State law governing the development of a comprehensive plan (Section 15.2-2223 of the Code of Virginia) requires every county, city, and town to adopt a plan for the physical development of the territory within its jurisdiction. The Code further requires that comprehensive plans be reviewed every five years to ensure that the plan is responsive to current circumstances and that its goals continue to be supported by the citizenry; however, the City should consistently be prepared to make interim changes to the plan because necessary changes can result from the completion of strategic plans or changes to other City policies. The Planning Commission is tasked with preparing the plan and recommending it to the City Council for adoption.

The Code of Virginia includes both required and optional content for comprehensive plans. Required provisions relate to issues that are fundamental to the plan itself, such as long-range recommendations for development and methods of implementation. In order to address what are perceived as critical issues statewide, the Code of Virginia specifically requires that all comprehensive plans address both affordable housing and transportation infrastructure.

Authority

While the Comprehensive Plan communicates a vision for future land use and development in the City, the zoning ordinance provides the regulatory mechanism to ensure that new development and changes in land uses are consistent with this vision. Section 15.2-2232 of the Virginia Code states that a comprehensive plan "shall control the general or approximate location, character and extent of each feature shown on the plan." Consistency with the Comprehensive Plan is one of the approval considerations for zoning text amendments, zoning map amendments, special use permits, and special exceptions to the zoning ordinance.

Where any new development is proposed that requires a land use action not consistent with the Comprehensive Plan, the applicant should request a modification to the Comprehensive Plan as well, in order to keep the two documents consistent. Such modifications must be reviewed by the Planning Commission and approved by City Council. This provides flexibility for the Comprehensive Plan to adjust to market conditions and design trends, but ensures that any such changes are reviewed and considered within the greater context of the City's vision.

In addition to guiding decisions on land use and development, the Comprehensive Plan includes guidance on investment for transportation and infrastructure. Section 15.2-2232 of the Code of Virginia requires that no public facilities – such as streets, parks, utilities, or public buildings – shall be approved or constructed unless deemed to be in accordance with the Comprehensive Plan by the Planning Commission. The Comprehensive Plan should be used as a reference for all land use and budget decisions. Any budget item in the Capital Improvement Plan should support at least one of the goals of the Comprehensive Plan.

Implementation

In addition to providing guidance on land use and budget decisions, the Comprehensive Plan includes numerous actions to be taken by the City or its affiliates in order to achieve the vision of the plan. A separate Implementation Guide has been developed in support of the Comprehensive Plan to track progress on implementation of these actions. This is accomplished through an implementation matrix that provides the lead responsibility, timeframe for initiation and timeframe for completion of each action. Where appropriate, performance metrics are listed for goals to provide a mechanism for determining whether the implemented actions are achieving the desired result.

The Implementation Guide is a separate document from the Comprehensive Plan because it is expected to be updated regularly as progress is made toward achieving each action. The lead responsibilities, timeframes and performance metrics are also subject to change as more information is obtained in support of specific actions.

City of Fairfax

2035 Comprehensive Plan

IMPLEMENTATION GUIDE

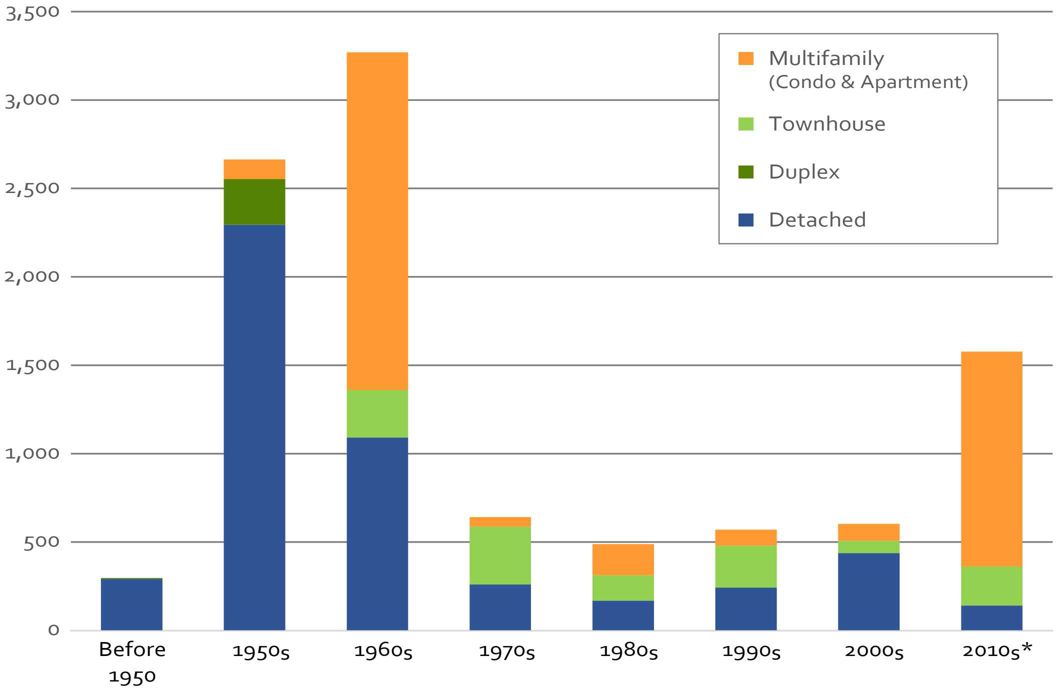
November 2018

2 Land Use

The City's residential neighborhoods are distinct in housing types, age, and character. While much of the land area of the City is encompassed by single-family neighborhoods initially developed in the 1950s and 1960s, there is also a significant amount of multifamily neighborhoods built primarily during the 1960s. Since then, the City has continued to accommodate residential development on smaller sites, including single-family homes, townhomes, and multifamily residences.

As developable land has become scarcer, new residential development has been more dependent on infill and redevelopment sites. Developers are offering higher-end products and seeking greater densities to offset the higher land values and development costs associated with redevelopment sites. In addition, some homes in existing single-family neighborhoods are being significantly renovated, expanded, or redeveloped.

