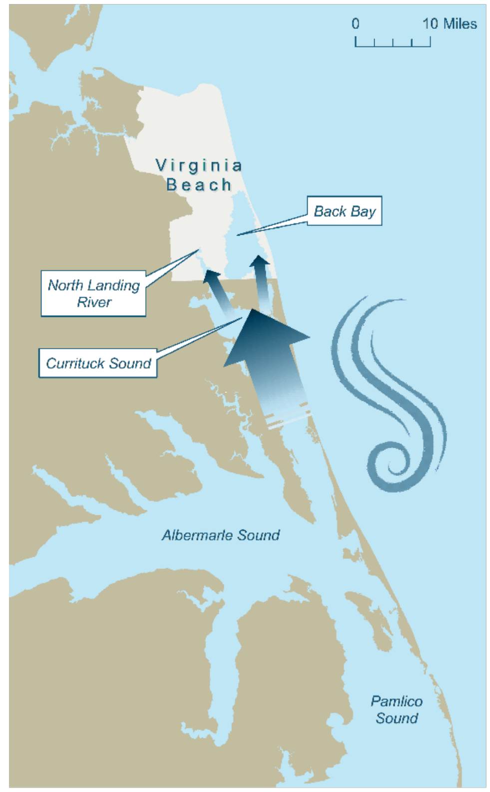

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

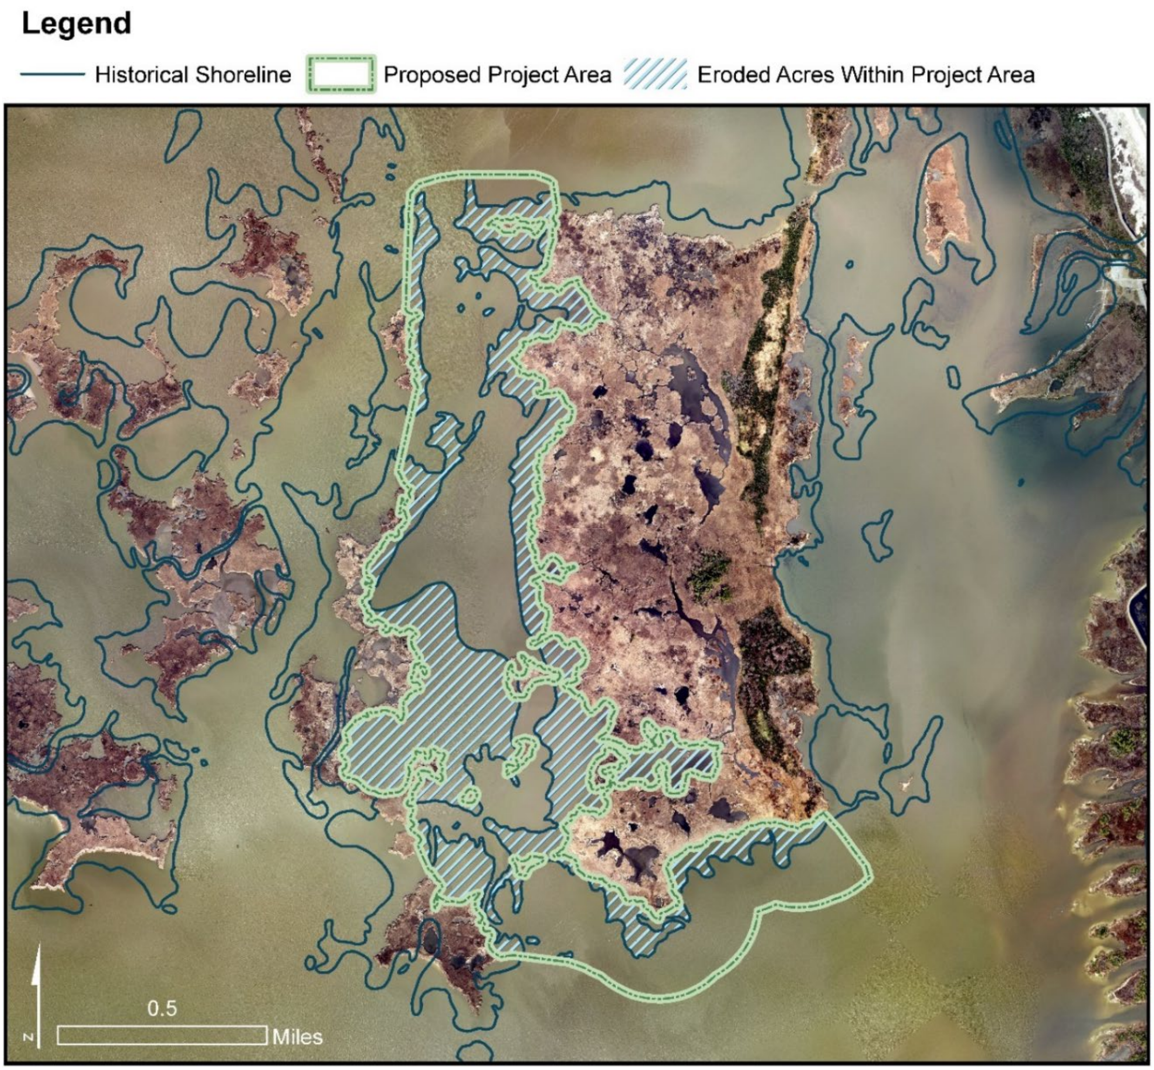

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

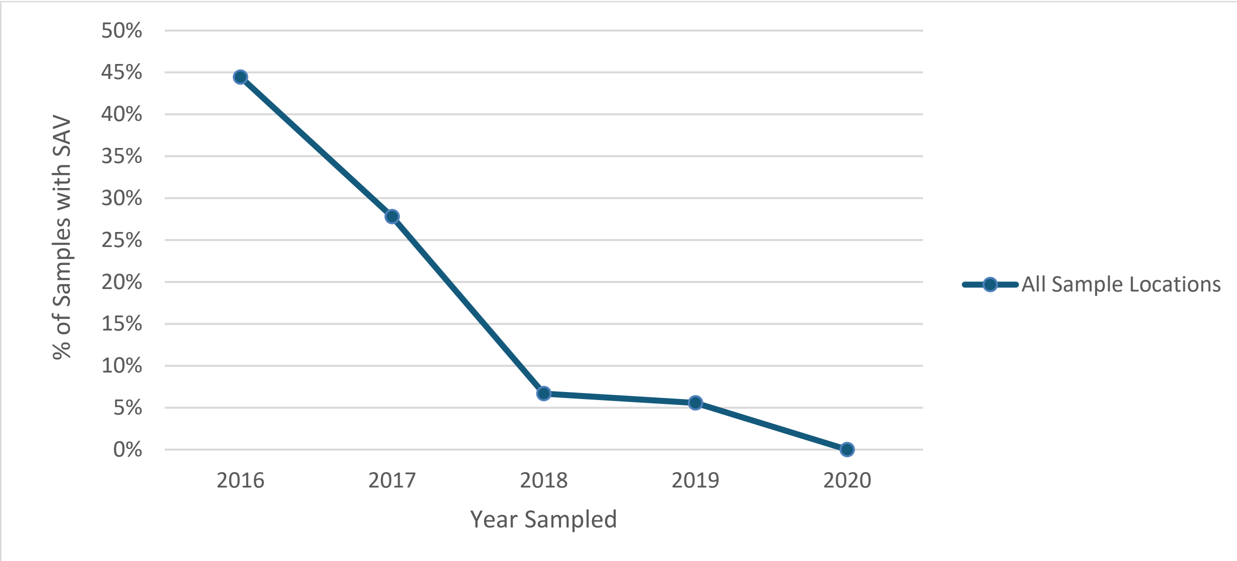

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

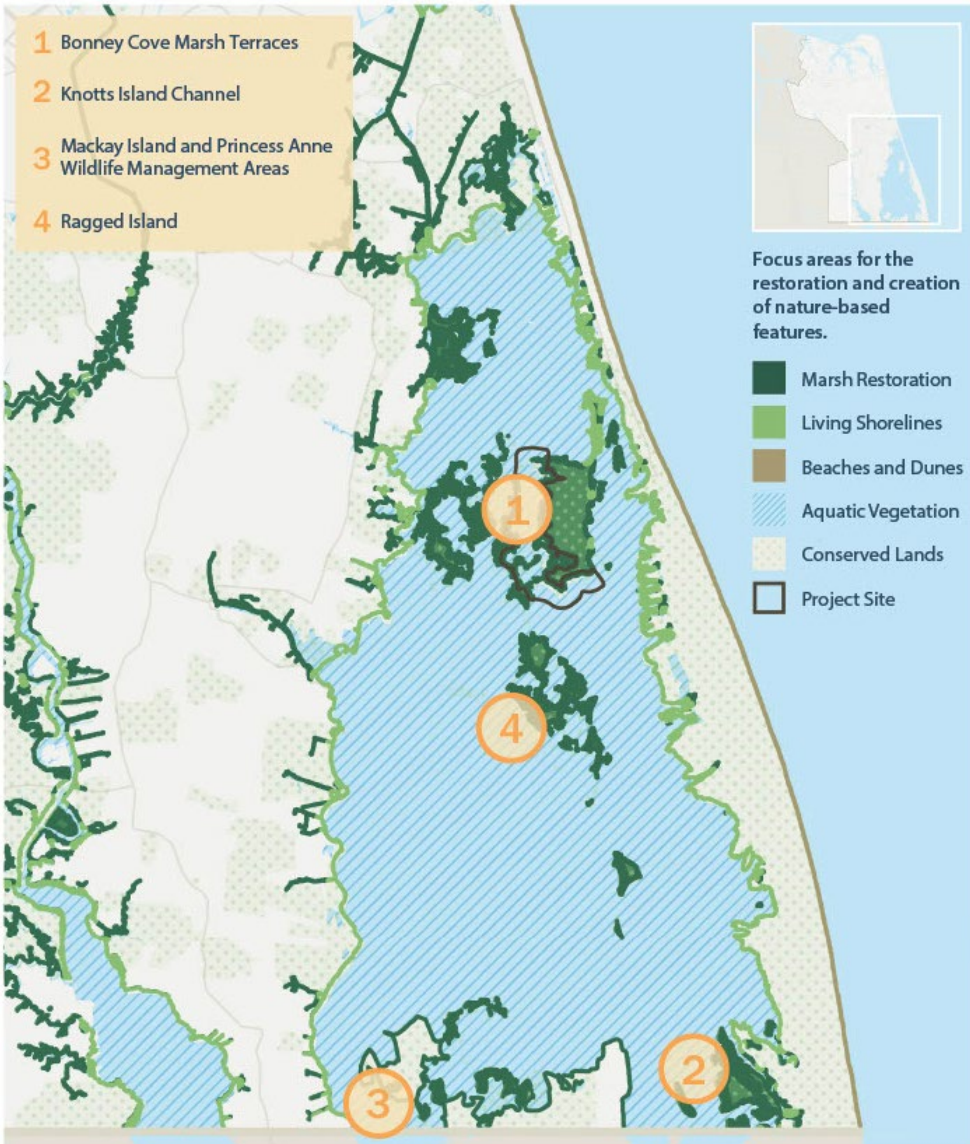

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

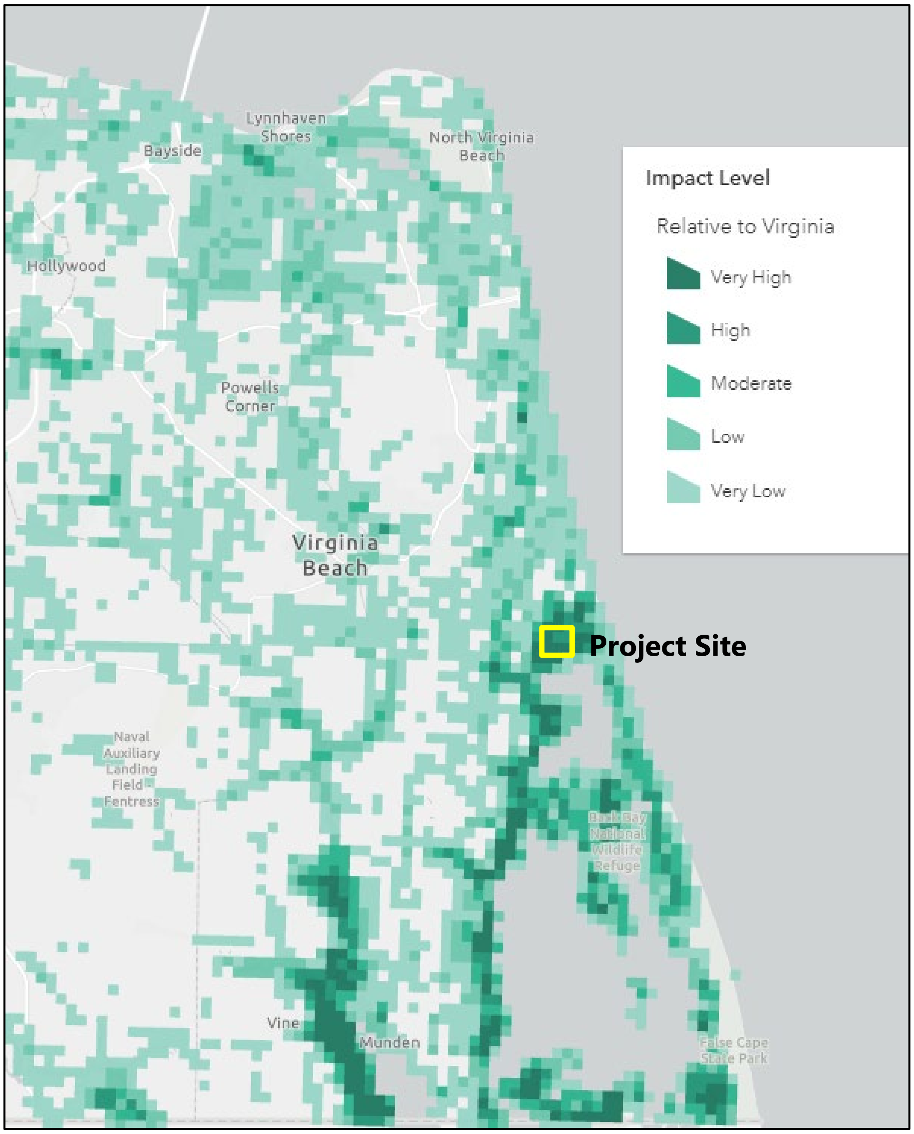

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

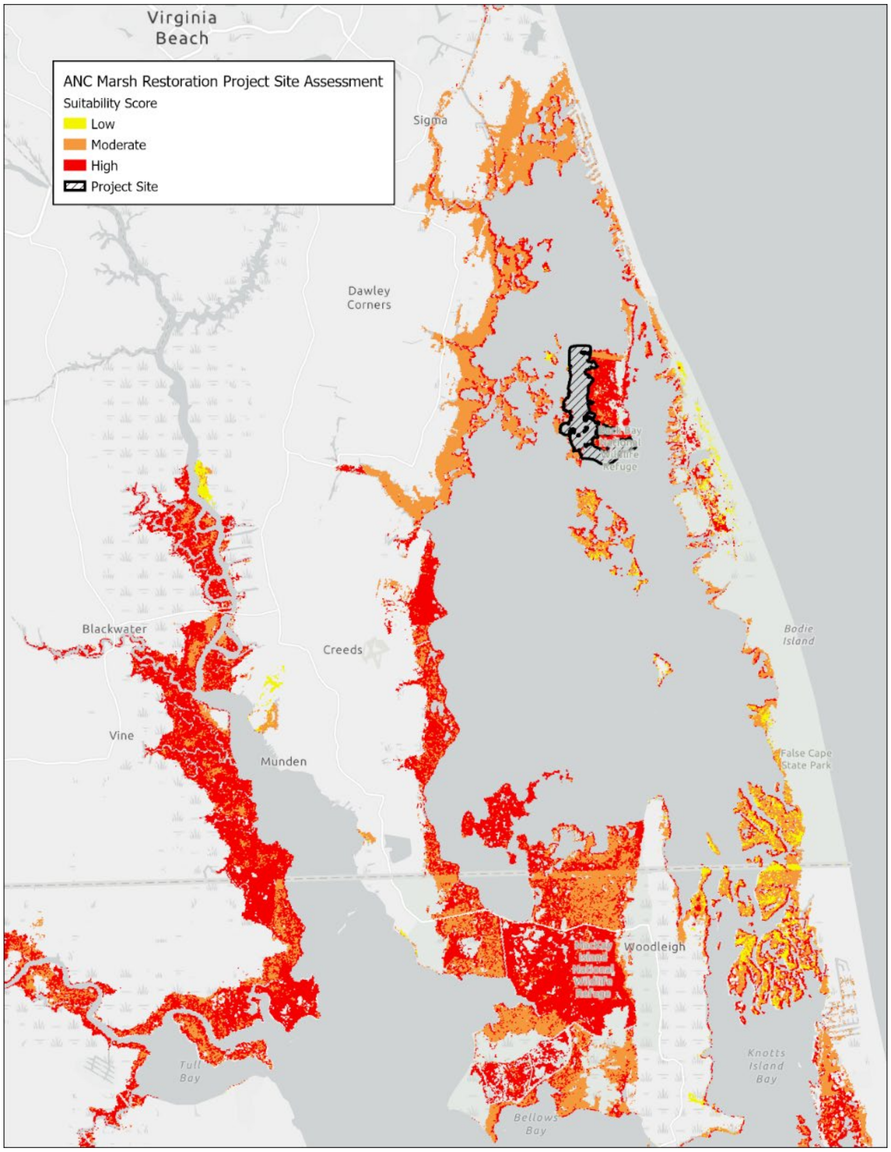

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

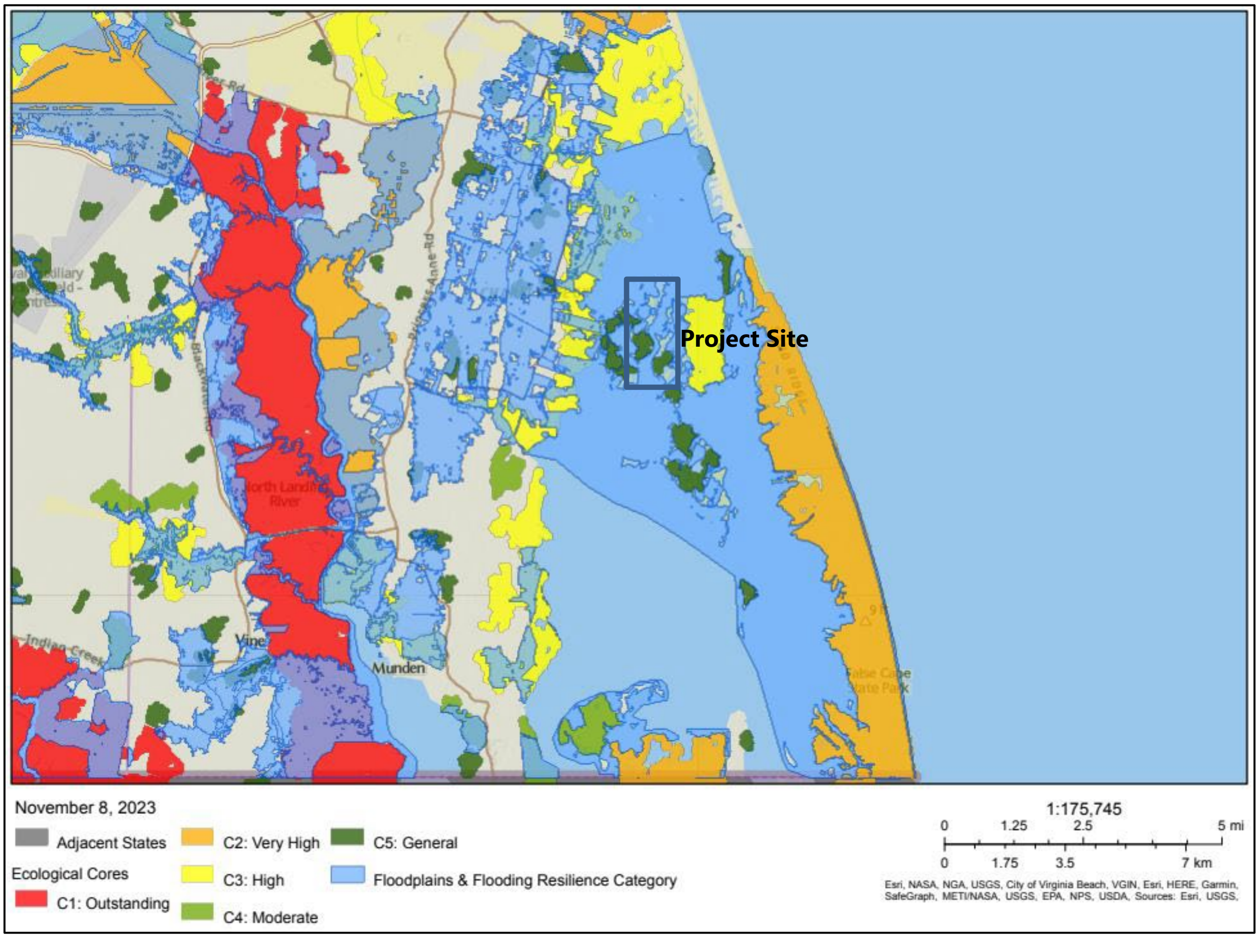

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

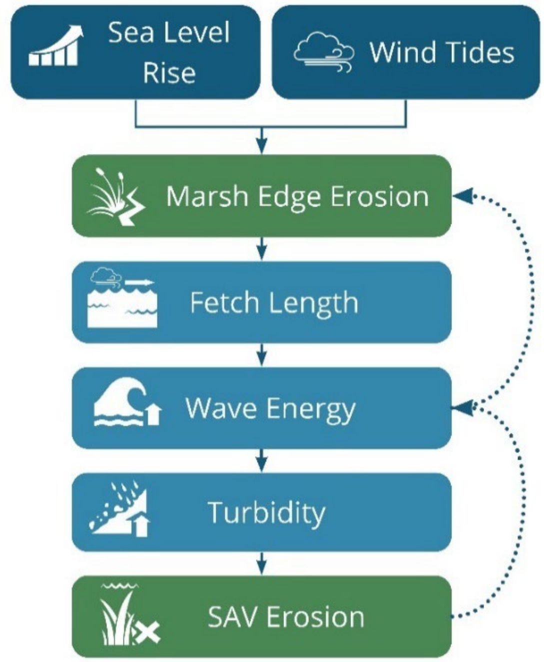

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

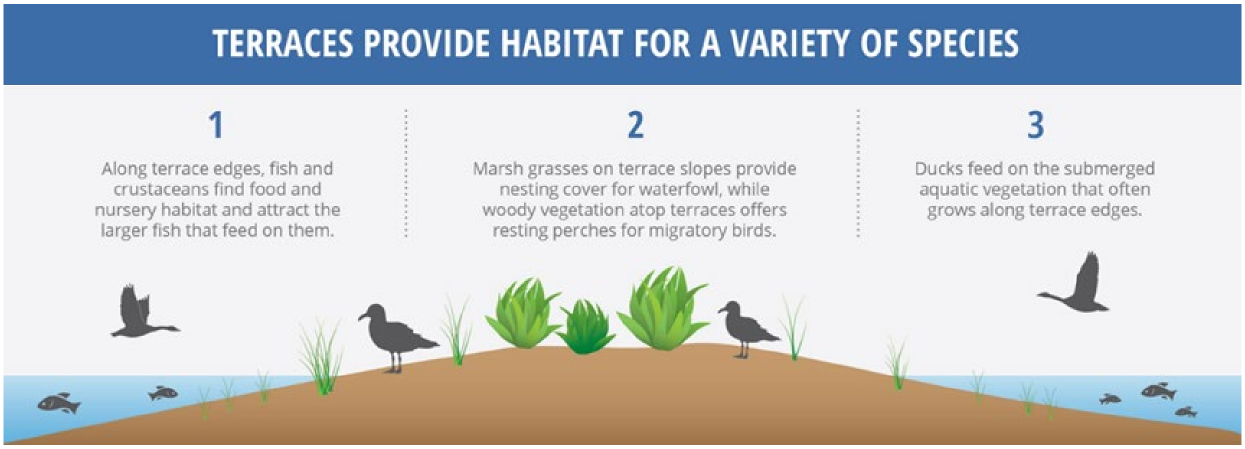

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

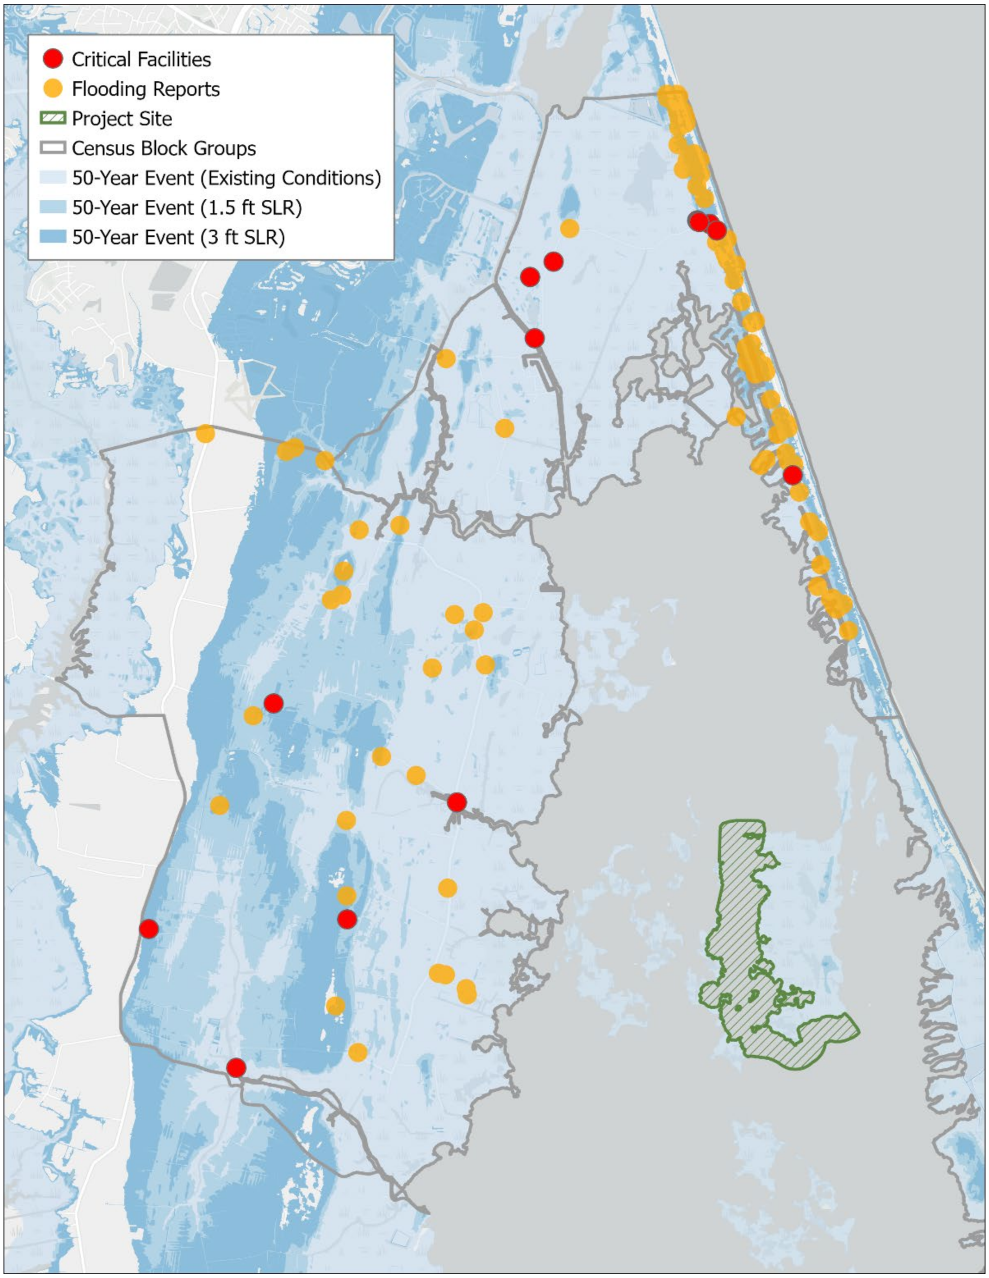

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

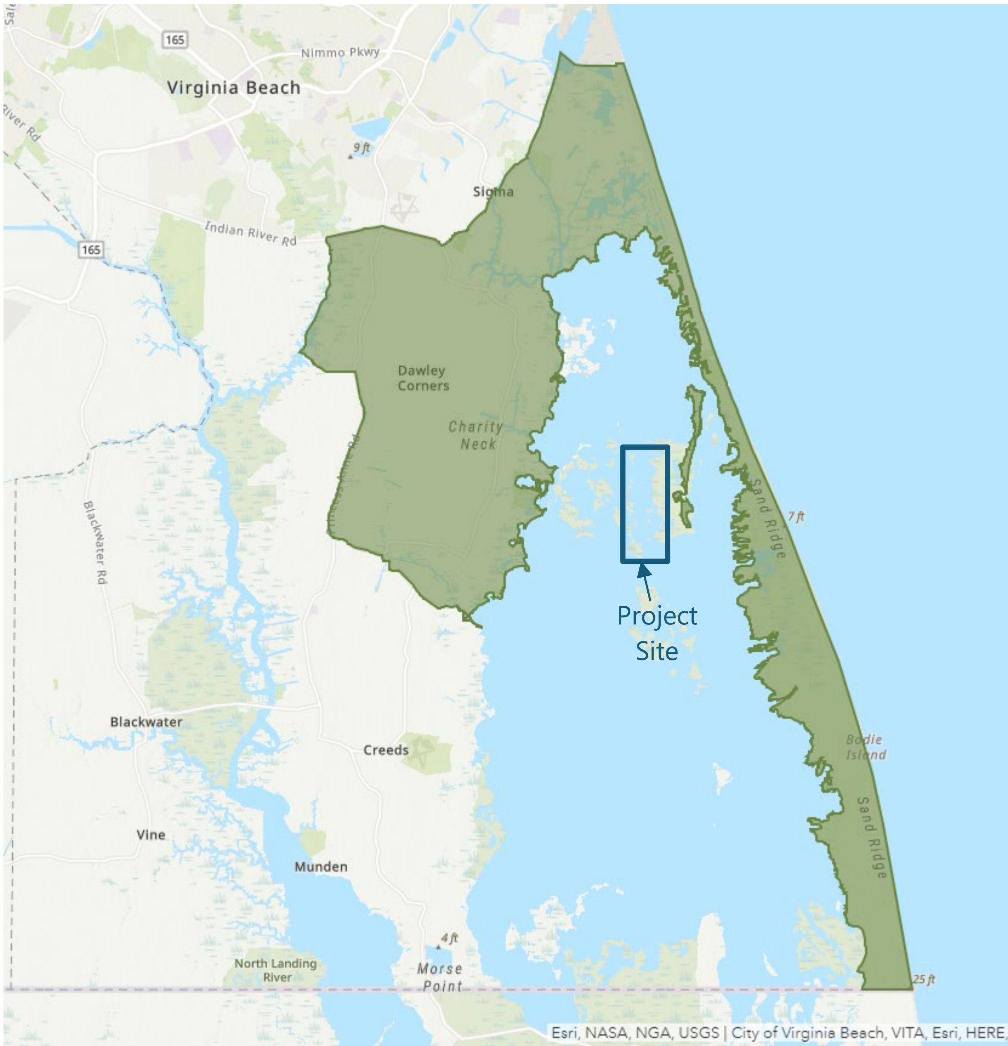

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

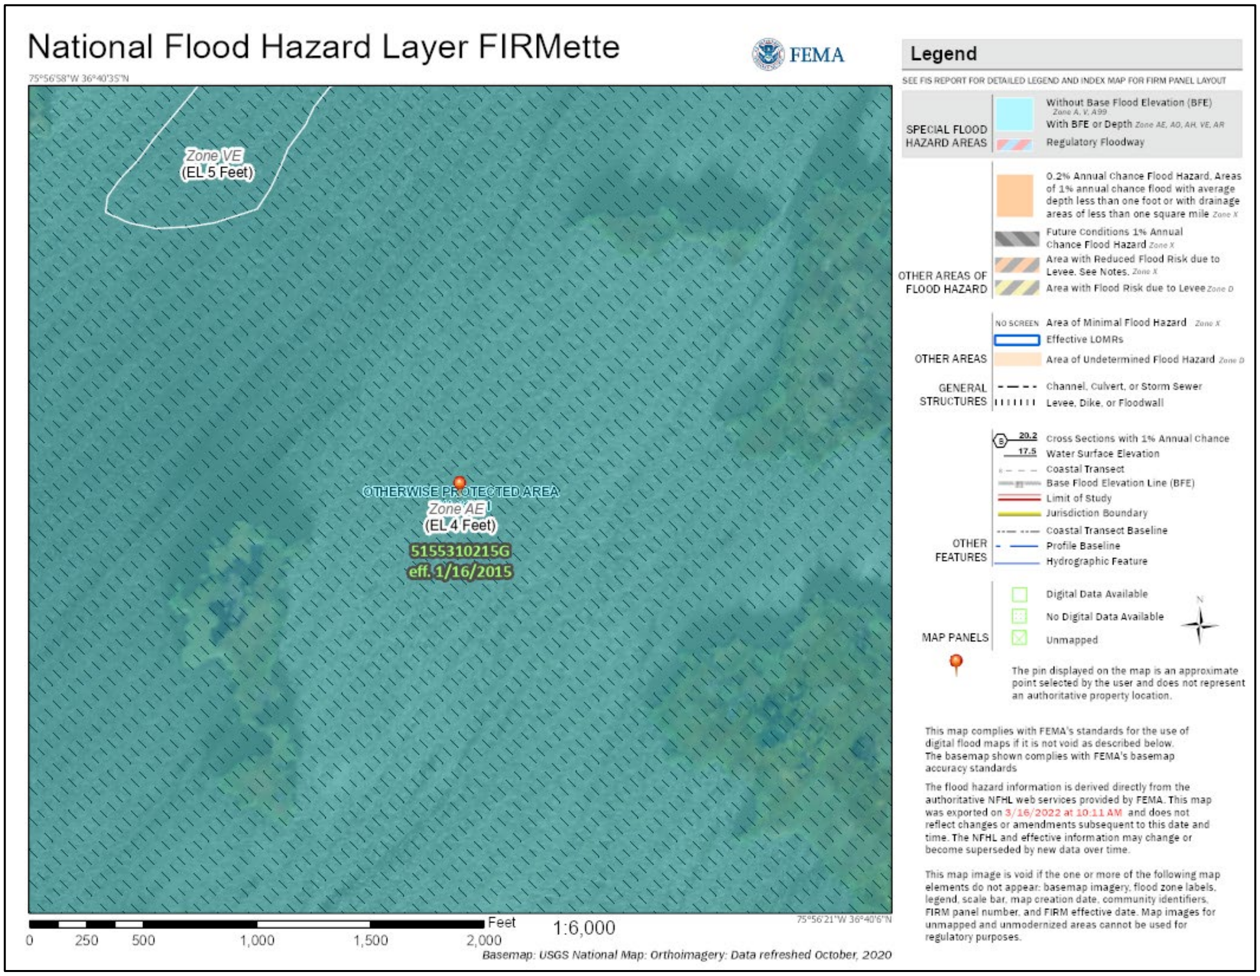

Figure 15: FIRMette for the project area (northern boundary).

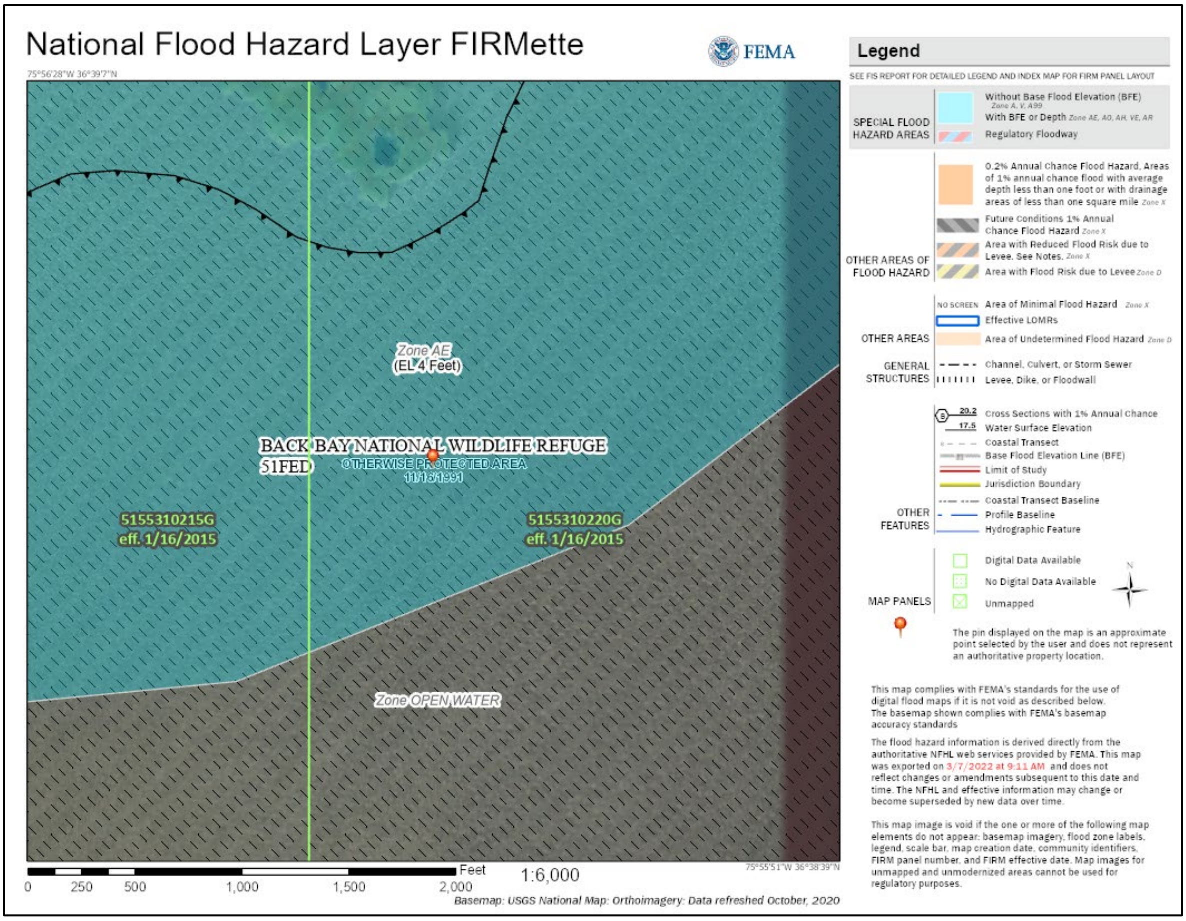

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

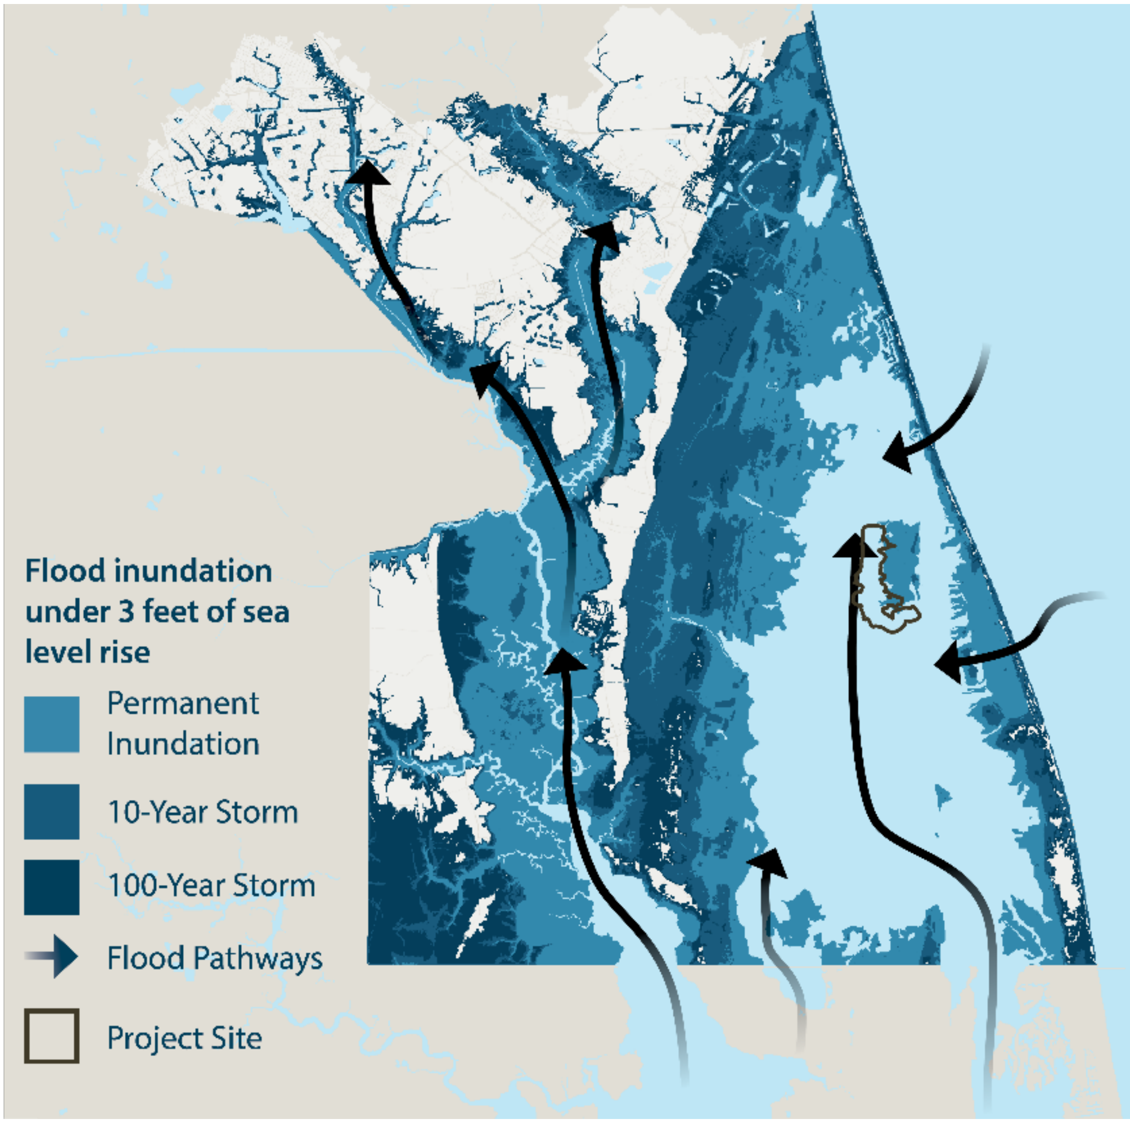

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

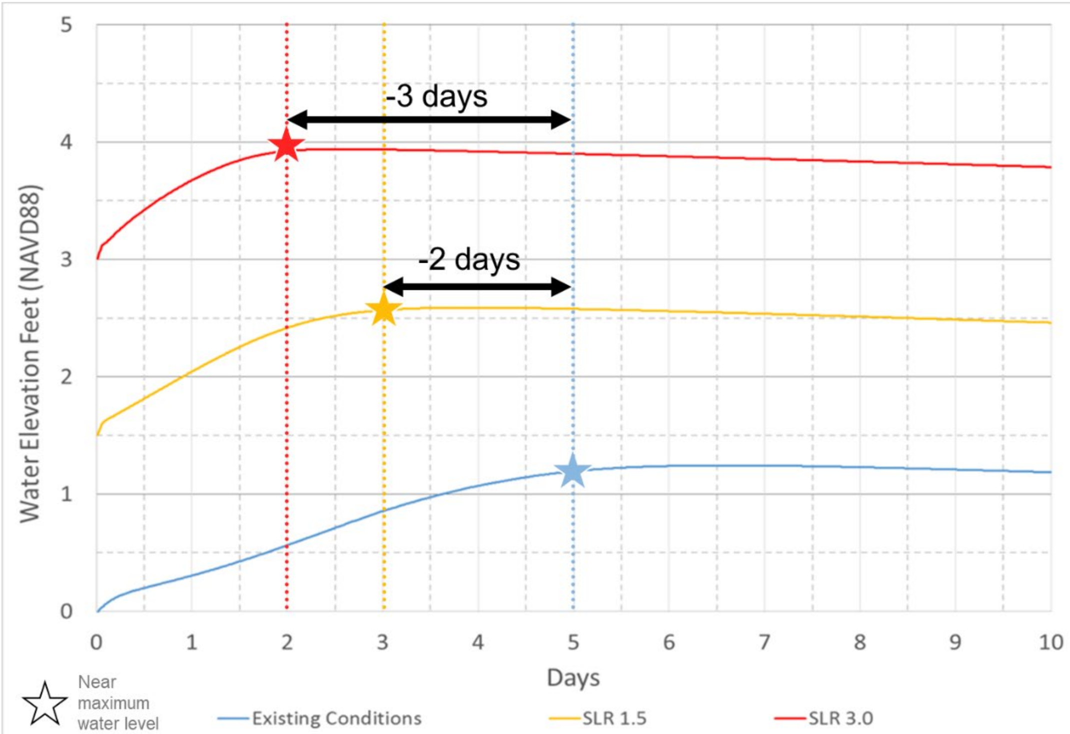

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

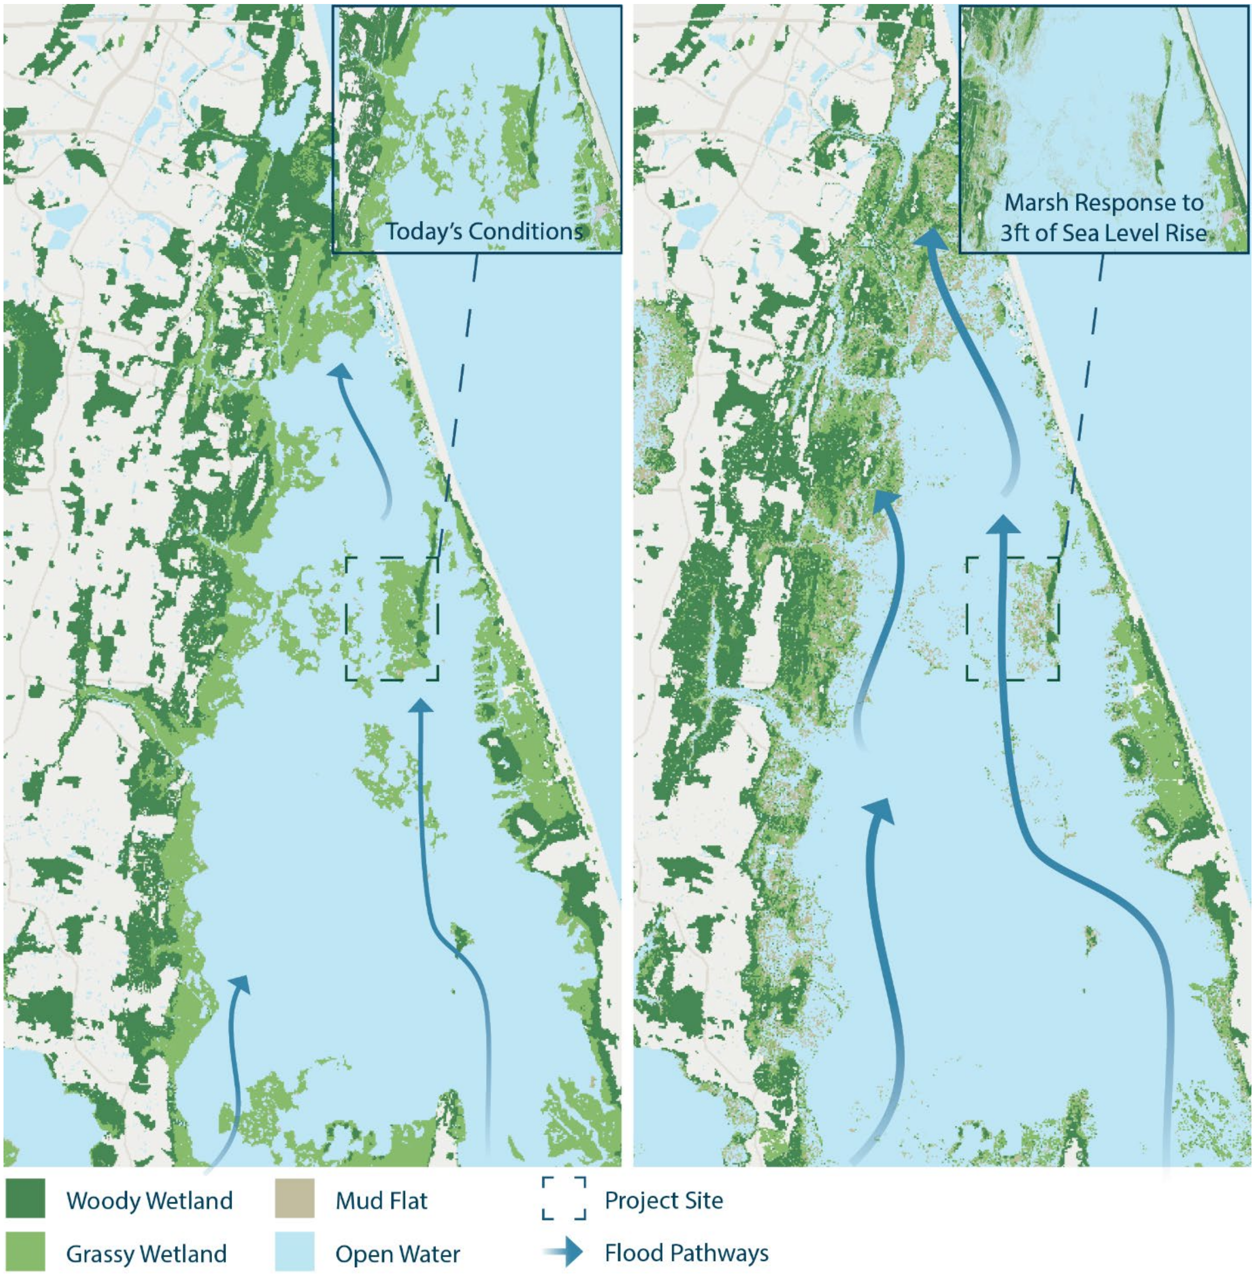

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

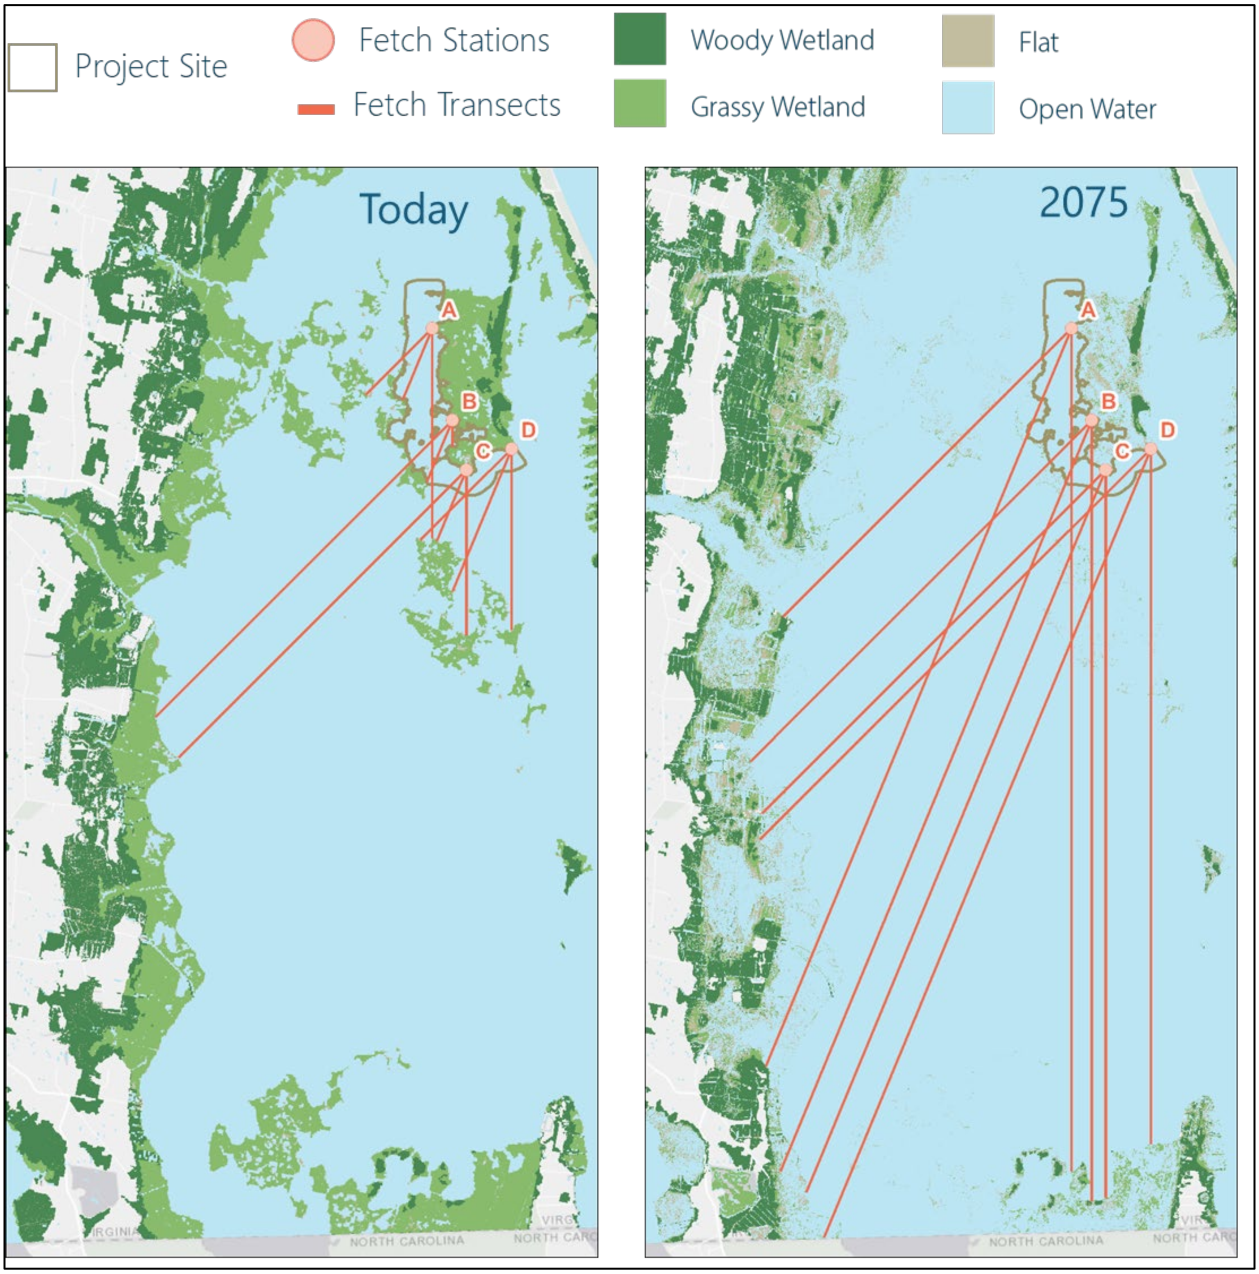

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

---

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

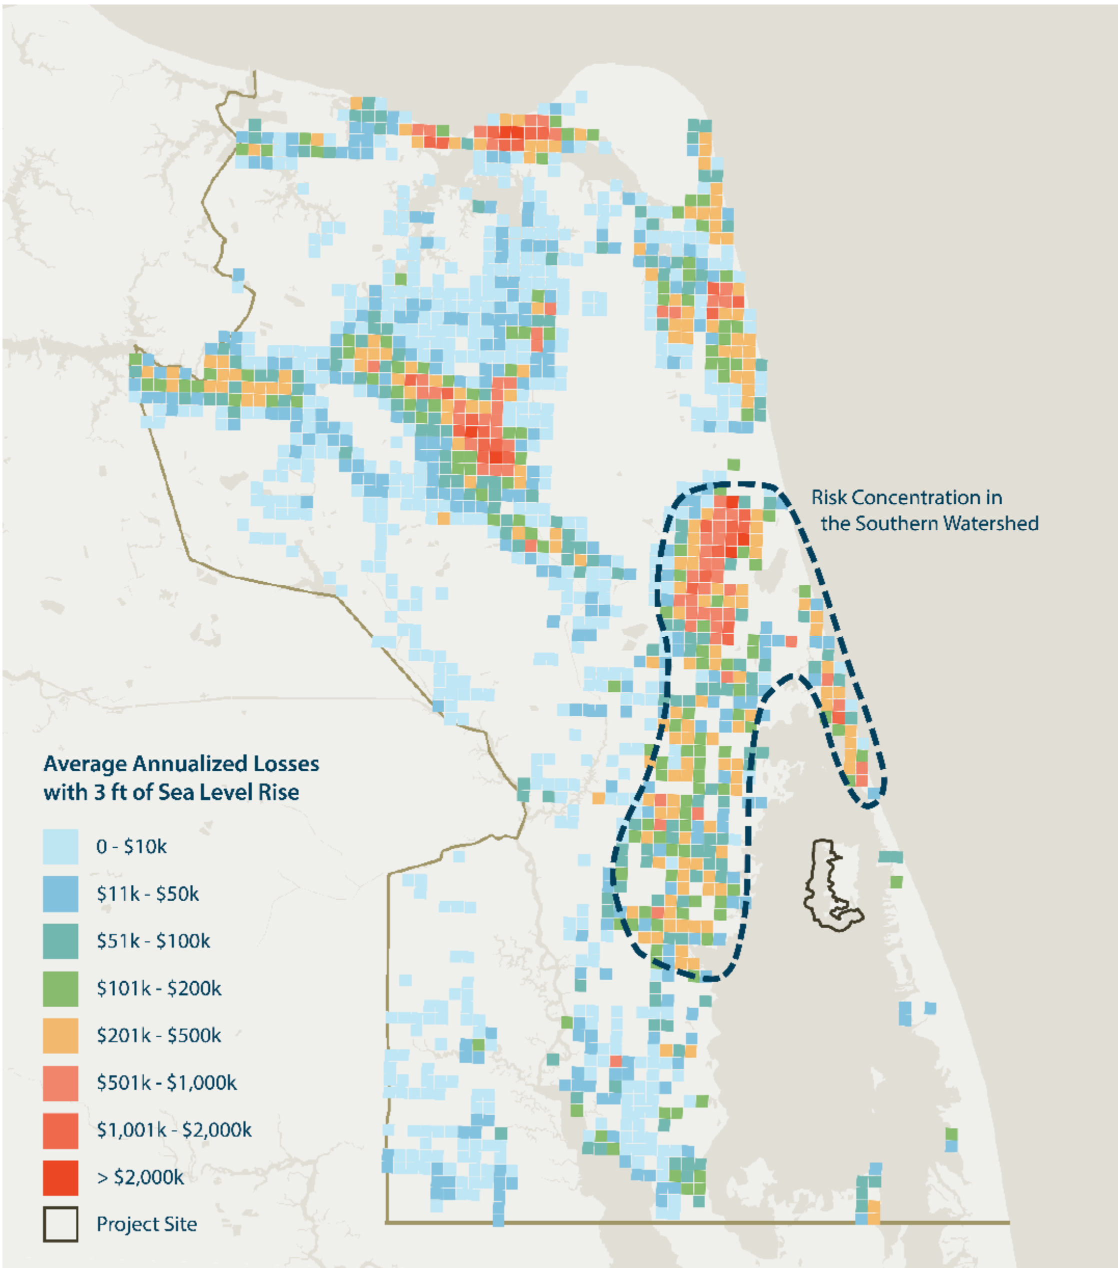

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

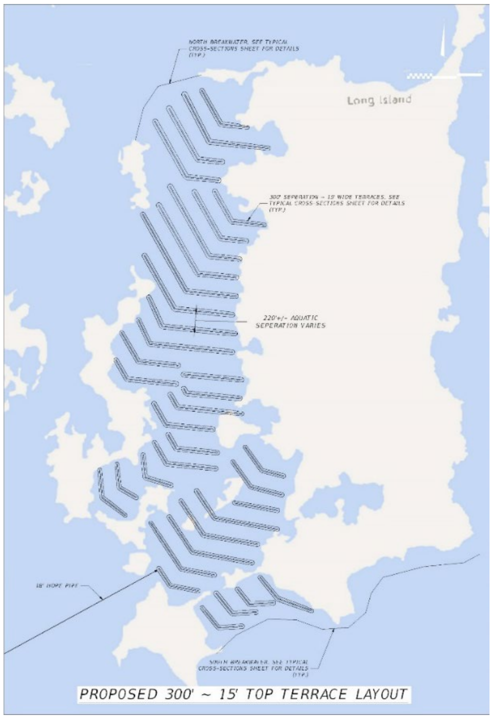

Figure 22: Alternative 2a.

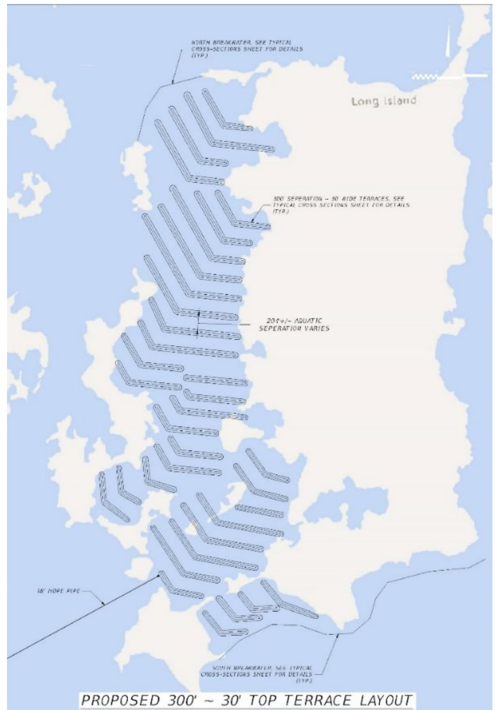

Figure 23: Alternative 2b.

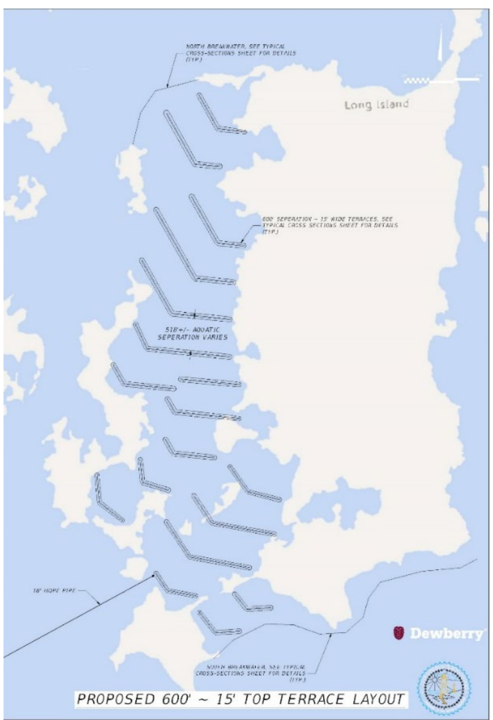

Figure 24: Alternative 2c.

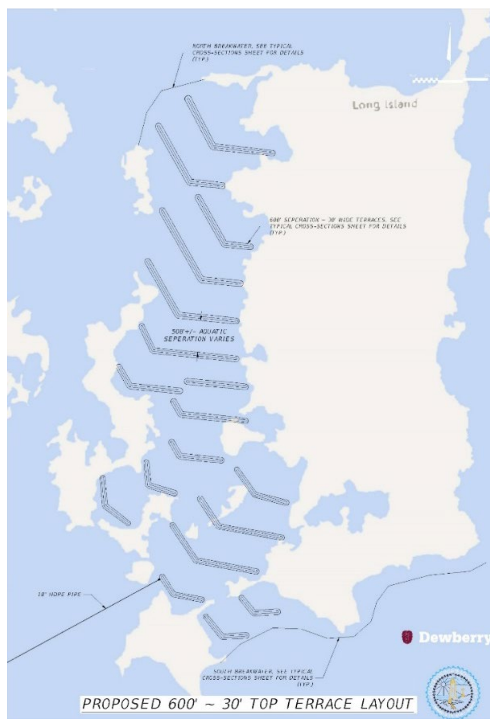

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

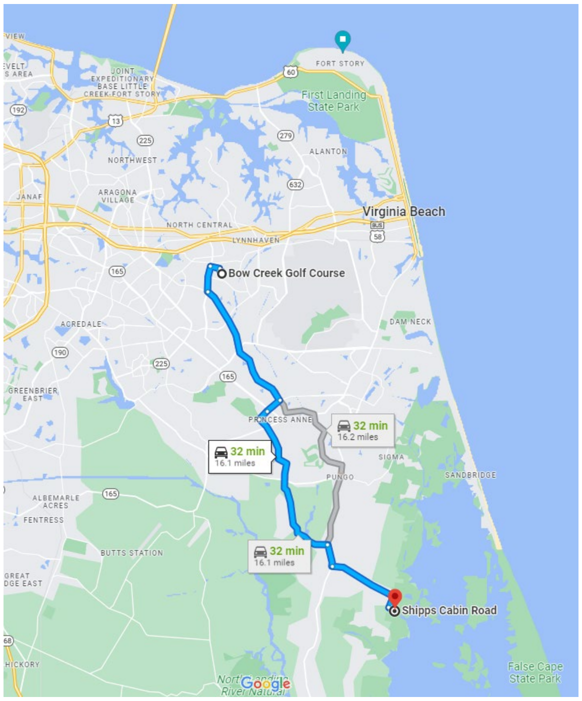

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

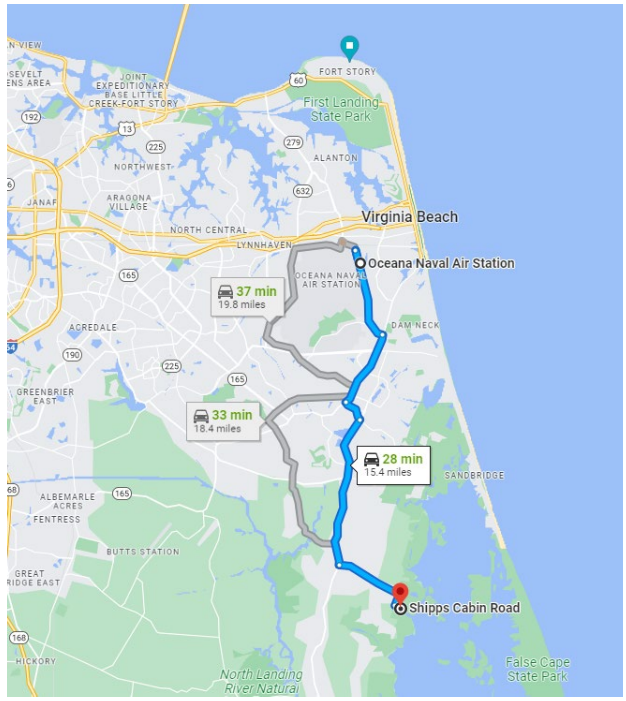

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

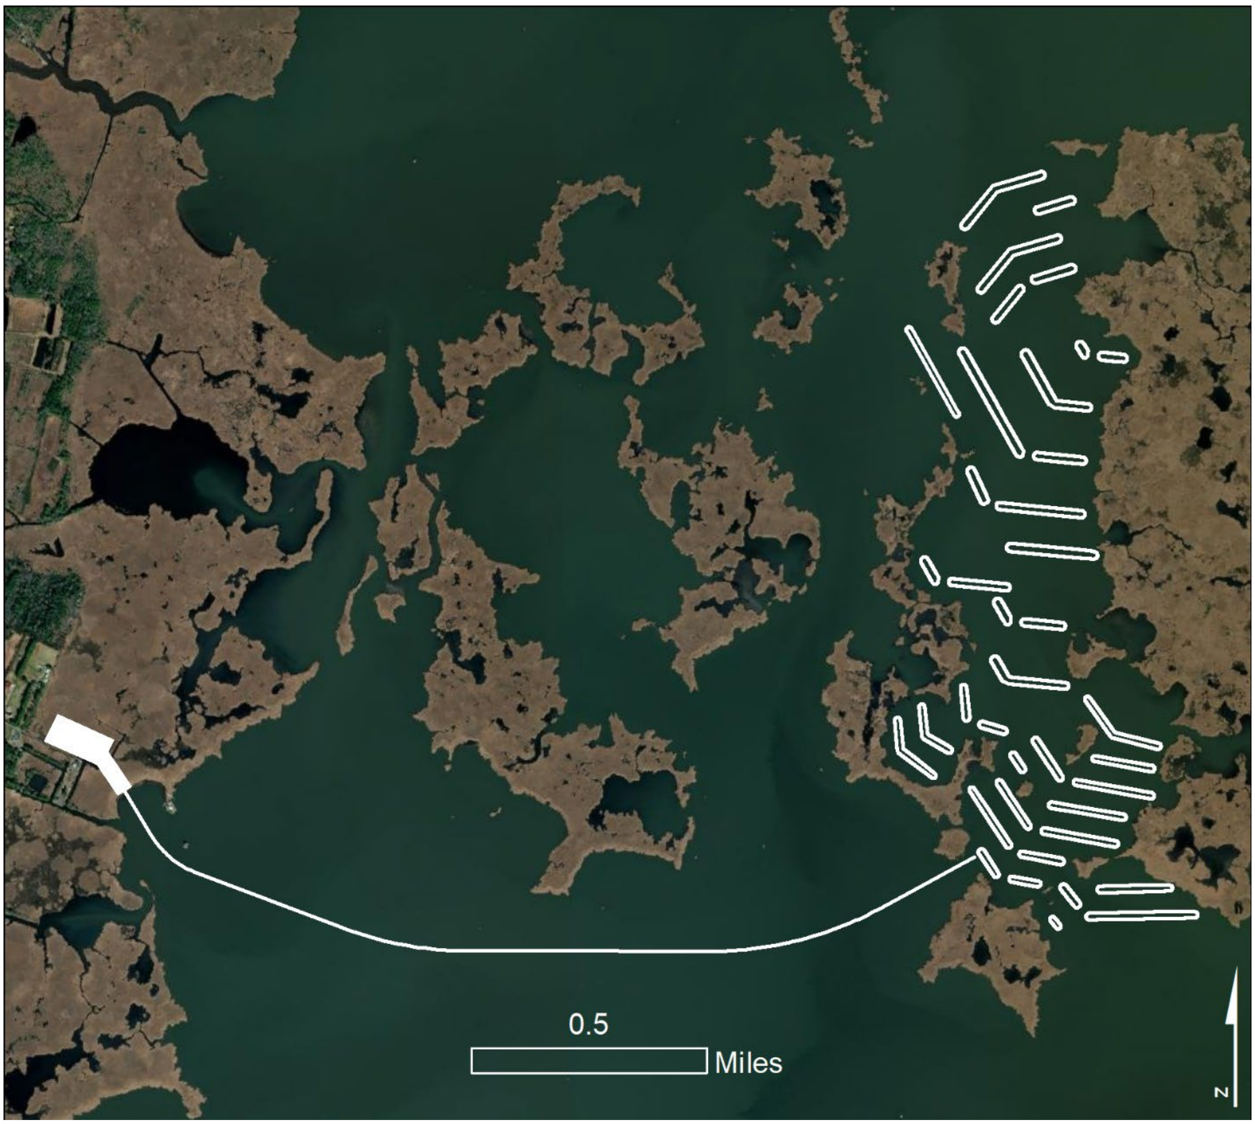

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

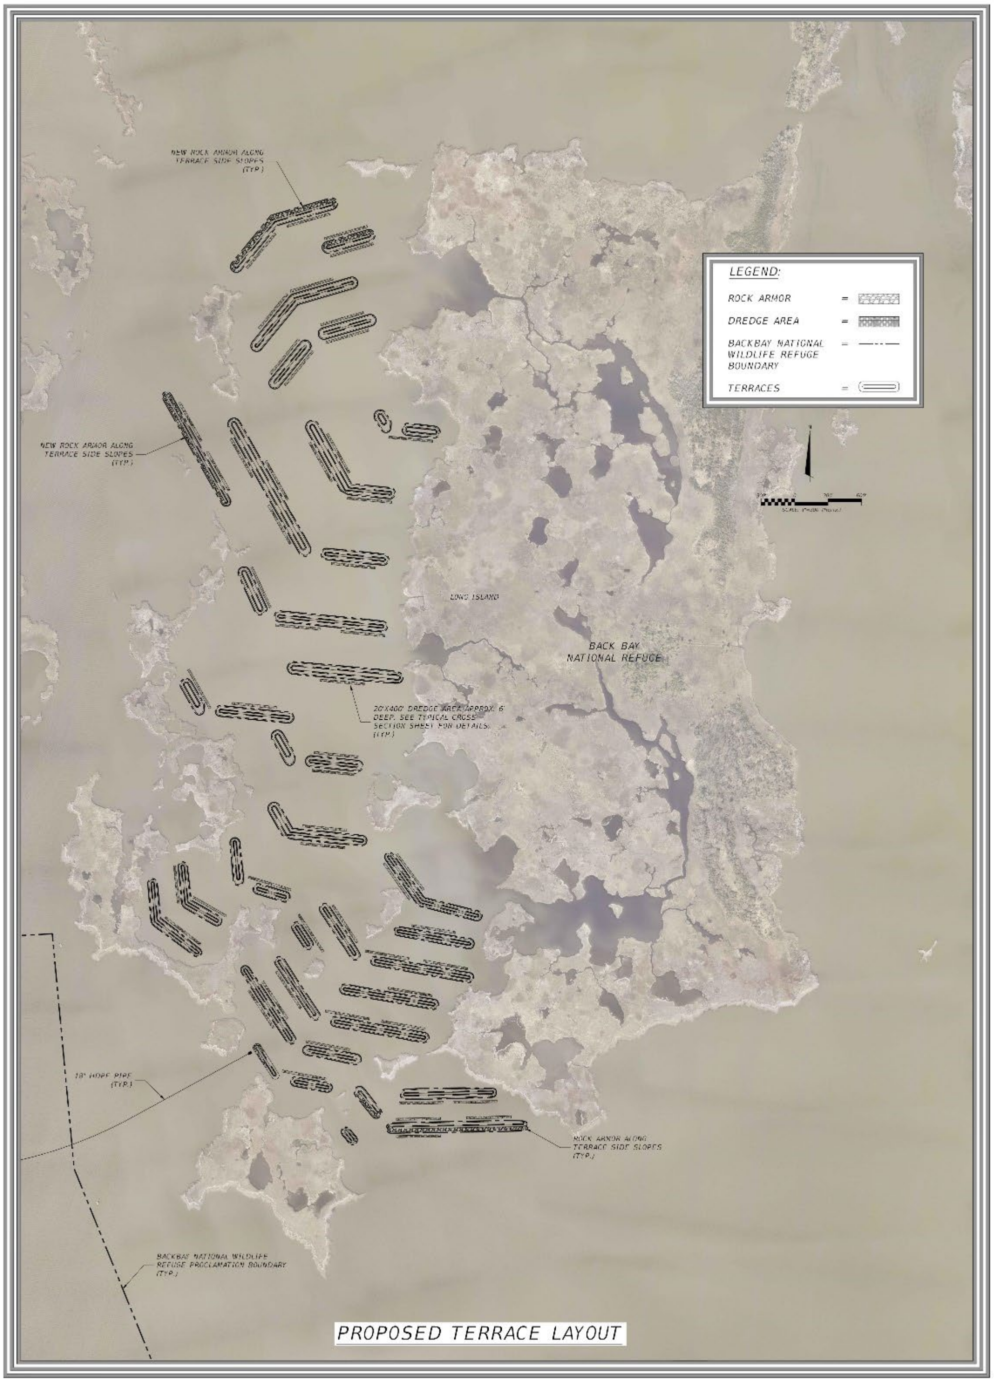

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

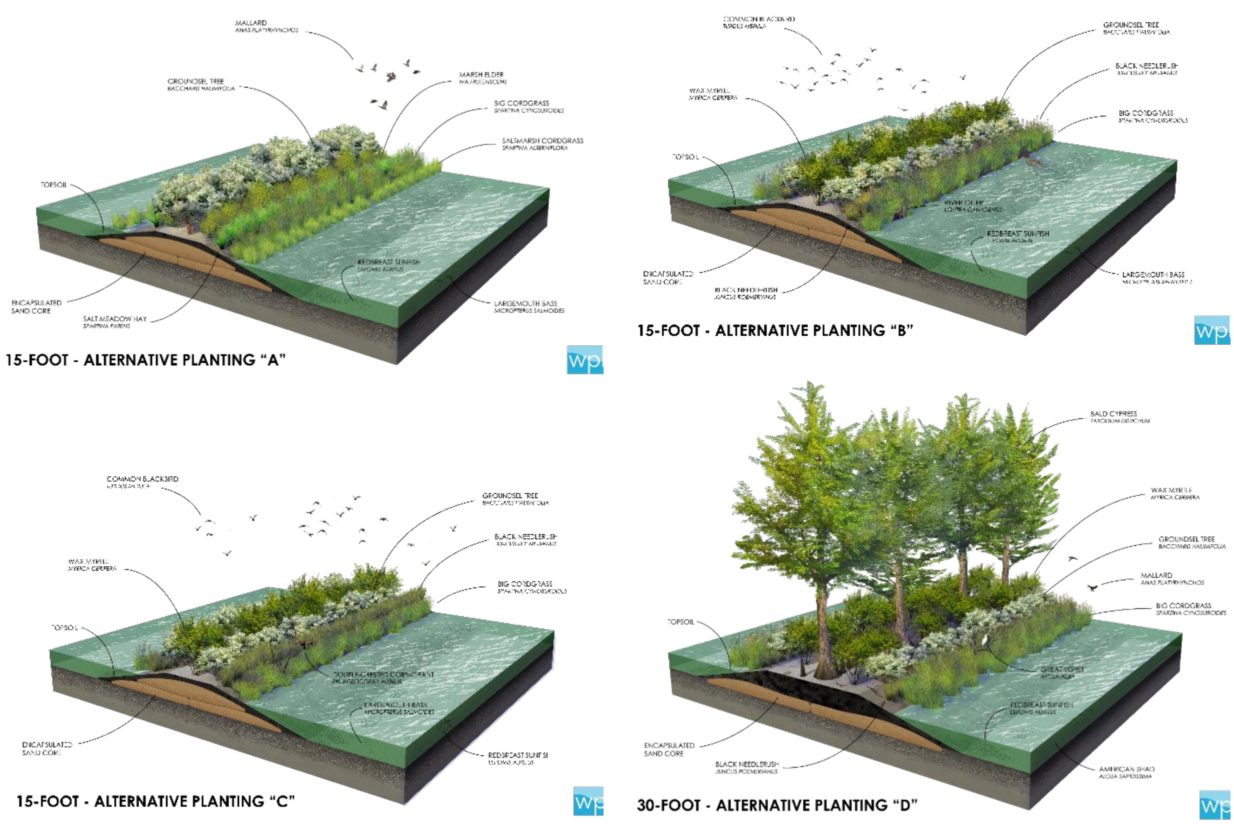

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter **(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

  - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

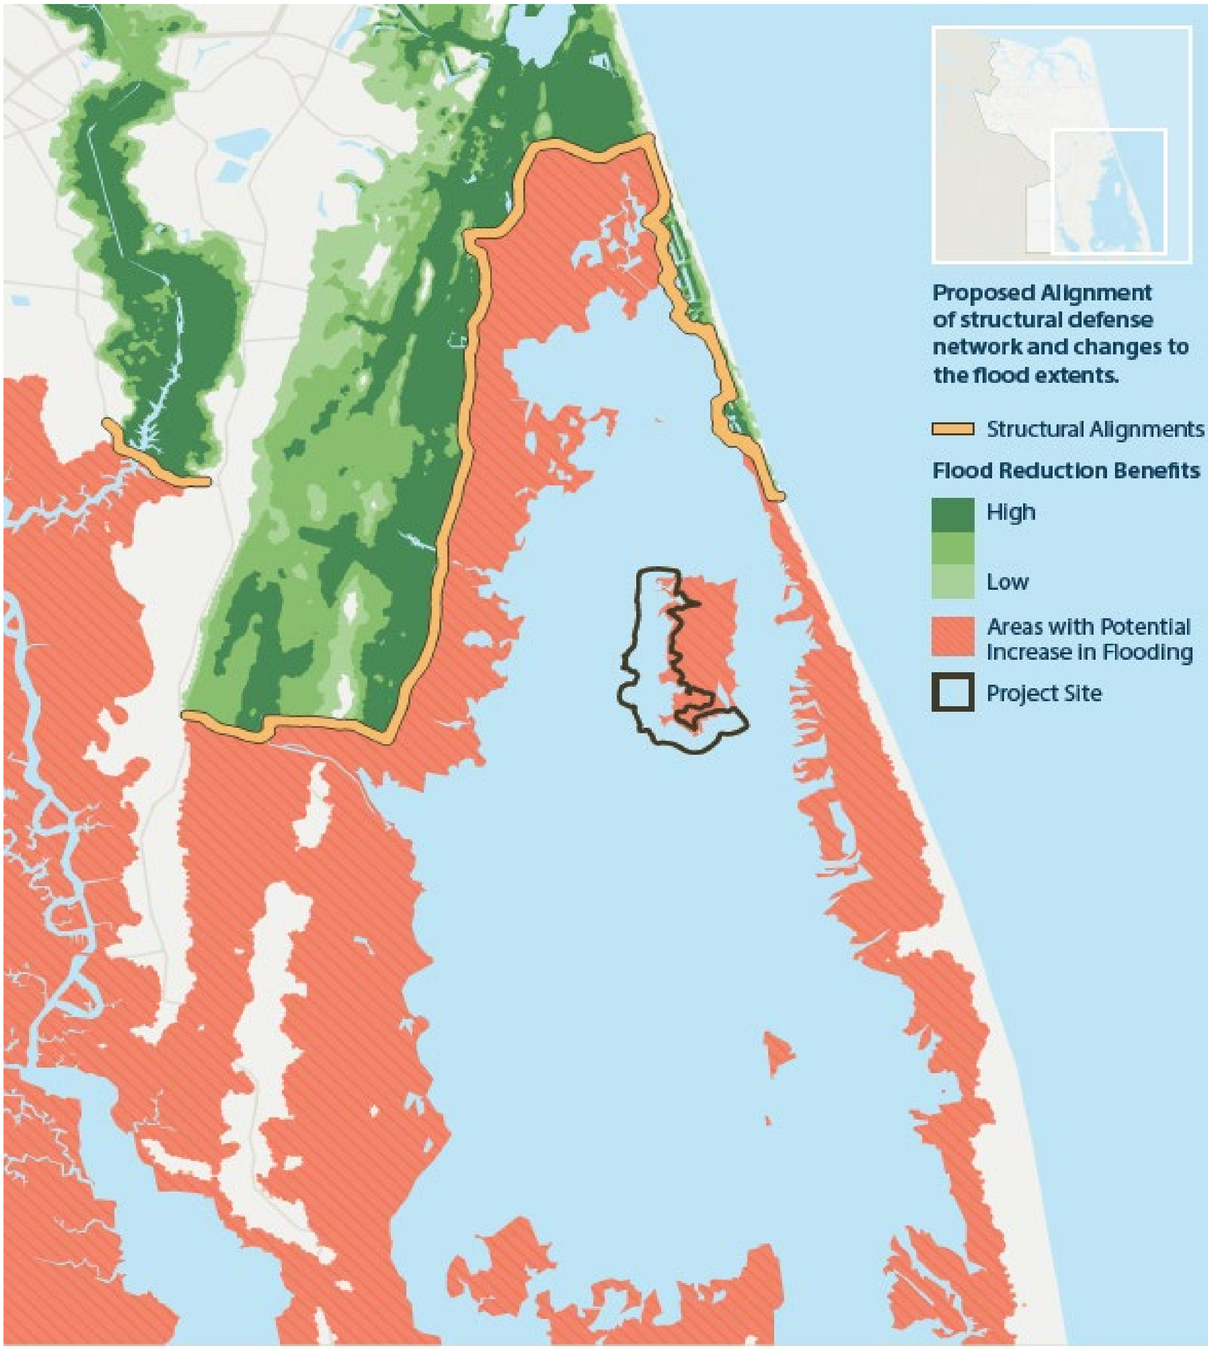

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements.   As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with discrete projects identified.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell Jr.

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence<u> and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan</u>.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ <u>at risk of flooding by the City of Virginia Beach or shown</u> ~~according to~~ <u>on </u>the Flood Insurance Rate Map (FIRM) <u>or included on the flood insurance study (FIS)</u> that ~~is~~ <u>are</u> provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

<u>*Design Flood Elevation (regulatory flood protection elevation)*. The base flood elevation plus the freeboard required by this ordinance.</u>

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ <u>Reserved.</u>

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C. The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1. Public and private outdoor recreational facilities;~~

~~2. Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3. Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

~~4.~~ ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

~~5.~~ ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

~~6.~~ ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

~~a.~~ ~~Only one (1) such stand shall be permitted per lot;~~

~~b.~~ ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

~~c.~~ ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C.~~ ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty (\$~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

    a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

    b. Comply with the Public Works Design Standards Manual; and

    c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

Attachment 6: Copy of Monitoring/Maintenance Plan

[DRAFT] Annual Monitoring Plan and Post-Construction Monitoring Report

Marsh Restoration in Back Bay, Virginia Beach, VA

Prepared by: Dewberry Engineers, Inc.

[July 6, 2023]

[REPORT VERSION [DRAFT]]

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

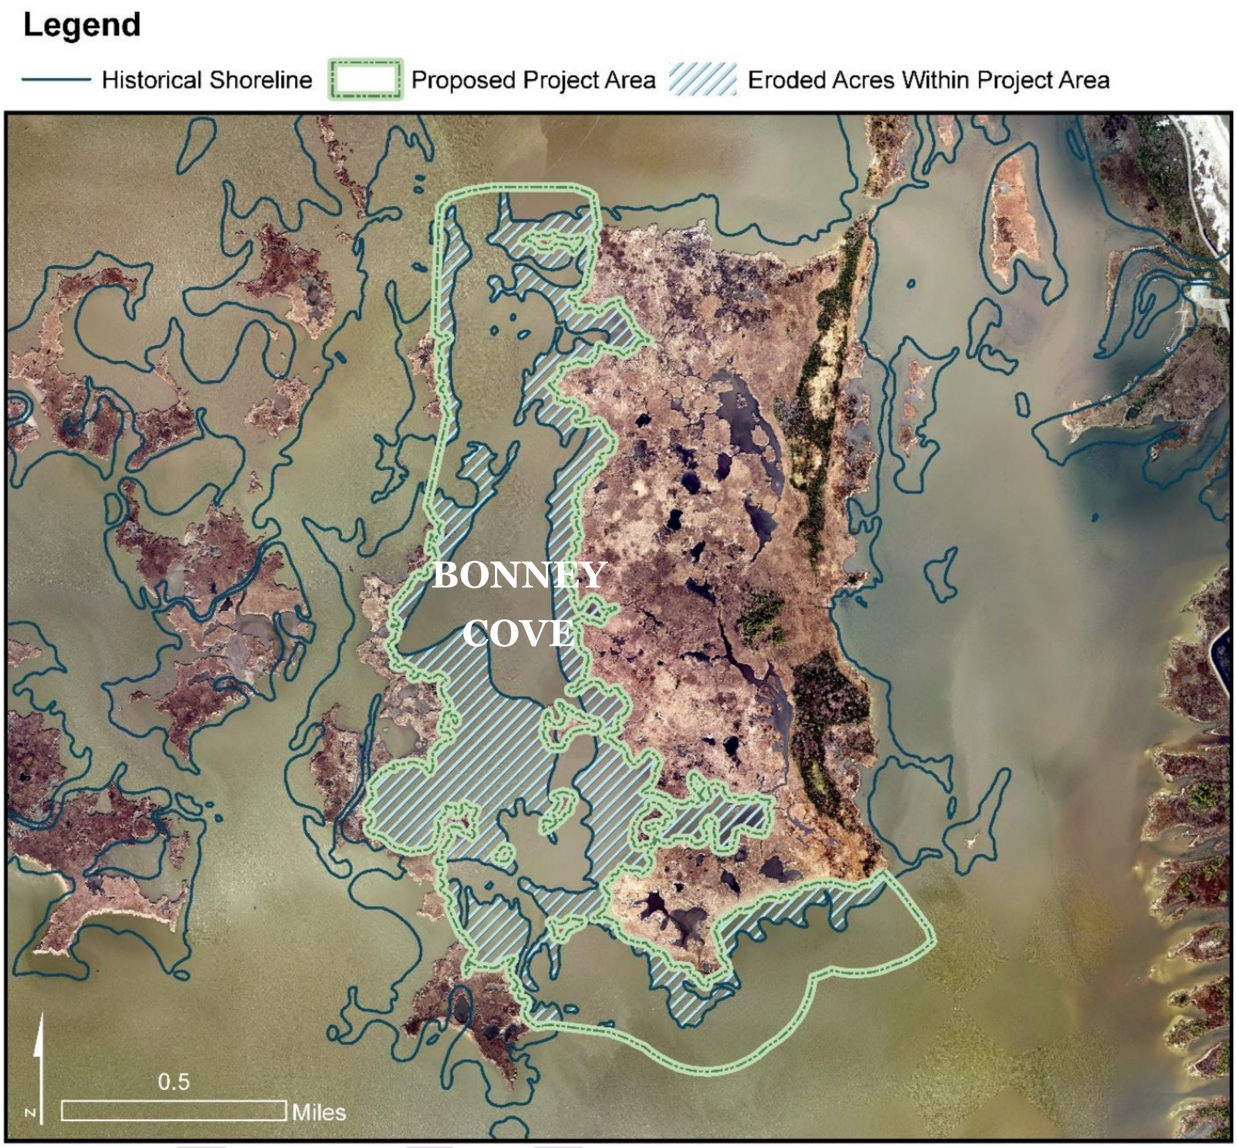

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

---

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

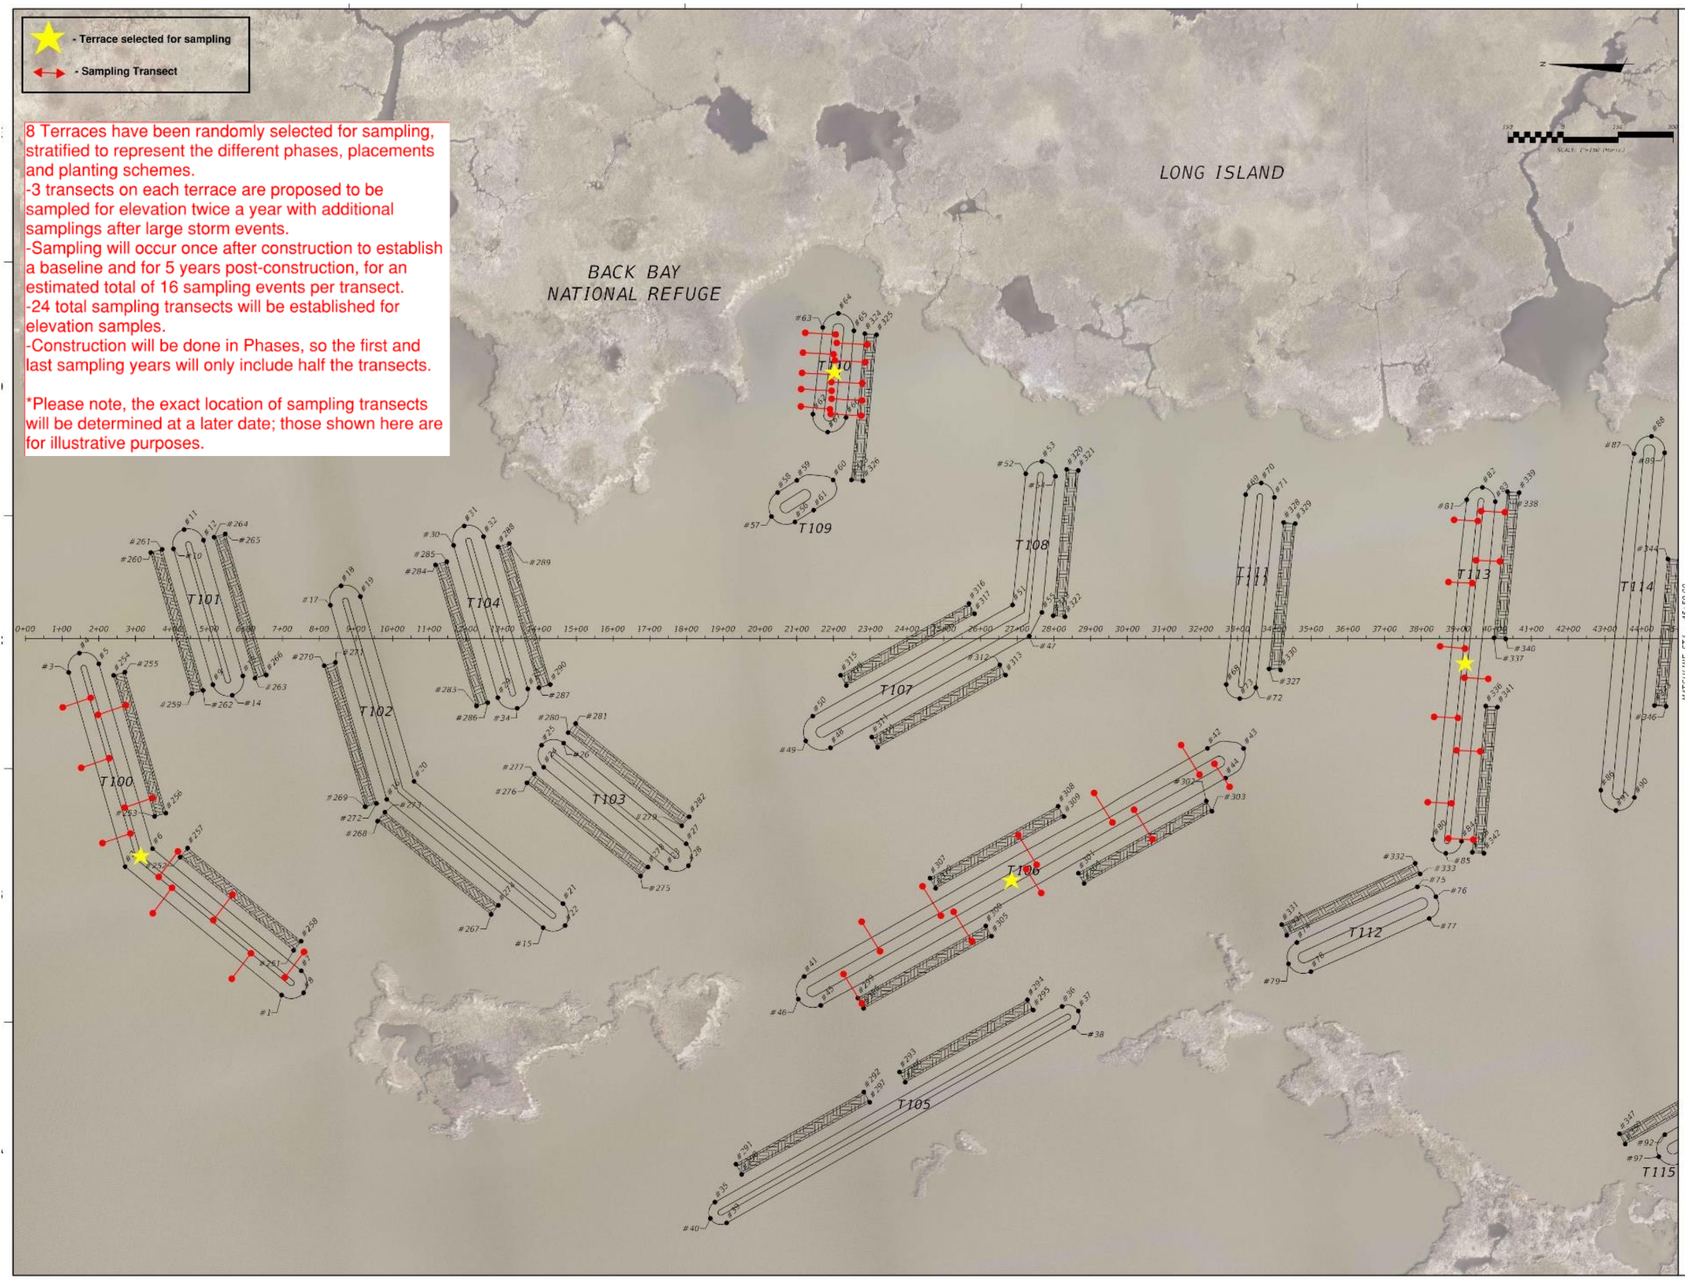

Figure 3: Monitoring design site plan – North Terraces

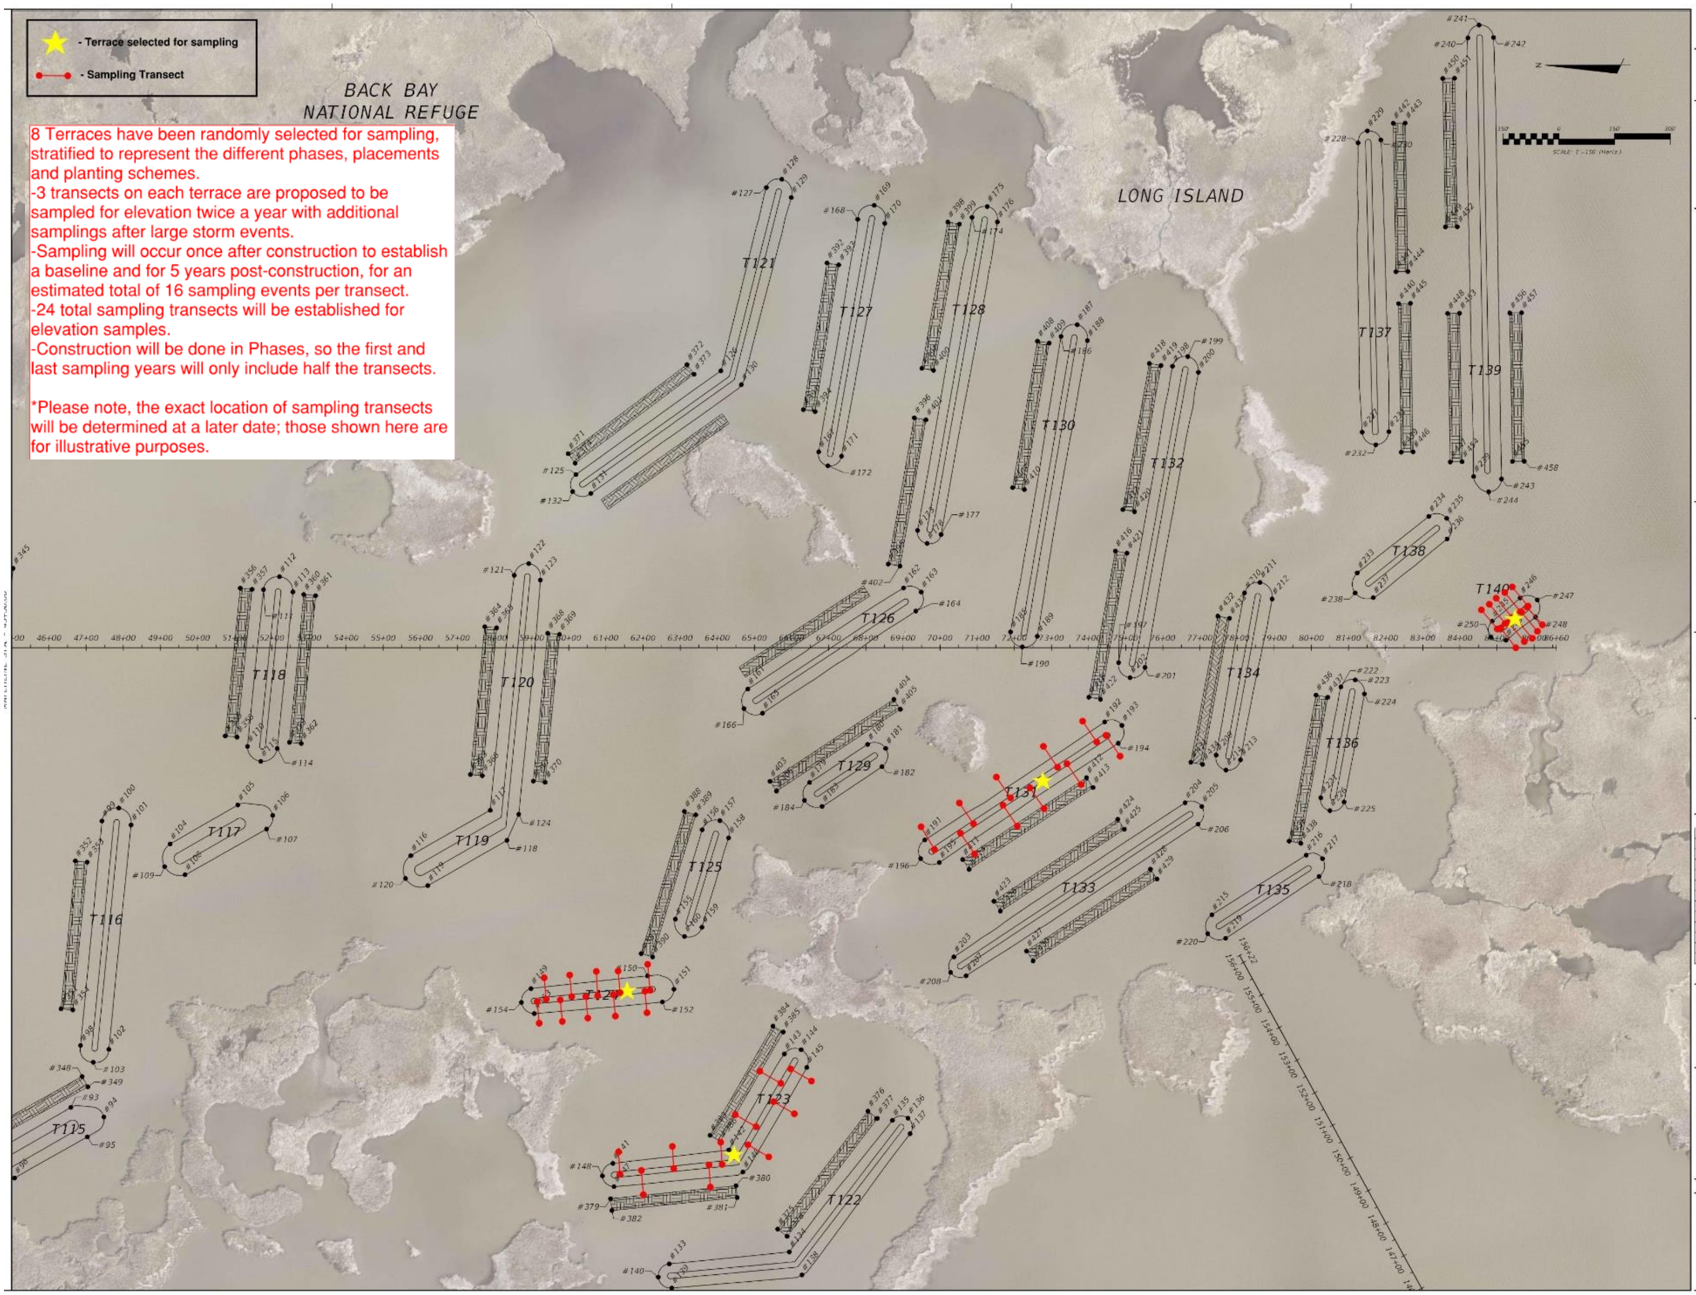

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

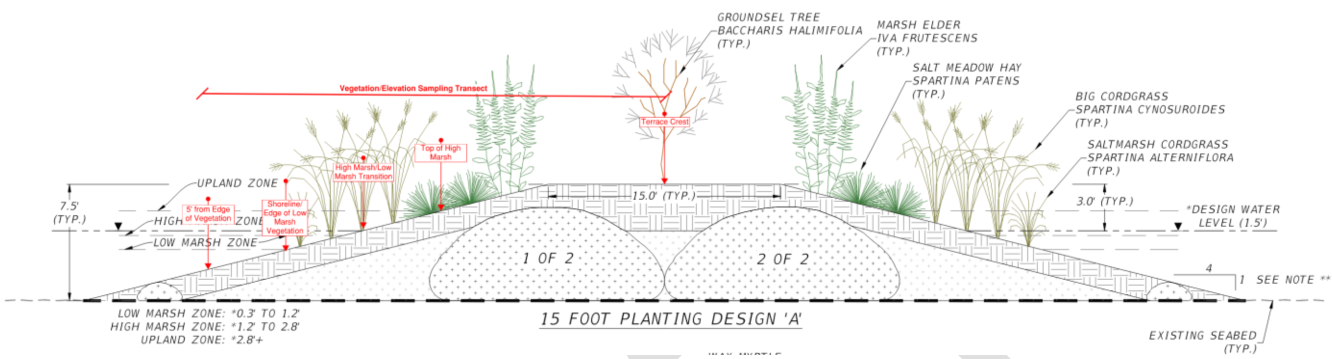

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023									
Grand Total State Funding Request									$ 5,000,000
Grand Total Local Share of Project									$ 38,356,966
National Fish and Wildlife Foundation Grants Federal Funding (if applicable)									$ 10,021,524
Project Grand Total									$ 53,378,490
Locality Cost Match									% 71.85
Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