FIGURE 2 HOUSING UNITS BY TYPE AND DECADE BUILT



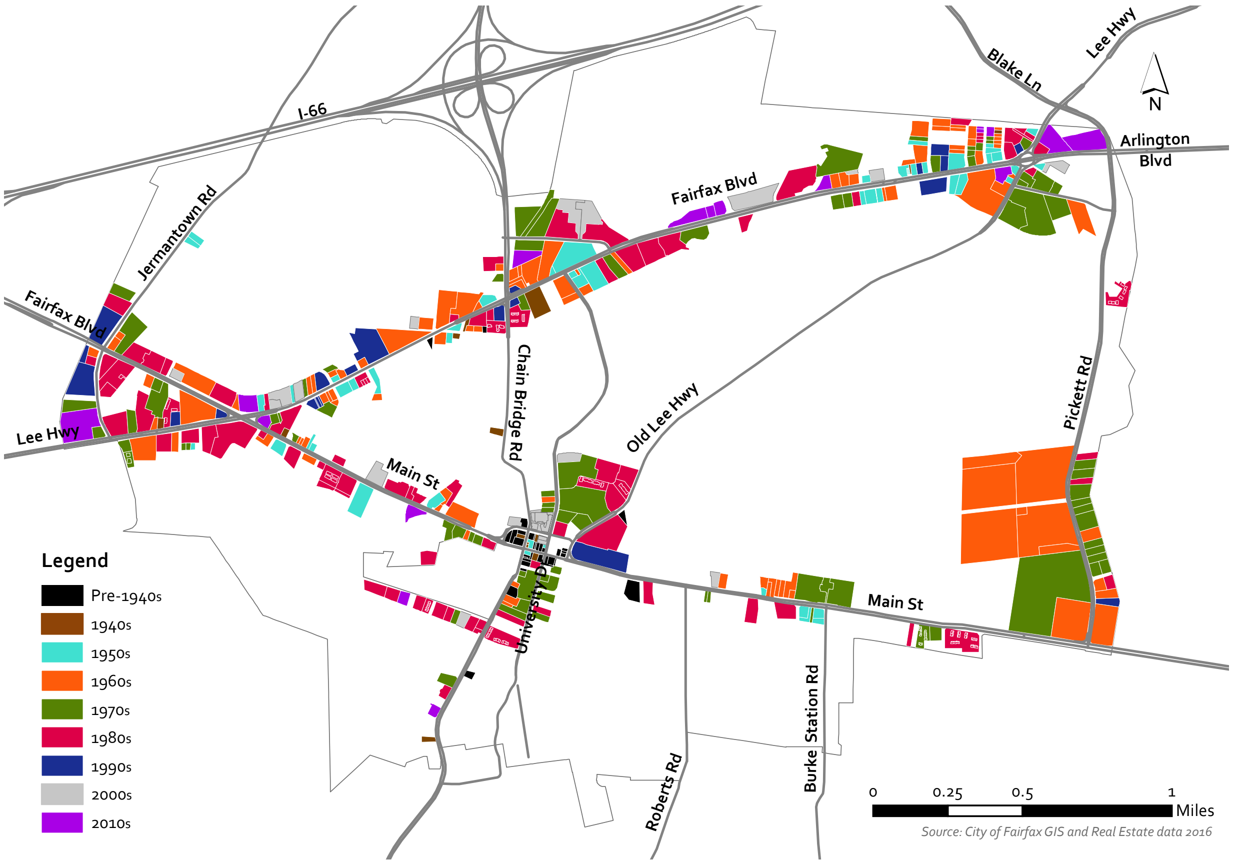
Note: Includes housing units existing and approved as of January, 2018. "2010s" includes housing units under construction, as well as projects that have been approved by City Council, but for which construction has not begun.

Source: Fairfax City Real Estate Assessments

Commercial uses in the City have historically benefited from its location at a crossroads of several regional transportation routes. While most neighborhoods in the City were established in the 1950s and 1960s, heavy commercial growth continued through the 1980s. This was fueled by continuing regional population growth and by general market trends that supported extensive office and retail growth. There has been less commercial growth in recent years as the commercial real estate market has changed and new development in surrounding areas of Fairfax County has added competition to the local market. Despite this, the City has experienced some redevelopment of older commercial properties, and recently approved mixed-use projects indicate that unsubsidized redevelopment remains feasible.

The Land Use Chapter encompasses the following Guiding Principles: Land Use Strategies, Neighborhoods, Commercial Corridors and Activity Centers, Housing, and Community Design and Historic Preservation.

FIGURE 3 COMMERCIAL AND INDUSTRIAL BUILDING AGE BY DECADE BUILT



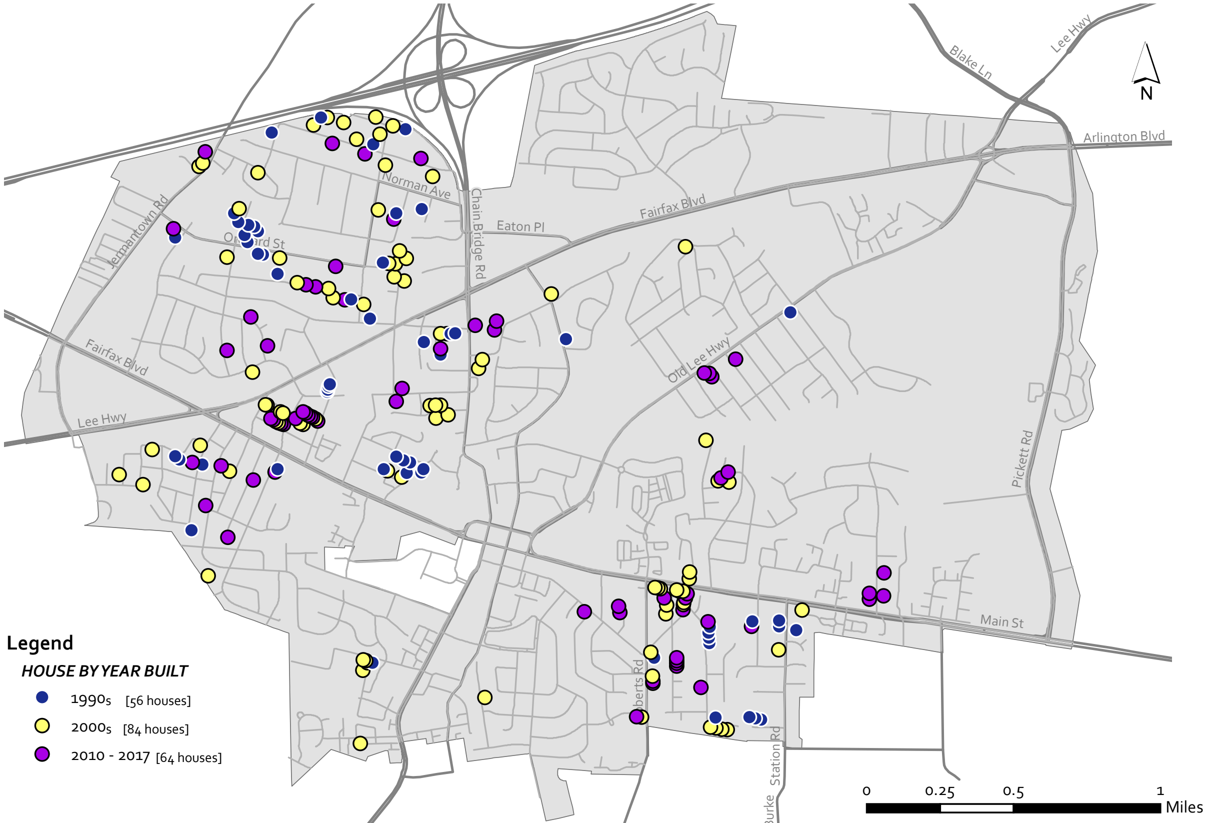
Source: City of Fairfax GIS and Real Estate data 2016

Opportunities and Challenges

Residential improvements

With an aging housing stock, there is consistent pressure for upgrading or replacing existing homes. While this can help keep neighborhoods current with consumer desires and housing preferences, it can also impact the character of existing neighborhoods.

FIGURE 4 INFILL HOUSING BY DECADE BUILT



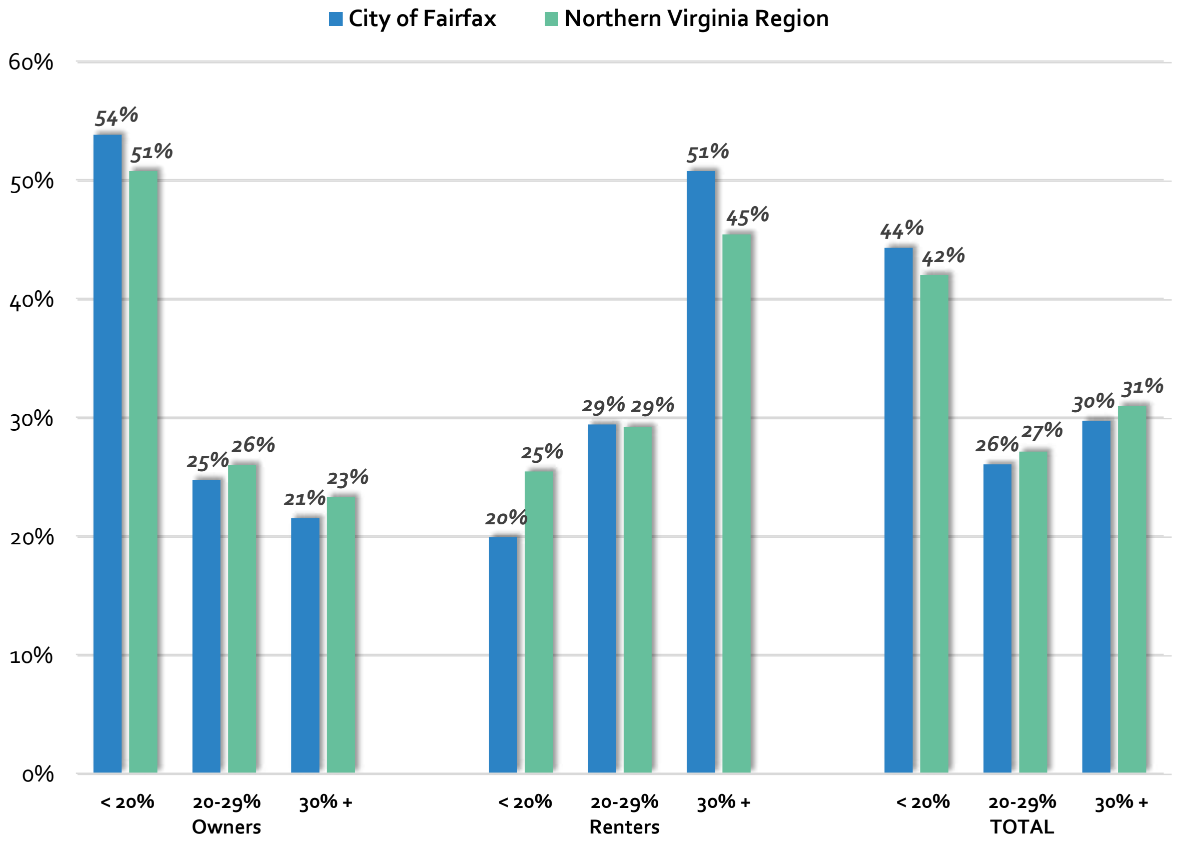
Source: City of Fairfax GIS and Real Estate data 2017

Housing affordability

As the regional economy has grown, increases in housing values have outpaced increases in income. As a result, there are few residential units in the City that are affordable to lower income households. About one-third of City households spend more than 30% of their income on housing costs, as shown in Figure 5 , which also highlights that almost half of renters reside in units that are potentially cost-burdensome.

While many of the apartments that were built in the 1960s are more affordable than newer apartments in the surrounding areas of Fairfax County, their asking rents are not achievable to a full range of incomes. There is also no guarantee that these apartment complexes will remain as "naturally occurring affordable housing." Redevelopments of two complexes have been approved since 2013, and there has been communicated interest in redevelopment of additional complexes.

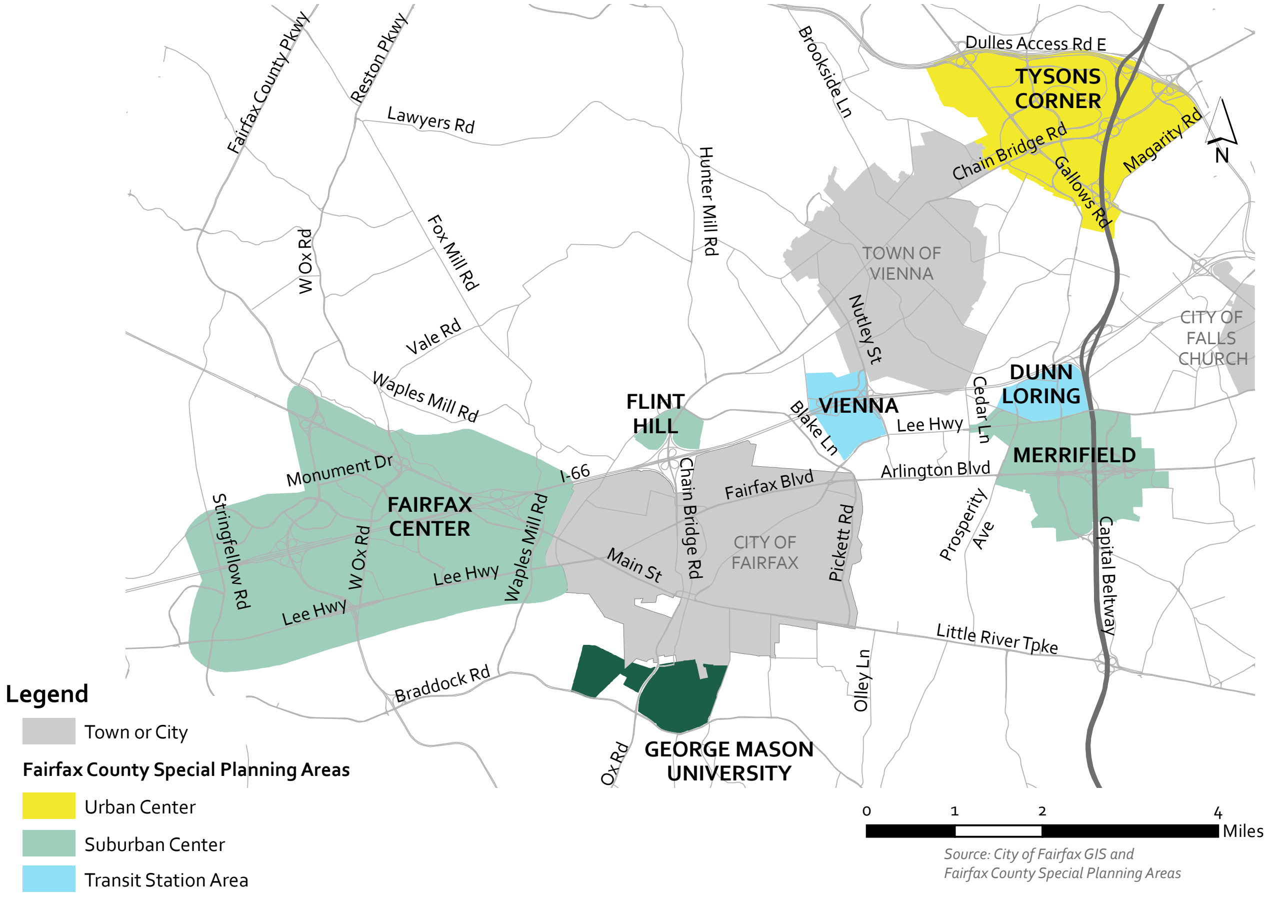
FIGURE 5 HOUSING COSTS AS A PERCENTAGE OF HOUSEHOLD INCOME BY TENURE AND IN TOTAL