2023 Virginia Community Flood Preparedness Fund

Marsh Restoration in Back Bay, Virginia Beach

CITY OF VIRGINIA BEACH

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

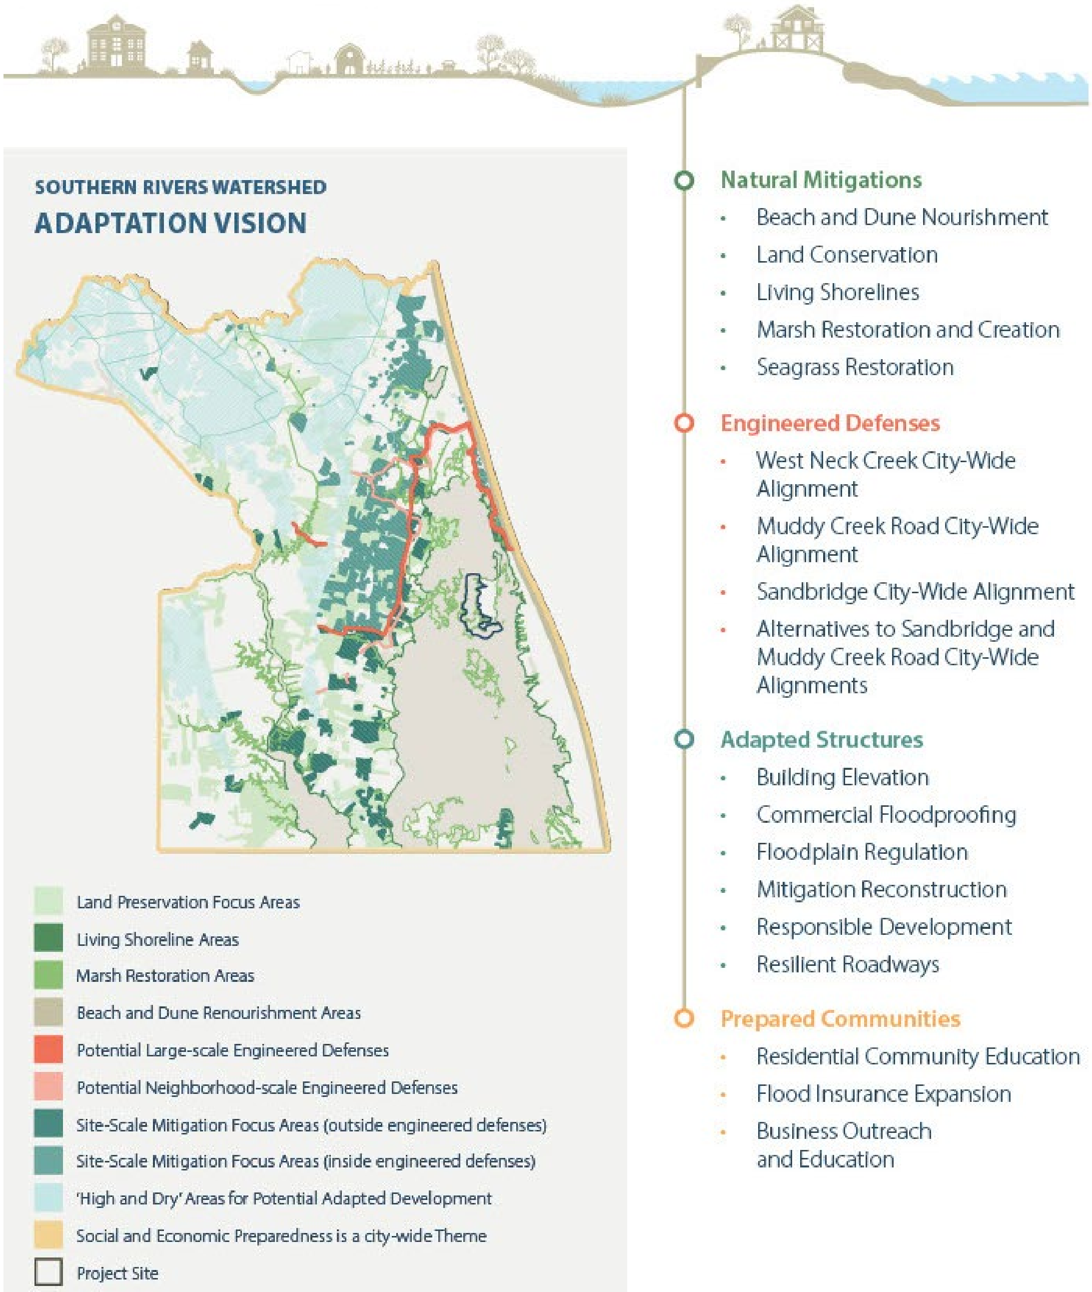

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

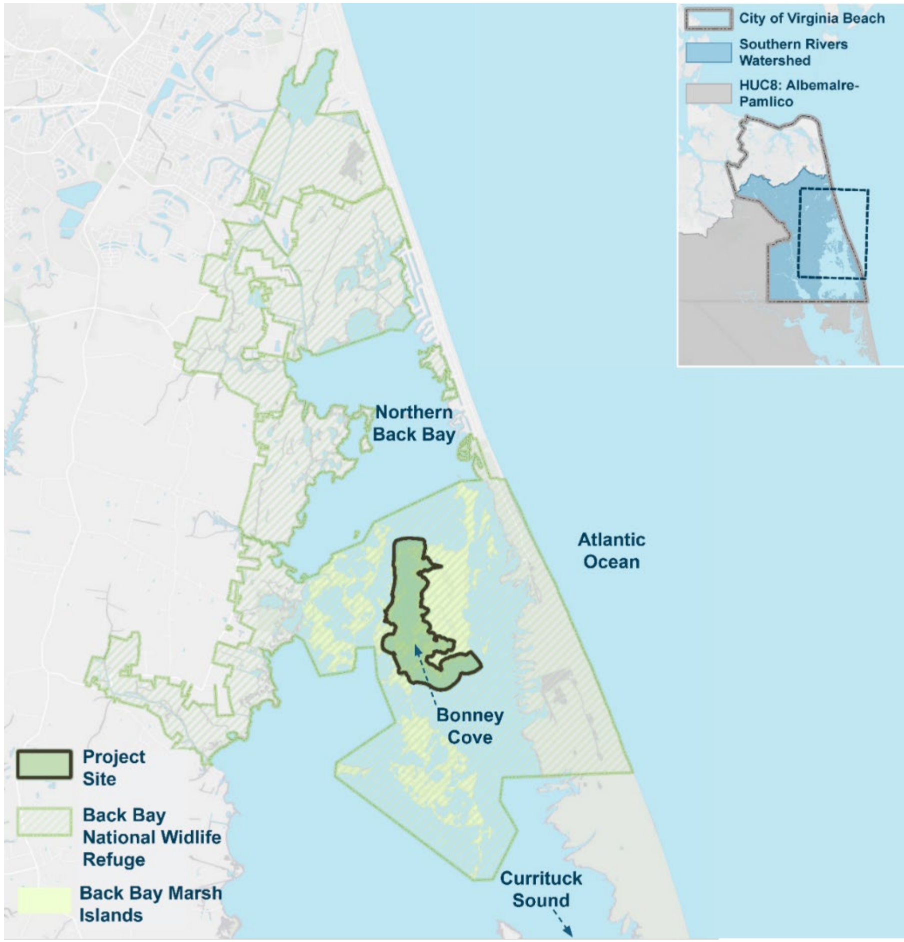

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

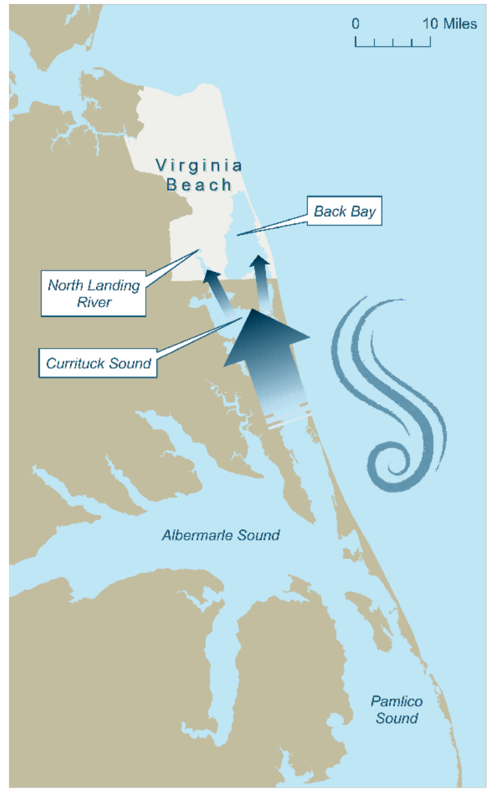

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

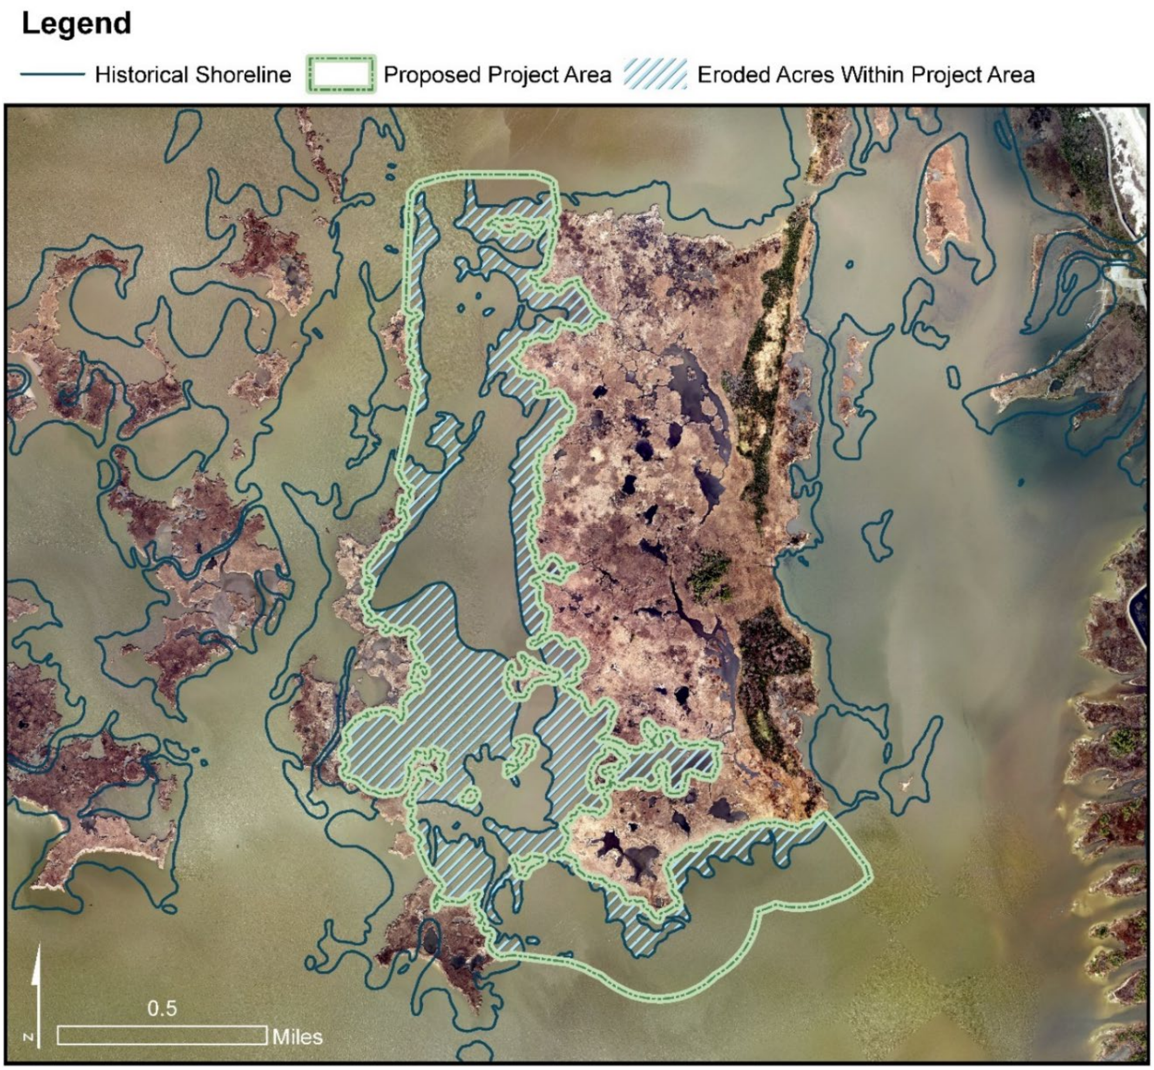

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

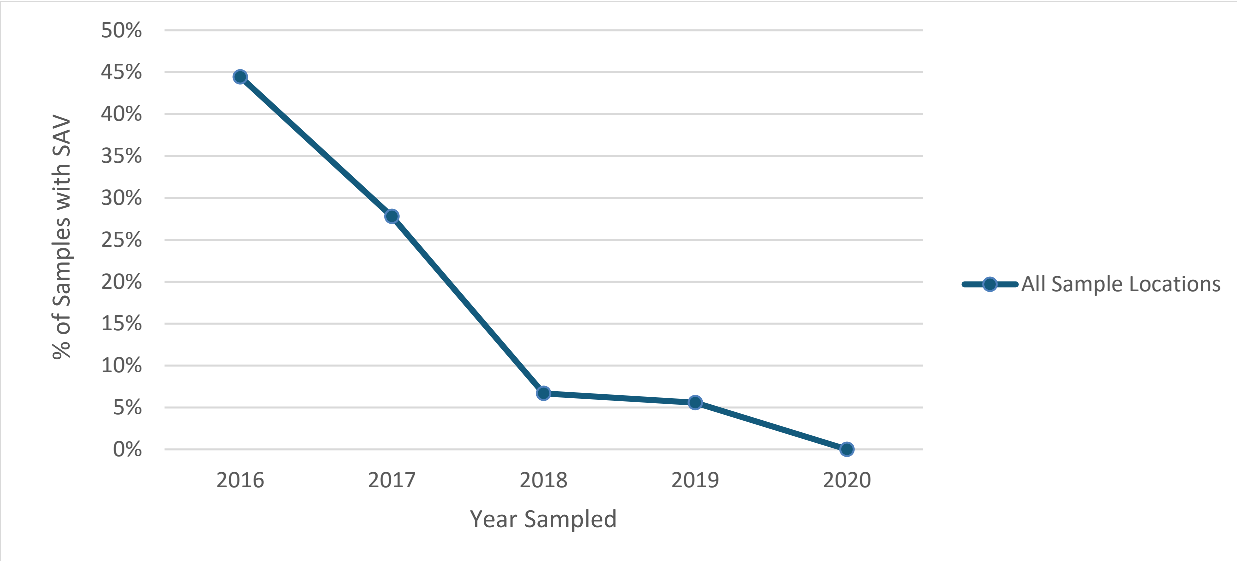

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

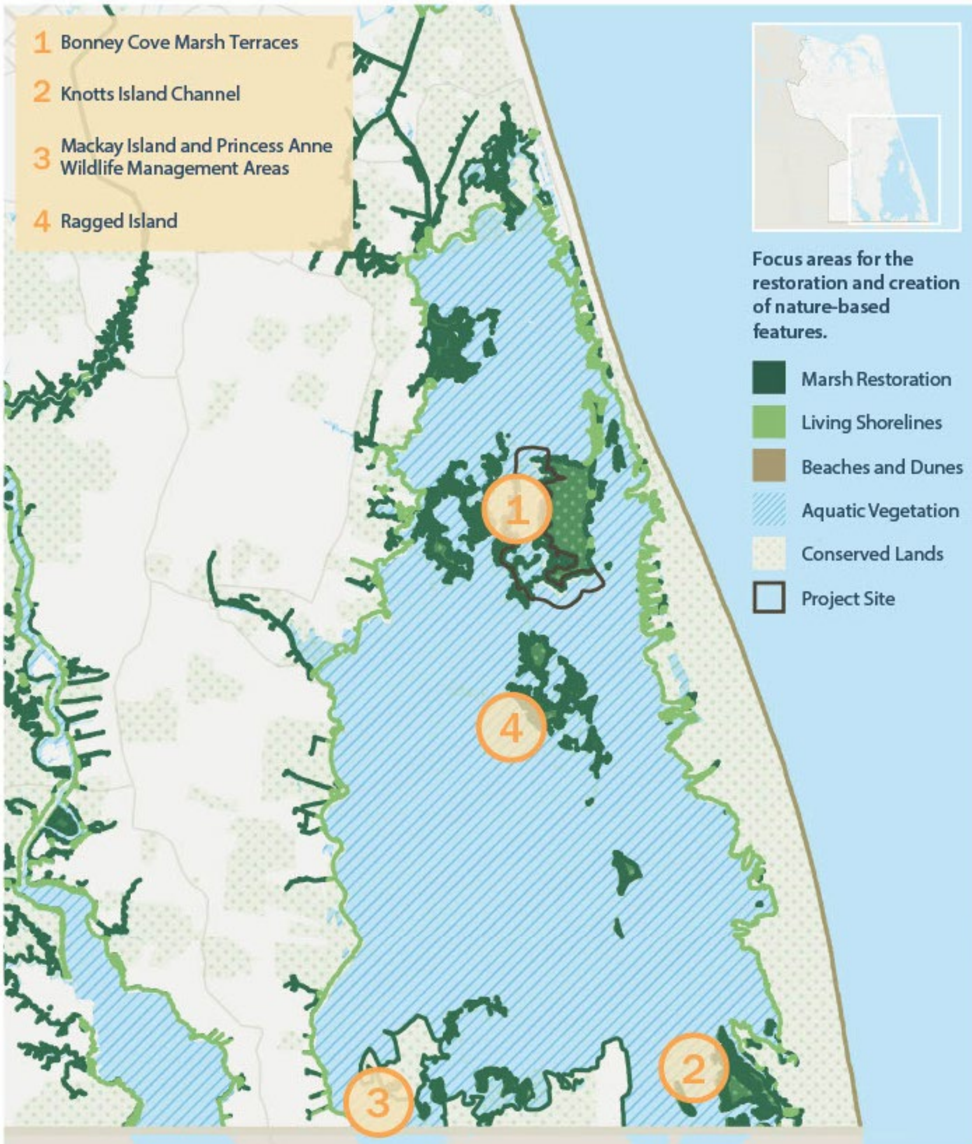

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

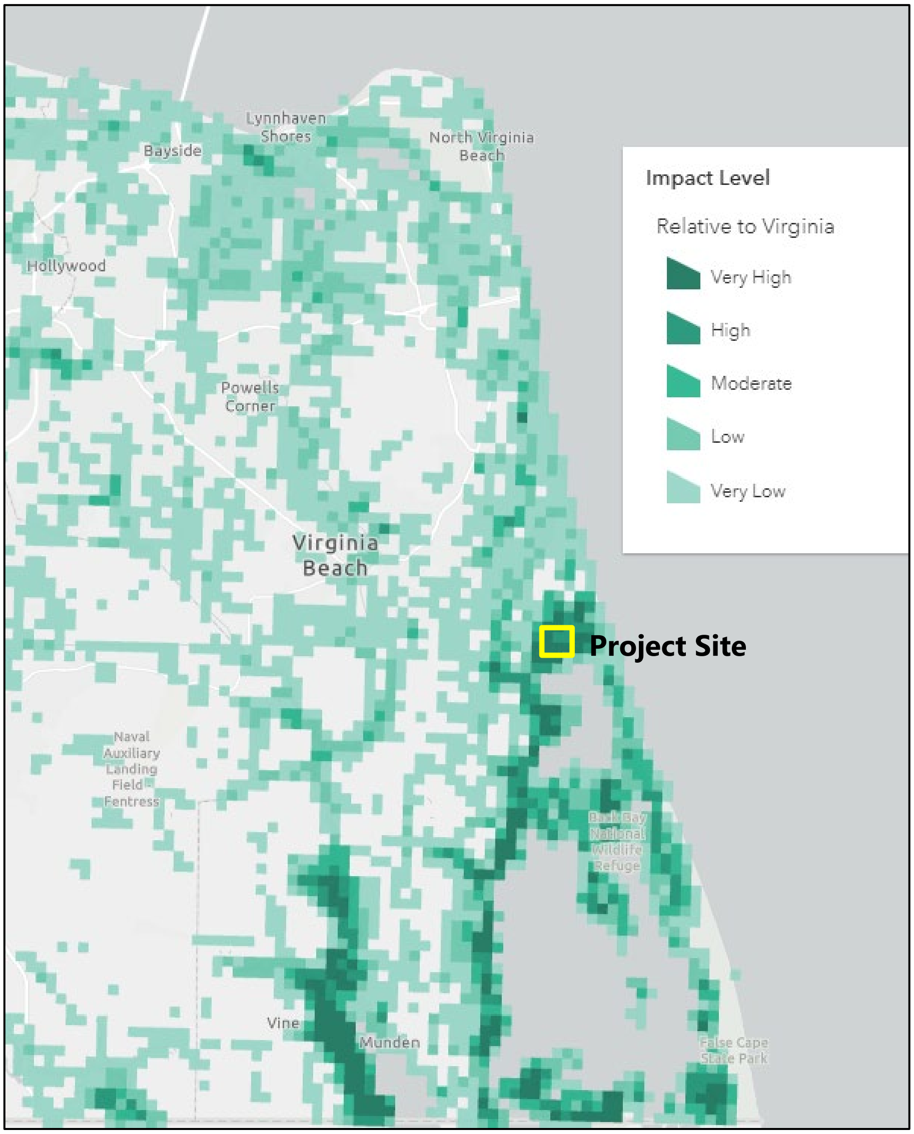

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

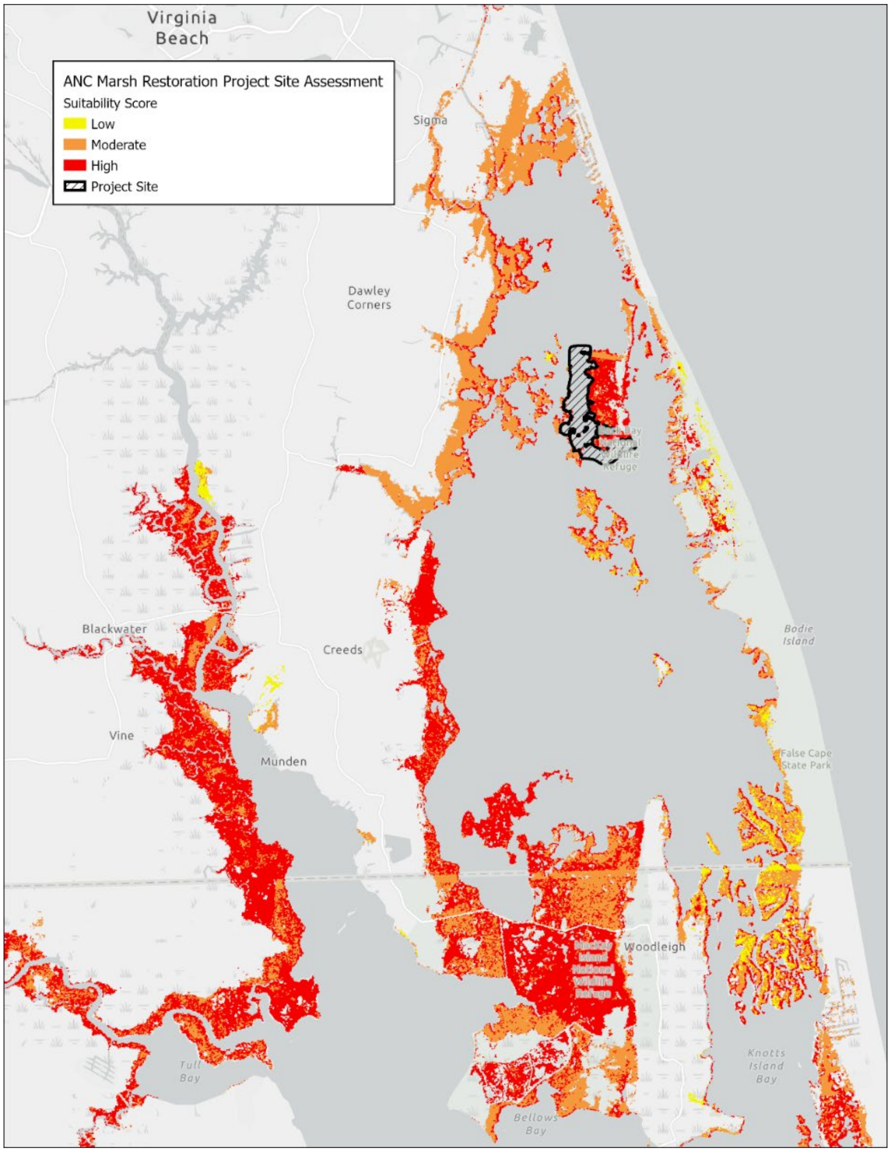

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

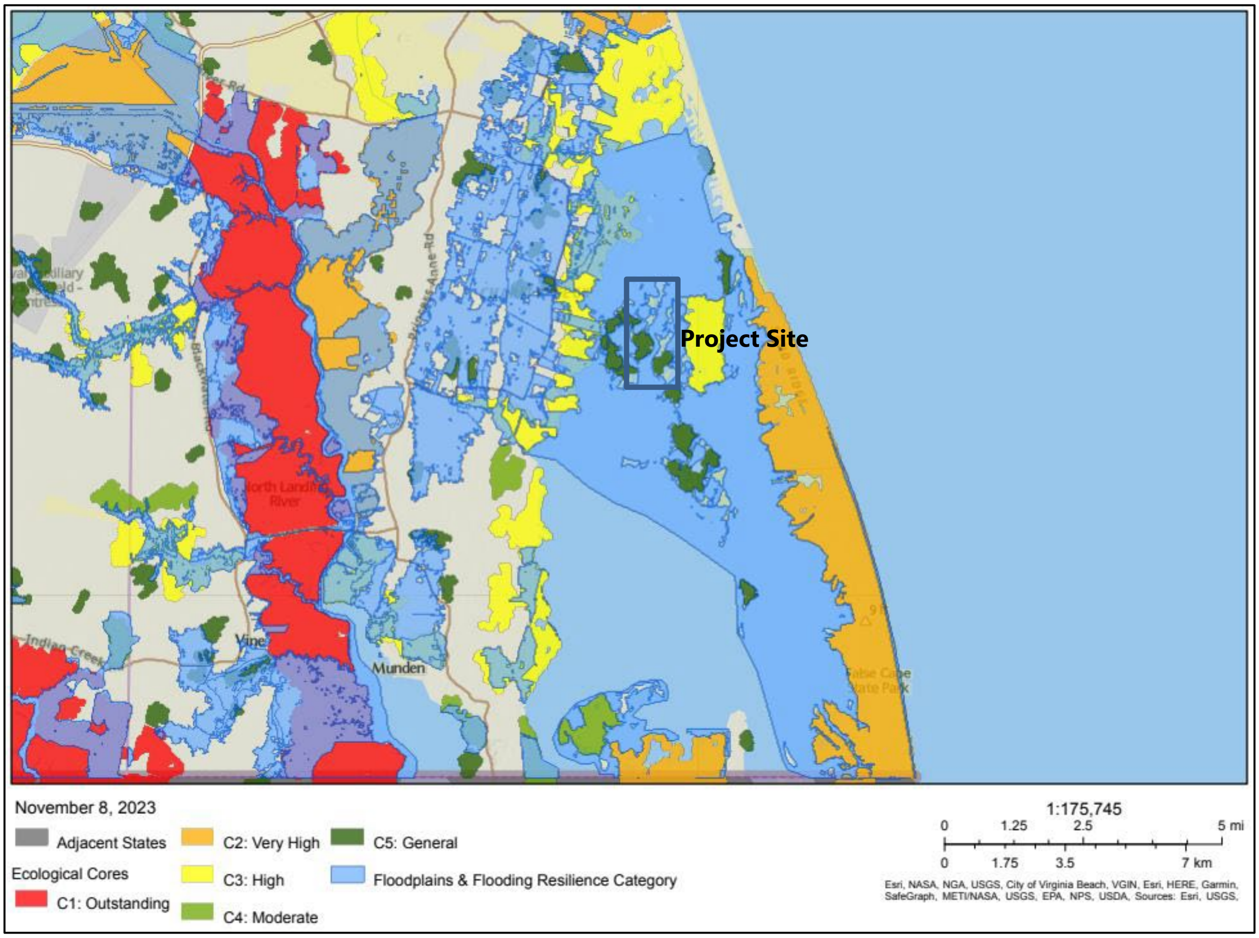

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

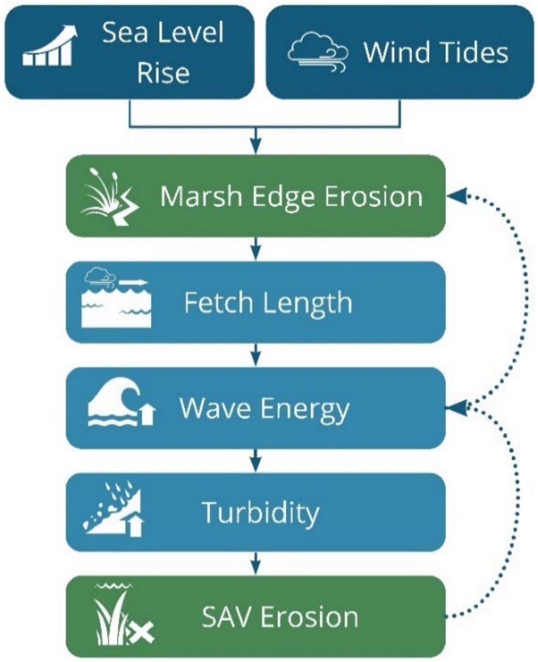

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

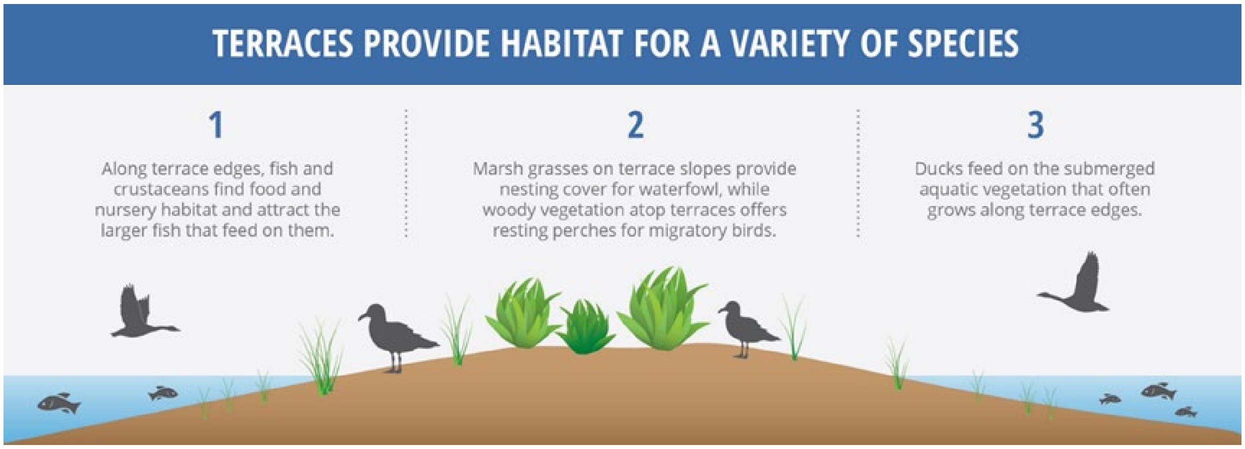

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

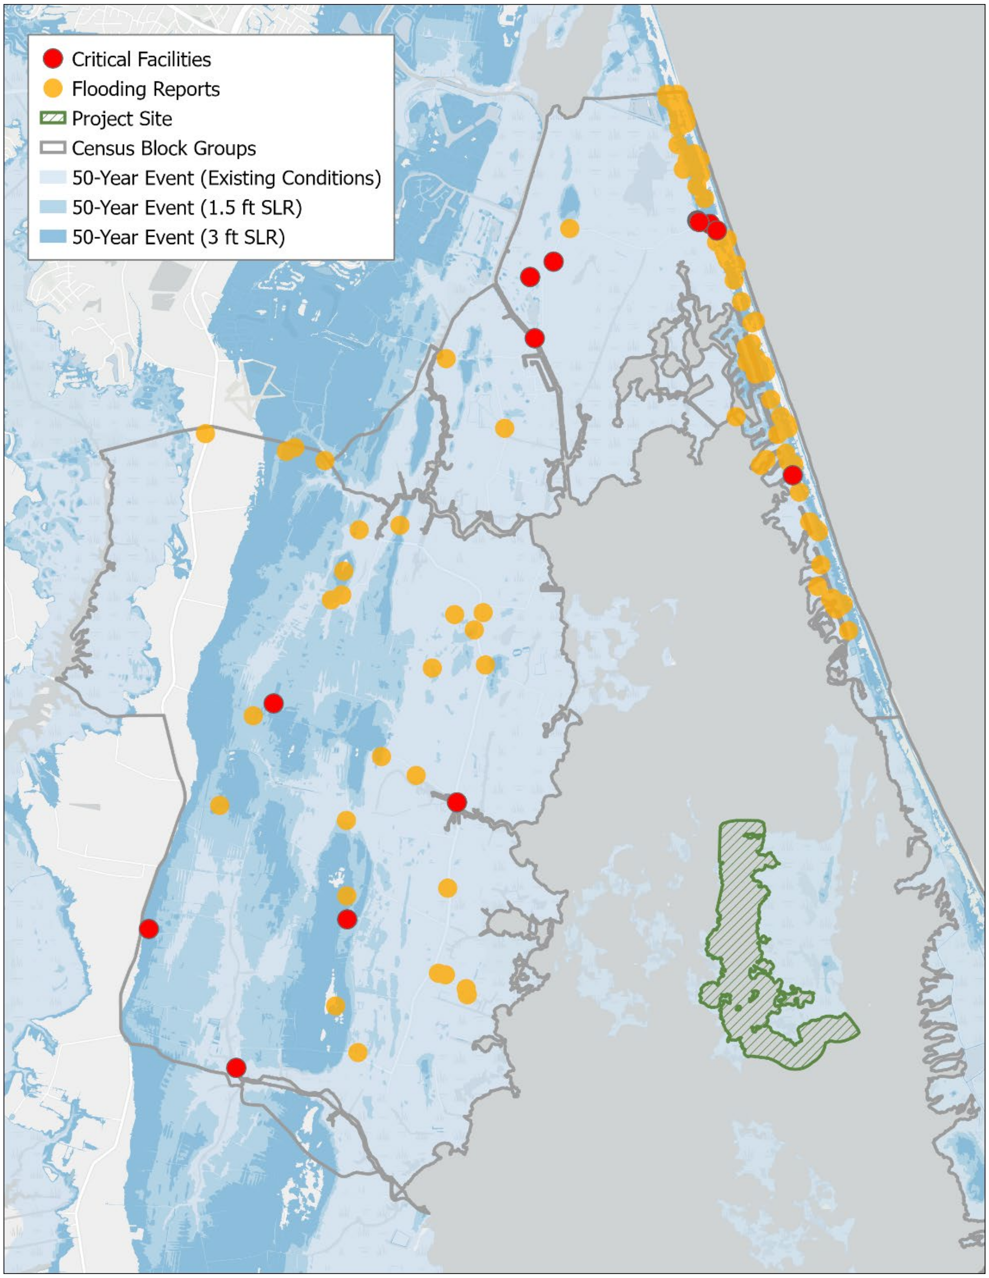

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the S*upporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

<u>Categories (select applicable activities that will be included in the project and used for scoring criterion):</u>

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ______________________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

☐ Dam restoration.

☐ Beneficial reuse of dredge materials for flood mitigation purposes

☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>

☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ____________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) ___________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023									
								Grand Total State Funding Request	$ 5,000,000
								Grand Total Local Share of Project	$ 38,356,966
			National Fish and Wildlife Foundation Grants					Federal Funding (if applicable)	$ 10,021,524
								Project Grand Total	$ 53,378,490
								Locality Cost Match	% 71.85
Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

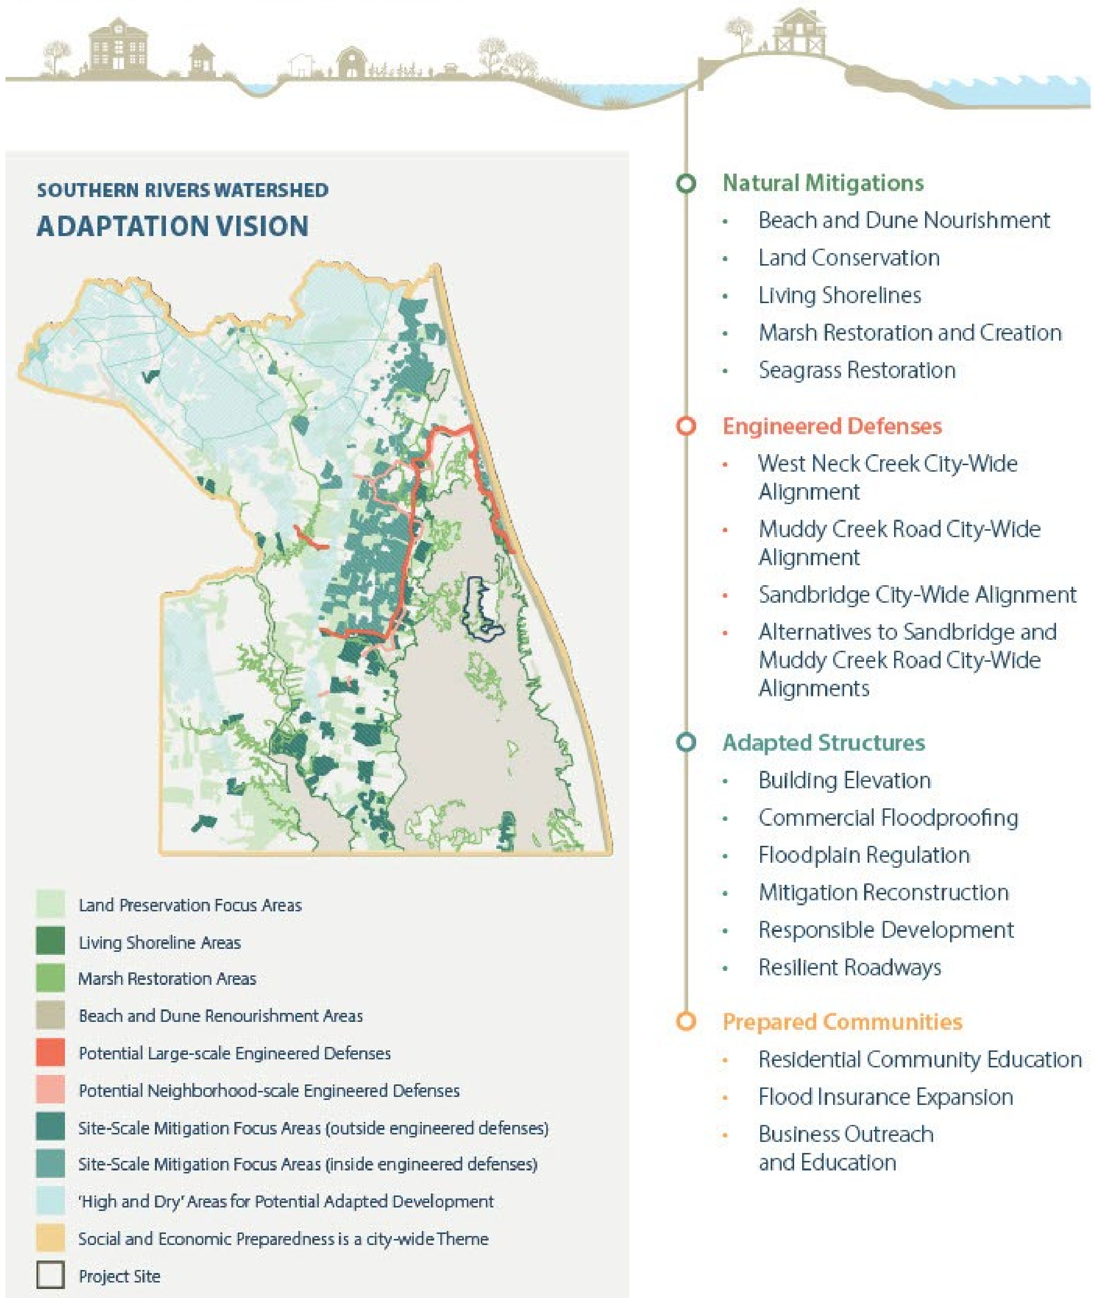

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

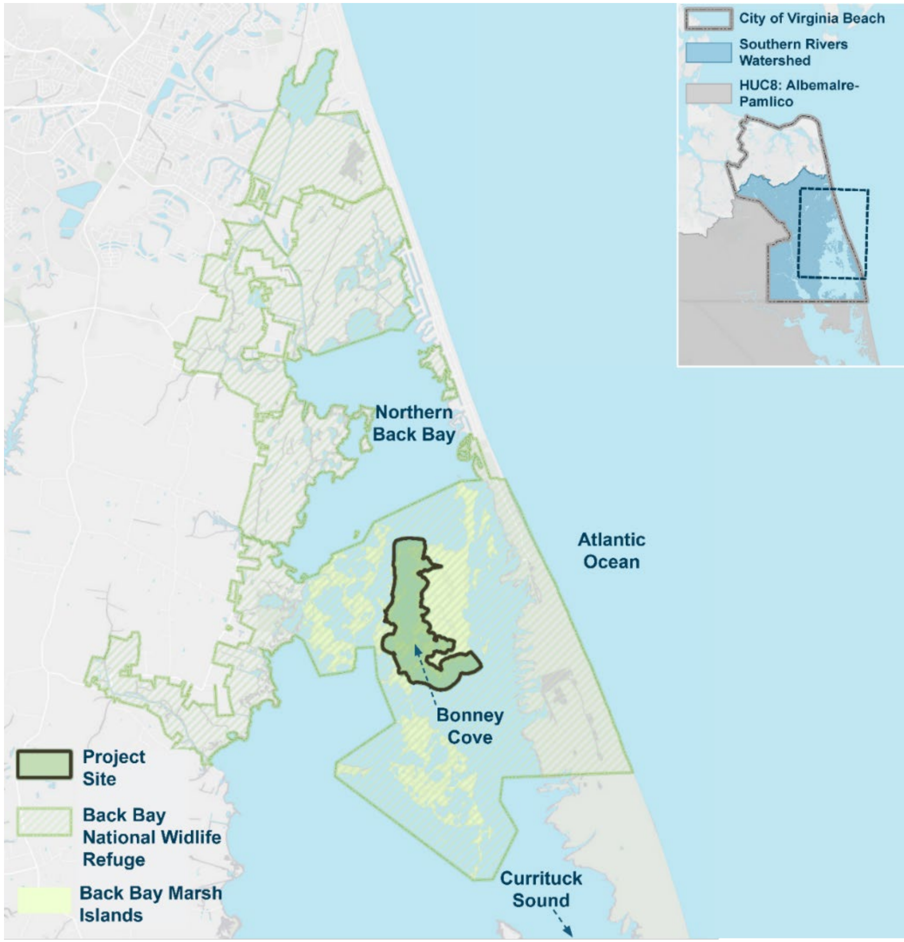

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

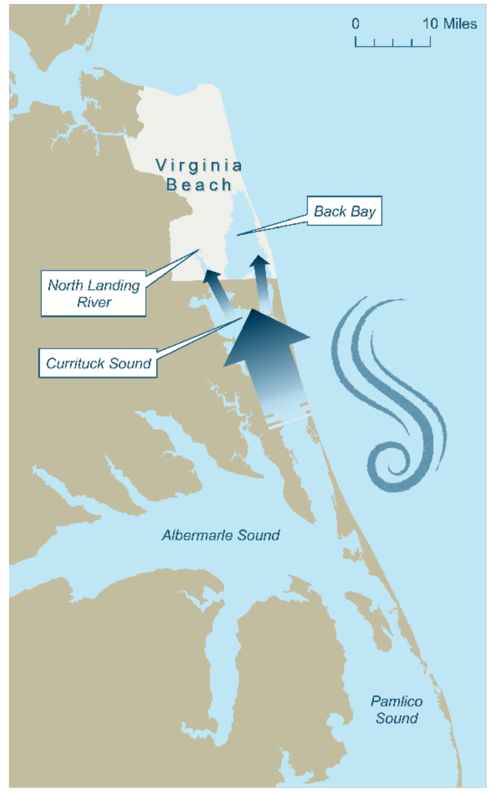

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

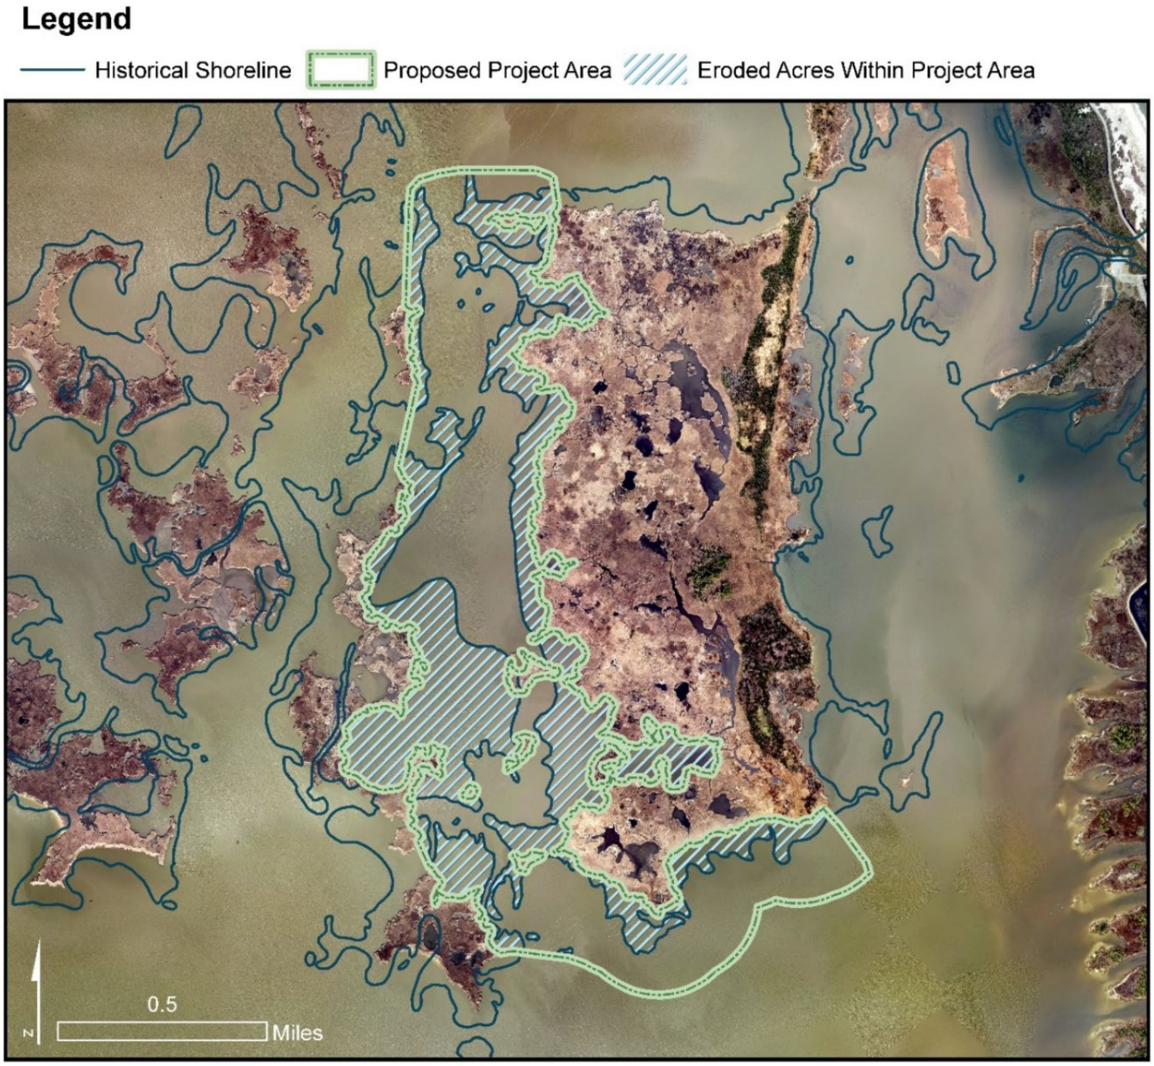

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

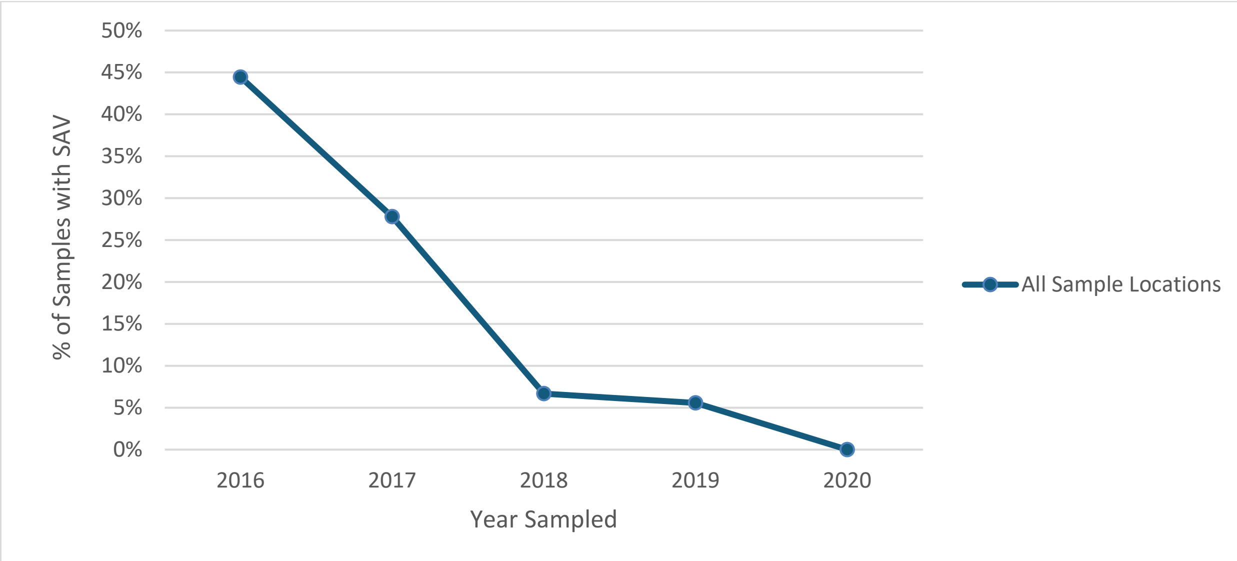

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

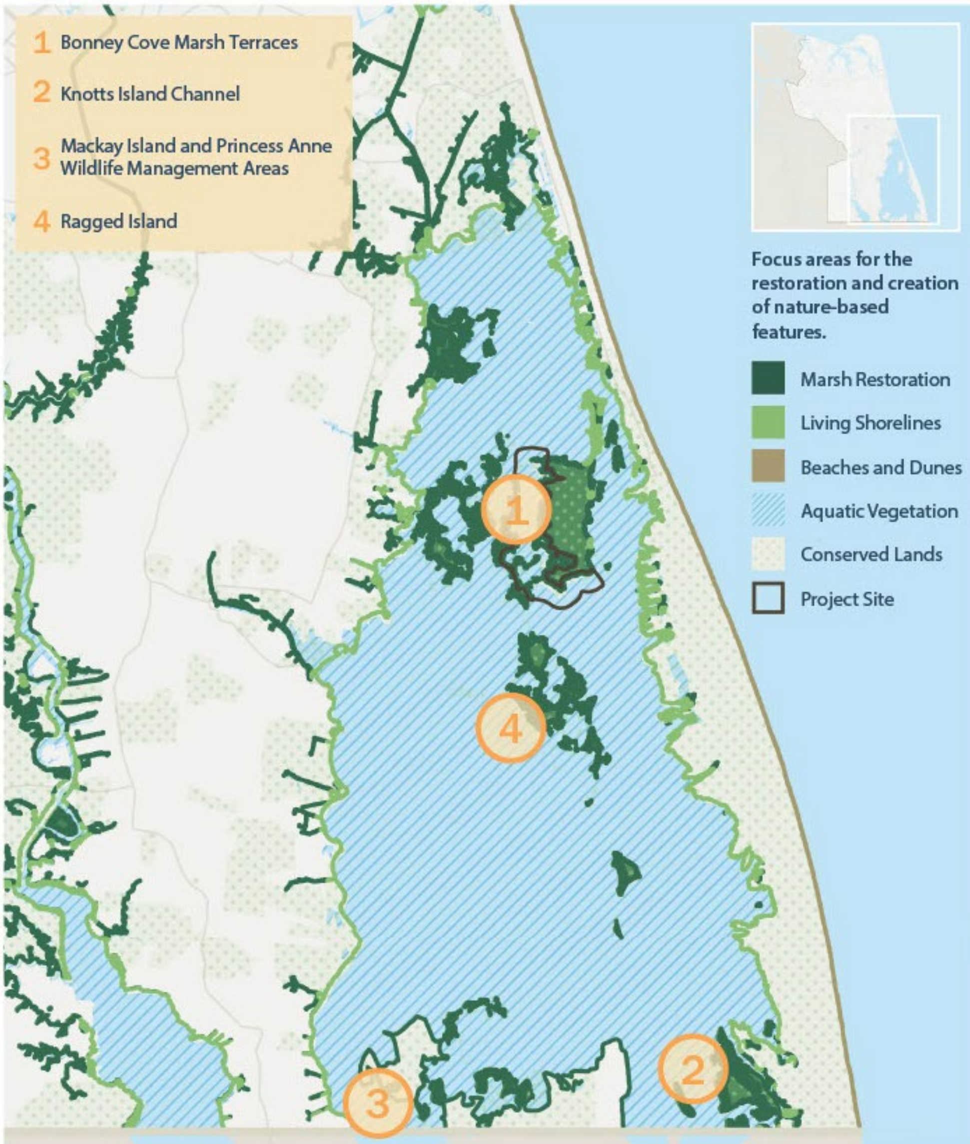

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

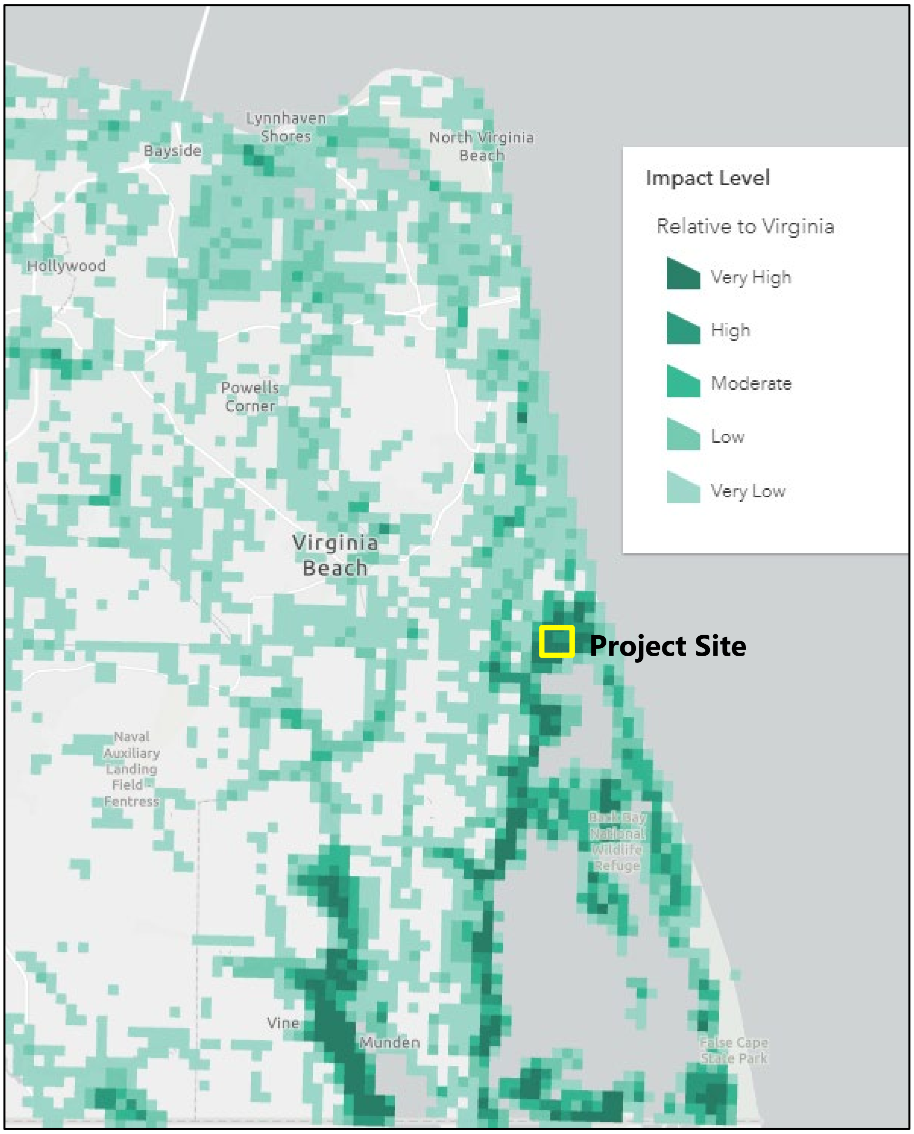

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

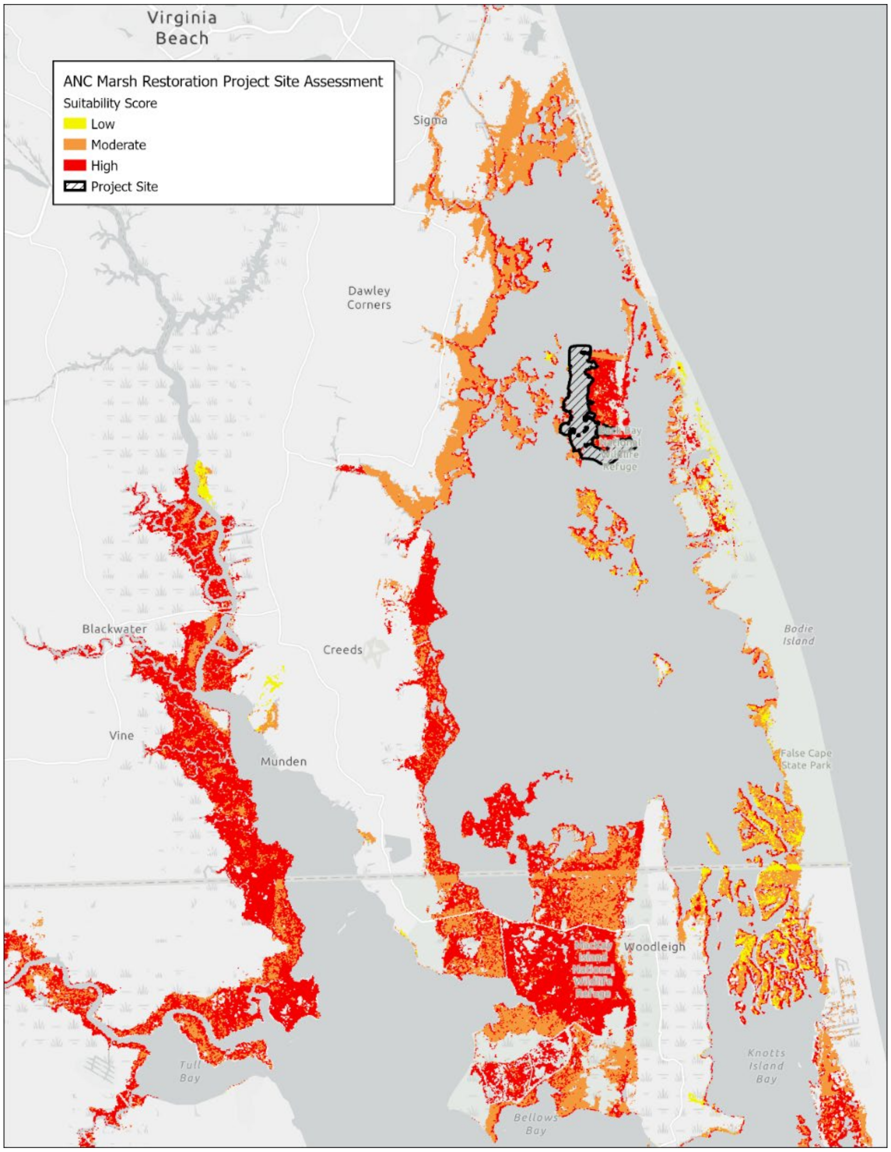

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

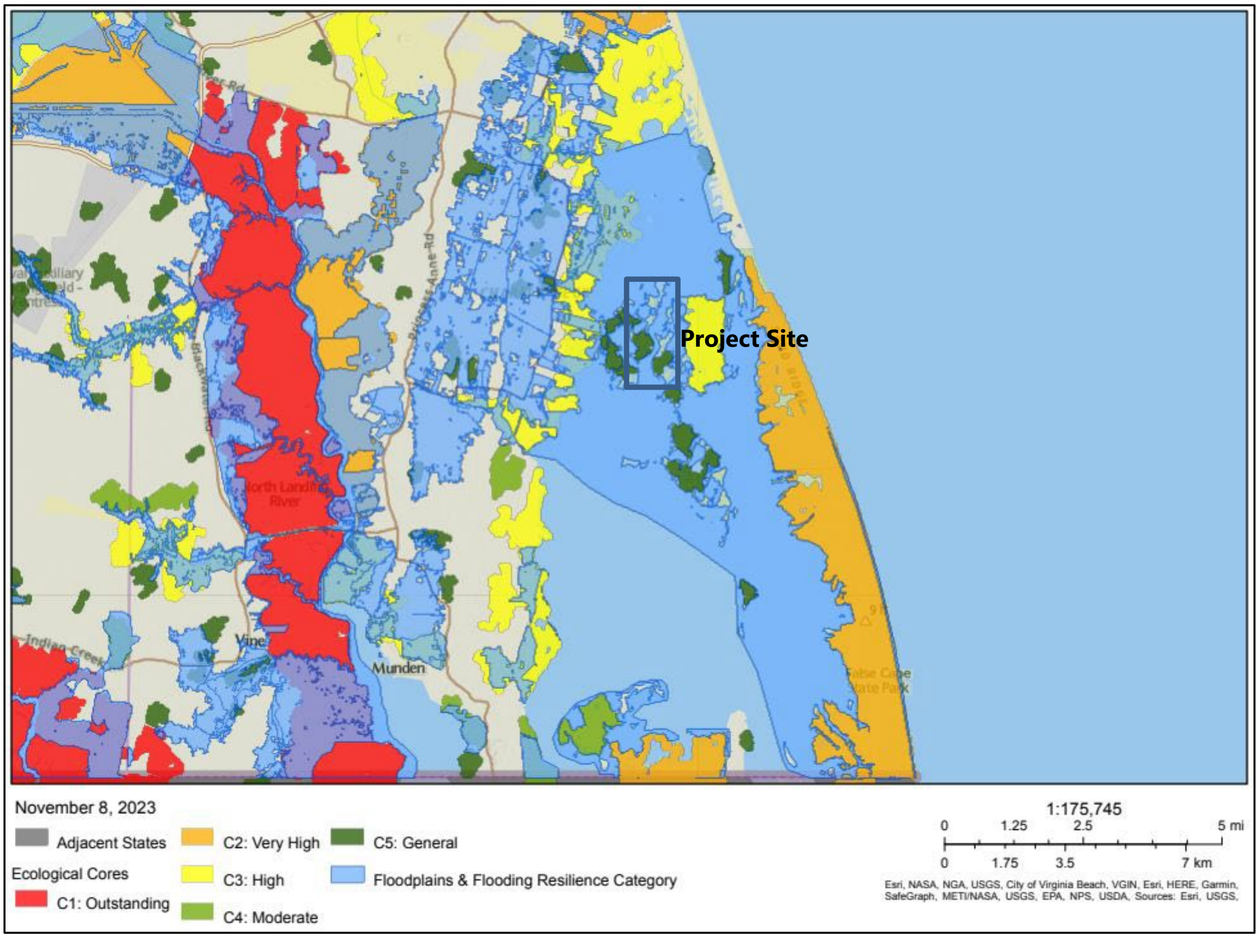

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

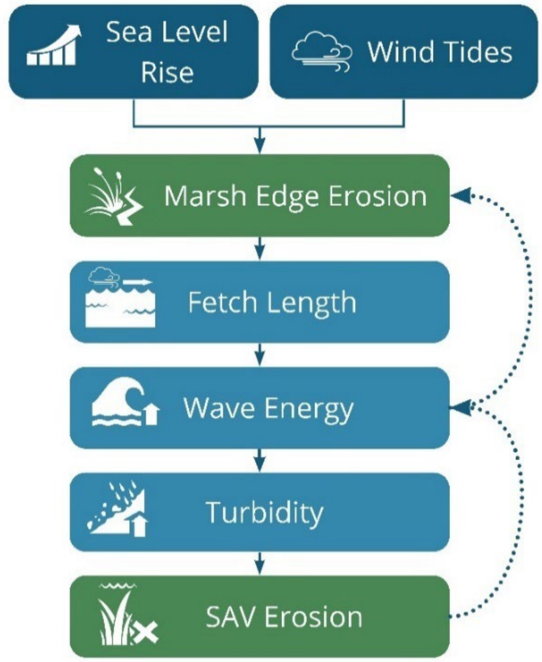

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

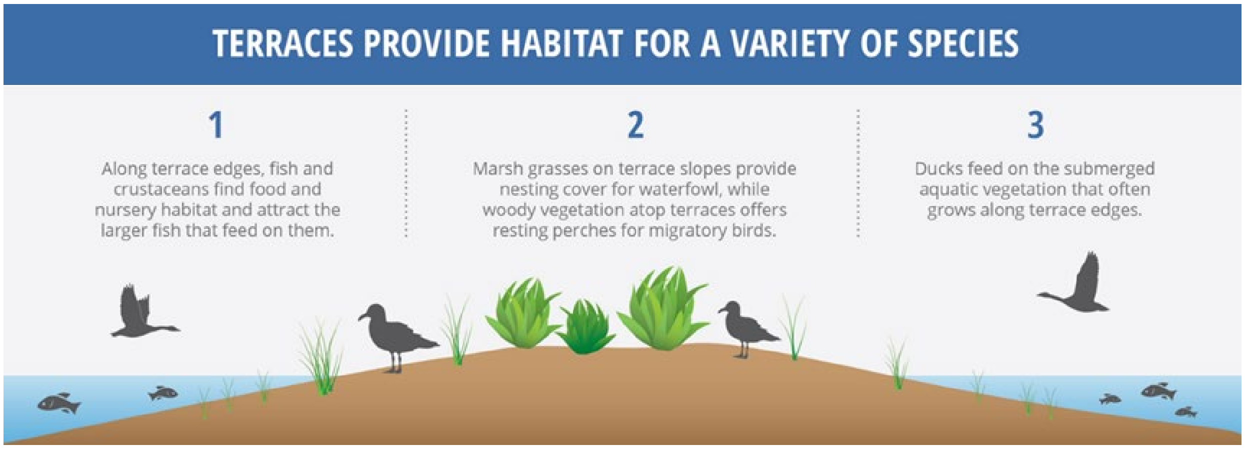

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

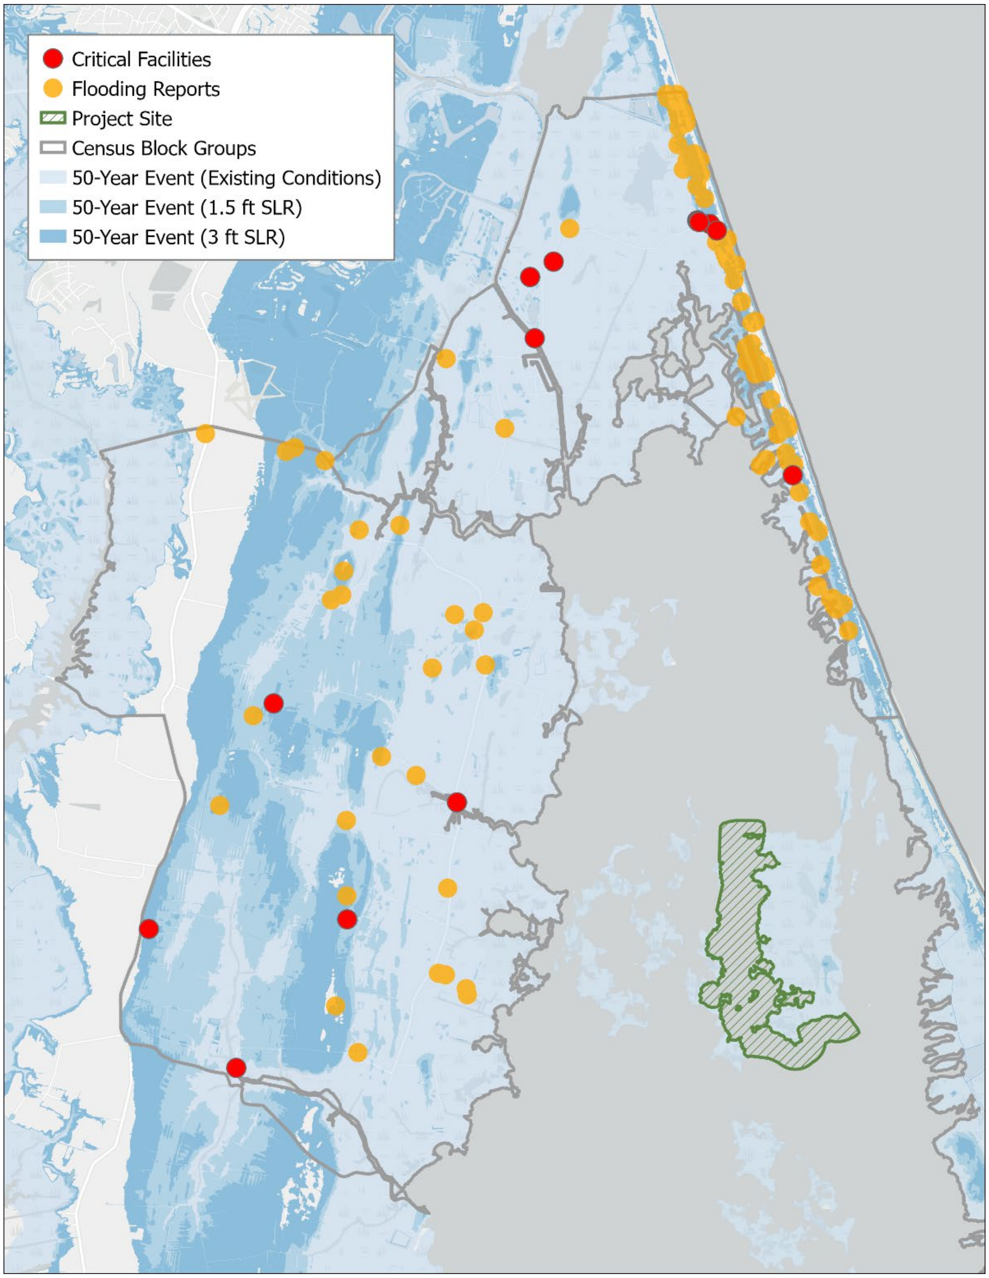

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

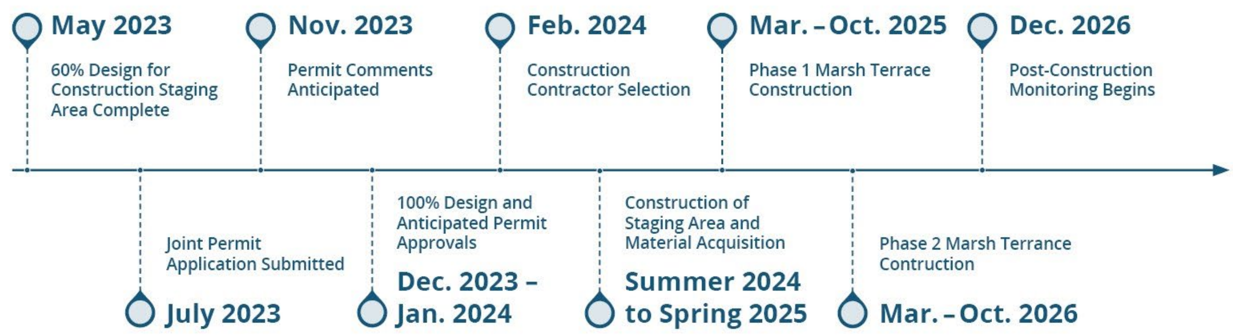

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

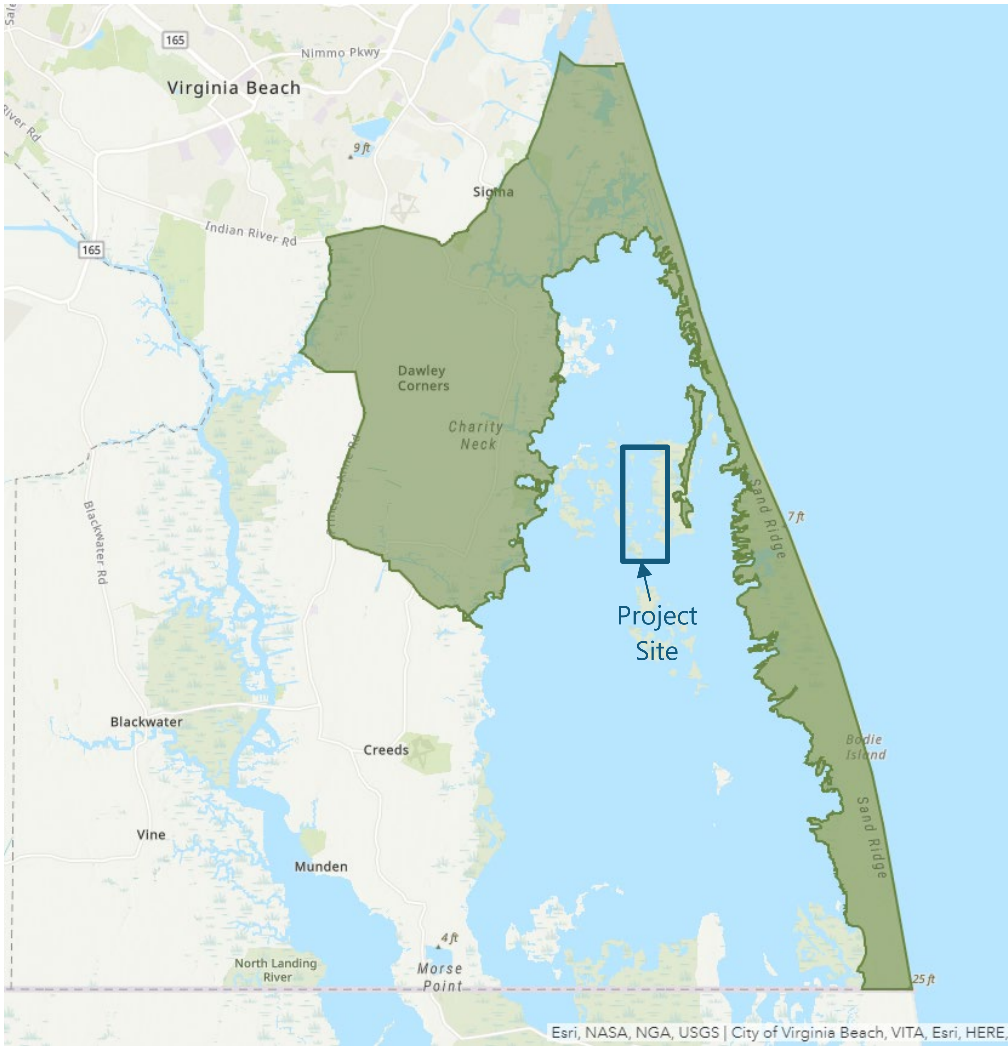

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

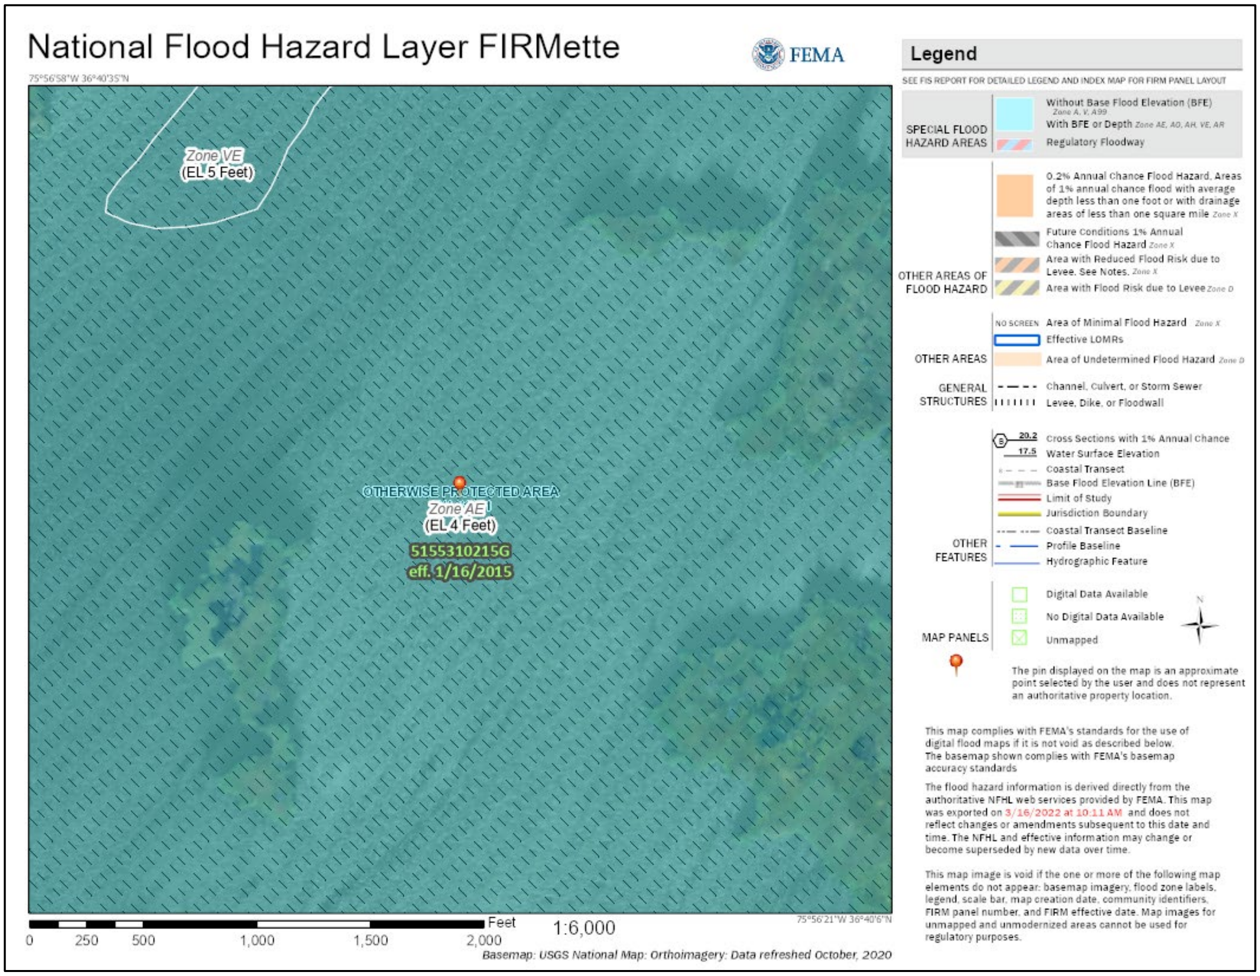

Figure 15: FIRMette for the project area (northern boundary).

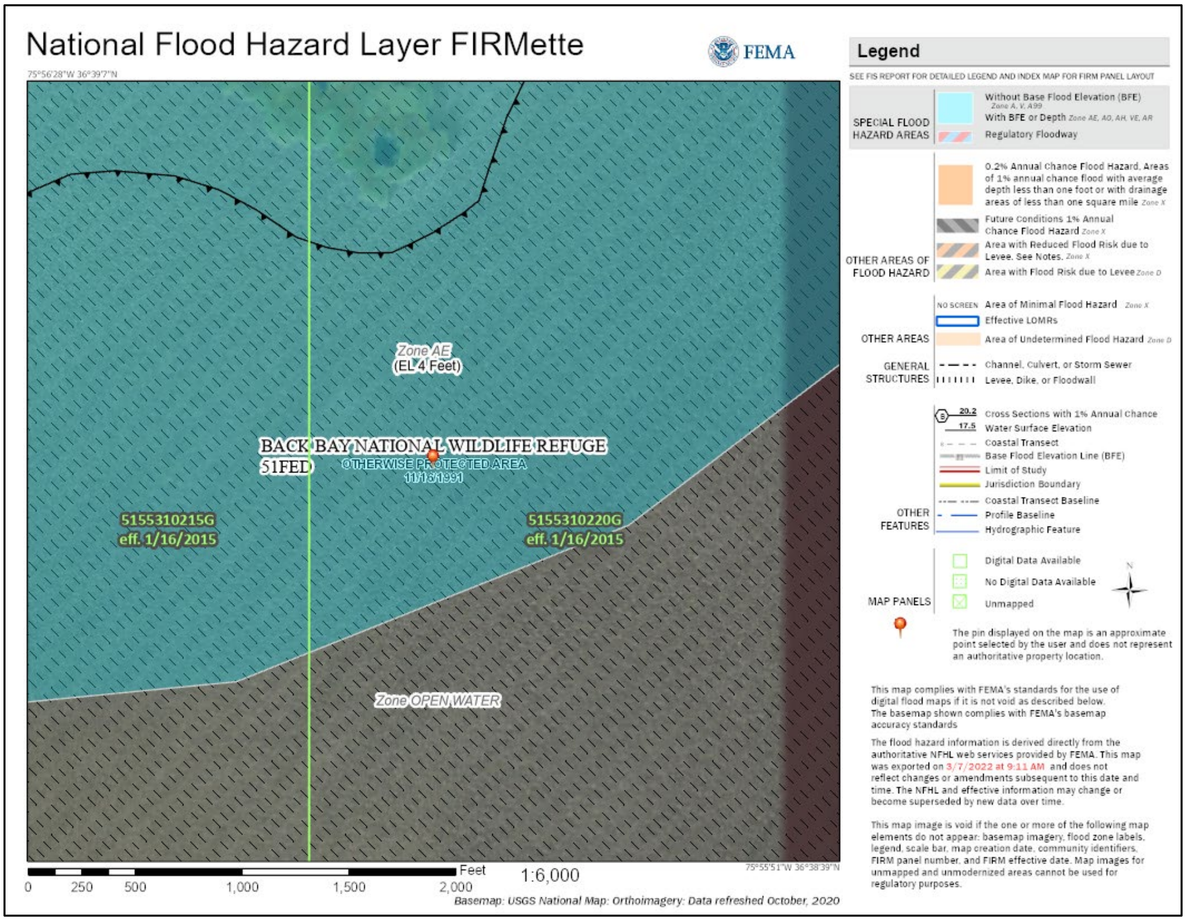

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

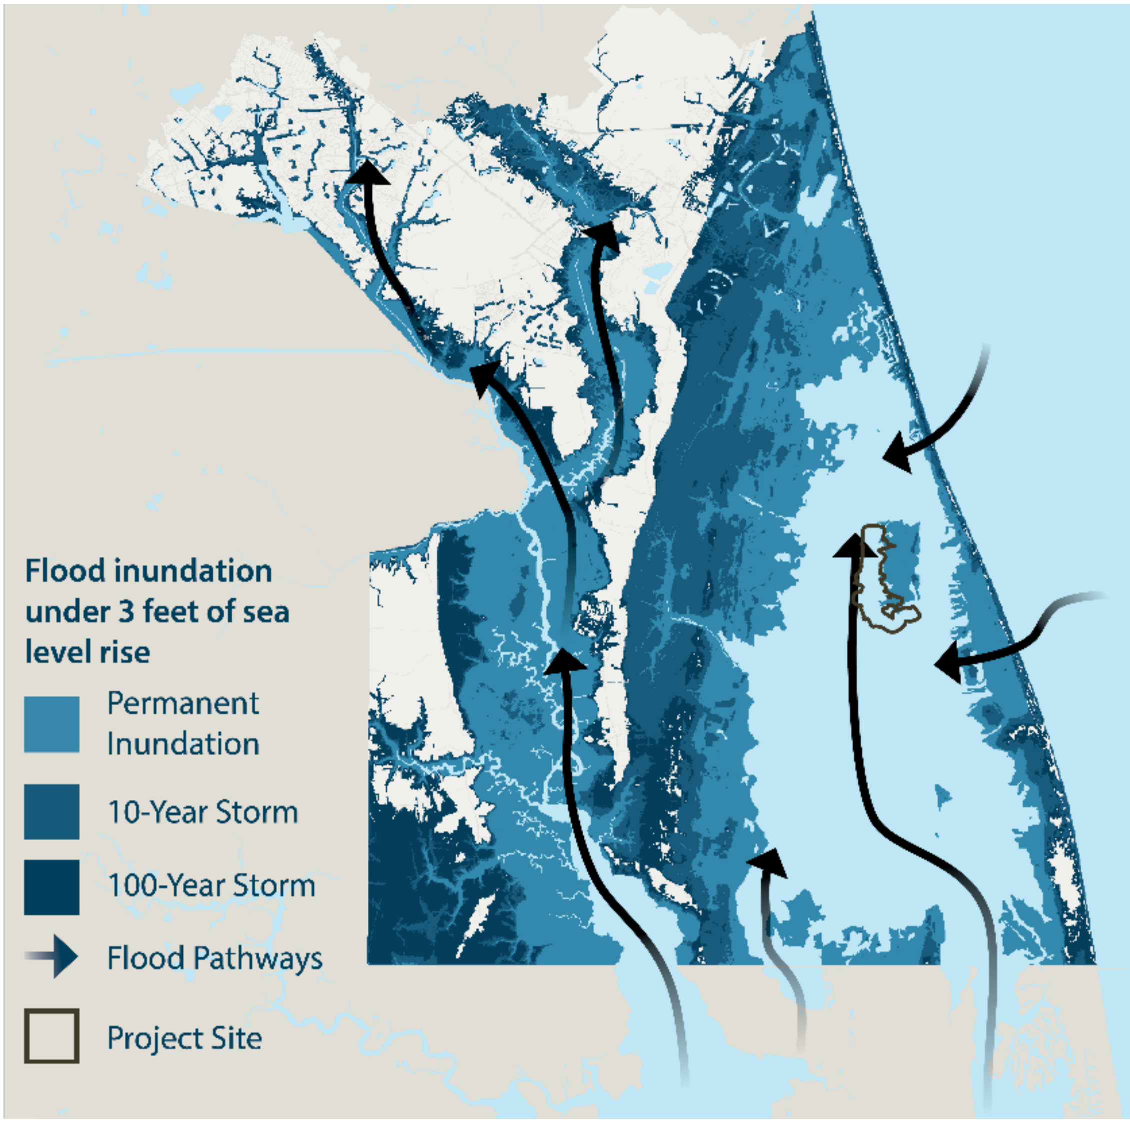

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

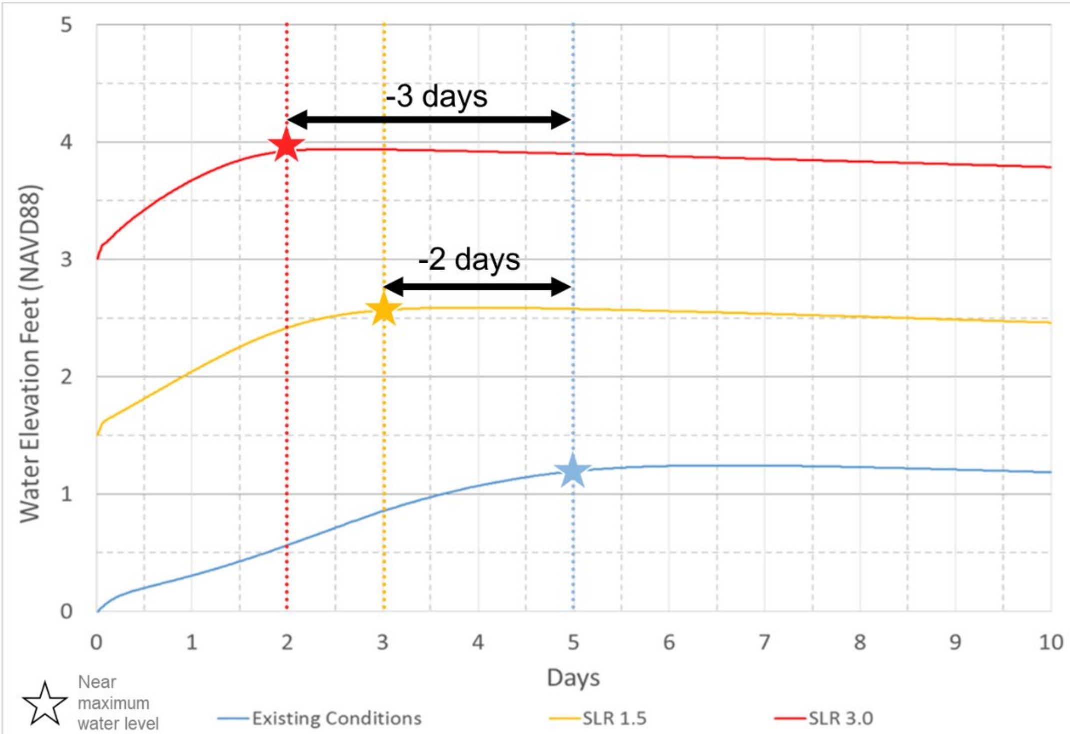

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

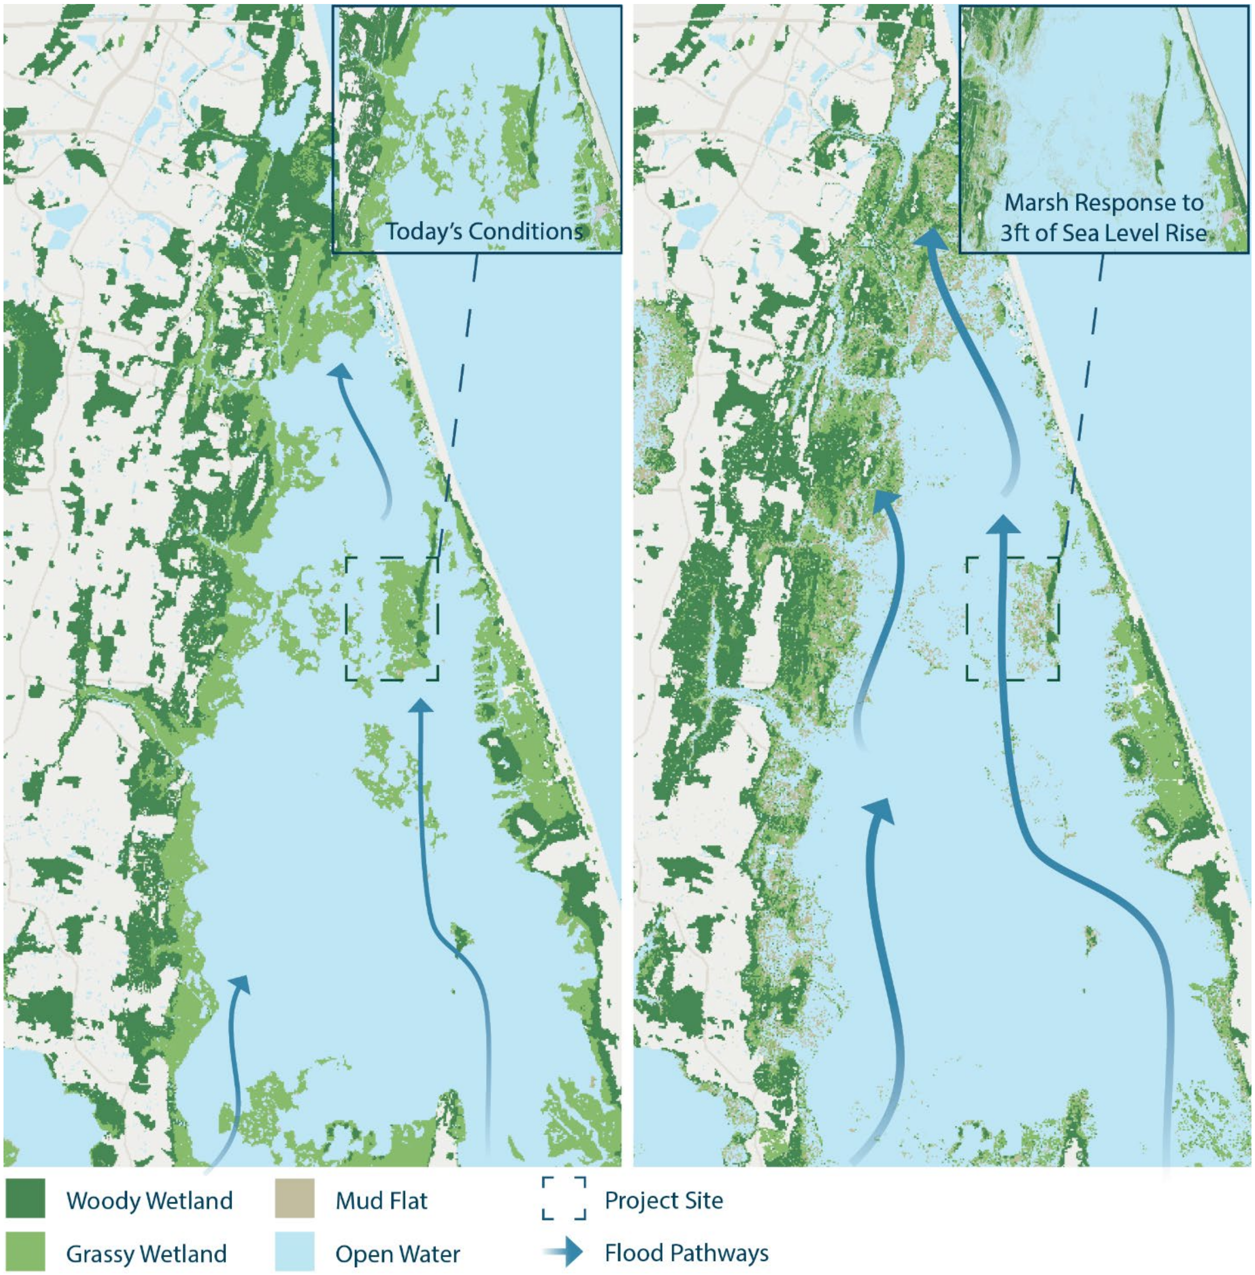

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

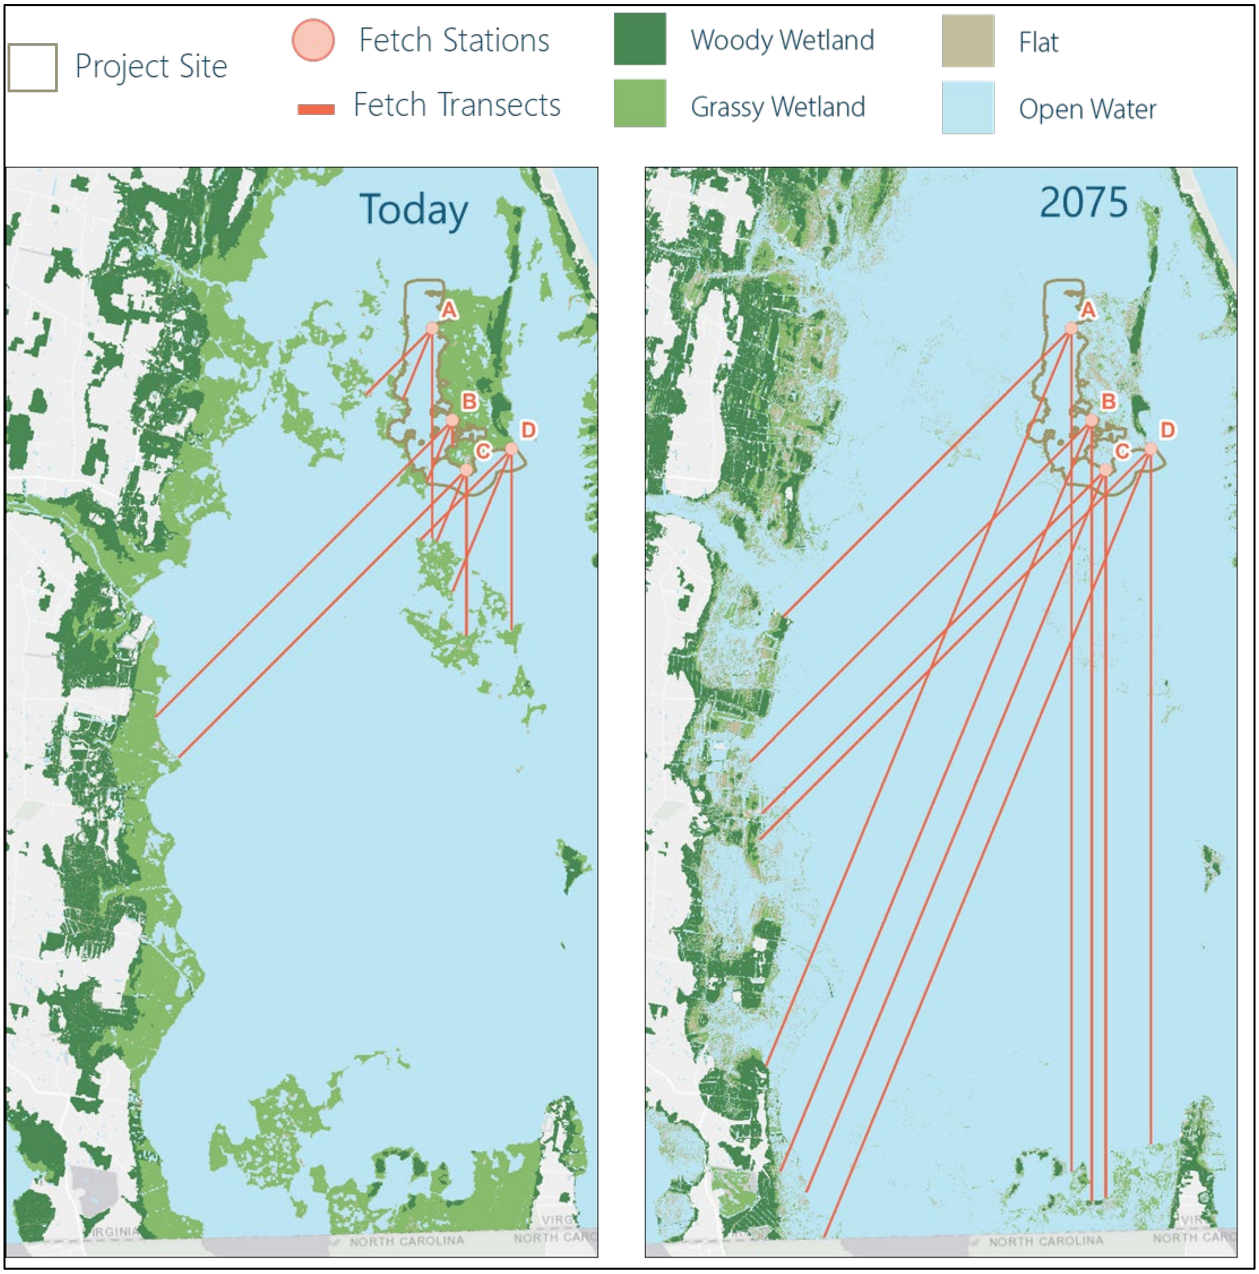

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

---

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

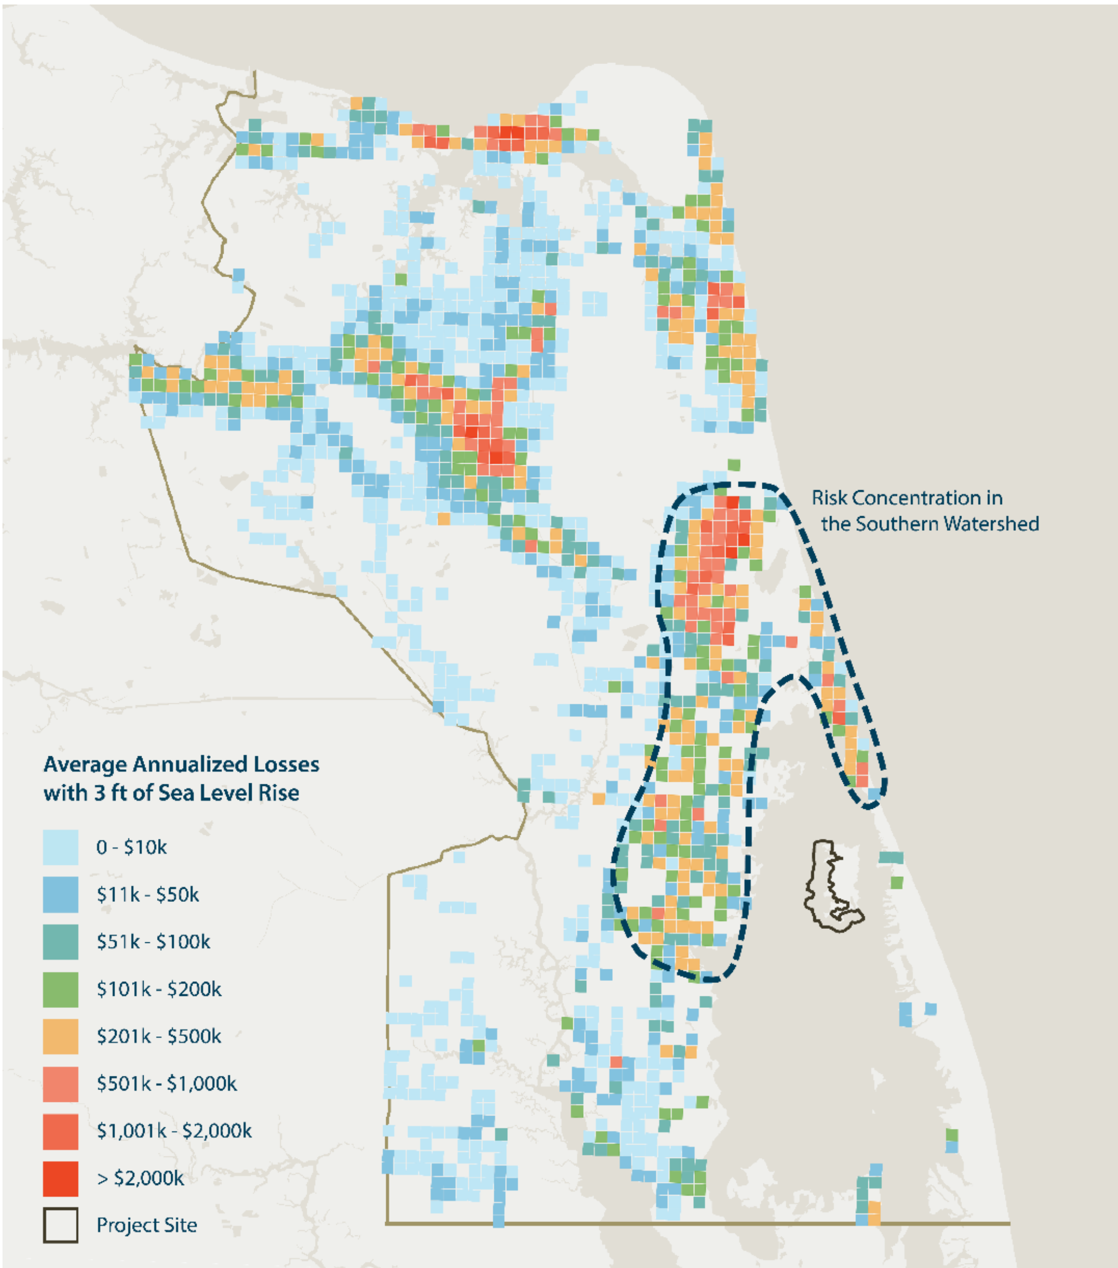

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

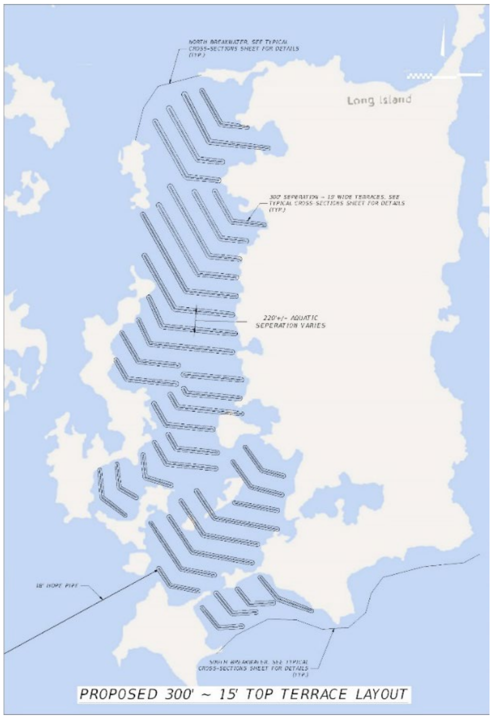

Figure 22: Alternative 2a.

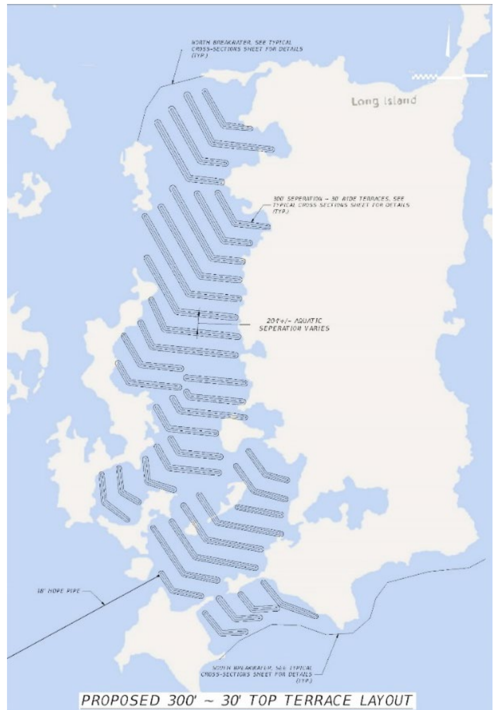

Figure 23: Alternative 2b.