Source: US Census ACS, 2012-16

Note: The Department of Housing and Urban Development defines cost-burdened families as those who pay more than 30% of their income for housing and may have difficulty affording necessities such as food, clothing, transportation, and medical care.

FIGURE 6 NEARBY MAJOR MIXED-USE CENTERS

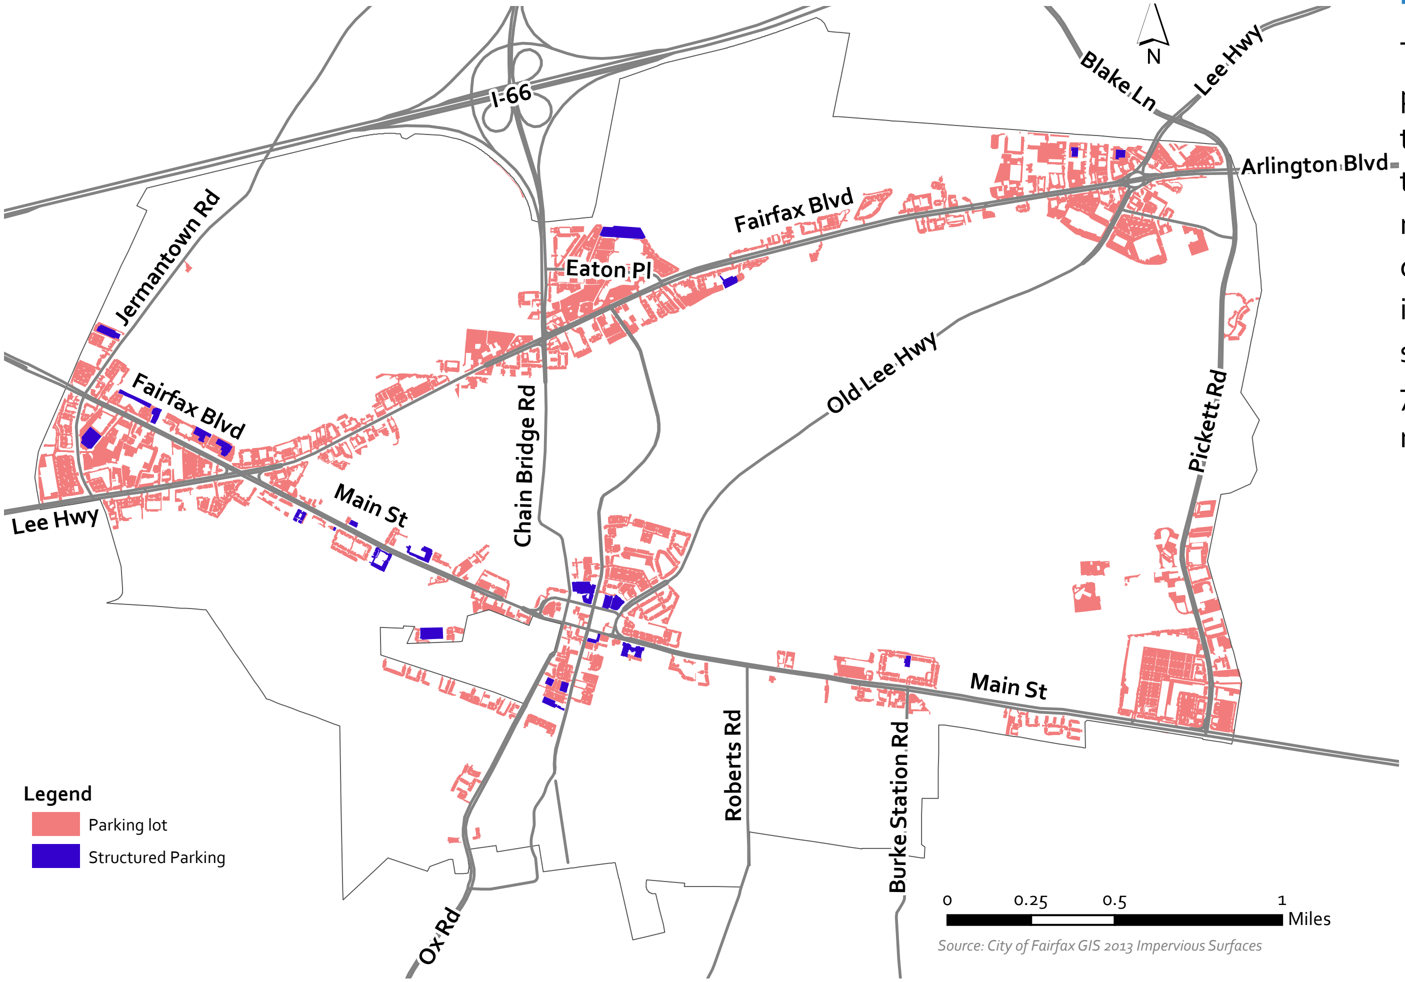


Source: City of Fairfax GIS and Fairfax County Special Planning Areas

Commercial market changes

Long-term shifts in retail and office markets have added uncertainty to the continued marketability of some commercial properties in the City. In addition, new development to the east and west of the City absorbs potential demand for destination commercial offerings, and the City's Commercial Corridors and Activity Centers currently lack many popular types of retail and entertainment establishments. This trend could continue with the Fairfax County Comprehensive Plan encouraging new commercial and mixed-use development in designated Special Planning Areas proximate to the City, as shown in Figure 6.

FIGURE 7 COMMERCIAL AND INDUSTRIAL SURFACE AND STRUCTURED PARKING



Source: City of Fairfax GIS 2013 Impervious Surfaces

Commercial redevelopment potential

There are numerous commercial properties throughout the City with the potential for redevelopment or to reposition themselves for current market demands. Characteristics of potential redevelopment sites include significant amounts of surface parking, as shown in Figure 7, and low building-to-land value ratios.

Land Use Strategies

More than 200 years of growth and development have formed Fairfax into a unique small city with development patterns and building styles that span multiple eras. A variety of land uses are distributed throughout the City to complement and support each other. Existing land uses and a summary of land use coverage areas in the City are shown in Figure 8. The City, however, continues to evolve to accommodate changing needs of residents and businesses. The Land Use Strategies Guiding Principle supports measures to manage growth in such a way to allow the City to evolve while maintaining the unique character that has taken decades to build.

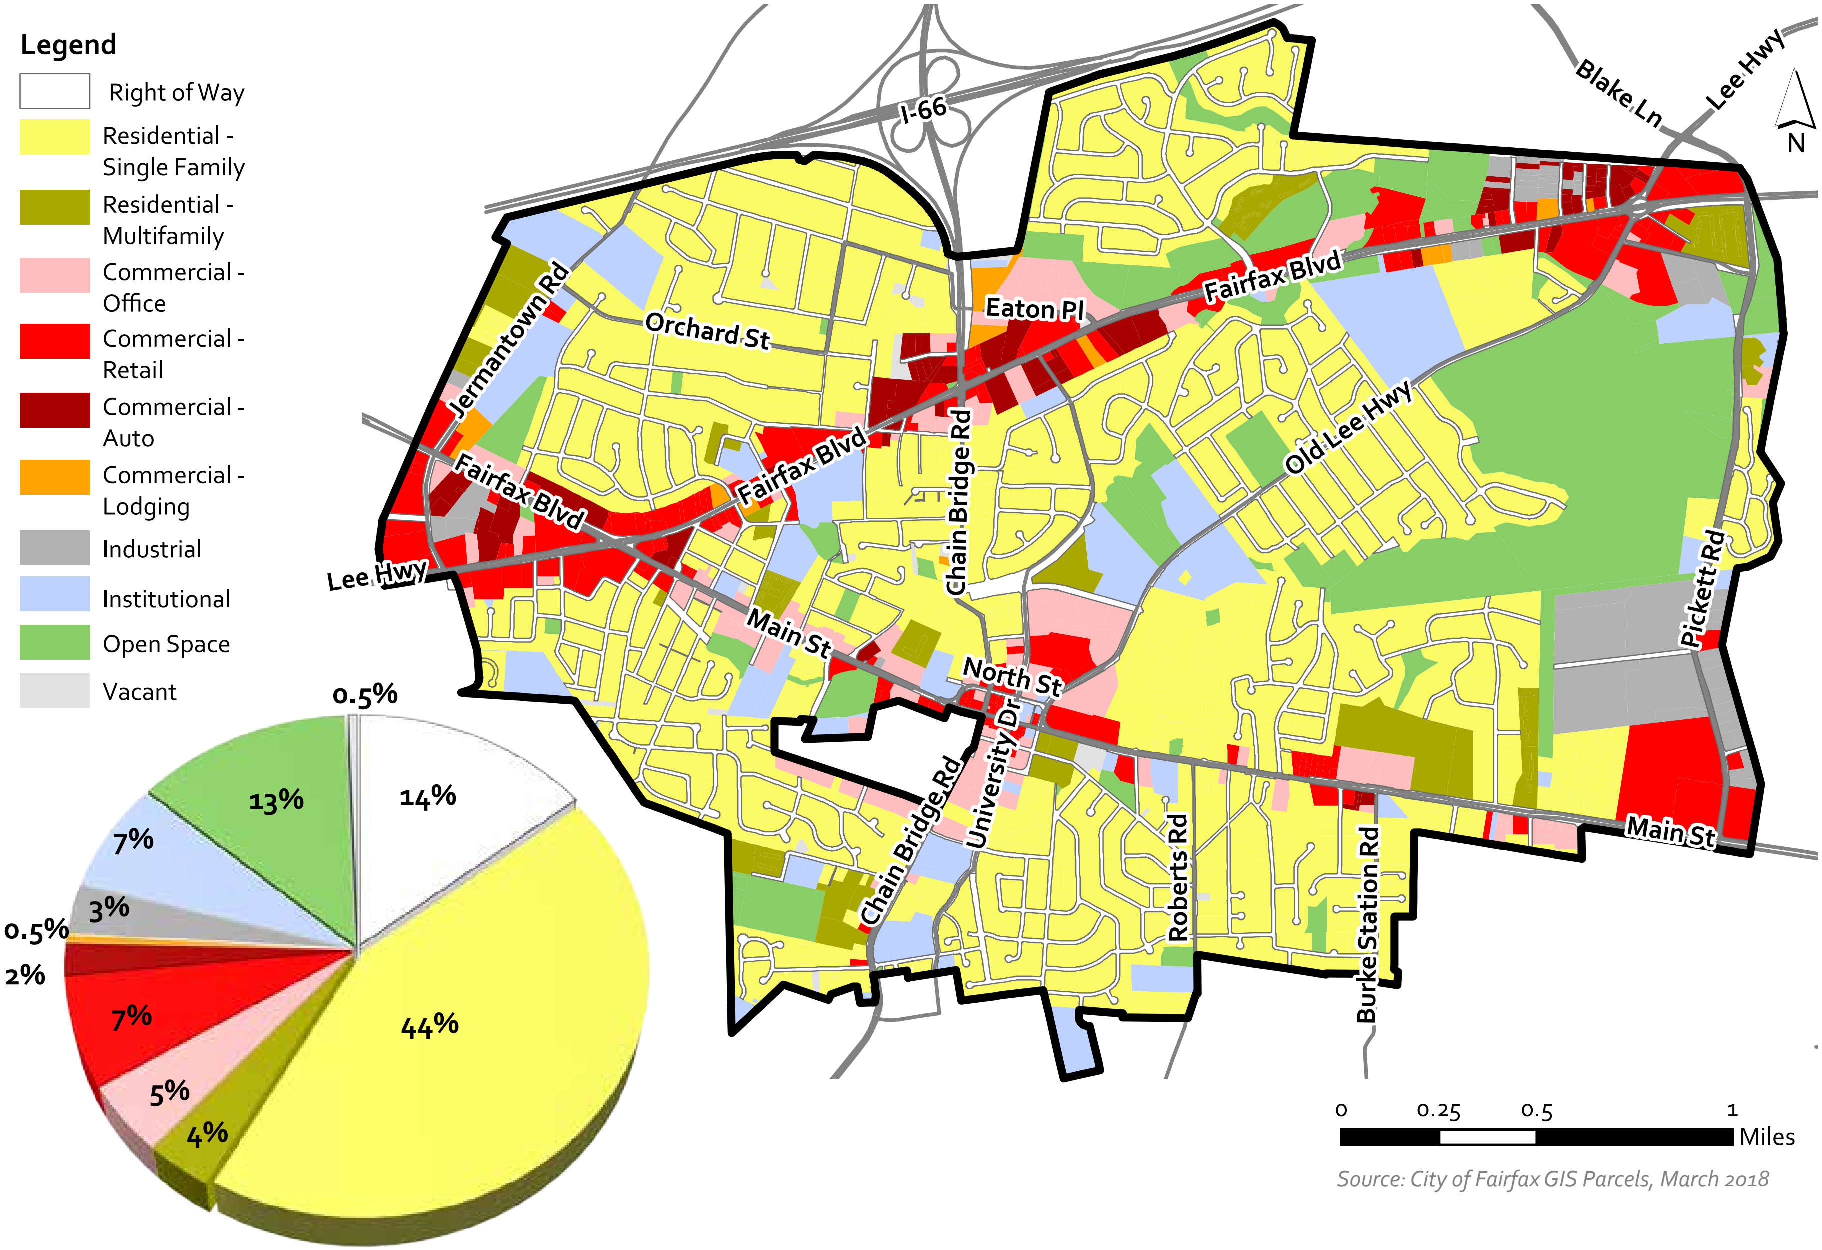
Managing development depends heavily on the Comprehensive Plan Future Land Use Map (shown on p. 27). This map, which is supported by Goal 1 of this Guiding Principle, illustrates the desired land uses in the City organized by Place Types, which are locations within the City that are intended to share similar physical characteristics and have both zoning and "Link + Place" street types (as defined under Multimodal Transportation Goal 2) that are consistent with these characteristics.