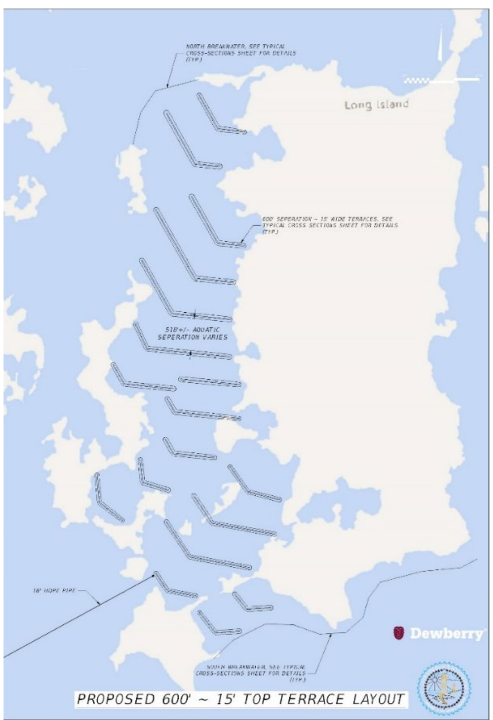

Figure 24: Alternative 2c.

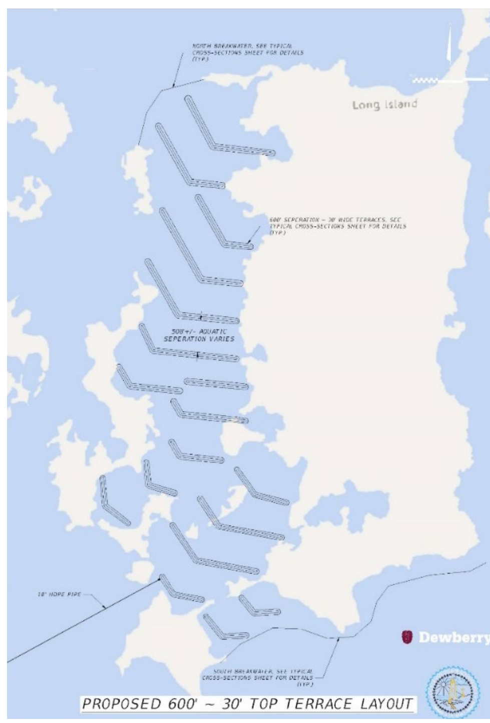

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

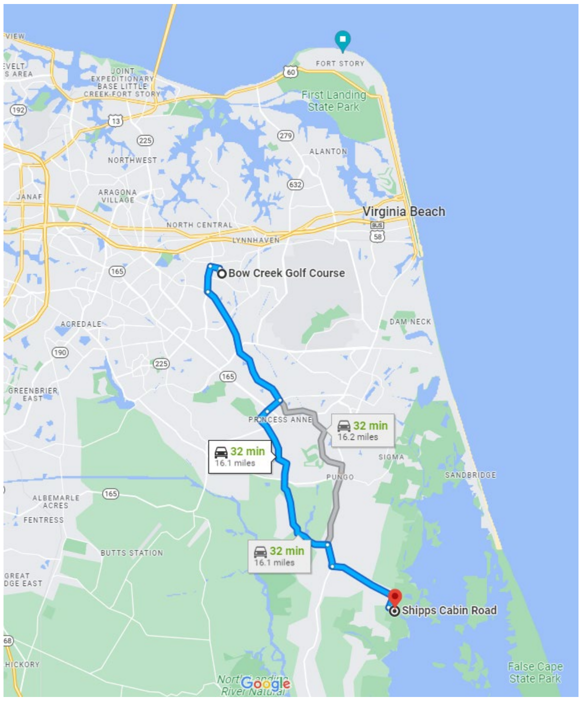

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

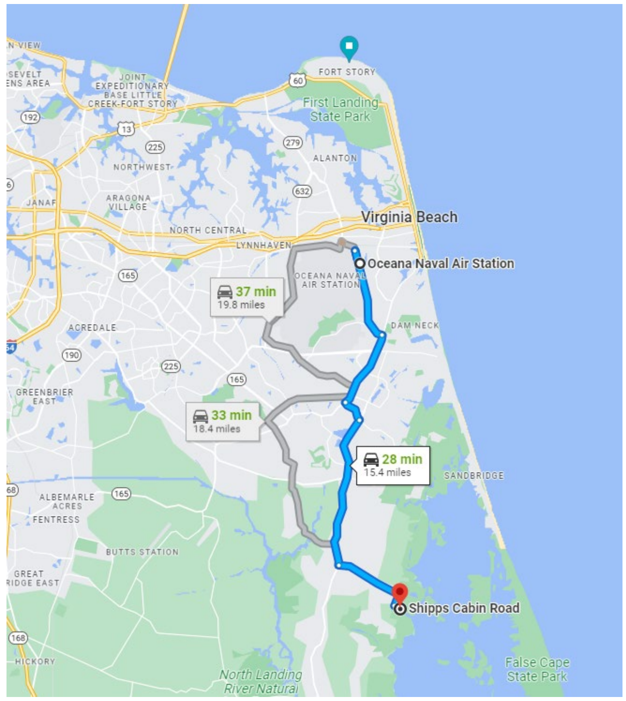

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

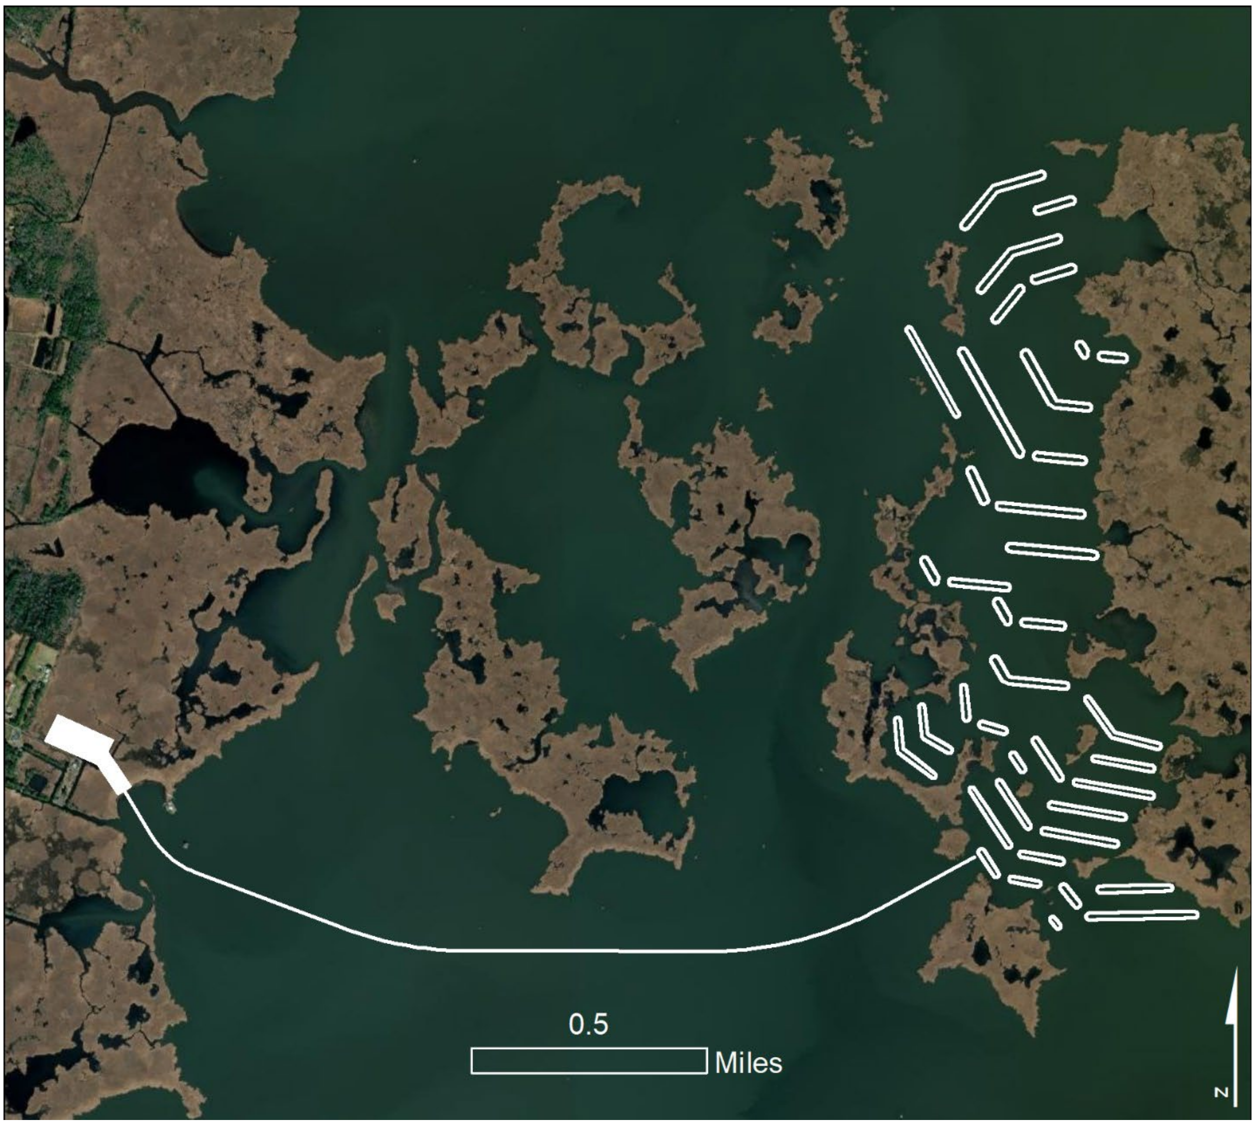

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

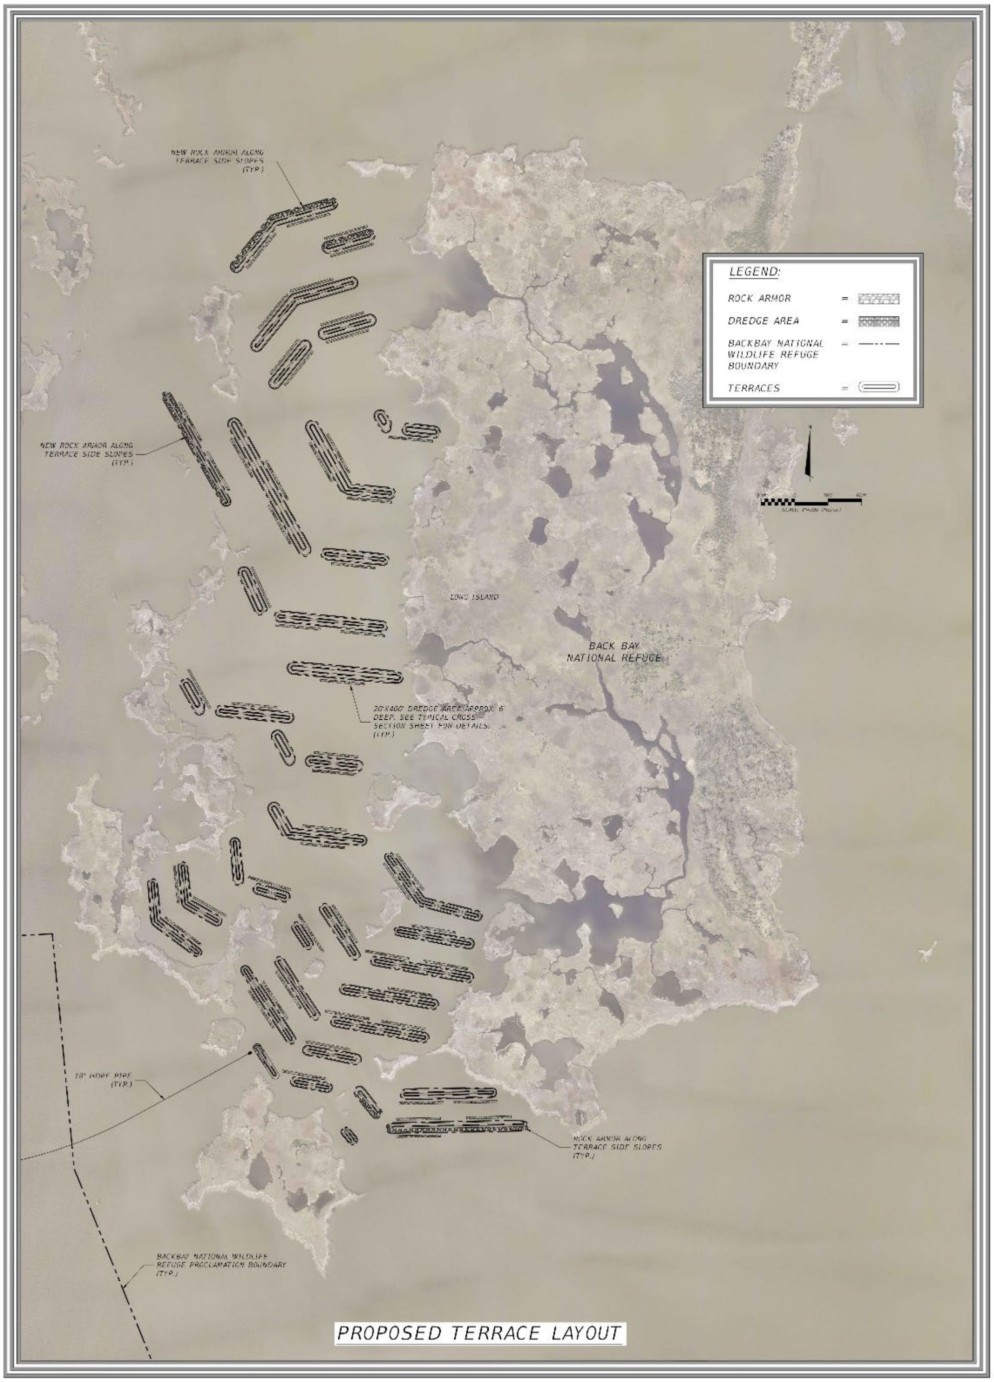

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

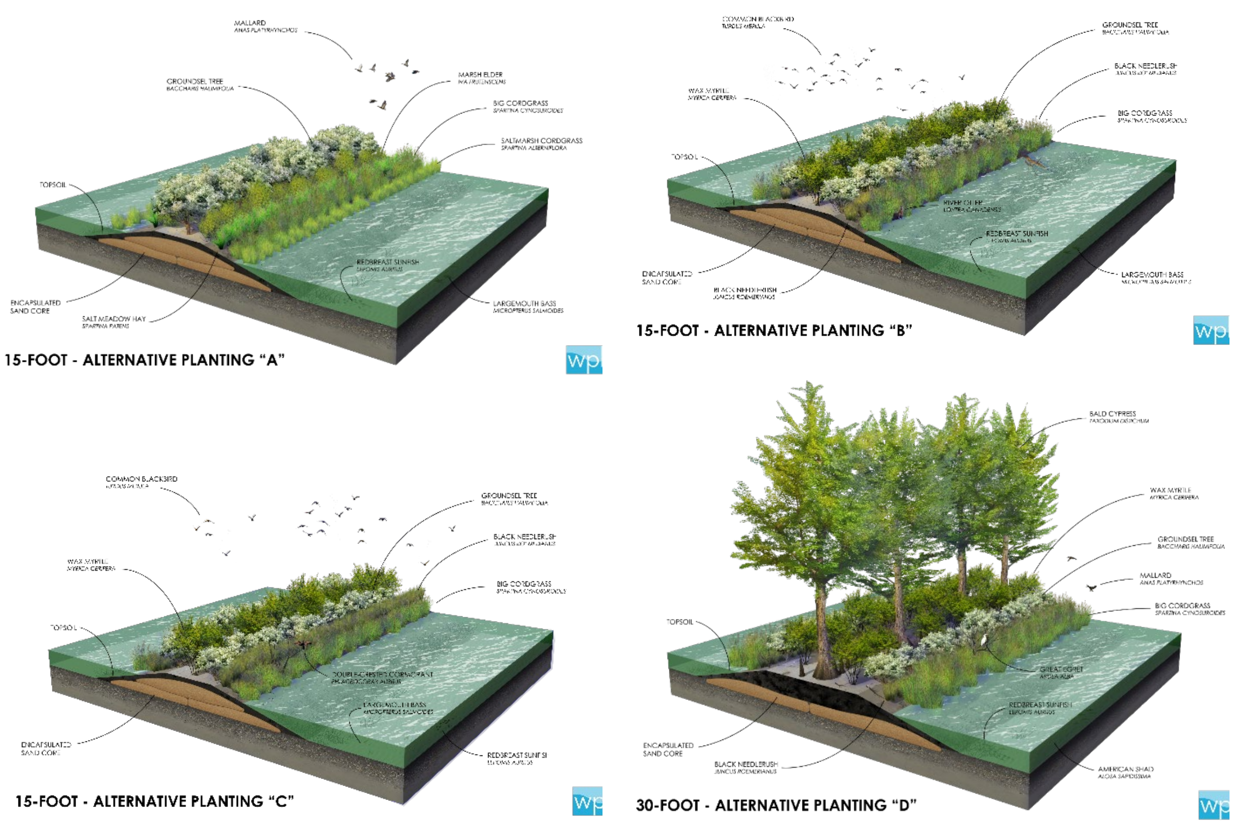

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities
CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the: o Virginia Beach City Council o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase. • City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.
REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to: o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan. o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound. • Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to: o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures. o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee . o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation. • Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

- Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

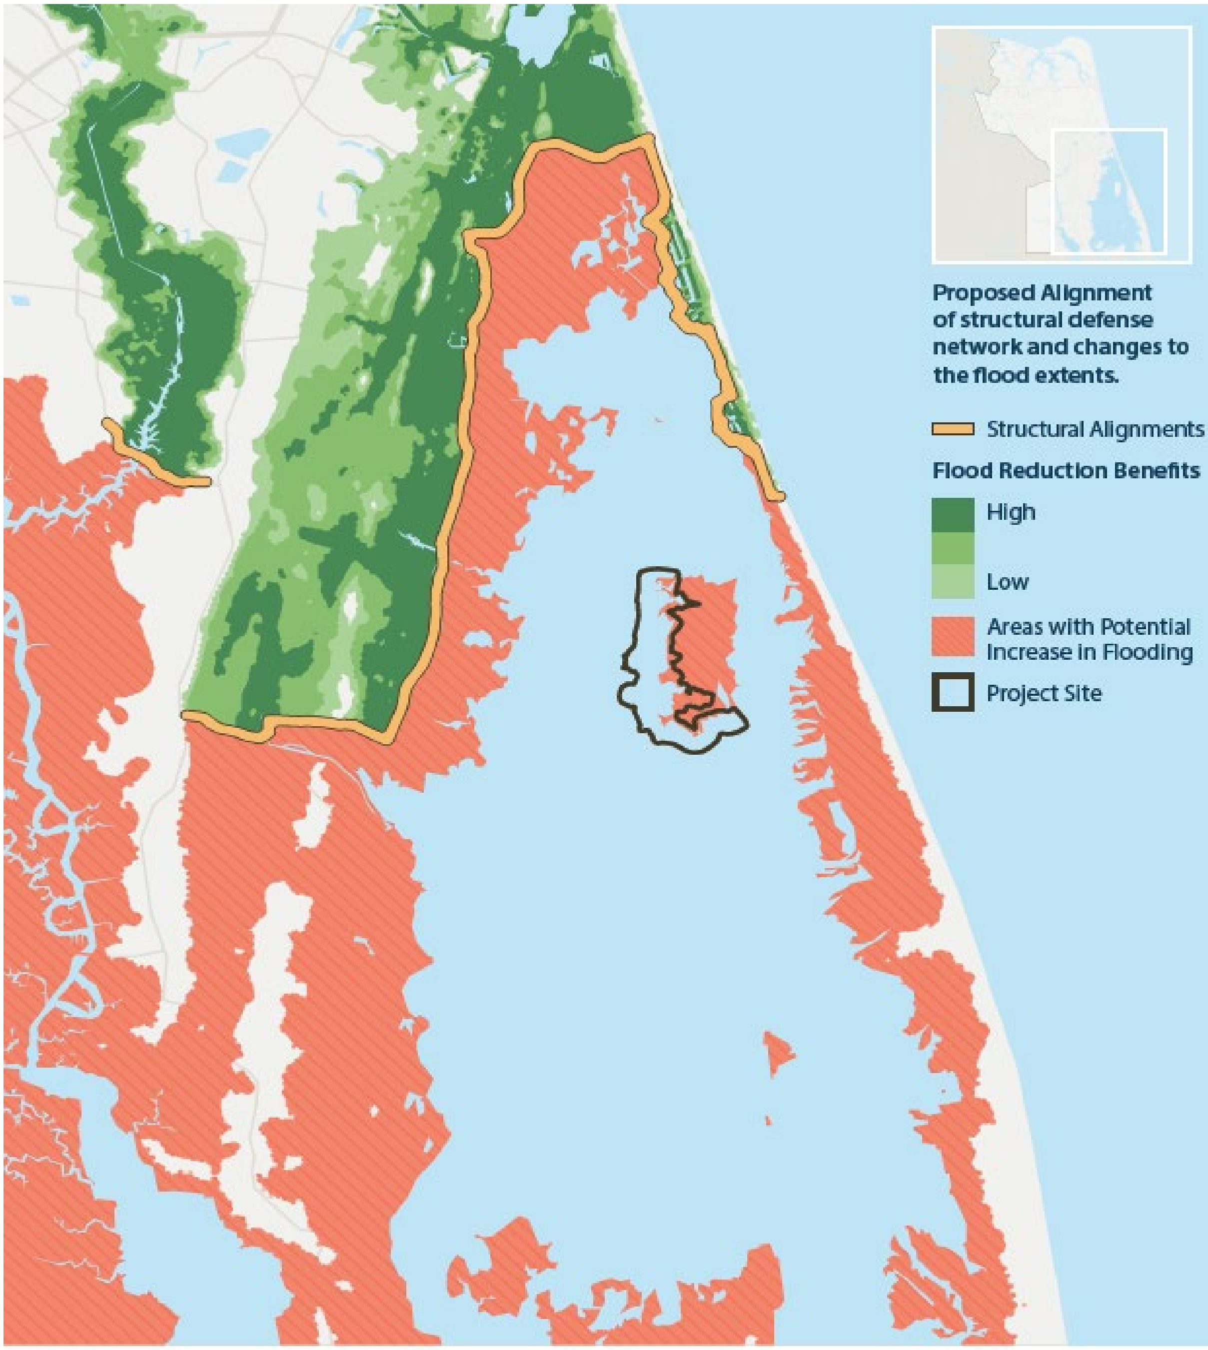

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

Virginia Beach, VA 23452

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**
    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

    a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
    a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
    b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
    c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
    a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
    b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
    a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Jared Brandwein

Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed

Megan Reed
Refuge Manager

Albemarle - Pamlico
National Estuary Partnership

Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping <u>records that are necessary for the administration of these regulations, including:</u>

<u>1.</u> ~~flood~~ <u>Flood</u> insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; <u>and</u>

<u>2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.</u>

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A.~~ ~~Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B.~~ ~~Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C.~~ ~~Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D.~~ ~~Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E.~~ ~~Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F.~~ ~~Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G.~~ ~~Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H.~~ ~~Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~

~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ <u>Reserved.</u>

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~<u>F</u>ully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ <u>design</u> flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ <u>design</u> flood ~~protection~~ elevation.

3. <u>Space below the lowest floor of SFHAs delineated on the FIRM shall</u> ~~I~~<u>i</u>nclude measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C.~~ ~~The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1.~~ ~~Public and private outdoor recreational facilities;~~

~~2.~~ ~~Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3.~~ ~~Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

   a. ~~Only one (1) such stand shall be permitted per lot;~~

   b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

   c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

   1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

   2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C. When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

    a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

    b. Comply with the Public Works Design Standards Manual; and

    c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

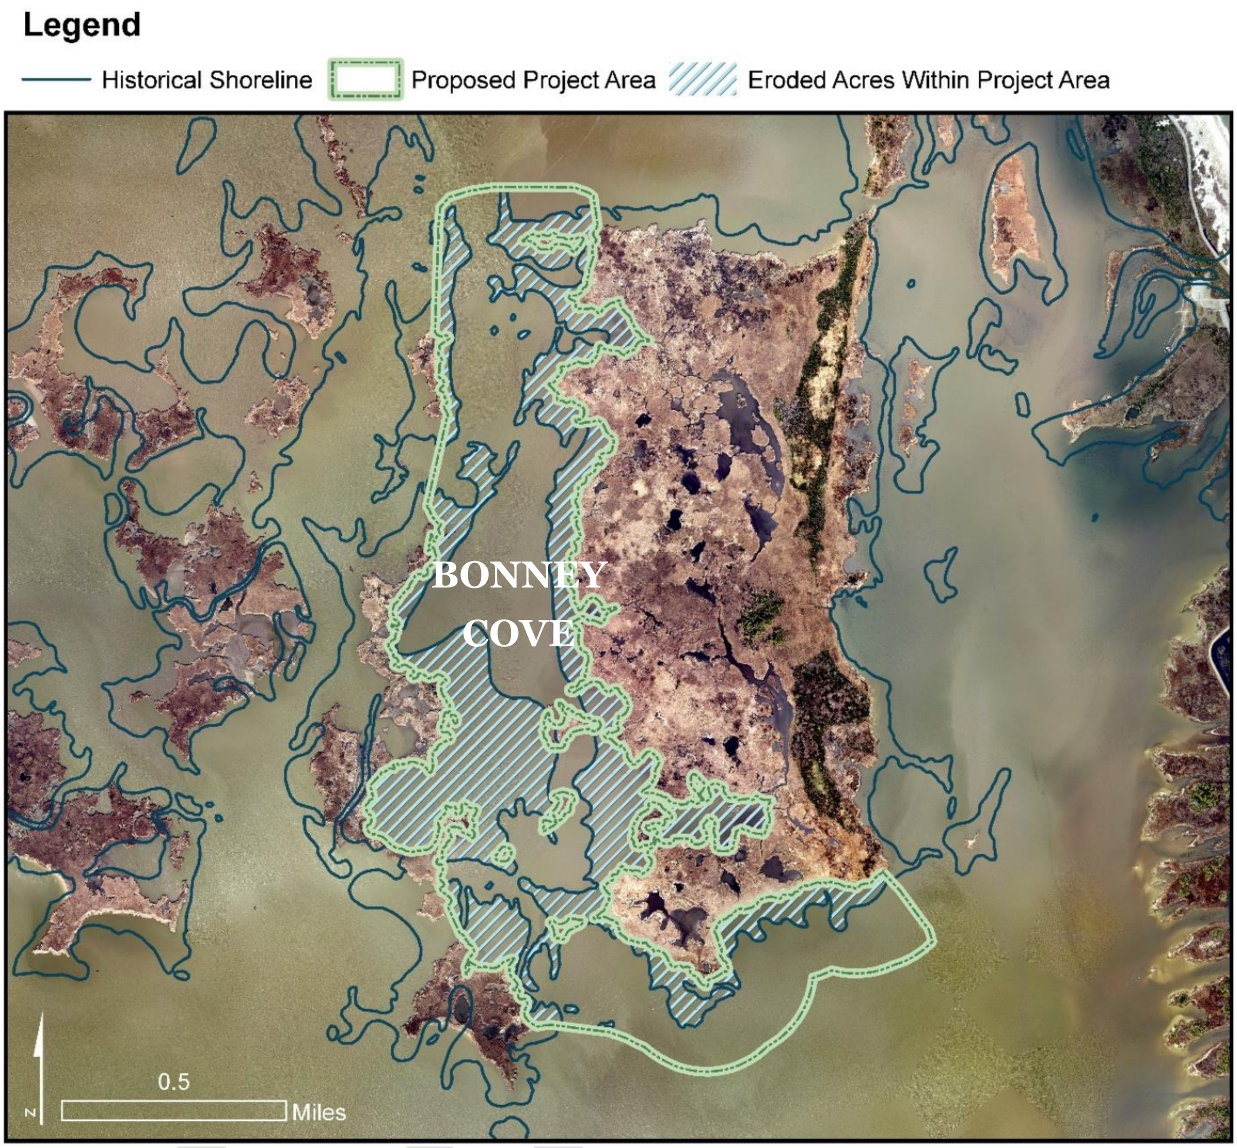

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

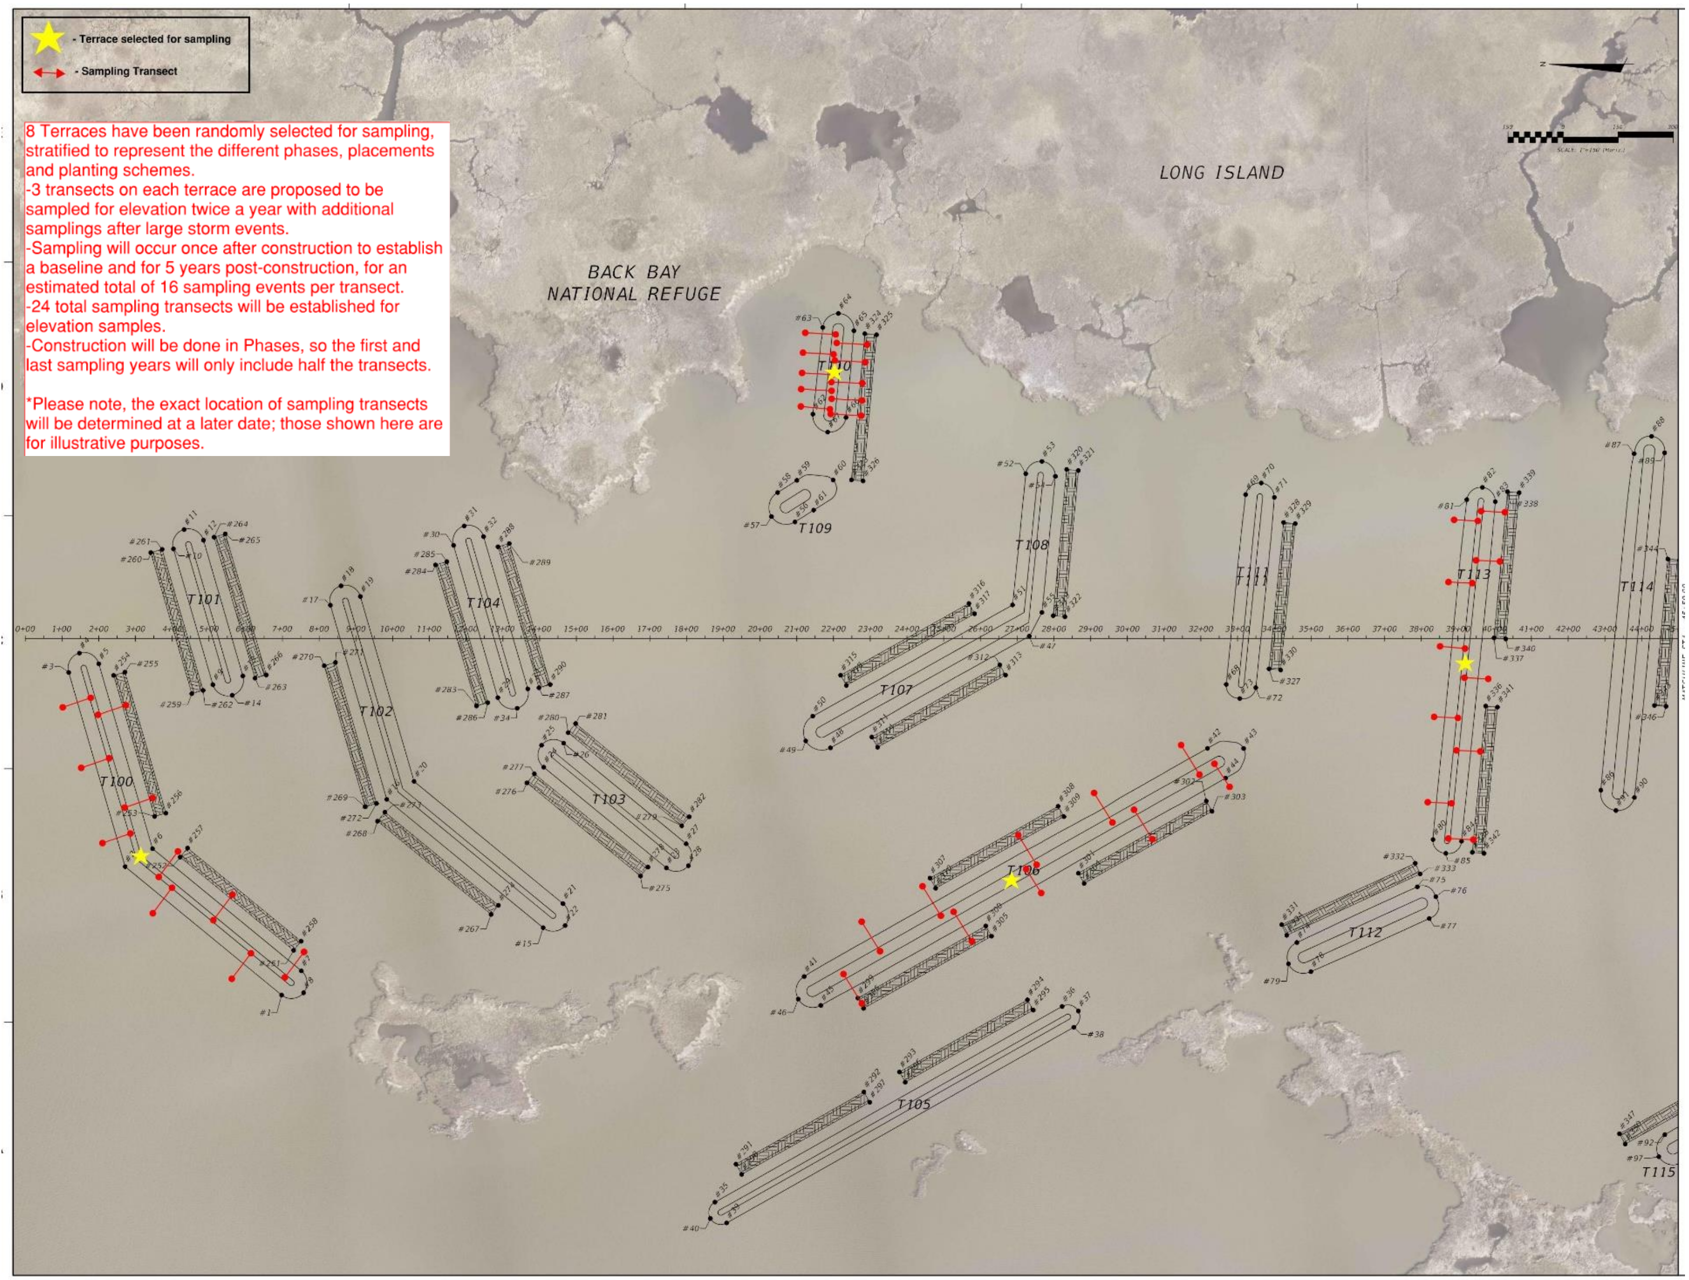

Figure 3: Monitoring design site plan – North Terraces

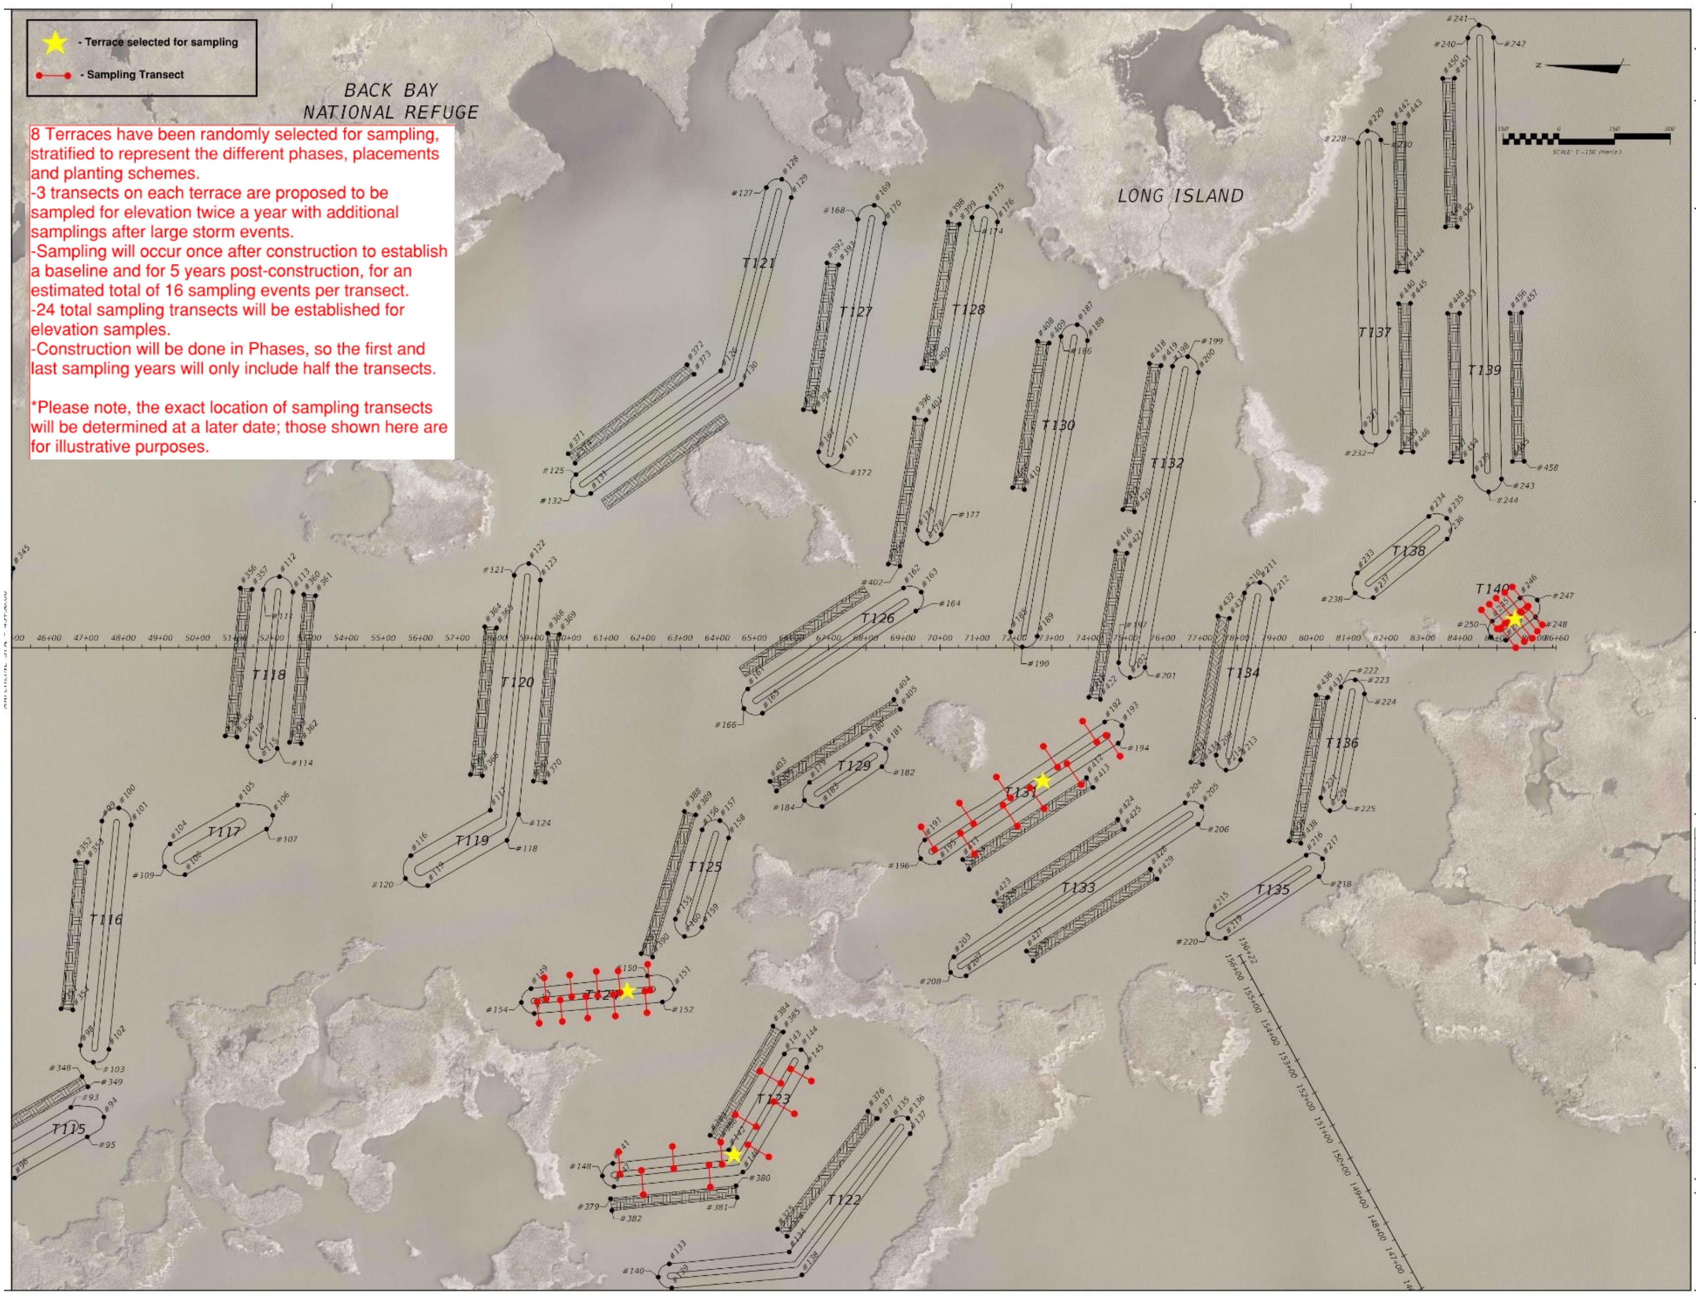

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

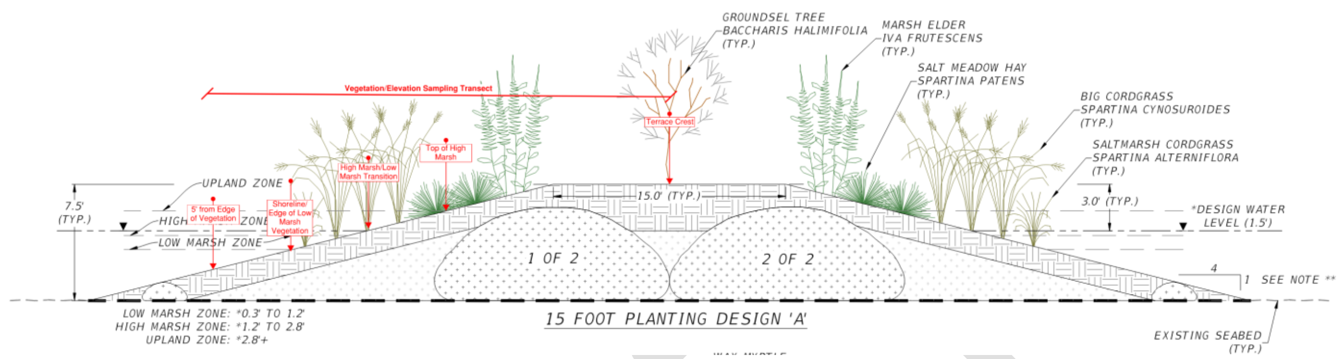

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

MONITORING RESULTS

2023 Virginia Community Flood Preparedness Fund

Marsh Restoration in Back Bay, Virginia Beach

CITY OF VIRGINIA BEACH

Table of Contents

Appendix A – Application Form

Applicants must have prior approval from the Department to submit <u>applications, forms, and supporting documents by mail in lieu of the WebGrants portal.</u>

Appendix A: Application Form for Grant and Loan Requests for All Categories

---

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Name of Local Government:

Category Being Applied for (check one):

☐ **Capacity Building/Planning**

☑ **Project**

☐ **Study**

NFIP/DCR Community Identification Number (CID) 515531

Name of Authorized Official and Title: Toni Utterback, Stormwater Engineering Center Administrator

Signature of Authorized Official: Katie E Shamm for Toni Utterback

Mailing Address (1): 2875 Sabre Street, Suite 250

Mailing Address (2): ______

City: Virginia Beach **State:** Virginia **Zip:** 23452

Telephone Number: (757) 385-8746 **Cell Phone Number:** (____) ______

Email Address: TPUtterback@vbgov.com

Contact and Title (If different from authorized official): C.J. Bodnar, Technical Services Program Manager

Type text here

Mailing Address (1): 2875 Sabre Street, Suite 250

Mailing Address (2): ______________________________

City: Virginia Beach **State:** Virginia **Zip:** 23452

Telephone Number: (757) 385-8430 **Cell Phone Number:** (____) ________________

Email Address: CBodnar@vbgov.com

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ______________________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ___________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) _________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: _____________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: _________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name:
Community Flood Preparedness Fund &
Resilient Virginia Revolving Loan Fund
Detailed Budget Narrative
Period of Performance: June 2024 through June 2027
Submission Date: November 12, 2023

	Grand Total State Funding Request	$ 5,000,000
	Grand Total Local Share of Project	$ 38,356,966
National Fish and Wildlife Foundation Grants	Federal Funding (if applicable)	$ 10,021,524
	Project Grand Total	$ 53,378,490
	Locality Cost Match	% 71.85

Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

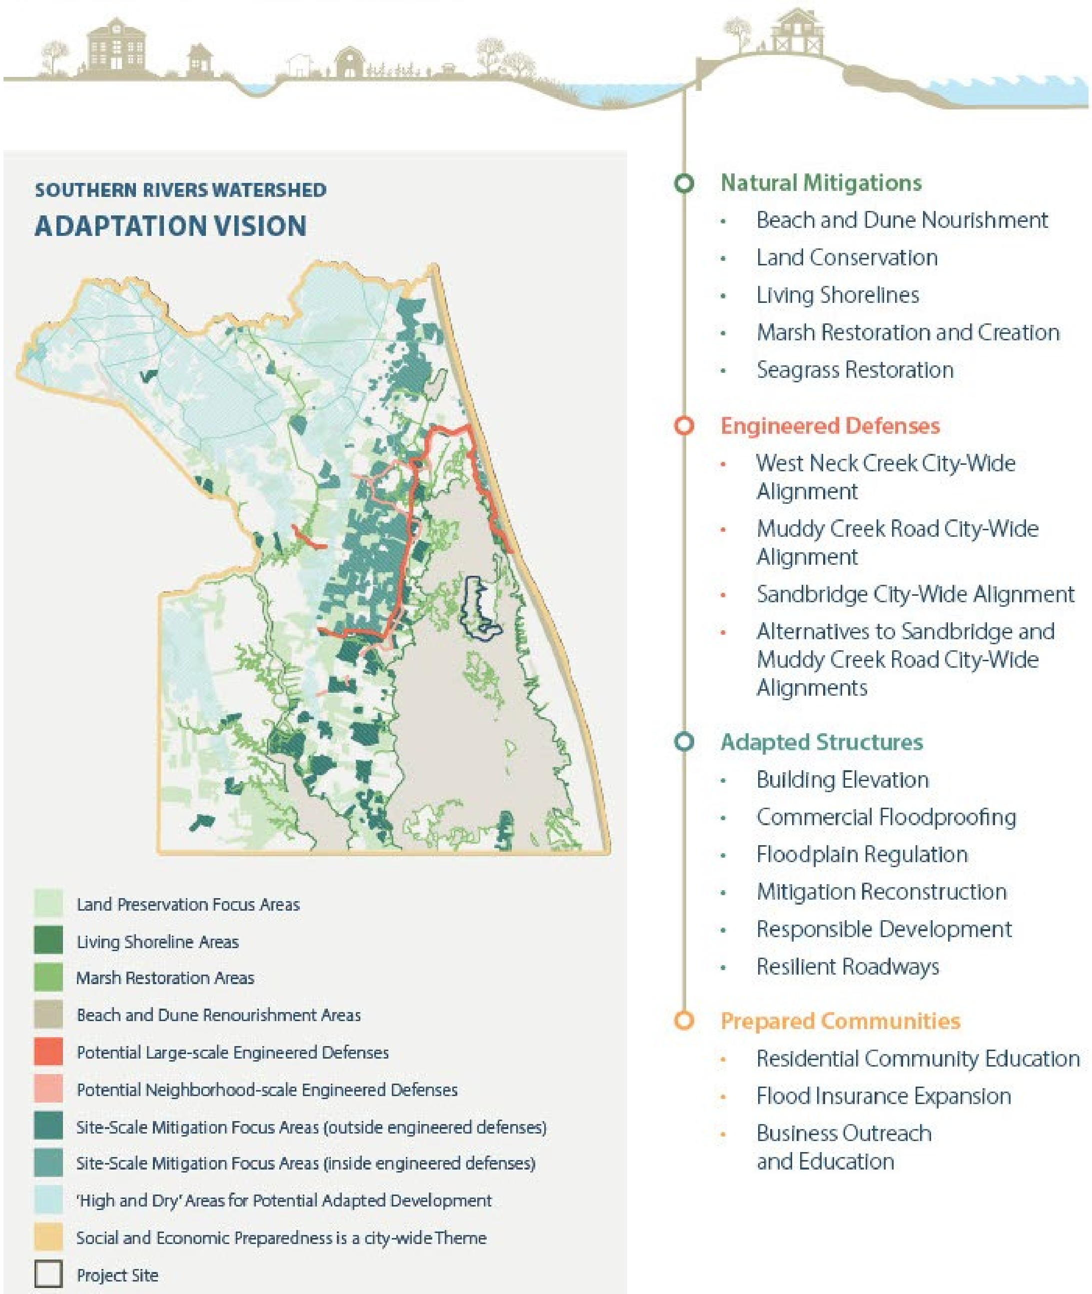

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

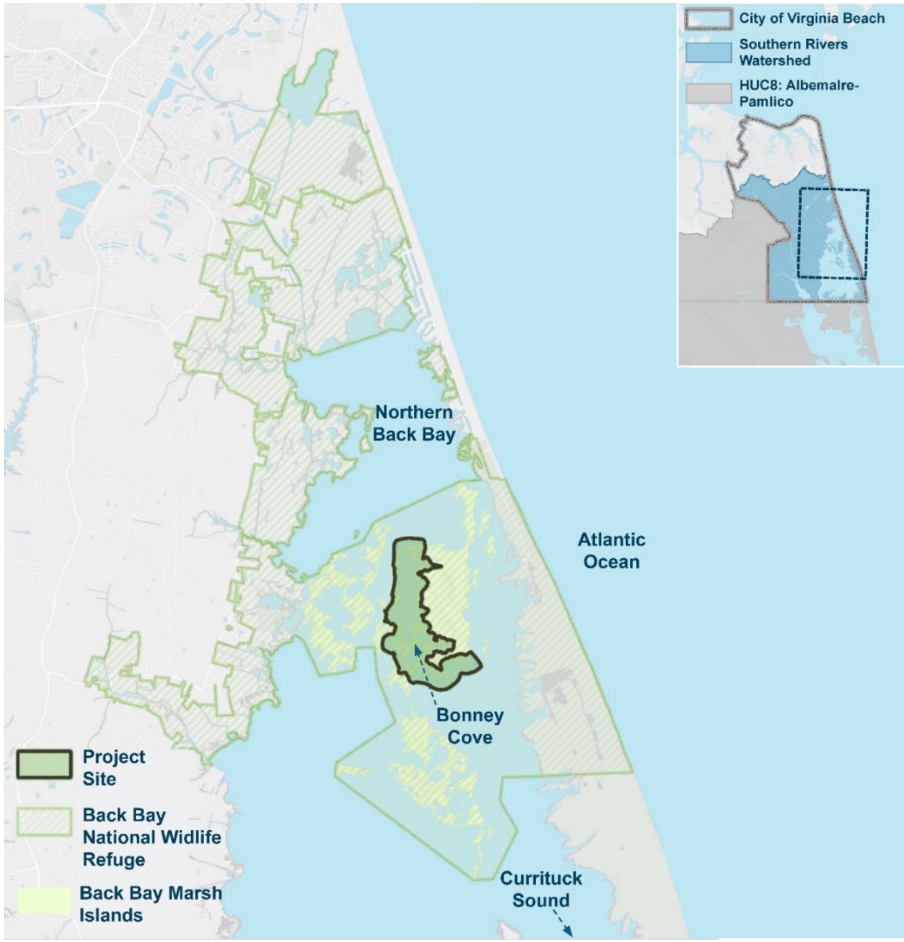

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and “Wind Tide” Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

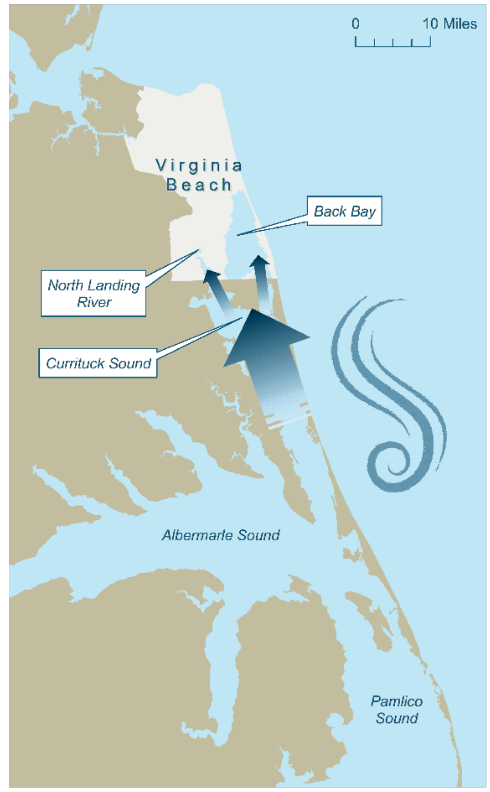

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and “wind tide” flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is “fetch”, which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

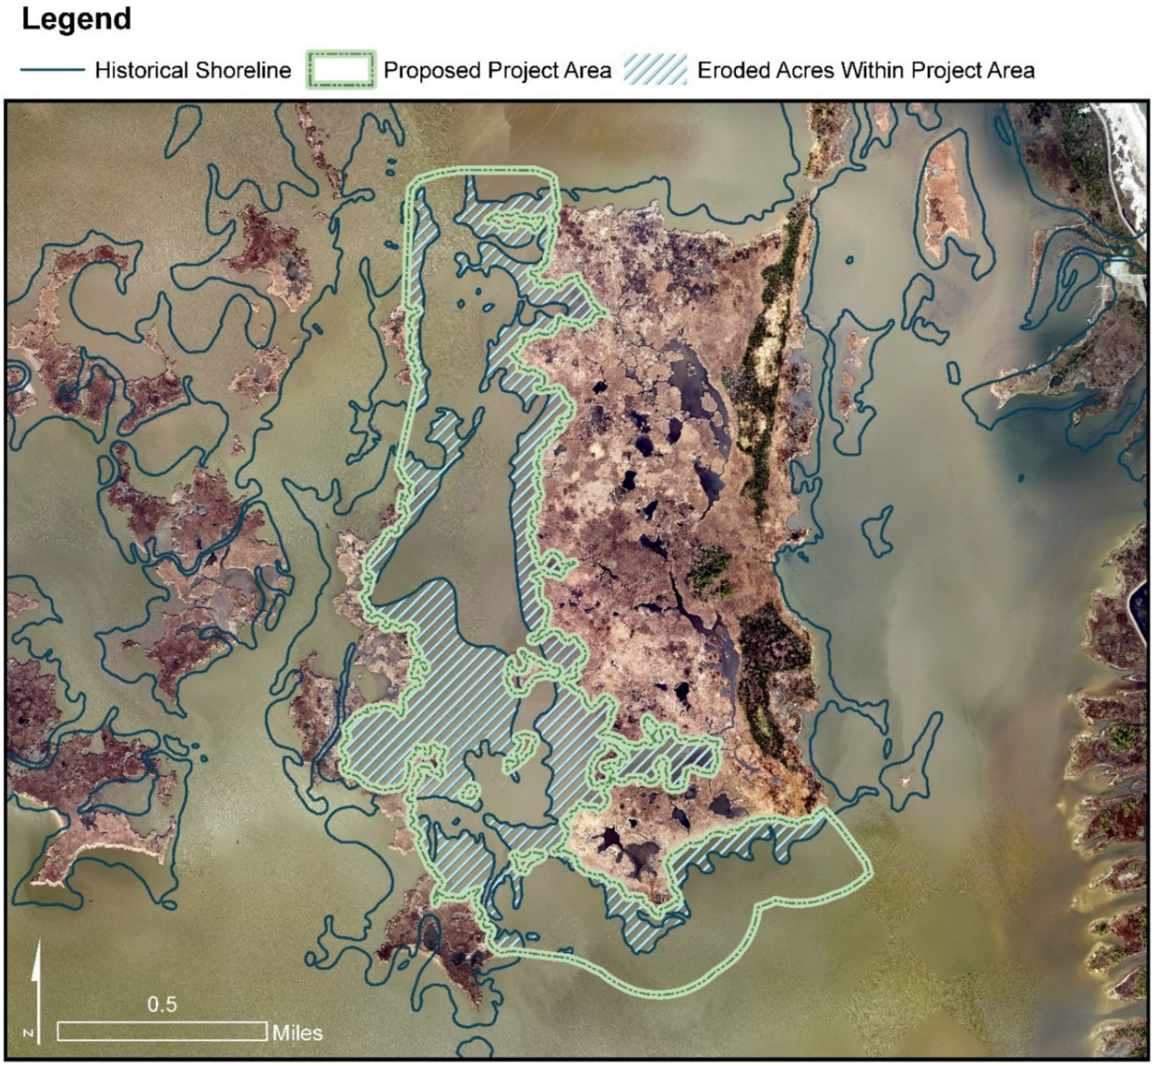

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

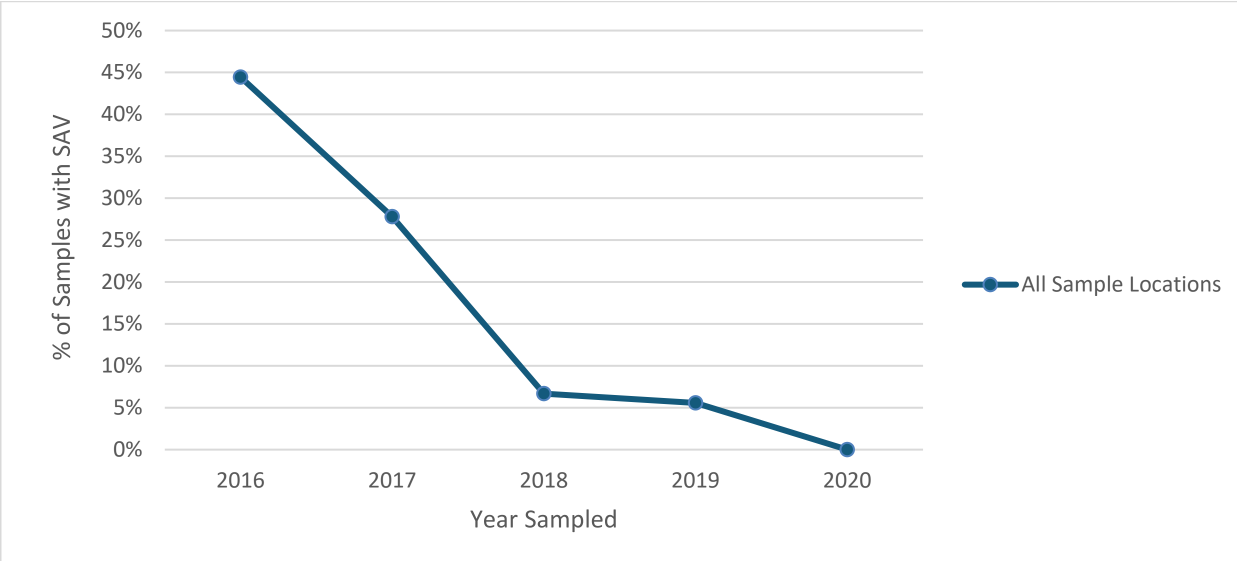

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

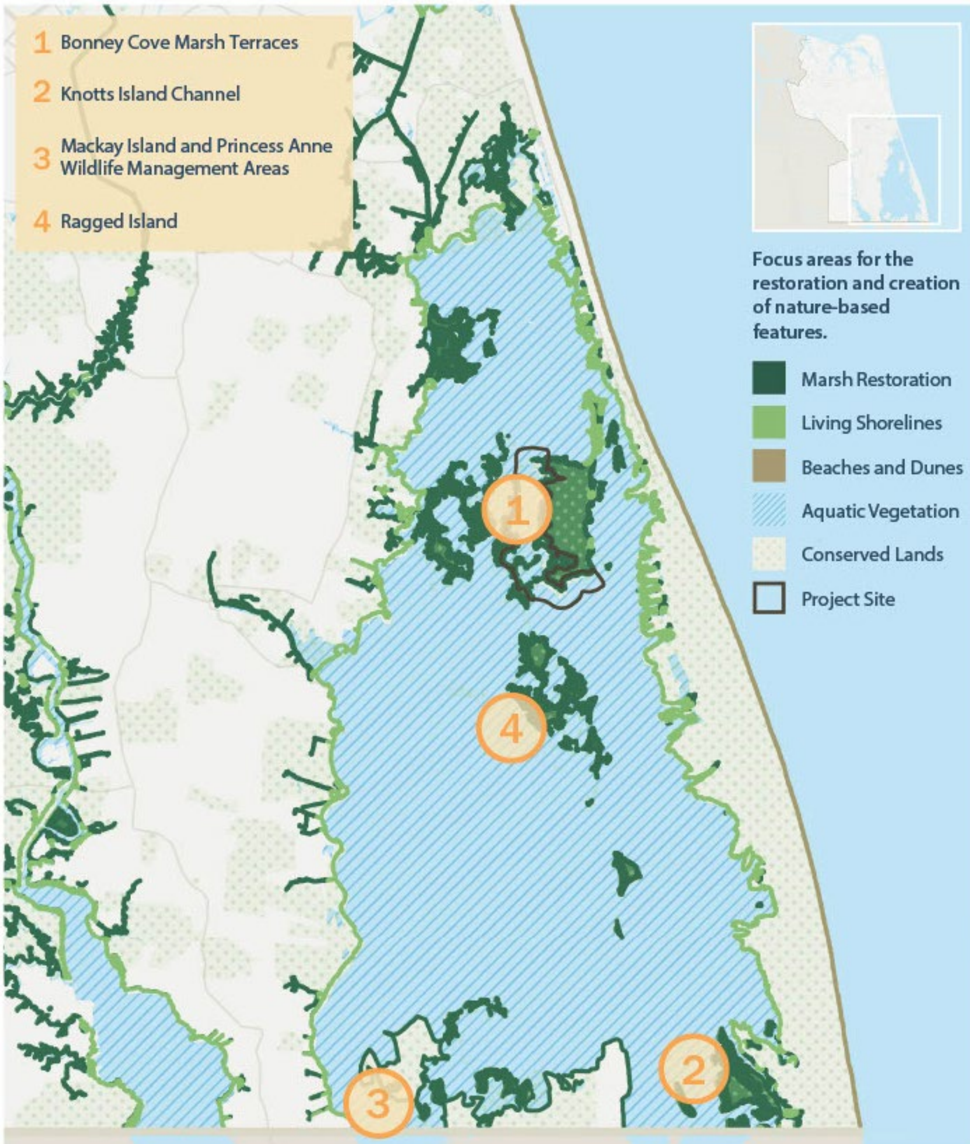

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have “High” and “Very High” impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

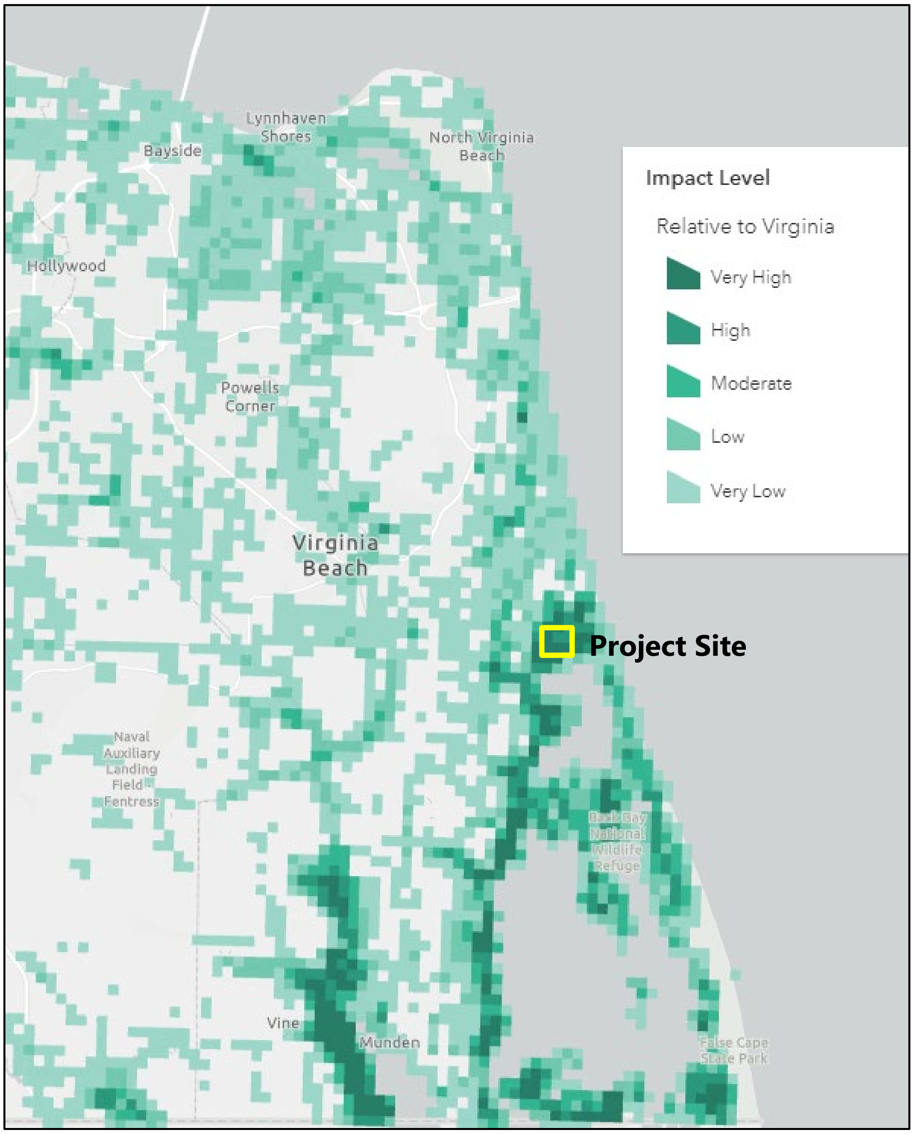

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

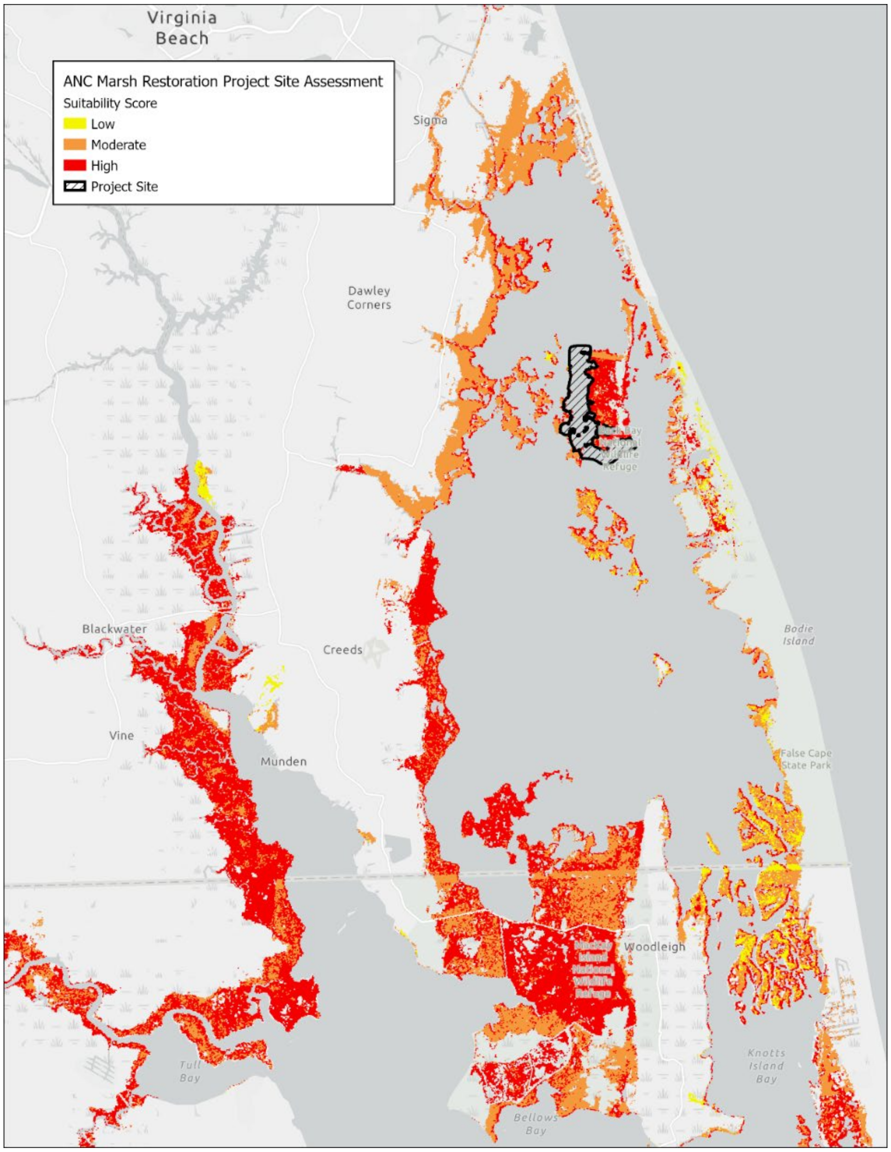

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

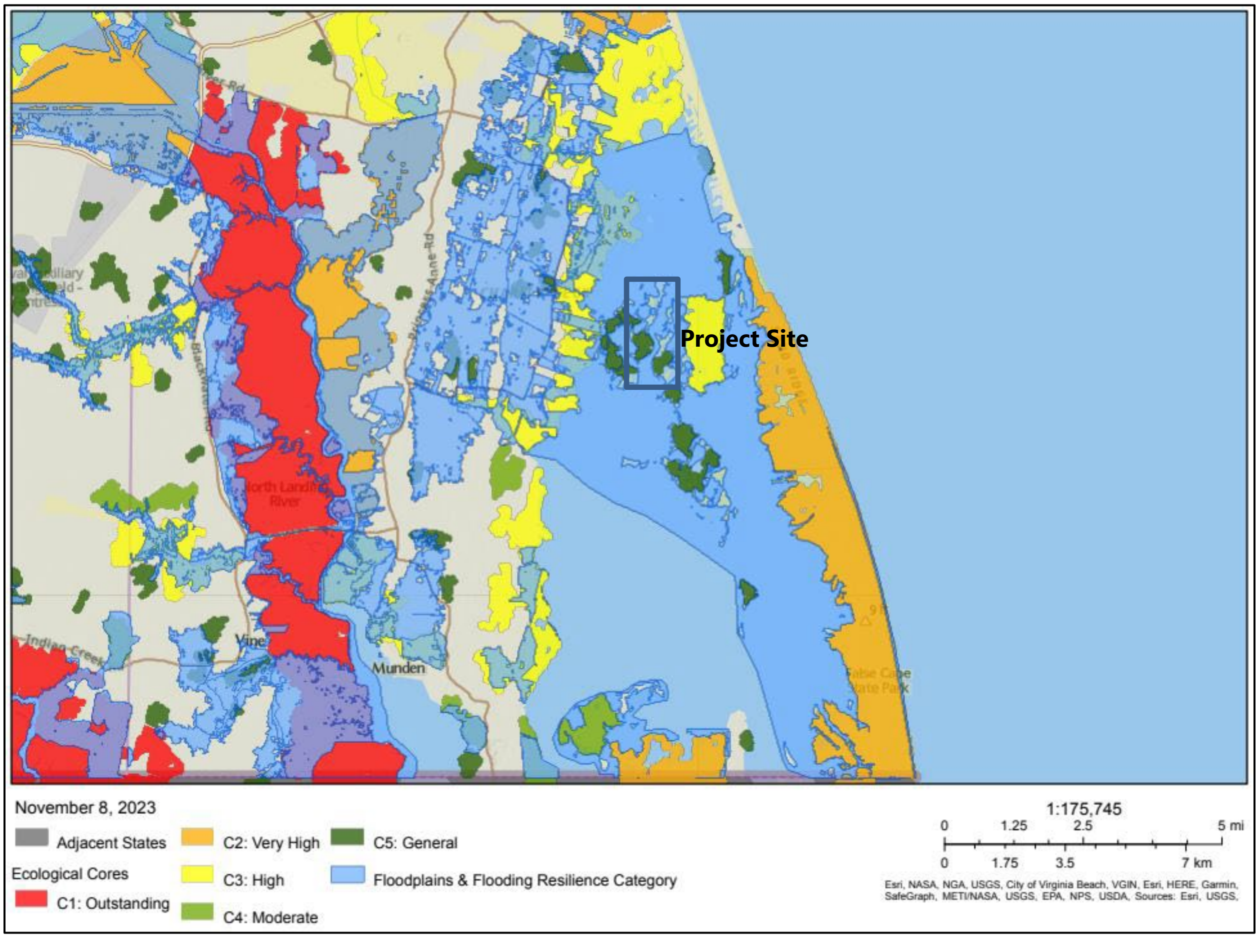

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

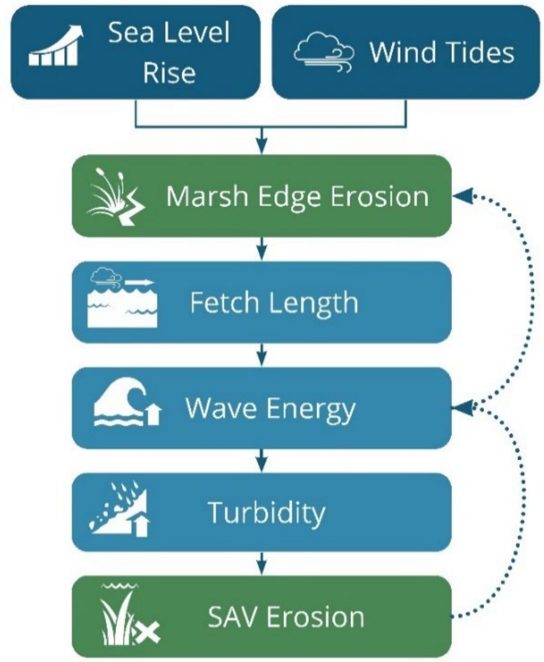

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

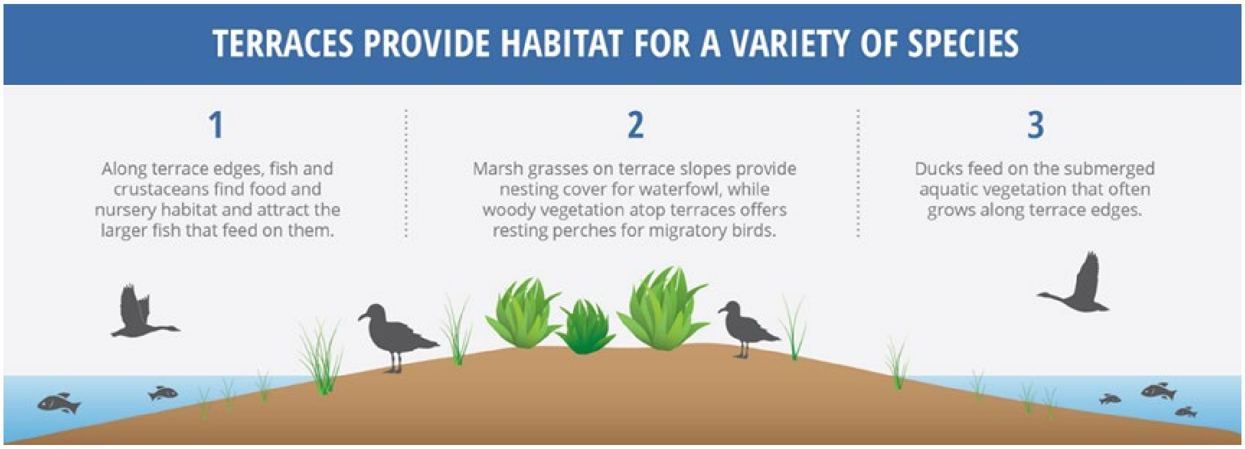

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

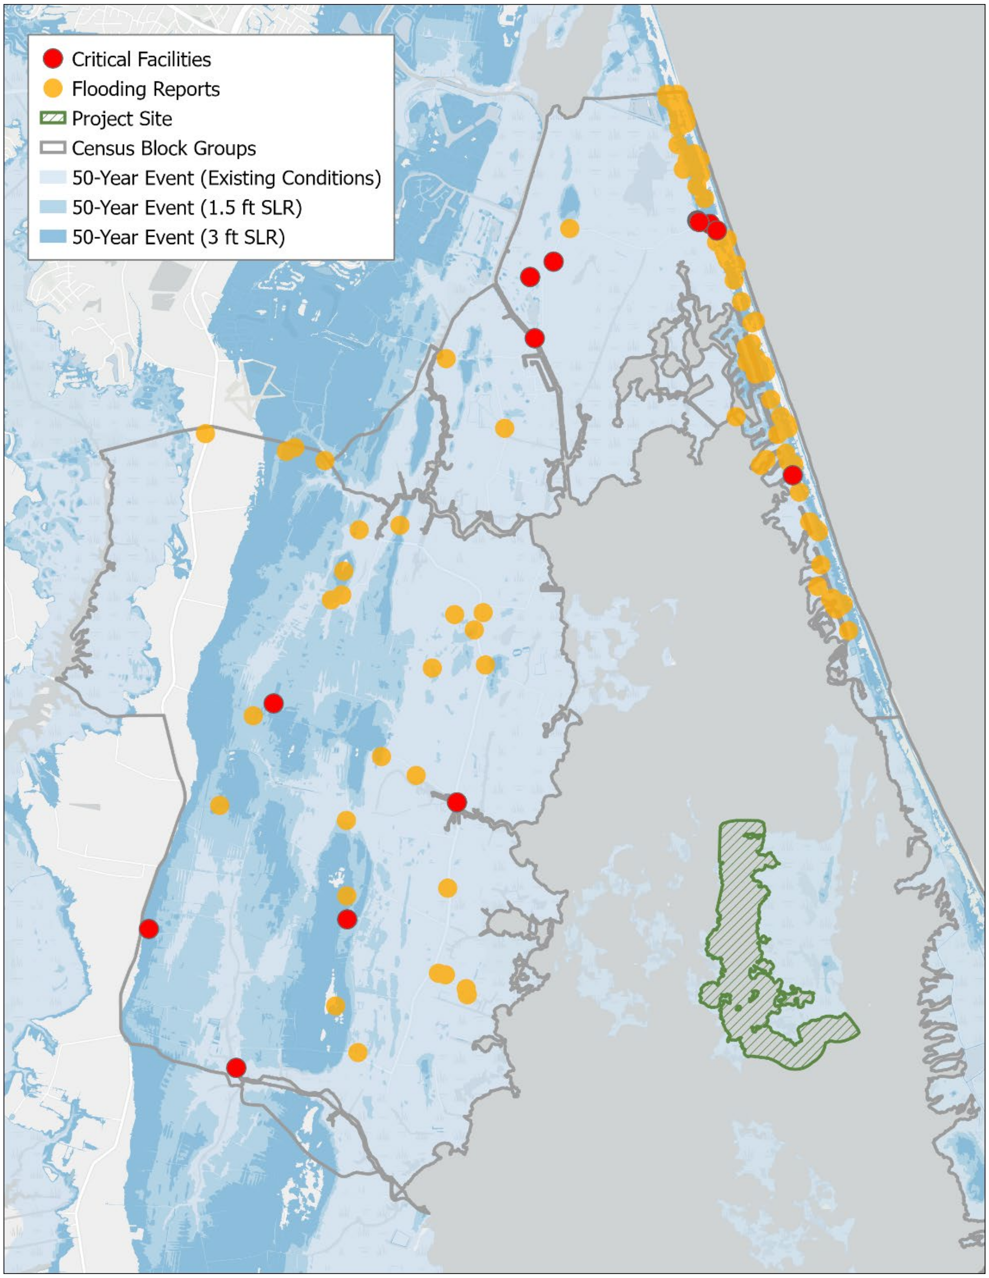

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

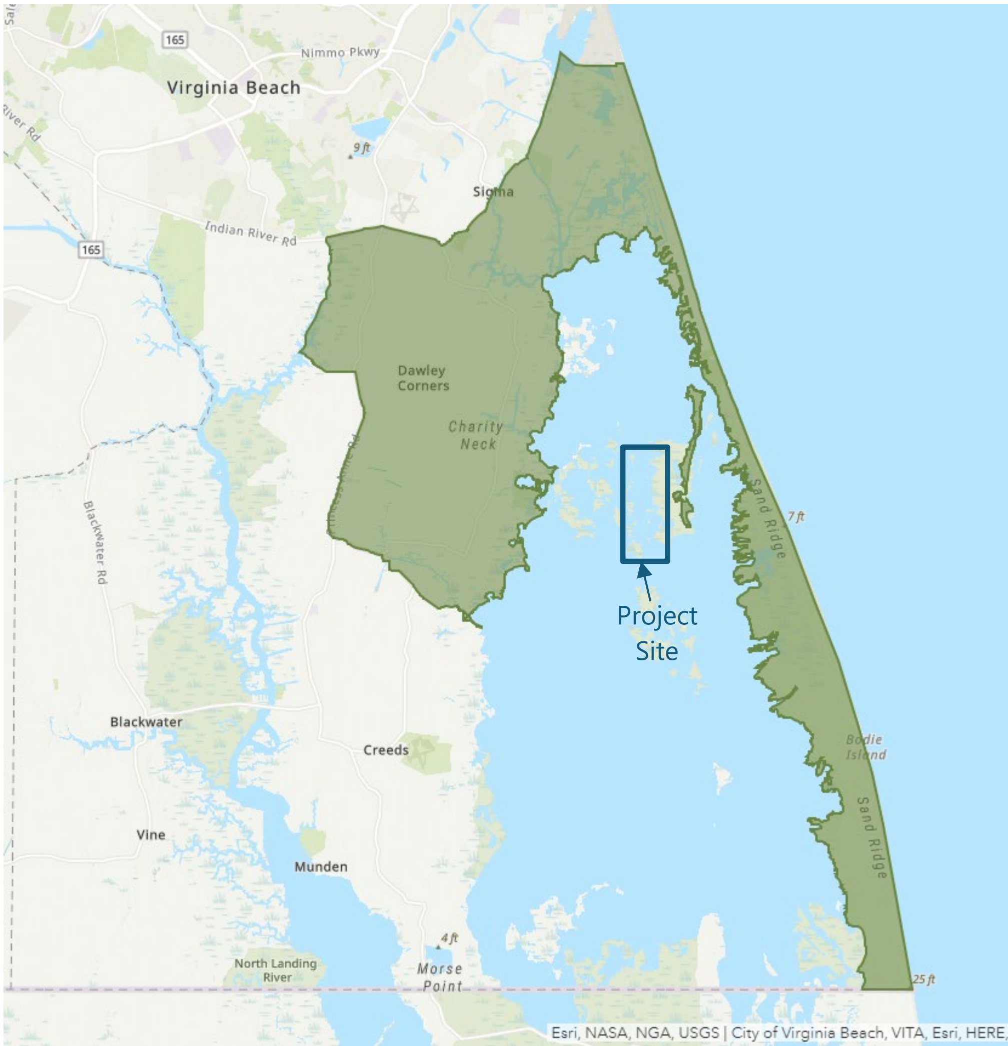

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

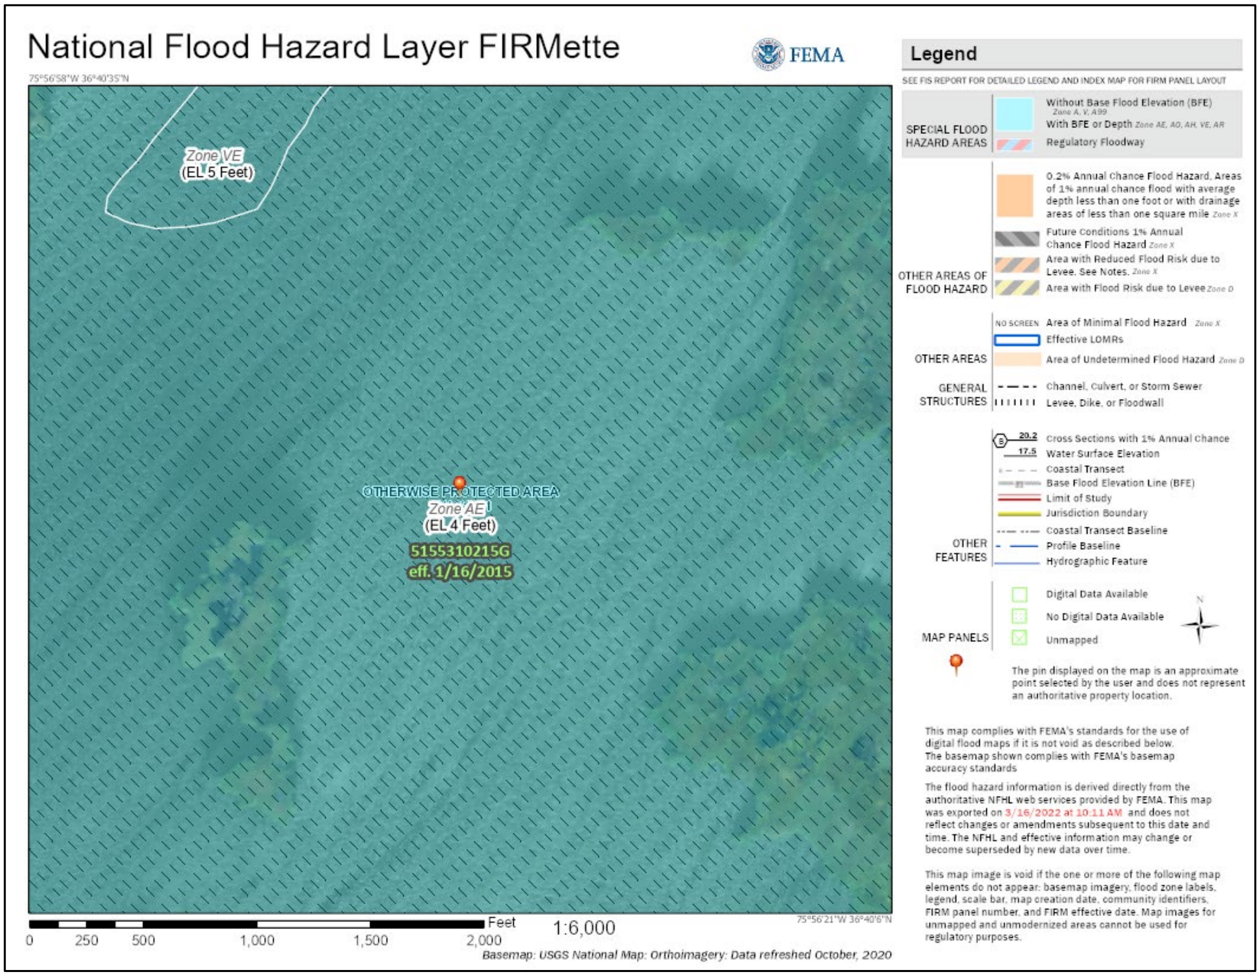

Figure 15: FIRMette for the project area (northern boundary).

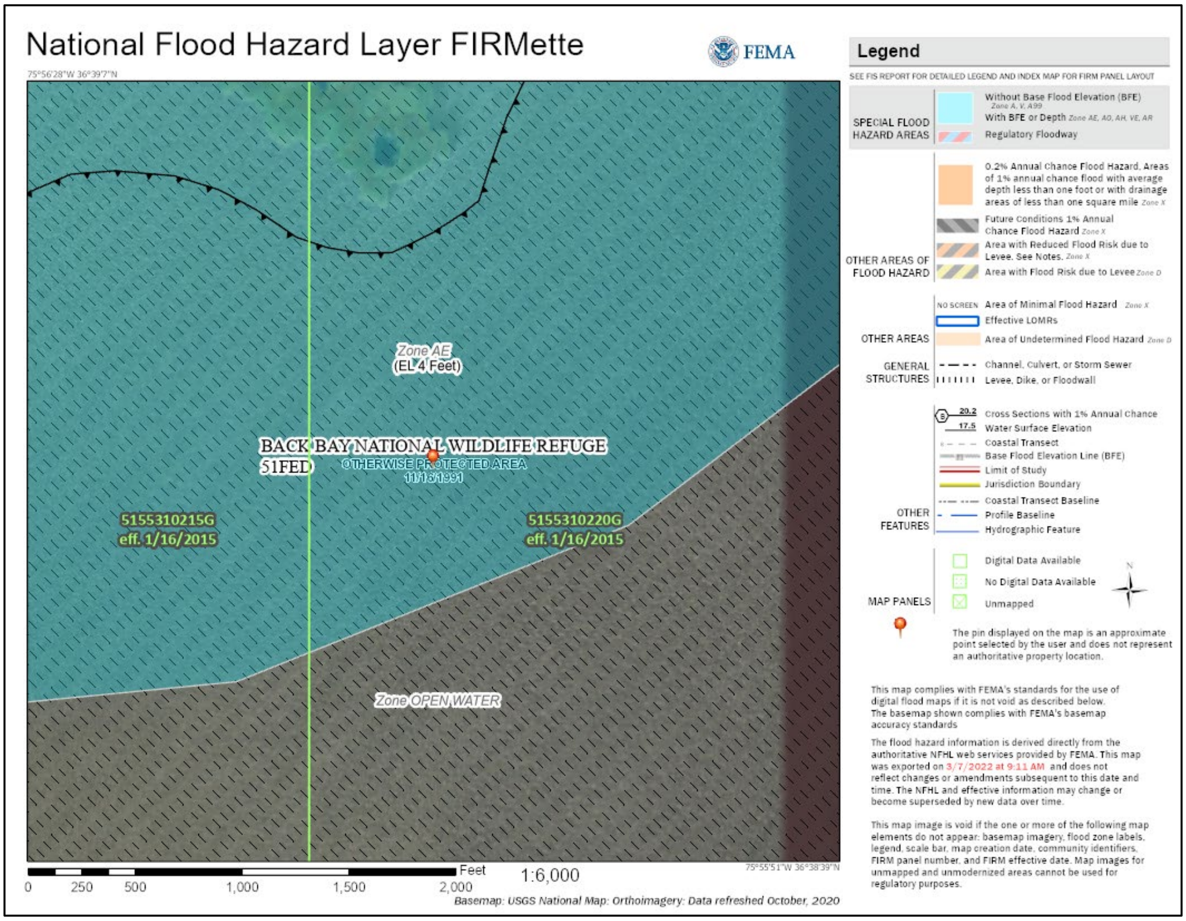

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

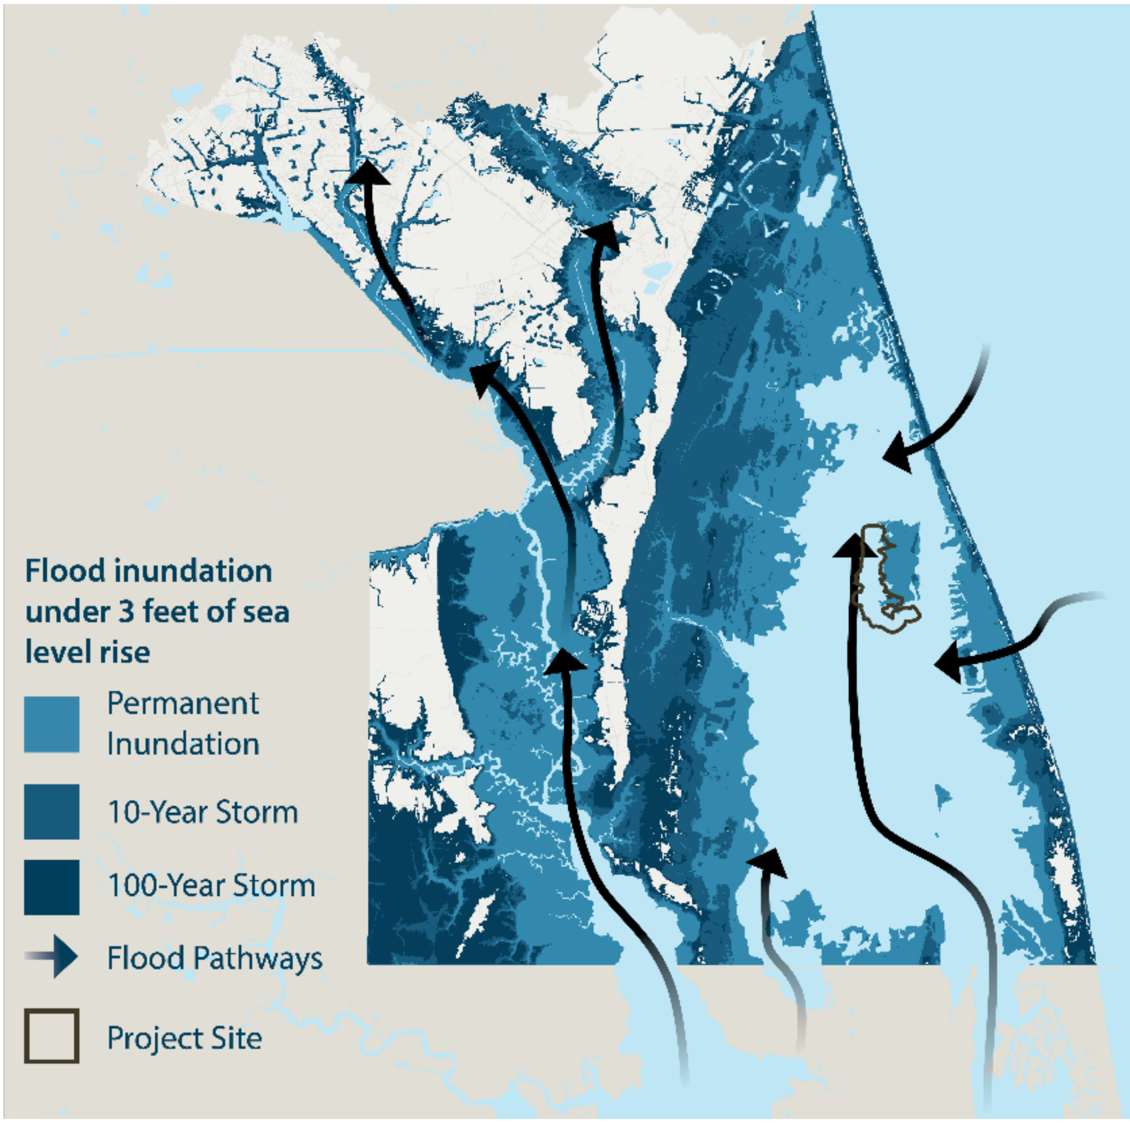

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

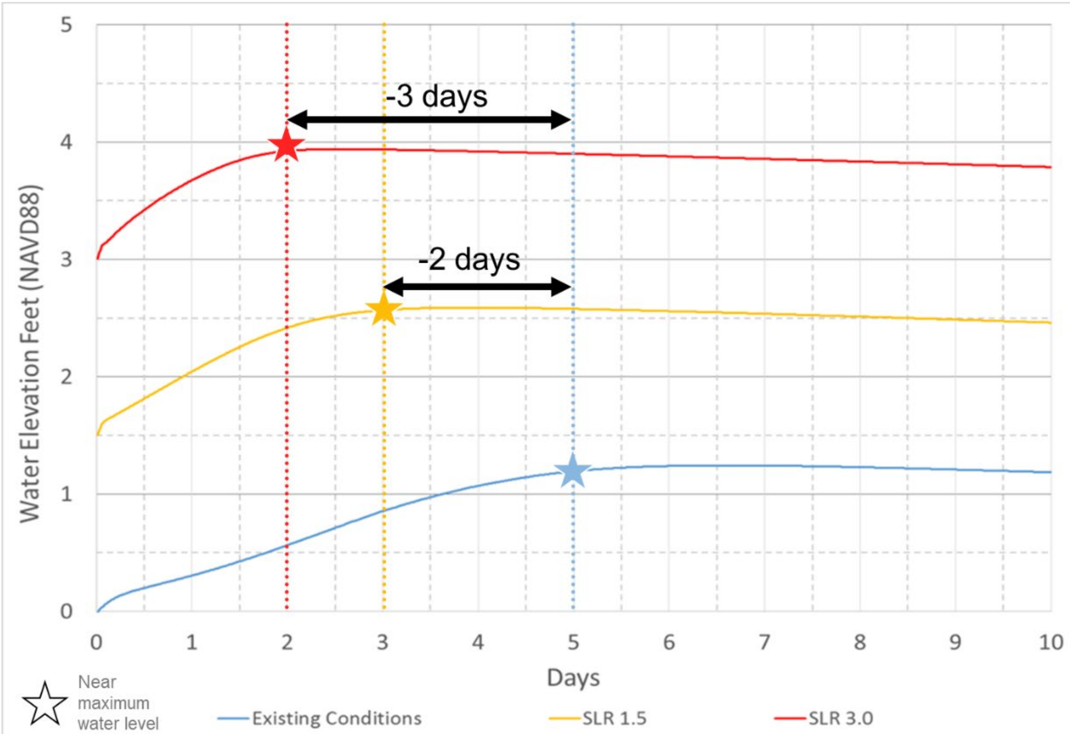

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

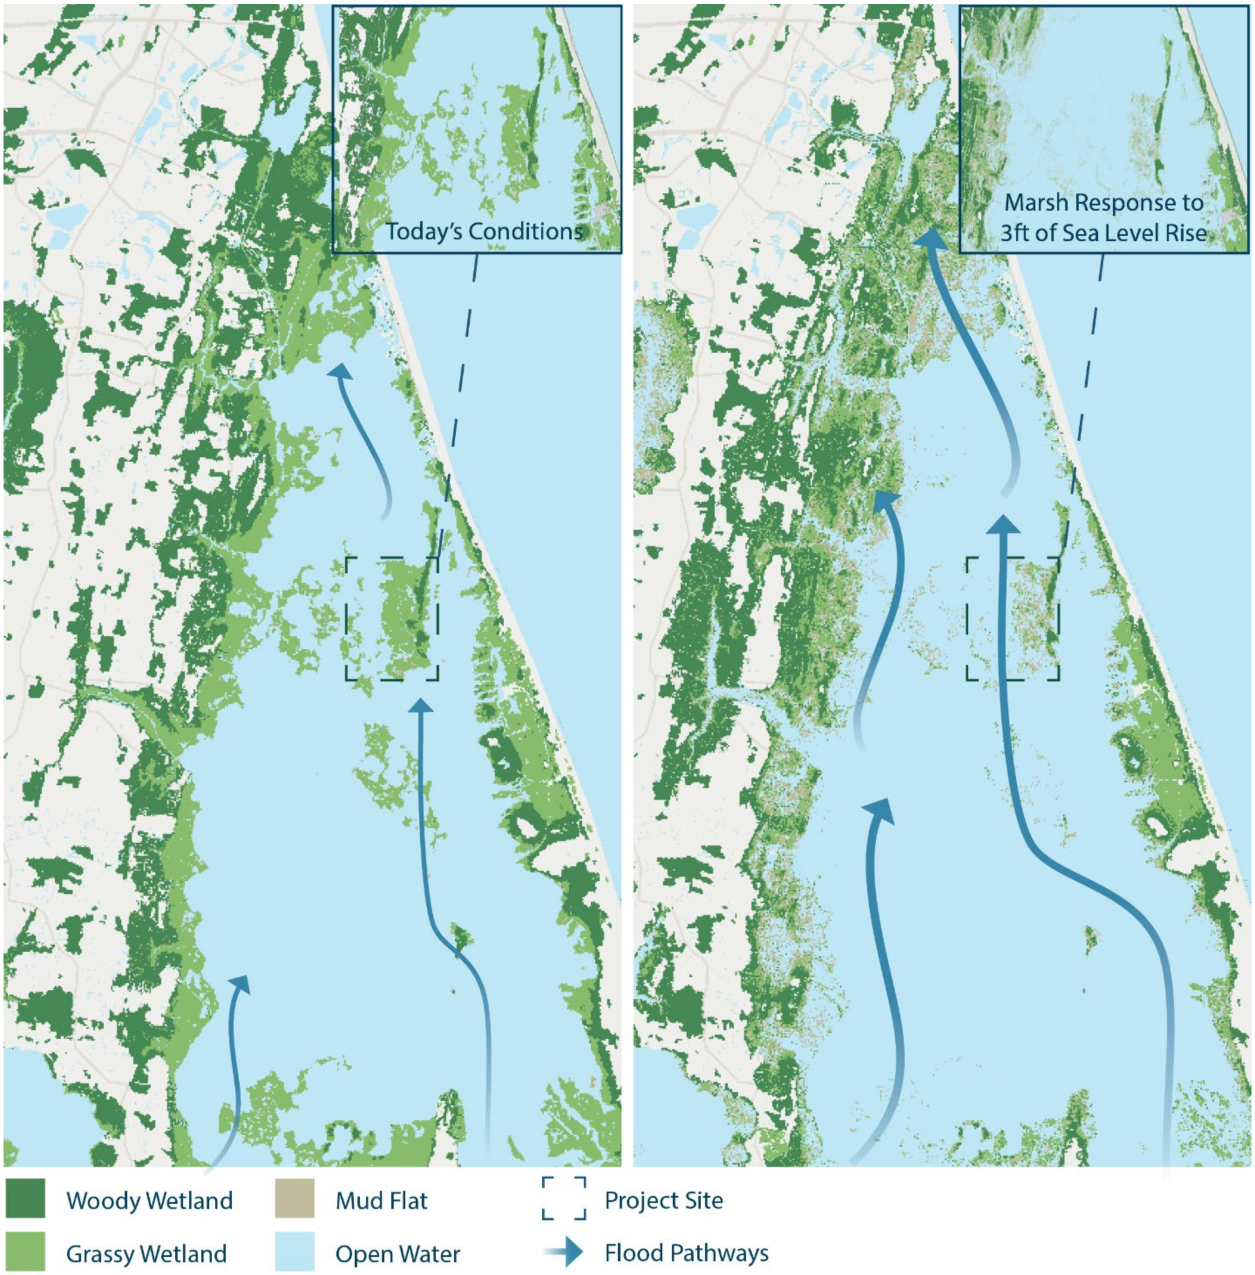

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

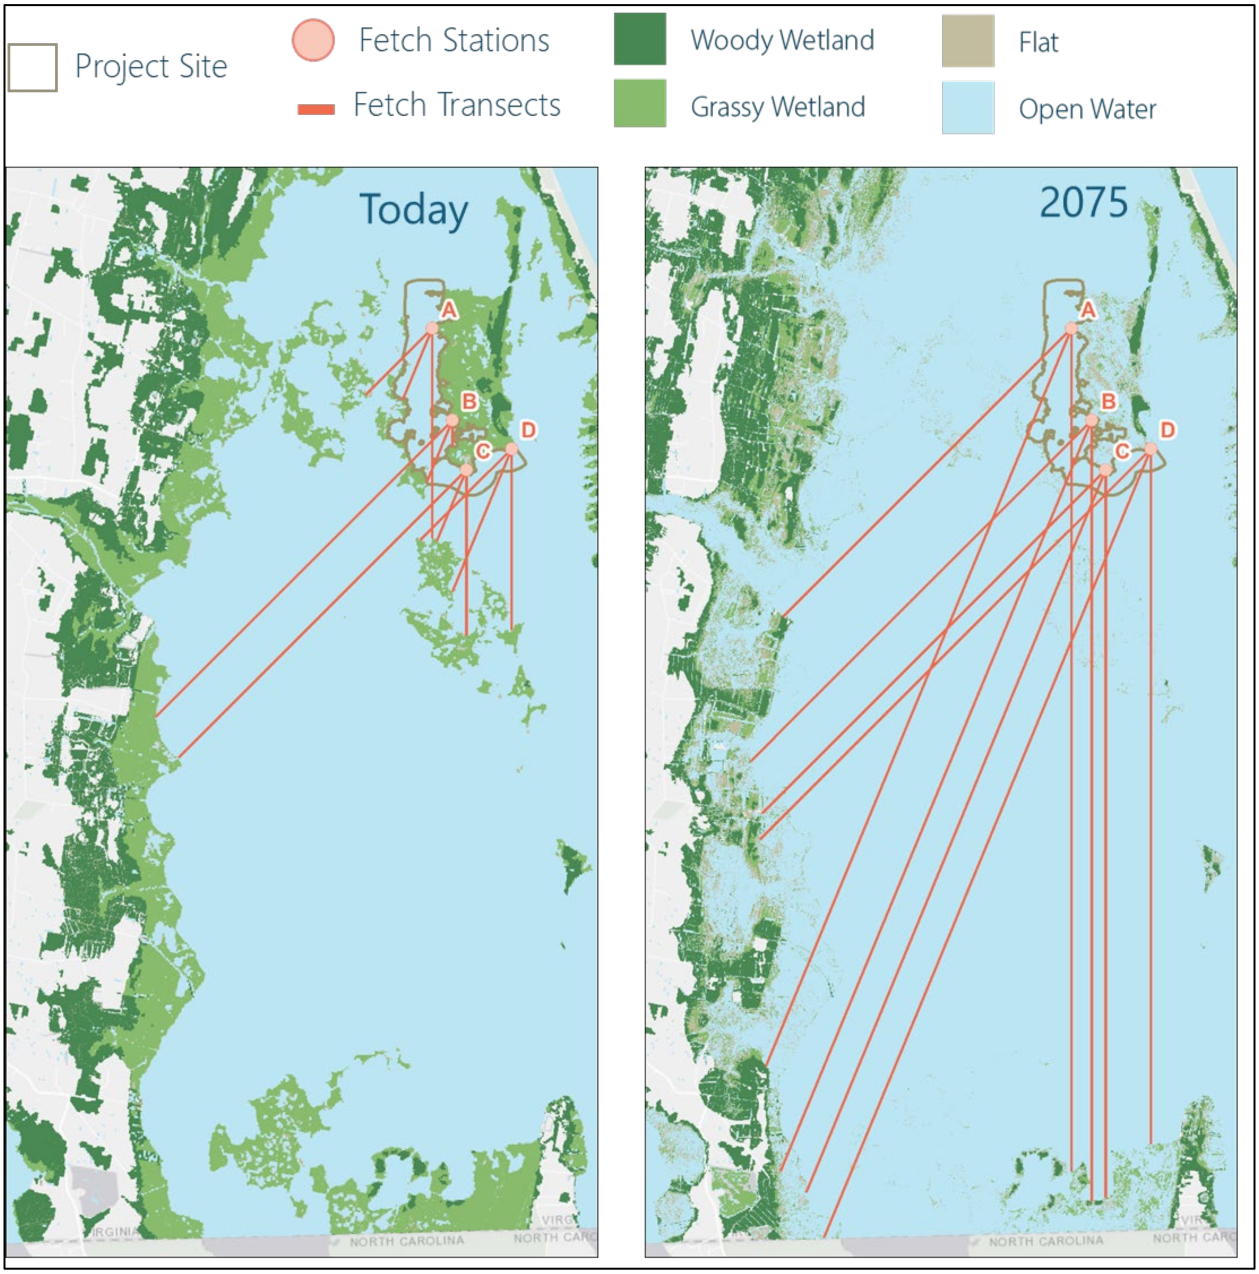

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.

- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

---

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

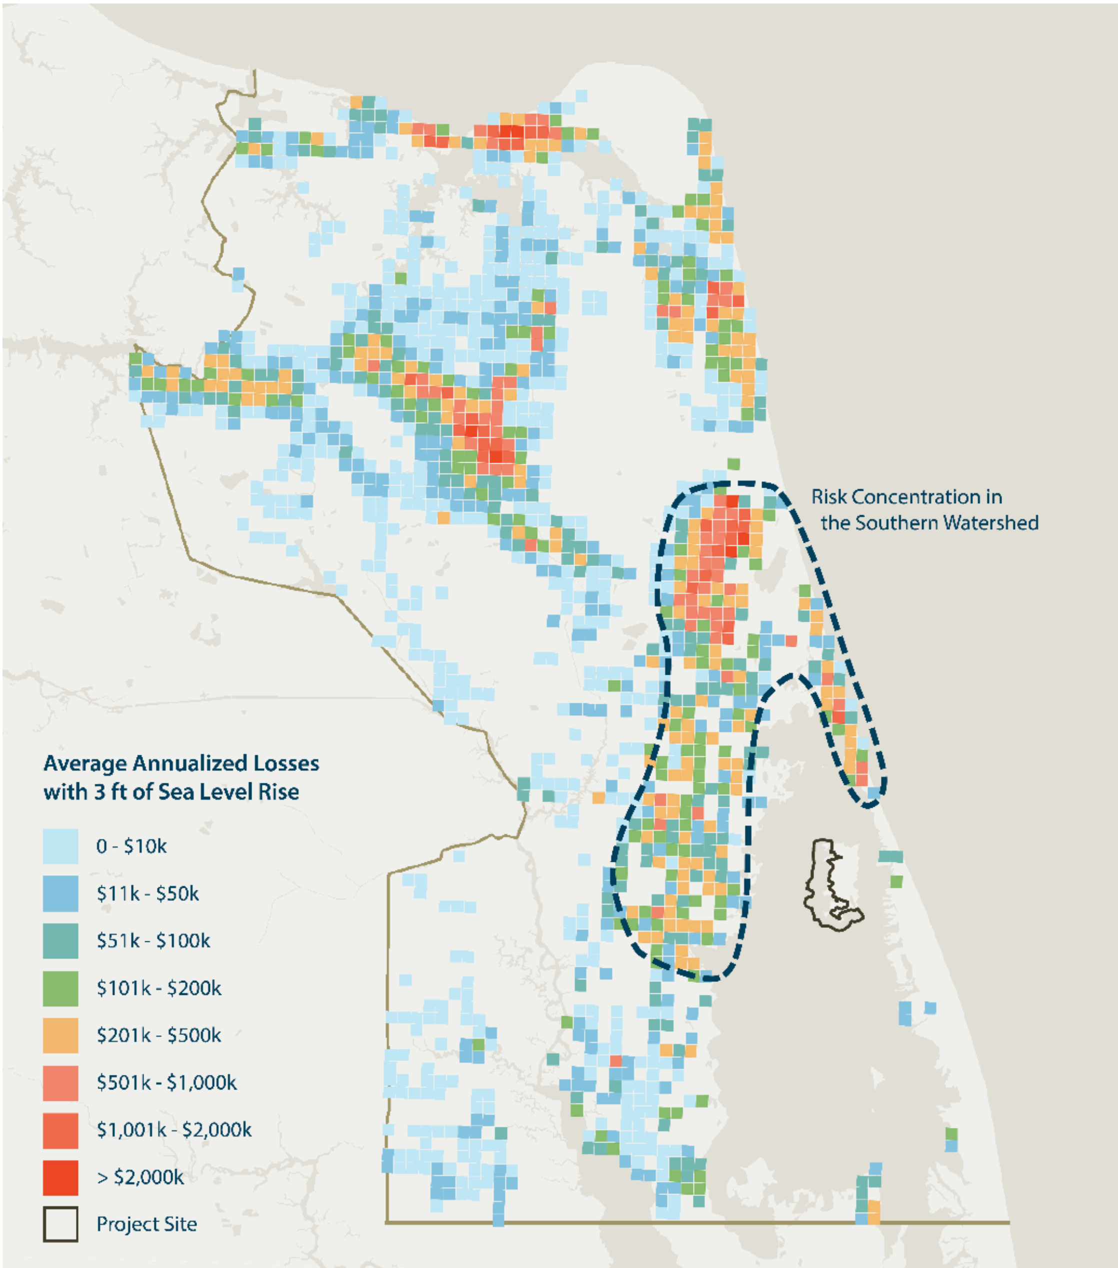

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City’s technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City’s Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City’s Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

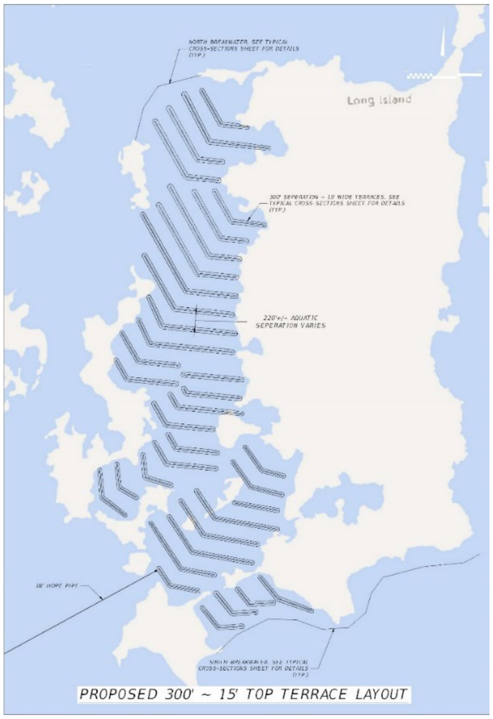

Figure 22: Alternative 2a.

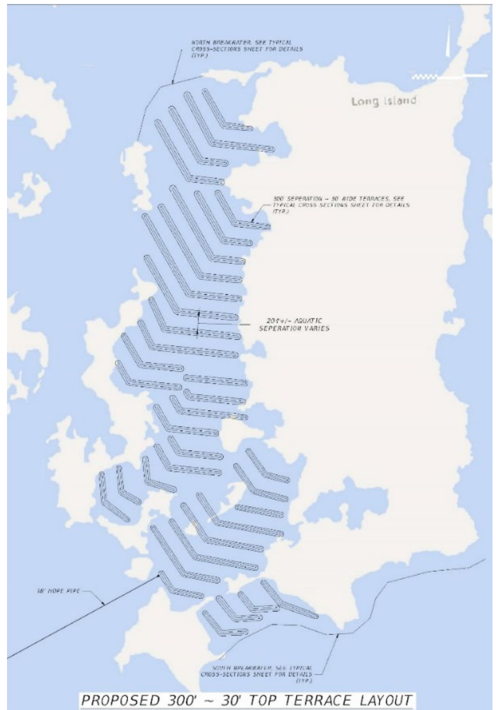

Figure 23: Alternative 2b.

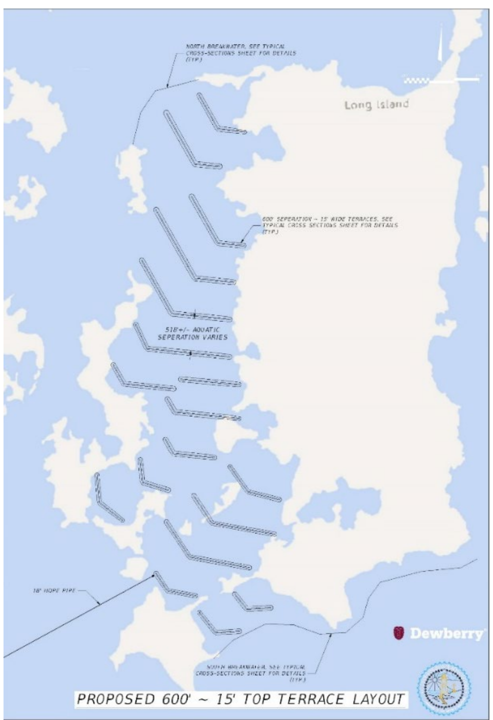

Figure 24: Alternative 2c.

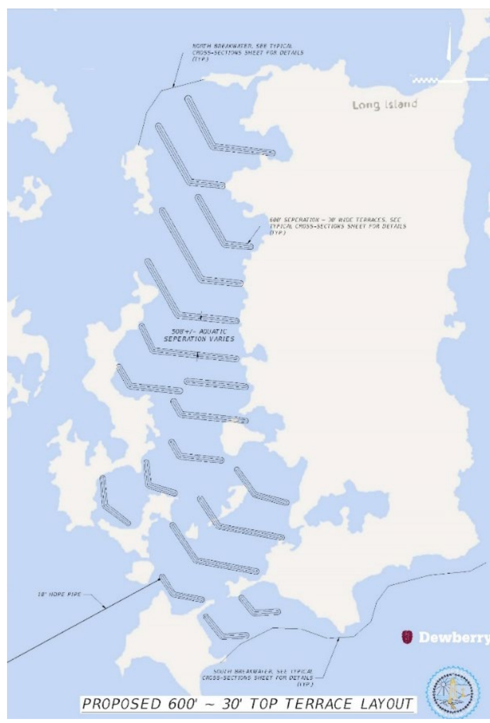

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

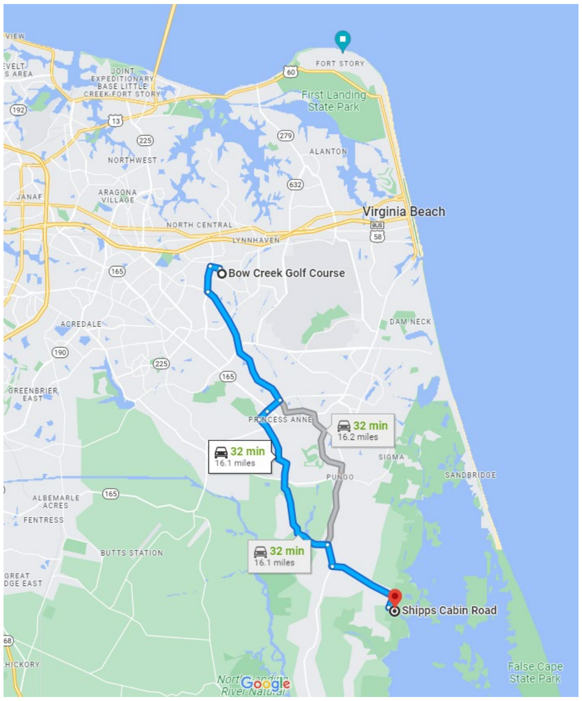

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

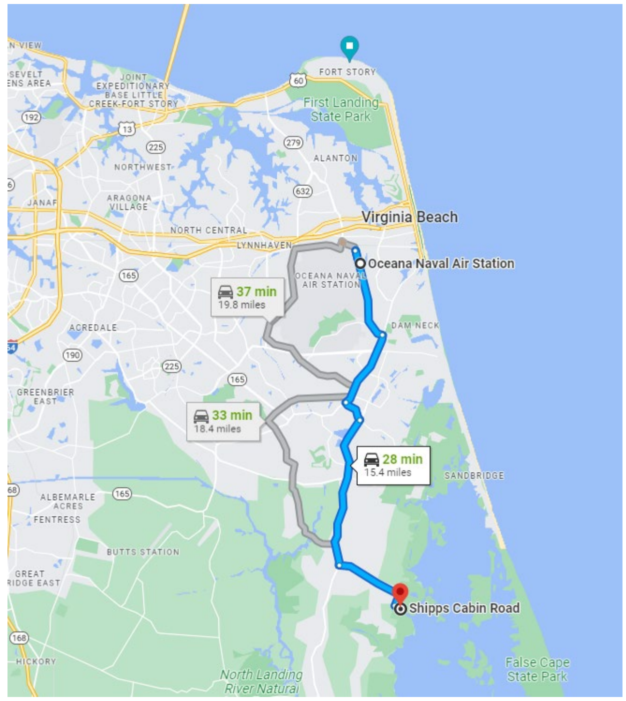

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay.   A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted.   As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

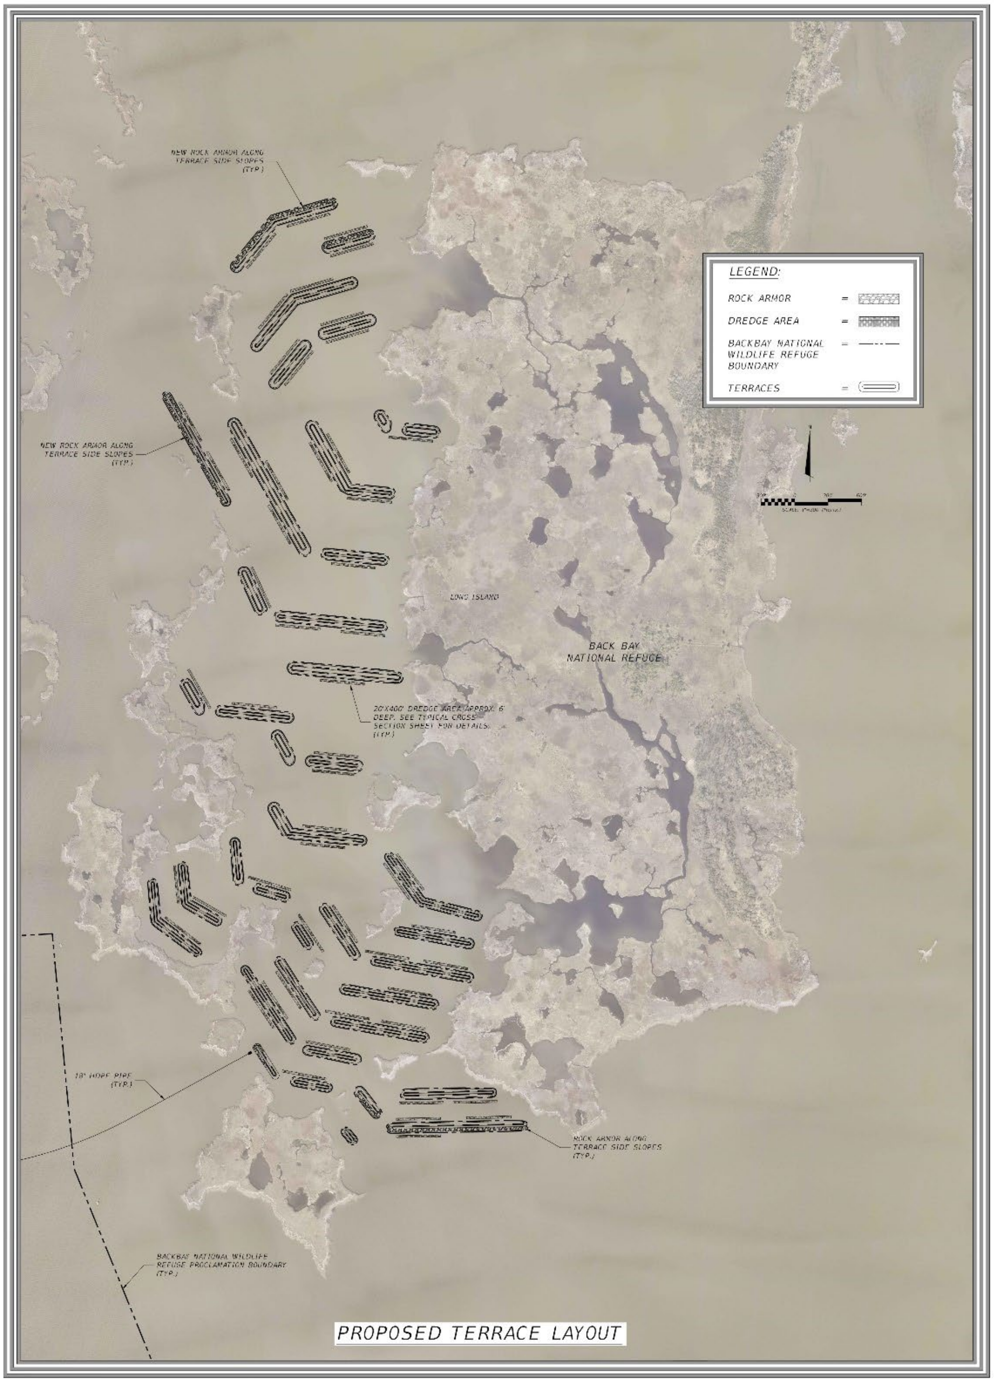

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

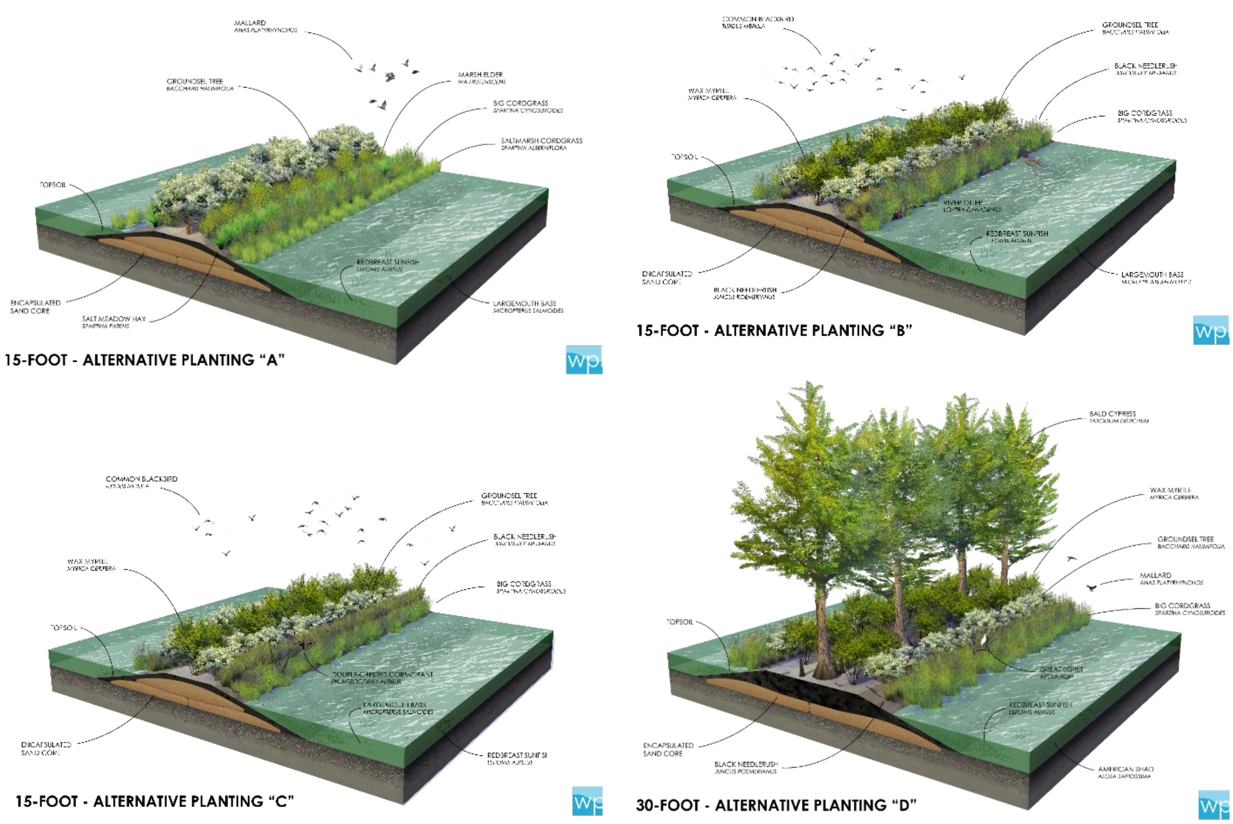

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities
CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the: o Virginia Beach City Council o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase. • City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.
REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to: o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan. o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound. • Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to: o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures. o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee . o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation. • Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

  - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

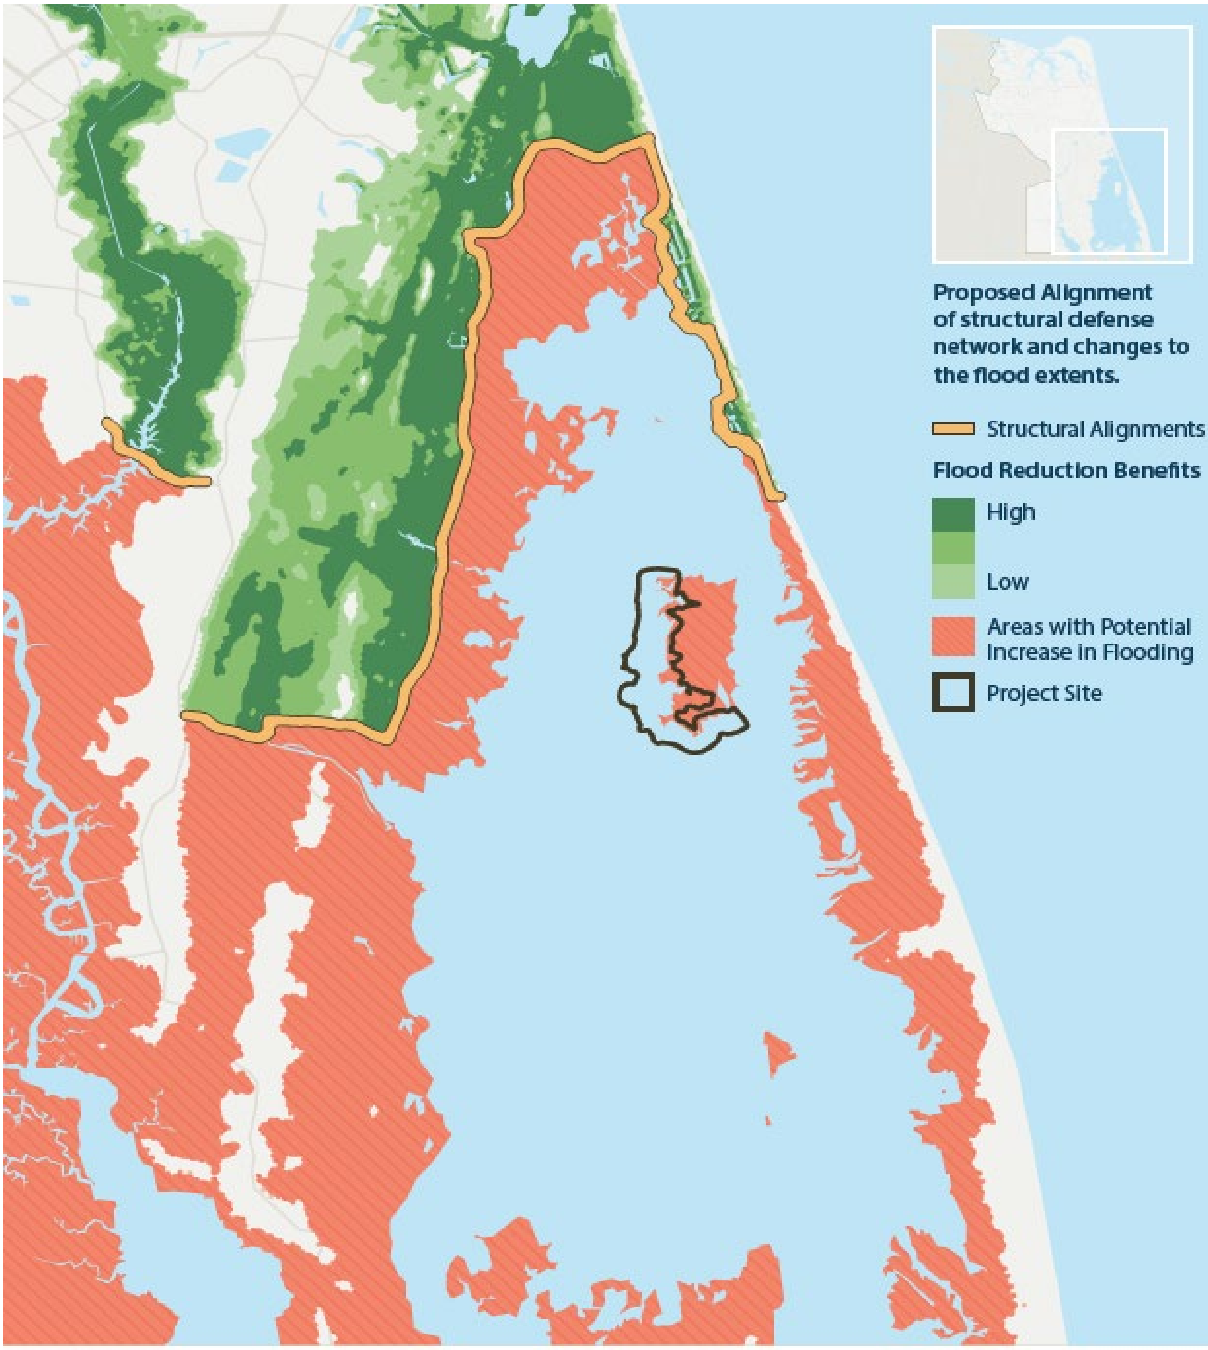

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
    a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
    b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
    c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
    a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
    b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
    a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed

Megan Reed
Refuge Manager

Albemarle-Pamlico
National Estuary Partnership

Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ Reserved.

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C. The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1. Public and private outdoor recreational facilities;~~

~~2. Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3. Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

   a. ~~Only one (1) such stand shall be permitted per lot;~~

   b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

   c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

   1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

   2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

C. ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

   a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

   b. Comply with the Public Works Design Standards Manual; and

   c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

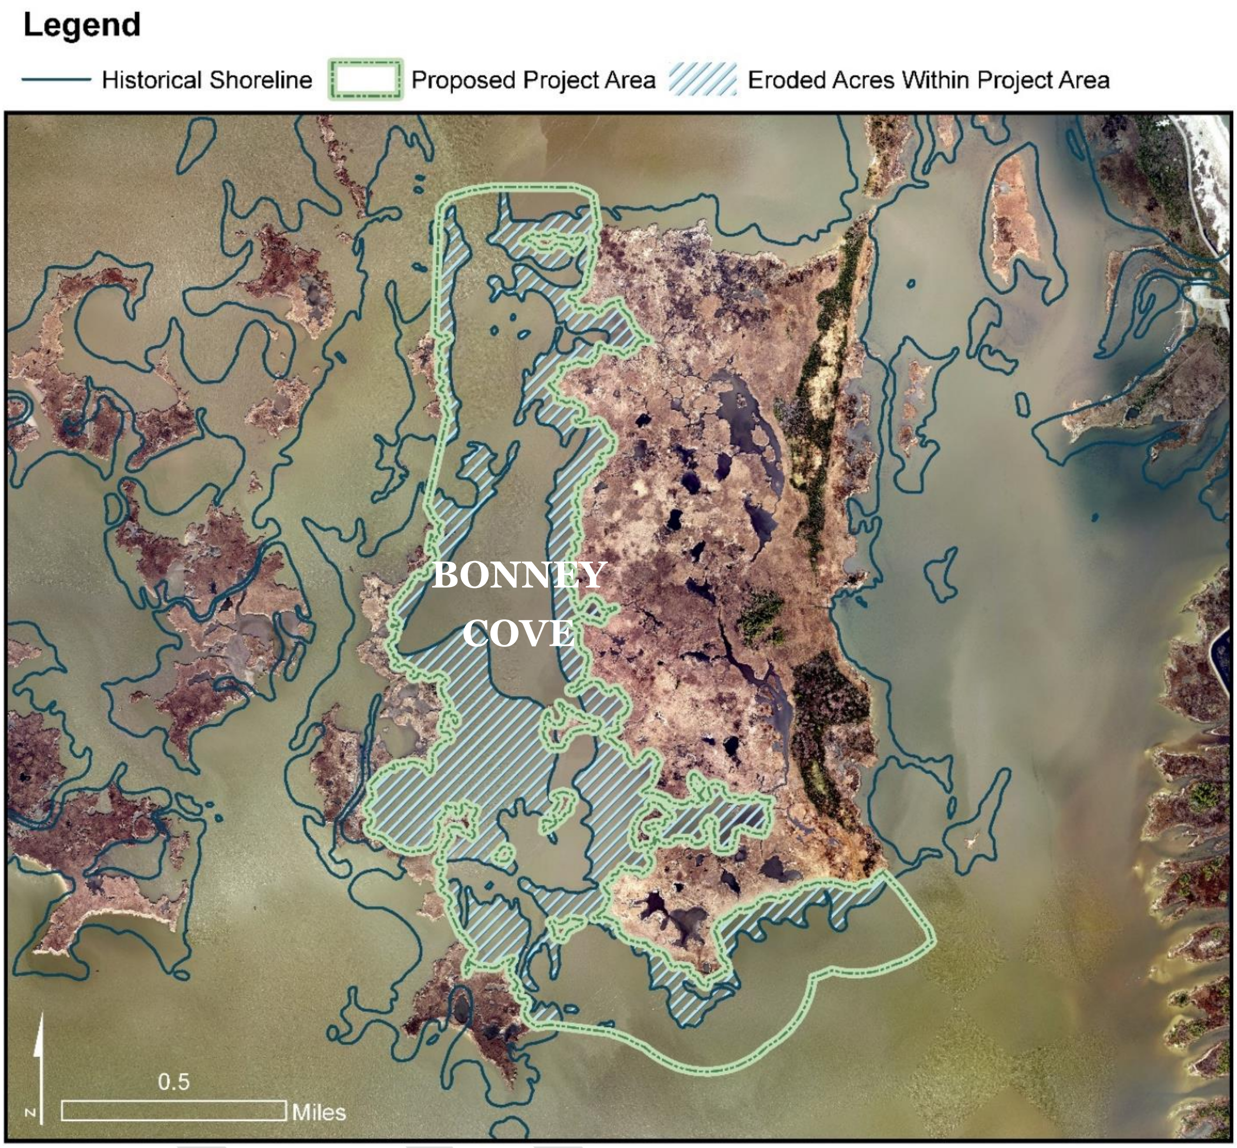

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats.   Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR’s requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics (“geobags”). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12” diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

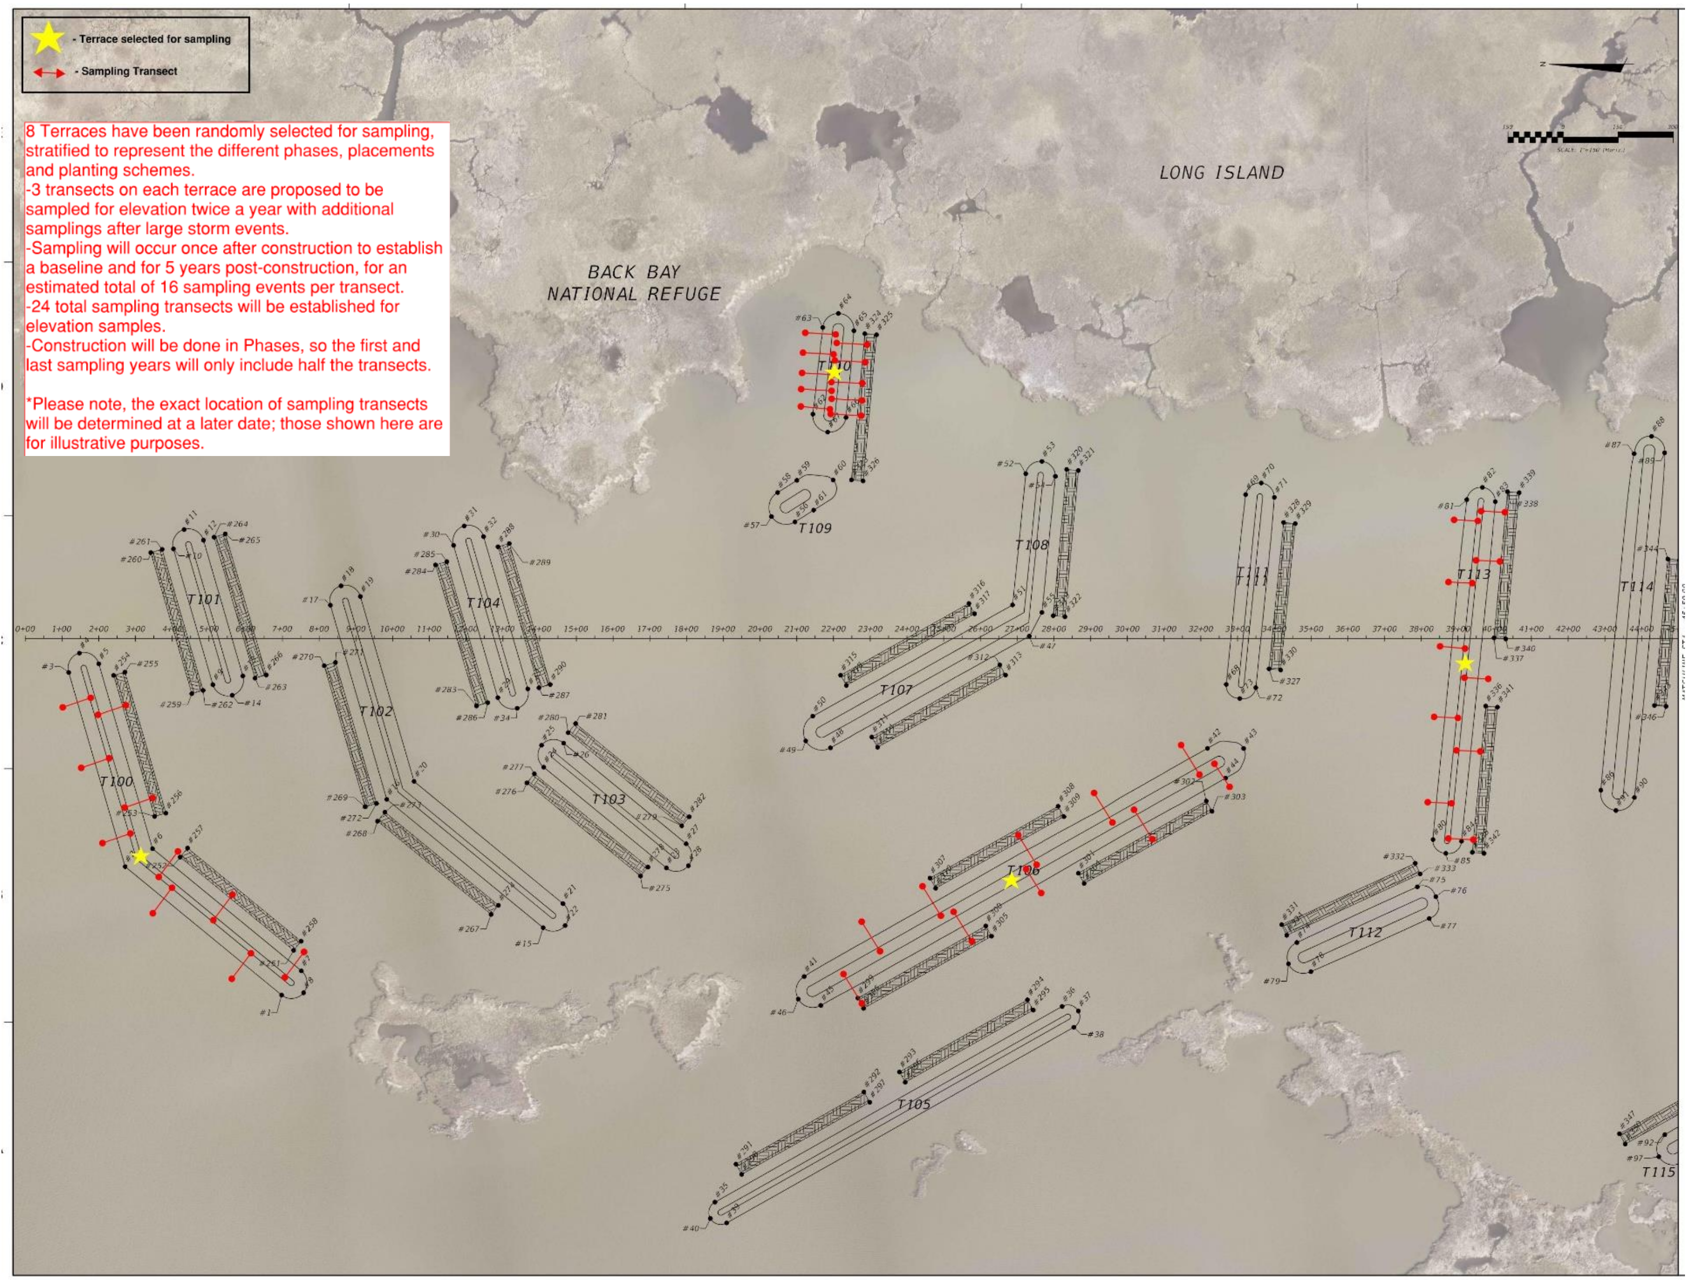

Figure 3: Monitoring design site plan – North Terraces

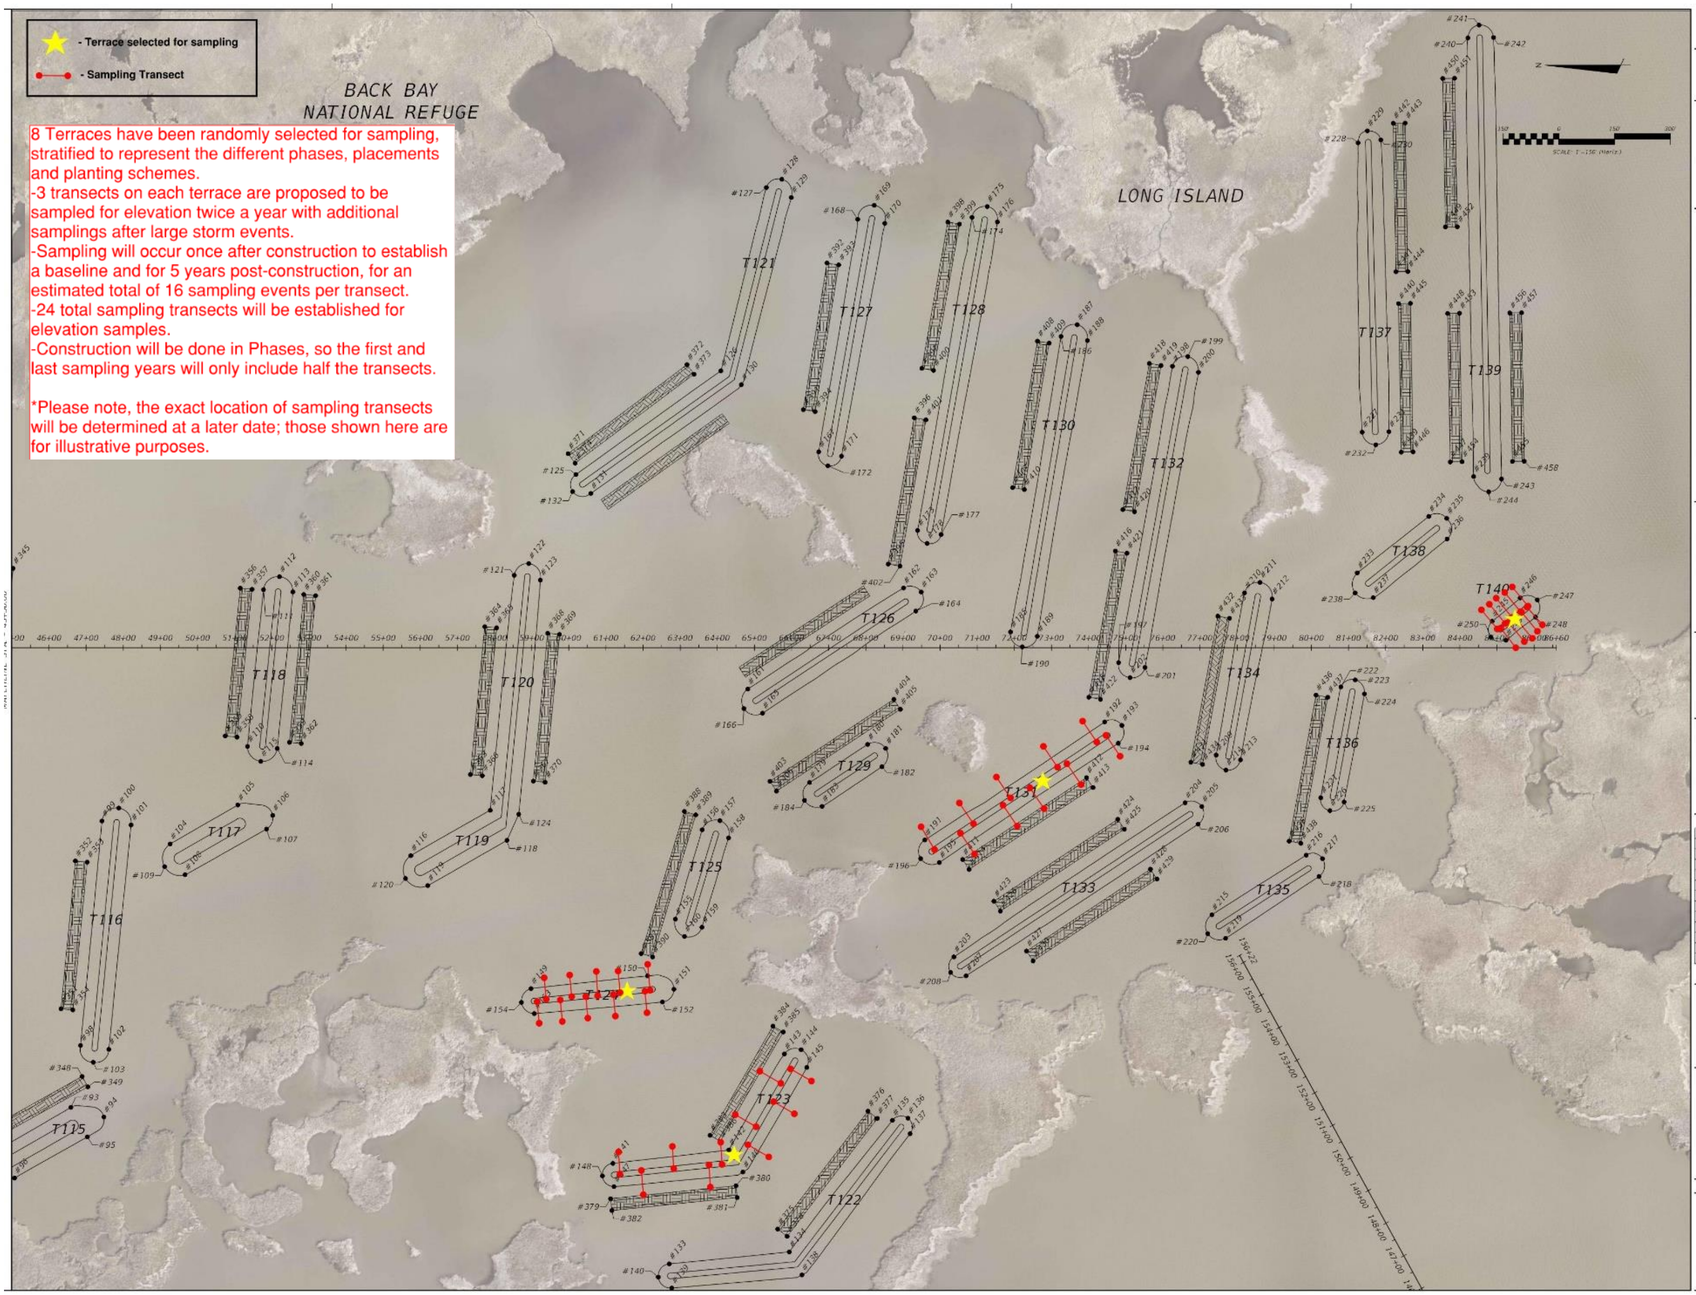

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

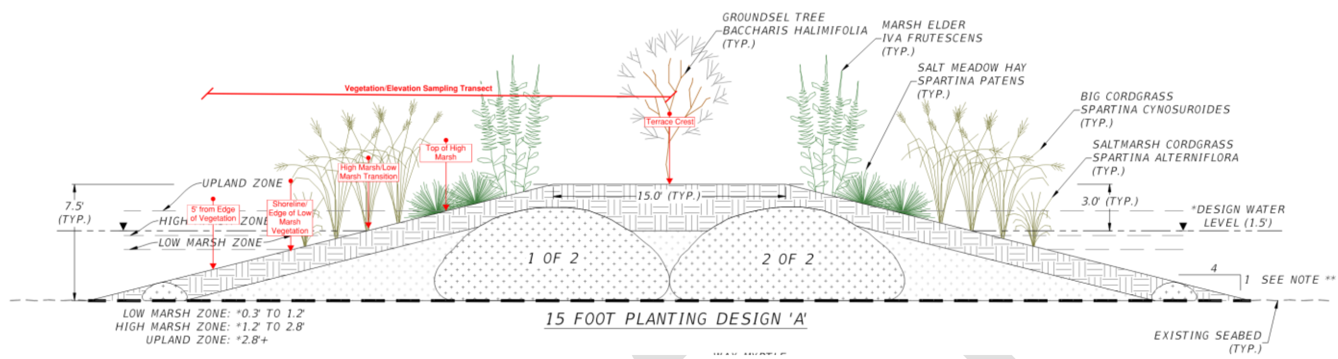

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ____________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the “Nature-Based” and “Other” categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

☐ Dam restoration.

☐ Beneficial reuse of dredge materials for flood mitigation purposes

☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>

☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ____________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) __________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: ______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: __________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name:
Community Flood Preparedness Fund &
Resilient Virginia Revolving Loan Fund
Detailed Budget Narrative
Period of Performance: June 2024 through June 2027
Submission Date: November 12, 2023

	Grand Total State Funding Request	$ 5,000,000
	Grand Total Local Share of Project	$ 38,356,966
National Fish and Wildlife Foundation Grants	Federal Funding (if applicable)	$ 10,021,524
	Project Grand Total	$ 53,378,490
	Locality Cost Match	% 71.85

Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

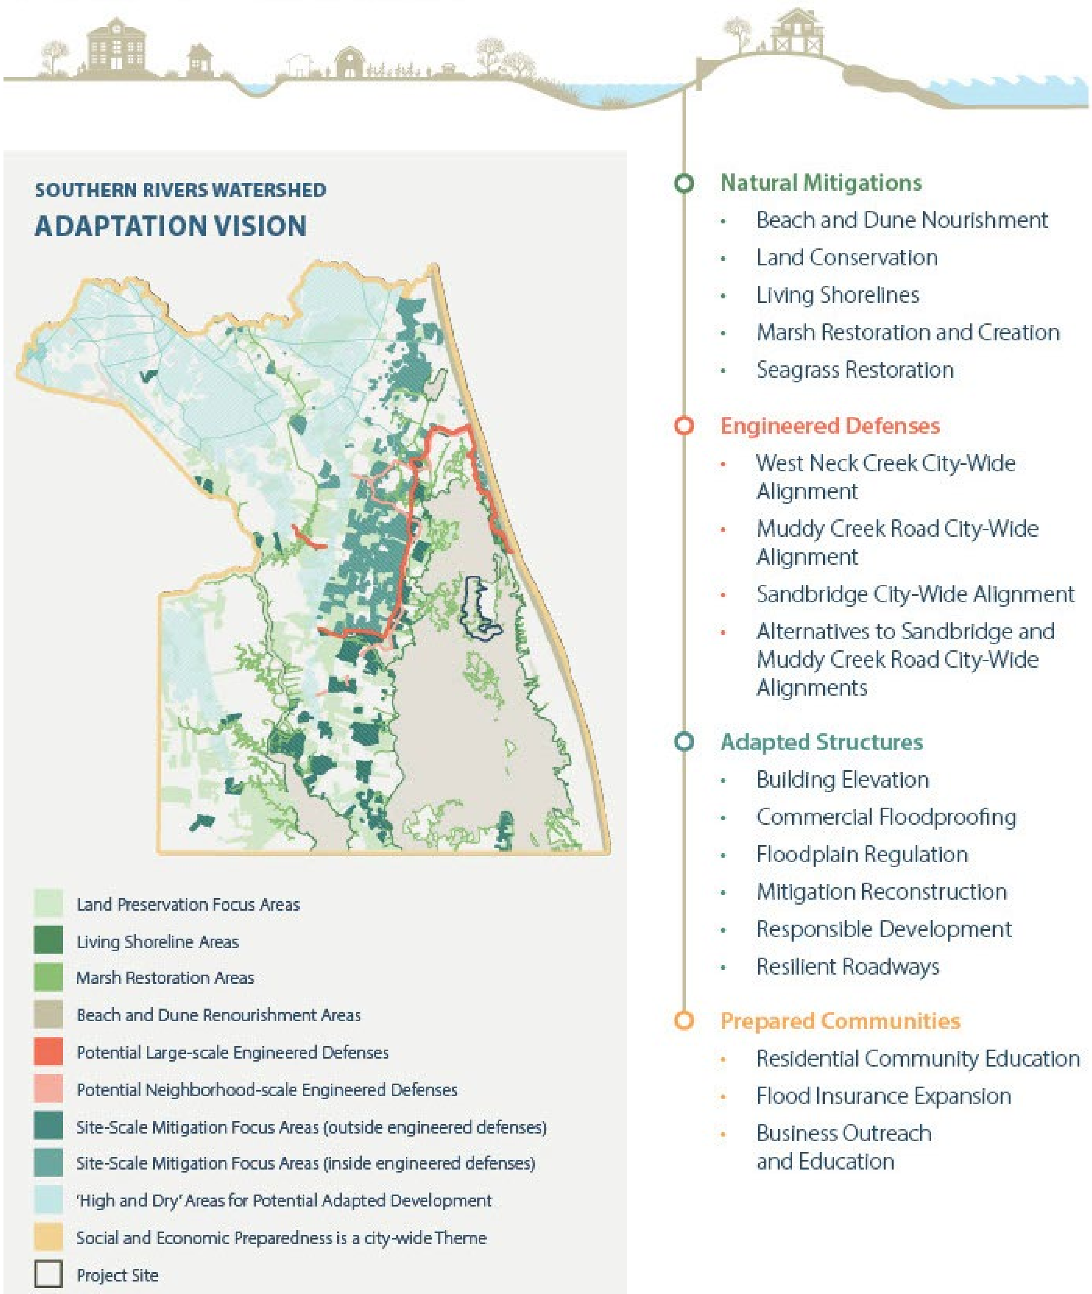

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

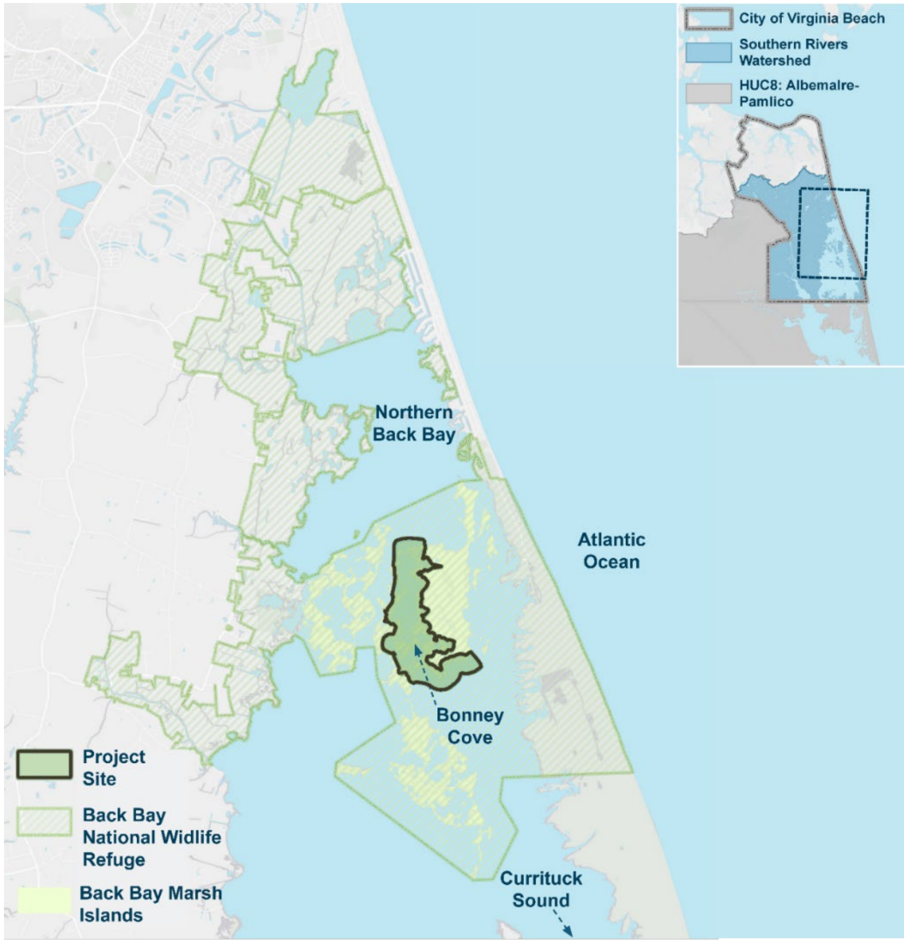

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

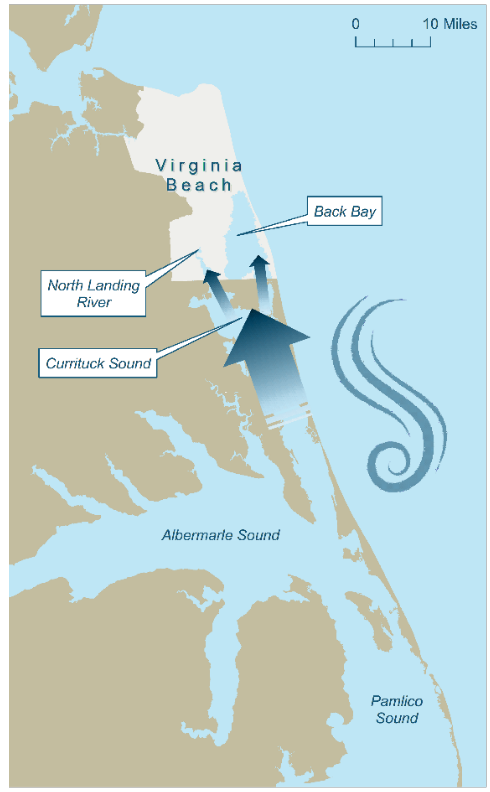

Figure 3: Flood pathways in the Southern Rivers Watershed.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

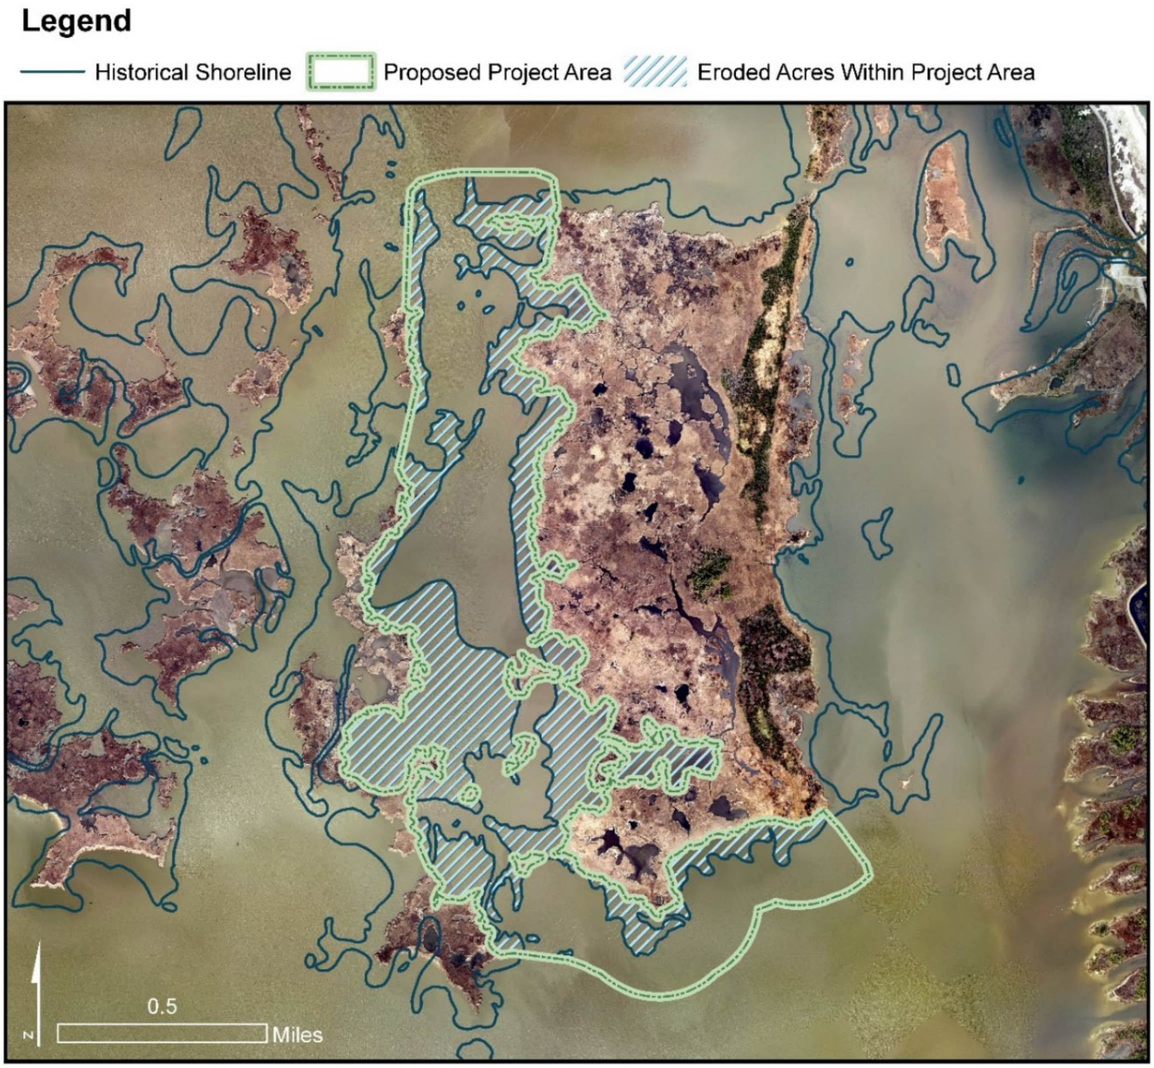

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

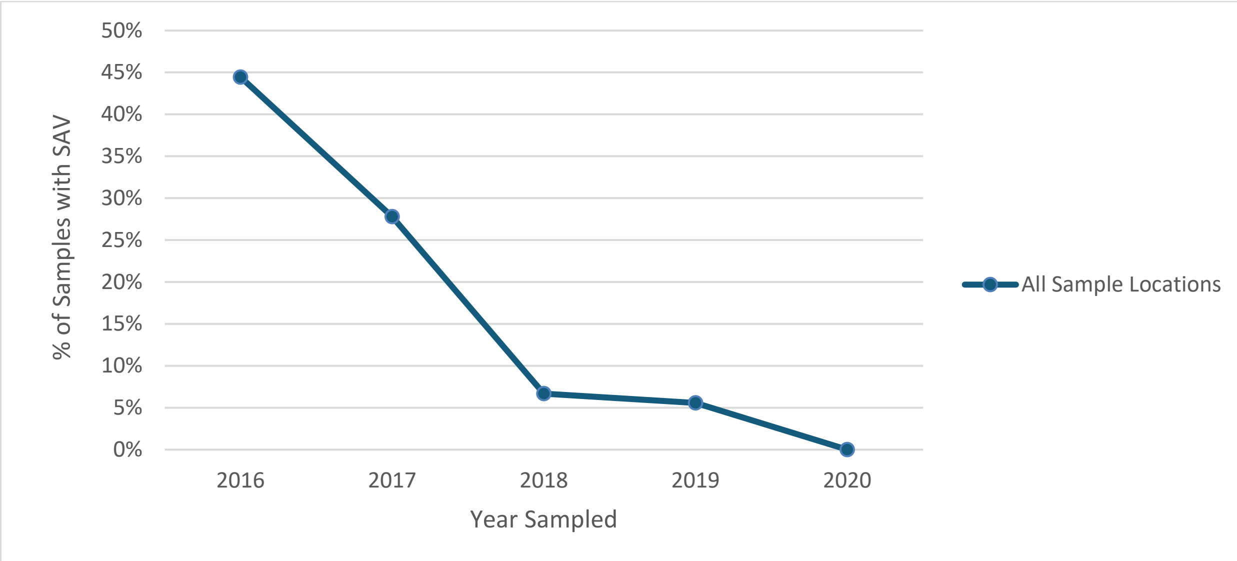

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

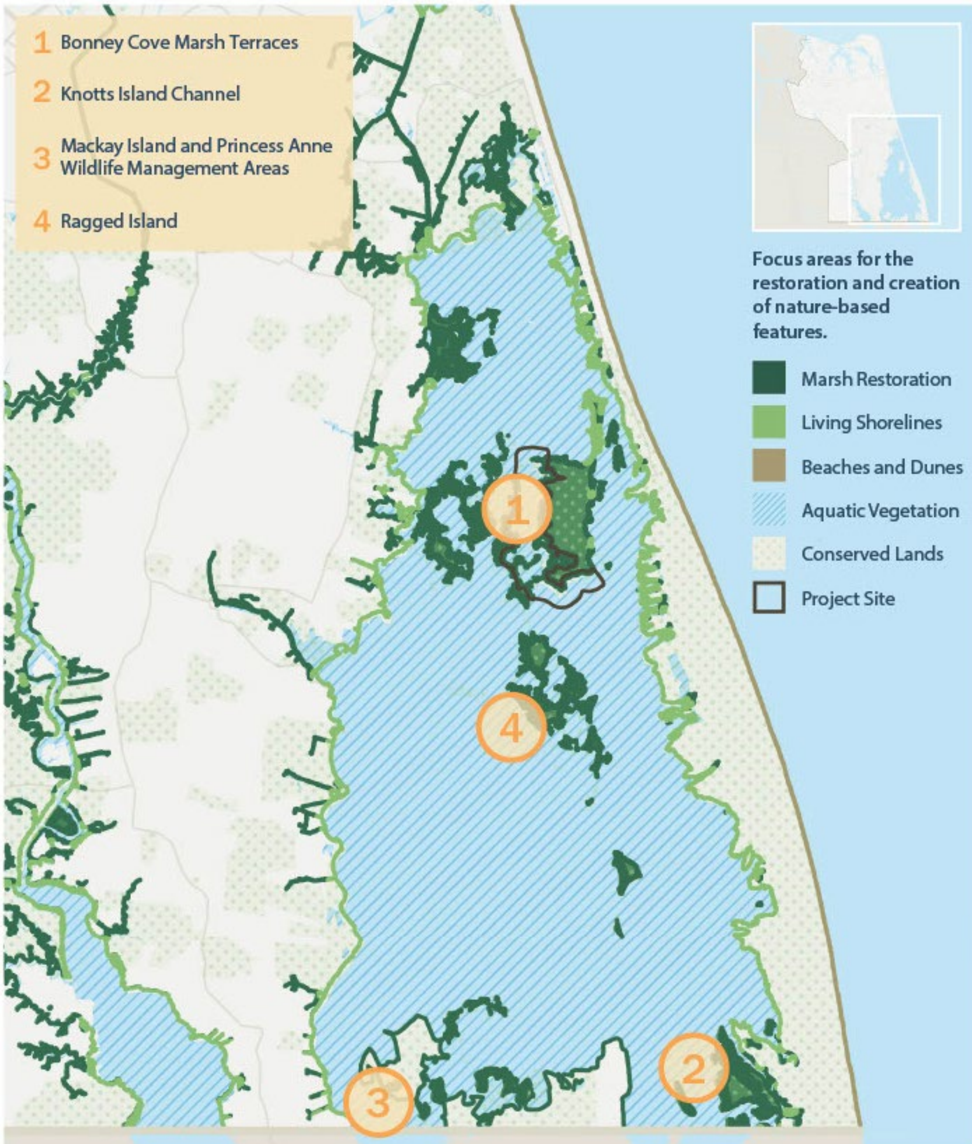

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

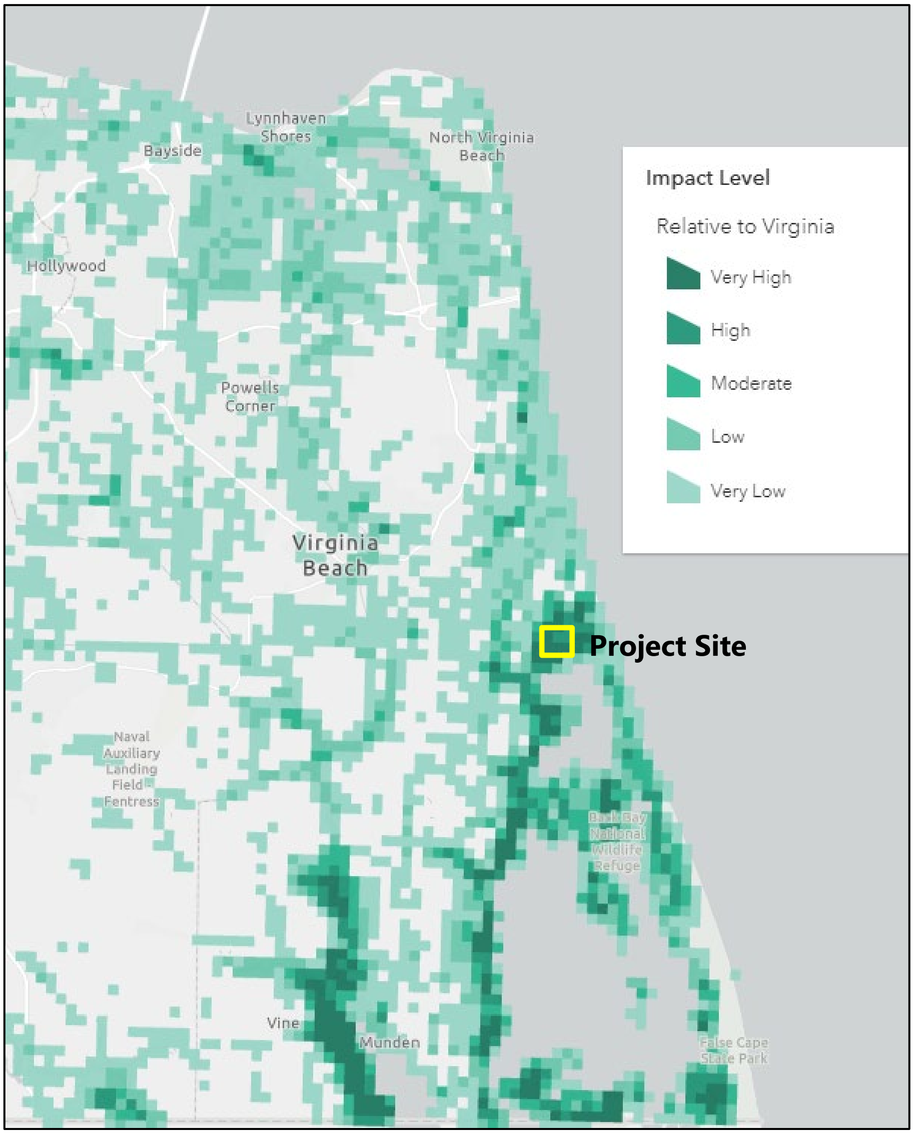

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

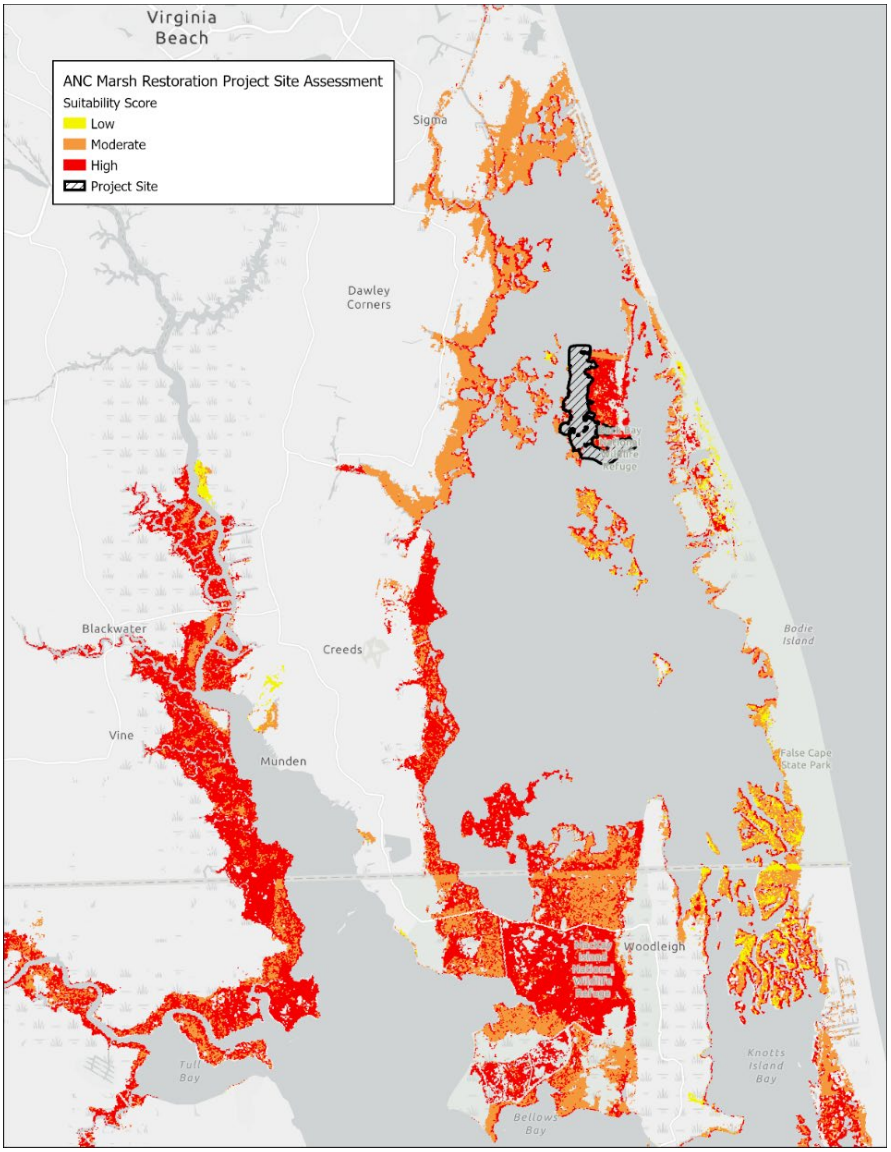

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

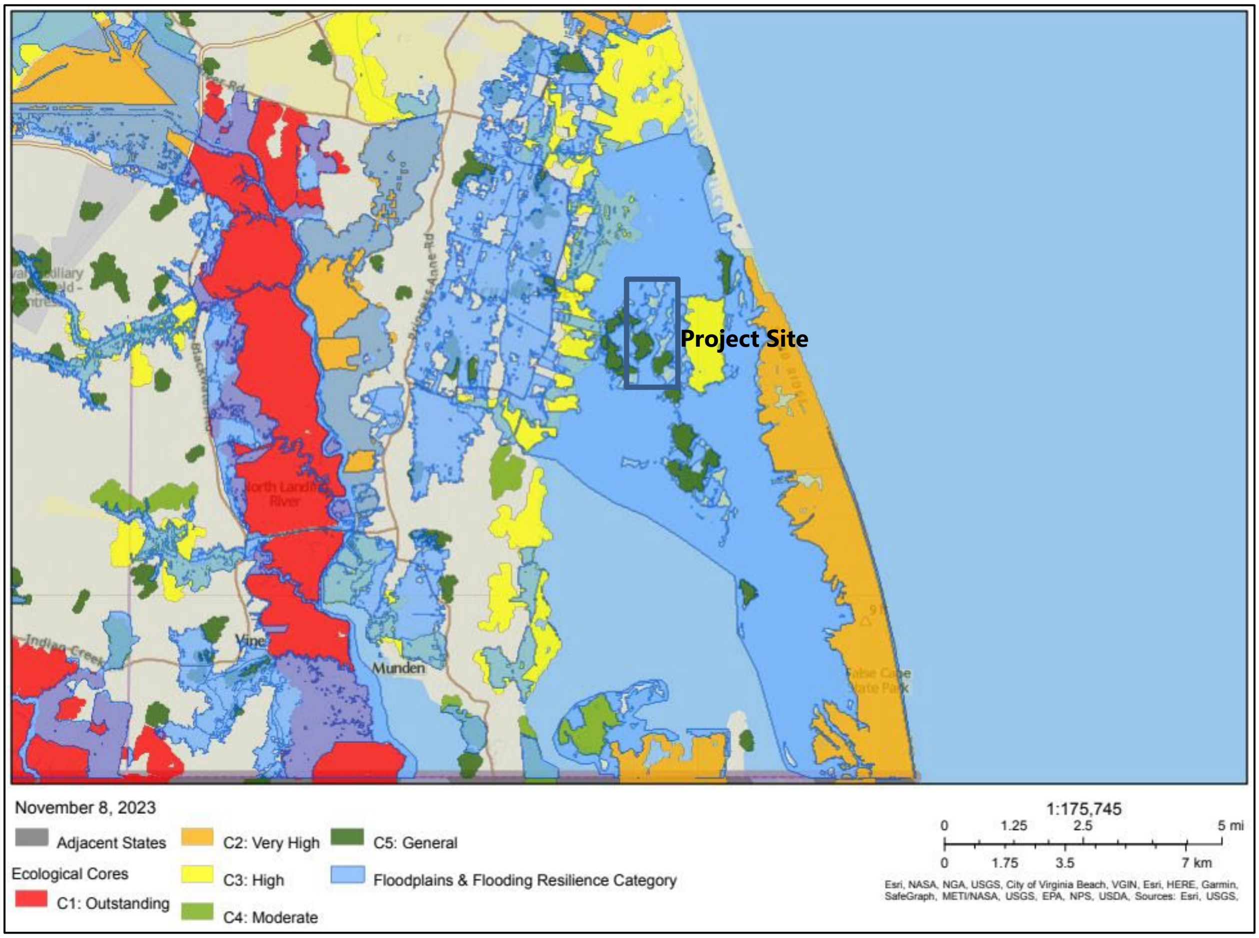

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

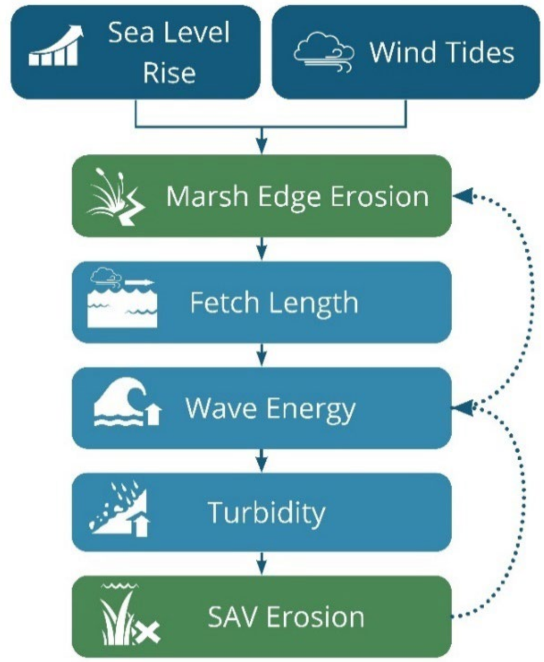

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

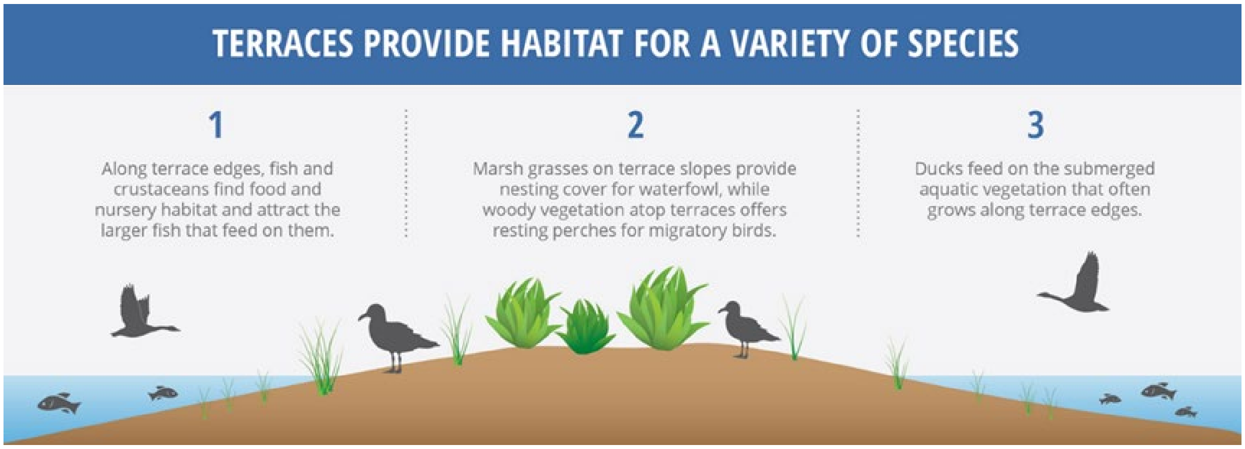

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

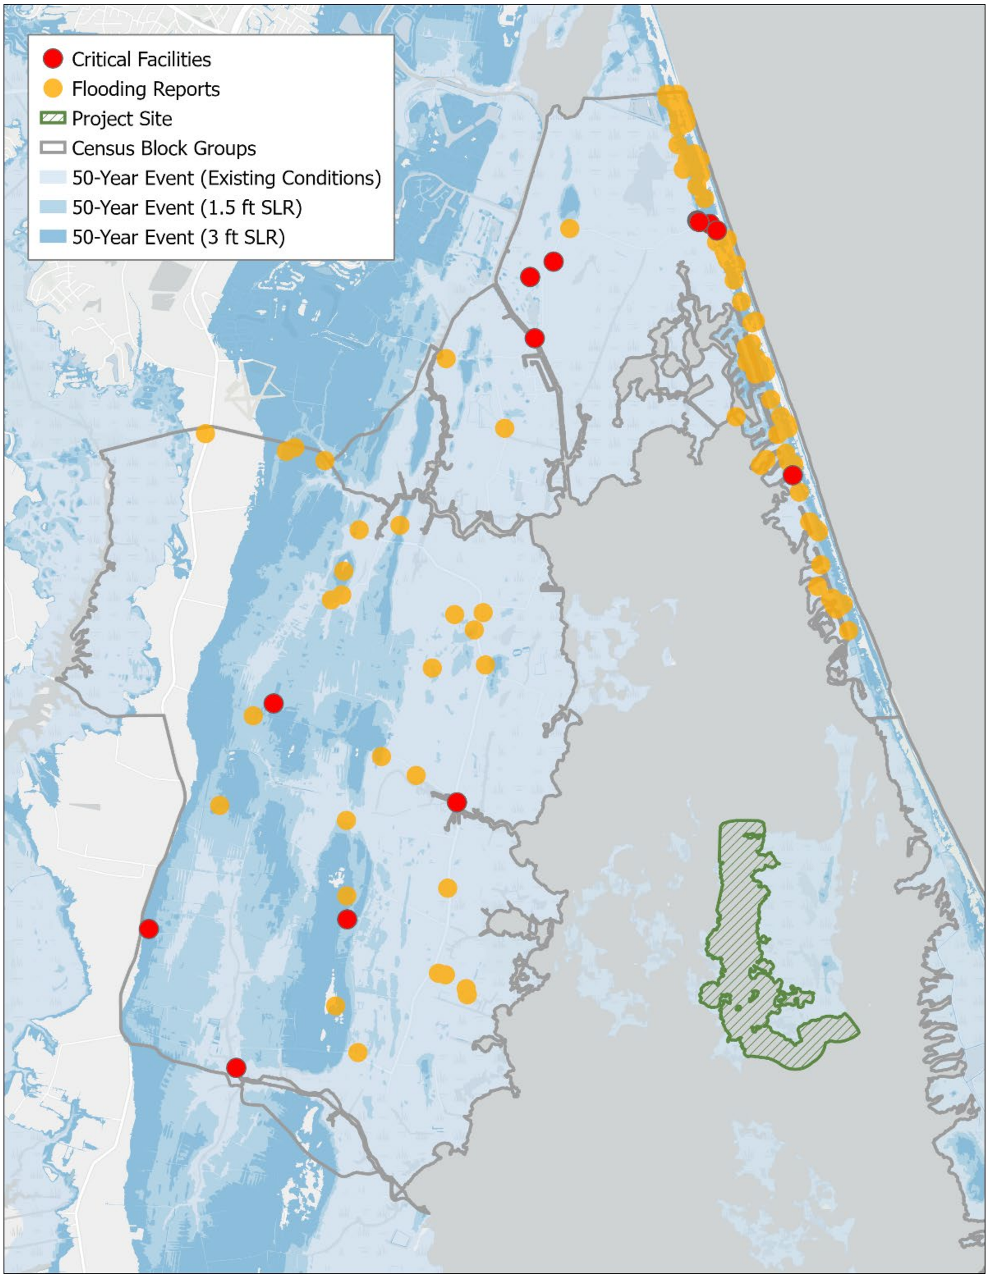

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

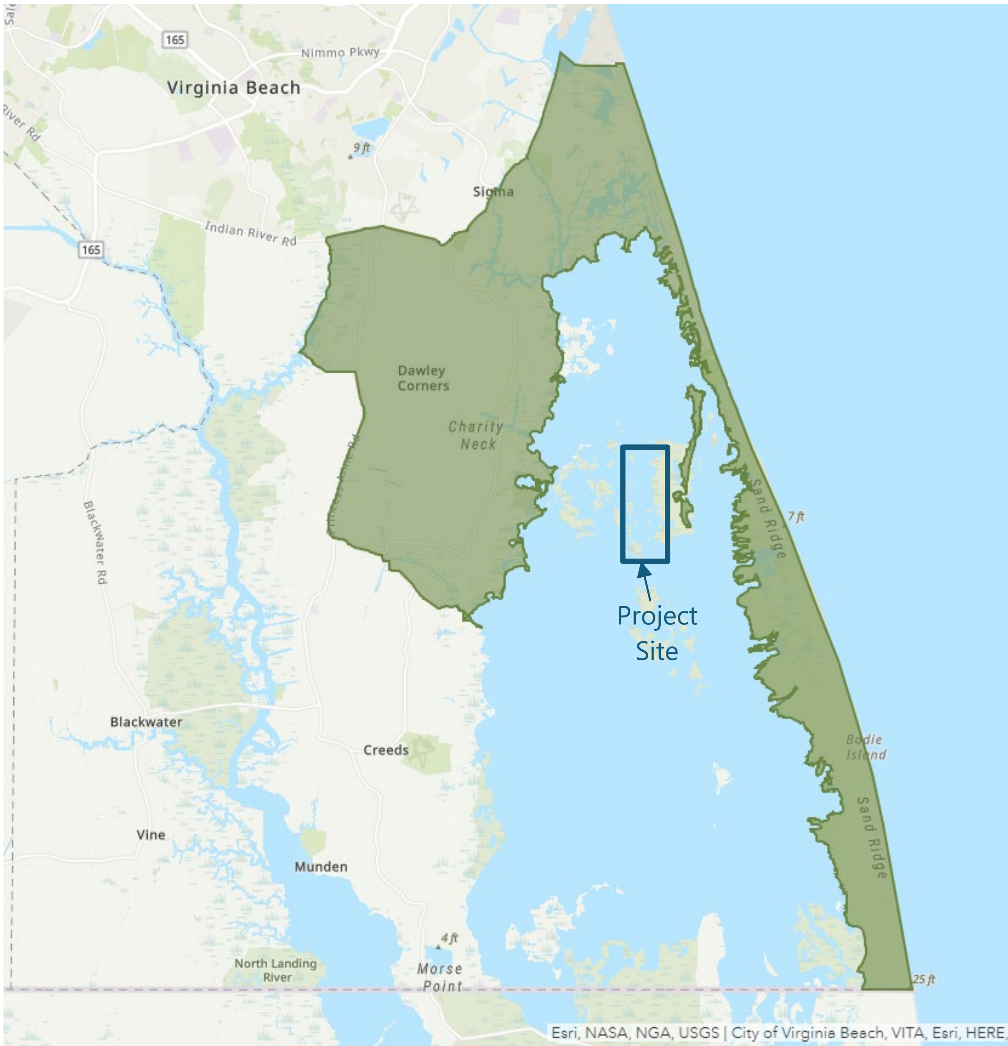

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

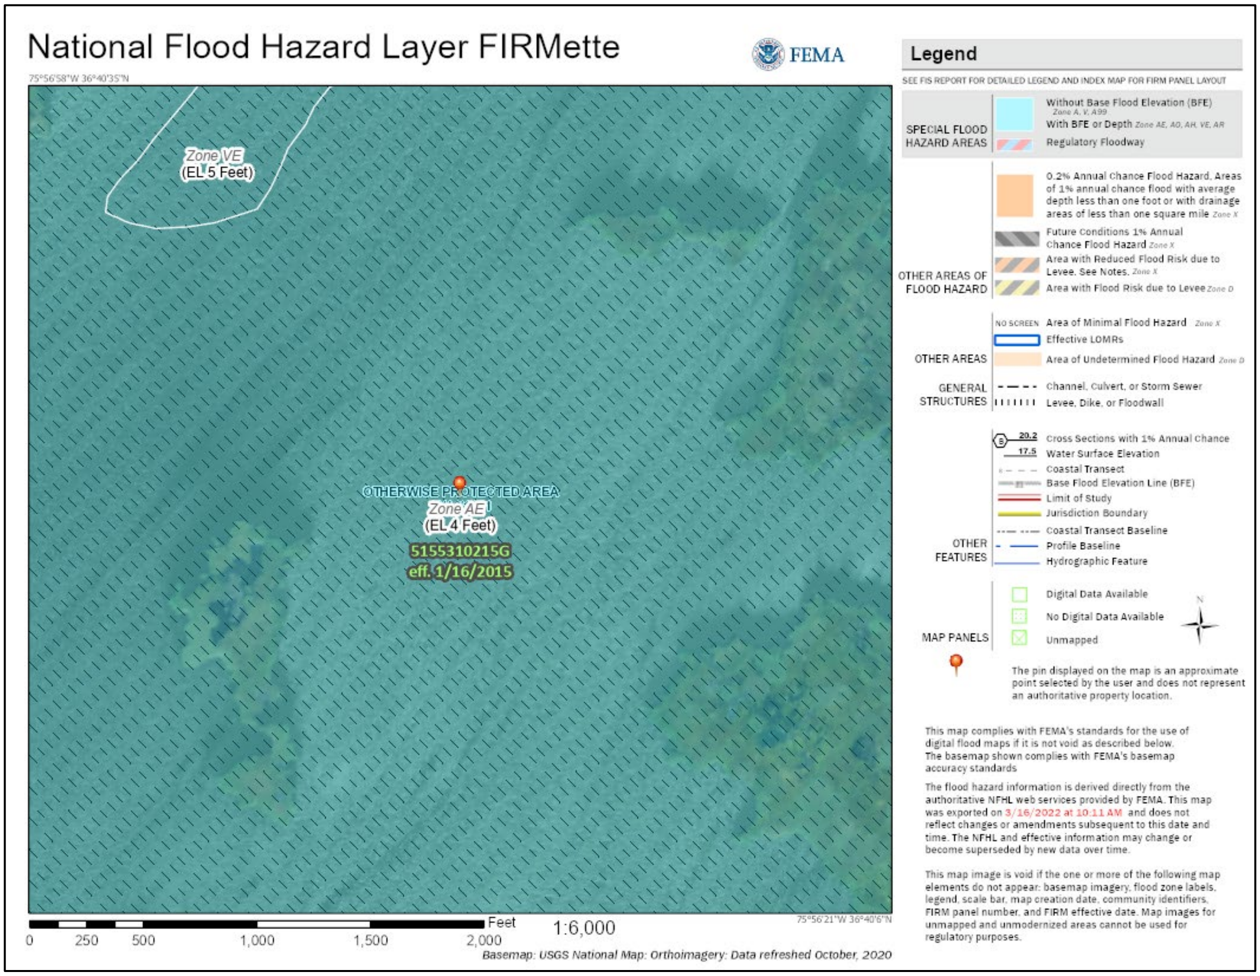

Figure 15: FIRMette for the project area (northern boundary).

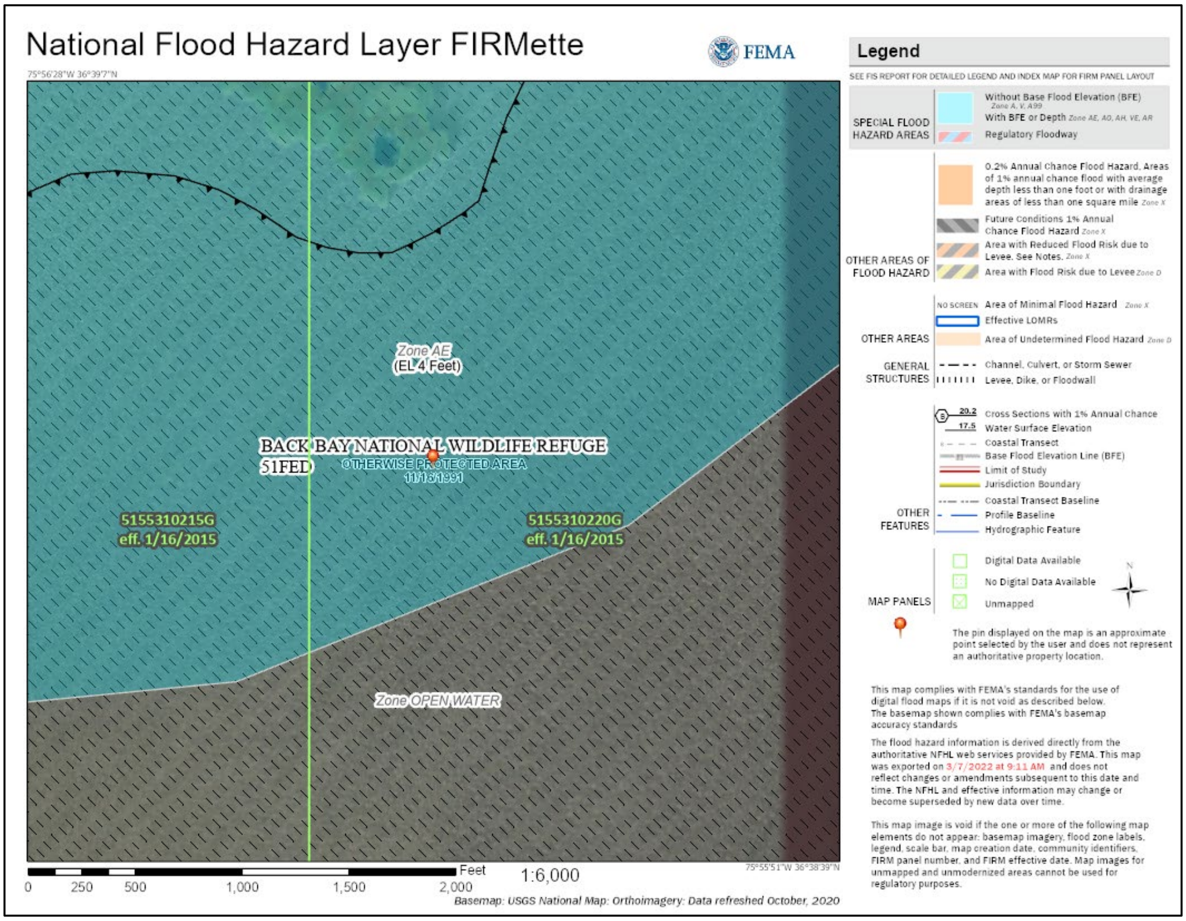

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

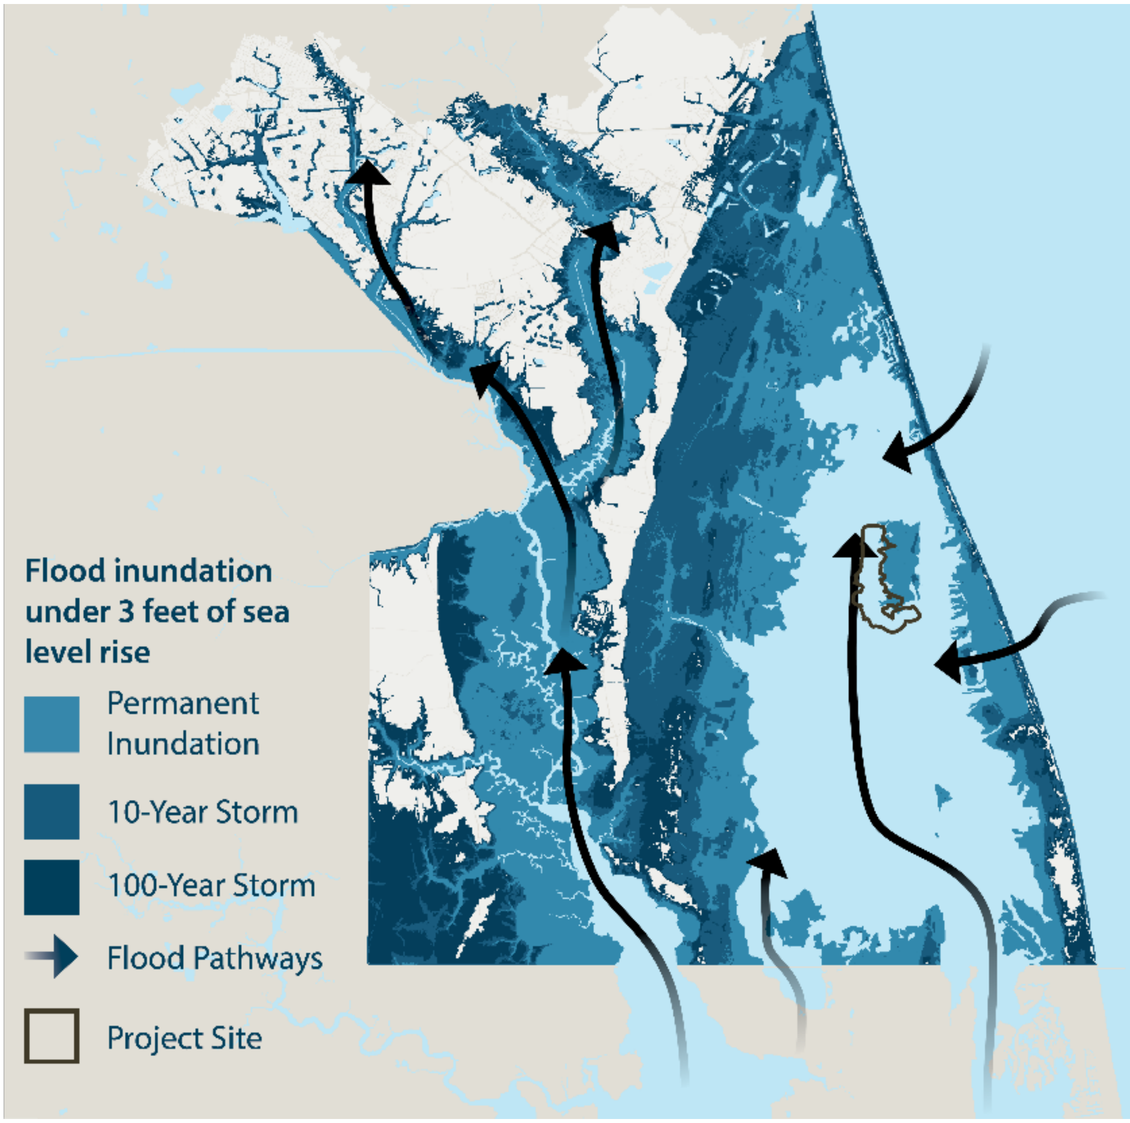

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

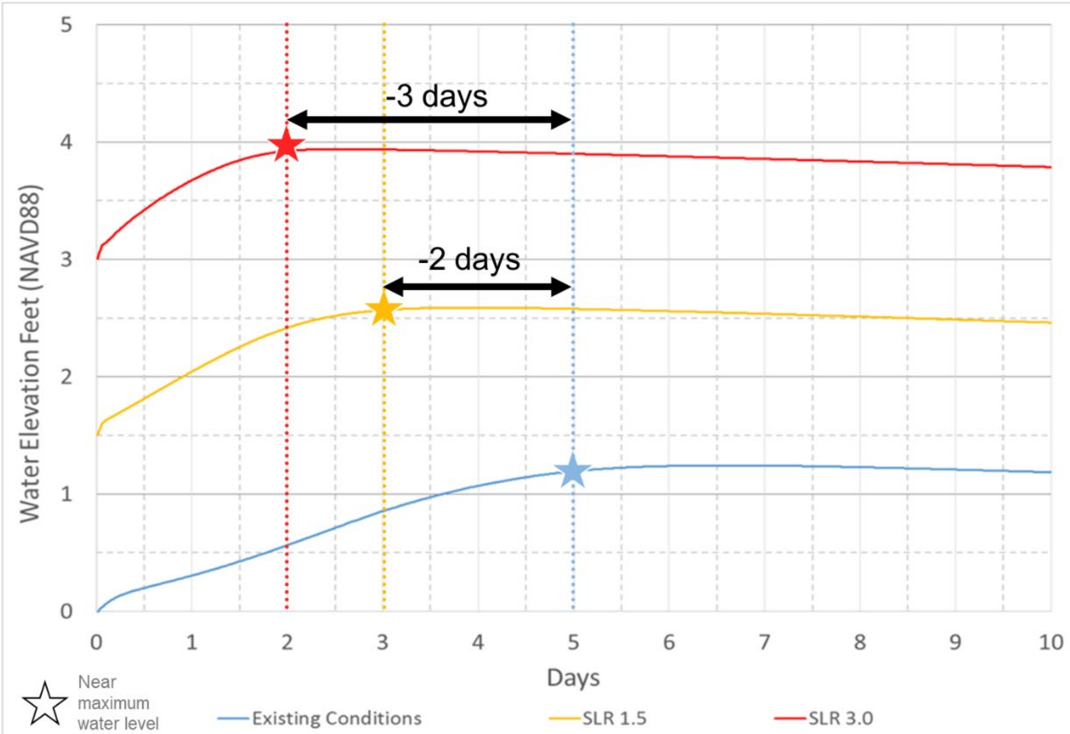

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

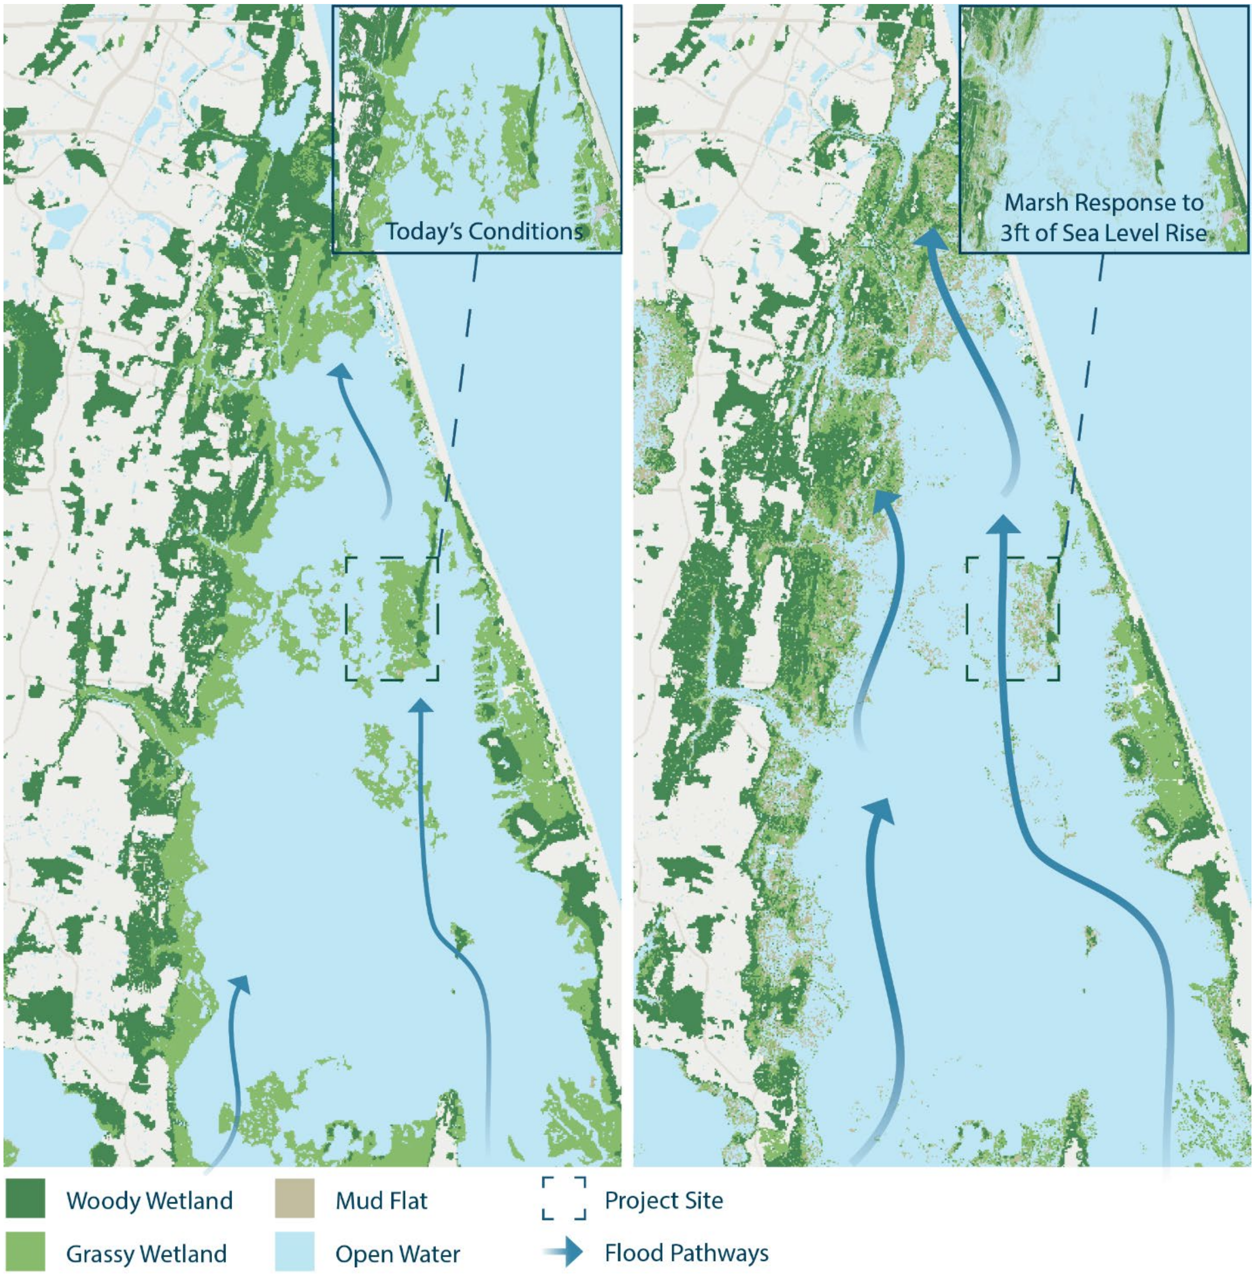

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

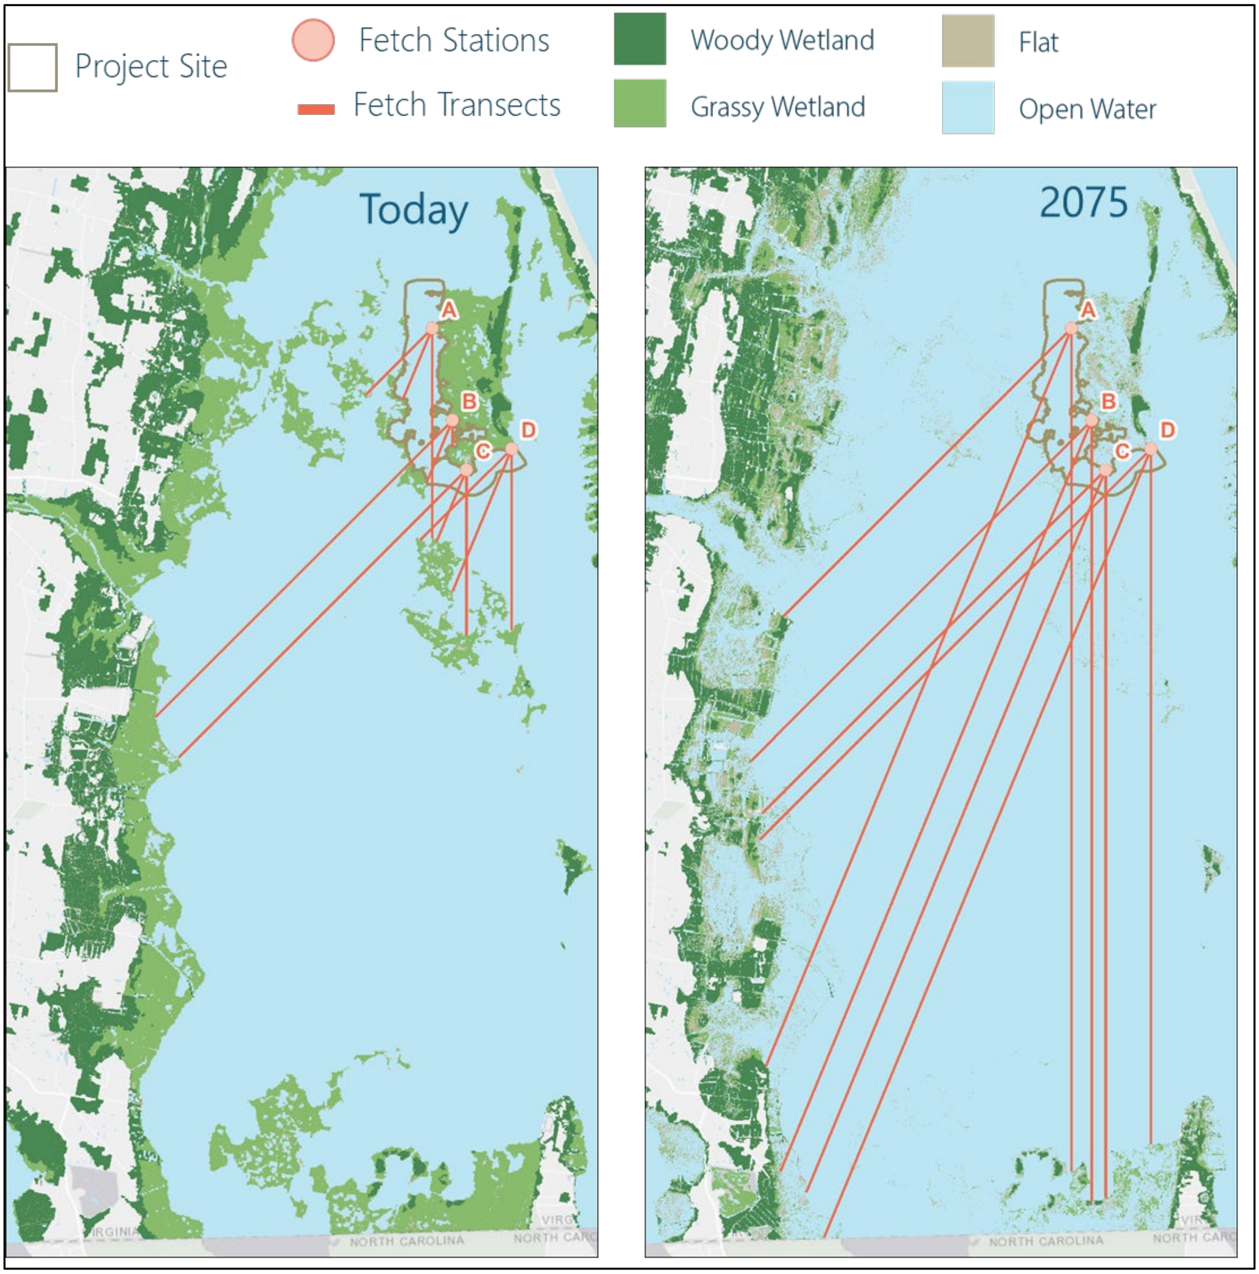

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina’s Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.

- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

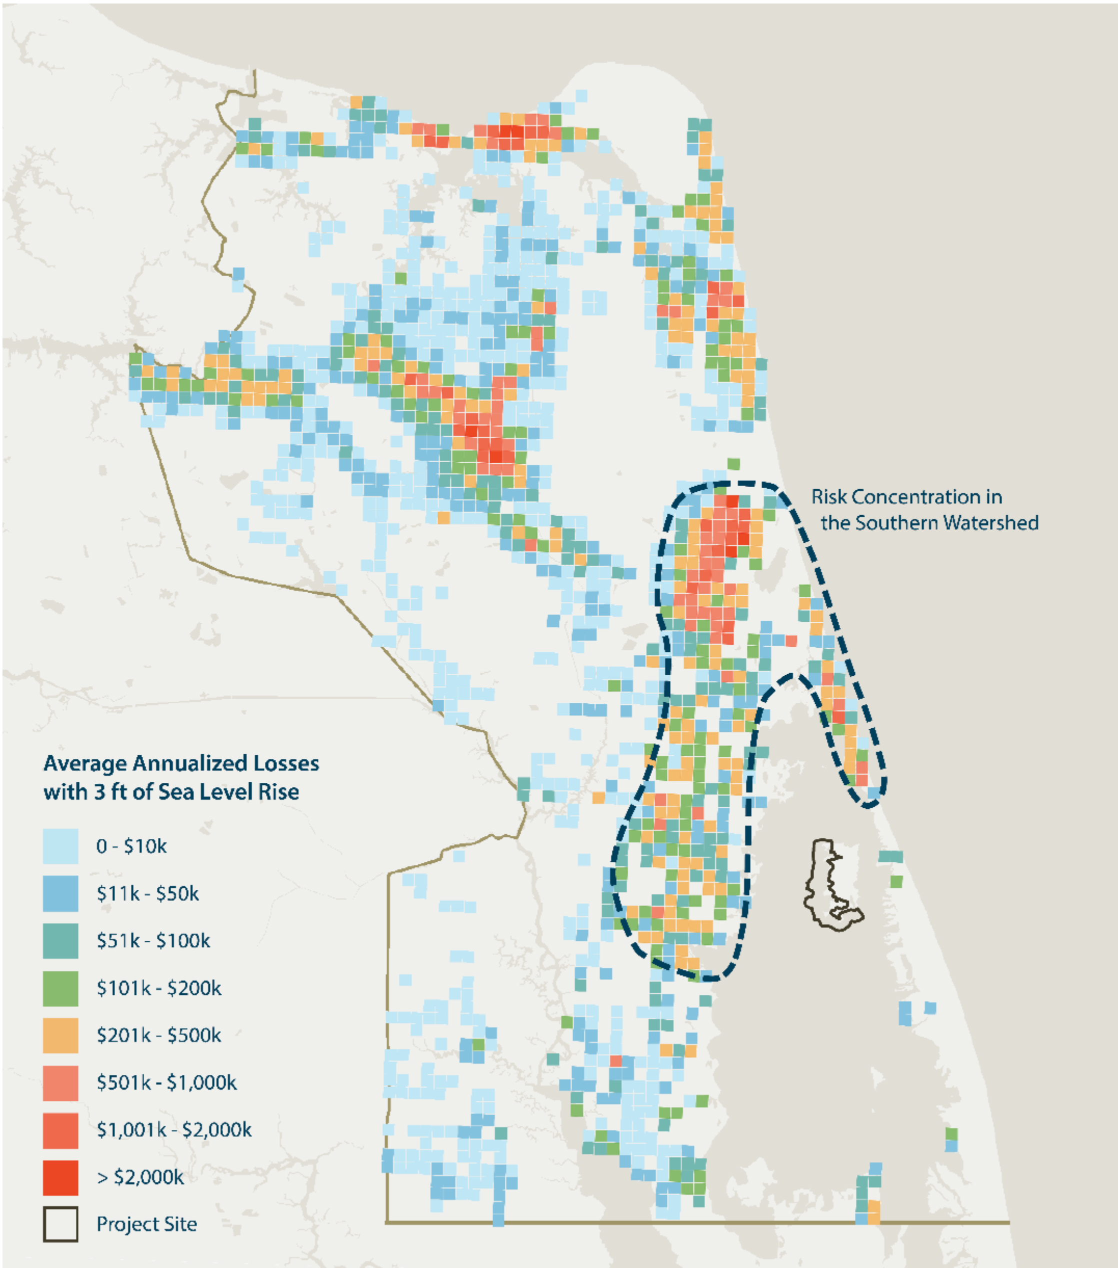

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.

Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

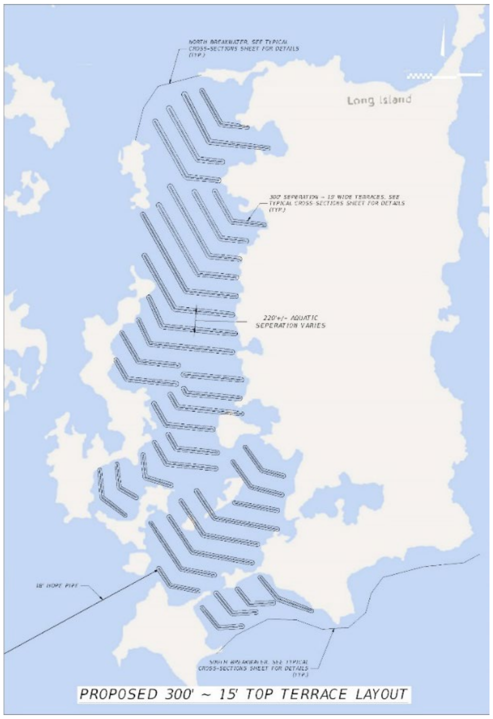

Figure 22: Alternative 2a.

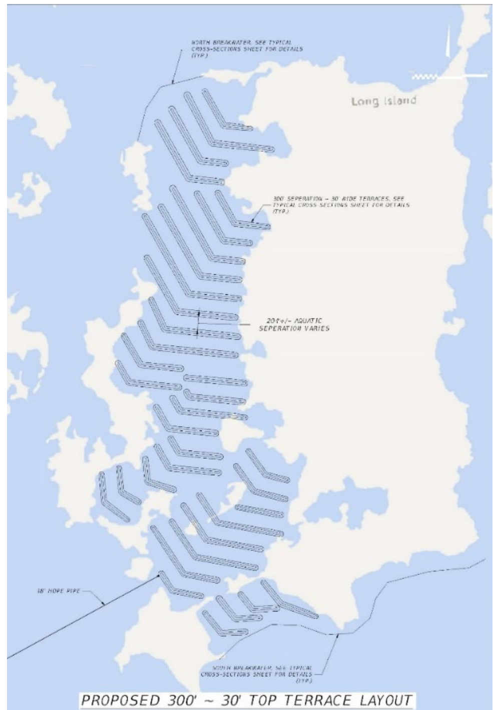

Figure 23: Alternative 2b.

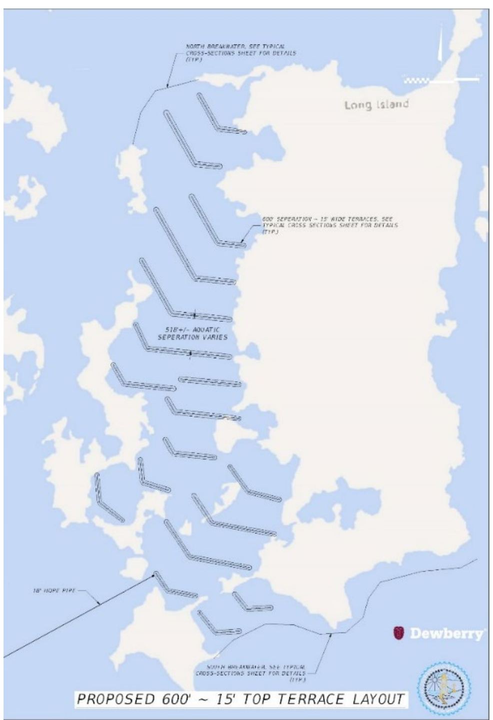

Figure 24: Alternative 2c.

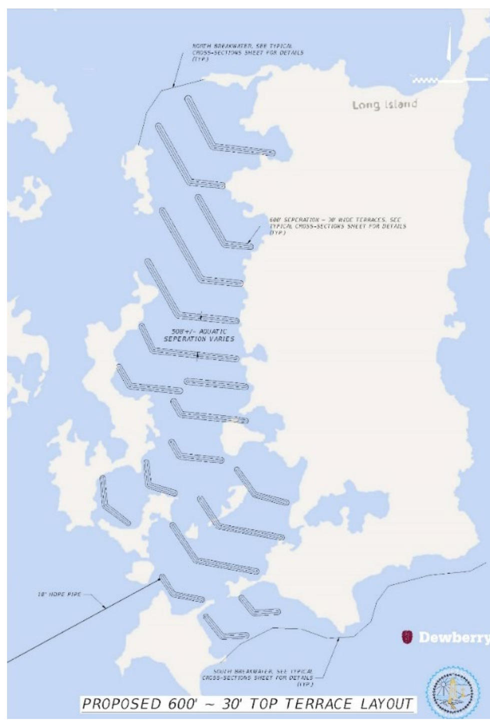

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

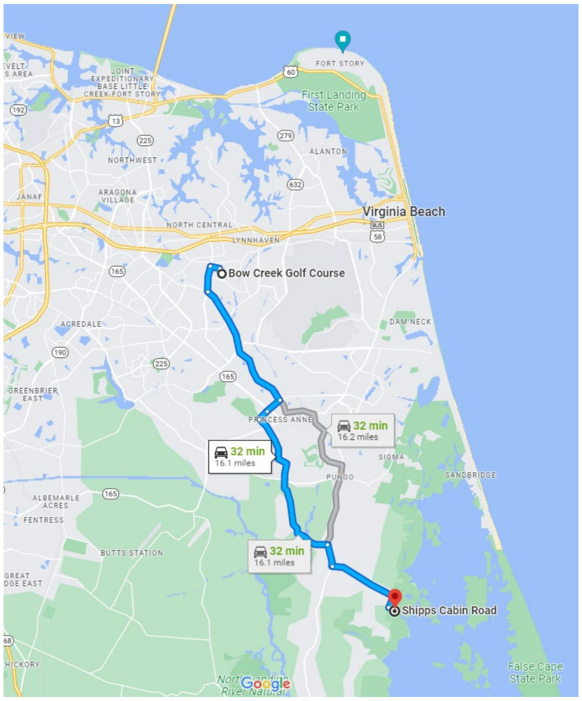

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

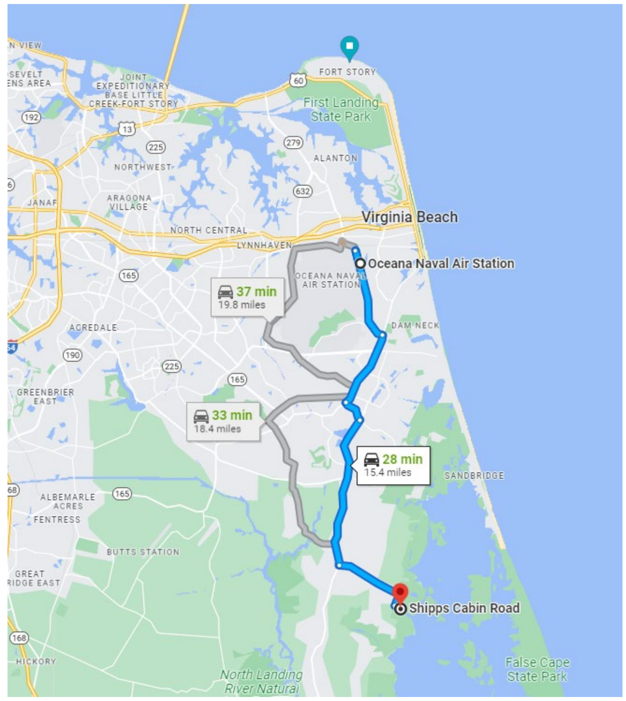

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

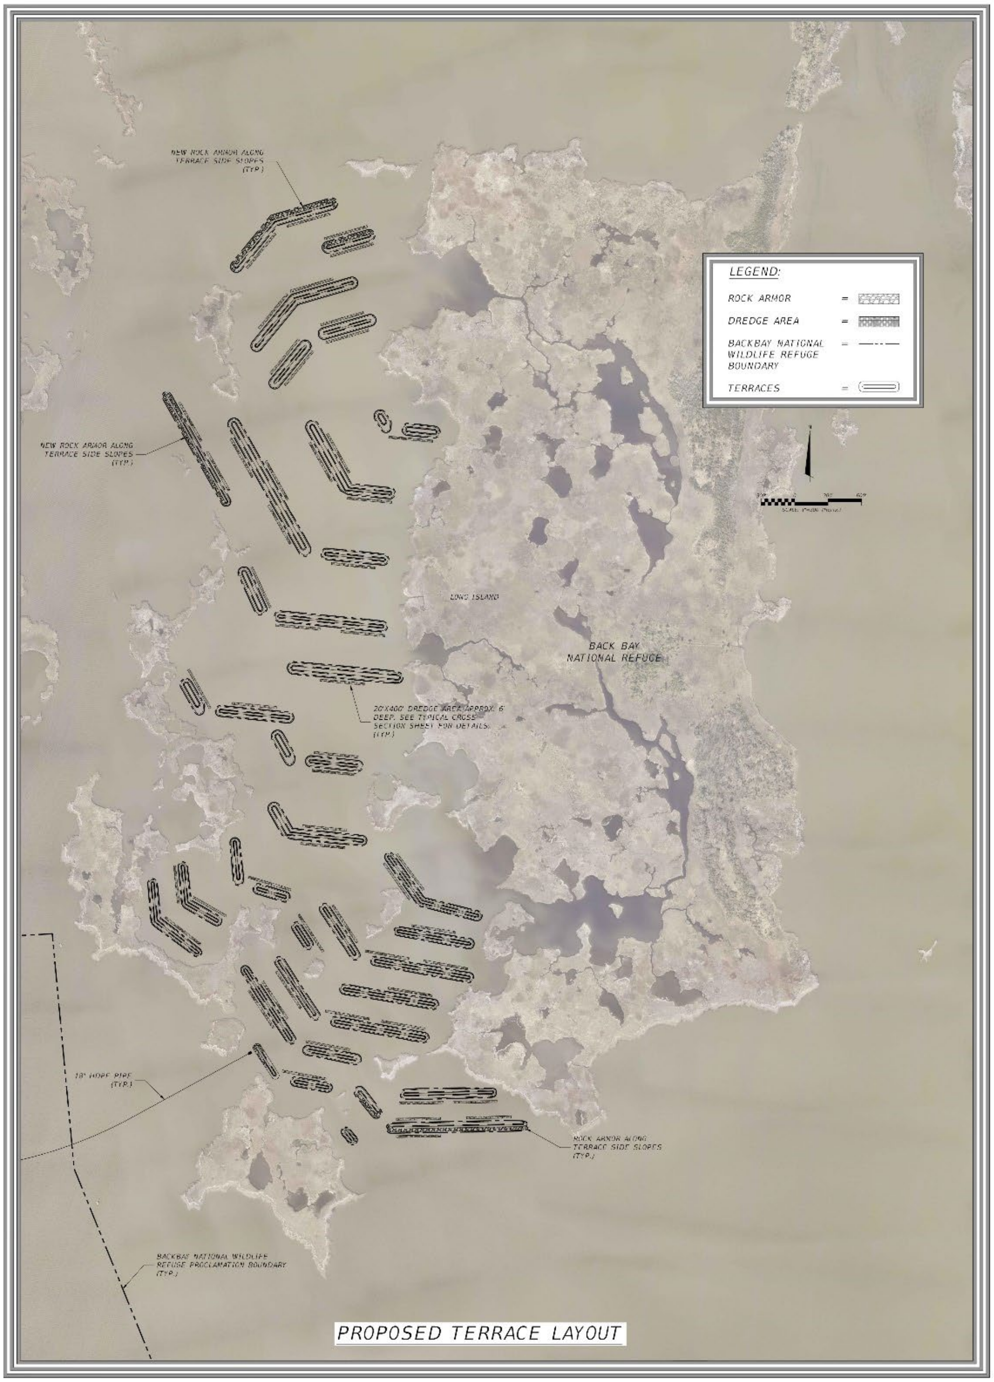

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

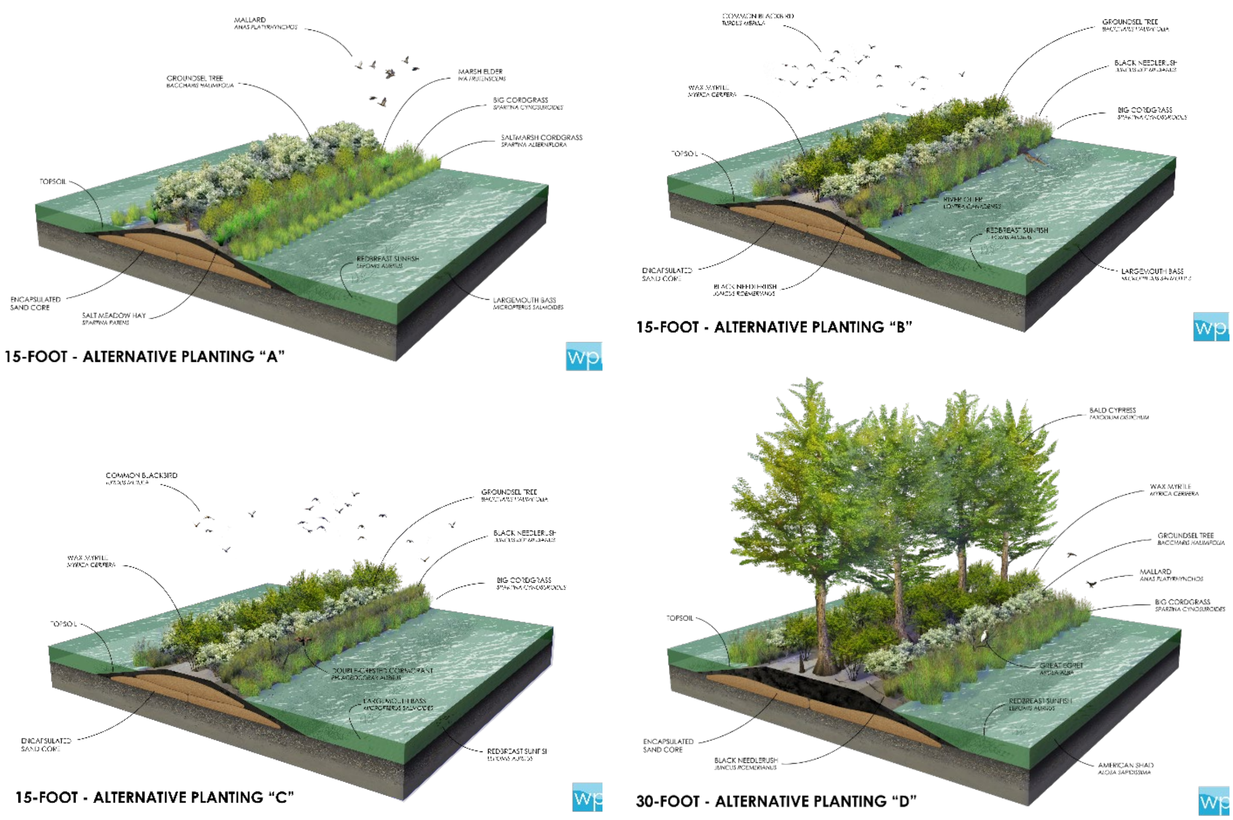

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities

STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to:
	  o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure.
	  o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state.
	• Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters
	• Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.

NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

    - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
    - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
    - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
    - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

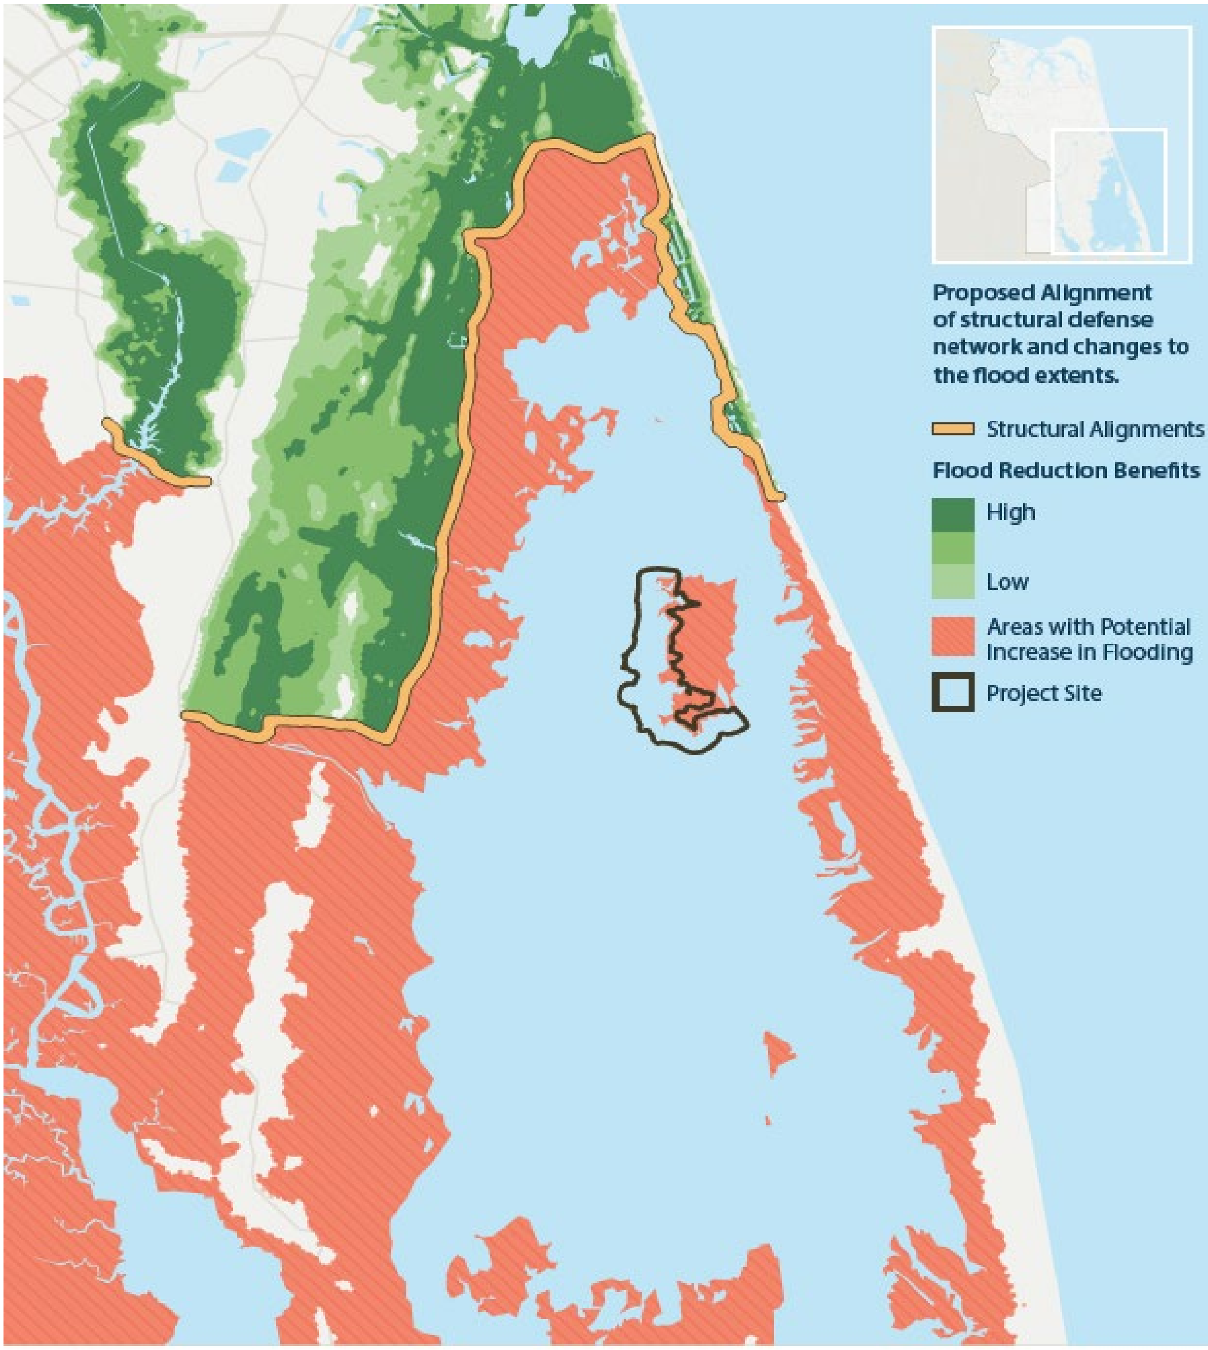

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

FISH AND WILDLIFE SERVICE

Back Bay National Wildlife Refuge
1324 Sandpiper Road
Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed
Refuge Manager

Albemarle-Pamlico
National Estuary Partnership

Our mission is to identify, protect, and restore
the significant resources of the Albemarle-Pamlico estuarine system.

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

William L. Crowell, Jr., Ph.D., AICP, CEE

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ <u>Reserved.</u>

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C. The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1. Public and private outdoor recreational facilities;~~

~~2. Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3. Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

    a. ~~Only one (1) such stand shall be permitted per lot;~~

    b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

    c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C.~~ ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

    a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

    b. Comply with the Public Works Design Standards Manual; and

    c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

Attachment 6: Copy of Monitoring/Maintenance Plan

[DRAFT] Annual Monitoring Plan and Post-Construction Monitoring Report

Marsh Restoration in Back Bay, Virginia Beach, VA

Prepared by: Dewberry Engineers, Inc.

[July 6, 2023]

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

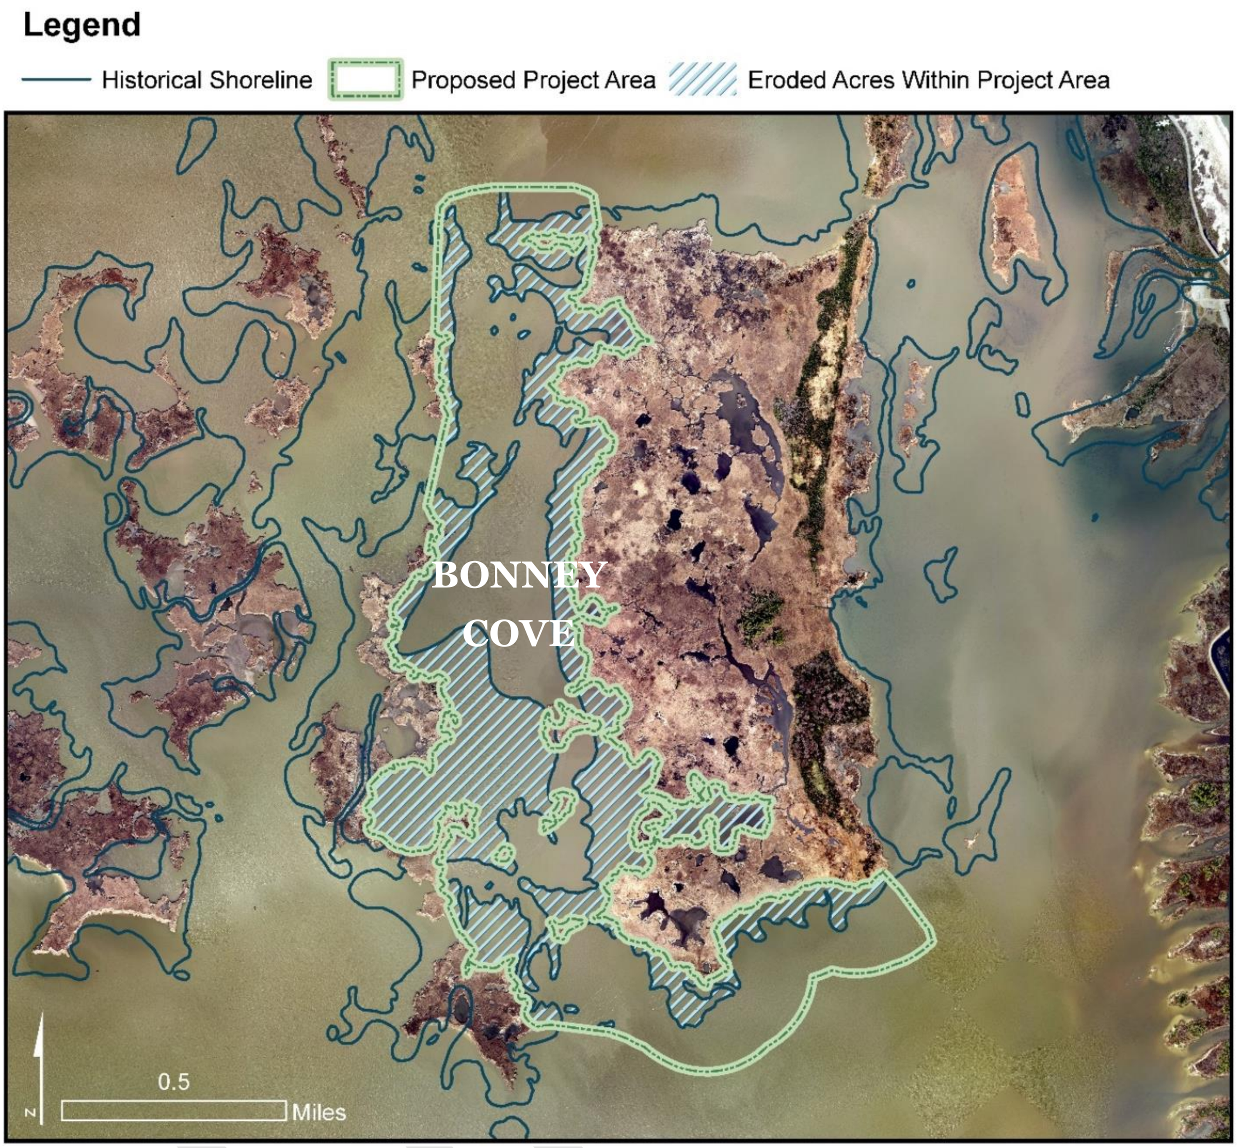

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

---

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

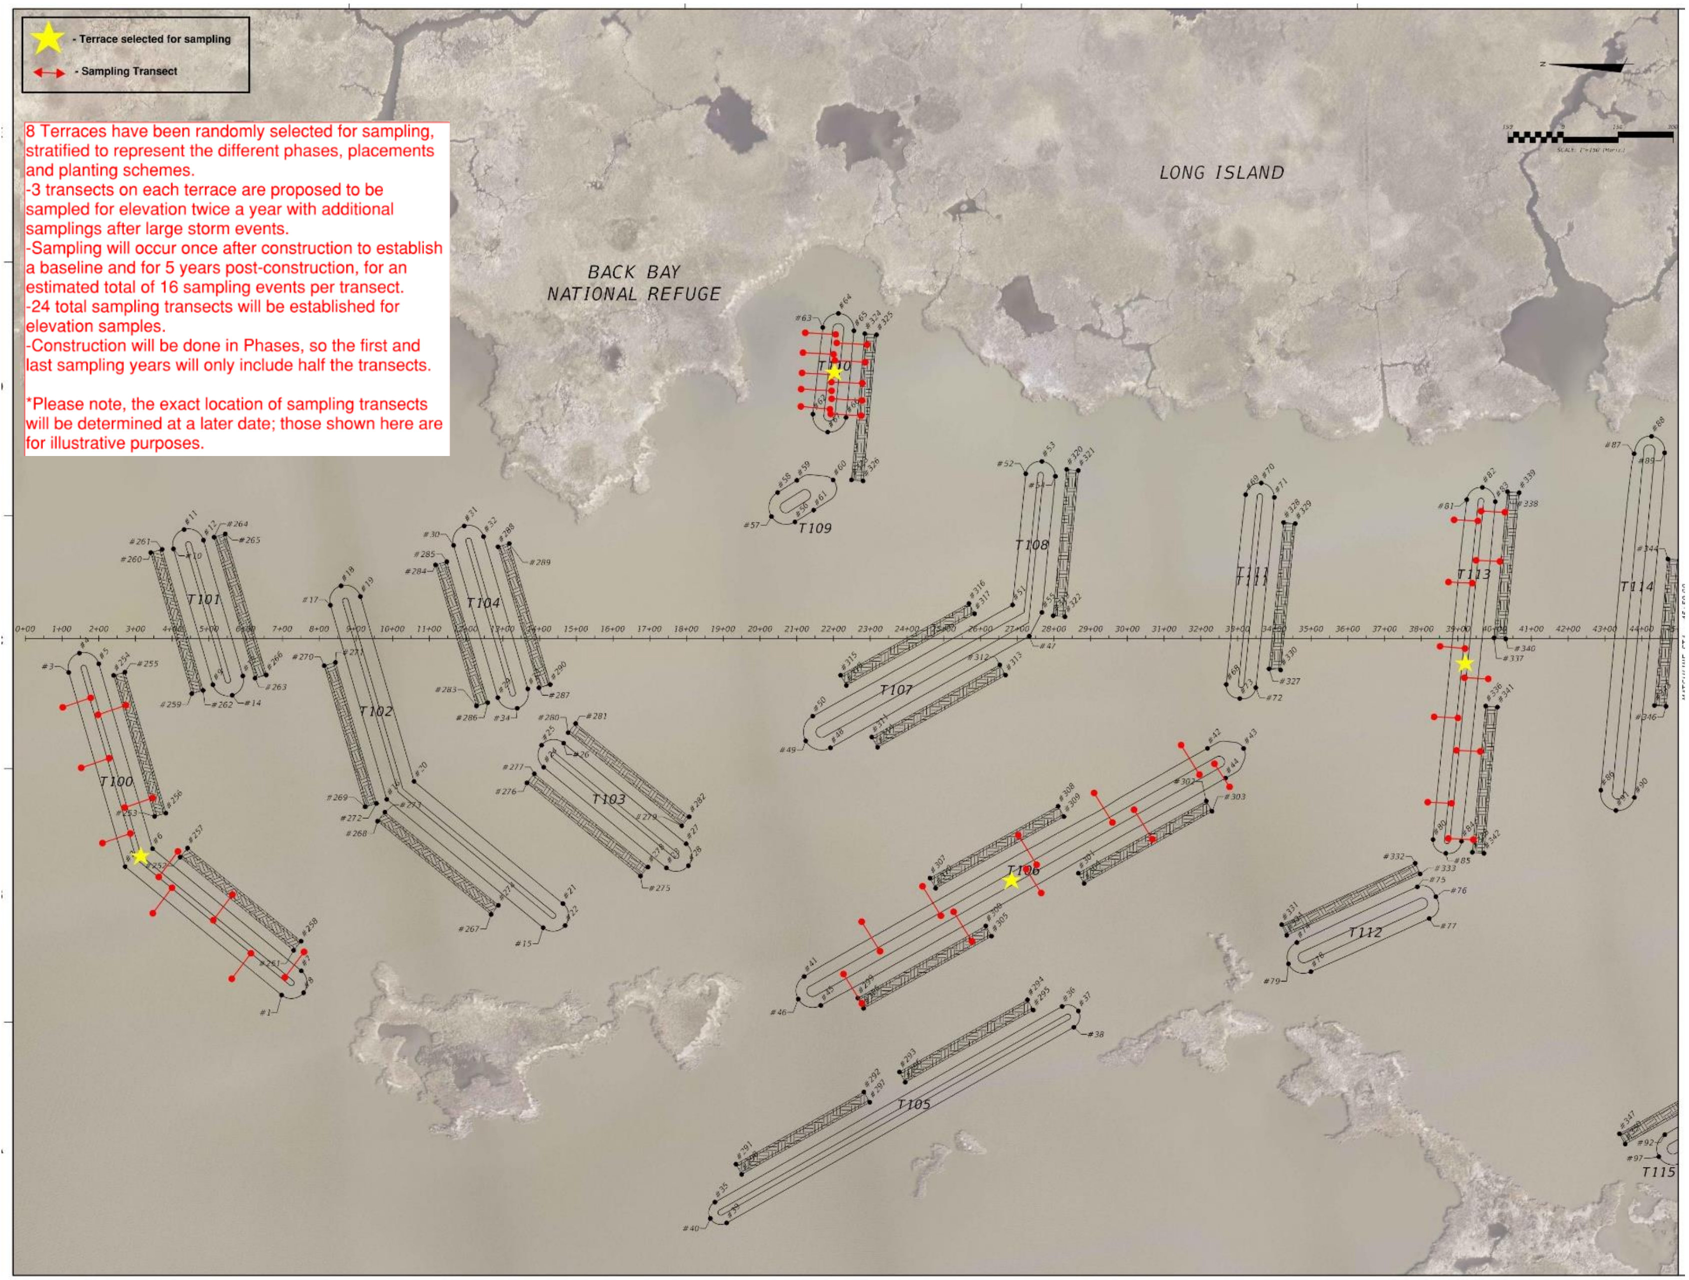

Figure 3: Monitoring design site plan – North Terraces

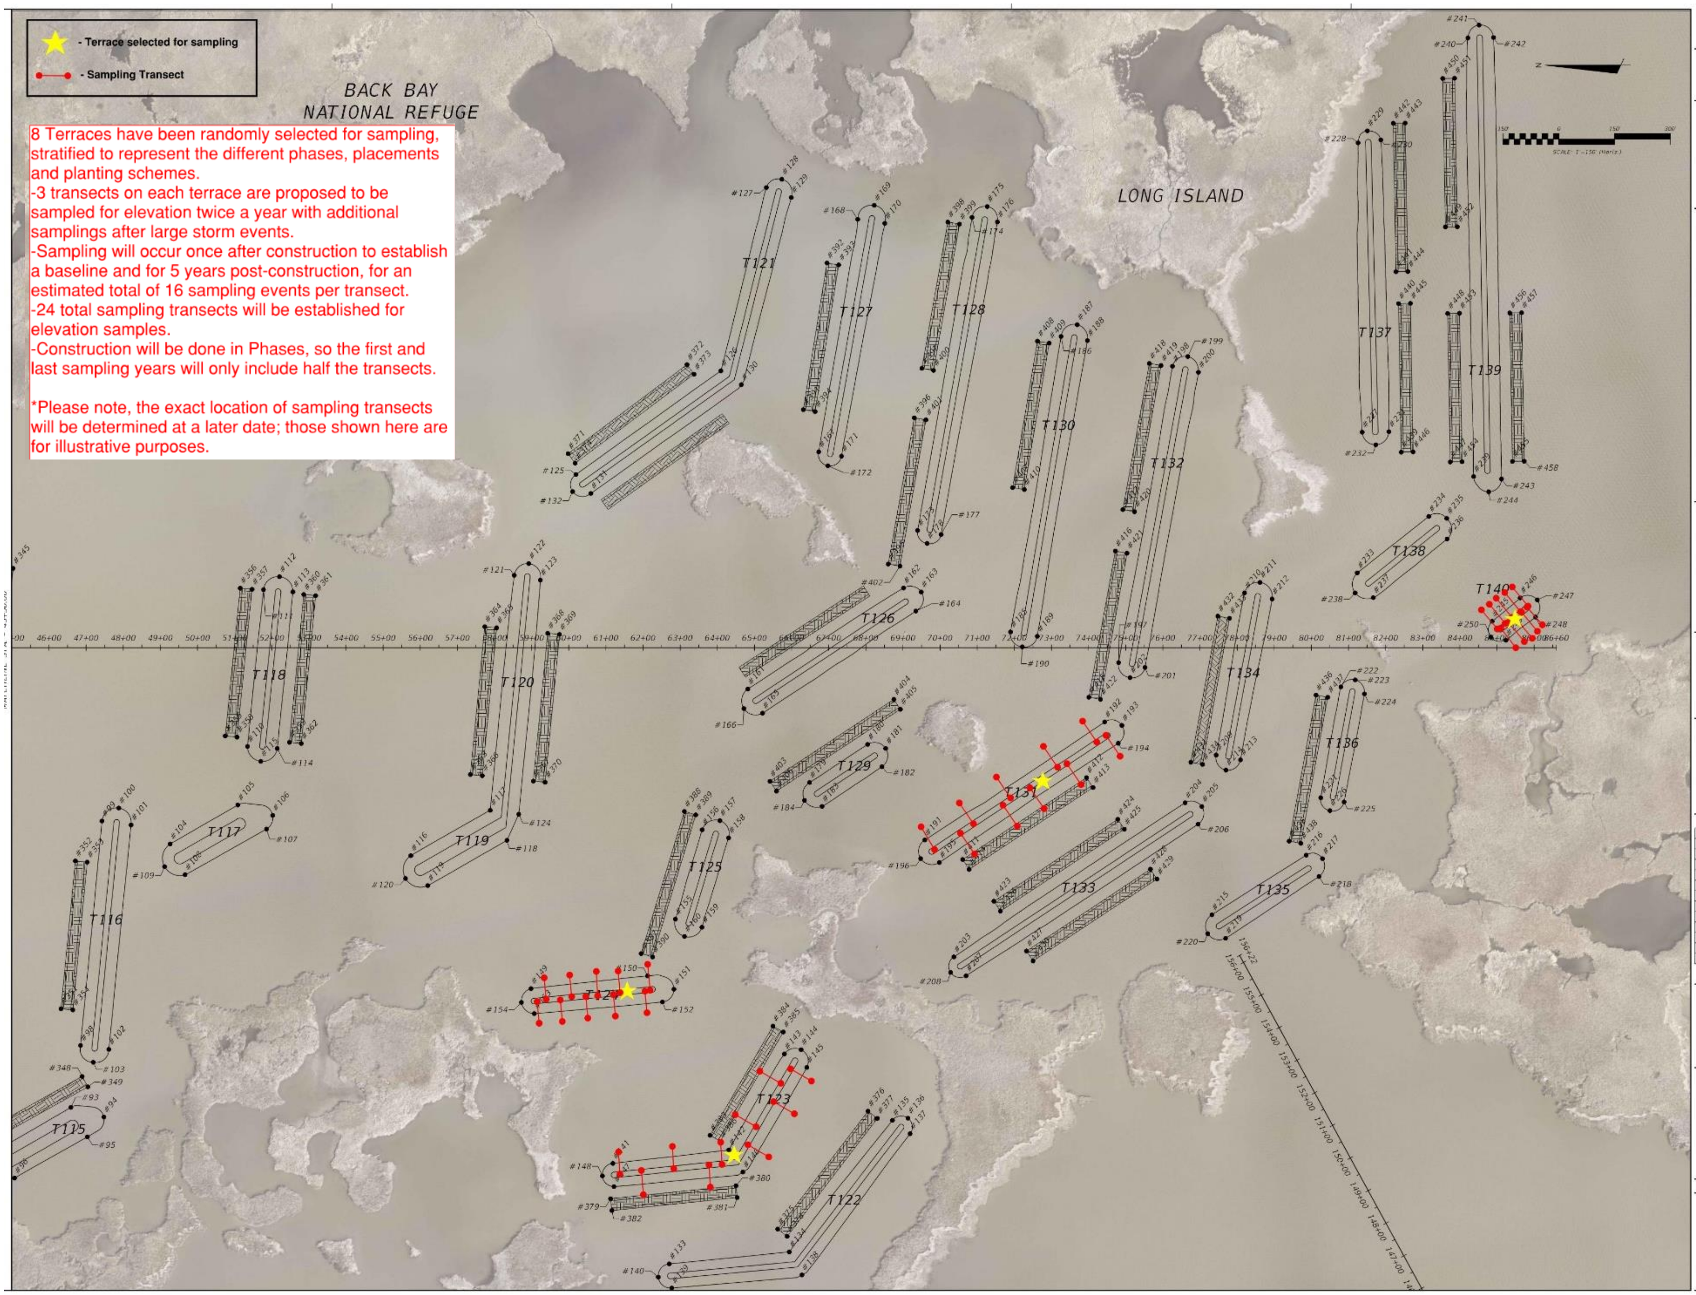

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

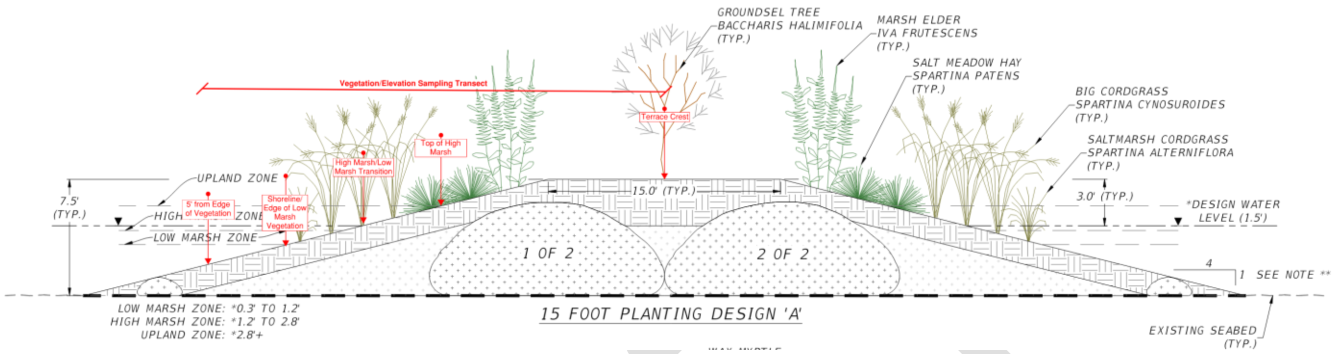

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ____

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- ☐ Dam restoration.
- ☐ Beneficial reuse of dredge materials for flood mitigation purposes
- ☐ Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- ☐ Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ____________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) __________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: ______________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: __________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach FY2024 adopted budget or refer to website

Attach current Capital Improvement Plan

Attach adopted Financial Policies

Attach a list of the ten largest employers in the Applicant's jurisdiction.

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023									
								Grand Total State Funding Request	$ 5,000,000
								Grand Total Local Share of Project	$ 38,356,966
			National Fish and Wildlife Foundation Grants					Federal Funding (if applicable)	$ 10,021,524
								Project Grand Total	$ 53,378,490
								Locality Cost Match	% 71.85
Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

[3] Office of Governor Ralph S. Northam Commonwealth of Virginia. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

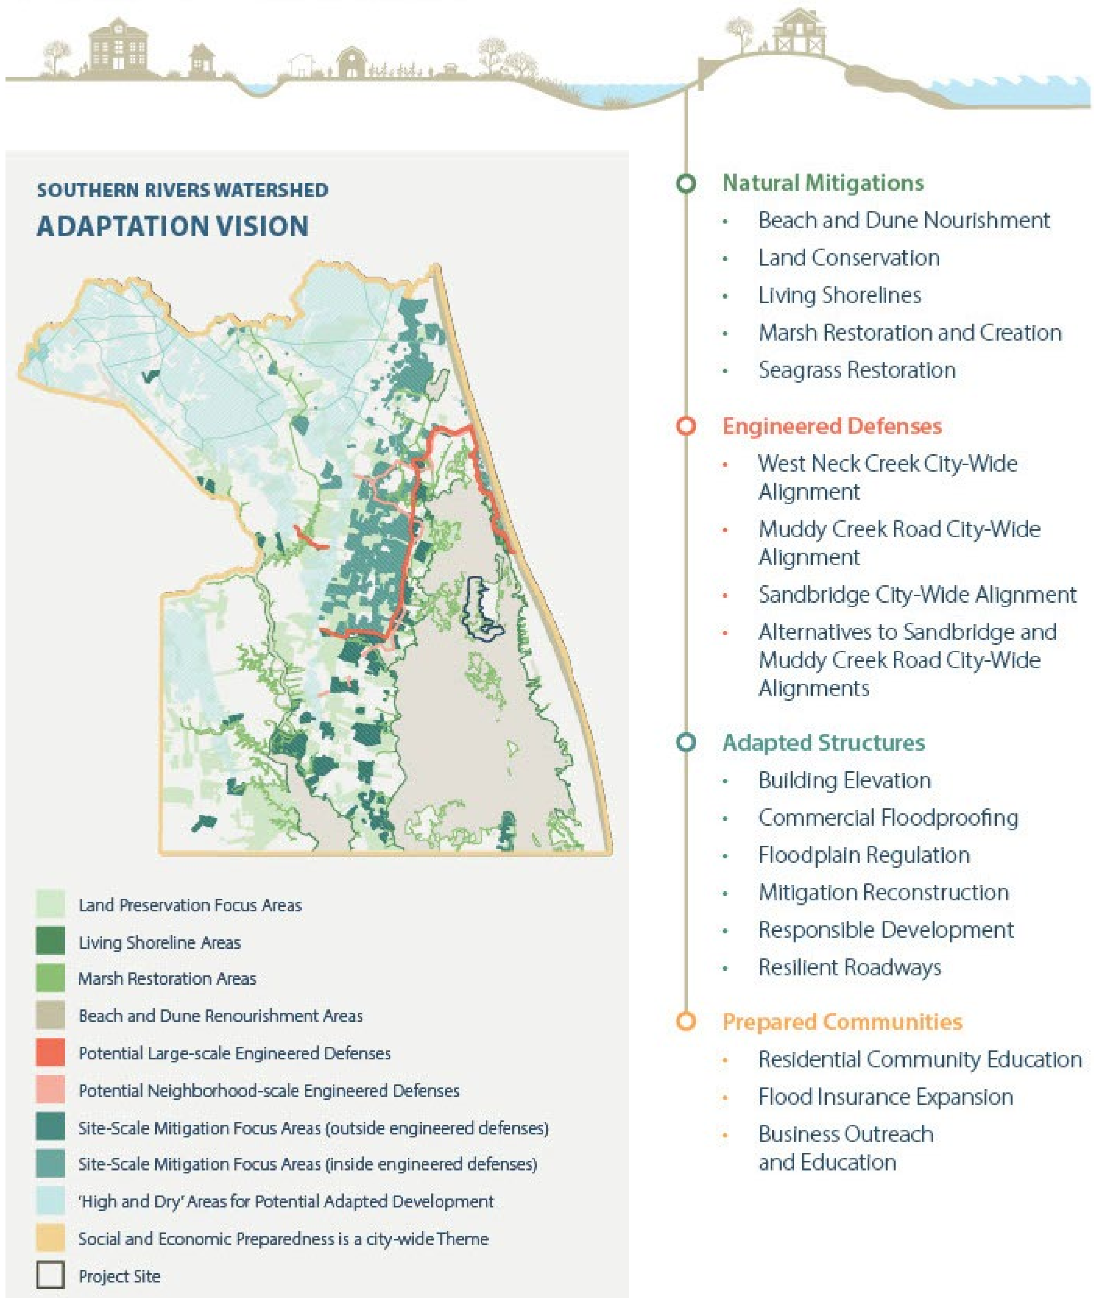

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

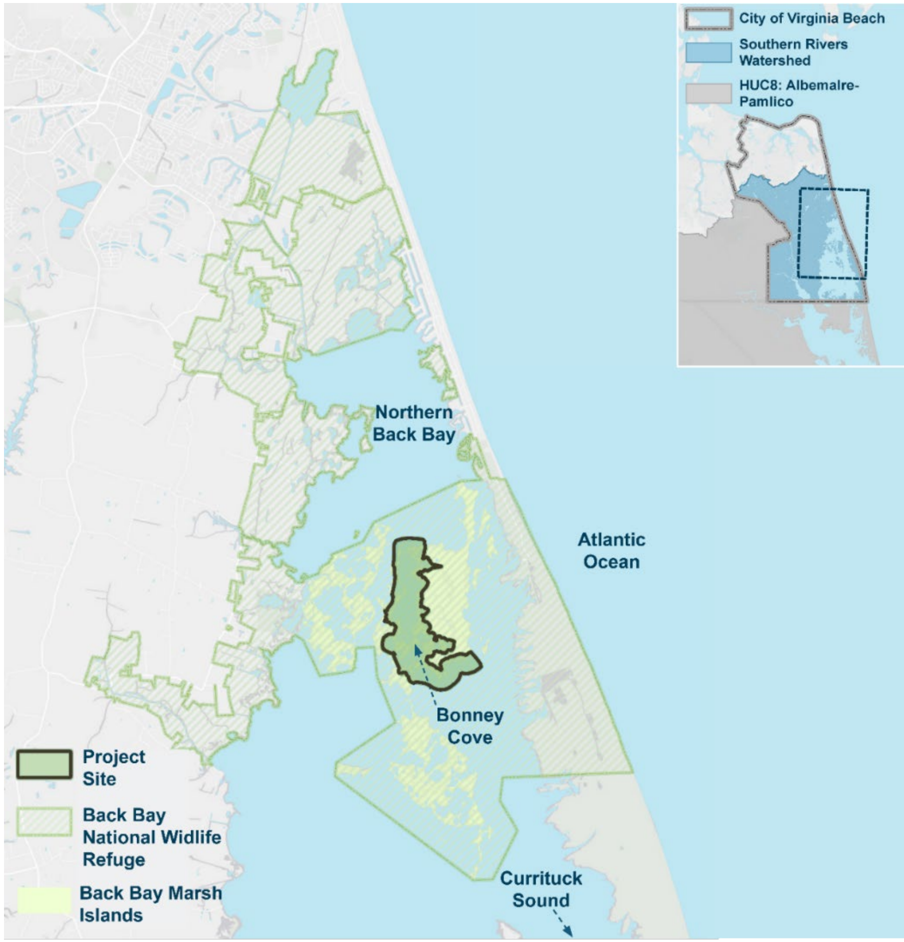

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

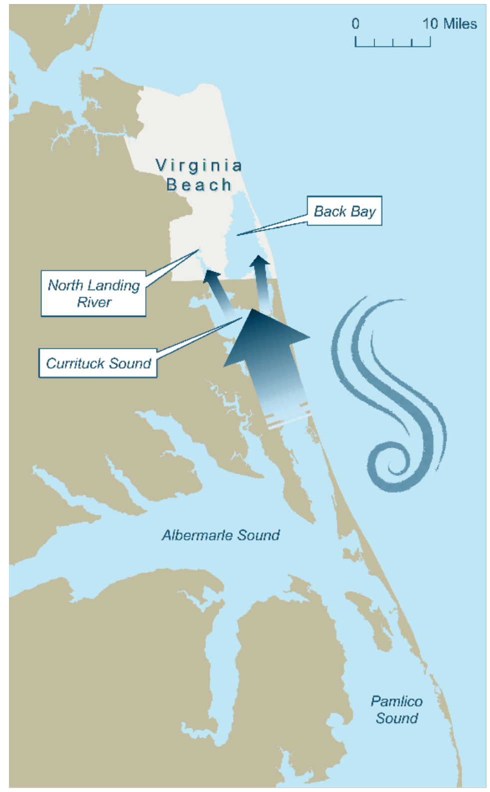

Figure 3: Flood pathways in the Southern Rivers Watershed.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

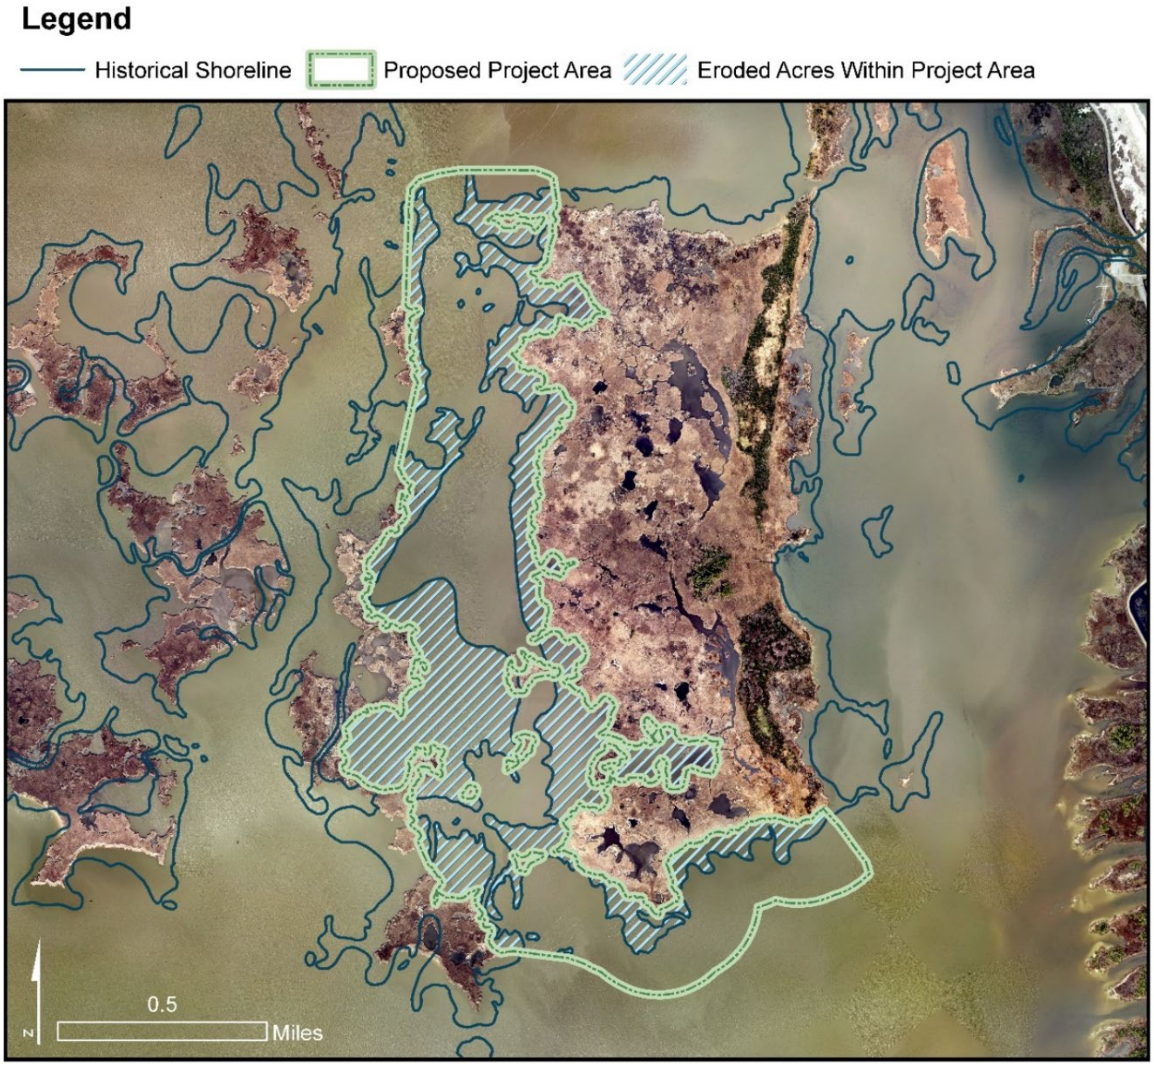

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

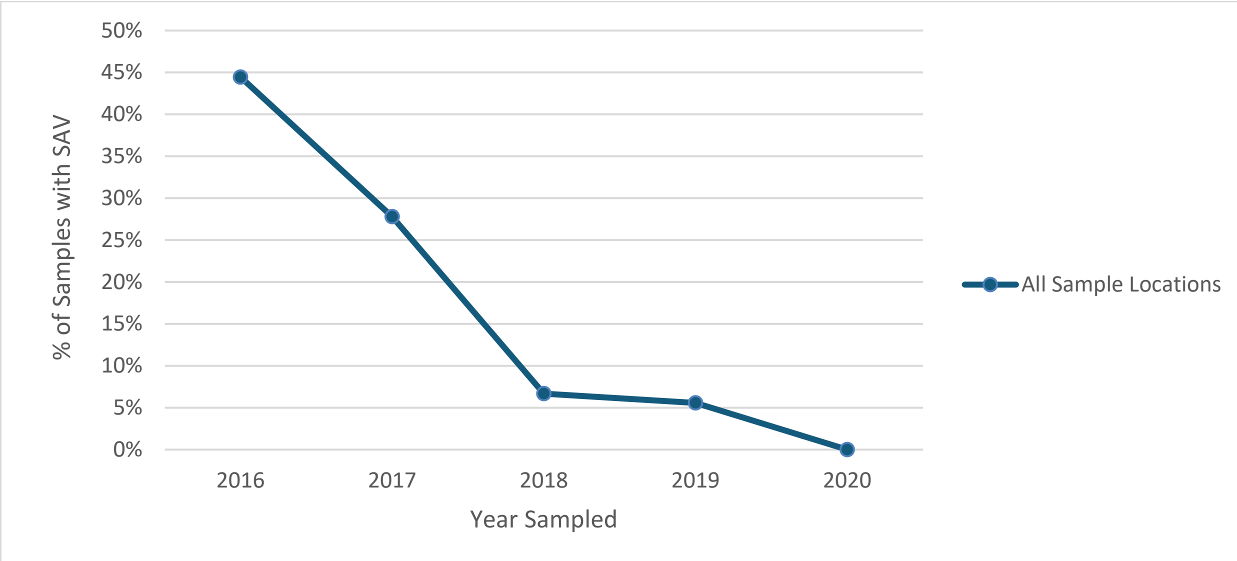

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

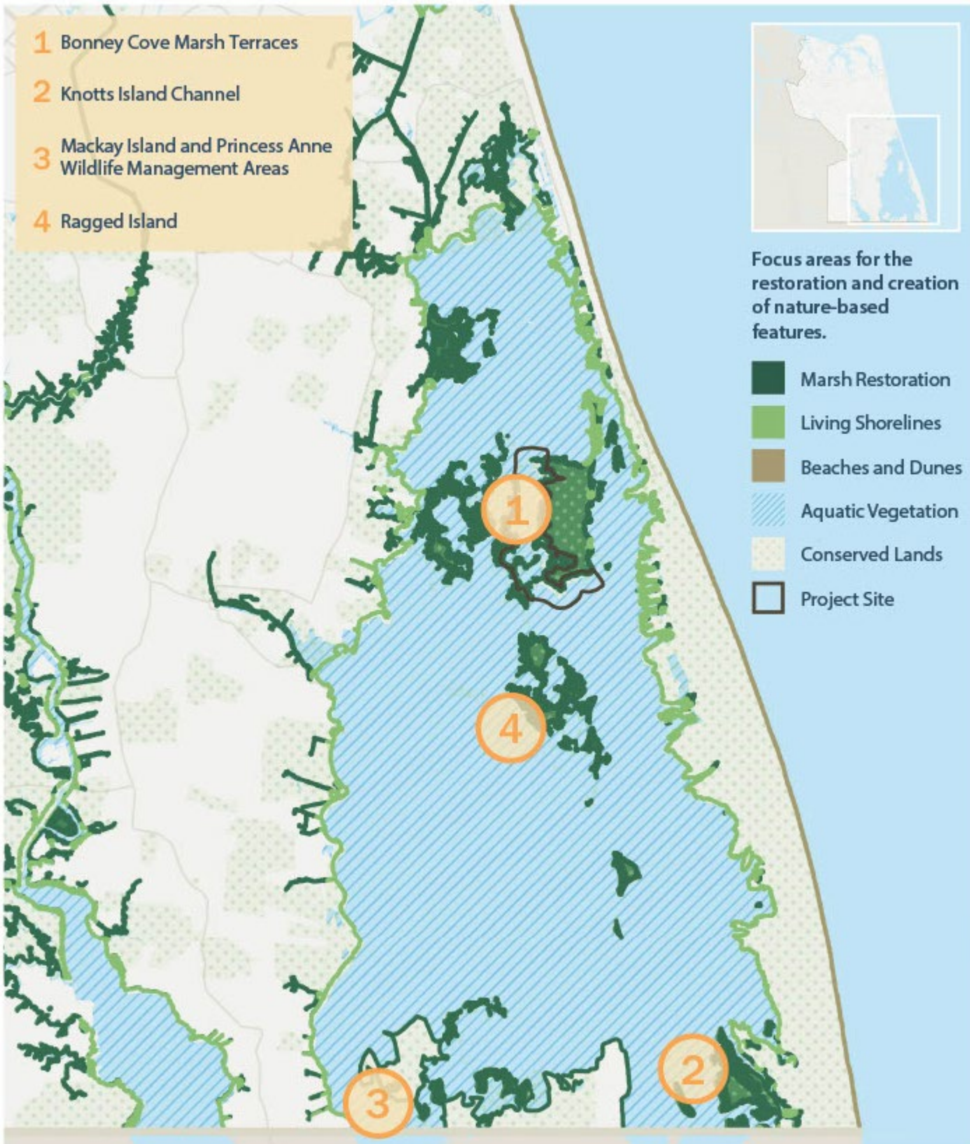

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

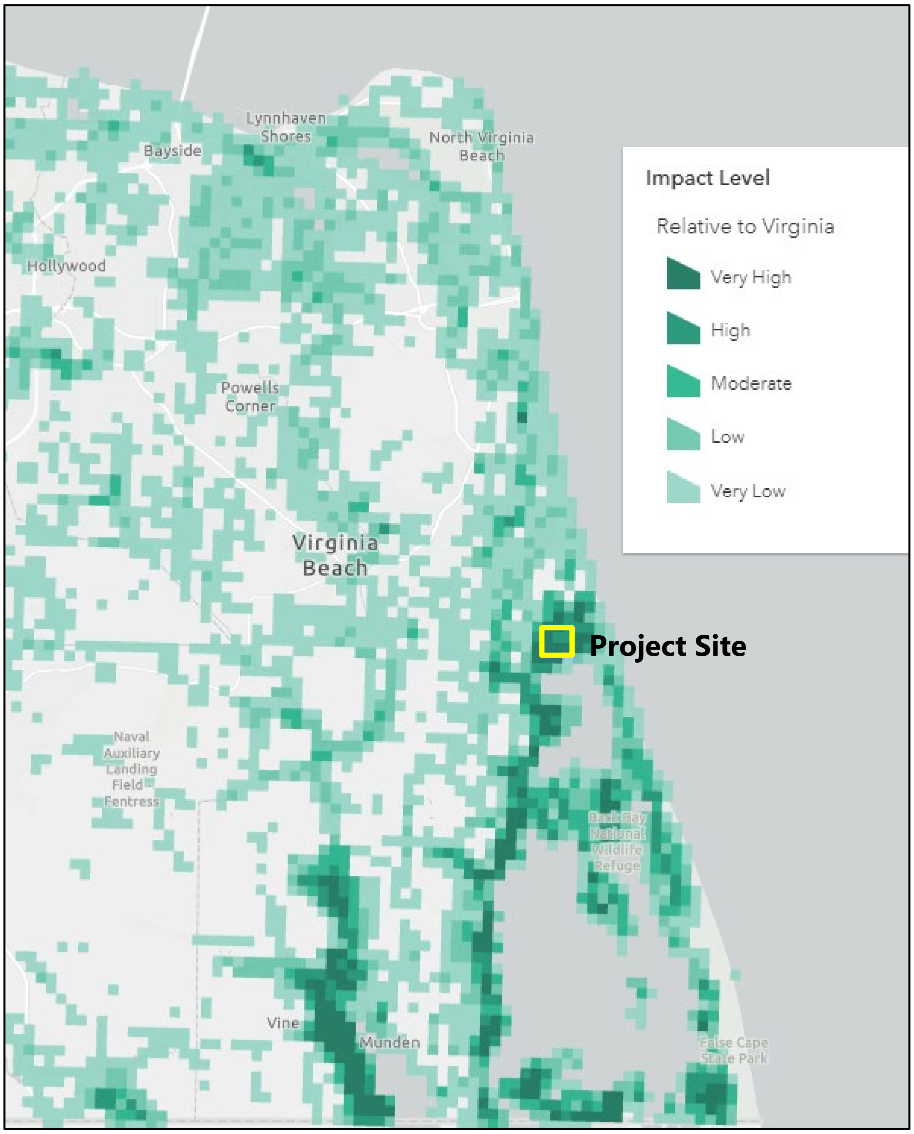

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

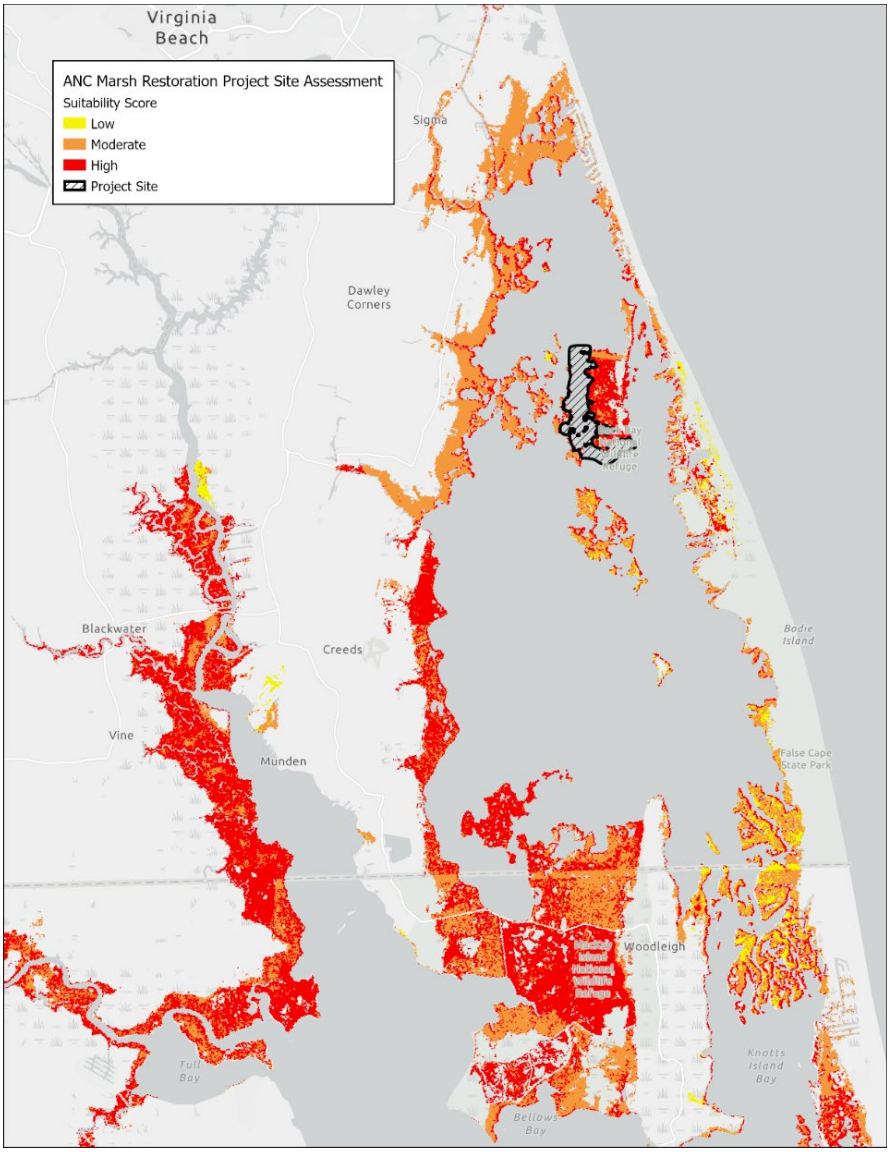

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

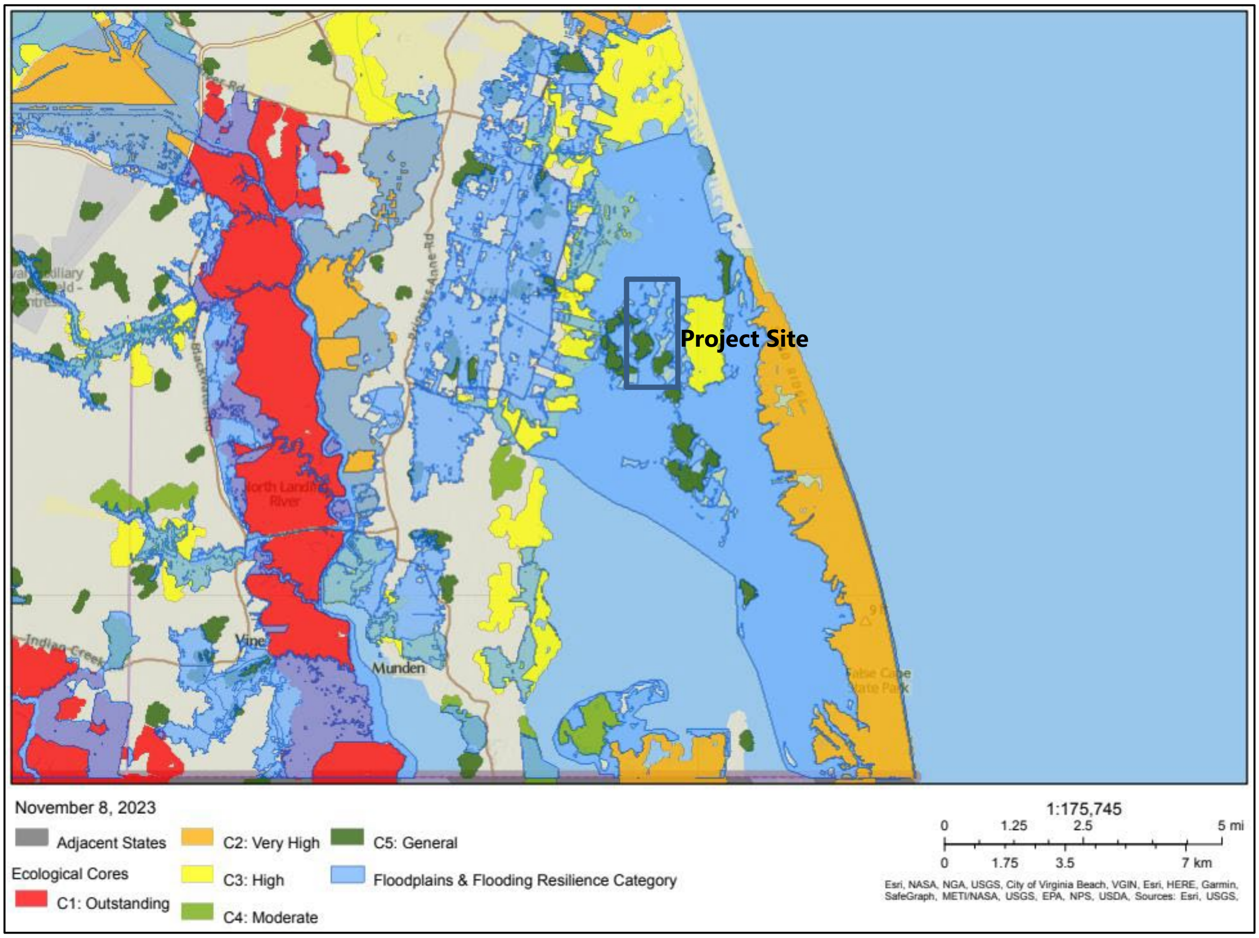

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

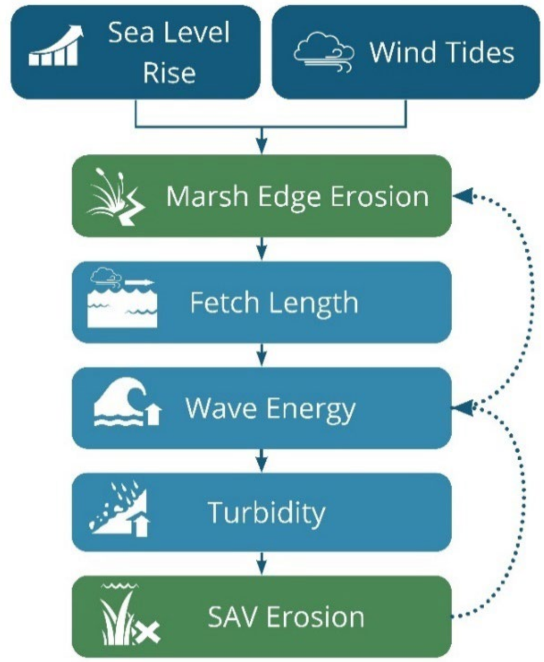

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

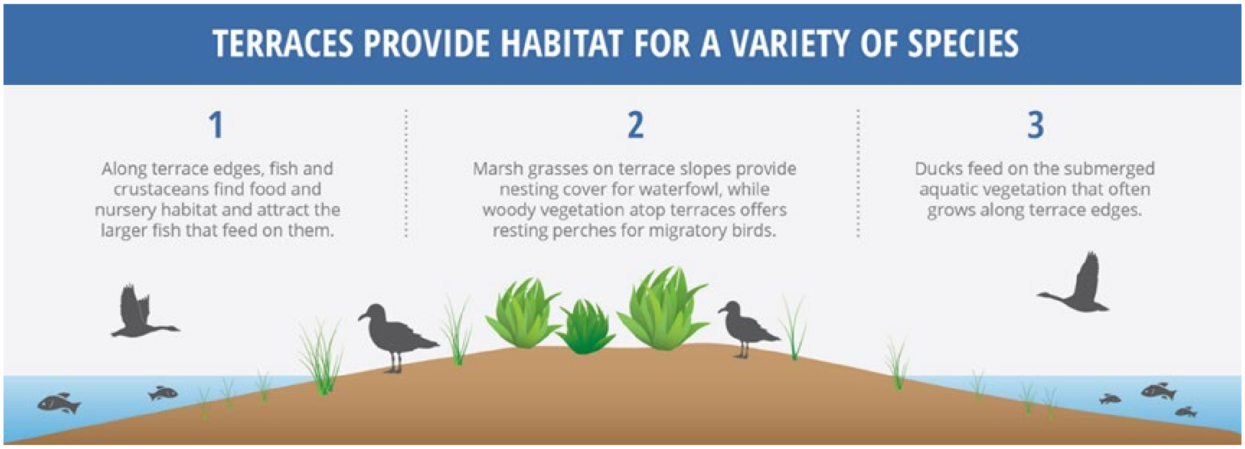

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

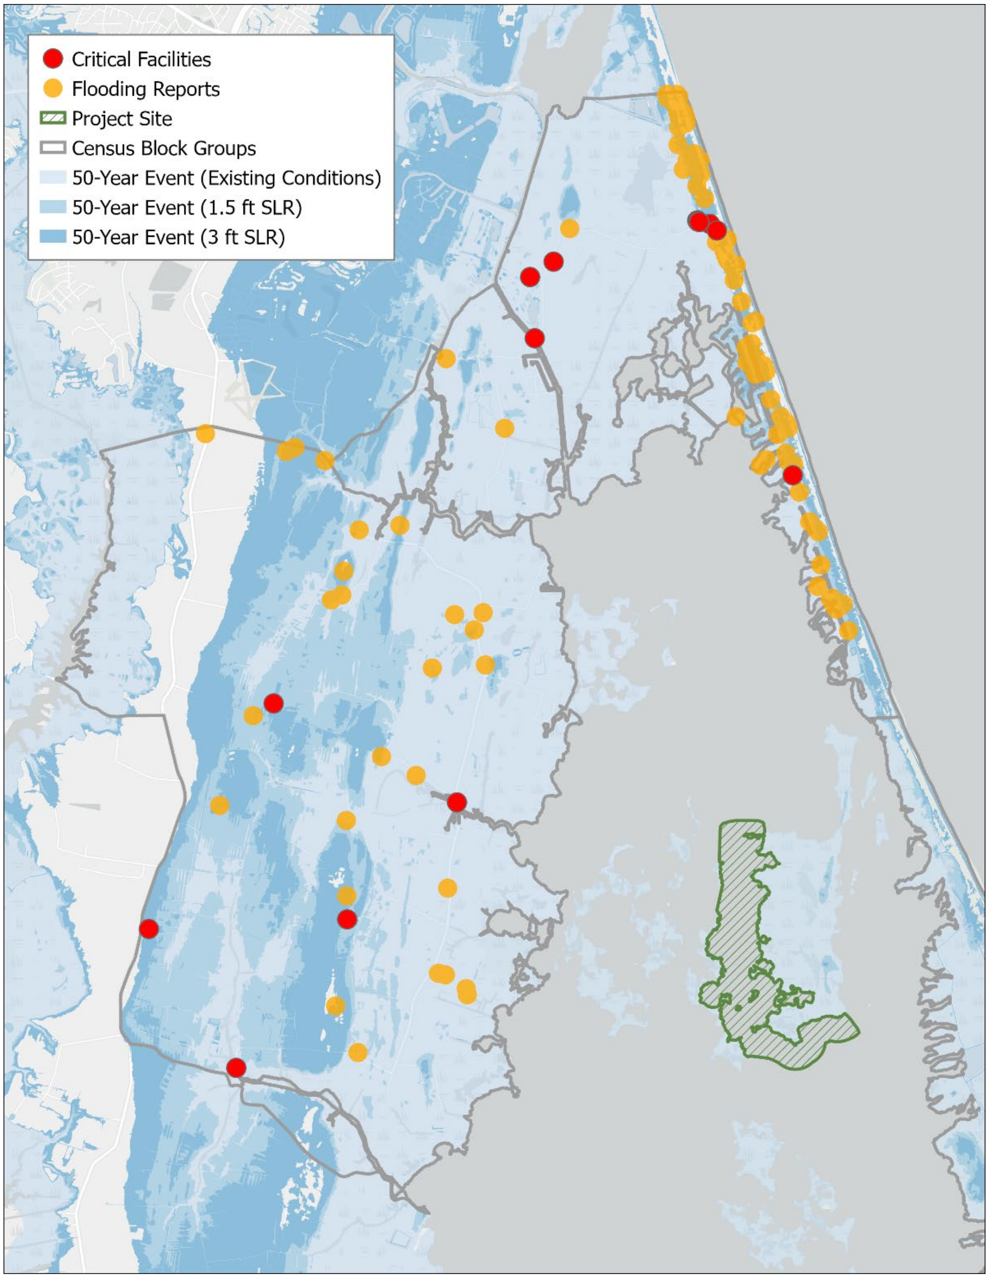

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

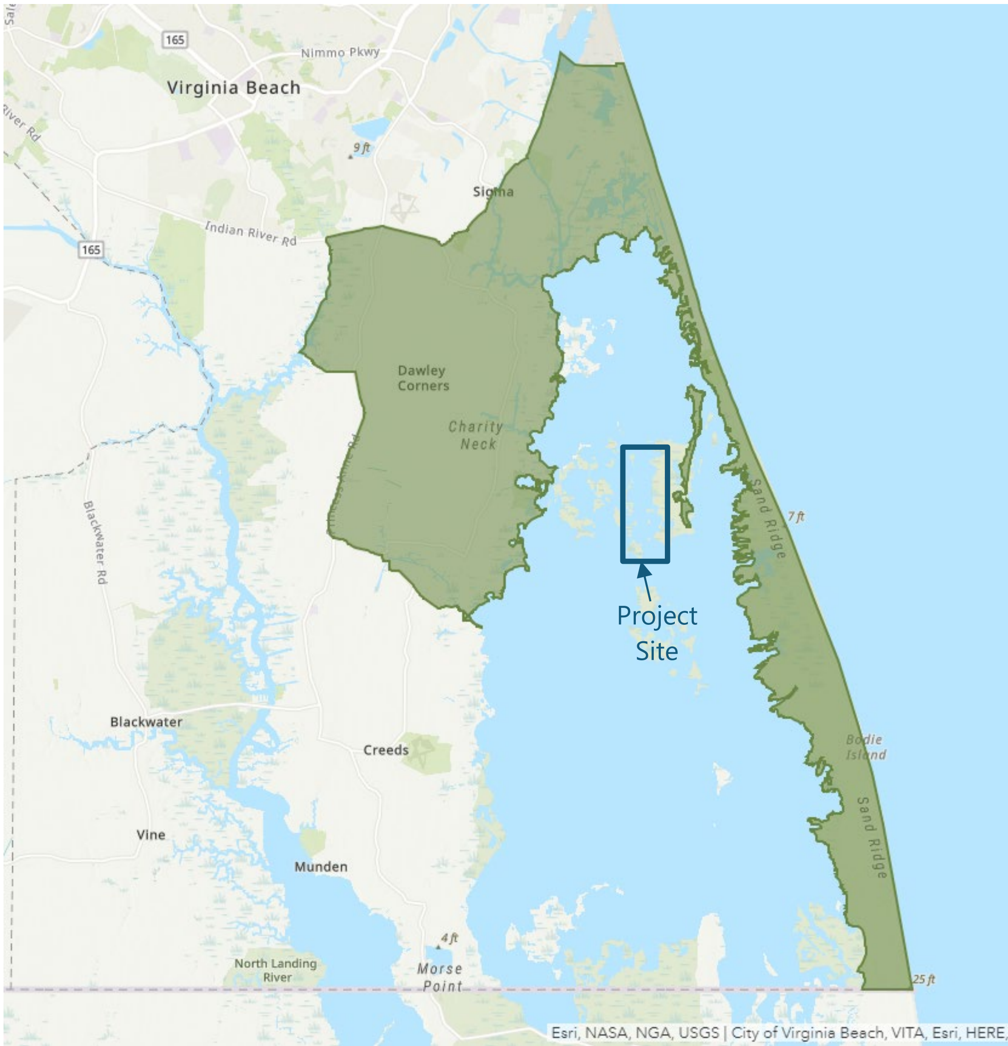

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

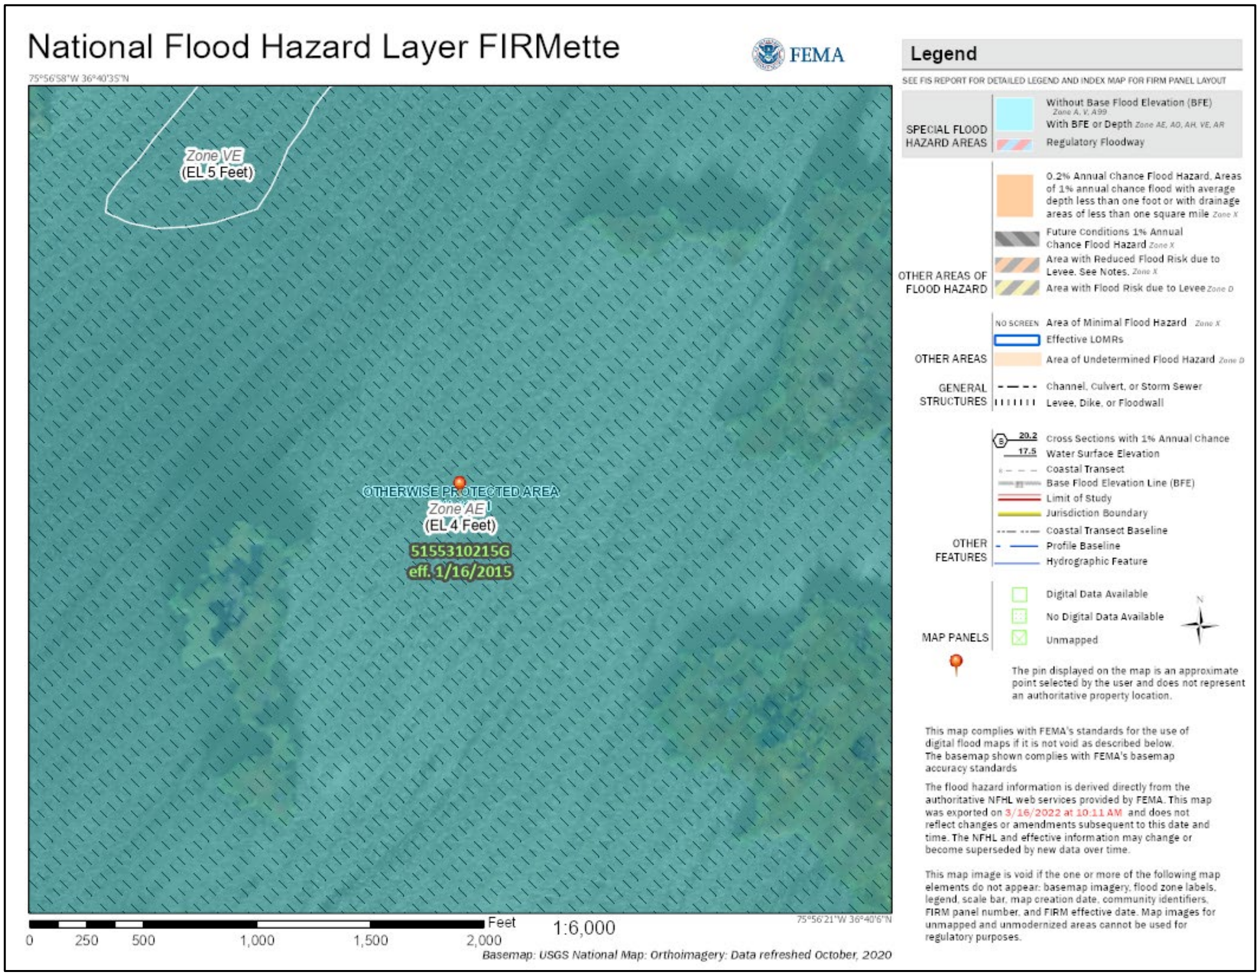

Figure 15: FIRMette for the project area (northern boundary).

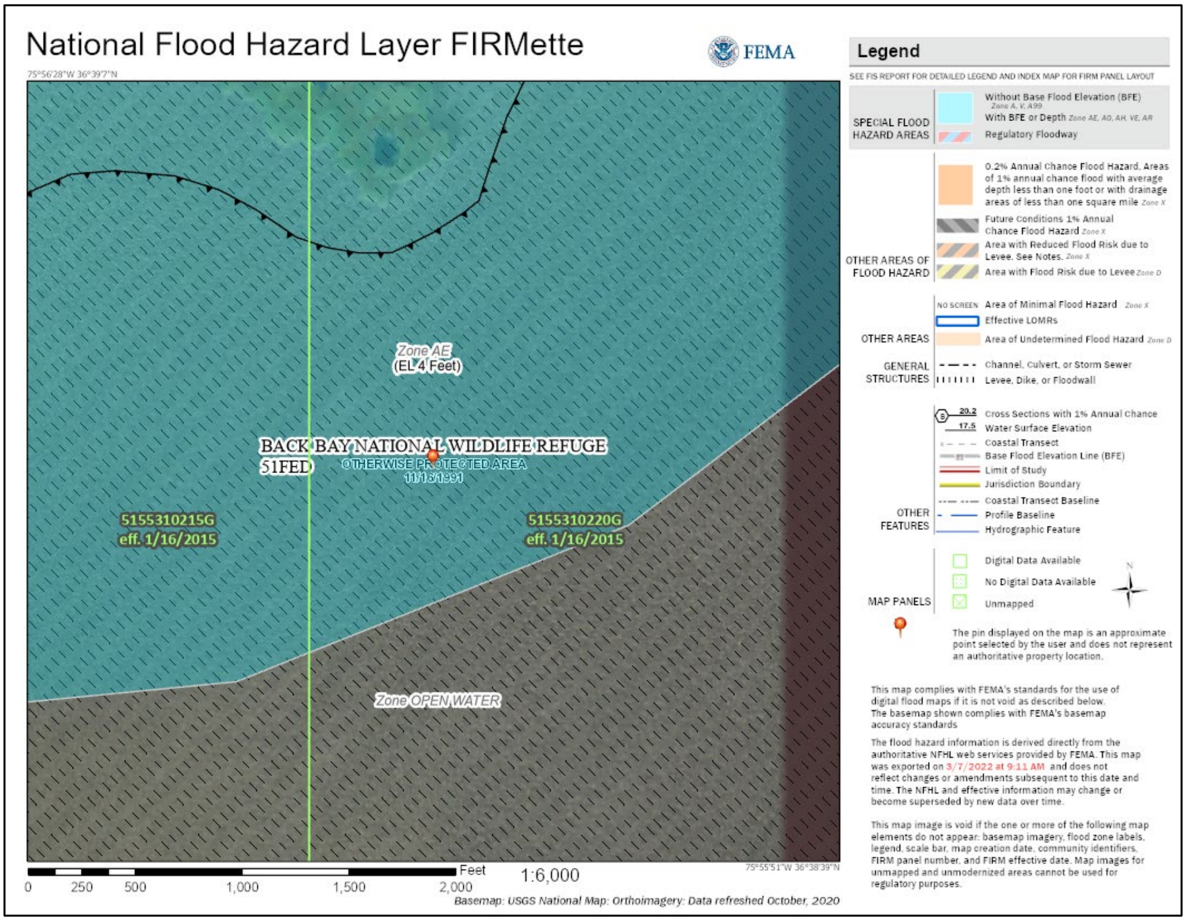

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

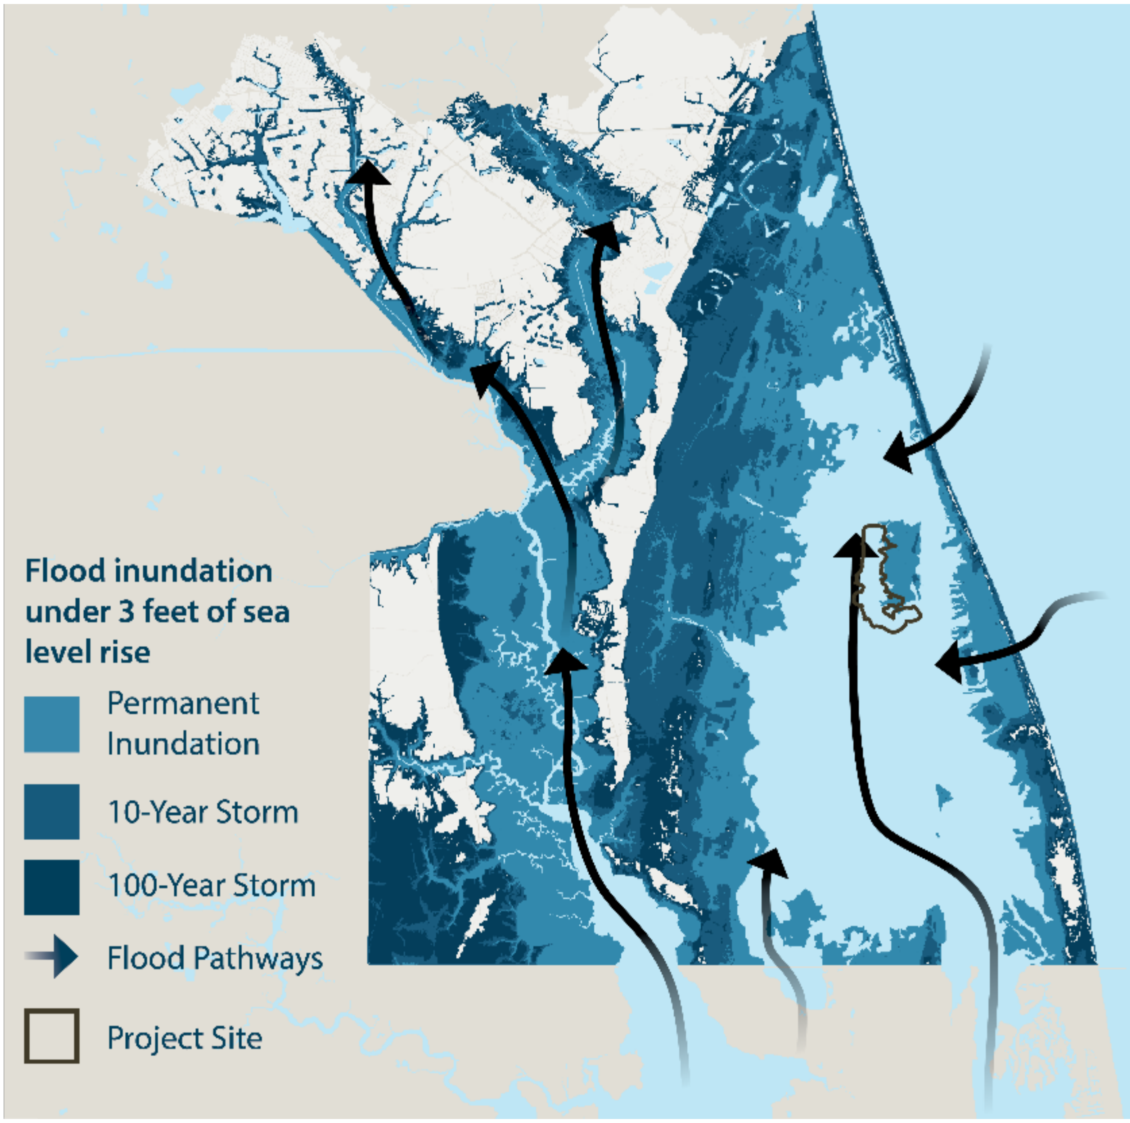

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

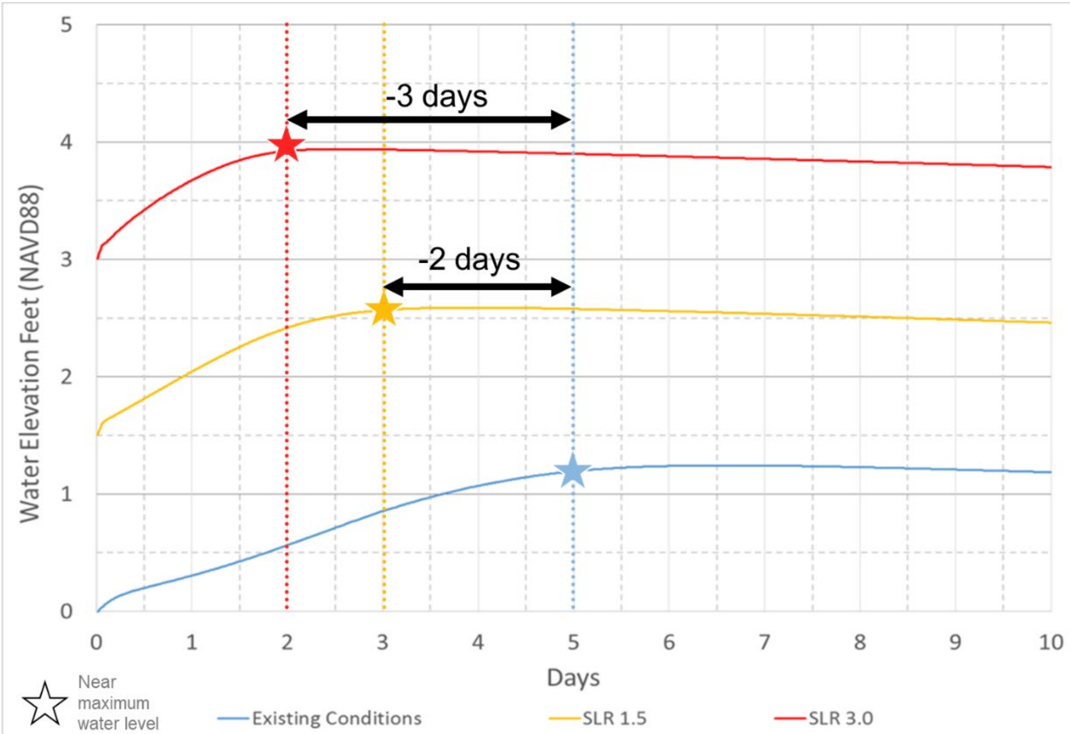

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

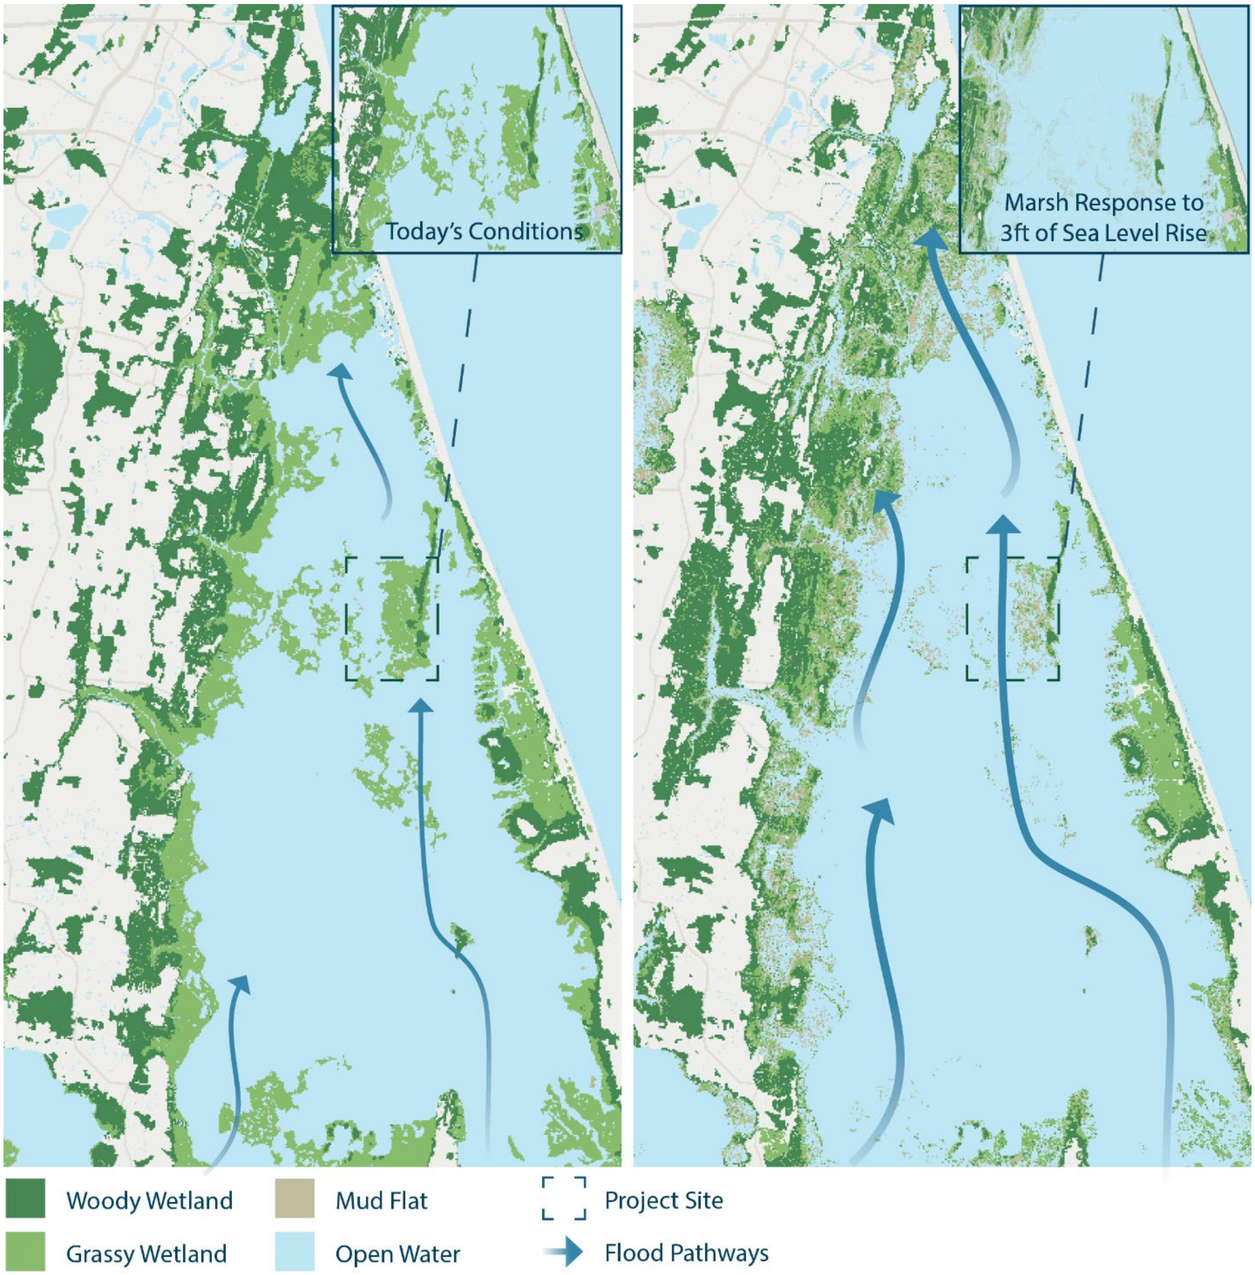

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

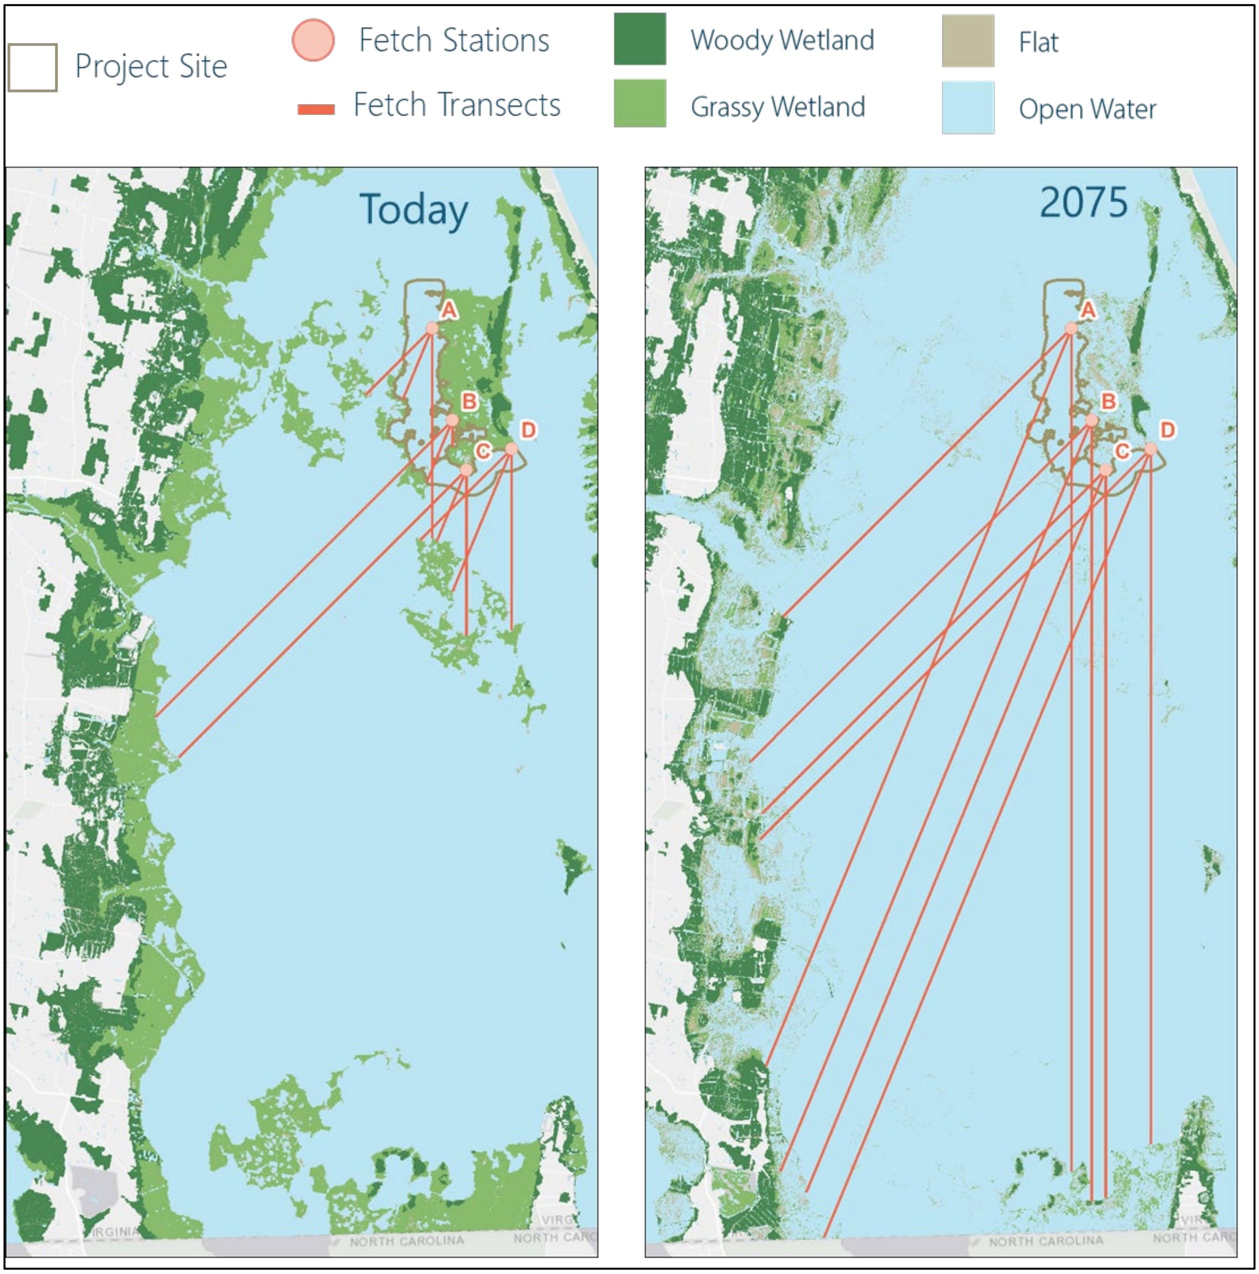

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina’s Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

---

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

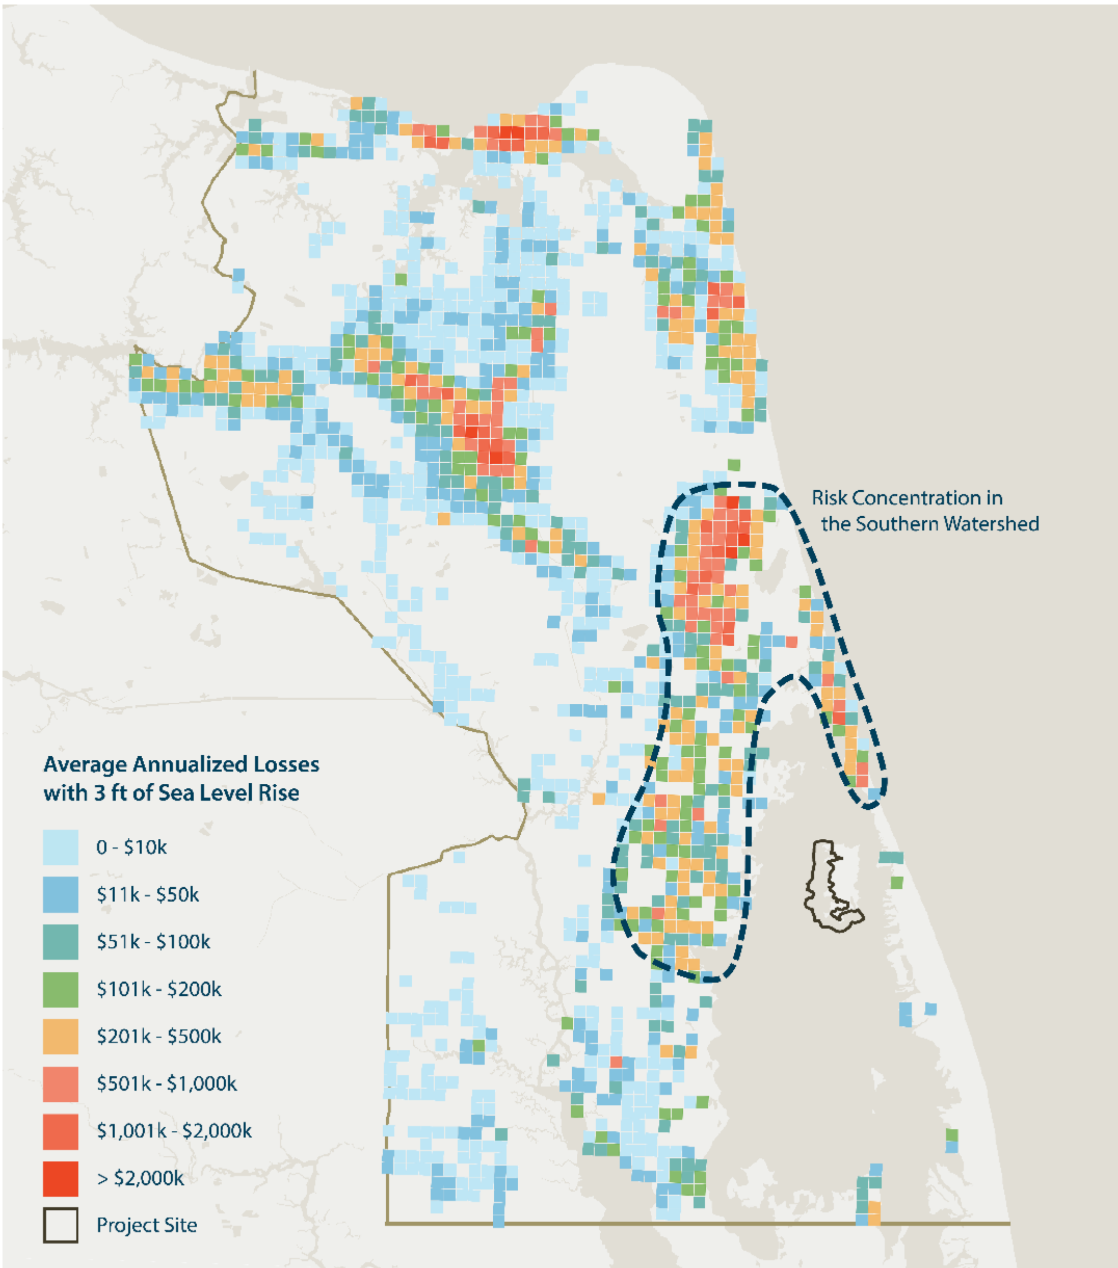

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.

Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

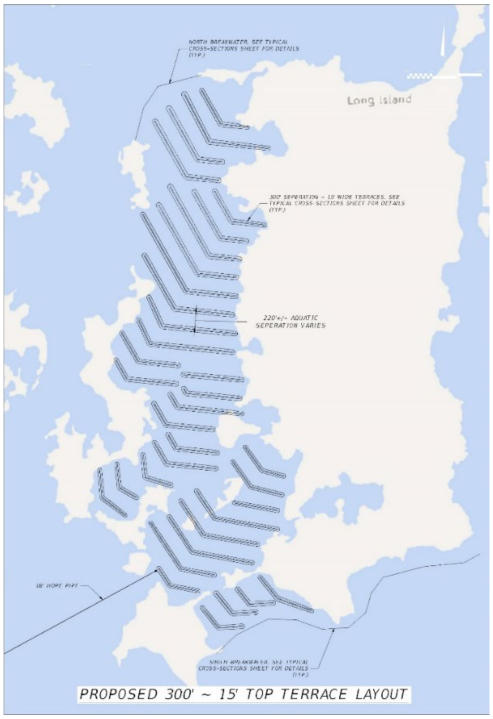

Figure 22: Alternative 2a.

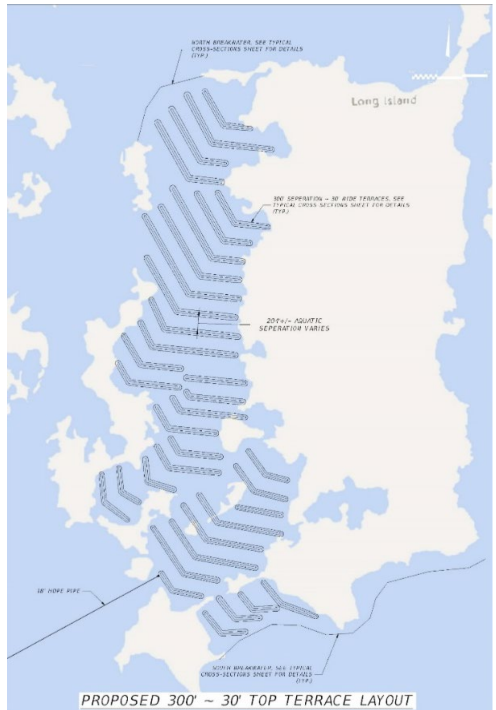

Figure 23: Alternative 2b.

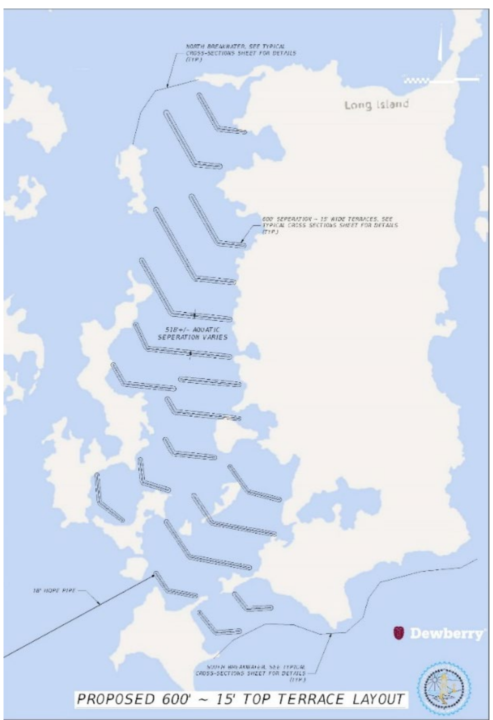

Figure 24: Alternative 2c.

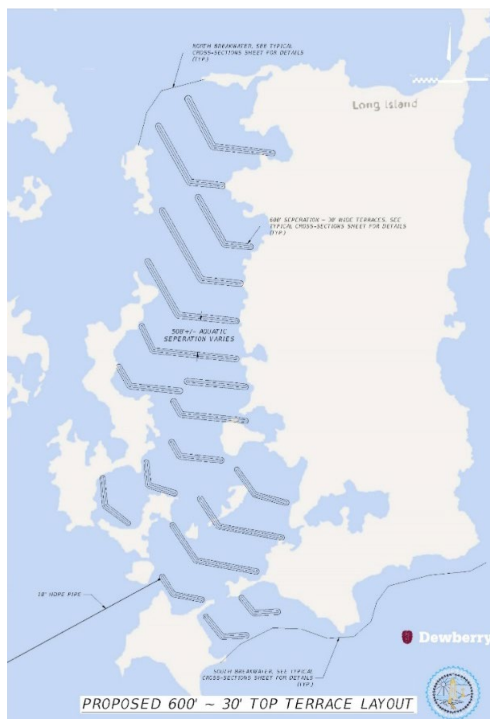

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

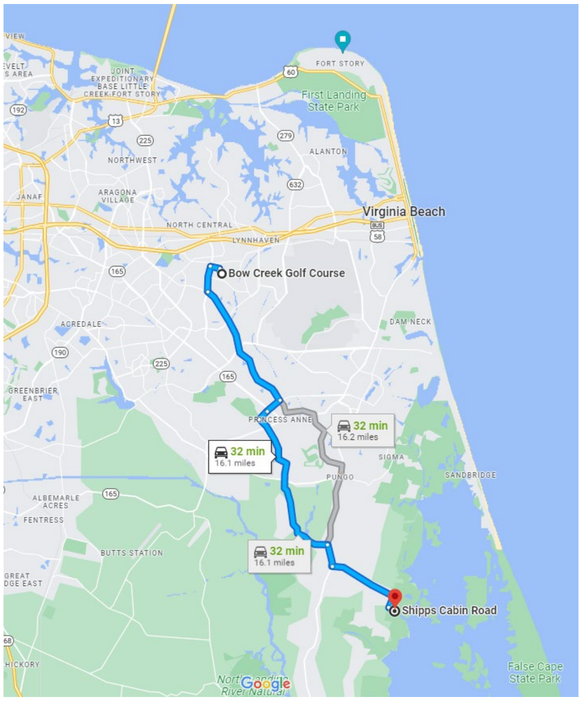

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

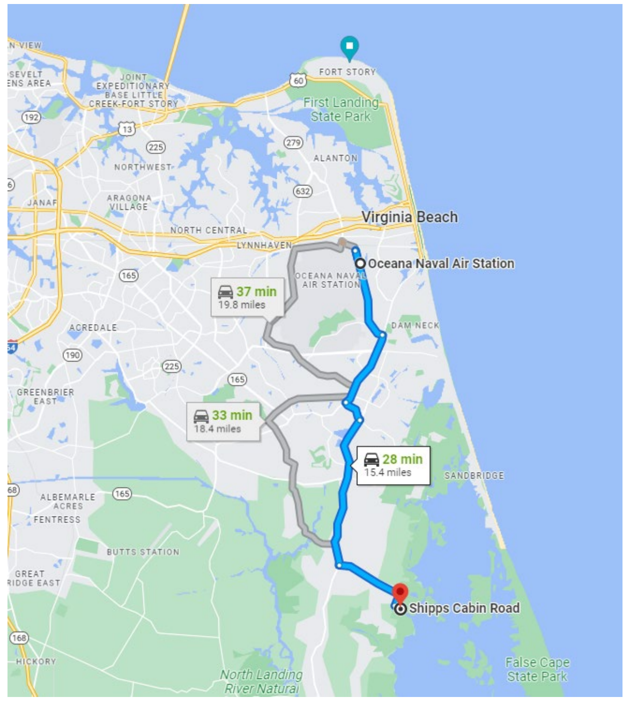

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

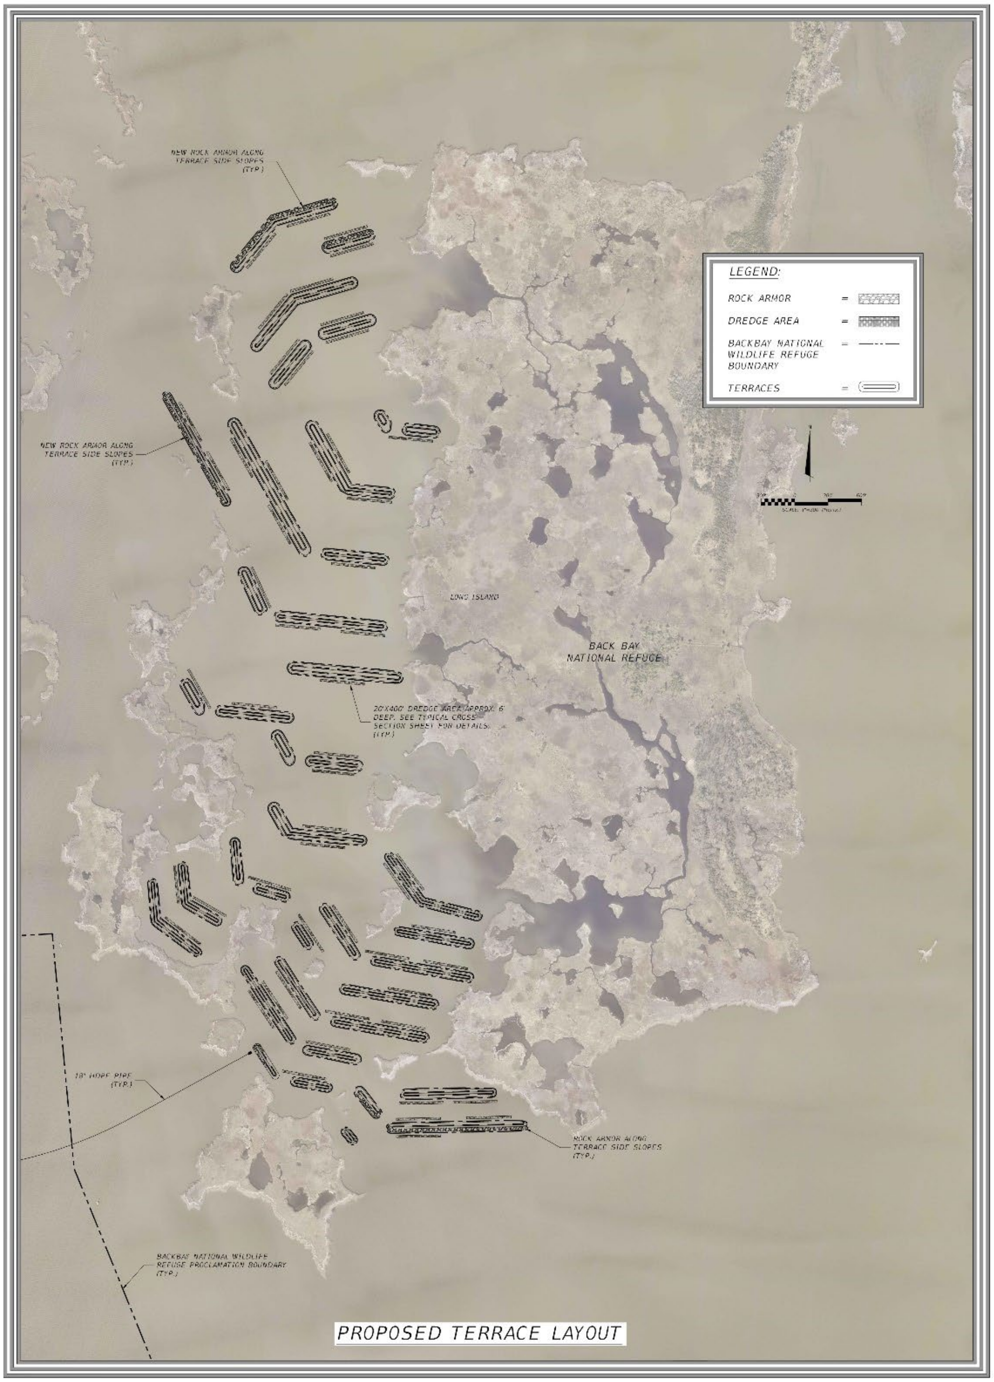

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

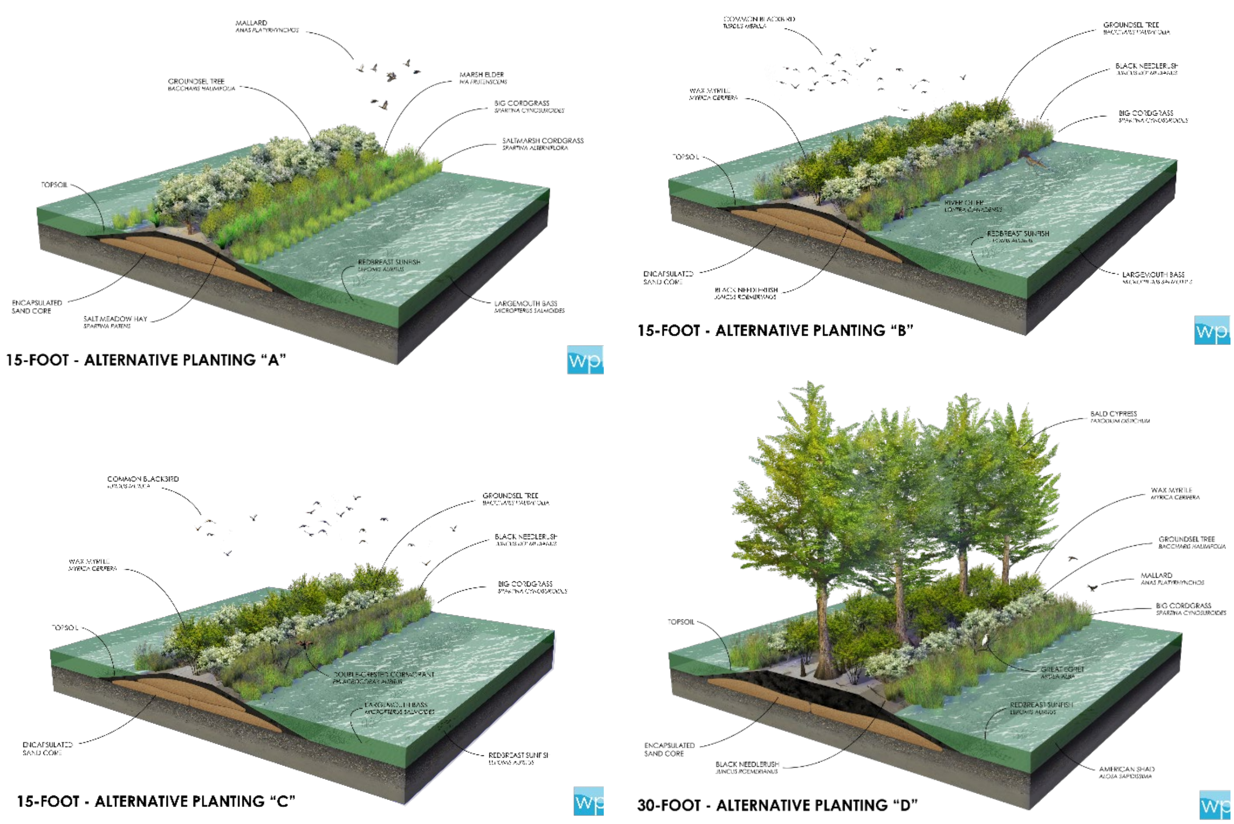

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter **(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

- Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
    - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
    - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
    - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

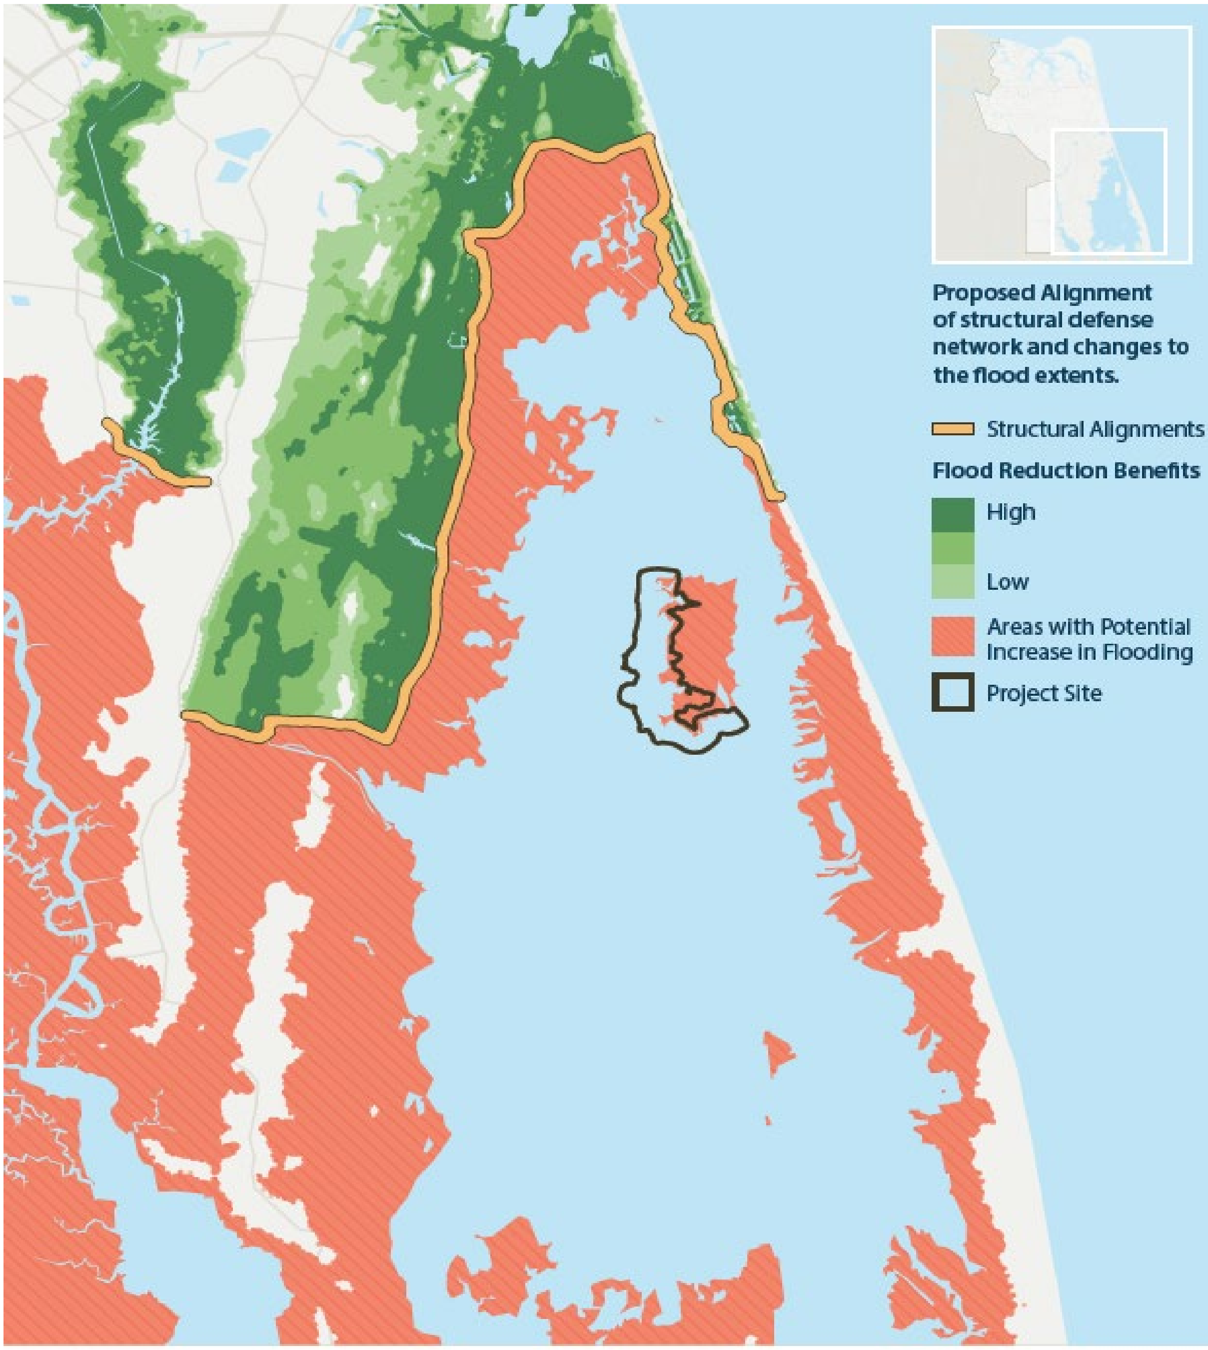

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with <u>discrete projects identified</u>.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
   a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
   b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
   c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
   a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
   b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
   a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Jared Brandwein

Executive Director
Back Bay Restoration Foundation

FISH AND WILDLIFE SERVICE

Back Bay National Wildlife Refuge
1324 Sandpiper Road
Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Megan Reed
Refuge Manager

October 26, 2023

Wendy Howard Cooper
Virginia Dept. of Conservation and Recreation
Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ at risk of flooding by the City of Virginia Beach or shown ~~according to~~ on the Flood Insurance Rate Map (FIRM) or included on the flood insurance study (FIS) that ~~is~~ are provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

Design Flood Elevation (regulatory flood protection elevation). The base flood elevation plus the freeboard required by this ordinance.

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~
~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ <u>Reserved.</u>

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

~~3. Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO, f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C.~~ ~~The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1.~~ ~~Public and private outdoor recreational facilities;~~

~~2.~~ ~~Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3.~~ ~~Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

4. ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

5. ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

6. ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

   a. ~~Only one (1) such stand shall be permitted per lot;~~

   b. ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

   c. ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

   1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

   2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C.~~ ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~4 and in addition thereto, shall:

   a. Contain supporting data and calculations required for a Preliminary Stormwater Engineering Analysis as appropriate~~, given the preliminary nature of the floodplain study~~;

   b. Comply with the Public Works Design Standards Manual; and

   c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

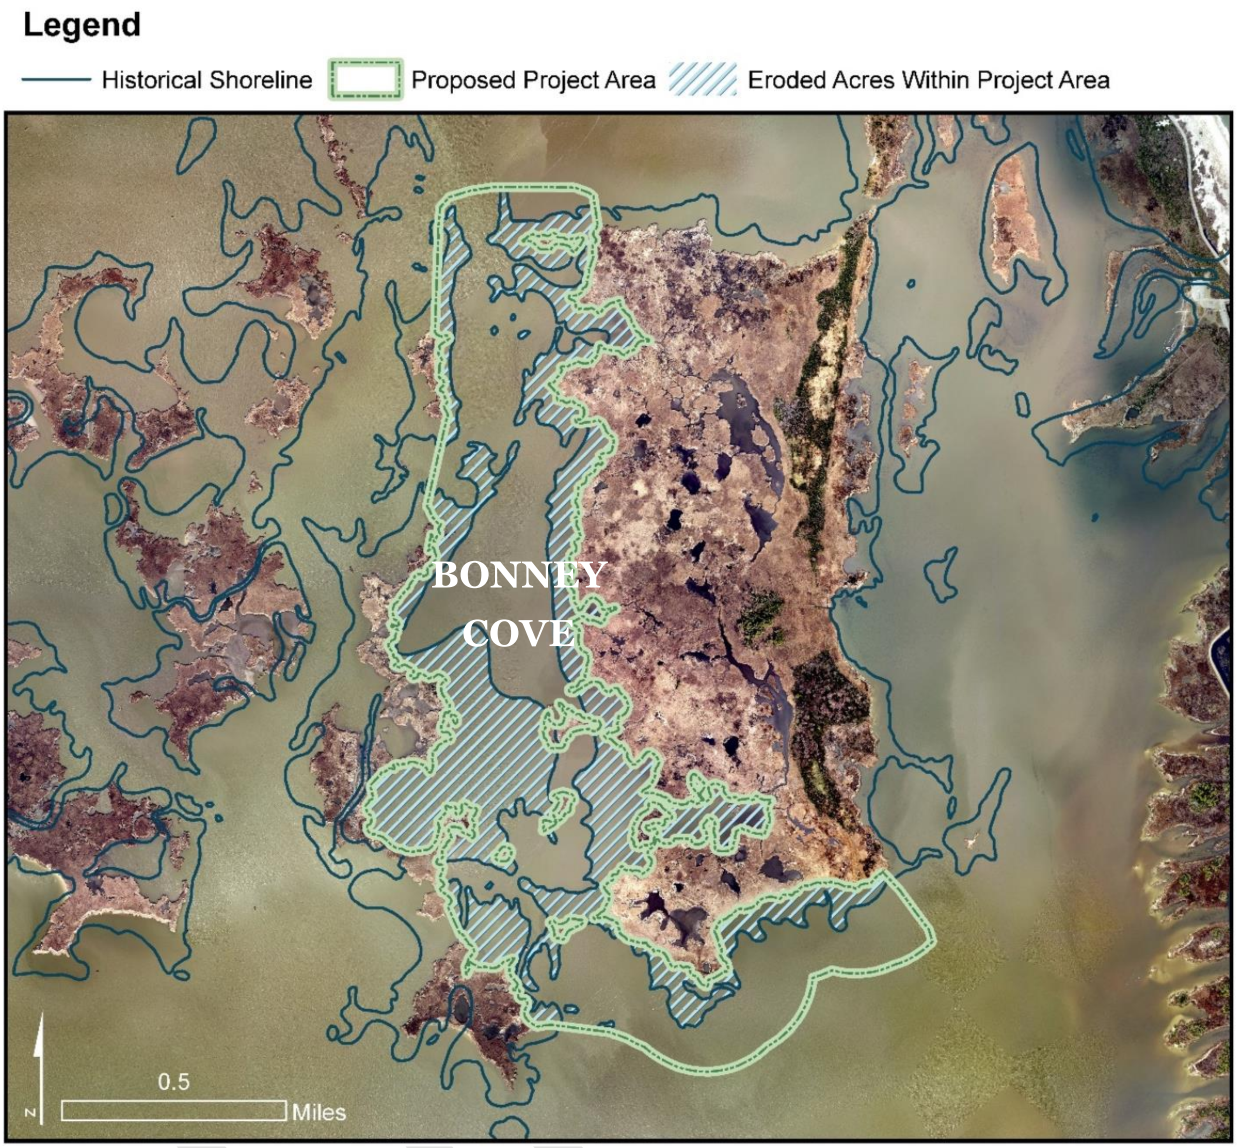

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

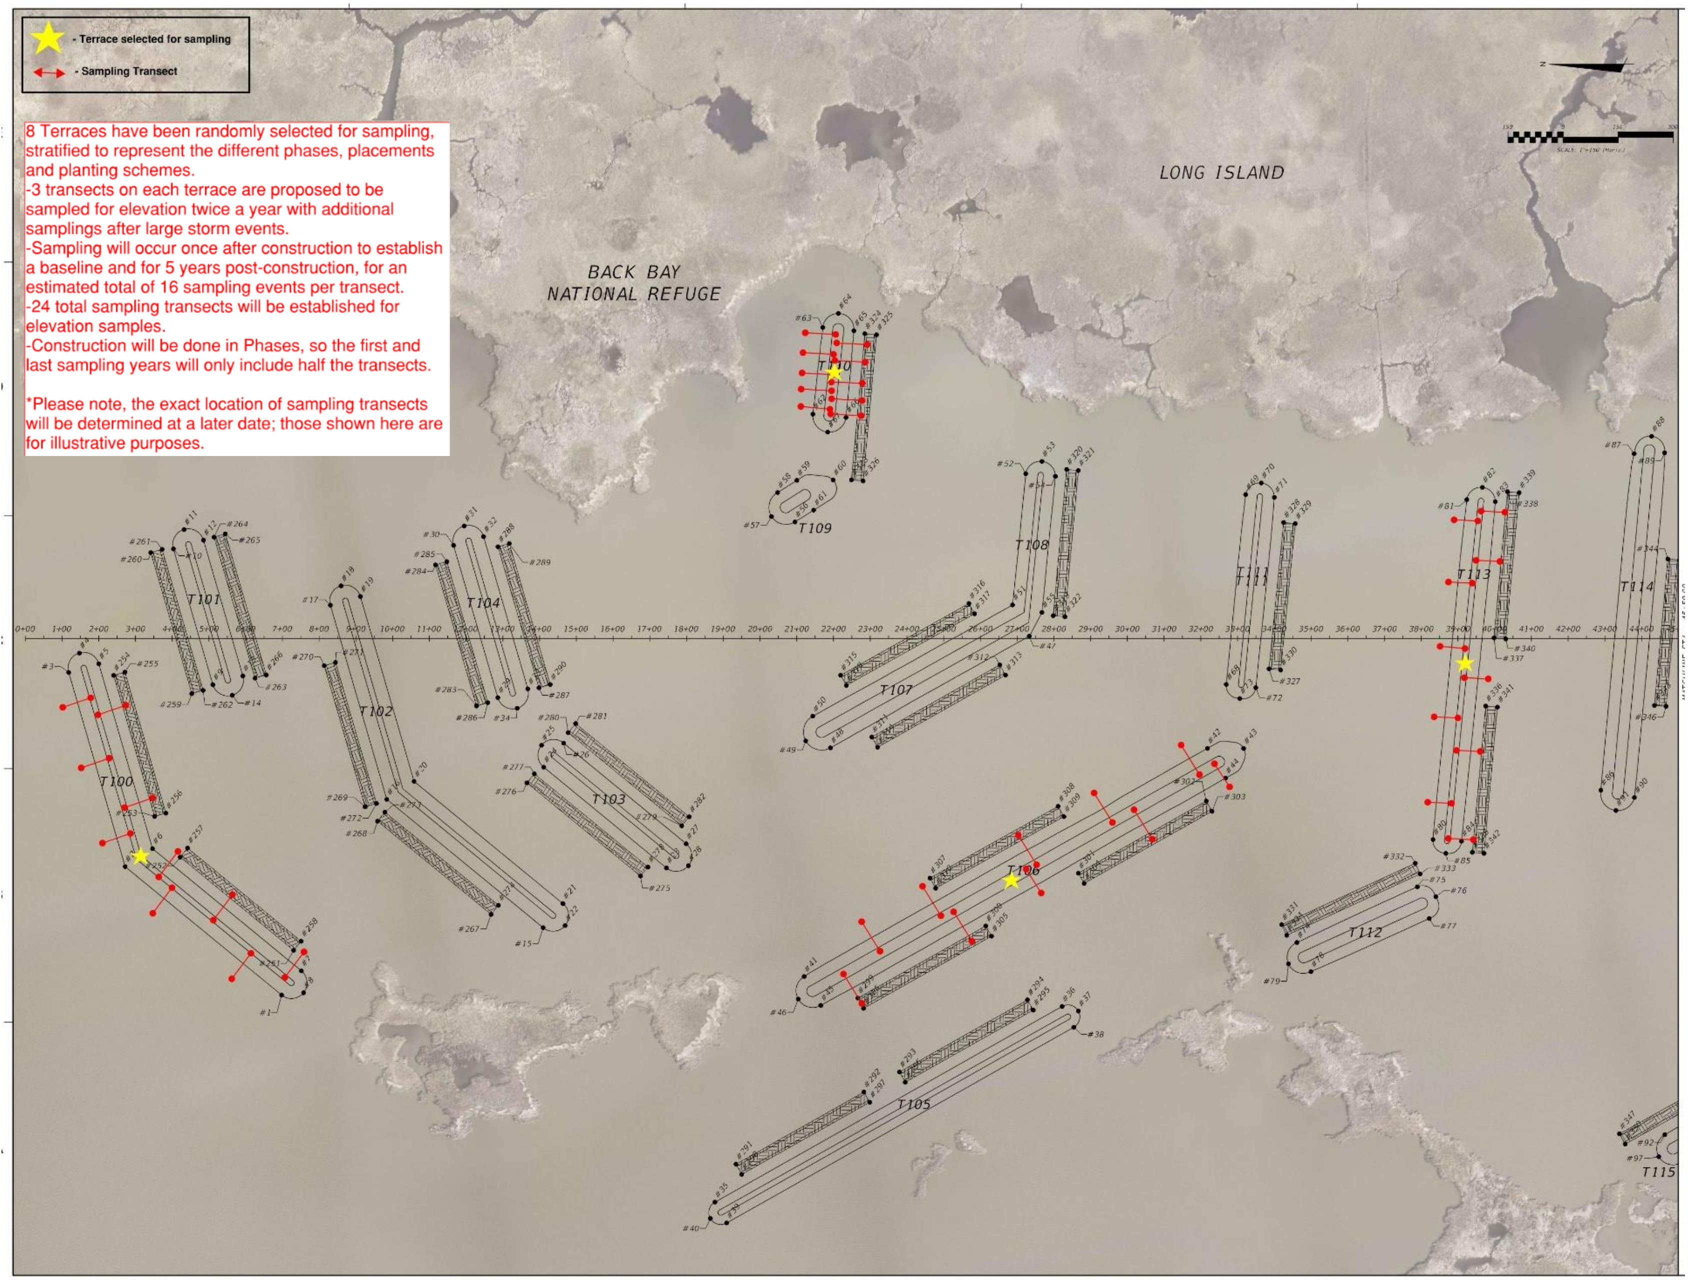

Figure 3: Monitoring design site plan – North Terraces

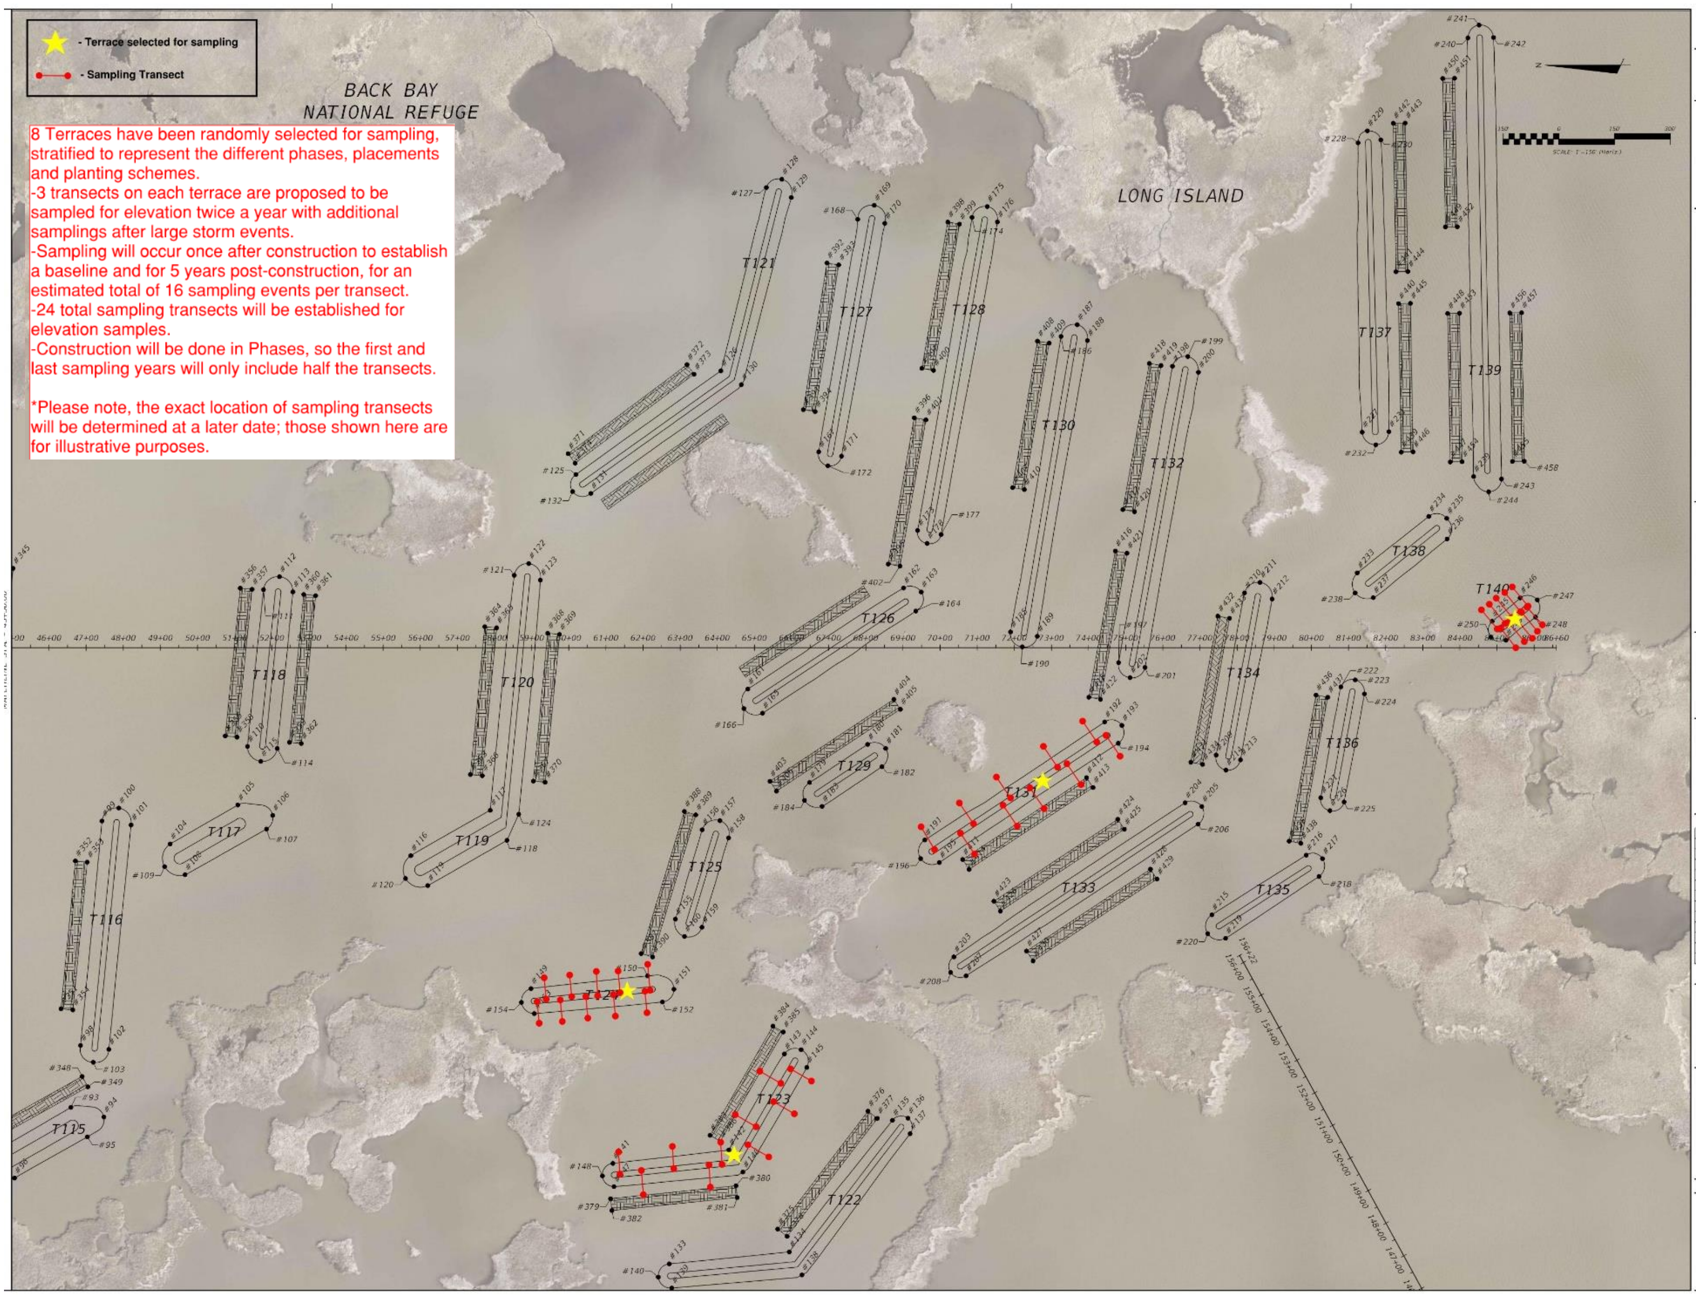

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

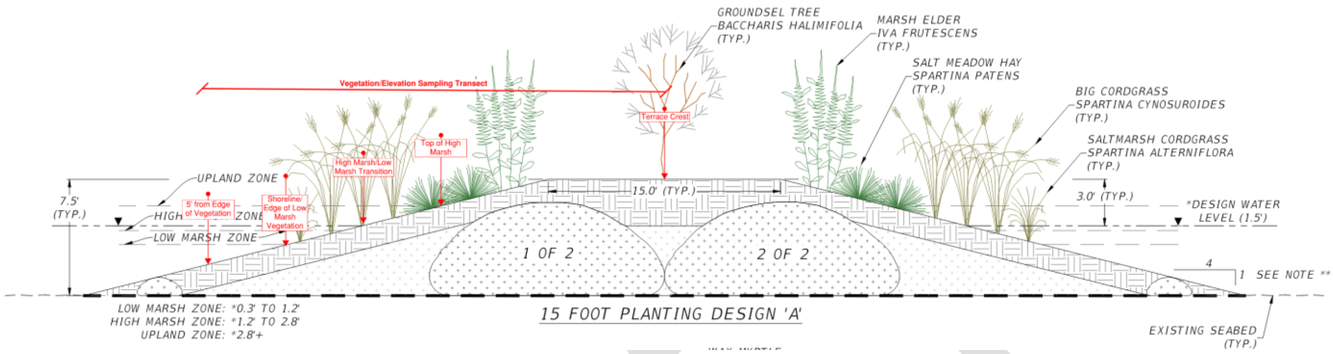

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

[DRAFT] Annual Monitoring Plan and Post-Construction Monitoring Report

Marsh Restoration in Back Bay, Virginia Beach, VA

Prepared by: Dewberry Engineers, Inc.

[July 6, 2023]

[REPORT VERSION [DRAFT]]

TABLE OF CONTENTS

LIST OF FIGURES

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

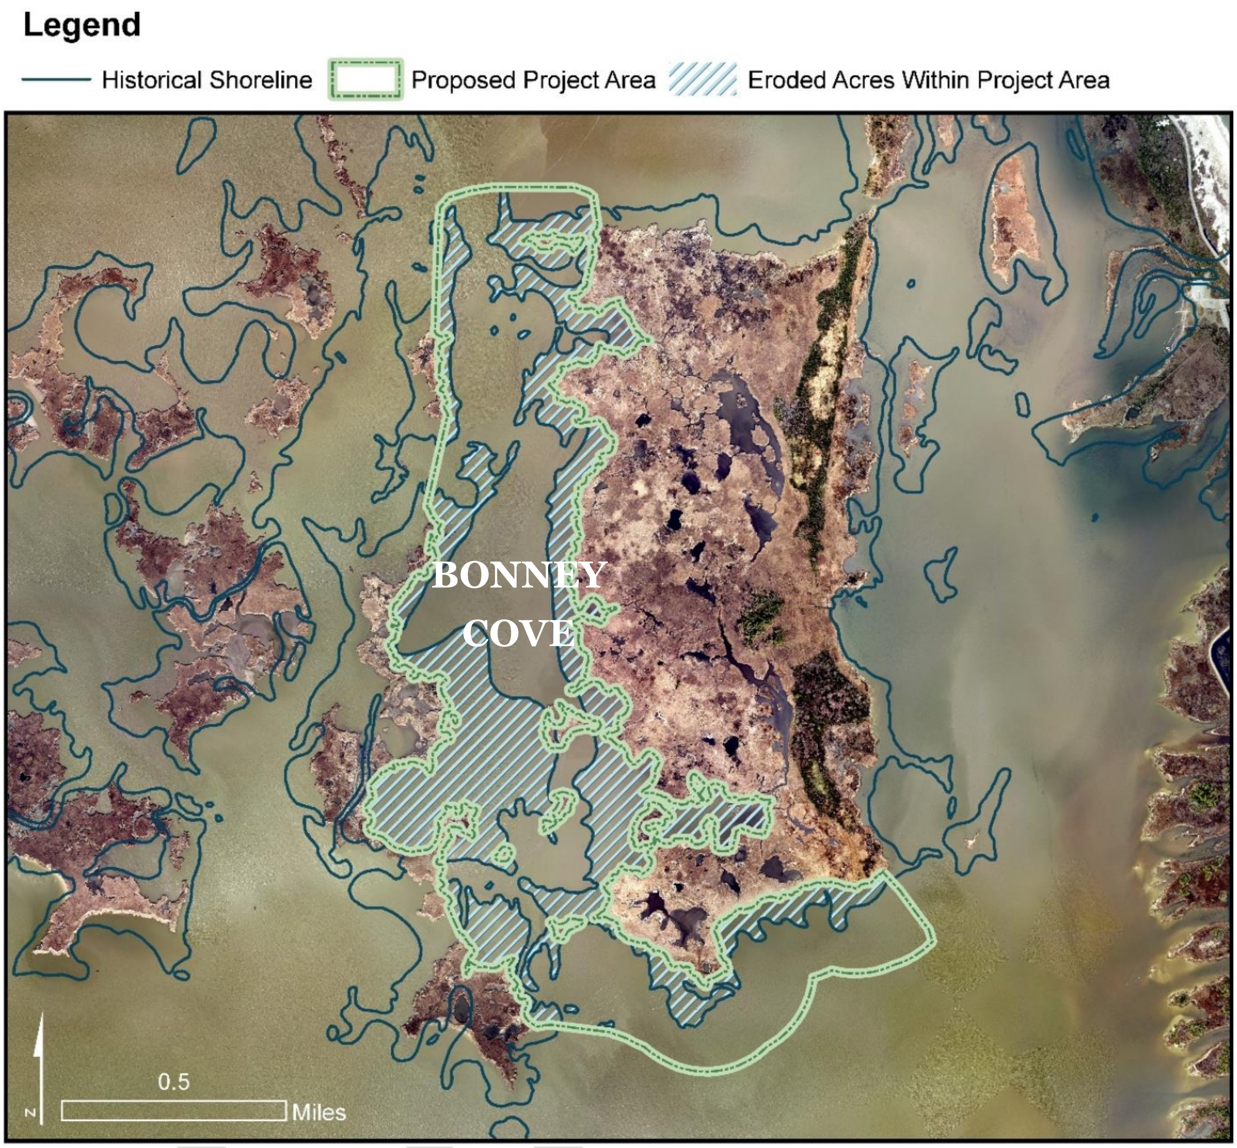

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Figure 2: Example Back Bay SAV experiment; photo courtesy of Virginia Tech.

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

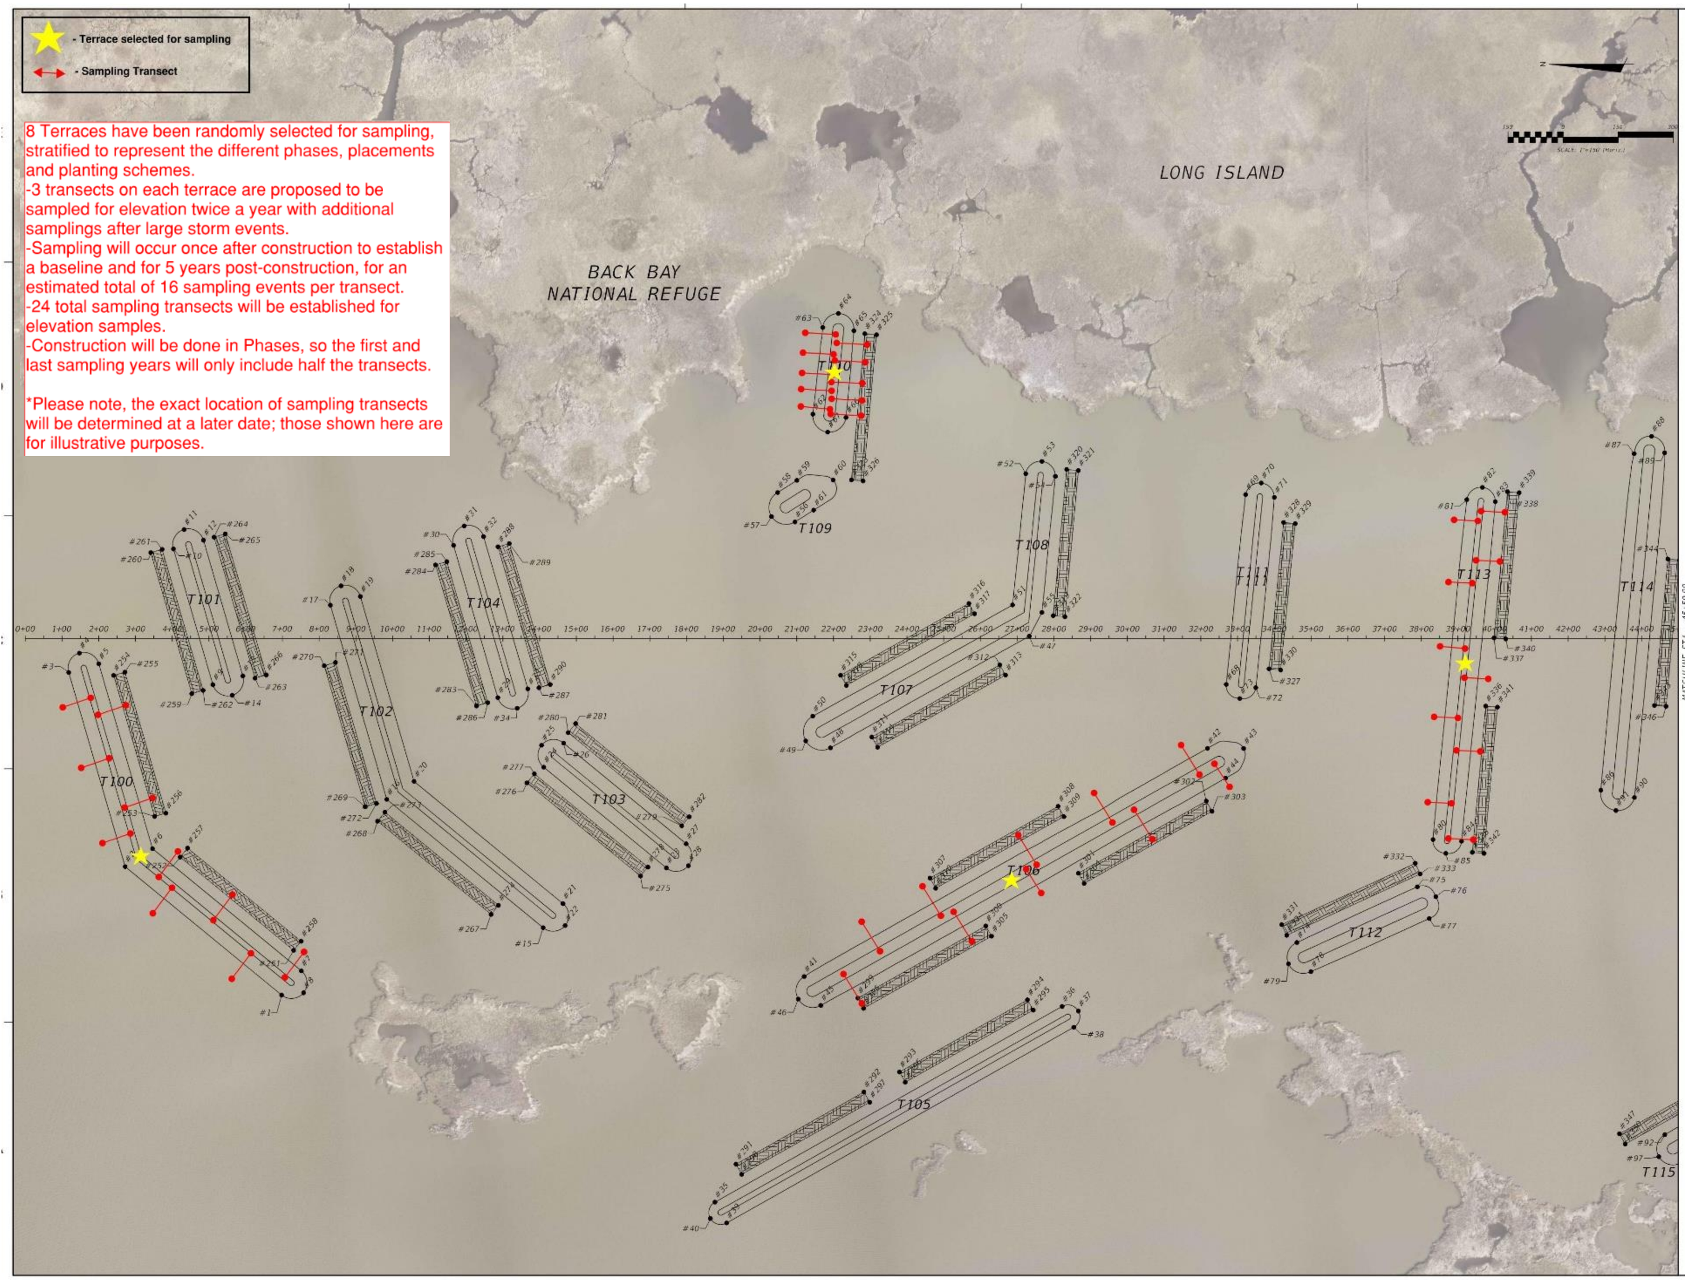

Figure 3: Monitoring design site plan – North Terraces

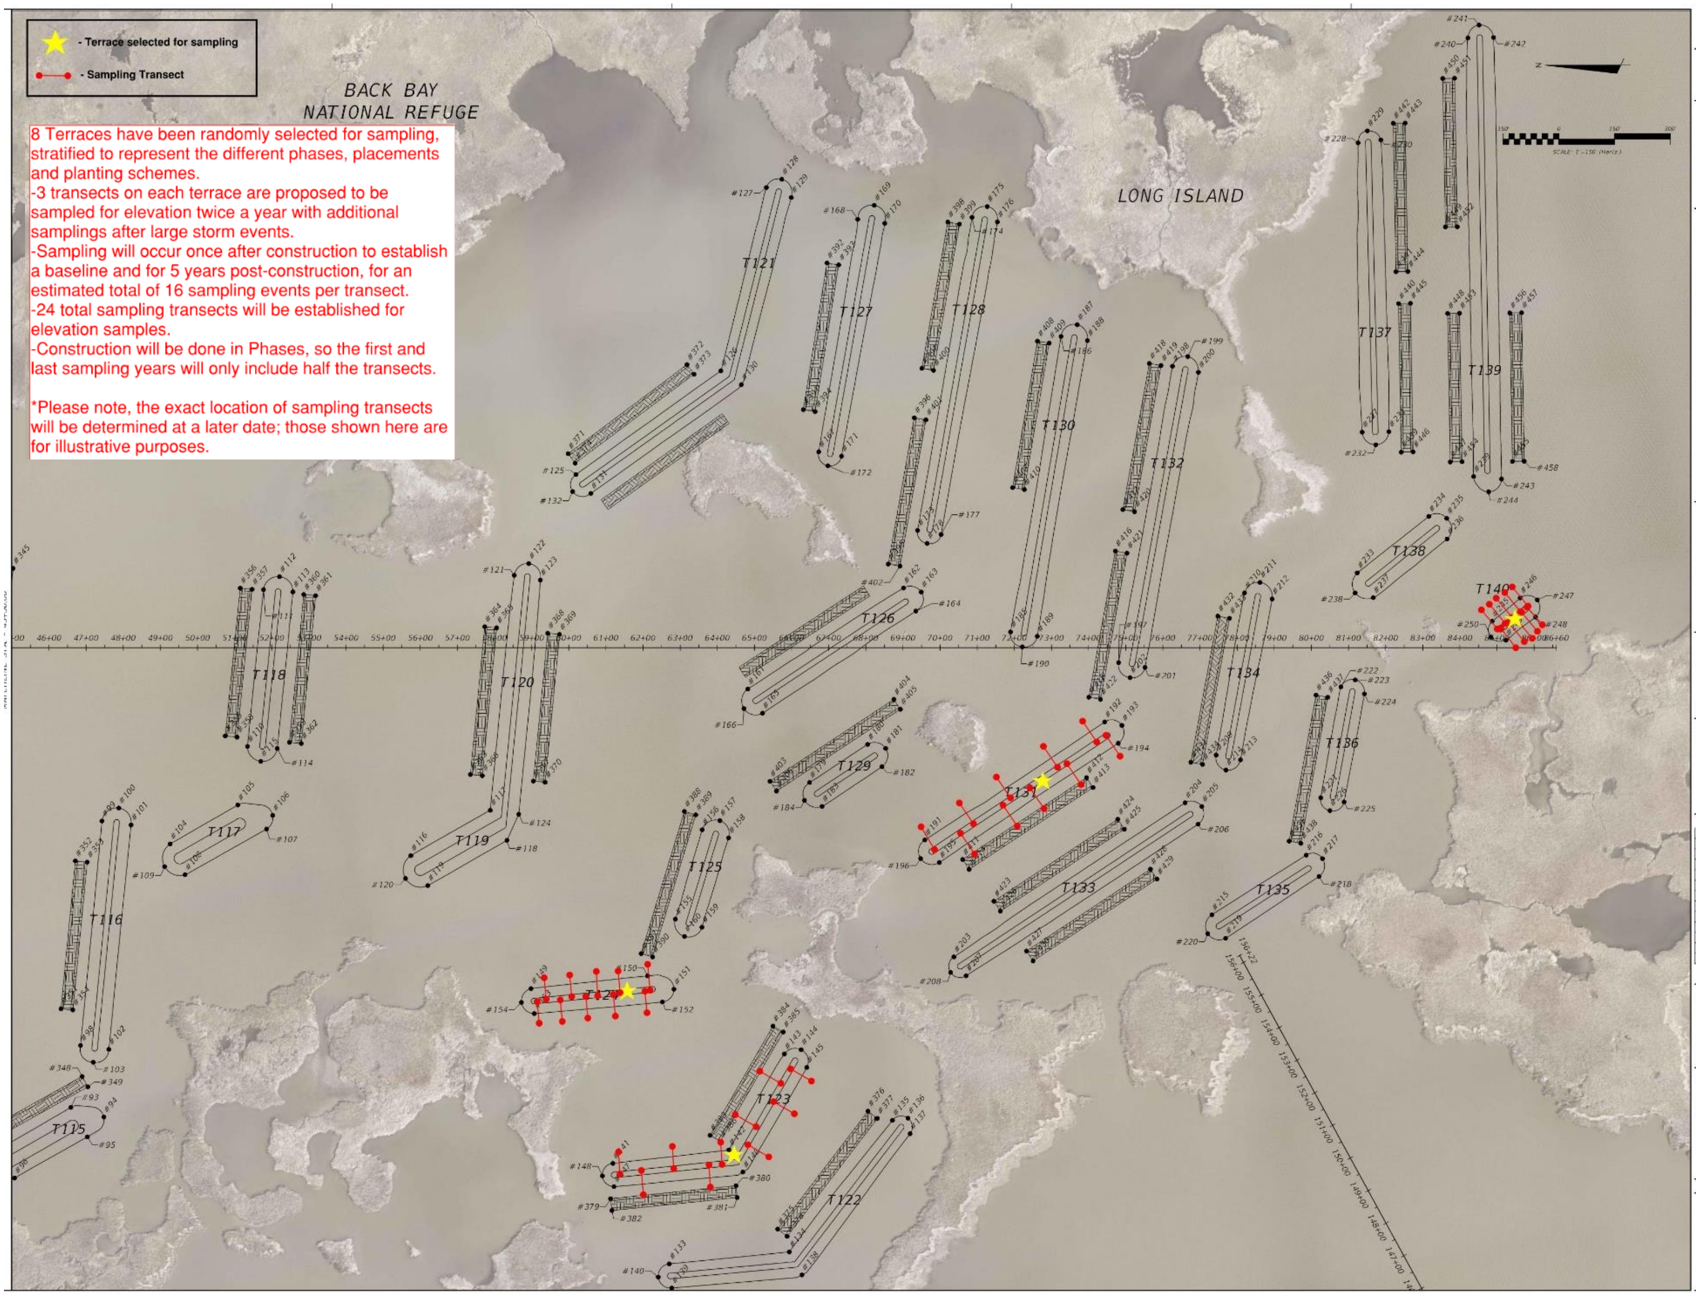

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

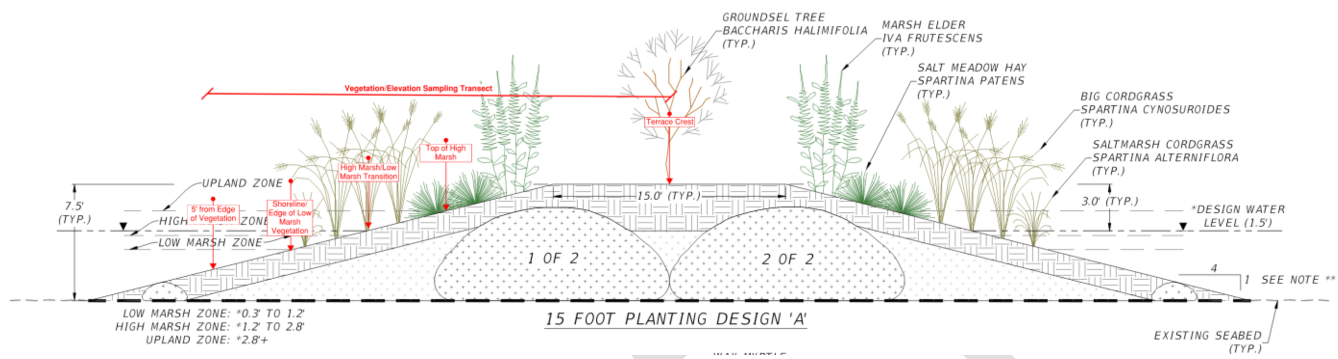

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

MONITORING RESULTS

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable activities that will be included in the project and used for scoring criterion):

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies, and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

☐ Other: ____________________

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP, or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks, freeboard, or other

higher standards, RiskMAP public noticing requirements, or correcting issues identified in a Corrective Action Plan.

- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards, and practices.
- ☐ Conducting hydrologic and hydraulic (H&H) studies of floodplains. *Changes to the base flood, as demonstrated by the H&H must be submitted to FEMA within 6 months of the data becoming available.*
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

Project Grants and Loans (Check All that Apply – Hybrid Solutions will include items from both the "Nature-Based" and "Other" categories)

Nature-based solutions

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will be achieved as a part of the same project as the property acquisition.</u>
- ☑ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool, or the acquisition of developed land for future conservation.
- ☐ Dam removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.

Other Projects

- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.

- Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
- Dam restoration.
- Beneficial reuse of dredge materials for flood mitigation purposes
- Removal or relocation of structures from flood-prone areas where the land will not be returned to open space.
- Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development, <u>and where the flood mitigation benefits will **not be** achieved as a part of the same project as the property acquisition.</u>
- Other project identified in a DCR-approved Resilience Plan.

Location of Project or Activity (Include Maps): Bonney Cove in Back Bay, Virginia Beach

NFIP Community Identification Number (CID#) : 515531

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zone VE (EL 5 Feet), Zone AE (EL 4 Feet), Zone Open Water

Flood Insurance Rate Map Number(s) (If Applicable): 5155310215G and 5155310220G

Total Cost of Project: $53,378,490

Total Amount Requested $5,000,000

Amount Requested as Grant $5,000,000

Amount Requested as Project Loan (not including short-term loans for up-front costs) ____________________

Amount Requested as Short-Term loan for Up-Front Costs (not to exceed 20% of amount requested as Grant) _________________________

For projects, planning, capacity building, and studies in low-income geographic areas: Are you requesting that match be waived? □ Yes □ No

<u>Additional Information for Loan Requests</u>
Requested Loan Security: _____________________________

(General Obligation, Lease, Revenue, Special Fund Revenue, and/or Moral obligation from other government entity)

Desired loan term: _________________________________

Since the date of your latest financial statements, did the applicant issue any new debt? ______
(If yes, provide details)

Is there any pending or potential litigation by or against the applicant? ______________

Attach five years of current audited financial statements (FY18-22) or refer to website if posted
(Not necessary for existing VRA borrowers)

Attach a list of the ten largest taxpayers in the Applicant's jurisdiction

Appendix B: Budget Form

Appendix B: Budget Narrative Template

Applicant Name: Community Flood Preparedness Fund & Resilient Virginia Revolving Loan Fund Detailed Budget Narrative Period of Performance: June 2024 through June 2027 Submission Date: November 12, 2023									
								Grand Total State Funding Request	$ 5,000,000
								Grand Total Local Share of Project	$ 38,356,966
			National Fish and Wildlife Foundation Grants					Federal Funding (if applicable)	$ 10,021,524
								Project Grand Total	$ 53,378,490
								Locality Cost Match	% 71.85
Breakout By Cost Type	Personnel	Fringe	Travel	Equipment	Supplies	Contracts	Indirect Costs	Other Costs	Total
Federal Share (if applicable)								10,021,524	10,021,524
Local Share								37,330,166	37,330,166
State Share								5,000,000	5,000,000
Pre-Award/Startup								276,800	276,800
Maintenance								750,000	750,000
Total	$	$	$	$	$	$	$	$53,378,490	$ 53,378,490

1. Federal Share represents National Fish and Wildlife Foundation (NFWF) Grants. NFWF is not a federal agency.
2. Local Share represents the total project cost less design and implementation (monitoring and initial maintenance) costs.
3. State Share represents the CFPF grant request.
4. Pre-Award costs represent project design costs.
5. Maintenance costs represent implementation (monitoring and initial maintenance costs).

Scope of Work Narrative

Introduction

The City of Virginia Beach ("City") is pleased to submit the Marsh Restoration in Back Bay project for consideration under the Flood Prevention and Protection Projects category in the 2023 Virginia Community Flood Preparedness Fund. The City has made significant investments in the study of historical flooding data, current and future hydrology, and the projected increase in flood frequency due to changing rainfall patterns and sea level rise. These studies culminated in Virginia Beach's Resilience Plan, socialized as "Sea Level Wise,"[1] which includes a conceptual suite of projects focused on flood control and resilience. The Virginia Beach Resilience Plan leverages four overarching adaptation strategies to identify actionable projects for each of the City's four unique major watersheds. This project represents the first adaptation project to advance to construction to implement the City's Resilience Plan.

The adaptation strategy for the Southern Rivers Watershed, which includes Back Bay, is presented in Figure 1. The strategy focuses on employing natural mitigation methods, an integrated system of defense structures, and complementary measures, such as land-use strategies. Collectively these approaches are designed to strategically reduce flow into and within Back Bay and improve flood storage and overall coastal resiliency. Marsh restoration was identified as a key resilience-building strategy as part of an extensive evaluation of structural and non-structural alternatives. Marsh restoration provides multiple benefits of flood risk reduction, enhanced habitat, and improved water quality.

As part of the Virginia Coastal Resilience Master Planning Framework, a precursor to the first phase of the Virginia Coastal Resilience Master Plan (CRMP), the Commonwealth of Virginia identified guiding principles for a statewide resilience strategy. One of these guiding principles is recognizing the importance of protecting and enhancing natural infrastructure and prioritizing nature-based infrastructure.[2] The City's marsh restoration project aligns with this principle and was highlighted as an exemplary nature-based project in the CRMP (refer to pages 178-179).[3]

[3] Office of Governor Ralph S. Northam Commonwealth of Virginia. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

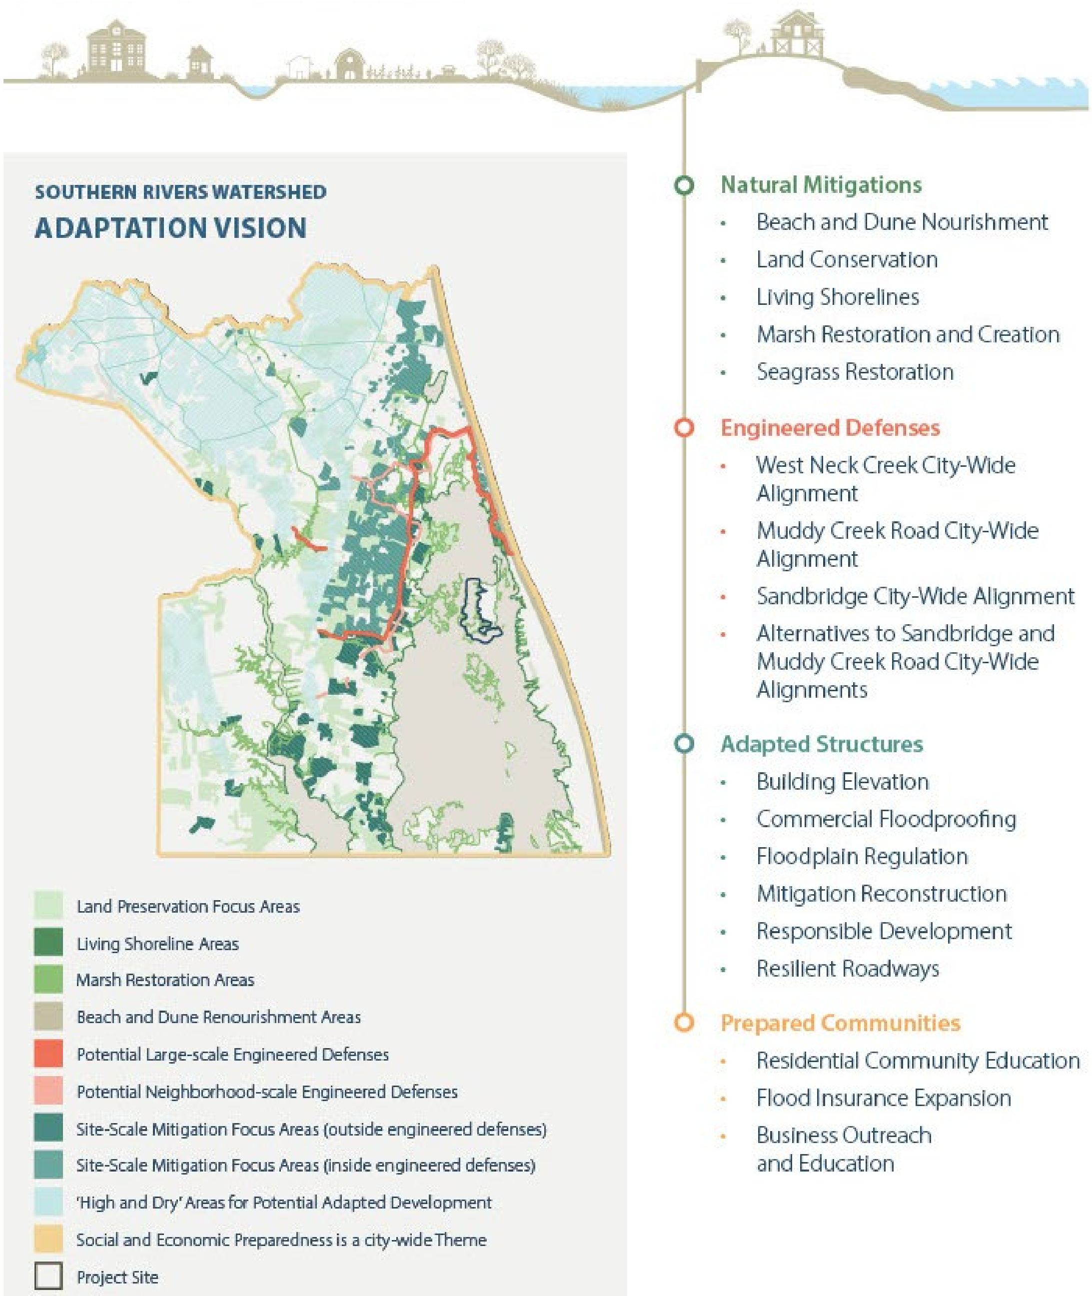

Figure 1: Adaptation Vision for the Southern Rivers Watershed.

Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay (Figure 2). The City prioritized this project as the first to advance to construction due to its significant benefits to community and habitat resilience.

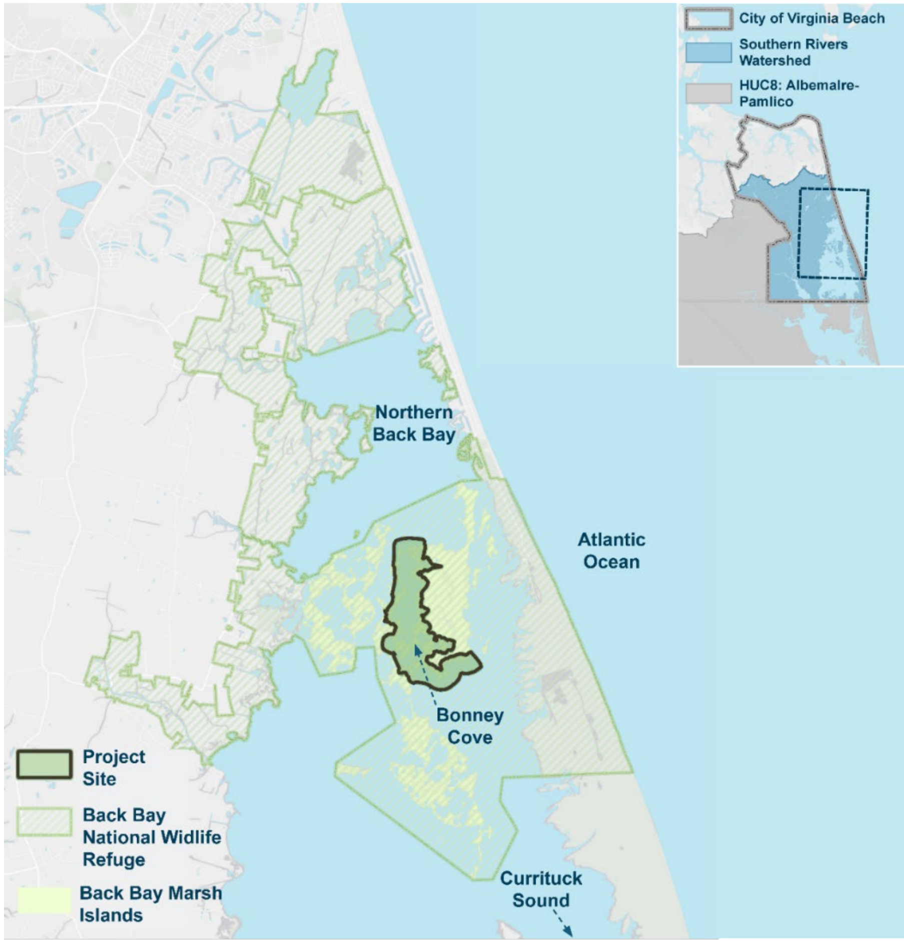

Figure 2: Project site location map.

This project represents a collaborative effort between the City's Department of Public Works alongside other City departments, public constituents, local nonprofits, and state and federal agencies. In selecting the project location and developing the design approach, the City has coordinated closely with the Back Bay National Wildlife Refuge (BBNWR), part of the U.S. Fish and Wildlife Service (USFWS), and the Virginia Department of Wildlife Resources (VDWR). Environmental organizations committed to stewardship of Back Bay have also contributed input throughout the design process, including the Back Bay Restoration Foundation (BBRF), Friends of Back Bay, the Back Bay National Wildlife Refuge Society, and the Albemarle-Pamlico National Estuary Partnership (APNEP). Project field investigations involved local support from Old Dominion University (ODU) and others, and outside expertise from Louisiana. The National Fish and Wildlife Foundation (NFWF) provided grant funding under the National Coastal Resilience Fund (NCRF) to support design, permitting, and environmental assessments. Broad support of the project is demonstrated by contributions from the organizations noted above along with other stakeholders engaged in the restoration effort.

Needs and Problems

Specific Problem Being Solved – Habitat Degradation and "Wind Tide" Flooding

Marshes are vital to the Southern Rivers Watershed for the ecological and flood reduction benefits they provide. The Southern Rivers Watershed contains 90% of the City's land area under an elevation of three feet, making this area particularly susceptible to flood impacts. As illustrated in Figure 3, sustained southerly winds push water up from the Albemarle-Pamlico Sound through the Currituck Sound and into Back Bay, creating a phenomenon referred to locally as "wind tide flooding". Marsh habitat loss has contributed to the opening of a secondary channel in Bonney Cove that has increased water flow during wind tide and other flood events to areas with high community exposure.

Within today's marsh system, it takes between two to five days of sustained southerly winds to cause flooding, depending on the wind speed and direction. Over the last four years, more than five wind tide flooding events have occurred in this area. The increasing frequency of flooding events is primarily attributed to a foot of relative sea level rise in the last 50 years and degradation of marsh and seagrass habitat.

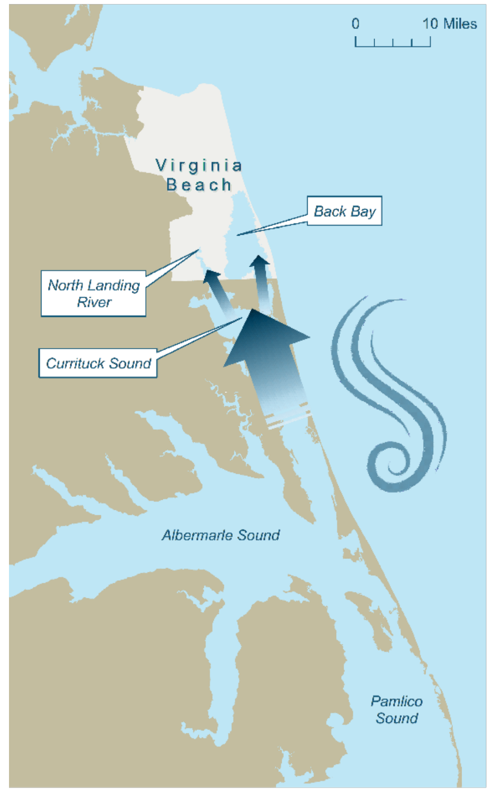

Figure 3: Flood pathways in the Southern Rivers Watershed.

This marsh restoration project aims to address the challenges of habitat degradation and "wind tide" flooding by stabilizing two critically eroding marsh islands, decreasing turbidity to promote the growth of aquatic vegetation, and providing flood risk reduction benefits through increased friction and wave attenuation.

Factors Contributing to the Identified Problem

This growing flood risk in the Southern Rivers Watershed can be attributed mainly to the reduced friction in the water column from the increased water depth and eroded vegetation, which allows water to move more quickly through key hydraulic pathways. Another term for this is "fetch", which is defined as the open water distance over which a given wind can blow and generate higher waves without obstruction. Unmitigated, the continued loss of these marsh island systems and aquatic vegetation is expected to result in more frequent and intense wind tide flooding events.

Emergent Marsh Degradation

Approximately 50% of former marshland at the site (260 acres) has eroded into open water leading to the opening of a wide secondary channel ("Bonney Cove") that is about two miles

long and half a mile wide (Figure 4). The southern exposed edge of the adjacent marsh islands is exposed to approximately 1.5 miles of fetch in the predominant wind direction.

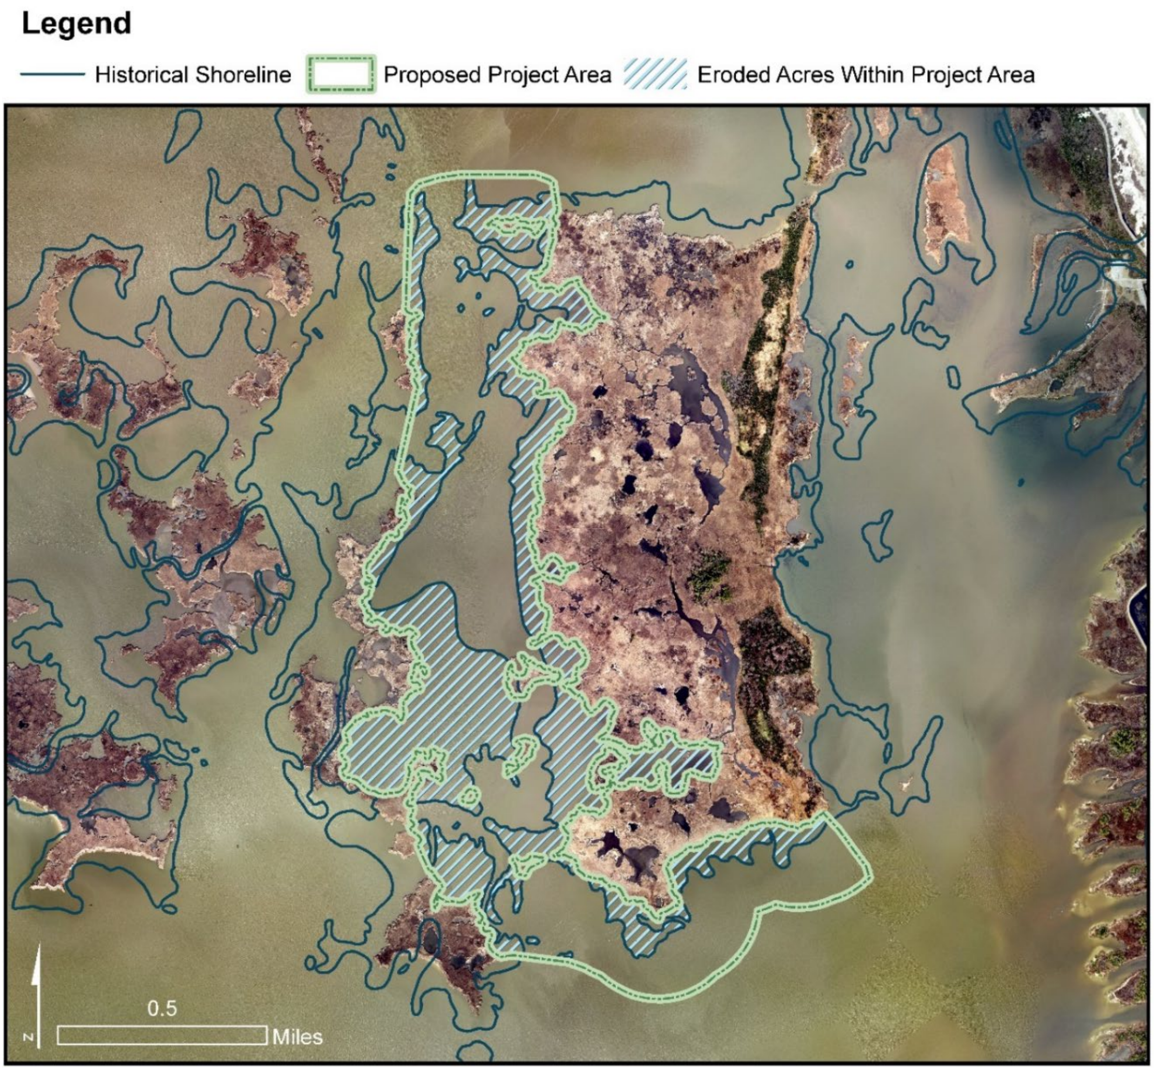

Figure 4: Historical marsh erosion within the project area.

Submerged Aquatic Vegetation (SAV) Loss

SAV used to be abundant at the site (around 45% coverage, overall) but is now extremely sparse, ranging from 0% to 10% coverage across the site, on average. Field studies conducted by the VDWR show that wind-driven waves and high flow velocities are the primary drivers of this loss, particularly in the last 5 years as shown in Figure 5.

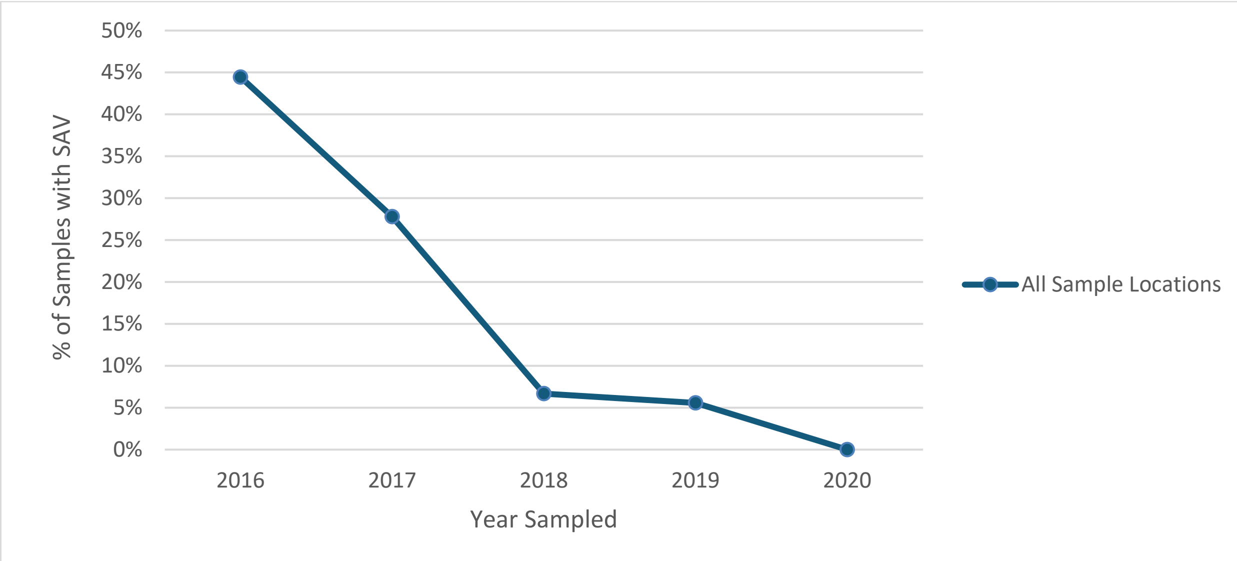

Figure 5: SAV sampling data from VDWR within the project vicinity.

Why is the Project Needed Locally/Regionally?

Pilot Project

The City's design concept for the marsh restoration project leverages "marsh terracing," an innovative coastal engineering technique widely used in Texas and Louisiana to convert shallow subtidal bottom to marsh. This technique has not yet been implemented along the U.S. East Coast and has not yet been implemented in the Mid-Atlantic region. Through the export of proven expertise from successful marsh terraces, this project would lay the foundation for future projects in the region, Virginia, and other states along the East Coast. The project would document detailed cost estimates, demonstrate effective construction practices for large-scale marsh creation projects, identify best sources for local/regional materials, and establish partnerships with permitting officials at various levels of government. The City has outlined a preliminary sequencing plan for marsh island restoration projects in Back Bay to strategically close hydraulic pathways and address priority restoration areas as shown in Figure 6. Some of these projects would require coordination with the State of North Carolina to realize its broader resilience efforts.

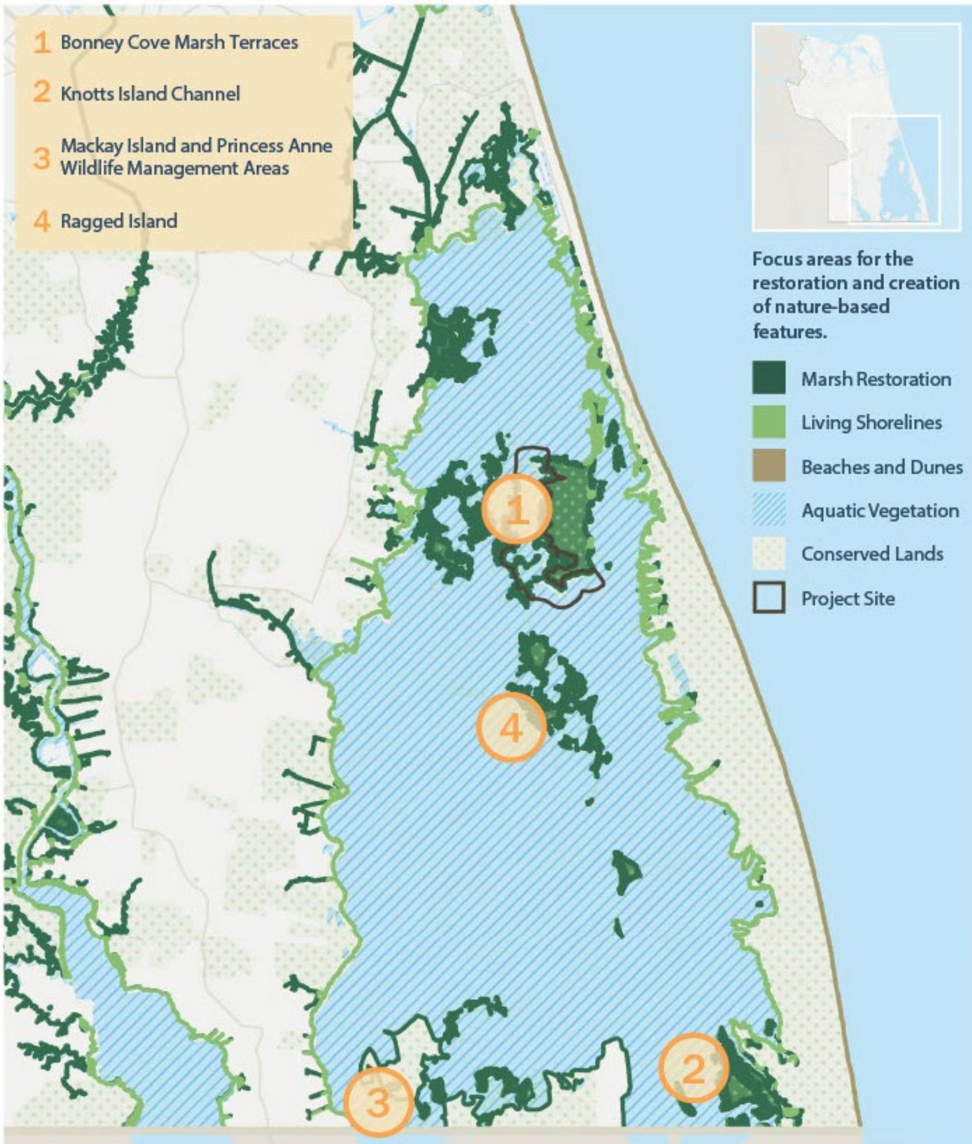

Figure 6: Preliminary Sequencing Restoration Plan.

Virginia Coastal Resilience Master Plan Exemplary Project

The CRMP impact assessment shows a high vulnerability of nature-based features to coastal flood hazards that is consistent with the City's analysis. In the Hampton Roads region, the CRMP impact assessment estimates a decrease from 40,600 acres to 2,940 acres of tidal wetlands by 2080, representing a 93% decline in tidal wetlands.[4] Back Bay was identified as a hotspot for tidal wetland loss, emphasizing the critical location of the City's marsh restoration effort. Specifically, the Virginia CRMP impact assessment shows that portions of tidal wetlands within the project area have "High" and "Very High" impact levels, which indicates areas of tidal marsh

[4] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF).

that are anticipated to be lost through inundation causing conversion to open water (Figure 7).

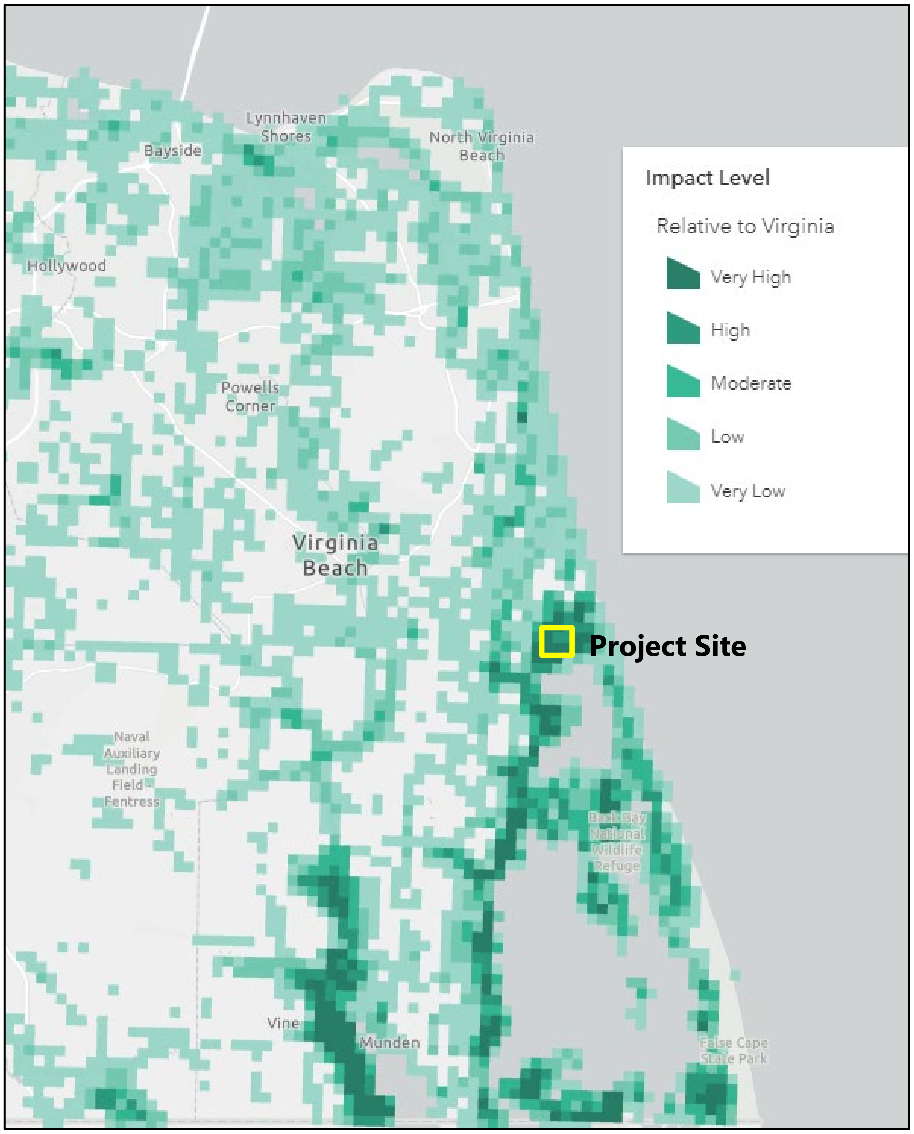

Figure 7: Virginia CRMP Impact Assessment for Tidal Wetlands.

Currituck Sound Coalition High Priority Area

In coordination with Audubon North Carolina, the Currituck Sounds Coalition designated the project site as a High Priority Area for restoring and enhancing vulnerable and degraded marshes with "high flood risk reduction benefits and habitat value" as shown in Figure 8[5].