Guiding Principle:

In 2035, Fairfax is a city with...
a close-knit community and a
population that is diverse in its
culture, demographics, and lifestyles,
that capitalizes on its location in the
center of the growing region and with
easy access to the nation's capital.

Rather than show land uses as they exist today, the Future Land Use Map shows how the Comprehensive Plan foresees appropriate development over the next 15 to 20 years. The Place Types shown on the map communicate the types of uses and character of development envisioned throughout the City.

FIGURE 8 EXISTING LAND USE MAP



Source: City of Fairfax GIS Parcels, March 2018

Land Use Strategies

Goal 1

Ensure development is complementary.

OUTCOME LU1.1:	The Future Land Use Map is used in conjunction with other recommendations from the Comprehensive Plan to guide development throughout the City.
ACTION LU1.1.1	Maintain and update, as necessary, a Future Land Use Map that provides for a balanced mix of development types and addresses current and future needs of the City.
ACTION LU1.1.2	Use the Future Land Use Map (Figure 9), Place Types, and general text from the Comprehensive Plan as a guide when considering new development throughout the City.
ACTION LU1.1.3	Refer to Parcel Specific Recommendation, as detailed on pages 39-44 for potential alternative uses. Amend the Comprehensive Plan to provide additional Parcel Specific Recommendations as appropriate.
OUTCOME LU1.2:	Zoning regulations that accommodate high-quality design and development practices.
ACTION LU1.2.1	Consistently review the Zoning and Subdivision Ordinances and the Zoning Map to ensure they are able to support the Future Land Use Map and other guidance of the Comprehensive Plan.

While the 6.3 square mile City is primarily built out, leaving few opportunities for large new development, there is consistent pressure for the City's variety of land use types to adapt to environmental, economic and cultural demands. This means that some flexibility must be provided with a balanced mix of development types that accommodate adaptations without negatively impacting the existing community. New development and redevelopment should be complementary to surrounding areas and contribute to an attractive, accessible, and economically viable place.

This can be managed by using the Future Land Use Map in conjunction with recommendations of this Comprehensive Plan and the requirements of the Zoning and Subdivision Ordinances to guide development within the City. While the Future Land Use Map communicates the most appropriate types of uses and character of development, the Zoning and Subdivision Ordinances provide the regulatory measures to accommodate such development. The Ordinances may occasionally be amended to furnish necessary changes for various land uses.

Future Land Use Map

The Future Land Use Map is provided in Figure 9, with specific guidance on development for each of the Place Types identified on the map provided on the following pages. Additional guidance is provided for certain specific sites beginning on page 38. When using the Future Land Use Map, consideration should also be given to the other Guiding Principles of this chapter, depending on site location and types of uses.

The following information is provided for each of the Place Types:

1. Definition: A brief description of the types of uses and structures the Place Type applies to.
2. Zoning Districts: A list of Zoning Districts that are most likely to accommodate the uses and structures provided in the definition for the Place Types.
3. Link + Place Street Types: A list of the types of streets (as provided in the Multimodal Transportation Chapter) where the Place Type is most appropriate.
4. Physical Characteristics: A description of general preferences for site design and building placement.
5. Concept diagrams and photos: Provided to show typical development patterns for each Place Type.

Most new development is anticipated to occur in areas designated as an Activity Center Place Type. There are five areas of the City that have this Place Type designation: Old Town Fairfax, Northfax, Kamp Washington, Fairfax Circle, and Pickett & Main. The following additional guidance is provided for the Activity Center Place Type:

6. Use Characteristics: Since multiple uses can be accommodated in the Activity Center Place Type, separate physical characteristics are provided for various uses to ensure that new development provides a consistent character in spite of varying uses.
7. Residential Limitations: As a more detailed analysis of specific development scenarios is not included in this plan, limitations on the number of residential units that can be absorbed in each Activity Center are provided. This is intended to communicate to developers and the general public that unrestrained increases in residential development will not be considered in these areas of the City.

Small Area Plans

Small Area Plans are an opportunity to conduct detailed analyses of concentrated geographic areas of the City and provide more specific recommendations on issues such as land use and transportation than that provided in the Comprehensive Plan. Once approved, Small Area Plans serve as the primary source for guidance on development in the respective Activity Centers. As supported by Land Use Action CCAC2.3.5, Small Area Plans are proposed for each of the five Activity Centers. As each of the Small Area Plans is completed and adopted, the recommendations from that plan will supersede the Activity Center Place Type recommendations from the Future Land Use Map. This may include the guidance provided for Physical Characteristics, appropriate Street Types, Use Characteristics, and Residential Limitations.

In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. While a brief description of these two Activity Centers is provided in the Activity Center Place Type description, please refer to the respective Small Area Plans for specific guidance in those two areas. The general guidance in the Activity Center Place Type description applies to Kamp Washington, Fairfax Circle, and Pickett & Main until Small Area Plans are adopted for those Activity Centers.

FIGURE 9   FUTURE LAND USE MAP

Adopted February 12, 2019
Revised June 9, 2020

SINGLE-FAMILY DETACHED NEIGHBORHOOD

Definition

The Single-Family Detached Neighborhood Place Type, identified in yellow on the Future Land Use Map, applies to neighborhoods that are primarily developed with single-family detached homes. Accessory uses associated with these residences are permitted, such as home-based businesses and accessory dwelling units.

Physical Characteristics

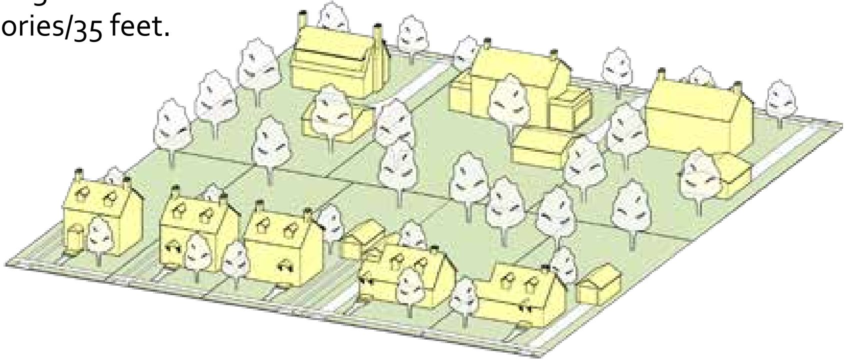
New development of single-family detached homes in an existing residential neighborhood should reflect the character of that neighborhood by providing similar lot widths and building setbacks as surrounding properties. In order to support shared stormwater management facilities and usable open space, narrower lot widths and building setbacks may be considered where a new development provides a similar overall density to the surrounding neighborhood. New development is considered to be within an existing neighborhood where any vehicular access is taken from an existing Limited Connection Residential street or a Neighborhood Circulator. New residential units on all lots that are adjacent to those streets should be oriented with the front of the structure facing that street, even where vehicular access is taken from a new public or private street. Predicated on the underlying zoning district, the Single-Family Detached Neighborhood Place Type supports up to 7 dwelling units per acre and a maximum height of 3 stories/35 feet.

Zoning Districts

- RL, Residential Low
- RM, Residential Medium
- RH, Residential High
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Some existing Single-Family Detached Neighborhoods are present along Avenues and Boulevards, such as portions of Chain Bridge Road, Old Lee Highway, and Main Street.



TOWNHOUSE/SINGLE-FAMILY ATTACHED NEIGHBORHOOD

Definition

The Townhouse/Single-Family Attached Neighborhood Place Type, identified in orange on the Future Land Use Map, applies to neighborhoods that are primarily developed with townhouses and single-family attached or duplex housing. Single-family detached uses may be considered in the Townhouse/Single-Family Attached Neighborhood Place Type when developed in conjunction with Townhouse/Single-Family Attached Neighborhood uses.

Physical Characteristics

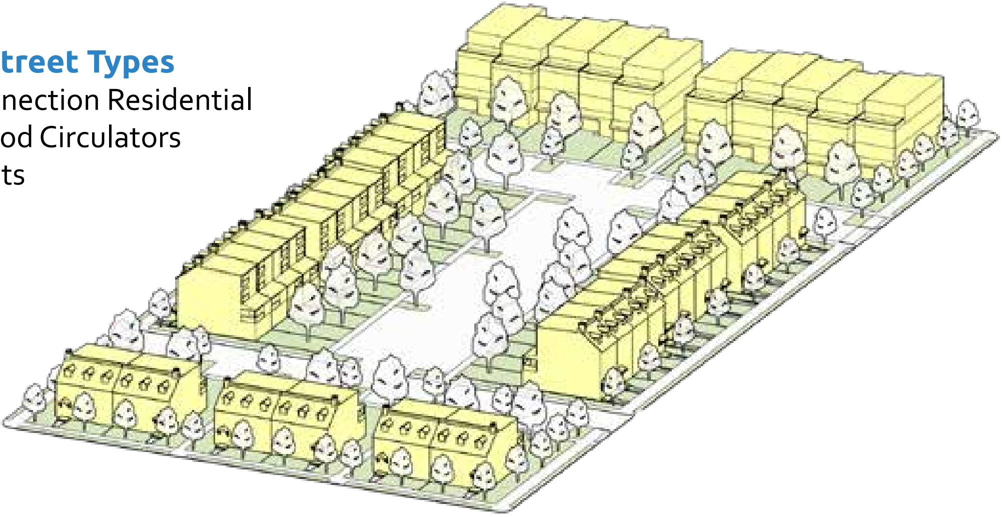
The design and layout of new Townhouse and Single-Family Attached Neighborhood developments should reflect the location of the development within the City. In particular, development that is adjacent to Single-Family Detached Neighborhoods within City limits, or to neighborhoods zoned primarily for single-family detached residences within adjacent jurisdictions, should have a maximum of three floors and provide landscaped setbacks for that portion of the site that is adjacent to any such neighborhood. Otherwise, a building height of up to four stories or 45 feet may be considered. Predicated on the underlying zoning district, the Townhouse/Single-Family Attached Neighborhood Place Type supports up to 12 dwelling units per acre.

Zoning Districts

- RT, Residential Townhouse
- RT-6, Residential Townhouse
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Active Streets
- Avenues
- Boulevards



MULTIFAMILY NEIGHBORHOOD

Definition

The Multifamily Neighborhood Place Type, identified in brown in the Future Land Use Map, applies to neighborhoods that are primarily developed with multifamily apartment or multifamily condominium housing. Townhouse/Single-Family Attached Neighborhood uses and Single-Family Detached Neighborhood uses may be considered in the Multifamily Neighborhood Place Type when developed in conjunction with Multifamily Neighborhood uses.

Physical Characteristics

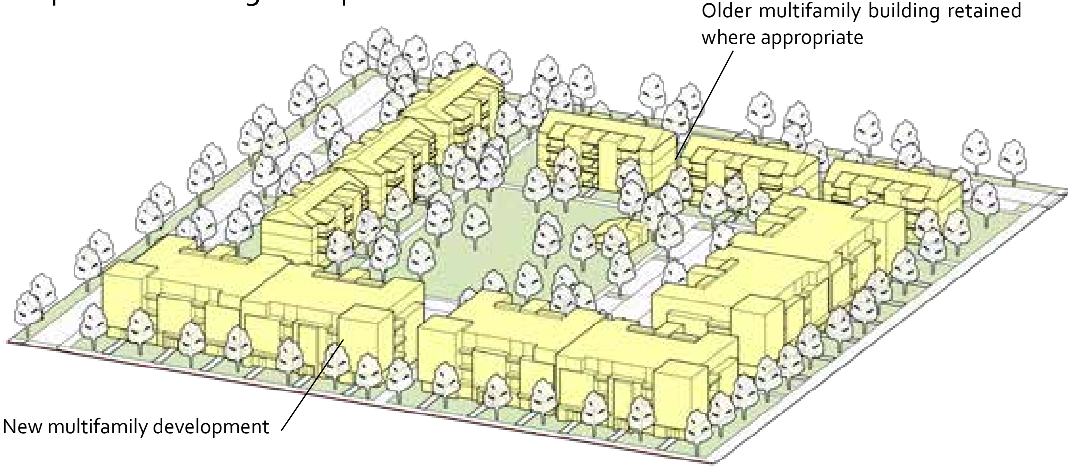
The design and layout of new Multifamily Neighborhood developments should reflect the location of the development within the City. Development that is adjacent to Single-Family Detached or Townhouse/Single-Family Attached neighborhoods within City limits, or to neighborhoods zoned primarily for single-family detached or single-family attached residences within adjacent jurisdictions, should have a maximum of three floors and provide landscaped setbacks for portions of the site that are adjacent to any such uses. Otherwise, a building height of up to four stories or 45 feet may be considered. In order to retain the relative affordability available in many existing multifamily structures, redevelopment of existing multifamily sites within Multifamily Neighborhood land use areas, where additional density is permitted by the Zoning Ordinance, should consider accommodating existing multifamily structures. Predicated on the underlying zoning district, the Multifamily Neighborhood Place Type supports up to 20 dwelling units per acre and a maximum height of 4 stories/45 feet.