[5] Audubon North Carolina. (2021). Currituck Sound Coalition Marsh Conservation Plan. (PDF)

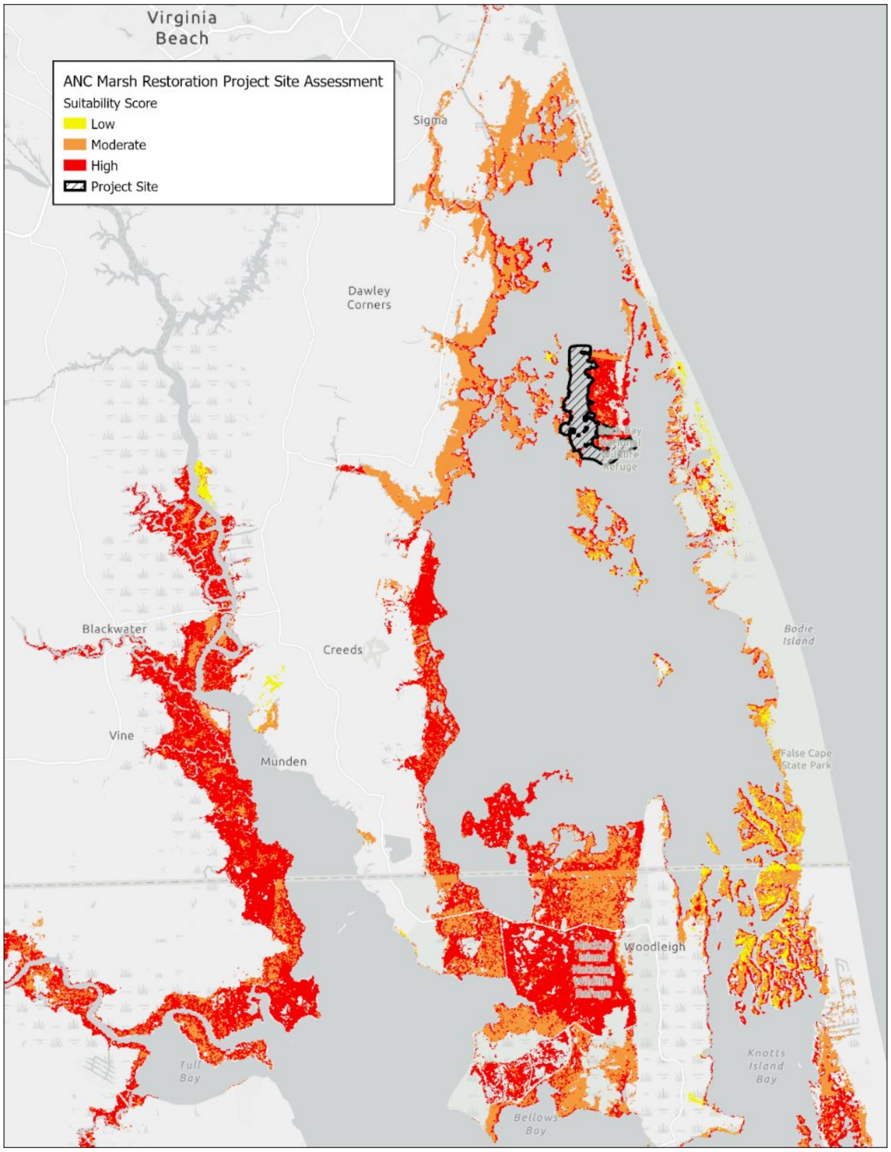

Figure 8: Audubon North Carolina Marsh Restoration Project Site Assessment

Ecological Core for Flood Resilience

The Virginia Department of Conservation and Recreation Natural Heritage Data Explorer provides data from ConserveVirginia v3.0 and other data to support conservation planning. The following map in Figure 9 displays Ecological Cores and the Floodplains and Flooding Resilience Category layer (blue polygon) from ConserveVirginia. The project area contains "High" (C3) and "General" (C5) Ecological Cores and is within the boundaries of the Floodplain and Flooding Resilience area.

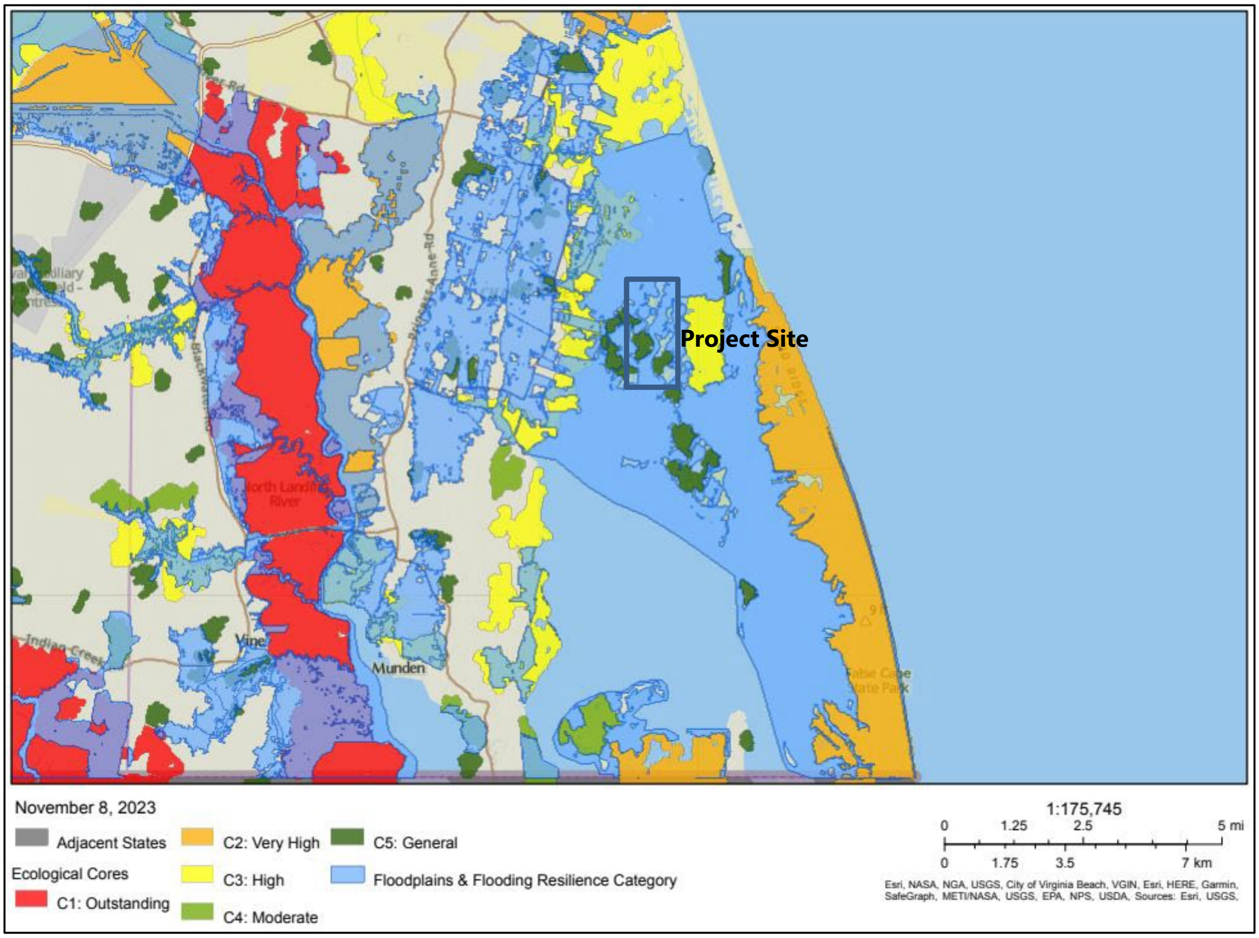

Figure 9: Virginia Natural Heritage Data Explorer Ecological Cores and ConserveVirginia Data.

The safety threats, or environmental concerns related to flood risk.

The City's risk assessment forecasts that approximately 70% of the remaining marsh (730 acres) surrounding the project site will convert to open water with three feet of sea level rise if unmitigated. Fragmentation of this adjacent marsh would result in about eight miles of fetch acting on the southern extent of the site in the predominant wind direction. Without these central marsh islands, the northern shorelines of Back Bay would be exposed to 12 miles of fetch from the Knotts Island Channel at the Virginia-North Carolina boundary. This condition would leave the fringing marshes highly vulnerable to accelerated erosion.

How does the project decrease the risk to public safety through flood risk reduction?

Construction of the forty-one individual marsh terraces, totaling 27,000 linear feet (a 51-acre footprint), across Bonney Cove offers a nature-based technique that will stabilize and protect the marsh island in the center of the bay and reduce erosion of the fringing marsh systems to the north. Numerical modeling was leveraged to quantify specific erosion reduction benefits of the project for wave heights and flow velocities:

- **Wave Height Reduction**: The marsh terraces are expected to reduce wave heights within the project site by approximately 45%. This reduction is consistent with other field studies, which have found that average wave heights within two terraced sites were 37% to 48% lower than those observed at the reference site (Brasher 2015). Wave energy reduction is anticipated to increase the potential for sediment deposition on the terraces' leeward side, leading to the growth of new emergent marsh and reducing erosion of adjacent marsh. Approximately five miles of marsh island shoreline around Bonney Cove will benefit directly from the erosion reduction associated with the computed wave attenuation.
- **Flow Velocity Reduction**: The marsh terraces reduce flow velocity within the project area. This reduction in velocity will reduce bottom shear stress, decrease turbidity, increase light penetration into the water column and promote the growth of SAV. Reducing bottom shear stress will make conditions more suitable for SAV growth between the terraces. Field studies of marsh terraces in Texas and Louisiana document an approximately 45% to 56% reduction in turbidity and the emergence of SAV in the years following terrace construction (Brasher 2015).
- **Wind Shear Stress Reduction**: Although not included as a parameter within the numerical modeling effort, the bald cypress trees planted on the terraces within the middle of the site are expected to reduce wind speed within the project site. This will further reduce wind-generated waves within the project site on the terraces' leeward and windward sides. Research shows that trees that grow to at least 30 feet at maturity result in lower wind speeds of up to 60 to 150 ft on the windward side and up to 900 ft on the leeward side (USDA).

How does the project protect or conserve natural resources?

The proposed project aims to restore marsh island communities in Bonney Cove that have historically provided environmental and flood reduction benefits to the communities in northern Back Bay. As illustrated in Figure 10, when an intact marsh begins to fragment and convert to open water, fetch increases and enables greater wave energy, increasing marsh erosion rates, and ultimately accelerating conversion to an ever-expanding body of open water. Strategic marsh restoration and creation in Bonney Cove would help mitigate the cycle of marsh island erosion and loss of SAV currently occurring in Back Bay, thereby protecting the remaining marsh islands and reducing fetch and wave energy.

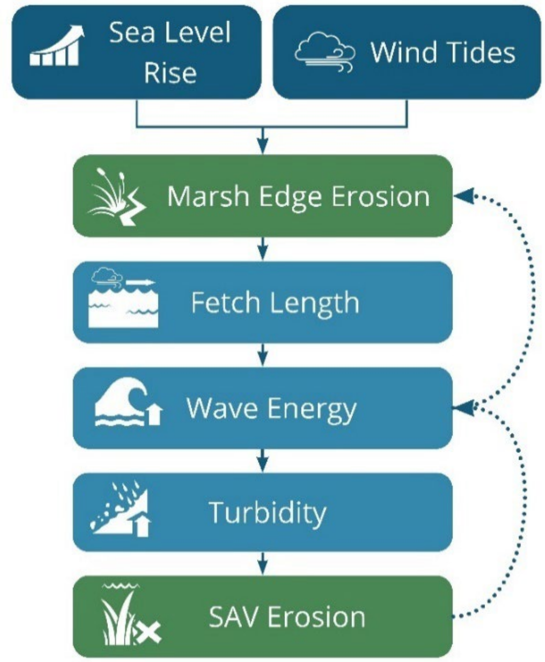

Figure 10: Cycle of marsh erosion, SAV loss, and increased wind-driven flooding.

The primary objective of this project is to create a sustainable coastal marsh island system in Back Bay through reclamation of historically lost marsh habitat and protection of existing marsh complexes from erosion. This restoration effort aims to provide multiple benefits of reduced flood impacts, enhanced fish and wildlife habitat, and improved water quality. The project is designed to achieve the following outcomes:

- Decrease turbidity to create conditions that promote the growth of emergent vegetation and aquatic grasses;
- Maximize habitat value for ecologically important fish and wildlife populations (e.g. Largemouth Bass, Bluegill, Yellow Perch, Striped Bass, Blueback Herring, Alewife, American Eel, etc.); and,
- Reduce fetch, wave heights, and flow velocities to mitigate erosion of fringing marsh systems that provide a buffer for the low-lying neighborhoods and roads that experience frequent flooding in northern Back Bay.

The City selected marsh terracing as the preferred restoration approach because the design is compatible with Back Bay's shallow bottom and the historical loss of habitat. Marsh terraces are narrow, man-made islands placed in shallow open water to restore previous marsh environments. Typically arranged in a chevron pattern, the overall field of marsh terraces dissipates waves, decreases turbidity, and slows down the moving water. The resulting calmer water conditions allow more sunlight to penetrate to the shallow bottom, promoting the establishment and growth of marsh seagrass and ultimately improving habitat quality for fish and wildlife. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species, as illustrated in Figure 11.

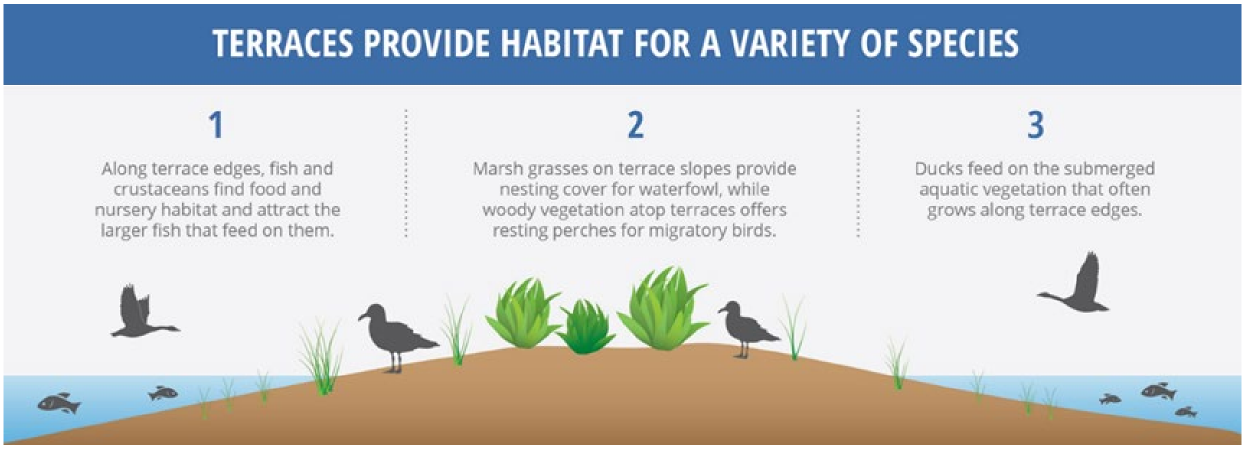

Figure 11: Conceptual diagram of marsh terraces.

Groups to be targeted who might directly benefit from this flood risk reduction effort.

The northern Back Bay communities adjacent to the project area and interested stakeholders have been engaged in the planning effort through public meetings. These meetings provided an opportunity for the community to provide feedback on the 30% and 95% designs and artistic renderings. We anticipate the project to benefit properties and infrastructure assets in northern Back Bay, including the following:

- **Reduce erosion rates along approximately 8 miles of shoreline by reducing wind and wave energy north of the project site.** Most of the properties along this reach of shoreline are not protected by traditional erosion risk reduction measures, such as bulkheads. Maintaining a naturalized shoreline while protecting fringe marsh is a priority of the City and its project partners. This approach will ensure that these marsh systems can migrate landward in response to sea level rise.
- **Reduce flood risk to commercial and residential properties north of the project site.** There are approximately 70 commercial and 2,350 residential structures within the two census block groups surrounding the project site. Around 635 of those structures are vulnerable to flooding during a 50-year event today. With three feet of sea level rise, approximately 2,060 structures are expected to be vulnerable to flooding during a 50-year return period event, representing about 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.
- **Reduce the magnitude and duration of flooding along critical access roads and critical facilities.** In addition to Muddy Creek Road, two other critical access roads are anticipated to benefit from delayed flooding. This includes Shipps Cabin Road (intersecting with Muddy Creek Road) and Sandpiper Road, which runs parallel to the eastern bank of Back Bay and provides ingress/egress out of the Sandbridge community (Figure 12).

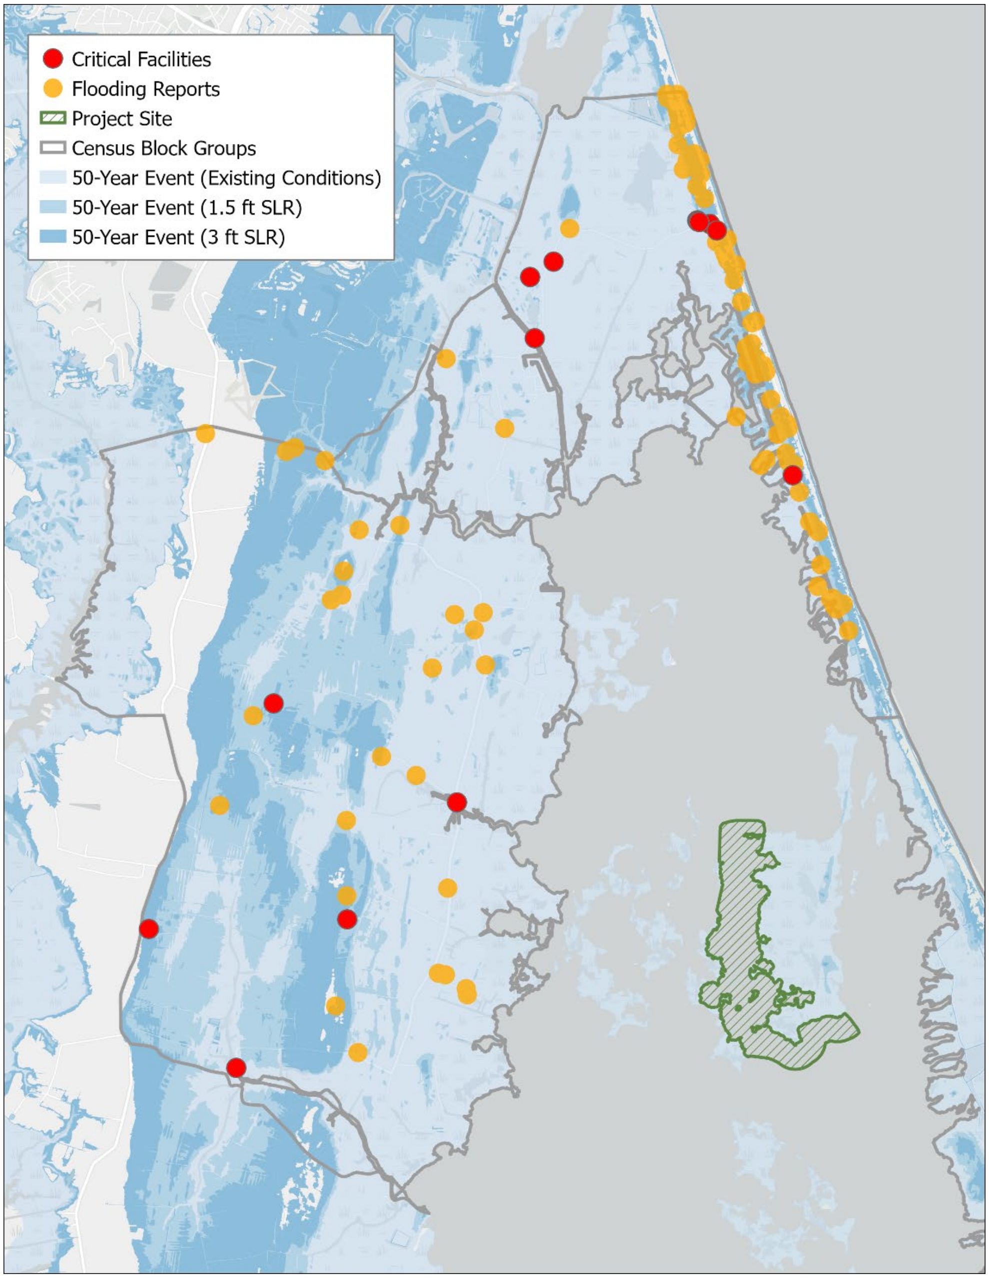

Figure 12: Critical facilities and flooding reports within project vicinity.

What would happen (or not happen) if the applicant does not receive funding?

If this project does not advance from design to construction, erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternatives Analysis

The proposed project offers the best approach for addressing the needs and problem statement outlined in this Scope of Work narrative. The project would result in the creation of 46.5 acres of marsh terraces, which would produce a net gain of approximately 16 acres of low/high marsh habitat by the end of the project construction compared to the No Action Alternative. The integrated system of marsh terrace ridges and perimeter rock armoring would stabilize the two critically eroding marsh islands (Long Island to the east, and a series of smaller unnamed islands to the west) from continued degradation. The tall terrace design improves the functionality and resiliency of the marsh system while also providing diversified habitat for fish and wildlife in the form of increased marsh edge as sea level rises. Numerical modeling of the preferred alternative demonstrated that the project would decrease wave heights and decrease the overall flow velocity of water moving through the project site, reducing water exchange in Back Bay during flooding events, encouraging sediment deposition, mitigating wave effects and consequent erosion, and result in localized water quality benefits. The proposed terraces would not only create a platform for vegetation growth within the marsh, but also reduce wave fetch in these large open water areas. The reduction in wave energy would lead to improved water clarity to promote the growth of SAV in the area between the terraces (approximately 310 acres).

Dredging in between the terraces to obtain sediment for the terrace cap would ensure no invasive vegetation is introduced into Back Bay, which is a high priority of the USFWS and VRMC. The dredging areas would also create valuable fish habitat to attract signature Back Bay fish and wildlife populations such as Largemouth Bass. The proposed dredging areas in between the terraces was evaluated and not anticipated to increase erosion of the adjacent marsh system. Furthermore, dredging in-situ material for building terraces is a widely accepted approach in Gulf Coast region marsh creation/terracing projects, as determined through conversations with project owners in Louisiana. Some terrace cap material will also be obtained from the Nimmo VII-A project. Through export of proven expertise from successful marsh terracing projects, this project would lay the foundation for future similar projects in the region through the development of detailed cost estimates, identification of best sources for local/regional materials, and establishment of partnerships with permitting officials at various levels of government.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation, and provide flood risk reduction benefits through increased friction and wave attenuation. Table 1 below provides a high-level overview of the specific objectives established to solve the problem/need identified – specifically habitat degradation and wind tide flooding along with measure(s) of success. A more detailed description of these objectives is provided in the Supporting Documentation section.

Table 1: Overview of Project Objectives.

Objectives	Description	Measure(s) of Success	Timing of Measures
Objective 1	Create a Construction Access and Staging Area	a. Secured permits for construction. b. Contractor Selection. c. Construction of Staging Area.	a. December 2023 b. April-May 2023 c. June 2023 -February 2024
Objective 2	Restore Marsh and Aquatic Vegetation	a. Secured permits for construction. b. Restoration of 46.5 acres of habitat.	a. December 2023 b. March - October 2025 and March – October 2026
Objective 3	Engage Stakeholders and Disseminate Effective Practices	Number of people meaningfully engaged in the process of the project within the agreement period.	Continuous through period of performance.

Work Plan

Current Status and Ongoing Activities

The marsh terrace project design is progressing and will be ready for construction in the CFPF grant timeline. Table 2 summarizes ongoing tasks related to the project and an anticipated schedule for completion.

Table 2: Completed, ongoing, and anticipated activities leading up to construction.

Activity	Description	Schedule
Stakeholder Scoping Workshop	In November 2020, the City hosted a virtual workshop to receive initial input from project stakeholders.	Completed (Fall 2020)
Site Characterization and Vegetation Survey	In fall 2020, a site characterization and vegetation survey within Bonney Cove was conducted under a USFWS Special Use Permit (SUP). The purpose of the survey was to document existing emergent marsh and submerged aquatic vegetation (SAV) species composition and percent coverage within the proposed project area. MAP Environmental, Inc. conducted a literature review of marsh terracing projects in the Gulf Coast region to identify effective practices for project planning and design.	Completed (Fall 2020)
Bathymetric Survey	An updated bathymetric survey of Bonney Cove, also covered under a USFWS SUP, was completed in March 2021. This data serves as an input to identify appropriate design elevations to determine quantities of materials necessary to build the proposed marsh terraces and for numerical modeling of project alternatives.	Completed (Spring 2021)
Geotechnical Investigation	A geotechnical investigation of Bonney Cove was conducted in the spring of 2021. The permitted survey, (Virginia Marine Resources Commission (VMRC) Permit No. 2020-2286, U.S. Army Corps of Engineers (USACE) Permit No. 2020-02439, and USFWS SUP) included the collection of 10 soil borings in locations that avoided aquatic vegetation habitat. The soil samples were retrieved by drilling with a specialized airboat-mounted drill rig which was essential for drilling in shallow areas as it avoids disruption to bottom habitat. The soil samples were analyzed to determine the suitability and physical characteristics of the soils within the project area. Additional soil analysis was conducted to determine the suitability of Back Bay sediments for building components of the marsh terraces.	Completed (Spring 2021)

Activity	Description	Schedule
Water Quality and Hydrodynamic Survey	ODU conducted a water quality and hydrodynamic survey of Bonney Cove in the spring of 2021. The USFWS permitted survey collected water samples and deployment/retrieval of hydrodynamic sensors (pressure sensors, acoustic Doppler current profilers, and optical backscatter sensors) at three sampling points in Bonney Cove. Sensor equipment was deployed for two one-month periods (3/10/2021 – 4/12/2021 and 5/19/2021 – 6/8/2021). The water level, wave, and current data served as an input to the numerical model calibration. The water quality parameters (including pH, salinity, temperature, dissolved oxygen, chlorophyll, and turbidity) will serve as a reference to compare pre-and post-construction water quality conditions.	Completed (Summer 2021)
30% Design	Dewberry leveraged the field-collected data to establish design criteria for the project to ensure that it will be resilient in the face of changing future conditions during wind-tide events. Artistic design renderings were developed to enable stakeholders to visualize the implemented project.	Completed (Fall 2021)
Public Engagement – 30% Design	The City held a public information meeting on October 14, 2021, at Creeds Elementary School. The project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the preliminary (30%) designs and artistic renderings and submitted comments regarding environmental and community impacts.	Completed (Fall 2021)
Numerical Modeling	Numerical modeling has been completed to evaluate the proposed project's impact on water levels, wave heights, and flow velocities within and surrounding the project area. Potential water quality impacts were also evaluated. The numerical modeling effort involved the development of an XBeach model, which is a nearshore model that accounts for wave-vegetation interactions based on field-derived drag coefficients.	Completed (Winter 2021)
Environmental Assessment and Scoping	In coordination with the USFWS and with technical assistance from Dewberry, the City evaluated the potential environmental impacts of the project. The draft environmental assessment document was distributed to key stakeholders with jurisdictional authority or a vested interest in the project for review and comment.	Completed (Summer 2023)

Activity	Description	Schedule
60% Design	After numerical modeling and stakeholder review of the 30% design, the engineering design plans were advanced from 30% to 60%.	Completed (Spring 2023)
95% Design and Public Engagement	The engineering design team prepared 95% engineering design plans to address comments on the 60% plan set. The City held a second public information meeting from 6:00 – 7:30 p.m. on July 13, 2023, at the Senior Resource Center in Virginia Beach where the project team delivered a 10-minute presentation of the proposed project followed by an open-format discussion where participants reviewed the 95% designs, updated artistic renderings, and submitted comments.	Completed (Fall 2023)
Construction Permit Applications Submitted	The City submitted the Joint Permit Applications for the proposed project, including the initial post-construction monitoring plan, to VMRC and the USACE in August 2023.	Completed (Summer 2023)
Modeling of Potential Adverse Impacts	In response to public concerns, the City performed additional numerical modeling of both northerly and southerly wind events and reviewed water level responses at locations in Back Bay for any potential adverse impacts. No adverse impacts were found for either type of event.	Completed (Fall 2023)
Publication of Frequently Asked Questions	The City will be publishing findings for the potential adverse impacts modeling, along with other responses to public concerns raised at the question in a Frequently Asked Questions webpage in November 2023.	In Progress (Fall 2023)
100% Design	The engineering design team prepared and submitted the 100% engineering design plans to the City for review. The plans will be finalized on receipt of any comments from the permitting process, anticipated to occur by end of 2023.	In Progress (Fall 2023)
Contractor Procurement	The engineering team will provide final plans, specifications, and construction estimates (PS&E). The City will prepare the bid Request for Proposal (RFP), provide Bid Packages, and review bids obtained, and select a construction contractor.	Planned (Winter 2023 - Spring 2024

What are the major activities and tasks?

The key activities and tasks to be competed under the agreement period are summarized in Table 3. Please refer to the Supporting Documentation section for a more detailed description of these activities and tasks.

Table 3: Overview of Activities and Tasks.

Activities	Description	Tasks
Activity 1	Construction Staging Area Preparation and Construction	1. Mobilize equipment 2. Stabilize road, establish construction staging area, abutments, install pre-engineered bridge, construct ramp to water and slurry basins. 3. Establish traffic flagging stations. 4. Install pipe and booster stations.
Activity 2	Marsh Terrace Construction	1. Construct 41 terraces (2-phased approach). 2. Demobilize equipment.
Activity 3	Stakeholder Engagement	1. Develop project marketing materials. 2. Attend and document engagement activities.

Who is responsible for completing the activities and tasks?

Responsibility for completing the project's activities and tasks lies with a collaborative effort led by the City's Department of Public Works. To ensure the successful execution of the project, the City has assembled a diverse team of consultants, advisors and subject matter experts. For a comprehensive understanding of the specific roles and responsibilities of each entity involved in carrying out the proposed scope of work, please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report, which provides a detailed description of how each team member contributes to the project's overall success.

What is the timeframe for accomplishing activities and tasks?

An overview of the planned project timeline is shown in Figure 13. Grant activities will initiated in Summer 2024 with construction of the staging area and material acquisition. Please refer to the S*upporting Documentation – Approach, Milestones, and Deliverables –Milestone Schedule* section of this report for a detailed outline for each activity and associated deliverables.

Figure 13. Timeline overview for project implementation.

Identify the required partners to ensure success and where they are represented in the workplan.

A diverse team of consultants, advisors, and subject matter experts, led by the City's Department of Public Works, has been assembled to complete the project's activities and tasks. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables – Project Partner*s section of this report for a detailed description of each team member's role, responsibilities, and contribution to the project's overall success.

Deliverables

An overview of the project deliverables is provided in Table 4. Please refer to the *Supporting Documentation – Approach, Milestones, and Deliverables* section of this report for more detail.

Table 4: Summary of Deliverables.

Activities	Deliverables
Activity 1: Construction Staging Area Preparation and Construction	1. Material acquisition. 2. Progression and completion of the construction staging area, with daily inspections to monitor progress. 3. Documented progress and completion through quarterly reports to DCR.
Activity 2: Marsh Terrace Construction	1. Progression and completion of the 2025 and 2026 construction phases, including plantings, with daily inspections to monitor progress. 2. Demobilization and removal of equipment from construction staging area. 3. Documented progress and completion through quarterly reports to DCR.
Activity 3: Stakeholder Engagement and Lessons-Learned Dissemination	1. Project marketing materials. 2. Records documenting number of stakeholders engaged during the outreach activities.

Maintenance plan tied to the identified viability of the project. Plan for sustaining the project after the agreement period (if applicable)

The City has developed a draft Annual Monitoring Plan and Post-Construction Monitoring Report that was submitted along with the Joint Permit Application for the project. See Attachment 5 for a copy of the draft report.

Project maintenance will be addressed by the City of Virginia Beach's Public Works Stormwater Operations Group. Any maintenance issues identified by the monitoring effort or other observers will be flagged to the Operations Group to address. The City intends to maintain the construction staging area to support future project maintenance needs. After completion of the monitoring program, the City will perform inspections every 2-5 years and make any repairs needed for the life of the project.

Evaluation

Indicators of Success

Indicators of success for this project have been identified during the development of the monitoring plan. Three (3) indicators of success were defined in relation to the primary objectives of the project (as defined elsewhere in this document), and include:

- The establishment of a sustainable coastal marsh island system.
- Stability of the marsh terrace structures.
- Establishment of a sustainable SAV community.

What data will be collected and how will it be used to measure success?

Data collection for the project has been detailed in the proposed monitoring plan and includes two sets of data: one set associated with as-built surveys to establish baseline reference conditions for subsequent monitoring efforts, and monitoring data to assess the success of the project in meeting the indicators defined above. Baseline and monitoring data will be compiled in an annual report and distributed to permitting agencies, and stakeholders as appropriate, to fulfill monitoring requirements and ensure success criteria are being met and maintenance needs are addressed.

Baseline data, which is proposed to be collected after the completion of each of two phases of terrace installation, will include the following data:

- Coordinates and diagrams of established transects, as well as site photographs from photo stations established along each sampling transect, as defined in the Methods section of the monitoring plan.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Monitoring data will be collected at the end of the full growing season during each monitoring year and include the following:

- Site photographs from photo stations defined in the Methods section of the monitoring report.
- Estimated percent cover and change in coverage from the as-built conditions to sampling year conditions for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to sampling year conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

This monitoring data will be used to define success by tracking the establishment of the proposed vegetative communities on and between the proposed marsh terraces as well as the structural integrity of the marsh terrace structures themselves. Vegetation cover thresholds for each year will be defined to ensure planted communities are appropriately established on each marsh terrace. Acceptable measures of deviation will be defined for structural elements to ensure design requirements are met. Maintenance and mitigation measures defined in the monitoring plan will be implemented as required if success criteria are not met during any particular monitoring year.

How was cost effectiveness evaluated and measured against the expected outcomes?

Through a BCA approach using FEMA methods and ecosystem service valuations, a BCR of 1.17 was calculated for the project. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.2M in value over the current estimated project costs.

A description of the BCA analysis and methods is provided in the following Benefit Cost Analysis Section.

What products, services, meetings, outreach efforts etc. will be conducted and how will success be measured?

The City is firmly dedicated to fostering meaningful engagement with project partners and external stakeholders throughout the project, with the goal of raising awareness about the project's approach and its benefits and enhancing the likelihood of its successful adoption in other areas within the region and the state.

Activity 4, titled "Stakeholder Engagement and Lessons-Learned Dissemination," provides a comprehensive outline of the City's outreach strategy, encompassing proposed deliverables and outreach endeavors. This strategic plan entails the development of project marketing materials, along with the facilitation of presentations and meetings with local and regional stakeholders, as well as participation in state and national-level conferences.

To gauge the effectiveness of our efforts, the City will employ metrics to track and document the number of individuals engaged throughout the project. This information will be regularly communicated to DCR to serve as a key performance indicator for project success.

For a more detailed breakdown of the tasks and deliverables associated with Activity 4, please refer to the Supporting Documentation section of this application.

Project Progress Monitoring Plan

The City's Project Progress Monitoring Plan is designed to guarantee the seamless and effective execution of the project. We have established a robust internal system to oversee the entire project lifecycle, ensuring that all key stakeholders are aligned with the project's objectives, activities, deliverables, and schedule.

The process commences with a kickoff meeting involving all project partners, where we collectively set the stage for the project. During this meeting, we thoroughly review the project's objectives and scope, ensuring that everyone is on the same page. This initial step is instrumental in fostering a shared understanding of the project's vision and goals among all involved parties.

In addition to the kickoff meeting, we place a strong emphasis on quality assurance and control. We meticulously assess each contractor's quality management system to ensure that well-defined procedures are in place to maintain the highest standards of quality throughout the project. This dedication to quality is paramount to delivering a successful project that meets the City's standards and the expectations of our stakeholders.

The City is committed to ongoing and transparent communication with our design and construction contractors, as well as our advisory stakeholders. Regular meetings will be held to monitor progress, address any potential challenges, and ensure the project adheres to the proposed milestone schedule and deliverables as outlined in this grant application. This proactive approach to project monitoring allows us to stay on track, identify and address issues promptly, and uphold our commitment to the successful completion of the project.

Supporting Documentation

Project Information

The following sections provide details regarding the project site and highlight the impacted population, residential and commercial structures, and critical facilities. This section also provides an overview of the historical, existing, and projected flood conditions in and around the project site.

Population

As shown in Figure 14, two census block groups (518100454.121 and 518100464.001) adjacent to Back Bay are within the extent of the anticipated project benefits. The total population of these two block groups is 3,531.[6] The residential population has grown approximately 1.8% in the past two decades. The median household income in 2021 dollars is $99,078. There are approximately 2,500 residential housing units, of which 43.1% are owner-occupied, 11.4% are renter-occupied, and 45.5% are vacant. The high percentage of vacant housing units can likely be attributed to seasonal rentals within the Sandbridge Resort Area. The race and ethnicity demographics of the community are 94.4% White, 1.4% Black, 3.4% Hispanic, and less than 1% Asian and American Indian.

[6] Population, household income, housing units, and demographic data obtained from Esri ArcGIS Community Analyst (2022). Esri forecasts for 2021 based on U.S. Census Bureau 2010 data.

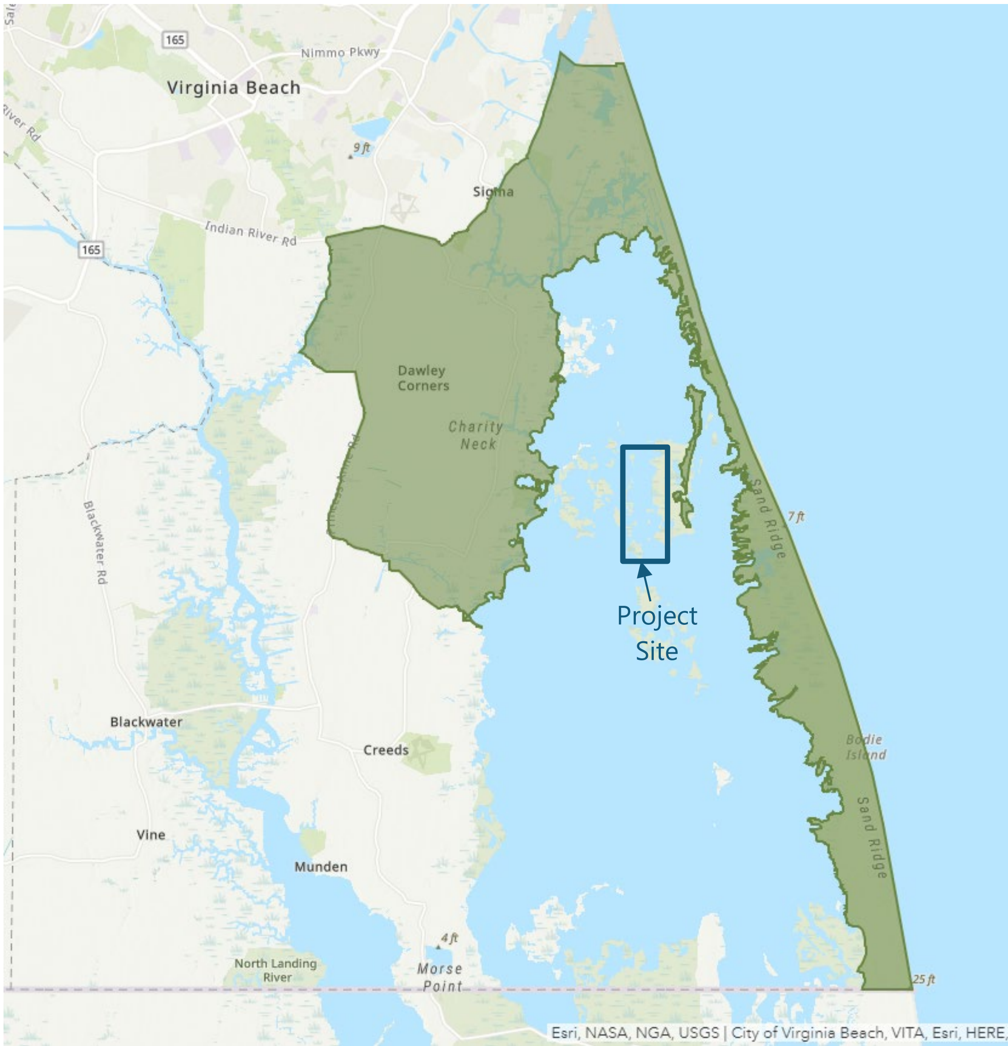

Figure 14: Census block groups selected for population estimates.

Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

Historical and Existing Flood Data

The project is located within a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA), as shown in Figure 15 and Figure 16. Based on the City's current flood maps (effective January 16, 2015), the project site's flood zones are VE, AE, and Open Water. Portions of the site are within Otherwise Protected areas.

The following maps provide an overview of the existing flood hazards for the project area, including the northern boundary (Figure 15) and southern boundary (Figure 16). Based on the City's current flood maps (effective January 16, 2015), the project site contains VE and AE flood zones and Open Water.

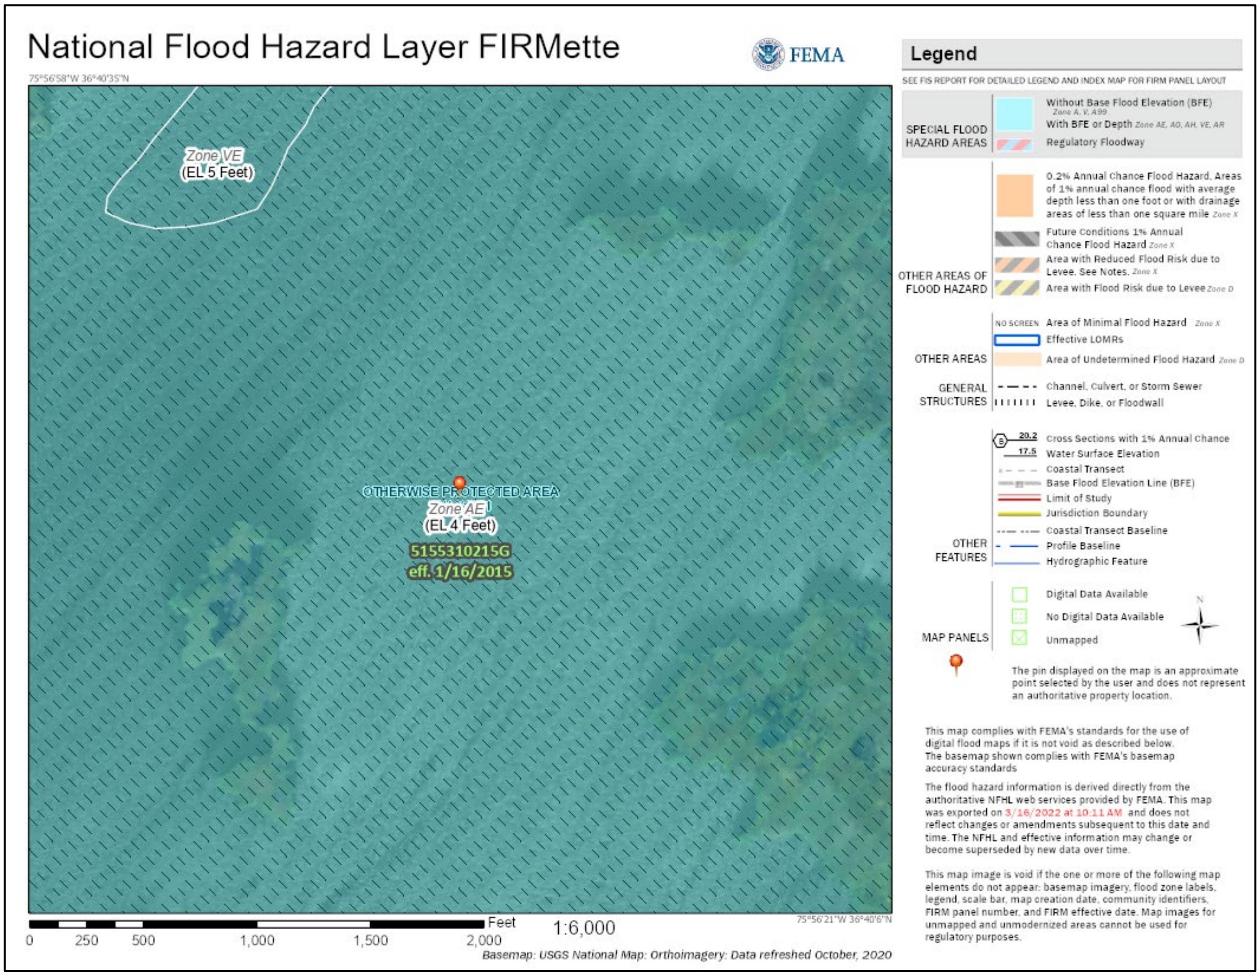

Figure 15: FIRMette for the project area (northern boundary).

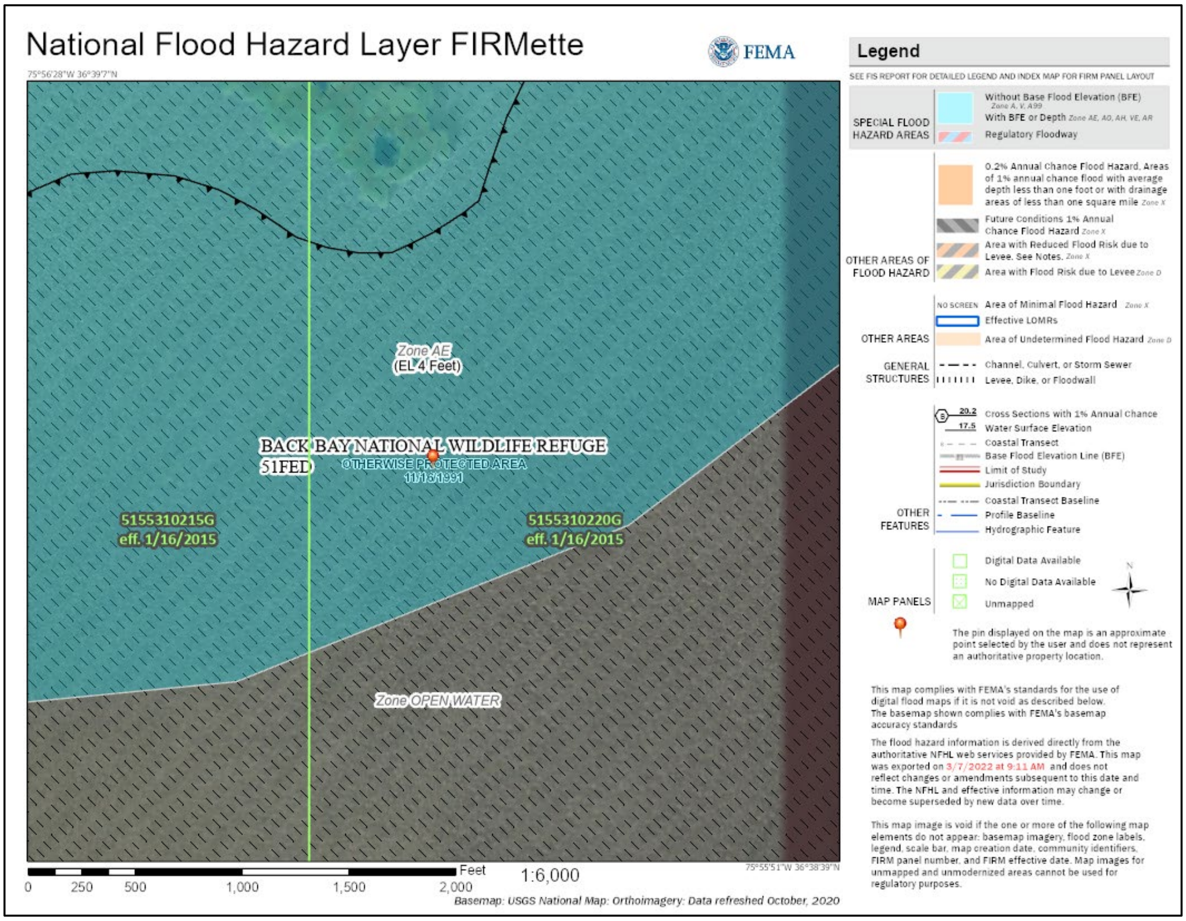

Figure 16: FIRMette for the project area (southern boundary).

The City maintains records of where residents report flood issues and what type of flooding is causing the issue. Residents regularly report flood issues through a hotline, which are then recorded in a flood event database. The census block groups adjacent to the project area reported 111 flood issues associated with heavy rain or high tide between 2001 and 2019. Critical facilities and flood incidences are relatively concentrated in the Sandbridge Resort Area.

Projected Flood Frequency

The USFWS, the City, and other stakeholders have made significant investments in detailed assessments, sophisticated computer models, and water level gauges to better understand historical and future wind tide flooding. Figure 17 displays the projected flood pathways under the 10-year and 100-year storm event under a 3 feet sea level rise scenario surrounding the project site.

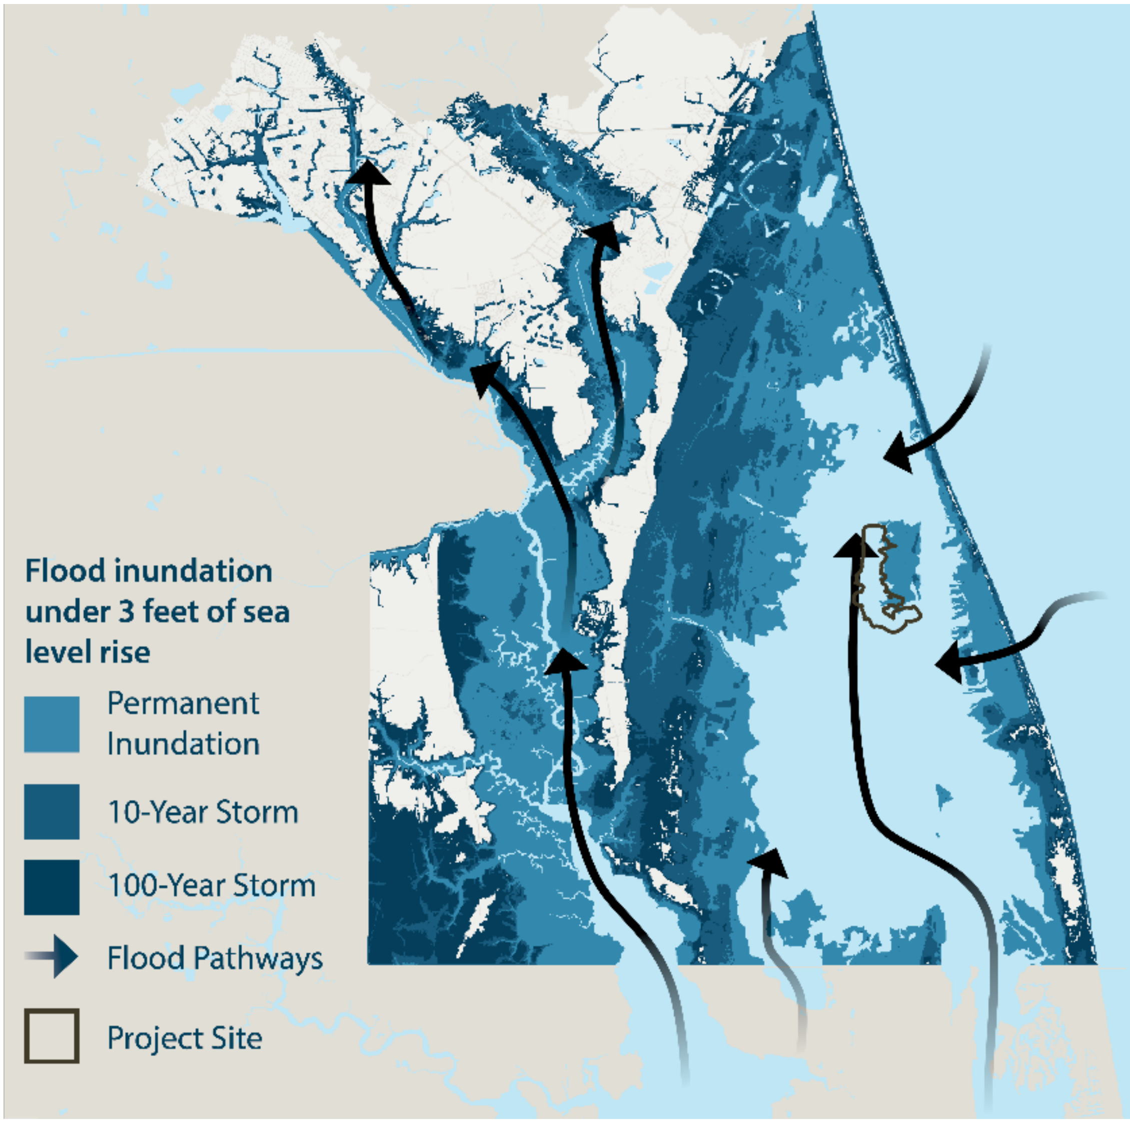

Figure 17: Flood pathways into the Southern Rivers Watershed with 3 feet of sea level rise.

Numerical modeling also shows that as sea levels continue to rise, a shorter duration wind event will produce more wind-induced flooding in less time. The three lines in Figure 18 represent the water level response to a sustained 15-mph wind for each sea level rise scenario. With the existing marsh system today (blue line), it takes approximately five days of sustained southerly wind to cause flooding. With 1.5 feet (yellow line) and 3 feet (red line) of sea level rise, the peak water level could be reached two to three days sooner, respectively. Model simulations showed that marsh island creation across Back Bay would help delay the onset of flooding by several days, which would allow the City and residents more preparation time[7].

[7] City of Virginia Beach. (2018). Analysis of Marsh Response to Sea Level Rise (PDF).

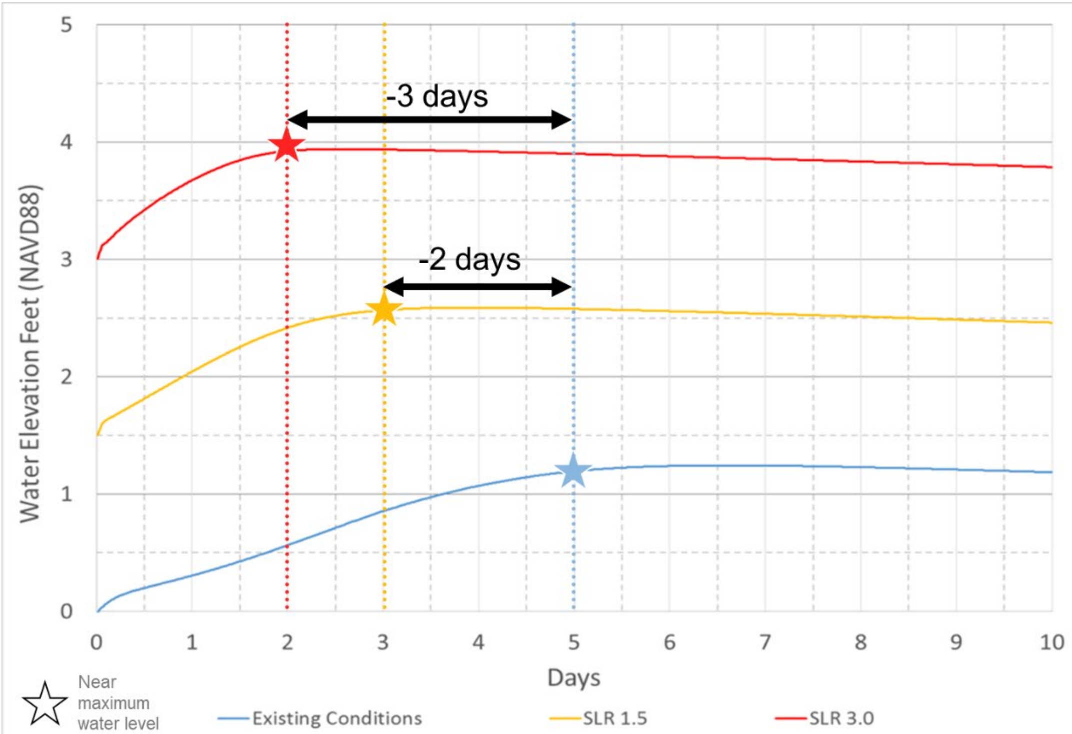

Figure 18: Water-level response under sustained 15-mph southerly wind.

The City analyzed future marsh conditions using the Sea Level Affecting Marshes Model (SLAMM).[7] Figure 19 illustrates areas likely to experience accelerated degradation of marsh in Back Bay due to rising water levels. If no action is taken, substantial marsh loss is projected in Bonney Cove under 3 feet of sea level rise. Within a 1-mile radius of Bonney Cove, the City's SLAMM model predicts that approximately 730 additional acres could be eroded into open water in response to sea level rise. This represents more than a 70% reduction as compared to the existing marsh system surrounding Bonney Cove today. It is also presumed that open water areas would continue to experience high levels of turbidity, which will continue to negatively affect SAV communities in Back Bay.

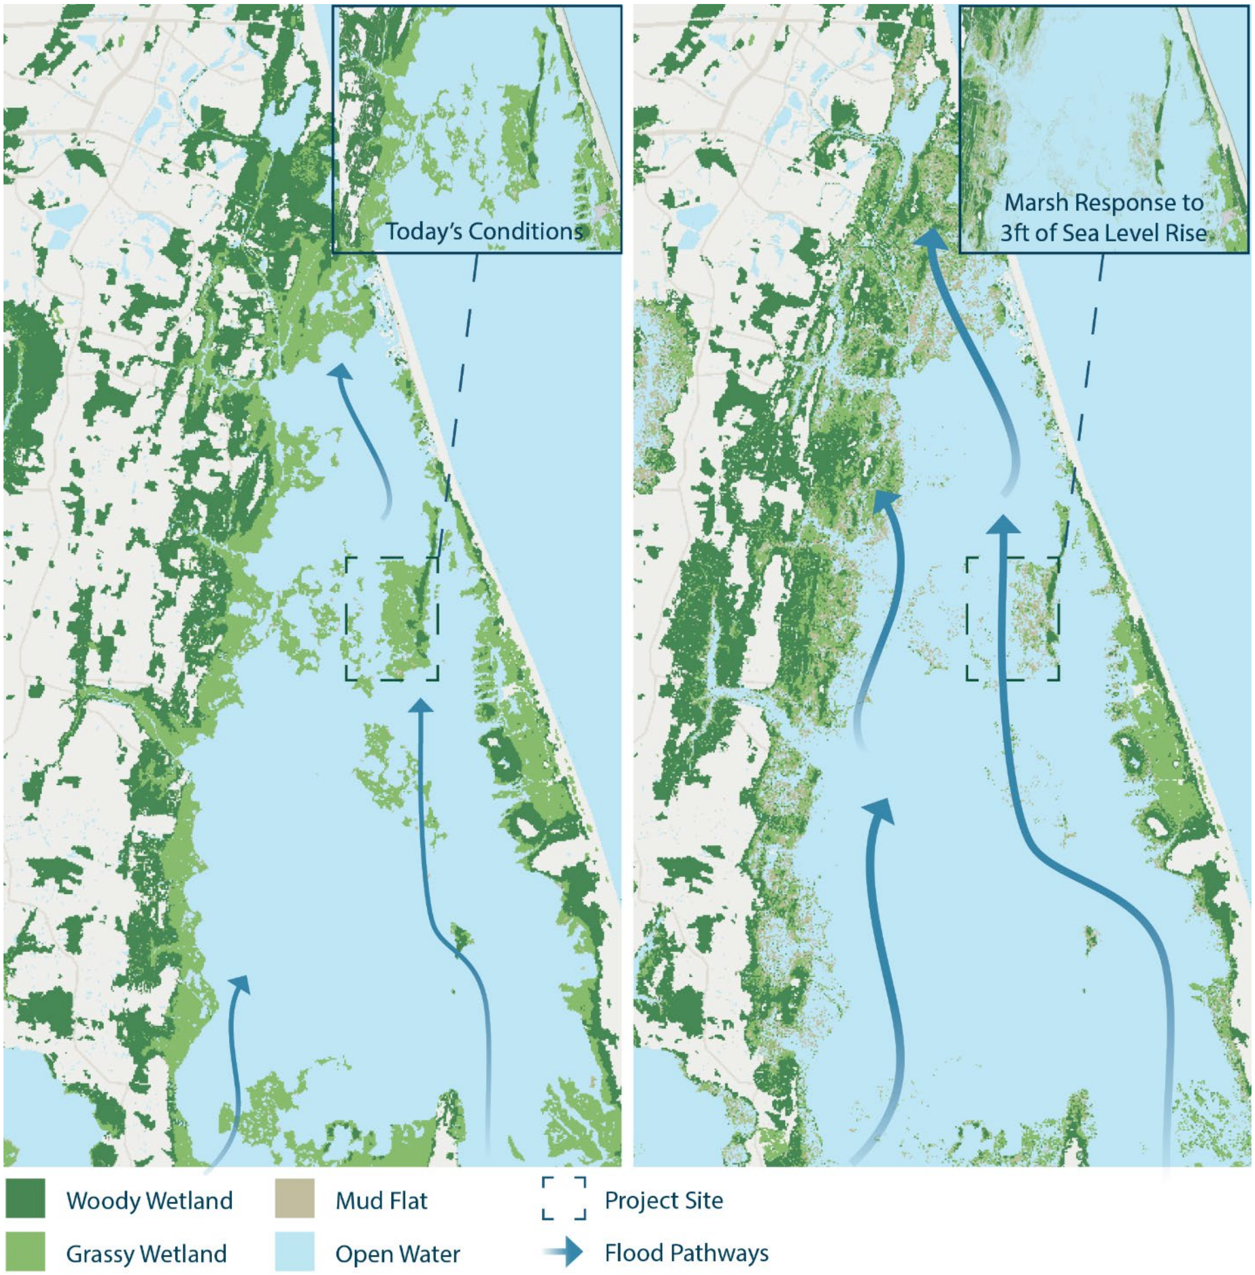

Figure 19: Comparison of current marsh conditions to future marsh conditions with 3 feet of sea level rise.

The proposed project site in Bonney Cove has a predominant south-southwest wind direction, which contributes to significant wave generation in the large unobstructed open-water areas and provides a continuous source of scouring and erosion in those areas. Marsh loss is likely to continue in the project area, creating a negative feedback cycle as continued fragmentation of the marsh would further deteriorate the remaining stands of healthy marsh and increase fetch. Today, the site faces low to medium fetch exposure, but in the future, the site could experience high to very high fetch exposure, as defined by the Virginia Institute of Marine Science (VIMS)

Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments.[8] Projections of increasing fetch at the site, along with the transects used for the wind fetch analysis, are summarized in Figure 20.

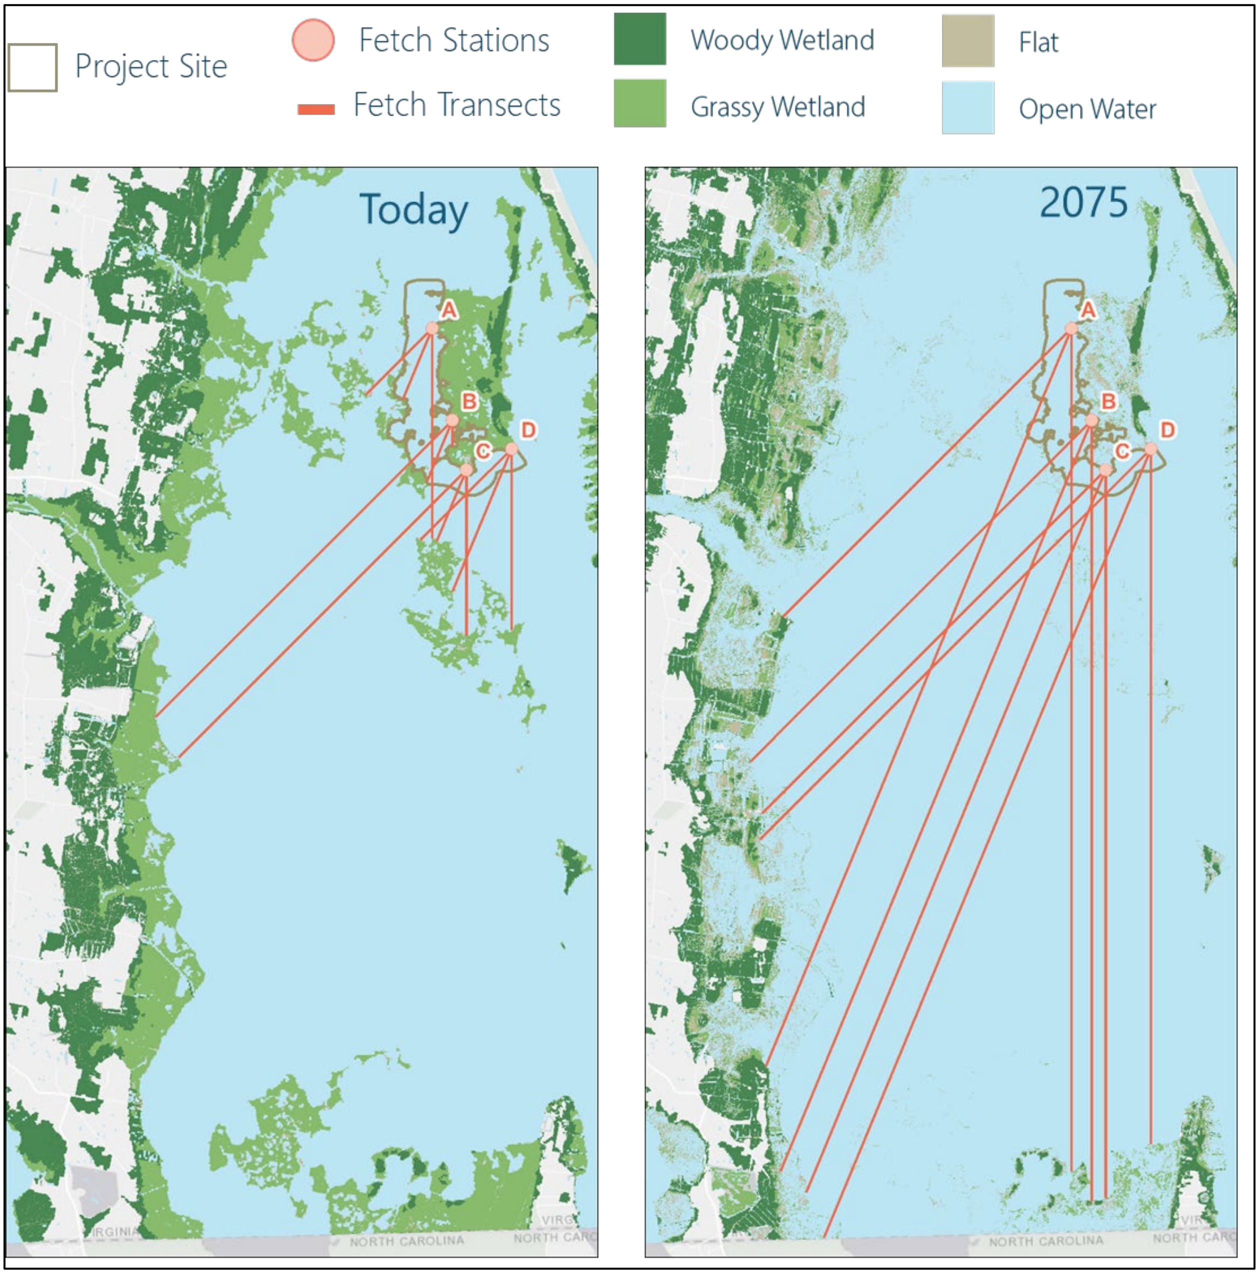

Figure 20: Wind fetch analysis of project area.

The following table displays specific values of fetch distances and classifications that correspond with the transects displayed in Figure 20 above.

[8] Virginia Institute of Marine Science. (2010). Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments; Version 1.2 (PDF).

Table 5: Measurements of fetch transects referenced in Figure 20.

Fetch Transect	Length, Miles (Today)	Classification	Length, Miles (3 feet SLR)	Classification
A-SW	0.9	Low	3.7	High
A-SSW	0.7	Low	7.3	Very High
A-S	1.9	Medium	7.7	Very High
B-SW	3.8	Medium	4.4	High
B-SSW	0.6	Low	7.4	Very High
B-S	0.2	Very Low	7.2	Very High
C-SW	3.7	Medium	4.4	High
C-SSW	0.7	Low	7.2	Very High
C-S	1.5	Medium	6.7	Very High
D-SW	1.2	Medium	5.1	Very High
D-SSW	1.4	Medium	7.8	Very High
D-S	1.7	Medium	6.4	Very High

No Adverse Impact

The City conducted additional hydraulic numerical modeling to identify any potential adverse impacts in response to concerns raised during a public meeting in July 2023. The City utilized a Danish Hydraulic Institute MIKE FLOOD model developed for stormwater master planning activities in Lower Southern Rivers Watershed of Virginia Beach. This model encompasses the entirety of Back Bay and extends into North Carolina's Currituck Sound. Model performance has been validated against observations from multiple flood events.

The effort looked at water level and velocities in response to a historical southerly wind tide flood in May 2017 and a northerly wind event associated with Tropical Storm Ophelia in September 2022. These events were ran with model grids depicting with- and without project conditions, considering the 100% project design specifications. The northerly wind event was

included to address concerns from residents of Knott's Island, at the southern end of Back Bay. Both the terrace field and the construction staging area were included in the with-project condition. The modeling found that there were no increases in water levels to areas within Back Bay or to Knotts Island. Negligible changes in water velocity (0.2 ft/s or less) were observed in the channel to the west of the terrace field. No increases in water levels were observed in the area of the construction staging area.

Local Government to Provide its Share of the Cost

The City of Virginia Beach is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative, "Amount of Cash Funds Available." The funding for the grant match is contained within the City budget.

Benefit-Cost Analysis

FEMA recognizes the economic value of restoration projects and has provided ecosystem service economic valuations for benefit cost considerations. The approach and values used here are consistent with FEMA Benefit-Cost-Assessment (BCA) toolkit approaches and ecosystem service valuations published in "FEMA Ecosystem Service Value Updates, June 2022[9]." The 2022 FEMA guidance provides methods and values for various nature-based projects, including coastal wetlands. The valuations recognize ecosystem services for coastal wetlands including aesthetic value, climate regulation (carbon sequestration), flood and storm hazard reduction, habitat, recreation/tourism, water filtration and supply benefits of coastal wetland features.

Feasibility and Effectives Criteria

The project meets FEMA's Feasibility and Effectives Criteria for a Coastal Wetland as defined in the 2022 guidance, including:

- Land cover associated with the project is a "Estuarine and Marine Wetland" as classified for NWI for remaining marsh within and adjacent to the study area. The area of the project is also a historical marsh.
- The project demonstrates "ecosystem restoration" by using the terrace approach to recover degraded, damaged, and destroyed wetlands and submerged aquatic vegetation in the Back Bay ecosystem.
- The project meetings EPA concepts of restoration through direct creation of marshes (the terraces themselves) and enhancement of the ecosystem (reduction of water turbidity to enhance growth of submerged aquatic vegetation).
- The project will result in notable increased health and function of the local ecosystem in the "after mitigation" scenario through reduction of wave heights, water flow, and significantly decreased turbidity within the project area, as well as reduction of wave heights to adjacent areas.

[9] FEMA Ecosystem Service Value Updates, June 2022 (PDF).

- The project approach was aligned with established principles and techniques on wetland restoration, as outlined in the Coastal Wetlands and Tidal Flats section of the International Guidelines on Natural and Nature-base Features for Flood Risk Management10.

Design Life

As mentioned, the project useful life is 30-years. The FEMA 2022 guidance allows 50-years a typical lifespan; however, as stated in the project description, the elevation of the terraces was set based on a 30-year design life and estimated settlement.

Ecosystem Services Valuation

- The 2022 guidance values ecosystem services for coastal wetlands at $8,955 in 2021 U.S. dollars (USD), per acre, per year.
- The project will restore 46.5 acres of intertidal and upland marsh through direct creation of the marsh terraces. The project will also promote the growth of SAV in between the terraces, an area estimated at 310 acres. This provide for a total project benefit area of (46.5 + 310) = 356.5 acres.
- Project benefits occur over a period of time into the future; while most of the project costs are incurred up front and in the present. FEMA conducts its BCAs on a net present value basis, meaning the present value of the benefits gained from the project over the life of the project are compared to the total project cost to establish the BCR. Because project benefits accumulate over time, project benefits are calculated on an average annual basis ("annualized") and then multiplied by a Present Value Coefficient (PVC) to determine the present value of the annualized benefits.
- The present value coefficient is calculate as follows:

$$PVC = \left[\frac{1-(1-r)^{-T}}{r}\right]$$

  where *r* is the discount rate and *T* is the useful life of the project. The CFPF 2023 Grant Manual does not specify a discount rate for the benefits calculation; therefore, the latest FEMA program grant guidance was reviewed. For the 2023 FEMA Building Resilient Infrastructure and Communities (BRIC) and Floodplain Mitigation Assistance Grant Program (FMA) cycles FEMA has established a set discount rate of 3%[11]. The 3% discount rate provides for a PVC of 19.60 for a 30-year lifecycle for the project.
- Project benefits were calculated by:

$$Benefits = PVC \times Project\ Area \times Coastal\ Wetland\ Benefits$$

- The benefit cost ratio (BCR) was calculated as:

[10] International Guidelines on Natural and Nature-Based Features for Flood Risk Management - Engineering With Nature (dren.mil)

[11] FEMA Fact Sheet. Notice of Funding Opportunity for Fiscal Year 2023 Building Resilient Infrastructure and Communities Program (PDF).

$$BCR = \frac{Benefits}{Costs}.$$

A summary of the calculated values is provided in the below table:

Table 6. Summary of BCA parameters and results.

Project Area	Benefits (acre / year, 2021 USD)	Project Lifespan	Benefits, 3% discount rate	Project Cost	BCR, 3% discount rate
356.5	8,954	30	$62,566,588	$53,378,490	1.17

The calculated BCR for the project was 1.17, based on the FEMA ecosystem services valuation approach. This BCR is greater than 1, indicating the project can be considered cost-effective. The project also provides an additional $9.19M in value over the project cost.

Local Floodplain Management Regulations

The City recognizes the vital importance of floodplains in the natural movement of water through the community. Appendix K of the Virginia Beach Code of Ordinances regulates development in the community's floodplains. The City requires that a permit is obtained for any construction or development in the Special Flood Hazard Area. For more information and details regarding the City's floodplain management and ordinances, please refer to the following:

- Link to current floodplain ordinance: Virginia Beach Floodplain Ordinance.

In addition, a copy of the current floodplain ordinance has been included in *Part IV, Section E5*. For further information regarding the City's hazard mitigation and comprehensive planning, please refer to the following:

- Link to current hazard mitigation plan: Regional Hazard Mitigation Planning.
- Link to current comprehensive plan: Virginia Beach Comprehensive Planning.

Other Necessary Information to Establish Project Priority

Repetitive Loss and/or Severe Repetitive Loss Properties

The repetitive loss database shows 113 repetitive loss and severe repetitive loss properties within the two census block groups (518100454.121 and 518100464.001) associated with the project area.

Residential and/or Commercial Structures

A detailed economic flood loss assessment presented in the City's Resilience Plan showed that approximately 45% of the entire future risk exposure in the City is concentrated in the Southern Rivers watershed. Of that risk, 65% is concentrated in three communities north of Back Bay

(Figure 21).[12] Under a "no action" scenario, average annualized flood losses would increase from $974 thousand, representing present day conditions, to $6 million with 1.5 feet of sea level rise as anticipated by 2050. This figure equals an increase of six times present day conditions. With 3 feet of sea level rise as anticipated by 2080, annualized losses are expected to drastically increase to $80 million, more than 80 times today's conditions.

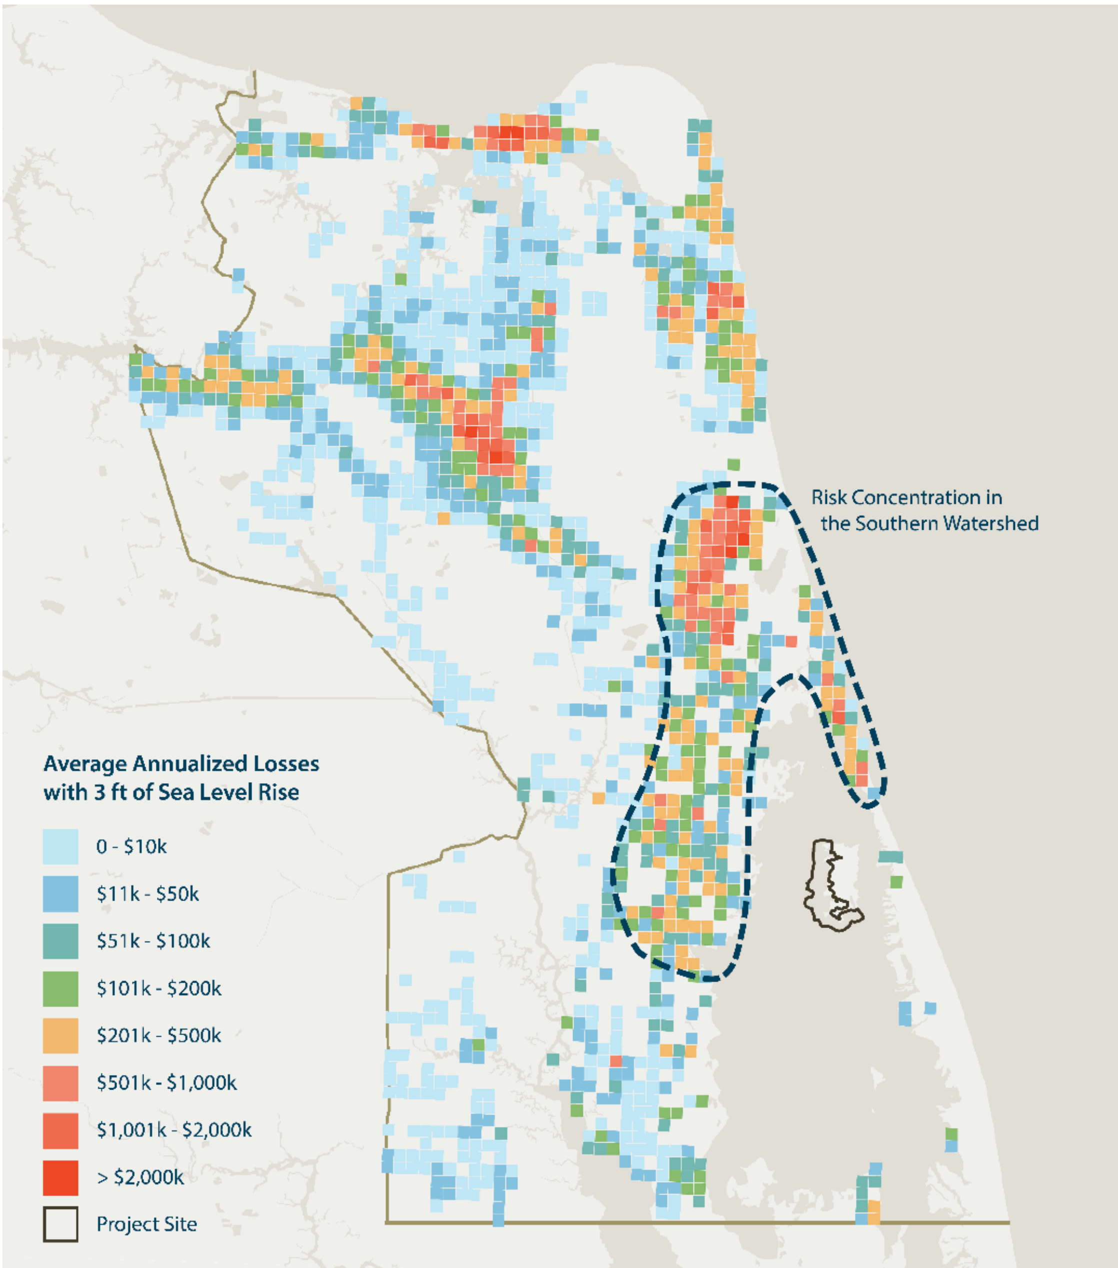

Figure 21: Concentration of average annualized losses estimated with 3 feet of sea level rise under a "no action" scenario presented in the City's Resilience Plan.

[12] City of Virginia Beach. (2020). Coastal Flooding and Economic Loss Analysis (PDF).

Within the two census block groups adjacent to Back Bay near the project area, there are approximately 70 commercial structures and 2,350 residential structures. Of those structures, approximately 635 structures are vulnerable to flooding during a 50-year event today. With 3 feet of sea level rise, approximately 2,060 structures are expected to be vulnerable during a 50-year event, representing approximately 85% of the residential structures within the project vicinity. These numbers underscore the importance of implementing the proposed project alongside complimentary flood risk reduction projects.

Critical Facilities

The two census block groups near the project site include 10 critical facilities. Table 7 summarizes critical facilities by type, total number, and the number of facilities exposed to the 50-year storm scenario under current and future "no action" scenarios. Under current 50-year storm conditions, 2 communication facilities and 1 electric power station would be exposed to flooding. With 3 feet of sea level rise, the number of critical facilities exposed to flooding increases to 9 total facilities.

Table 7: Summary of critical facilities located in the selected census block groups and flood hazard exposure to the 50-year storm event under current conditions and with 1.5 feet and 3 feet of sea level rise.

Type of Facility	Number of Facilities	Current 50-year storm	50-year storm with 1.5 feet sea level rise	50-year storm with 3 feet sea level rise
Communication	3	2 (66%)	2 (66%)	3 (100%)
Electric Power	1	1 (100%)	1 (100%)	1 (100%)
Fire Station	1	0	0	0
Potable Water	2	0	2 (100%)	2 (100%)
School	1	0	0	1 (100%)
Wastewater Treatment	2	0	0	2 (100%)

Need for Assistance

The City of Virginia Beach has invested significant time, money, and staff resources in understanding, communicating, and planning for the threats of sea level rise and recurrent flooding to the community. The City is ready to begin the implementation of adaptation measures, and the marsh terrace project is the first project to advance to construction from the City's Resilience Plan. The project represents the first step in restoring Back Bay and the larger Albemarle-Pamlico estuary, and serves as a pilot for additional restoration projects. Virginia Beach understands that flood mitigation costs are substantial and is seeking funds to support project implementation alongside dedicated resources procured by the City. The City's

Department of Public Works Stormwater Engineering Center has closely coordinated with the City's Department of Planning & Community Development throughout the design and permitting process. The Department of Public Works will oversee the construction of the marsh terrace project, including providing construction inspectors to monitor that the project is built to the City's design standards and technical specifications. Additionally, the City has access to necessary software, including AutoCAD and ArcGIS Desktop, and support from consultants to augment the City's technical capabilities.

Examples of City staff who will support the project include the following:

- Program Manager for the Technical Services Division of the Stormwater Engineering Center.
- Project Manager for Green Infrastructure Projects for the Technical Services Division of the Stormwater Engineering Center.
- Environmental Planner / Certified Floodplain Manager from the Wetlands & Shoreline Construction Team of the Planning Administration Division of the Department of Planning & Community Development.
- Planning Evaluation Coordinator from the Chesapeake Bay Preservation Area & Southern Rivers Watershed Team of the Planning Administration Division of the Department of Planning & Community Development.
- Full-time Construction Inspector assigned exclusively to this project from the City's Construction Bureau or under contract with the City Public Works Engineering Division.
- Grant Coordinator from the City's Public Works Engineering Division.

Additional staffing will be provided as needed to ensure project success.

This project benefits communities in northern Back Bay with a high concentration of flood losses (as shown in Figure 21). These communities contribute significantly to Virginia Beach's rural economy, including agriculture, forestry, fishing, hunting, and eco-tourism. In Hampton Roads, these industries contribute a combined $100 million in gross domestic product.[13] Protection of vulnerable natural infrastructure, such as the marshes in Back Bay, is critical to ensuring these industries can continue to thrive within the region.

Alternatives

Several other alternatives were considered but not advanced due to technical and environmental limitations. These alternatives are briefly summarized below.

[13] Office of Governor Ralph S. Northam Commonwealth of Virginia and Virginia Department of Conservation and Recreation. (2021). Virginia Coastal Resilience Master Plan Phase 1 (PDF); data referenced sourced from the US Bureau of Economic Analysis. (2019).

Alternative 1 - No Action Alternative

Under this alternative, no action would be taken to restore marsh habitat in the shallow open water channel of Bonney Cove. Erosion of the adjacent marsh would continue to occur, resulting in fragmented habitat lacking the capacity to reduce wave action and slow water velocities. It is anticipated that wind-driven flooding events will continue to increase in frequency, resulting in increasing flooding of the low-lying properties and roadways surrounding northern Back Bay.

Alternative 2 - Alternative Terrace Configuration Design(s)

Several configuration alternatives for the terraces were considered during the design process. These included four alternative layouts with different spacing and terrace top widths:

- **Alternative 2a** (Figure 22): Terraces would be spaced at approximately 300-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 220 feet for potential establishment of SAV habitat.
- **Alternative 2b** (Figure 23): Terraces would be spaced at approximately 300-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 200 feet for potential establishment of SAV habitat.
- **Alternative 2c** (Figure 24): Terraces would be spaced at approximately 600-foot intervals and have a top width of 15 feet. Between the base of the terraces, there would be approximately 520 feet for potential establishment of SAV habitat.
- **Alternative 2d** (Figure 25): Terraces would be spaced at approximately 600-foot intervals and have a top width of 30 feet. Between the base of the terraces, there would be approximately 500 feet for potential establishment of SAV habitat.

A common feature across all of these design alternatives was a breakwater that spanned the entire length of the southern extent of Long Island and a northern breakwater that spanned the northern exposed section of the project site.
Alternative 2a and 2b were eliminated due to constructability concerns regarding the quantity of sediment that would be required and due to the limited amount of room for SAV establishment in between the terraces (approximately 220- and 200- feet of potential SAV habitat between terraces for Alternative 2a and 2b, respectively).

Alternatives 2c and 2d were discussed extensively amongst the project team; however, it was ultimately determined that they did not maximize the opportunity for species diversity (by including both smaller and larger terraces). These alternatives were combined to form the preferred alternative presented in this document. Additional refinements that were made to these alternatives include the removal of the perimeter breakwater, as the proposed design elevation evaluated in the geotechnical analysis revealed stability issues with these large features.

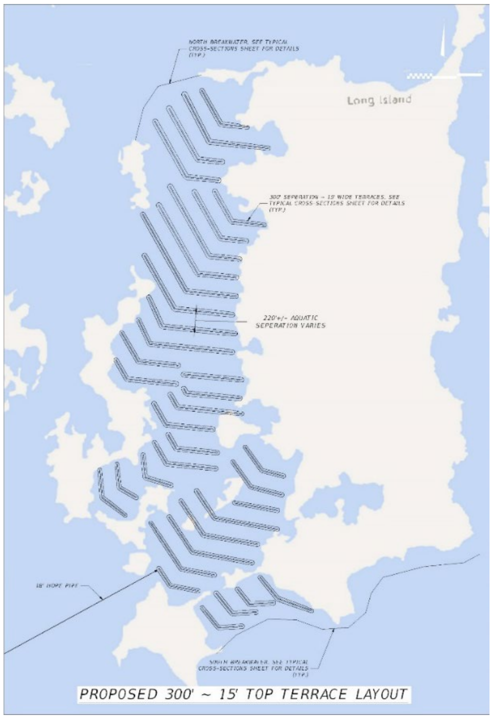

Figure 22: Alternative 2a.

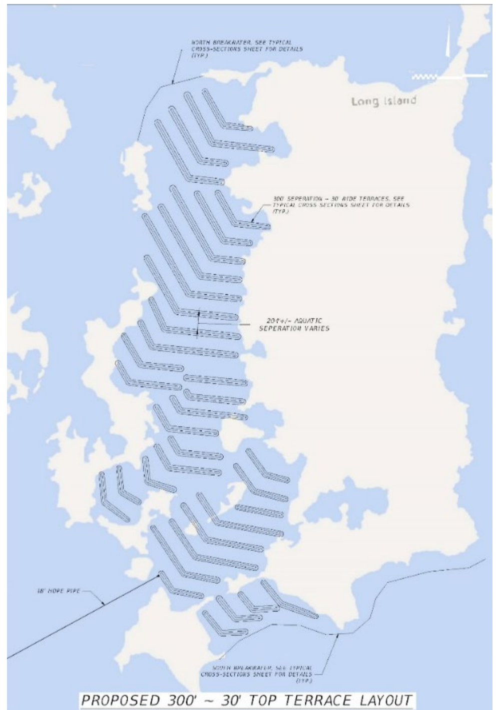

Figure 23: Alternative 2b.

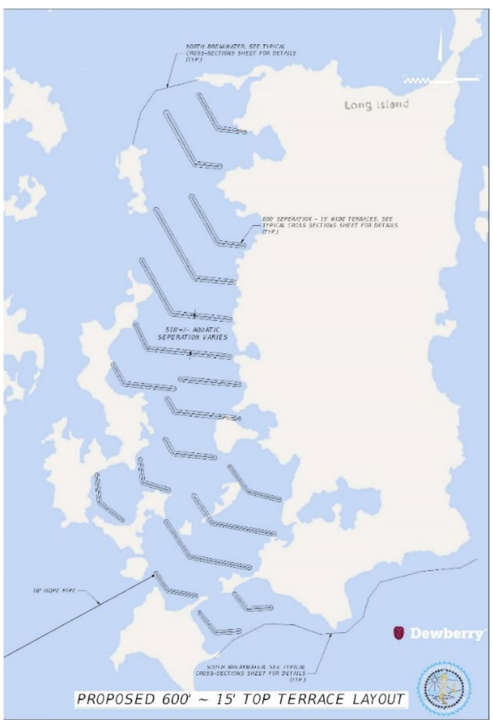

Figure 24: Alternative 2c.

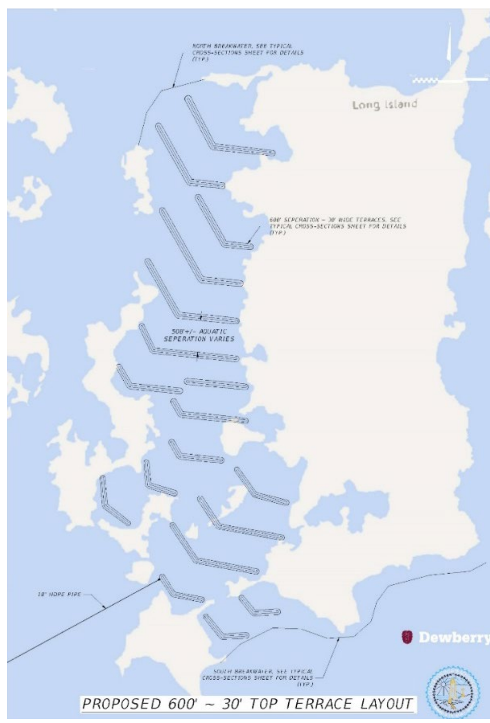

Figure 25: Alternative 2d.

Alternative Terrace Core Material Sources and Transportation – Alternative 3

In the proposed alternative with sand cores, a no-dredging alternative was considered. However, in order to successfully complete the project and establish the vegetation desired, material would need to be sourced, blended, transported, and placed. The City helped identify two potential borrow sources of material: Bow Creek Golf Course (Figure 26) and the Whitehurst Dredged Material Management Area (DMMA) (Figure 27).

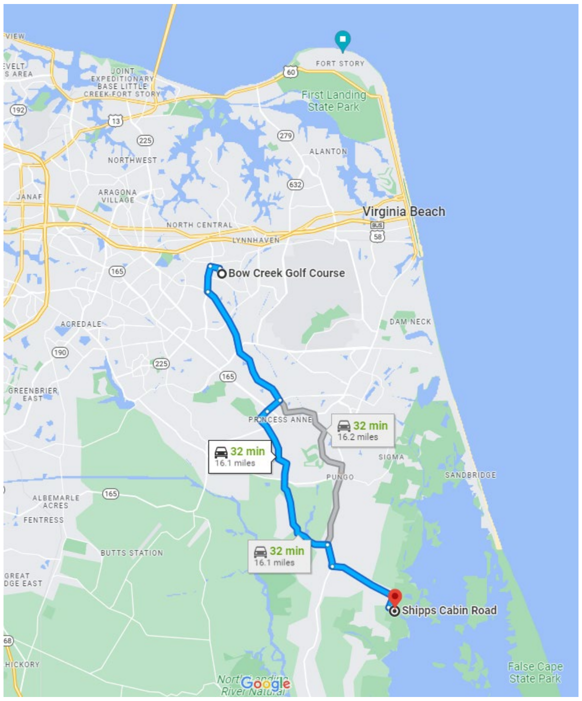

Figure 26: Distance from Bow Creek Golf Course to the proposed Shipps Cabin staging area.

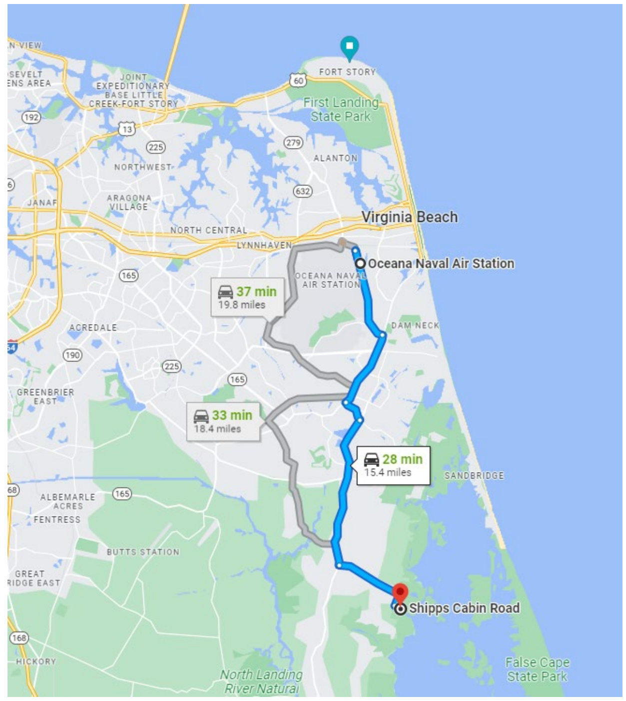

Figure 27: Distance from Whitehurst DMMA to the proposed Shipps Cabin staging area.

Bow Creek Golf Course: Bow Creek Golf Course is located approximately 16 miles from the proposed Shipps Cabin staging area. In the next few years, The Bow Creek Golf Course is scheduled to be converted into a Stormwater Park as one of 21 projects funded by the City's Stormwater Flood Protection Program. Large quantities of materials will be removed from the site for use within the City. The material from Bow Creek would need to be excavated, screened, and tested for foreign seeds and contaminants. Most likely, this material would have to be processed before it could be loaded again on dump trucks and hauled approximately 16 miles to a potential staging area where it would be loaded again on shallow draft barges.

Whitehurst DMMA: The Whitehurst DMMA is a similar distance to the proposed Shipps Cabin Road Construction Staging Area. The material at Whitehurst may not have to be processed as much; however, it would need to be tested for foreign seeds and contaminants. Because of the organic components in this soil and the need for the material to establish vegetation on the terraces, this material is not able to be hydraulically blended and pumped to the site. Therefore, this material would need to be loaded on shallow draft barges and then

placed by mechanical means. Further, the amount of material needed to cap the proposed terraces is approximately 110,000 cubic yards which equates to roughly 5,500 quad-axle dump trucks traveling city streets and damaging other infrastructure.

Barging of all materials was considered. Dewberry conducted meetings, site investigations, and talked with both industry leaders in maritime construction and locals who know the water in Back Bay. A typical 35-foot by 95-foot construction barge drafts approximately 7 feet. This type of barge is not able to be trucked to the landing site, nor is it able to be brought into Back Bay. There are truckable barges, but again the drafts of those barges can be in the 4 to 5 feet range when loaded and would require dredging a channel for access. Shallow draft barges can be used in Back Bay that only draft 1 to 3 feet, and they would need to be off-loaded from a staging site. To bring any materials such as stone, sandy fill, or terrace cap material by barge around Knotts Island is not feasible. The actual channel into the southern point of Back Bay has a height restriction due to the causeway serving Knotts Island.

Continuous Marsh Platform – Alternative 4

A continuous marsh platform to fill in the areas of historical marsh would help to restore this eroded habitat but would not provide conditions suitable for SAV establishment or optimize the wave/flow velocity attenuation through the project area. Furthermore, for a single marsh platform across Bonney Cove, the amount of material required would be more than 3 or 4 million cubic yards of material. To achieve that volume of material by dredging, significant areas of existing SAV present in Back Bay would need to be impacted. As the geotechnical report indicated, the existing material of the project site and surrounding areas is not capable of supporting itself in a constructed arrangement and would slough off back into the water. Further, providing this amount of material without dredging would require bringing external sediment sources into Back Bay, which could introduce invasive species. Finally, while the platform will reclaim marshland, it is not anticipated to establish extensive areas appropriate for SAV reestablishment and would eliminate deeper water areas preferred by some endemic wildlife species.

Goals and Objectives

The overarching goal of this project is to construct the City's first nature-based adaptation project in the Southern Rivers Watershed and one of the CRMP's exemplary nature-based projects. This project aims to stabilize two critically eroding marsh islands from further degradation, decrease turbidity to promote the growth of aquatic vegetation and provide flood risk reduction benefits through increased friction and wave attenuation. The following section summarizes the objectives through which this goal will be realized.

Objective 1 – Create a Construction Access and Staging Area

The project's first objective is to employ a construction approach that is compatible with the shallow nature of Back Bay and the large quantity of material required to build the marsh terraces. The engineering team performed a constructability review of suitable landing sites to

stage construction operations for the terraces. A property located at the end of Shipps Cabin Road (Figure 28) was identified as the preferred staging and construction access location for the following reasons:

- Shipps Cabin Road Construction Staging Area Proximity to site (2 miles).
- Shipps Cabin Road Construction Staging Area Proximity to sand borrow sources.
- Shipps Cabin Road between Muddy Creek Road and the Construction Staging Area is in disrepair and was identified as an opportunity to improve the condition of the road as part of the construction activities.

Figure 28: Proposed Construction Access.

On completion of the project, the City plans to retain the staging area for future monitoring and maintenance needs for the project. This future use is consistent with the sentiments of local stakeholders, as communicated during public engagement meetings for the study.

Expected Benefits:

- Enables constructability of the marsh terraces.
- Enable access to the project for post-construction monitoring and future marsh restoration projects.

Objective 2 – Restore Marsh and Aquatic Vegetation

The second objective of the project is to restore marsh and aquatic vegetation for habitat and flood resilience. Specifically, the City's construction of the marsh terraces will result in the restoration of approximately 46 acres of habitat within Back Bay, consisting of:

- 10 acres of low marsh habitat; low marsh plantings would include Big Cordgrass (*Spartina cynosuroides*) and Saltmarsh Cordgrass (*Spartina alterniflora*).
- 6 acres of high marsh habitat; high marsh plantings would include Black Needlerush (*Juncus roemerianus*) and Salt Meadow Hay (*Spartina patens*).
- 14 acres of upland vegetated habitat; upland vegetation would include Arrow-leaf Tearthumb (*Persicaria sagittate*), Groundsel Tree (*Baccharis halimifolia*), Wax Myrtle (*Myrica cerifera*), and Bald Cypress (*Taxodium distichum*).
- 16 acres of submerged terrace habitat anticipated to create suitable conditions for the emergence of SAV.

Additionally, approximately 310 acres of open water SAV habitat would remain between the proposed marsh terraces, and it is anticipated that construction of the terraces would create conditions within the project area favorable to the re-establishment of SAV populations.

Expected Benefits:

- Reduce wave heights, flow velocities, and wind sheer stress within the project area to protect marsh islands from continued erosion.
- Restore the natural buffer that helps protect low-lying neighborhoods and critical access roads from wind-driven flooding.
- Improved water quality by removing excess nutrients.
- Lowered transport of suspended sediment and prevention of resuspension of fine sediments in the water.
- Reduced flow velocity and absorbing wave/wind energy to reduce shoreline erosion.
- Creation of habitat (nursery and feeding areas) for fish (such as Largemouth Bass, Bluegill Yellow Perch, Striped, Blueback Herring, Alewife, and American Eel), migratory waterfowl (such as the Canvasback Duck [*Aythya vallisineria*]), and other aquatic animals.

Objective 3 – Engage Stakeholders and Disseminate Effective Practices

The City is committed to continued meaningful engagement with project partners and external stakeholders throughout the restoration and monitoring phases to ensure transferability to other sites in the region and state.

Expected Benefits:

- Ensure that the lessons from this project can be transferred and scaled to other sites in the state or region.

Approach, Milestones, and Deliverables

The following approach, milestones, and deliverables lay out a plan of action. The milestone schedule follows in *Section B: Milestone Schedule*.

Approach & Deliverables

Activity 1 – Construction Staging Area Preparation and Construction

Activity 1 involves preparing the Shipps Cabin Road property as a construction staging area. Construction activities will include stabilization of the road, laying geotextile to stabilize the ground under the construction staging area, filling with material for the construction staging area, adding fencing, creating bridge abutments and installing a temporary bridge and ramp for waterfront construction access, construction of slurry basins, and establishment of traffic flagging stations.

In the final step, the contractor will install pipe to pump the slurry material from the Shipps Cabin staging area to Bonney Cove. The pipe will be floated with subaqueous tie-downs at channels and certain points of access to maintain boat crossings. Those subaqueous locations will be marked by a buoy every 10 feet and temporary signage as reasonable. The contractor will install two booster stations along the alignment, one approximately half-way between the landing and Bonney Cove, and one at the edge of Bonney Cove. These booster stations will consist of a pontoon-mounted diesel engine pump capable of moving the sand slurry from the construction staging area to the site. It is estimated that 150 CY per hour of sand slurry would be pumped through the pipe in a 60:40 ratio. Additional booster stations may be required for manifolding and supplying slurry stations to individual terraces.

Relevant Objective(s): Objective 1

Deliverables:

- Conduct daily inspections to monitor construction progress of the Shipps Cabin Road Construction Staging Area preparation.

Assumptions:

- It is anticipated that the Shipps Cabin Road Construction Staging Area construction activities can occur simultaneously with material production in Year 1 (2024).

Activity 2 – Marsh Terrace Construction

Once the Shipps Cabin Construction Staging Area preparation is complete, marsh terrace construction activities can commence. The contractor will construct the terraces according to the 100% Final PS&E documents. The most recent engineering designs and design report are available upon request; they are not included as an attachment to this proposal due to file size. Figure 29 shows the overall layout of the terraces, and Figure 30 and Figure 31 show the project renderings. Terrace construction will begin in the northern extent of the project site at Terrace #100, noted in Figure 29, and the contractor will work south towards Terrace #140. The contractor will complete each terrace (including installation of plants) before moving onto the next.

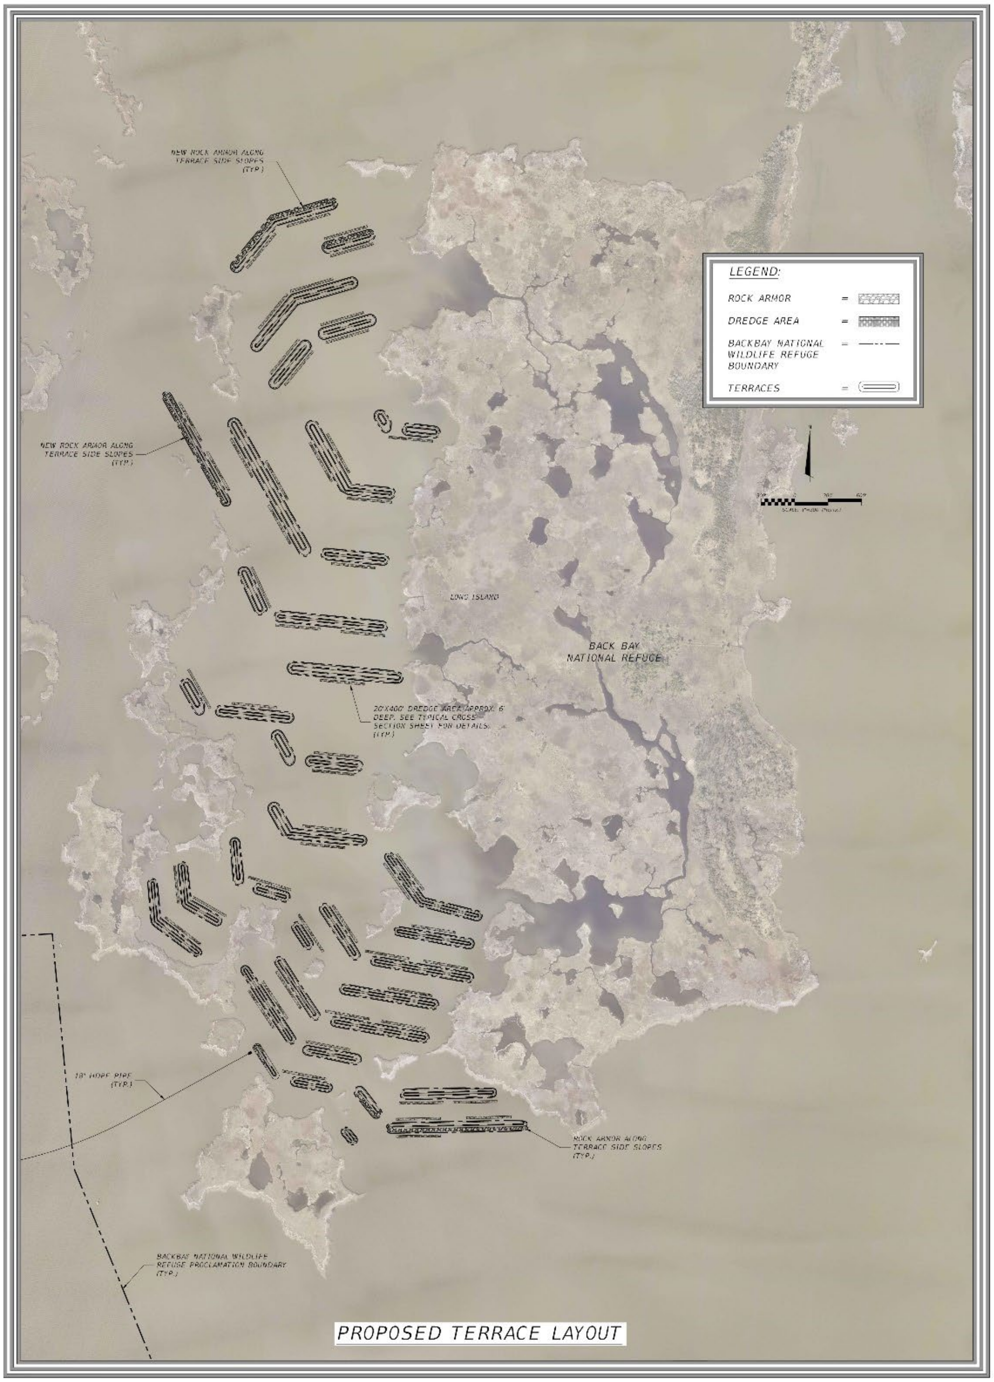

Figure 29: Marsh terrace layout across Bonney Cove.

Figure 30: Marsh terrace design rendering.

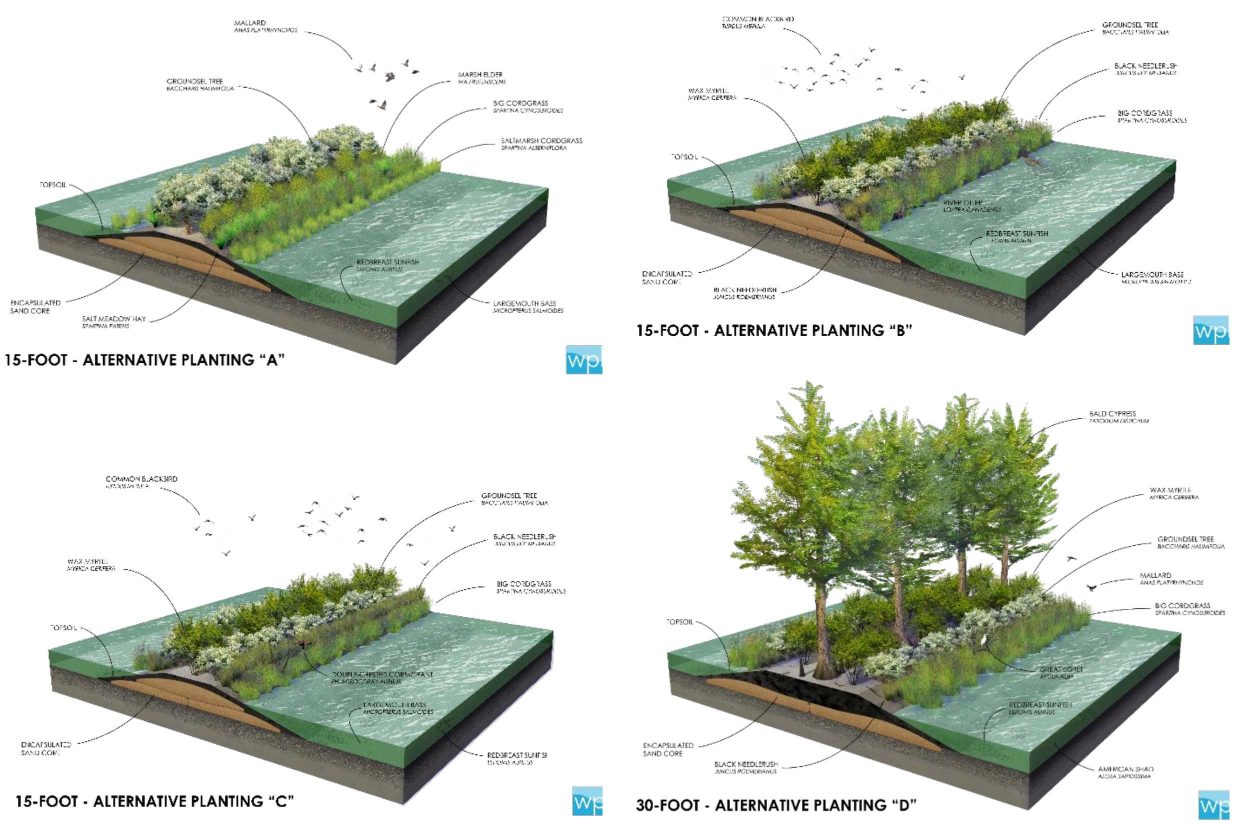

Figure 31: Marsh terrace cross-section design renderings.

The following section provides a high-level description of the proposed design and

construction approach.

Terrace Orientation:

The orientation of the terraces will be perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces in the northern extent of the project site will be angled perpendicular to a north-northwest wind direction. The terraces would be segmented in a chevron pattern (duck-wing pattern) to provide the most favorable fish and swimming crustacean (termed "nekton") habitat while also allowing adequate circulation to promote sedimentation and maintaining navigability throughout the project area. The terraces would not be connected to the adjacent marsh; this gap, or physical open water barrier, is intended to deter the invasion of Common Reed (*Phragmites australis*) stands from adjacent marshes.

Spacing:

The terraces would be spaced at approximately 300-foot intervals in the northern and southern quarters, and then 600-foot or greater intervals in the center. This arrangement aims to lessen the open water and subsequent wave action at the northern and southern ends of the site and allow adequate construction space for marine-based construction equipment.

Terrace Elevation and Width:

To achieve a sustainable marsh elevation throughout the project life, the marsh terraces would initially be built to a higher elevation during construction and allowed to settle to the desired target elevation over time. Taller terraces improve the functionality and resiliency of the system while also providing diversified habitat for fish and wildlife. The goal is that, by the end of the 30-year design life and with 1.5 feet of relative sea level rise, the terraces will be at or above the elevation of a moderate wind tide event (when Back Bay water levels are anticipated to reach +3.0 feet NAVD88 over the design water level). This threshold was determined to ensure the terraces would not be fully overtopped during a future wind tide event and maintain resiliency to anticipated sea level rise. The 1.5 feet sea level rise scenario is consistent with the near-term planning scenarios identified in the City's Resilience Plan to represent conditions from 2035 to 2050 and adopted by the Hampton Roads Planning District Commission (HRPDC) as part of resolution number 2018-01.

The terraces would have a top width of 15 or 30 feet and be built to an elevation of +4.5 to +5.0 feet NAVD88, depending on the width of the crest, underlying soils, and local bottom depth, with side slopes of 4 horizontal to 1 vertical (4H:1V). The +4.5- to +5.0-foot elevation is calculated based on a target elevation of +3.0 feet NAVD88 or higher at the end of the project's 30-year design life and an estimated settlement of approximately 1 to 2 feet, depending on where the terrace is located. The geotechnical investigation revealed that terraces in the site's southern portion are expected to experience greater settlement than those to the north.

Terrace Composition:

The terraces would consist of a sand-filled core that is encapsulated by a high-strength blend of woven and non-woven geotextile fabrics. The sand for this material will come from nearby offsite sources and be pumped through the 1-inch diameter pipe described in Activity 2. Once the cores are in place, long-reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Existing adjacent material devoid of SAV would be mechanically dredged and placed over the sand-filled cores. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths, and then planted with native emergent and brackish plant species to stabilize the terraces and provide wind-driven flood reduction benefits.

Relevant Objective(s): Objective 2

Deliverables:

- Conduct daily inspections to monitor construction progress of the marsh terraces.

Assumptions:

- It is anticipated that construction of the terraces will occur in two phases over two years from 2025 through 2026, with the following assumptions:
    - Construction activities are not permitted within BBNWR from October 31 through February 28, annually, to limit disturbance to wintering waterfowl and migration during those months.

Activity 3 – Stakeholder Engagement and Lessons-Learned Dissemination

As the first large scale terracing project on the Atlantic coast, the City recognizes the importance of documenting lessons learned and effective practices during each of the proposed activities: contractor procurement, construction, and post-construction monitoring. The City plans to develop a set of project marketing materials (PowerPoint presentations, StoryMap, information flyers, etc.) to cover key topics, such as:

- Lessons learned during contractor procurement, construction, and post-construction monitoring.
- Effective practices for contractor procurement, bid development, and evaluation. This project is expected to require a highly specialized contractor given the complexity of the project, very shallow water depths, and distance of the site from available construction access and staging areas.
- Guidance for identifying the best sources for local and regional materials for building the terraces and developing a project construction schedule with enough lead time for producing the quantity of material needed for large-scale marsh creation projects.
- Effective practices for developing a post-construction monitoring plan for marsh terraces that a) aligns with permitting, grant, and other requirements and b) enables quantification of project benefits and areas for improvement.

- Effective practices for communicating project benefits based on a combination of field data collection, numerical modeling, and post-construction monitoring.

The City plans to leverage the materials to facilitate dissemination to key stakeholders to increase likelihood of transferability of the approach to other areas in the region and state. The City's plan for engagement is summarized in the following table. In addition to these efforts, the City is committed to collaborating with DCR to identify any additional opportunities to help socialize the project's innovative design and lessons learned.

Table 8: Summary of opportunities for City, regional, state, and national stakeholder engagement; expected benefits.

	Description of Proposed Outreach Activities

CITY	• Facilitate internal municipal awareness, coordination, and approval to gain budgetary approval for funding to expand the approach to other sites in Back Bay (such as "The Great Narrows", Mackay Island and Princess Anne Wildlife Management Areas, and Ragged Island) through presentations to the:
	  o Virginia Beach City Council
	  o City Manager Working Group for SLR and Recurrent Flooding, comprised of representatives from all City departments, to facilitate awareness, coordination, and action to advance the project to the restoration phase.
	• City of Virginia Beach Management Leadership Team (MLT), which includes the City Manager, Deputy City Managers, and Department heads from across the City.

REGION	• Collaborate with the National Audubon Society and Albemarle-Pamlico National Estuarine Partnership (APNEP) to:
	  o Highlight the marsh terrace project as a success story in the next iteration of the Currituck Sound Coalition Marsh Conservation Plan.
	  o Explore opportunities for marsh terrace projects in the Knotts Island Channel, a key flood pathway into Back Bay, as well as other locations in the Currituck and Albemarle-Pamlico Sound.
	• Share lessons learned to regional and state stakeholders, improving knowledge-based, awareness, and capacity for future efforts through presentations to:
	  o Hampton Roads Adaptation Forum – a regional dialogue for academics, non-profits, consultants, and municipalities committed to resilience measures.
	  o The Hampton Roads Planning District Commission (HRPDC) Coastal Resiliency Committee .
	  o Regional conferences on green infrastructure, coastal resilience, and SLR adaptation.
	• Collaborate with Wetlands Watch, a regional non-profit organization committed to the protection of wetlands using nature-based solutions, to socialize the project and disseminate lessons learned.

	Description of Proposed Outreach Activities
STATE	• Continue to coordinate with the Virginia Department of Conservation and Recreation (DCR) to: o Promote the project as a success story for the State Coastal Master Plan (CRMP), which highlighted the project as an "exemplary" resilience project that aligns with the Commonwealth's objective to protect and enhance the state's natural infrastructure. o Incorporate project updates and lessons learned on the CRMP website is an excellent mechanism for dissemination to all coastal Planning District Commissions (PDCs)/Regional Commissions (RCs) across the state. • Continue to collaborate with The Nature Conservancy (TNC), a national player in guiding the implementation of nature-based strategies, to help disseminate lessons learned on project implementation. The City has engaged in early discussions with TNC about partnering to host a state-level workshop that would draw from the network of TNC's local and regional chapters • Presentations at state-level conferences on water resources, floodplain management, and resilience, such as hosted by Resilient Virginia and Virginia Lakes and Watersheds Association.
NATION	• Disseminate lessons learned/effective practices through presentations at 1-2 relevant national conferences such as Restore America's Estuaries, Association of State Floodplain Managers, or the American Shore and Beach Preservation Association, etc. • Leverage working relationships and existing contract work with the U.S. Army Corps of Engineers and partners to integrate lessons learned into the International Natural and Nature-Based Feature Design Guidelines to promote consideration of marsh terraces within similar Back Bay environments (for example, in North Carolina, Maryland, New Jersey, and New York).

Relevant Objective(s): Objective 3

Deliverables:

- Project marketing materials.
- Records documenting number of stakeholders engaged during outreach activities.

Activities Not Included Under this Grant

Submerged Aquatic Vegetation Transplant Plan: The City will evaluate opportunities for restoring native submerged aquatic vegetation populations in Back Bay, such as Wild Celery (*Vallisneria americana*), through consultations with subject matter experts. After terrace construction, the City will formulate a plan for planting submerged aquatic vegetation in between the terraces in coordination with identified partners and the construction contractor.

Post-Construction Monitoring: Post-construction monitoring and inspections will occur for a minimum of five (5) years following construction. Given the period of performance for the CFPF grant, post-construction monitoring activities have not been included in this application.

Milestone Schedule

The scope of work proposed in this grant application are scheduled to occur between June 2024 and June 2027. Work activities are anticipated to complete in December 2026; however, the proposed schedule extends through June 2027 for contingency. The project's expected progression is shown in the following milestone schedule, noting deliverables for each milestone:

2024 Activities

- *1st Quarter* ***(pre-grant period activities):***
  - 100% Final PS&E
  - Submit Bid Documents
- *2nd Quarter (pre-grant period activities):*
  - Final Bid Coordination/Acceptance
  - Construction NTP
- ***Begin Year 1 Grant Activities – 2nd Quarter 2024:***
  - Mobilization for Shipps Cabin Road Construction Staging Area
  - Initiation of Marsh Terrace Material Production
- *3rd Quarter:*
  - Construction NTP and Mobilization for Slurry Basin Installation
- *4th Quarter:*
  - Completion of Shipps Cabin Road Construction Staging Area and Slurry Basin Construction

2025

- *1st Quarter*
  - Completion of Marsh Terrace Material Production
  - Construction Mobilization for Marsh Terraces (beginning on March 1, 2025)
  - Oversight, Management, and Inspection Services of Slurry Basin Installation
- ***Begin Year 2 Grant Activities - 2nd Quarter 2025***
  - Construction of Marsh Terraces #100 – 105
- *3rd Quarter*
  - Construction of Marsh Terraces #106 – 114
- *4th Quarter*
  - Construction of Marsh Terraces #115 – 119
  - Marsh Terrace Construction Demobilization (to accommodate break in construction period from October 31, 2025 – February 28, 2026)

2026

- *1st Quarter*
  - Construction Re-Mobilization for Marsh Terraces (beginning on March 1, 2026)
- ***Begin Year 3 Grant Activities - 2nd Quarter 2026***

  - Construction of Marsh Terraces #120 – 134
- *3rd Quarter*
  - Construction of Marsh Terraces #135 – 140
- *4th Quarter*
  - Shipps Cabin Road Construction Staging Area Final Improvements & Demobilization

2027

- *1st and 2nd Quarter*
  - *Contingency for any delays experienced through end of 2026*

End Year 3 Grant Activities

Project Partners

The following table highlights the specific project partners, their roles, and their capabilities concerning the proposed project.

Table 9: Potential Project Partners.

Entity	Role	Description
U.S. Fish and Wildlife Service, Back Bay National Wildlife Refuge	Project Partner / Advisor / Adjacent Land Owner	BBNWR owns the land adjacent to the project footprint and monitors migratory bird hunting within Presidential Proclamation boundaries. BBNWR has coordinated with the City on project design and will continue to be involved during project construction as a stakeholder and advisor.
Virginia Department of Wildlife Resources	Project Advisory / Stakeholder	The City has coordinated closely with VDWR on project design. Furthermore, VDWR has been monitoring SAV distribution in Back Bay for decades and will be a critical partner for identifying native seagrass species and techniques for restoration based on extensive experience from previous SAV restoration projects in Back Bay.
Virginia Beach Department of Planning & Community Development	Permit Compliance	The City's Department of Public Works has been in close coordination with the City's Department of Planning & Community Development throughout the design and permitting process. Continued involvement and coordination during construction and post-construction monitoring is anticipated.
Dewberry	Engineering Contractor	Engineering consultant to support the City with contractor procurement and construction administration.
To be Determined	Construction Contractors	Construction contractor for the Shipps Cabin Road Construction Staging Area and marsh terrace construction activities.

Entity	Role	Description
Friends of Back Bay	Project Advisory / Stakeholder	Friends of Back Bay was formed in the 1980s to lead efforts to expand and conserve BBNWR, including securing millions in funding to support the Refuge's expansion. The City has coordinated with the BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay National Wildlife Refuge Society	Project Advisory / Stakeholder	The Back Bay National Wildlife Refuge Society (BBNWR Society) is an independent, 501(c)(3) non-profit group dedicated to supporting the mission of the USFWS National Wildlife Refuge System and specifically promoting awareness of the BBNWR through education and participation. The City has coordinated with BBNWR Society throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.
Back Bay Restoration Foundation	Project Advisory / Stakeholder	Back Bay Restoration Foundation (BBRF) is an independent, 501(c)(3) non-profit group focusing on growing concerns about issues such as recurrent flooding, sea level rise, and development in the Southern Rivers Watershed. The group aims to serve as an advocate for the Bay and surrounding residents. The City has coordinated with BBRF throughout the design and permitting process and will continue this coordination through construction and post-construction monitoring.

Relationship to Other Projects

This project represents the first nature-based project in the Southern Rivers Watershed to advance to design and construction to implement the City's Wise Resilience Plan. The project is also an aspect of the Stormwater Green Infrastructure aspect of the City's Flood Protection Plan. The City has received a $3M award from the CFPF to support another project in the Stormwater Green Infrastructure element of the Flood Protection Program – the Elizabeth River Wetland and Floodplain Restoration Project (Round 1 CFPF Grant Awards).

The City has also received two NFWF NRCF grants from the Marsh Restoration in Back Bay project. Approximately $135,000 in NFWF NRCF funding was awarded in 2020 for the previous phase (design and permitting) for the project. The City continues to meet the obligations and period of performance of this NFWF grant. In 2022, the NFWF NRCF awarded $9,886,400 to support construction activities.

In its Resilience Plan, Virginia Beach identifies an adaptation approach for the Southern Rivers Watershed that emphasizes natural mitigation methods and integrated systems of defenses. As a natural mitigation strategy, the marsh terrace project aims to serve as a first line of defense during flood events, reducing wind-driven fetch, wave energy, and flow velocities to protect the important marsh buffer surrounding the shorelines of Back Bay. Other projects are also needed to provide multi-layered flood protection to northern Back Bay communities (Figure 32). Several

of these projects are highlighted below. It should be noted that the projects described below are either not yet funded or will be funded in the future through the City's Capital Improvement Program.

Figure 32: Southern Rivers Watershed Adaptation Vision.

Marsh island restoration serves as a critical first line of defense of the multi-layered protection system in the Southern Rivers Watershed. The following map (Figure 33) shows the structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandbridge flood defense systems. The City's numerical modeling shows that, if implemented, there is potential for small increases in flooding outside of these structural protection systems.[14] This emphasizes the need for complimentary measures, including the marsh terrace project, land acquisition, and conservation efforts, to mitigate this residual risk.

[14] City of Virginia Beach (2020). City-wide Structural Alternatives for Coastal Flood Protection (PDF).

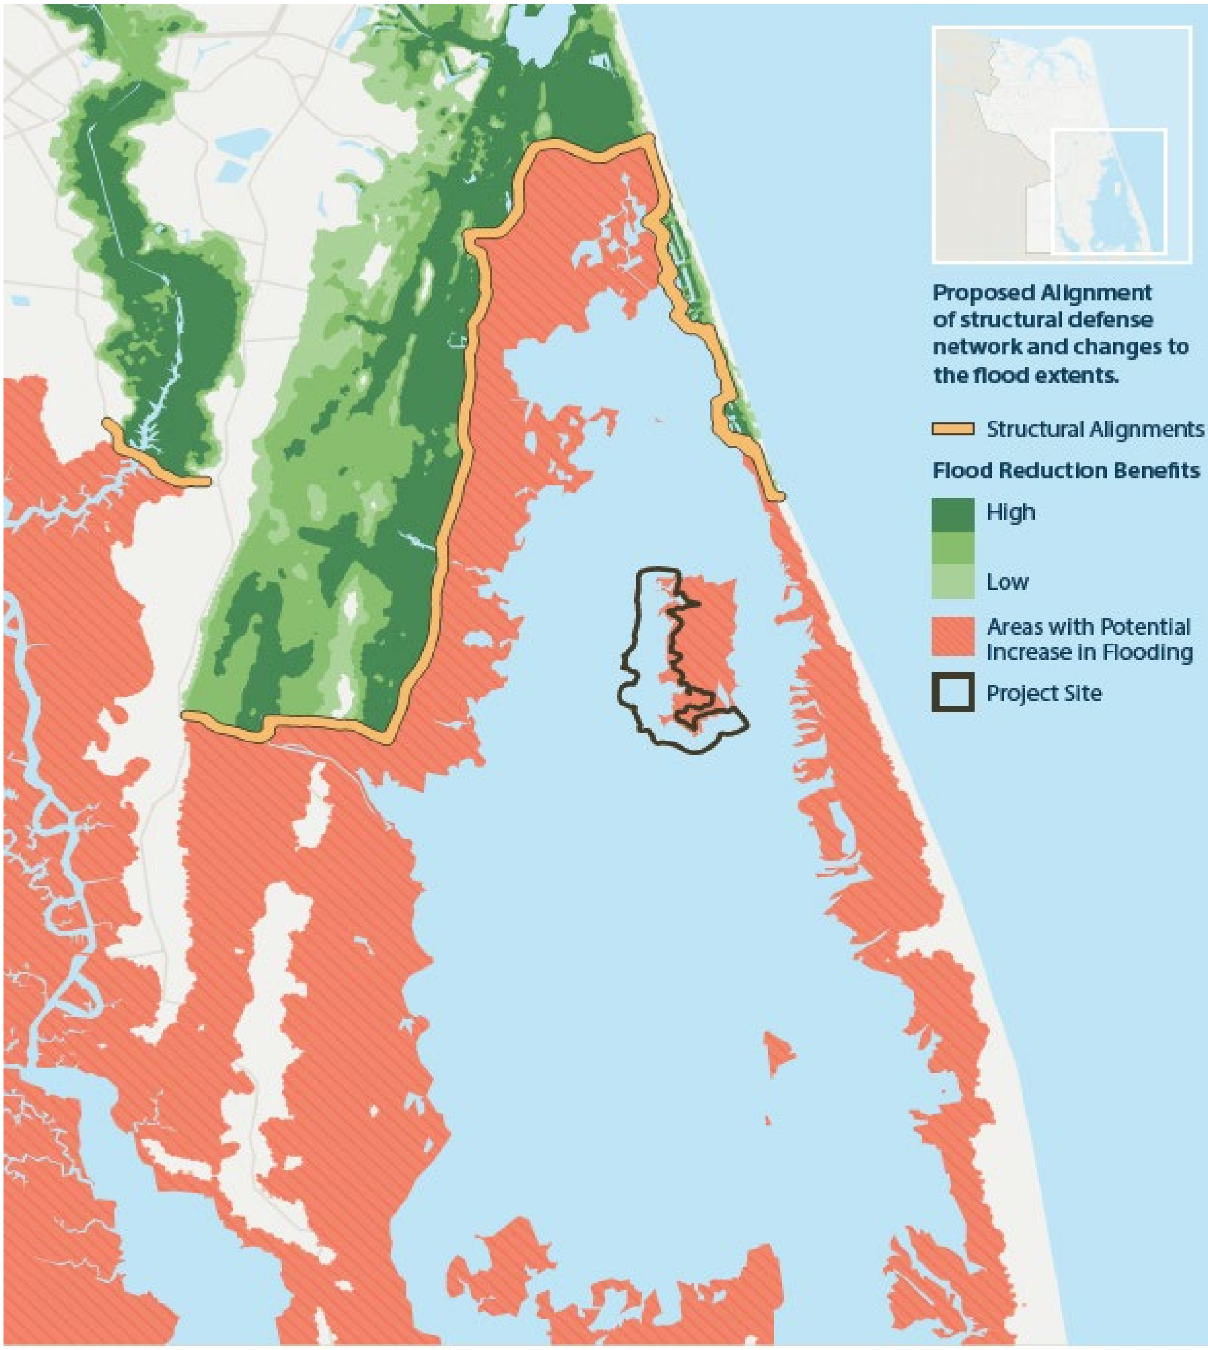

Figure 33: Structural adaptation projects proposed for the Southern Rivers Watershed, including the Muddy Creek Road and Sandridge flood defense systems.

Backside of Sandbridge Flood Defense System

Protection of the Sandbridge resort community from increasing coastal flood hazards would require a complex and expensive structural protection system because of the manufactured land configuration on the backside of Sandbridge. The proposed protection system includes elevating Sandbridge Road and constructing a network of seawalls, levees, and gates along the Back Bay shoreline of Sandbridge. This project does not have designated funding at this time.

Hell Point Creek Flood Defense System

As part of the integrated Sandbridge City-Wide flood defense network, a storm surge barrier across Hell Point Creek could block flood waters originating from Back Bay. Sandbridge Road would also need to be raised to ensure floodwaters could not flank the system. This project does not have designated funding at this time.

Sandbridge/New Bridge Intersection Improvements

Road and shoulder improvements are planned to increase safety at the New Bridge Road/Sandbridge Road intersection and reduce the need for road closures due to flooding from the adjacent Ashville Creek.

Muddy Creek Road Flood Defense System

Muddy Creek Road provides access to important rural and agricultural communities and Back Bay and the Wildlife Refuge. Muddy Creek Road is one of the lowest-lying roadways in all of Virginia Beach and frequently floods. This City-Wide Structural Alternative Flood Protection analysis identified this roadway as a critical location to provide flood protection. The proposed system, known as the Muddy Creek Road Alignment, would transform much of Muddy Creek Road into a levee, with the road on the top. The City's numerical modeling effort shows that the Muddy Creek Road Flood Defense System could potentially increase flood risk to the east of Muddy Creek Road, as shown in Figure 33. Therefore, the implementation of nature-based strategies suitable to the low-lying shorelines of Back Bay is essential to mitigate these impacts. This project does not have designated funding at this time.

Voluntary Acquisition Program

Virginia Beach City Council has recently funded a $2.0 million City-wide voluntary acquisition program to encourage flood-prone property owners to apply for a buyout. Parcels acquired by the City, in the Southern Rivers Watershed, would then be converted to open space to serve as flood storage and a marsh migration buffer.

Stormwater Master Plan

The City Council initiated an update of the City's Stormwater Master Plan in 2014. This effort is interchanging information with aspects of the City's Resilience Plan to account for the impact of sea level rise on the stormwater system's performance. Specific stormwater drainage improvement projects are included within the Lower Southern Rivers Watershed Drainage Basin.

Virginia Coastal Resilience Master Plan

The CRMP highlighted the marsh terrace project as an exemplary nature-based resilience project. The CRMP emphasizes Virginia Beach's strategic use of multiple funding streams to implement a large-scale nature-based project. DCR’s contribution to the project’s construction could be highlighted as a success story for implementation of the CRMP.

Audubon North Carolina Currituck Sound Coalition Marsh Conservation Plan

In coordination with Audubon North Carolina, the Currituck Sounds Coalition identified marsh restoration priorities based on criteria for siting restoration projects, including vulnerability to sea level rise, historic increase in surface water, and distance to hardened shorelines. This assessment identified Virginia Beach's marsh terrace project site as a high-priority area for restoration. There is an opportunity to highlight this project as a success story in the next iteration of the Audubon's Marsh Conservation Plan, which is slated to be updated every three years.

Maintenance Plan

Standard maintenance measures have been defined as part of the draft Annual Monitoring Plan and Post-Construction Monitoring Report developed for this project. See Attachment 5 for a copy of the draft report.

Subsequent to the monitoring period, project maintenance will be addressed by the City's Public Works Stormwater Operations Group, who will also respond to any maintenance issues identified by the monitoring effort or other observers. The City intends to maintain the construction staging area to support future project maintenance needs. The City will perform inspections every 2-5 years and make any repairs needed for the life of the project after completion of the initial monitoring program.

As described by the draft Annual Monitoring Plan and Post-Construction Monitoring Report, maintenance measures include the replacement of plantings (including upland, marsh and SAV plantings), the removal of debris from the terraces, the removal of invasive vegetation identified in the planting areas, the addition of sediment to eroding areas of the terraces, and the replacement of waterfowl barriers as necessary. In addition, structural maintenance measures that might be identified and prescribed during monitoring efforts include replacement of dislodged stones, addition of stone to address structure settlement, and general repair of sand cores or other structural elements. As proposed, these measures would become conditions of the wetland permits required for this project, in addition to standard commitments and requirements defined by the permitting agencies.

In addition to the commitments made in the monitoring plan, and those anticipated to be defined during the permitting process, it is the assumption that the placement of the proposed marsh terrace structures in state waters (subaqueous bottoms) will require the City to maintain the marsh terraces in perpetuity. As previously defined through coordination with VMRC, the City would obtain a compensable interest in the property that has been filled on top of state-owned subaqueous bottomlands (i.e. the terraces). As such, the City would be responsible for maintaining the proposed marsh terraces structures to ensure they fulfill their intended functions, as defined in the objectives and indicators of success previously defined in this proposal.

Criteria

The project receives a total score of **65 Points**. An explanation of how the project meets each

of the applicable scoring criteria contained in Appendix D is provided below.

Eligible Project (Type)

Category/Points: Wetland/floodplain restoration, Living shorelines and vegetated buffers (25 Points)

Explanation: Marsh terraces are considered a type of wetland restoration or a component of a living shoreline project:

- Wetland Restoration: Wetland restoration aims to reestablish or enhance natural wetland ecosystems. Marsh terraces can be constructed in areas where wetlands have been degraded or lost, and they help to recreation or support wetland functions. They provide habitat for various species, improve water quality, and can contribute to the overall health and resilience of a wetland ecosystem.
- Living Shoreline Project: Living shorelines are designed to protect shorelines from erosion while also promoting ecological and environmental benefits. Marsh terraces are often used as a component of living shoreline projects. They can serve as a buffer against wave action, stabilize shorelines, and create suitable habitat for marsh and aquatic species.

Social Vulnerability Index Score

Category/Points: Low Social Vulnerability (0 Points)

Explanation: Based on the Virginia Flood Risk Information System (VFRIS) Social Vulnerability Index Layer, the Social Vulnerability Index scores of the communities located in the two census block groups adjacent to Back Bay near the project site are -1.07 and -0.43 (an average of -0.75), which falls into the Low Social Vulnerability category.

Community Scale Benefits

Category/Points: More than one census block group (30 Points)

Explanation: As documented in the *Supporting Documentation - Project Information – Population* section of this document, the project is anticipated to benefit two census block groups (518100454.121 and 518100464.001).

Expected Lifespan of Project

Category/Points: Over 20 Years (10 Points)

Explanation: As documented in the *Supporting Documentation – Approach, Milestones, and Deliverables – Activity 3 (Marsh Terrace Construction)* section, the marsh terraces have a 30-year design life.

Budget Narrative

The following budget narrative details the proposed project expenditures. See Appendix B for completed budget spreadsheet.

Estimated Total Project Cost

The current estimated total project cost is **$53,378,490.** This estimate includes design, site acquisition for the construction staging area, construction, inspections and support, implementation, and contingencies, as shown in the below table. The design engineer's opinion of probable cost for construction is provided

Project Activity	Capital Improvement Program Estimate
Design	$276,800
Site Acquisition	$50,000
Construction	$41,839,900
Inspections and Support	$5,609,200
Implementation	$750,000
Contingencies	$4,852,590
Total:	$53,378,490

Funds Requested from the Fund

The City is requesting a total of **$5,000,000.00** in funding from the CFPF Round 4. These funds will support contractual services of the engineering consultant and construction contractor to execute Activity 2 (Construction Staging Area Preparation and Construction) and Activity 3 (Marsh Terrace Construction). No support is requested for City personnel.

These funds will be used to support ongoing construction activities through 2024-2026. Example activities include contractor construction services, mobilization/demobilization, construction staging area construction, slurry pipe installation, portions of the terrace materials, and waterfowl barriers. Construction costs are based on a detailed estimate from the design engineer that includes detailed breakdown of estimated quantities and costs from the 95% design package using industry standards for the anticipated aspects of the project construction. The City has withheld the detailed estimate as it provides information that would affect bidding on the construction.

Amount of Funds Available

The City as prime recipient is providing a cash match of $38,356,966 from funds fully programmed and available from the City's Flood Protection Program Capital Improvement Program to support the project. The Flood Protection Program is supported by a related bond referendum that provided $567.5M to fund more than 40 projects identified for Phase 1 of the Program. The program is tightly managed by the City, an independent contractor, and has a resident oversight board. The City is fully confident these funds will be available for constructing this project.

The City's dedicated funds will provide cash match to cover contractual services to support Activity 1 (Construction Staging Area Preparation and Construction), Activity 2 (Marsh Terrace Construction), Activity 3 (Stakeholder Engagement and Dissemination), and all related City support and direct overhead costs related for the project.

The National Fish and Wildlife Foundation is also supporting the project through two grant awards from the National Coastal Resilience Fund. This includes an initial award of $135,124 in 2020 for design and a second award of $9,886,400 in 2022 to support construction. The 2022 grant funds are dedicated to purchasing the native vegetation and a portion of the materials needed to build the marsh terraces.

A summary of project costs, funds available, and funds requested is provided below:

Item	Amount
Project Cost:	$53,378,490.00
Funding Sources Available	
NFWF Grant:	$10,021,524.00
CFPF Grant Request:	$5,000,000
City Funds Available:	$38,356,96600
Total Project Funding:	**$53,378,490.00**

Authorization to Request for Funding

Please refer to *attachment* for the documentation authorizing the funding request.

RE: Virginia Beach Resilience Plan Second Submission - CFPF

Dear Ms. Utterback:

Thank you for the resubmission of the Sea Level Wise Adaptation Plan for City of Virginia Beach. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on July 31, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Four watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy with discrete projects identified.

Projects focused on flood control and resilience include:

Neighborhood	Flood Control Project
Elizabeth River	City-wide alignment, living shoreline, marsh restoration, land conservation
Lynnhaven	Chesapeake Bay alignment, Lesner Bridge Neighborhood alignment (East & West), beach & dune nourishment, ecological revetments, shellfish reef restoration, seagrass restoration
Oceanfront	Atlantic Oceanfront alignment, Rudee Heights alignment
Southern Rivers	West Neck Creek city-wide alignment, Muddy Creek Road city-wide alignment, Sandbridge city-wide alignment

**additional projects listed within the Sea Level Wise Adaptation Strategy.*

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

    a. Nature-based infrastructure: Flood mitigation projects throughout the city incorporate nature-based solutions and were identified for maximum use within specific watersheds.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**
    a. All parts of a locality: Locality divided into four watersheds, covering the entirety of the jurisdictional boundary.
    b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented.
    c. Demographic Analysis: Demographic and Population Vulnerability Analysis conducted by Dewberry and incorporated into the Plan.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**
    a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.
    b. Clearly articulated timeline or phasing for plan implementation: Program phases clearly articulated and described in detail—Impact assessment, Adaptation research, Strategy development, and Long-term implementation.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**
    a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into strategic approach.

VA DCR looks forward to working with you as you work to make Virginia Beach a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

INTER-OFFICE MEMORANDUM

DATE: November 1, 2023

TO: Patrick A. Duhaney, City Manager

FROM: Stuart McCrery, Budget and Policy Analyst KJ for SM

SUBJECT: Application for Virginia Community Flood Preparedness Fund Grant

---

The Department of Public Works is requesting permission to apply for the Virginia Community Flood Preparedness Fund Grant from the Virginia Department of Conservation and Recreation. The Virginia Community Flood Preparedness Fund was established in the 2020 session of the General Assembly. Money in this fund comes from the auction of carbon allowances through the Regional Greenhouse Gas Initiative. It was established to provide support to localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change.

Public Works is requesting a total of $5,000,000 to construct marsh terraces in Back Bay to promote wetland restoration and mitigate frequent flooding. The City has already made significant investments into this project through CIP project 100551 "Stormwater Green Infrastructure."

This grant also requires a local match of 30% for projects that implement nature-based solutions; however, the City has more than met this requirement through its current appropriations to CIP project 1000551 "Stormwater Green Infrastructure" which currently total over $49 million from the Referendum and other grant awards.

Budget & Management Services recommends this grant application for approval. Please indicate approval or disapproval below. Applications are due by November 12, 2023.

Approve 11/1/2023 (Date) | Disapprove (Date)

RE: Community Flood Preparedness Fund – Marsh Terrace Creation, Back Bay

The proposed project is located in both open water and a Federal Emergency Management Agency (FEMA) mapped Special Flood Hazard Area (SFHA). Hydraulic modeling analysis identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwater through key pathways within Back Bay. This project aims to stabilize two critically eroding marsh islands that serve as a key flood pathway into northern Back Bay, promote the growth of aquatic vegetation, and provide flood risk reduction benefits to communities in the surrounding area. Within the two census block groups that would benefit from this project, there are 113 repetitive loss and severe repetitive loss properties.

If I can provide any further information or assistance, please call me at 757-385-4621, or e-mail me at wmcnamar@vbgov.com.

Sincerely,

Whitney McNamara

Re: Virginia Community Flood Preparedness Fund Grant

Grantors:

The Back Bay Restoration Foundation (BBRF), is a 35 year-old non-profit watershed organization, founded in 1986 by a group of local citizens concerned about deterioration of the Back Bay watershed visible then through decreases in Submerged Aquatic Vegetation (SAV), fish, and waterfowl. BBRF is the only voice solely dedicated to conserving and improving Virginia Beach's two Southern Watersheds; namely, the Back Bay and North Landing River watersheds. Our efforts focus on education, stewardship and outreach to conserve the largest watersheds in Virginia Beach. We team with other non-profits, and city, state and federal agencies to work toward best solutions for the future of the Back Bay and North Landing River watersheds. BBRF strives to raise awareness, addressing issues that negatively affect these watersheds such as sea level rise, land subsidence and land use changes.

Back Bay is a historical, nationally significant, watershed. With the Back Bay National Wildlife Refuge (NWR) and significant State conservation lands at its core, the watershed was recognized as an Aquatic Resource of National Importance (ARNI) in 2008 by both the US Fish and Wildlife Service and the US Army Corps of Engineers. Back Bay is a wind-tidal oligohaline estuary and is located at the northern tip of the Albemarle/Pamlico estuarine system, the second largest estuarine complex in the United States. The Albemarle/Pamlico estuarine system was designated as an Estuary of National Significance in 1987 and selected to be studied as part of the Environmental Protection Agency's National Estuary Program. Back Bay is a shallow-water aquatic ecosystem with an average depth of four feet. Winds can influence the water depth by as much as three feet.

BBRF supports the City of Virginia Beach's application for Round 4 of VADCR's Community Flood Preparedness Fund. We were strong advocates of the City's successful applications to the National Fish and Wildlife Foundation (NFWF), and have seen what they accomplished with the initial NFWF funding they received. With the combined funding of NFWF, the City of Virginia Beach, and this application for DCR funding, their project of creating a Marsh Terrace Network to Achieve Restoration and Flood Resilience has overachieved by any measure. From community engagement and the NEPA process to conceptual and preliminary designs as described in the recent Army Corps Public Notice, the City has been productive and completely transparent.

As noted above, the City's community engagement and partnerships with organizations like ours has been transparent and resulted in broad support. Although the current project is localized in its first application, we expect the results will significantly mitigate SLR, land subsidence and wind tides in Back Bay. Similarly, this restoration will provide the biotic building blocks to maintain the watershed's national importance for wildlife. The innovative designs proposed will inform future projects at the landscape level. Although innovative, we believe the project is technically sound based on BBRF's 35 years of experience in habitat restoration.

Please feel free to contact us for further information.

Virginia Beach, VA 23456

October 30, 2023

Wendy Howard Cooper
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Dear Ms. Cooper,

The City of Virginia Beach is proposing to install marsh terraces in the waters of Back Bay adjacent to Back Bay National Wildlife Refuge. This project is expected to reduce wave energy and thus decrease the speed of erosion of remaining islands in the project area, many of which are managed by the U.S. Fish and Wildlife Service and provide habitat for migratory birds and other species. Additionally, the addition of multiple vegetative structures added to the bay will supplement habitat and provide nesting grounds for multiple species.

The mission of the U.S. Fish and Wildlife Service is *working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people*. Although much work is conducted on federal property to achieve this mission, the Service equally coordinates with external partners to further mutual goals. The proposed marsh terrace project is an excellent example of local and federal government coordination, and we support the City of Virginia Beach's proposed project.

Division of Dam Safety and Floodplain Management
600 E. Main St., 24th Floor
Richmond, VA 23219

Dear Wendy,

The Albemarle-Pamlico National Estuary Partnership (APNEP) strongly endorses the City of Virginia Beach and partners' application to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). The proposal is to support construction of the Back Bay Marsh Terrace Restoration Project.

APNEP relies on regional partnerships and collaboration to implement our 2012-2022 Comprehensive Conservation & Management Plan (CCMP) within the waterways of our congressionally designated "estuary of national significance." The proposed partnership between the City of Virginia Beach and the U.S. Fish and Wildlife Service will also advance our 2020 Memorandum of Understanding between Virginia and North Carolina to protect the ecosystem resources in the shared waterways between our two states. The project also addresses a "high priority" area for restoring and enhancing vulnerable marshes with high flood risk reduction benefits and habitat value, as identified by Audubon's Currituck Sound Coalition Marsh Conservation Plan released in 2021.

The marsh terrace project employs the use of natural features to build resilience to flooding in the Back Bay watershed. The project offers coastal resilience and habitat protection and conservation co-benefits including preserving marsh islands, restoring Submerged Aquatic Vegetation, migratory bird and fish habitat, reducing flow that could exacerbate wind tide flooding in local communities, and filling a gap in prior applied research on predominantly fresh water coastal lagoons. These features support the following CCMP actions:

- A2.3: Support research on adapting to impacts associated with climate change and sea level rise.
- C3.2: Develop and implement a coordinated wetland restoration strategy.
- C3.3: Develop and implement a submerged aquatic vegetation (SAV) restoration strategy.
- D3.3: Provide assistance to state, regional, and local governments to incorporate climate change and sea level rise considerations into their planning processes.

In closing, we strongly support the full funding of the City of Virginia Beach's proposal to Round 4 of The Virginia Community Flood Preparedness Fund (CFPF). Please contact Steve Anderson, Partnership Coordinator, at (919) 707-8743 with questions.

Sincerely,

W. Crowell

Attachment 5: Copy of the Current Floodplain Ordinance

ORD-3685

AN ORDINANCE TO AMEND SECTIONS 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, AND 6.3 OF APPENDIX K, FLOODPLAIN ORDINANCE OF THE CITY CODE PERTAINING TO HOUSEKEEPING THE DELETION OF PUBLIC WORKS REQUIREMENTS AND THE ADDITION OF A COASTAL A ZONE AND A COASTAL HIGH HAZARD ZONE

Sections Amended: 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance

WHEREAS, the public necessity, convenience, general welfare and good zoning practice so require;

BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF VIRGINIA BEACH, VIRGINIA:

That Sections 1.1, 1.2, 1.3, 1.8, 2.1, 2.2, 2.3, 2.4, 2.8, 2.11, 3.1, 4.1, 4.2, 4.3, 4.4, 4.6, 4.8, 4.9, 4.10, 5.1, 6.1, and 6.3 of Appendix K, Floodplain Ordinance is hereby amended and reordained to read as follows:

APPENDIX K FLOODPLAIN ORDINANCE

ARTICLE I. GENERAL PROVISIONS

Sec. 1.1. Statutory authorization and purpose.

A. This ordinance is adopted pursuant to the authority granted to localities by Code of Virginia § ~~10.1-600 et seq~~ 15.2-984.

B. The city council finds the purpose of these provisions is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development that, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;
3. Requiring all uses, activities, and developments that do occur in flood-prone districts be protected or flood-proofed against flooding and flood damage;

4. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards; and

5. Acknowledging that the tide data over the last one hundred (100) years shows that Virginia Beach is facing an increased danger of flooding caused by both sea level rise and subsidence<u> and has adopted the Sea Level Wise Adaptation Report as part of the Comprehensive Plan</u>.

Sec. 1.2. Applicability.

These provisions shall apply to all privately and publicly owned lands within the jurisdiction of the City of Virginia Beach and identified as areas ~~of special flood hazard~~ <u>at risk of flooding by the City of Virginia Beach or shown</u> ~~according to~~ <u>on </u>the Flood Insurance Rate Map (FIRM) <u>or included on the flood insurance study (FIS)</u> that ~~is~~ <u>are</u> provided to the City of Virginia Beach by the Federal Emergency Management Agency (FEMA) and dated January 16, 2015 ~~or identified as floodplains subject to special restrictions in section 4.10 of this ordinance~~.

Sec. 1.3. Definitions.

. . . .

City manager. The City Manager of the City of Virginia Beach, or his designees.

<u>*Design Flood Elevation (regulatory flood protection elevation)*. The base flood elevation plus the freeboard required by this ordinance.</u>

. . . .

Recreational vehicle. A vehicle that is:

1. Built on a single chassis;
2. Four hundred (400) square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light duty truck; and
4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

~~*Regulatory flood protection elevation (design flood elevation)*. The base flood elevation plus the freeboard required by this ordinance.~~

. . . .

Sec. 1.8. Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this ordinance or directions of the ~~d~~Directors of ~~p~~Planning ~~or public works~~ or any authorized employee of the City of Virginia Beach shall be guilty of the appropriate violation and subject to the penalties therefore. Any violation of the provision of this ordinance shall be punishable by a fine of not more than one hundred dollars ($100.00). Each person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this ordinance is committed.

The Virginia Uniform Statewide Building Code (VA USBC) addresses building code violations and the associated penalties in ~~section 104 and section 115~~ VA USBC § 104 and § 115. Violations and associated penalties of the Zoning Ordinance for the City of Virginia Beach are addressed in § 104 of the Zoning Ordinance.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this ordinance. The imposition of a fine or penalty for any violation of, or noncompliance with, this ordinance shall not excuse the violation or noncompliance or permit it to continue, and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered, or relocated in noncompliance with this ordinance may be declared by the City of Virginia Beach to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this ordinance.

ARTICLE II. ADMINISTRATION

Sec. 2.1. Designation of the floodplain administrator.

The City Manager of the City of Virginia Beach is hereby appointed the floodplain administrator to administer and implement this ordinance. The floodplain administrator has delegated the duties and responsibilities set forth in this ordinance to the ~~departments of public works and planning, as specified below~~ Department of Planning and Community Development.

Sec. 2.2. Duties and responsibilities of the ~~department of public works~~ floodplain administrator or his designee.

The duties and responsibilities of the ~~department of public works~~ floodplain administrator of his designee shall include but are not limited to:

A. Interpreting floodplain boundaries and providing available base flood elevation and flood hazard information;

B. Verifying that applicants proposing an alteration of a watercourse have notified adjacent communities, the department of conservation and recreation (division of dam safety and floodplain management), and other appropriate agencies (Virginia Department of Environmental Quality (VADEQ), United States Army Corps of Engineers (USACE), etc.) and have submitted copies of such notifications to FEMA;

C. Advising applicants for new construction or substantial improvement of structures that are located within an area of the coastal barrier resources system established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures; areas subject to this limitation are shown on FIRMs as coastal barrier resource system areas or otherwise protected areas;

D. Submitting to FEMA, or requiring applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six (6) months after such data and information becomes available if the analyses indicate changes in base flood elevations;

E. Maintaining and permanently keeping records that are necessary for the administration of these regulations, including:

1. ~~flood~~ Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and

2. Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

F. Notifying FEMA when the corporate boundaries of the City of Virginia Beach have been modified and:

1. Providing a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to this ordinance has either been assumed or relinquished through annexation; and

2. If the FIRM for any annexed area includes SFHAs that have flood zones with regulatory requirements that are not set forth in this

ordinance, prepare amendments to this ordinance to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended ordinance shall be provided to the department of conservation and recreation (division of dam safety and floodplain management) and FEMA.

G. Upon the request of FEMA, completing and submitting a report concerning participation in the NFIP, which may request information regarding the number of buildings in the SFHA, the number of permits issued for development in the SFHA, and the number of variances issued for development in the SFHA.

H. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;

I. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;

J. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;

K. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;

L. Granting administrative variances pursuant to section 6.1 of this ordinance;

M. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;

N. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;

O. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;

P. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;

Q. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and

R. Administering the requirements related to proposed work on existing buildings:

1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and

2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

S. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and

T. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those

hazards have been specifically delineated geographically (e.g., via mapping or surveying).

~~Sec. 2.3. Duties and responsibilities of the department of planning.~~ Reserved.

~~The duties and responsibilities of the department of planning shall include but are not limited to:~~

~~A. Reviewing applications for permits to determine whether proposed activities will be located in the SFHA;~~

~~B. Reviewing applications to determine whether proposed activities will be reasonably safe from flooding and requiring new construction and substantial improvements to meet the requirements of this ordinance;~~

~~C. Reviewing applications to determine whether all necessary permits have been obtained from the federal, state, or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the SFHAs of free-flowing non-tidal waters of the state;~~

~~D. Approving applications and issuing permits to develop in flood hazard areas if the provisions of this ordinance have been met, or disapproving applications if the provisions of this ordinance have not been met;~~

~~E. Granting administrative variances pursuant to section 6.1 of this ordinance;~~

~~F. Inspecting, or causing to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with this ordinance or to determine if non-compliance has occurred or violations have been committed;~~

~~G. Reviewing elevation certificates and requiring incomplete or deficient certificates to be corrected;~~

~~H. Maintaining and permanently keeping documentation supporting the issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been flood proofed, and other required design certifications, variances, and records of enforcement actions taken to correct violations of this ordinance;~~

~~I. Enforcing the provisions of this ordinance, investigating violations, issuing notices of violations or stop work orders, and requiring permit holders to take corrective action;~~

~~J. Advising the city council regarding the intent of this ordinance and, for each application for a variance, preparing a staff report and recommendation; and~~

~~K. Administering the requirements related to proposed work on existing buildings:~~

~~1. Making determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged; and~~

~~2. Making reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.~~

~~Sec. 2.4. Shared duties and responsibilities.~~ Reserved.

~~The duties and responsibilities shared by the departments of public works and Planning shall include but are not limited to:~~

~~A. Undertaking, as determined appropriate by the floodplain administrator due to the circumstances, other actions that may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other federal, state, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in SFHAs; and assisting property owners with documentation necessary to file claims for increased cost of compliance coverage under National Flood Insurance Program (NFIP) flood insurance policies; and~~

~~B. It is the duty of the city floodplain administrator to take into account flood, mudslide, and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g., via mapping or surveying).~~

. . . .

Sec. 2.8. Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain administrator. Should a dispute arise concerning the boundaries of any of the districts~~, the city council shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the city council and to submit his own technical evidence if he so desires~~ a surveyor shall provide either an elevation certificate or recent survey showing topographic elevations and delineating the Special Flood Hazard Area.

. . . .

Sec. 2.11. Appeals to decisions made by the floodplain administrator.

It is further provided that any decision of the floodplain administrator or his designee may be modified, reversed, or affirmed by the city council upon appeal by any aggrieved party to such decision, if such appeal is filed with the floodplain administrator within thirty (30) days of such decision through the application for a Floodplain Variance outlined in Section VI of this ordinance.

ARTICLE III. ESTABLISHMENT OF FLOODPLAIN DISTRICTS

Sec. 3.1. Description of floodplain districts.

A. Special flood hazard areas (SFHA). The SFHAs shall include land in the floodplain subject to a one (1) percent or greater chance of being flooded in any given year. The basis for the delineation of these districts shall be the FIS and the FIRM for the City of Virginia Beach prepared by FEMA, Federal Insurance Administration, dated January 16, 2015, and any subsequent revisions or amendments thereto.

The boundaries of the SFHAs are established as shown on the FIRM, which is declared to be a part of this ordinance and shall be kept on file at the City of Virginia Beach Department of ~~Public Works~~ Planning and Community Development, and include the following districts:

1. The Floodway District is in an AE Zone and is delineated, for the purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one (1) percent annual chance flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this district are specifically defined in Table 7 of the above-referenced FIS and shown on the accompanying FIRM.

2. The AE or AH Zones on the FIRM accompanying the FIS shall be those areas for which one (1) percent annual chance flood elevations have been provided and the floodway has not been delineated.

3. The A Zone on the FIRM accompanying the FIS shall be those areas for which no detailed flood profiles or elevations are provided, but the one (1) percent annual chance floodplain boundary has been approximated.

4. The AO Zone on the FIRM accompanying the FIS shall be those areas of shallow flooding identified as AO on the FIRM.

5. ~~Reserved.~~ The Coastal A Zone on the FIRM accompanying the FIS shall be those areas labeled as AE and are located seaward of the limit of moderate wave action (LiMWA) line.

6. The VE or V Zones on FIRMs accompanying the FIS shall be those areas that are known as coastal high hazard areas, extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storm or seismic sources.

B. ~~Floodplain subject to special restrictions~~ *Local Flood Hazard Areas*. The City of Virginia Beach may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas are ~~identified in section 4.10 and may be delineated on a map using best available topographic data and locally derived information such as flood of record, historic high water marks, or approximate study methodologies~~ identified as follows:~~.~~

a. *Other areas of flood risk*. The X and the X(Shaded) Zone on the FIRM where the City of Virginia Beach Stormwater Master Plan has identified areas, outside SFHAs delineated on the FIRM, that area susceptible to flooding. The most recent updated version of the modeling shall be used to identify areas that are likely to experience flooding.

b. *Floodplain Subject to Special Restrictions*. The Floodplain Subject to Special Restrictions is identified in section 4.10 and includes areas in the southern part of the city which are characterized by wind tides, low topography, and poorly draining soils.

ARTICLE IV. FLOODPLAIN DISTRICT PROVISIONS

Sec. 4.1. Permit and application requirements.

. . . .

B. Site plans and permit applications. All applications for development within any floodplain district and all building permits issued within ~~the~~ any floodplain district shall incorporate the following information:

1. For any addition, conversion of any non-habitable space to habitable space, or the construction or installation of a new accessory structure that requires a building permit.

   a. A physical survey, performed after the effective date of the FIRM that:

      i. accurately depicts current improvements on the property;
      ii. provides a flood zone determination and BFE or flood depth at the stie; and
      iii. delineates the location of the flood zones on the property.

   b. For structures located in the SFHA delineated on the FIRM, a current elevation certificate sealed by a licensed design professional.

2. For new construction and any substantial improvement of the principal structure:

   a. a proposed site plan sealed by a registered design professional that provides:

      ~~1~~i. The elevation of the base flood at the site;

      ~~2~~ii. The elevation of the lowest floor (including basement) or, in V Zones, the lowest horizontal structural member;

      ~~3~~iii. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed; and

      4iv. Topographic information showing existing and proposed ground elevations.

Sec. 4.2. General standards.

. . . .

5. Electrical, heating, ventilation, plumbing, air conditioning equipment, and other service facilities, including duct work, shall be designed and/or ~~located so as to prevent water from entering or accumulating within the components during conditions of flooding~~ or above the design flood elevation.

6. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

7. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

8. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

9. No use shall be permitted if such use will increase the amounts of potentially damaging materials, including those likely to be injurious to health, that might be transported in floods.

10. For properties located in SFHAs delineated on the FIRM, an elevation certificate and, if applicable, a flood-proofing certificate shall be provided to the Floodplain Administrator prior to any foundation inspection, final inspections, and the issuance of any certificates of occupancy, in order to assure compliance with these floodplain regulations.

11. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream within the city, a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.

12. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

~~B. In all SFHAs, the following additional provisions shall apply:~~

~~1. Prior to any proposed alteration or relocation of any channels or of any watercourse or stream, within the city a permit shall be obtained from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the department of conservation and recreation (division of dam safety and floodplain management), other required agencies, and FEMA.~~

~~2. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.~~

3. ~~Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune, other than for the purpose of conducting the activities specified in section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.~~

Sec. 4.3. Elevation and construction requirements.

In all ~~SFHAs where base flood elevations have been provided in the FIS or generated by a licensed professional in accordance with section 4.6 of this ordinance~~ floodplain districts, with the exception of Coastal A and Coastal High Hazard (VE) zones, the following provisions shall apply:

A. Residential construction requirements. ~~New construction or substantial improvement of any residential structure or manufactured home in Zones AE, AH, and A with detailed base flood elevations shall have the lowest floor, including basement, elevated to a minimum of two (2) feet above the base flood level.~~ The lowest flood, including basement, shall be set to the higher of the following:

   i. A minimum of two (2) feet above the base flood elevation established on the most recent FIRM or by the most recent FIS or,

   ii. A minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. Non-residential construction requirements. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as ~~minimum of two (2) feet above the base flood level~~ established in Section 4.3 A of this ordinance. Buildings ~~located in AE or AH Zones~~ may be flood-proofed in lieu of being elevated provided that all areas of the building components below the ~~elevation corresponding to the base flood elevation plus a minimum of two (2) feet freeboard~~ design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

C. ~~Space below the lowest floor requirements. In Zones A, AE, AH, and AO,~~ ~~f~~Fully enclosed areas of new construction or substantially improved existing structures that are below the ~~regulatory~~ design flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door), limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the ~~regulatory~~ design flood ~~protection~~ elevation.

3. Space below the lowest floor of SFHAs delineated on the FIRM shall ~~I~~include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings shall either be certified by a professional engineer or architect licensed by the Commonwealth of Virginia or meet or exceed the following minimum design criteria:

. . . .

Sec. 4.4. Floodway requirements.

. . . .

B. The placement of new or replacement manufactured homes (mobile homes) is prohibited.

~~C.~~ ~~The following uses and structures may be permitted in the floodway district, subject to the requirements of articles III, IV, V, and VI of this ordinance:~~

~~1.~~ ~~Public and private outdoor recreational facilities;~~

~~2.~~ ~~Agricultural uses, including farming, grazing, and the raising of poultry or livestock; provided, that poultry or livestock shall not be housed within five hundred (500) feet of any residential, apartment, or hotel district;~~

~~3.~~ ~~Open uses, such as public and private roadways, off street parking, or loading and unloading areas related to uses in adjoining districts;~~

~~4.~~ ~~Commercial mining, soil removal, and sand pits subject to regulations applicable to extractive industries as set forth in the conditional use provisions of the Zoning Ordinance of the City of Virginia Beach;~~

~~5.~~ ~~Public improvements, such as dams, levees and channel improvements, and utilities installations and substations, including temporary storage of materials, except flammable, toxic or noxious materials, and temporary location of maintenance installations; and~~

~~6.~~ ~~Uses and structures customarily accessory and clearly incidental and subordinate to uses listed above, including in connection with agricultural uses; roadside stands for the sale of agricultural products produced on the premises; provided that:~~

~~a.~~ ~~Only one (1) such stand shall be permitted per lot;~~

~~b.~~ ~~No such stand shall exceed five hundred (500) square feet in floor area; and~~

~~c.~~ ~~No such stand on the street frontage shall be erected within twenty (20) feet of the property line.~~

. . . .

Sec. 4.6. A Zone requirements.

. . . .

B. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development and to determine the base flood elevation. When such base flood elevation data is utilized, the lowest floor shall be elevated to minimum of two (2) feet above the base flood level. During the permitting process, the floodplain administrator shall obtain:

1. The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

2. If the structure has been flood-proofed in accordance with the requirements of this ordinance, the elevation (in relation to NAVD88) to which the structure has been flood-proofed.

~~C.~~ ~~When the data is not available from any source, the lowest floor of the structure shall be elevated to not less than two (2) feet above the highest adjacent grade.~~

Sec. 4.8. ~~Reserved~~ X and X(Shaded) Zone requirements. (Other Areas of Flood Risk).

A. *Residential construction requirements*. The lowest floor, including basements, shall be set to a minimum of one (1) foot above the 100-year HGL elevation measured at the nearest existing or proposed public drainage structure or BMP, in the City Stormwater Master Plan.

B. *Non-residential construction requirements*. New construction or substantial improvement of any commercial, industrial, or non-residential building or manufactured home shall have the lowest floor, including basement, elevated as established in Section 4.8 A of this ordinance above. Buildings may be flood-proofed in lieu of being elevated provided that all areas of the building components below the design flood elevation are watertight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A professional engineer or architect licensed by the Commonwealth of Virginia shall certify that the standards of this subsection area satisfied. Such certification, including the specific elevation (in relation to NAVD88) to which such structures are flood proofed, shall be maintained by the building official.

Sec. 4.9. – Coastal High Hazard (~~V and~~ VE Zone) requirements.

The following provisions shall apply within ~~V and VE Zones~~ Coastal A Zones and Coastal High Hazard Areas:

A. All new construction and substantial improvements, including to manufactured homes, shall be elevated on pilings or columns so that:

1. The bottom of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) is elevated to a minimum of ~~two~~ three (~~2~~3) feet above the base flood ~~level~~ elevation; and

2. The pile or column foundation and structure attached thereto is anchored to resist flotation, collapse, and lateral movement due to the effects of wind and water loads acting simultaneously on all building components. Wind and water loading values shall each have a one (1) percent chance of being equaled or exceeded in any given year.

B. A professional engineer or architect licensed by the Commonwealth of Virginia shall develop or review the structural design, specifications, and plans for the construction and shall certify that the design and methods of construction to be used are in accordance with accepted standards of practice for meeting the provisions of article IV, section 4.6 A. A V Zone

Design Certificate shall be submitted to Permits and Inspections with plans for a building permit.

. . . .

I. ~~The man-made alteration of sand dunes, which would increase potential flood damage, is prohibited.~~ Sand dunes, barrier beaches, and other natural protective barriers shall remain intact to provide protection against wind, waves, and erosion drainage. Any person who desires to use or alter any coastal primary sand dune or beaches, other than for the purpose of conducting the activities specified in Article 1600, Section 1602 of the Zoning Ordinance of the City of Virginia Beach, shall first obtain a permit, or authorization, from the USACE, VADEQ, the Virginia Marine Resources Commission, and the Wetlands Board through the joint permit application process.

J. Manufactured homes are prohibited.

Sec. 4.10. Floodplain subject to special restrictions.

A. All ~~FIRM delineated~~ SFHAs that ultimately drain to Back Bay or the Currituck Sound ~~located in the following areas~~ shall be identified as a floodplain subject to special restrictions~~:~~.

~~1. North Landing River and its tributaries south of Lynnhaven Parkway;~~

~~2. West Neck Creek and its tributaries south of Shipps Corner Road, London Bridge Road, and the portion of Dam Neck Road east of its intersection with London Bridge Road; and~~

~~3. Bays, creeks, lakes, guts, coves, wetlands, marshes and swamps and their tributaries comprising the Back Bay and Small Coastal South watersheds south of South Birdneck Road and east of Princess Anne Road and General Booth Boulevard.~~

B. The following provisions shall apply within the floodplain subject to special restrictions:

1. Notwithstanding any provision of this ordinance to the contrary, no filling shall be permitted, including filling with material excavated from the same floodplain except for:

a. The purpose of public roadway or other similar public works construction undertaken by the Department of Public Works or Virginia Department of Transportation, or their agent for

construction. This construction includes flood protection and flood mitigation projects;

b. The maintenance, alteration, or relocation of bona fide agricultural ditches, swales, or agricultural pathways or those ditches required for proper lot drainage;

c. For shoreline stabilization or maintenance projects, such as riprap revetment, bulkheads, or other treatment used to stabilize and protect the banks of waterways, the city manager or his designee may approve the placement of fill provided the following criteria are met:

i. A joint permit application is submitted;

ii. The alignment of the stabilization structure is along the escarpment or in line with adjacent stabilization structures; ~~and~~

iii. If there is an existing shoreline stabilization structure, any proposed replacement structure shall be no more than six (6) inches higher than the existing structure; and

~~iii~~iv. Fill must be the minimum necessary to support the stabilization project.

2. The city manager, or his designee, may approve the placement of fill provided that the following criteria are met:

a. Proposed fill within the floodplain:

i. Shall be mitigated to result in no decrease in flood storage volume on the site;

ii. Shall be mitigated entirely on the same site that will incur the fill;

iii. Shall be contiguous to the existing floodplain that is being filled; and

iv. Shall be limited to the smallest amount of area and volume possible to correct irregularities within the boundary of the project.

b. The combined areas of fill and mitigation shall not exceed five (5) percent of the total area within the floodplain located on the site that will incur the fill.

3. Residential dwelling structures shall not be located within the floodplains subject to special restrictions on lots created after October 23, 2001. Residential dwelling structures located in ~~local flood hazard areas as of~~ a SFHA and constructed prior to October 23, 2001 may be expanded with attached additions to a total footprint of less than one thousand (1,000) square feet; such additions shall also comply with the requirements set forth in article V of this ordinance.

. . . .

ARTICLE V. EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 5.1. Existing structures.

A structure or use of a structure or premises that lawfully existed prior to the adoption of this ordinance, but which is not in conformity with this ordinance, may be continued subject to the following conditions:

A. Any existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion or enlargement would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain ~~areas~~ district to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC and meet the freeboard height in effect at the start of construction for the original structure.

C. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, in any floodplain ~~area~~ district to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this ordinance and shall require the entire structure to conform to the VA USBC.

ARTICLE VI. VARIANCES AND APPEALS

Sec. 6.1. Administrative variances.

The floodplain administrator shall approve or deny an application requesting an administrative variance after receipt of a complete application. Administrative variances may only be granted for the following uses, development, or redevelopment:

A. As defined in section 4.10, floodplains subject to special restrictions, for filling only.

B. Any structure or use sustaining damage not caused by flood to an extent or amount of fifty (50) percent or more of its market value to allow the structure to be rebuilt to the freeboard height in effect at the start of construction for the original structure. If the structure is a pre-FIRM structure, full compliance with the current VAUSBC freeboard above the base flood elevation is required. Structures that are utilizing an approved land management plan for their on-site waste disposal may be allowed to continue the use of the land management plan as long as it is approved by the city and the health department, even for damage or destruction resulting from flood.

C. As defined in section 4.8 B, X and X(Shaded) Zone requirements. (Other Areas of Flood Risk), and 4.3 A(ii) when the required finished floor is higher than the BFE plus two feet of freeboard, where the floodplain administrator, in consultation with the Development Services Center, has determined that the proposed stormwater engineering design will approximately mitigate any impacts to the finished floor of the nonresidential development.

Sec. 6.3. Application process.

A. Applications for variances from the requirements of this ordinance shall be made to the city council and filed with the director of planning. The fee for such applications shall be ~~six hundred fifty dollars~~ seven hundred eighty ($~~650~~780.00). Such fee shall include all costs of notifications and advertising. Except in cases in which such fee is waived, the director shall not accept any application not accompanied by payment of the required fee. The procedure for the advertising, hearing and determination of applications for floodplain variances shall be in accordance with the requirements pertaining to applications for subdivision variances, as set forth in section 9.4 of the subdivision ordinance. In cases in which a variance application is filed by reason of a natural disaster that is the subject of a federal declaration of emergency, application and associated advertising fees shall be waived and such application shall be given expedited processing to the maximum practical extent.

B. All applications shall be accompanied by the following:

1. A separate map, on a 1″ = 100′ or greater scale, identifying all proposed land disturbance, including fill and mitigation areas, and the limits of the existing and proposed SFHAs, tidal and non-tidal wetlands, Southern Rivers Watershed Management Area Buffer, and CBPA Resource Protection Area Buffer; and

2. A preliminary floodplain study addressing the physical and environmental characteristics of the floodplain located on adjoining properties and in the general area. Such study shall be sufficient to show that the variance, if granted, will meet the standards defined in section 6.~~3~~<u>4</u> and in addition thereto, shall:

    a. Contain supporting data and calculations <u>required for a Preliminary Stormwater Engineering Analysis</u> as appropriate~~,~~ ~~given the preliminary nature of the floodplain study~~;

    b. Comply with the Public Works Design Standards Manual; and

    c. Be certified by a professional engineer, architect, surveyor, landscape architect or practitioner of a related field having a valid license issued by the Commonwealth of Virginia or who is exempt from licensure pursuant to applicable provisions of the Virginia Code.

Adopted by the Council of the City of Virginia Beach, Virginia, on the 1st day of February, 2022.

LIST OF TABLES

INTRODUCTION

This project is intended to implement one of the nature-based projects proposed in Virginia Beach's "Sea Level Wise" (SLW) Adaptation Strategy[1] adopted by the Virginia Beach City Council in June 2020. The SLW Adaptation Strategy presents a holistic framework for addressing flood risks across the City, consisting of four general strategies – natural mitigations, engineered defenses, adapted structures, and prepared communities. These strategies were applied to each major watershed in the City and tailored to their unique characteristics and risk profiles. The adaptation vision for the Lower Southern Rivers Drainage Basin, where the proposed project is located, focuses on employing natural mitigation methodologies to strategically reduce flow into and within Back Bay, along with an integrated system of defense structures and complementary adaptation measures, such as land-use strategies, to improve flood storage and overall coastal resiliency. The Bonney Cove area of Back Bay, where the project site is proposed, is particularly suitable for the use of nature-based strategies given the low elevations of marshlands and documented historic degradation of habitat. Participants at the 'near-neighbor' public engagement meetings held during the SLW Adaptation Strategy development were supportive of these types of strategies.

The City has several dedicated Capital Improvement Program (CIP) initiatives for the Lower Southern Rivers Drainage Basin for implementation of these strategies. The City's Stormwater Green Infrastructure CIP has obligated approximately $421,700 in contracts to support field investigations, environmental assessments, and engineering designs of the project – a true indication of the City's commitment to nature-based approaches and the critical first step in a broader effort. During the General Election on November 2, 2021, Virginia Beach residents voted to authorize $567.5 million dollars in debt to fund the design and construction of 21 Phase 1 projects in the citywide Flood Protection Program. [2] The Back Bay Marsh Terrace project is included under the Stormwater Green Infrastructure Master Project.[3] Other Southern Watershed projects that received funding under the Flood Protection Program include the West Neck Creek Bridge City-Wide Sea Level Rise Strategy, the Pungo Ferry Road Improvements, and the Sandbridge/New Bridge Intersection Improvements projects.

Outside of this project, the Virginia Beach City Council has recently funded a $5.2 million dollar voluntary acquisition program to encourage flood-prone properties to apply for a buyout to enable the City to convert parcels to open space to serve as flood storage and a marsh migration buffer. The City's

[3] Stormwater Green Infrastructure Page: https://www.vbgov.com/government/departments/public-works/flood-protection-program/Pages/Stormwater-Green-Infrastructure-.aspx

Stormwater Green Infrastructure CIP is also supporting the implementation of other natural and nature-based projects across the City, including a wetland and floodplain restoration project along the Eastern Branch of the Elizabeth River.

An assessment of restoration opportunities in the City's Lower Southern Rivers Drainage Basin with dual flood reduction and habitat restoration benefits identified the Bonney Cove area as a potential project site for several reasons. The Bonney Cove site has experienced significant historical ecological degradation. Historical shoreline data from 1869 indicates approximately 50% of present-day open water in Bonney Cove (260 acres) was previously marsh (Figure 1). Loss of the marsh island habitat within Bonney Cove has resulted in the opening of a secondary channel allowing increased flow exchange between the upper and lower bays. In comparison to shore-adjacent restoration, off-shore marsh restoration leveraging hydraulic modeling identified Bonney Cove as a location where marsh restoration has the potential to reduce the propagation of floodwaters through key pathways within Back Bay. The United States Fish and Wildlife Service (USFWS) and the Virginia Department of Wildlife Resources (VDWR) also identified Bonney Cove as a restoration priority as this area serves as an ideal location for Submerged Aquatic Vegetation (SAV) reestablishment and vital habitat for migratory birds and fish.

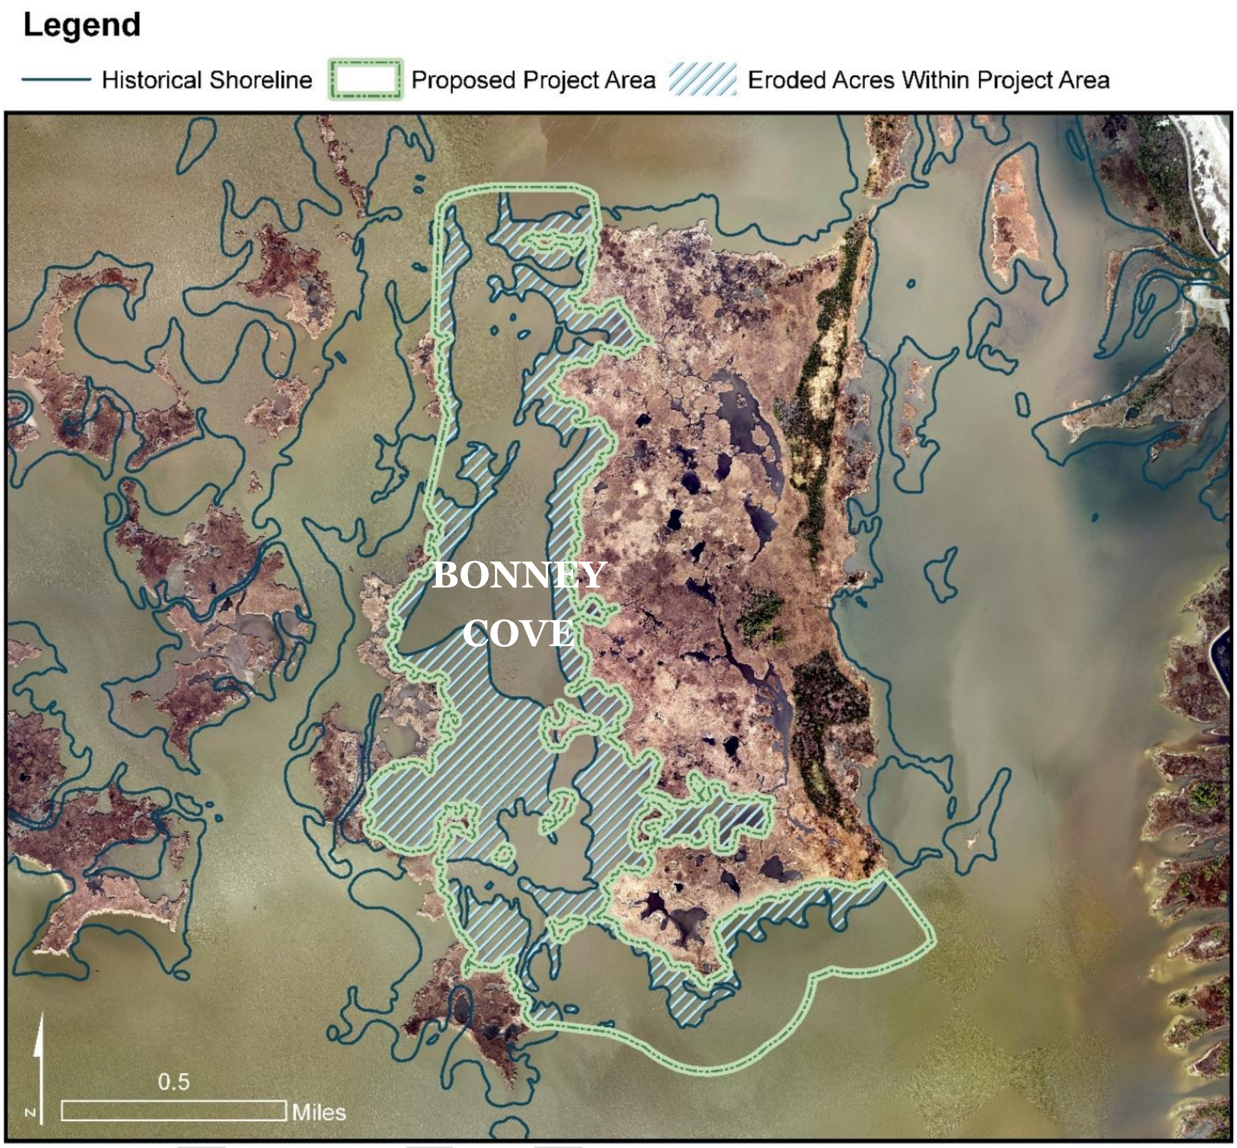

Figure 1: Historical marsh erosion within the project area.

The project is situated within the Bonney Cove area of Back Bay, spanning the western and southern lengths of Long Island, as shown in Figure 1.

Project Background

Marsh island restoration through terracing was identified as a particularly viable solution given Back Bay's shallow bottom and the historical loss of habitat. The marsh terraces are narrow man-made islands that will be arranged across areas that were historically marsh but are now shallow open water. A series of these islands, or terraces, are typically arranged in a chevron pattern. The overall field of terraces dissipates waves and slows down water moving through the area. In turn, the calmer water allows more sunlight to penetrate to the shallow bottom, promoting establishment and growth of marsh

and SAV habitats. Further, as opposed to one continuous marsh platform, marsh terraces maximize habitat for a variety of fish and wildlife species.

The Preferred Alternative includes the creation of 41 individual marsh terraces totaling approximately 25,000 linear feet (or an approximately 47-acre footprint) across Bonney Cove. These 47 acres of terraces are comprised of approximately 13 acres of emergent (low and high marsh) vegetated habitat, 14 acres of upland vegetated habitat, and 16 acres of submerged terrace habitat. Approximately 310 acres of suitable SAV habitat will remain in between the terraces.

Terrace Construction and Orientation

Terrace construction will begin in the northern extent of the project site, and the contractor will work towards the southern extent of the site. The contractor will complete each terrace, including installing plants, before moving to the next. Marsh terrace construction will occur over two years (2025 to 2026) and will pause annually between October 31st and March 1st to limit disturbance to wintering waterfowl and migration, in accommodation of BBNWR's requirement. Approximately 20 terraces will be constructed in 2025 ("Phase 1"), and 21 terraces will be constructed in 2026 ("Phase 2"). The following sections summarize the proposed design and construction approach.

Terraces will be generally oriented perpendicular to the predominant wind direction (south-southwest) to maximize wave energy reduction. The terraces will be segmented in a chevron (duck-wing) pattern to create the most favorable fish and swimming crustacean (termed "nekton") habitat, facilitate adequate circulation, and maintain navigability throughout the project area. The terraces will not be connected to the adjacent marsh to maintain a physical open water barrier to deter the invasion of Common Reed (*Phragmites australis*) stands.

The terraces will be spaced at approximately 300-foot intervals in the northern and southern quarters and span 15 feet in width, and at least 600-foot intervals in the center and span 30 feet in width. This arrangement will lessen the amount of open water and subsequent wave action at the northern and southern ends of the site and provide space for marine-based construction equipment. The design team reviewed the final spacing layout of the terraces to ensure navigability of a watercraft through the project site which will be required for post-construction monitoring, any needed maintenance, as well as community recreational access.

The terraces would consist of a sand filled core encapsulated by a high-strength blend of woven and non-woven geotextile fabrics ("geobags"). The sand for this material would need to come from offsite sources. Back Bay is too shallow to accommodate conventional barges for material placement. To avoid extensive impacts to the bottom of the bay, the slurry basin will pump sand for the project from the proposed Shipps Cabin Road staging area to Bonney Cove. The slurry pipeline will consist of approximately 10,424 linear feet of 12" diameter HDPE fused/welded pipeline that will be assembled on land and floated into its proposed alignment within Back Bay. The pipe would be marked by floats

every 5 feet and temporary signage as reasonable. It is anticipated the pipeline will be submerged to the bottom of the bay at channel crossings and adjacent to a duck hunting cabin adjacent to the alignment. By establishing a floating pipeline, it will limit disturbances to the subaqueous bottomlands along the alignment and allow for the retraction of the pipeline during the winter inactive periods and inclement weather events. Booster stations would be placed approximately every mile. These booster stations would consist of a pontoon mounted diesel engine pump capable of moving the sand slurry from the laydown area to the site. Given the distance to the site, four or five of these booster stations are anticipated to be necessary to create the sand cores of the terrace. It is estimated that 450 Gallons Per Minute (GPM) of sand slurry would be pumped through the pipe.

Once the cores are in place, long reach excavators would travel along the tops of the terraces and begin to shape the cross slopes. Appropriate materials for establishing vegetation atop the terraces will be primarily sourced from materials dredged during the Sandbridge Road Nimmo Parkway Phase VII-A project located immediately north of Back Bay (VMRC 15-1564, USACE IP NAO-2015-00151). Materials will be tested and screened to remove organics prior to application to the terraces. As needed, dredging sites adjacent to the proposed terrace locations that are confirmed to be devoid of SAV will be utilized to provide supplemental soil materials to top the proposed terraces[4]. It was determined that the in-situ bay sediment would be suitable for vegetation growth. The marsh terraces would be covered with 1 to 3 feet of suitable fill, depending on crest widths. Jute netting will cover the topsoil to control erosion and promote vegetation establishment. Coir logs will be places along the terrace slope controls to further promote vegetation establishment along the slope.

SAV Plantings

The City has partnered with Virginia Polytechnic Institute and State University ("Virginia Tech") to evaluate opportunities for restoring populations of native Wild Celery (*Vallisneria americana*) in Back Bay. The Virginia Tech research team has developed an innovative technique to grow Wild Celery in an aquaculture center that results in larger, mature plants that can better withstand Back Bay's turbidity. Once transplanted, plants are surrounded by cages to prevent predation. These founder colonies can be used for propagation throughout Back Bay. After terrace construction, the City will transplant Wild Celery in an area adjacent to the site. This founder colony will be used to strategically transplant Wild Celery in between the terraces for 5 years after construction (2026 – 2029) with the ultimate goal of establishing 10 acres of SAV vegetation in between the marsh terraces.

[4] The 60% preliminary design showed preliminary siting of these dredge areas based on avoidance of existing SAV habitat; however, pre-construction surveys of SAV would be required to re-delineate these dredging areas.

Terrace Plantings – Upland and Marsh Vegetation

The terraces' intertidal perimeter will be planted with appropriate emergent estuarine plant species (e.g., Saltmarsh Cordgrass [*Spartina alterniflora*] and Salt Meadow Hay [*Spartina patens*]) and brackish plant species (e.g., Big Cordgrass [*Spartina cynosuroides*]). These plants will be installed as soon as possible after construction to stabilize planting areas and protect the terrace from erosion. In addition to emergent grass, woody growth (i.e., shrubs and trees) within the terrace crest will be incorporated to protect the terraces' surfaces from rain and wind erosion and hold the landform together through substantial root systems.

Appropriate native species were identified based on the review of the reference marshes surrounding the project site and a review of water levels in Back Bay. Since the Bay's water levels are not affected by lunar tides and instead by wind-driven fluctuations, the project team evaluated average water elevations at the U.S. Geological Survey (USGS) Beggars Bridge Creek Gauge (Gauge ID 0204300267) from 2016 – 2021 to determine ranges of inundation to achieve functional marsh elevations throughout the project life, defined as:

- *Mean Low Water (MLW)*: the average low water at the site (10th Percentile: -0.62 ft NAVD88)
- *Mean High Water (MHW)*: the average high water at the site (95th Percentile: 1.22 ft NAVD88)
- *Mean Tide Level (MTL)*: halfway between MLW and MHW (0.3 ft NAVD88)
- *Upper Limit of Wetlands (ULW)*: approximately 1.5 times the mean tide range at the site (2.76 ft NAVD88)

These elevations were correlated to suitability for low marsh, high marsh, and upland species, as shown in Table 1.

Table 1: Proposed planting elevation zones.

Planting Zone	Definition	Elevation Range	Elevation (feet NAVD88)	Percentage of record where water reaches these elevations
Low Marsh	Marsh that is flooded frequently but exposed sometimes	MTL - MHW	0.3 – 1.2 ft	48%
High Marsh	Marsh that is generally only flooded during higher-than average water conditions	MHW – ULW	1.2 to 2.8 ft	7%
Upland Habitat	Habitat that is rarely flooded, only during extreme conditions	> ULW	> 2.8 ft	0%

Five planting schemas were identified to provide the highest possible environmental benefit in terms of erosion control, habitat diversity, and fetch reduction. The wider (30-foot) terraces will be planted with Bald Cypress (*Taxodium districhum*) trees capable of withstanding rising water levels. The full list of species and quantities is provided in the 95% design plan set.

The final engineered design component is the strategic placement of rock on the exposed perimeter terraces on the project site's north, west, and southern extents. The need for the rock armor was determined through analysis of wind data both from NOAA and ASCE-7-10 50-year return period anticipated 3-second gust values. These values were used to calculate fetch-generated waves at the project site. The calculations performed confirmed that armored protection would be required to protect the proposed terraces from the forces created by wave action. The stone sizes required for these features (Class II rip rap) were calculated following the procedures laid out in the USACE Coastal Engineering Manual (CEM) and Virginia Institute of Marine Science (VIMS) Living Shoreline Design Guidelines for Shore Protection in Virginia's Estuarine Environments. Two calculation methods, Hudson (1974) and Van Der Meer (1988), from the CEM were utilized to evaluate the range of acceptable rock armor for the exposed perimeter. These two methods calculate the armor stone size based on several design inputs including initial wave height, allowable damage level, revetment slope, and breaking versus non-breaking waves. The two methods often result in corresponding values that are used by the engineer to make an experienced determination on the final rock armor sizing. The rock armor will serve as a nature-based design element by acting as a substrate for the Wild Celery grass that has proven to be successful for SAV establishment in Back Bay (see Figure 2).

Monitoring Goals and Objectives

Annual post-construction monitoring of the site is required by the Virginia Marine Resource Commission (VMRC) (TBD) Permit (VMRC #XXXX-XXXX) and the U.S. Army Corps of Engineers (USACE) Individual Permit (NOA-20XX-XXXXX). [Insert details of the relevant permits and permit conditions]. The following goals, objectives, and metrics were established to enable consistent tracking of the primary living shoreline project components across each monitoring year.

1. **Monitoring Goal 1**: Establishment of a Sustainable Coastal Marsh Island System
   a. Objective 1a: Establish Emergent Marsh Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of emergent marsh vegetation. There should be no significant signs of herbivory or invasive species establishment.

   b. Objective 1b: Establish Upland Habitat
      - Metric: For each monitoring year, the project area should maintain or increase the overall coverage of upland vegetation. There should be no significant signs of herbivory or invasive species establishment.
2. **Monitoring Goal 2**: Stability of Marsh Terraces
   a. Objective 2: Marsh Terrace Structures
      - Metric: For each monitoring year, the terrace structures should show no significant signs of damage, deterioration or extreme settlement.
3. **Monitoring Goal 3**: Establishment of a Sustainable SAV Community
   a. Objective 3: Establish SAV Communities

- Metric: For each monitoring year, the SAV planting areas should maintain or increase the overall coverage of SAV vegetation. There should be no significant signs of herbivory or invasive species establishment.

MONITORING PLAN

The monitoring plan includes stakeholders, a schedule for the annual monitoring inspections, the monitoring strategy/sampling plan, and approach for addressing any needs for maintenance.

Monitoring Stakeholders

An Environmental Scientist from Dewberry Engineers Inc. will perform the annual monitoring inspections and provide a copy of the monitoring report to the City of Virginia Beach, USACE, VDEQ, VMRC, and the City of Virginia Beach Wetlands Board as necessary. As owners of the project, the City of Virginia Beach will review monitoring recommendations and perform corrective actions as necessary.

Annual Inspection Schedule

Monitoring inspections should be conducted annually, during the peak growing season, which is defined by VMRC as between June and August. To enable consistent tracking of project performance from year to year, annual monitoring inspections will be conducted prior to the end of the growing season in September of each year, with annual reports to be submitted to regulatory stakeholders prior to November 30th [or an annual date defined in the permit conditions] of each year. The following outlines the monitoring inspection schedule and deliverables.

Phase 1 Post-Construction As-Built Report (Date: Prior to December 31st, 2025)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 1 terraces will be completed following the construction of each phase of terraces and submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 1-40 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Phase 2 Post-Construction As-Built Report (Date: Prior to December 31st, 2026)

To serve as a baseline for the post-construction annual monitoring, an as-built report for the Phase 2 terraces will be completed following the construction of each phase of terraces and submitted to the

City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following.

- Coordinates and diagrams of established transects, as well as site photographs from photo stations 41-80 as defined in the Methods section.
- Final location of all planted vegetation (upland plantings, high marsh plantings and low marsh plantings).
- Final location and extent of SAV plantings.
- Final grade topographic surveys (plan, profile, and cross sections).
- Discussion of the project design versus as-built conditions.

Year 1a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2026)

At the end of the first full growing season following planting of the Phase 1 terraces, a Year 1a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 40 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 1b/2a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2027)

At the end of the first full growing season following planting of the Phase 2 terraces following planting, and the second full growing season of the Phase 1 terraces, a Year 1b/2a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 1 conditions (for Phase 2 terraces) and to Year 2 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 1 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion; it is anticipated that the wetland planting contractor will provide a one-year post construction maintenance and guarantee period for the wetland plantings.

Year 2b/3a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2028)

At the end of the second full growing season of the Phase 2 terraces following planting, and the third full growing season of the Phase 1 terraces, a Year 2b/3a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 2 conditions (for Phase 2 terraces) and to Year 3 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 2 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 3b/4a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2029)

At the end of the third full growing season of the Phase 2 terraces following planting, and the fourth full growing season of the Phase 1 terraces, a Year 3b/4a monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 3 conditions (for Phase 2 terraces) and to Year 4 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).

- Estimated percent cover and change in coverage from planted conditions to Year 3 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 4b/5a Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2030)

At the end of the fourth full growing season of the Phase 2 terraces following planting, and the fifth full growing season of the Phase 1 terraces, a Year 4b/Final (Year 5a) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 1 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 4 conditions (for Phase 2 terraces) and to Year 5 conditions (for Phase 1 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 4 conditions for SAV planting quadrants
- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Year 5b Post-Construction Annual Monitoring Report (Date: Prior to November 30th, 2031)

At the end of the fifth full growing season of the Phase 2 terraces following planting, a Final (Year 5b) monitoring report will be submitted to the City of Virginia Beach, USACE, VMRC, VDEQ, and the City of Virginia Beach Wetlands Board that includes the following:

- Site photographs from photo stations 41 – 80 defined in the Methods section.
- Estimated percent cover and change in coverage from the as-built conditions to Year 5 conditions (for Phase 2 terraces) for all planted vegetation (upland plantings, high marsh plantings, and low marsh plantings).
- Estimated percent cover and change in coverage from planted conditions to Year 5 conditions for SAV planting quadrants

- General observations of project performance within each monitoring quadrant, including documentation of any problem areas associated with the planted vegetation, terrace structures, or invasive species.
- Results from inspections of the breakwaters, vegetated and non-vegetated design features.
- Maintenance, corrective actions and estimated schedule for completion.

Monitoring Strategy

The monitoring strategy consists of established transects with photo stations and quadrants that cover the area between transects. This approach enables monitoring of the four primary features of the living shoreline: uplands, low-marsh plantings, high-marsh plantings, and SAV*.

*Note: The planting scheme for SAV has not yet been established but it is anticipated that some SAV will be planted along the submerged portions of the marsh terraces. If more suitable planting locations are determined to be between terraces, separate transects will be established and sampled to track SAV survival apart from the proposed terrace transects.

Transects/Photo Points

A total of eighty (80) transects will be established across the project site, with 10 transects located along each of 8 terraces. Transects will span perpendicular to the length of each terrace from the ridge to the edge of the planted/vegetated area. See Figures 3 and 4 for graphic depictions of the proposed transect locations and layouts. Terraces were selected using a random stratified method to ensure representative terraces in each location within the project area (North Interior, North Exterior, South Interior, South Exterior), and of each planting scheme, were represented in the proposed monitoring plan. The selected terraces are as follows:

- North Interior: T-110, T-113
- North Exterior: T-100, T-106
- South Interior: T-124, T-131
- South Exterior: T-123, T-140

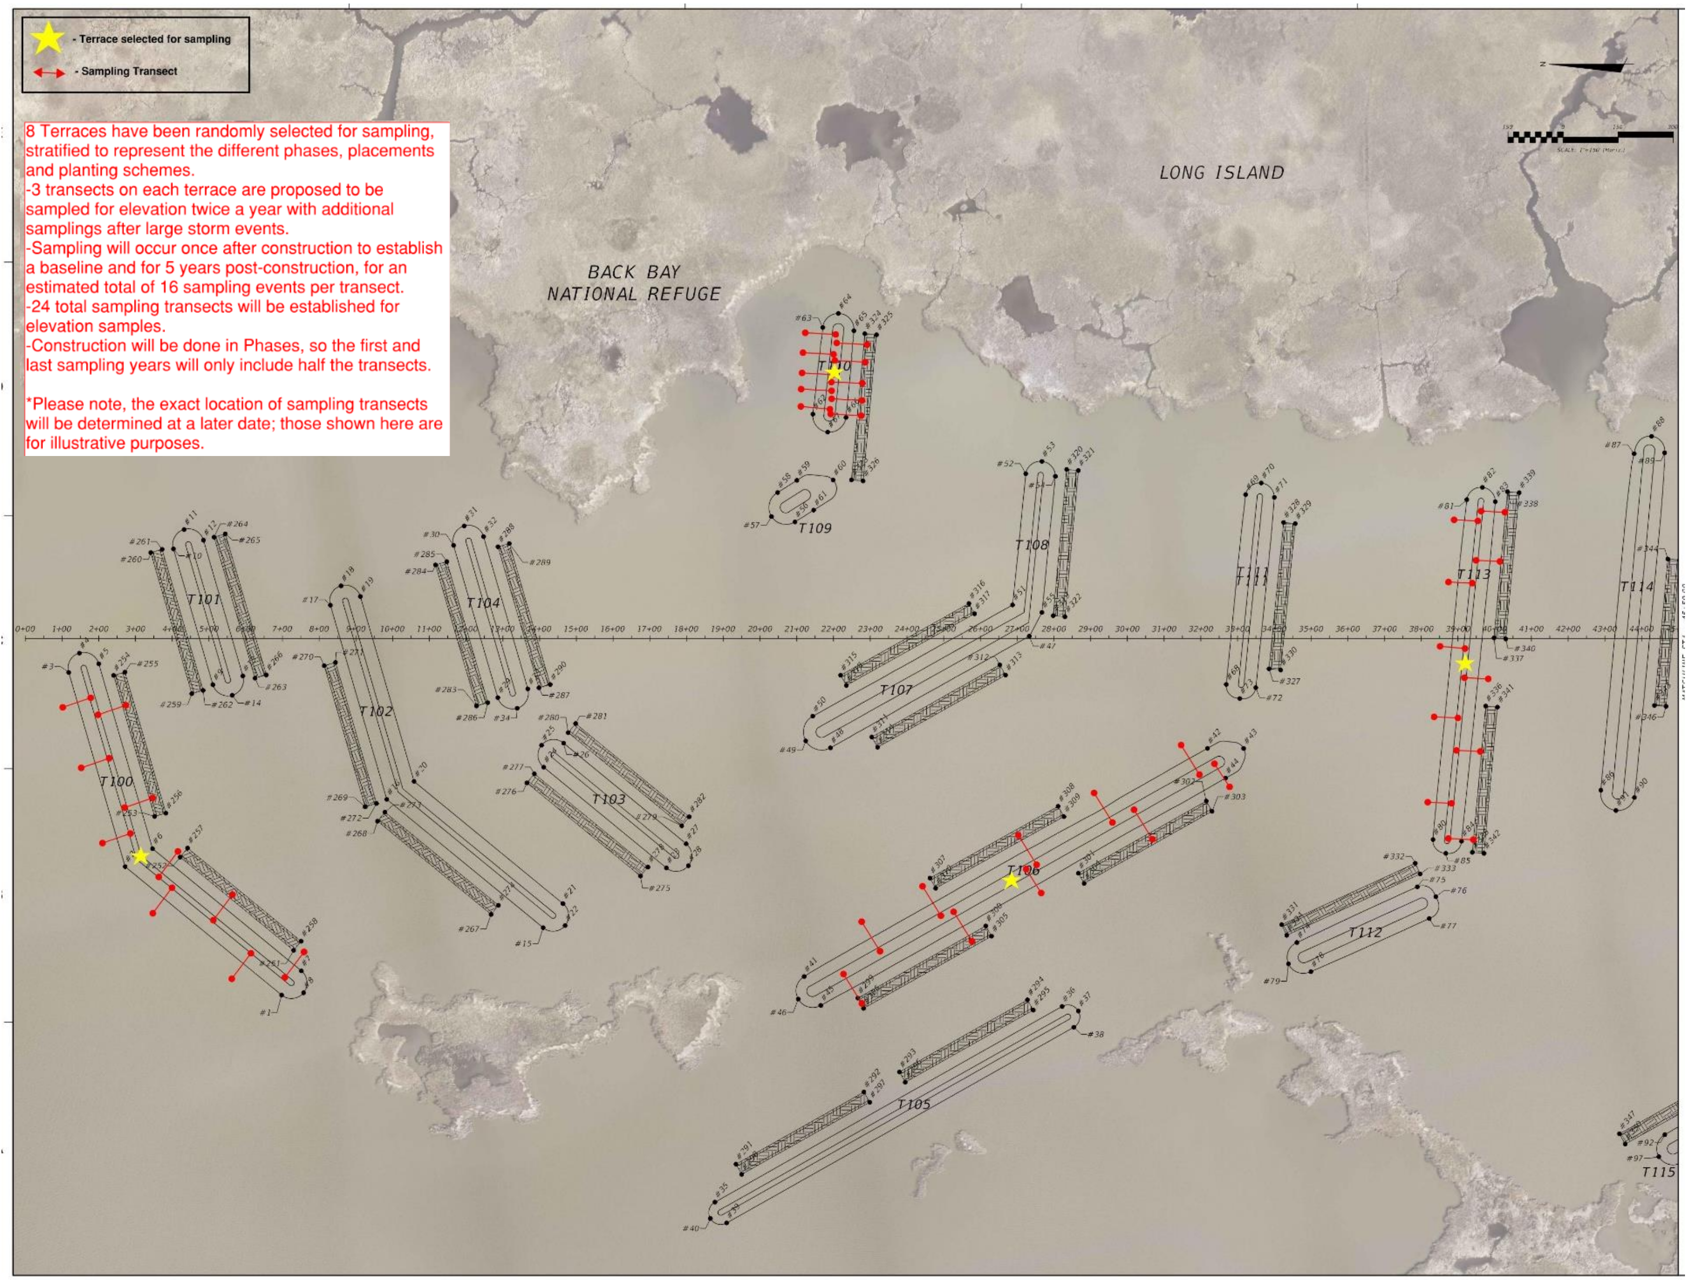

Figure 3: Monitoring design site plan – North Terraces

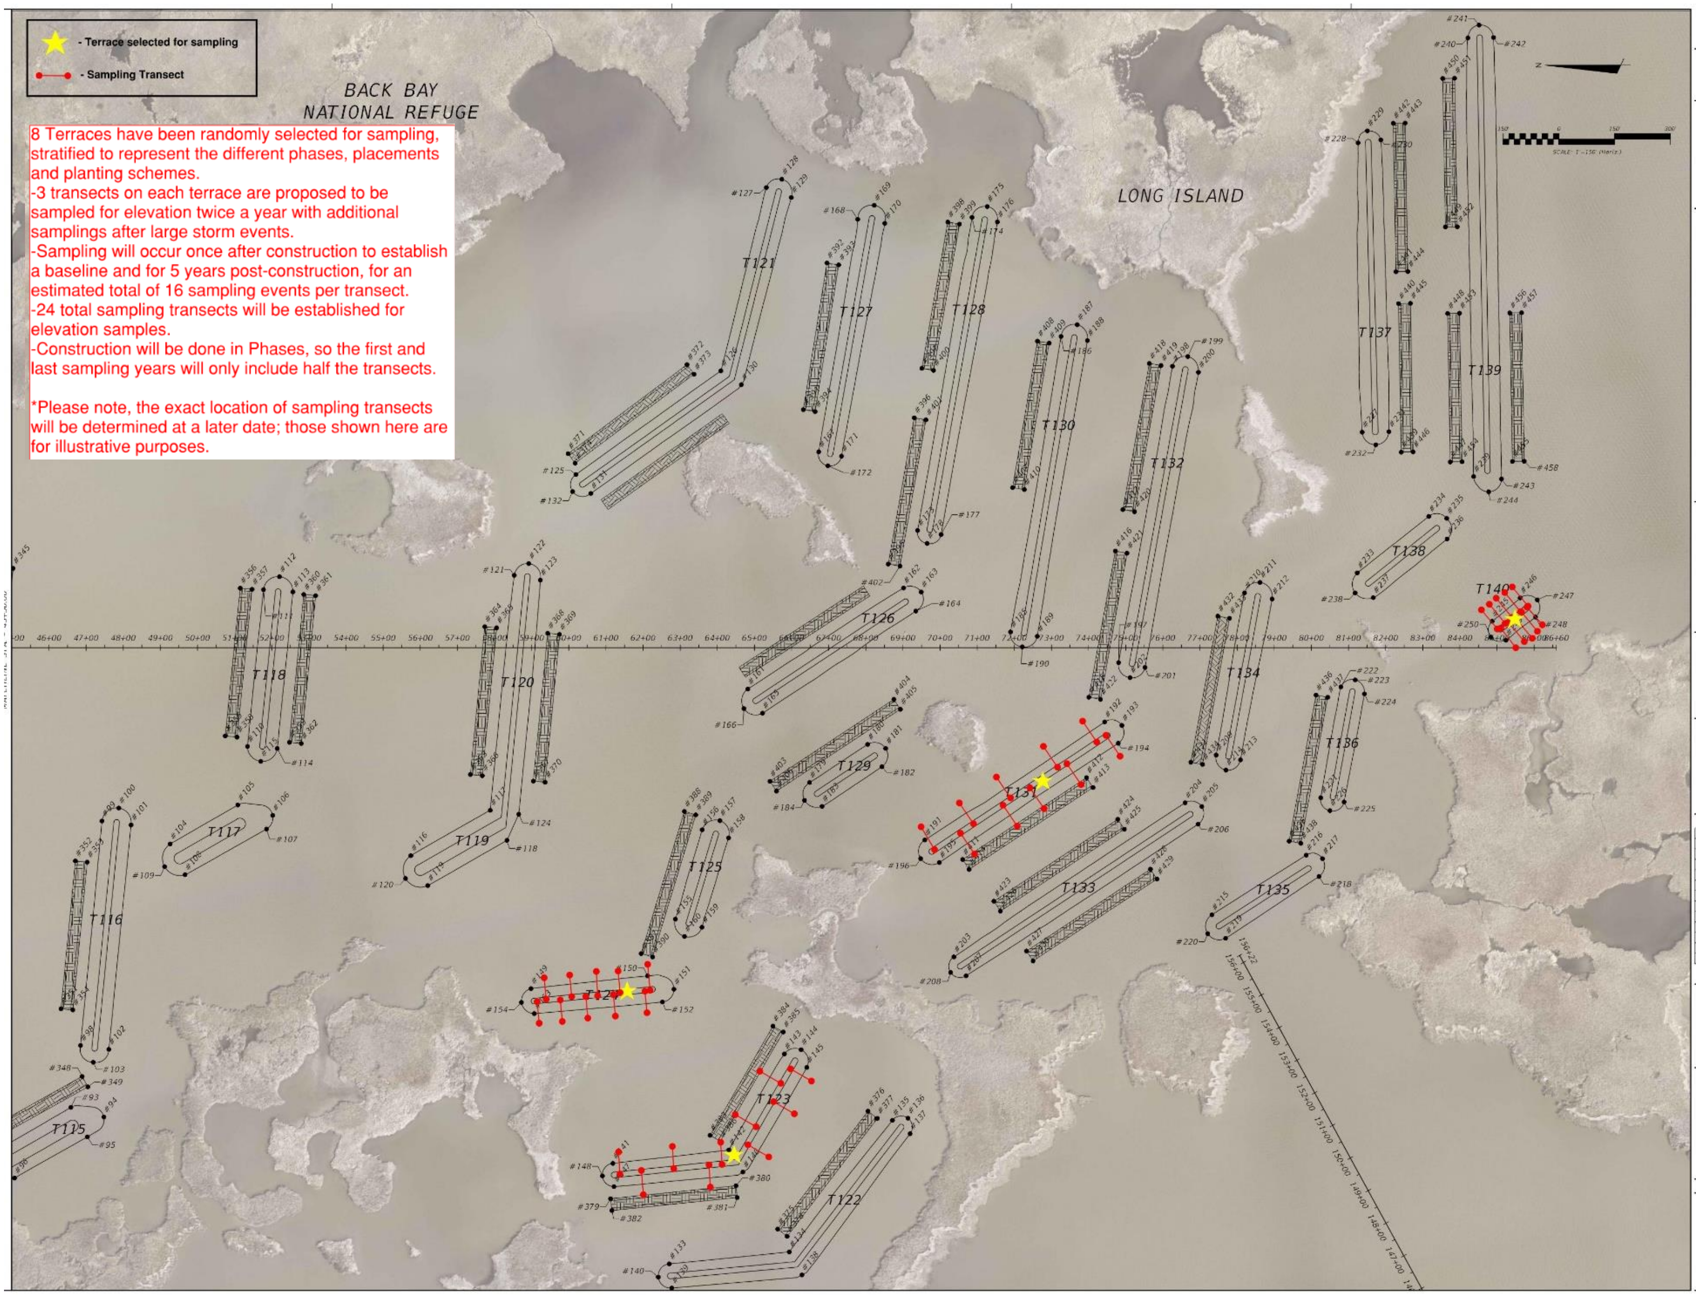

Figure 4: Monitoring design site plan – South Terraces

Permanent photo stations will be established at each quadrant along each transect to capture the design features/established habitats and vegetation. Figure 5 shows the general proposed locations (indicated by the red arrows/labels) for each quadrant and photograph station along each transect. Photos were shot from each photo location on [DATE]. These photos will be collected annually and compiled in Appendix B.

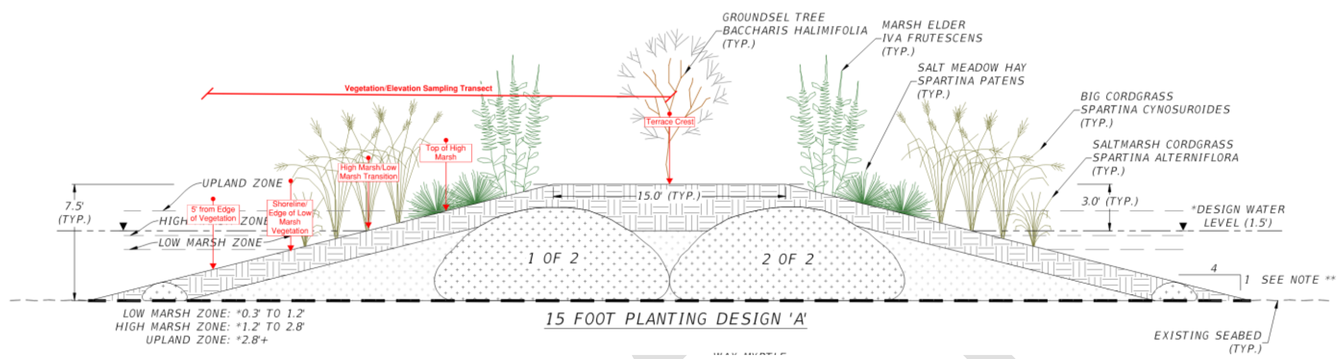

Figure 5: Photo station layout example

Quadrants

To estimate percent cover of vegetation, four (4) quadrants along each of ten (10) transects will be established on the eight selected terraces to allow for estimates of habitat coverage and planting survival. Estimates of coverage and survival were compared to post-construction conditions to evaluate changes.

Further, the following guiding questions were established to monitor overall project performance, presence of invasive species, and identify any needs for maintenance:

1. Are there specific problem areas where plants are dying or appear unhealthy?
2. Were any signs of herbivory observed?
3. Are there any undesirable plant species present?
4. Condition of the terrace structures: Is there any observed settlement, dislodged stone, significant debris etc.?
5. If an updated survey was conducted, are there any significant changes in the profile of the marsh terraces?
6. Does the upland portion of each terrace show any significant signs of erosion or loss of vegetation?

MONITORING RESULTS