Zoning Districts

- RMF, Multifamily
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Active Streets
- Avenues
- Boulevards



COMMERCIAL CORRIDOR

Definition

The Commercial Corridor Place Type, identified in red on the Future Land Use Map, includes a mix of retail, restaurant, service, medical, office, and other commercial uses. Limited manufacturing and other light industrial uses may also be considered. Heavy industrial uses should not be added or expanded beyond areas where they currently exist (such as the tank farm on Pickett Road). Residential uses are not recommended in Commercial Corridors. Commercial areas should accommodate access via a variety of transportation modes and be accessible to adjacent neighborhoods via pedestrian and bicycling facilities.

Physical Characteristics

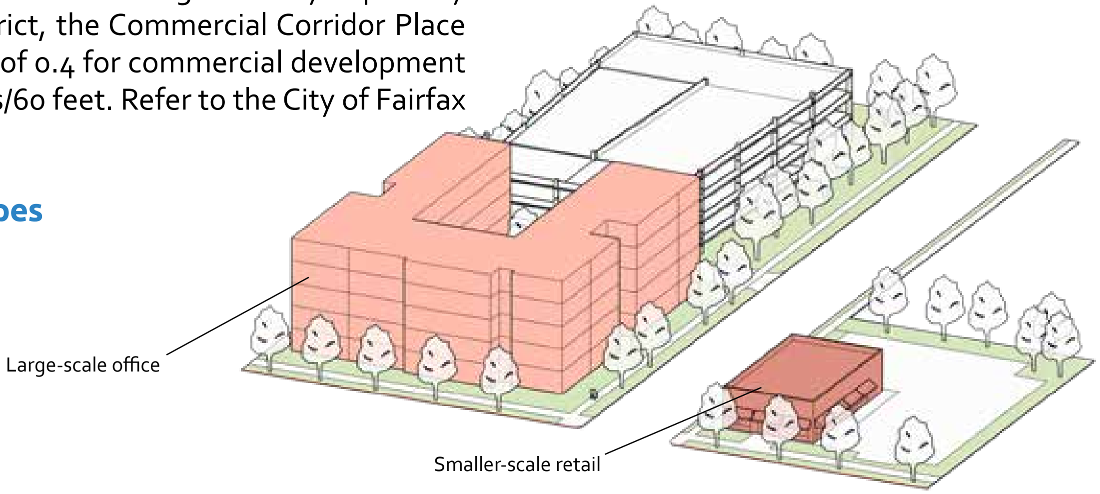
Commercial Corridor Place Types can accommodate a variety of buildings from small footprint retail buildings to multi-story office buildings. The desired orientation and placement of buildings on a Commercial Corridor site is primarily dependent on the adjacent Street Type. For sites located along Commercial Mains, buildings should have similar setbacks and building orientation as recommended for the nearby Activity Centers. Parking is encouraged in above-ground structures or underground, should be provided to the side or rear of buildings, and should be screened from view from the right-of-way by building mass or landscaping. For sites located along Boulevards or other street types, buildings should be located near front property lines with parking provided to the side or rear. Direct pedestrian access should be provided from the sidewalk in the right-of-way to primary building entrances. Predicated on the underlying zoning district, the Commercial Corridor Place Type supports a density of a minimum Floor Area Ratio (FAR) of 0.4 for commercial development and a maximum building height of 3 stories/35 feet to 5 stories/60 feet. Refer to the City of Fairfax Design Guidelines for more specific guidance on site design.

Zoning Districts

- CL, Commercial Limited
- CO, Commercial Office
- CR, Commercial Retail
- CG, Commercial General
- IL, Industrial Light
- IH, Industrial Heavy
- PD-C, Planned Development Commercial
- PD-I, Planned Development Industrial

Link + Place Street Types

- Boulevards
- Commercial Mains



ACTIVITY CENTER

Definition

The Activity Center Place Type, identified in purple on the Future Land Use Map, applies to locations in the City where pedestrian-oriented, mixed-use development is strongly encouraged. (Mixed-use development is pedestrian-oriented development that allows multiple activities to take place by layering compatible land uses, public amenities, and active streets accommodating multimodal transportation, and community-serving commercial.) Uses should be integrated as a mix of commercial uses, multifamily housing, and townhouses, either in the same building (i.e., vertical mixed-use) or as a combination of single-use buildings featuring a range of complementary uses within the Activity Center (i.e., horizontal mixed-use).

Physical Characteristics

Activity Centers can accommodate a variety of building types based on the different uses permitted and varying characteristics among individual Activity Centers. Recommended physical characteristics for specific uses are provided under Use Characteristics (p. 33) and more specific recommendations are provided for the Old Town Fairfax and Northfax Activity Centers on the following pages. The Comprehensive Plan also recommends Small Area Plans be developed for each of the City's five Activity Centers. As each of these plans is completed and adopted, the recommendations will supersede the pre-existing guidance of this Comprehensive Plan.

In general, new development in Activity Centers should support a connected street network as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan; provide an improved streetscape and pedestrian connections to surrounding uses, including links to the existing pedestrian network; and include inviting public and/or private open spaces. Parking should be provided in structured or below-grade facilities where reasonable.

Development in Activity Centers must meet the Code of Virginia definition for an Urban Development Area (Virginia Code § 15.2-2223.1) and follow the recommendations for Private Site Design and Elements in the applicable district of the City of Fairfax Design Guidelines. Predicated on the underlying zoning district, the Activity Center Place Type supports a density of a minimum FAR of 0.4; at least six townhouses or at least 12 multifamily dwelling units per acre; or any proportional combination of residential and commercial densities with building heights predominantly five stories or less, unless otherwise specified in an adopted Small Area Plan.

Photo Credit: Hord Coplan Macht

ACTIVITY CENTER (con't)

Use Characteristics

Office: Office uses are acceptable as components of mixed-use buildings or as stand-alone buildings.

Retail: Retail uses may be provided on the ground floor of mixed-use buildings, as stand-alone buildings, or on upper floors of buildings where larger tenant floor area requirements would detract from an active presence on the first floor. Retail uses are preferred along Commercial Mains, except where indicated otherwise in adopted Small Area Plans, but may be provided at other locations within an Activity Center.

Hotel: Hotels are acceptable as components of mixed-use buildings or as stand-alone buildings. Hotels are particularly encouraged in high visibility locations along Commercial Mains and at key intersections, or as may otherwise be identified in adopted Small Area Plans.

Public, Civic, and Institutional: Public, civic and institutional uses that are allowed by special use permit in commercial districts in the Zoning Ordinance may be provided as components of mixed-use buildings or as stand-alone buildings.

Residential Multifamily: Residential multifamily uses are acceptable as components of mixed-use buildings or as stand-alone buildings. Ground floor residential uses in multifamily or residential mixed-use buildings, including accessory spaces and amenities but not including residential lobby areas, should not be provided along Commercial Mains, unless such uses are identified in adopted Small Area Plans. Where ground-floor residential units are located adjacent to Active Streets or Commercial Mains, direct exterior access should be provided to individual units.

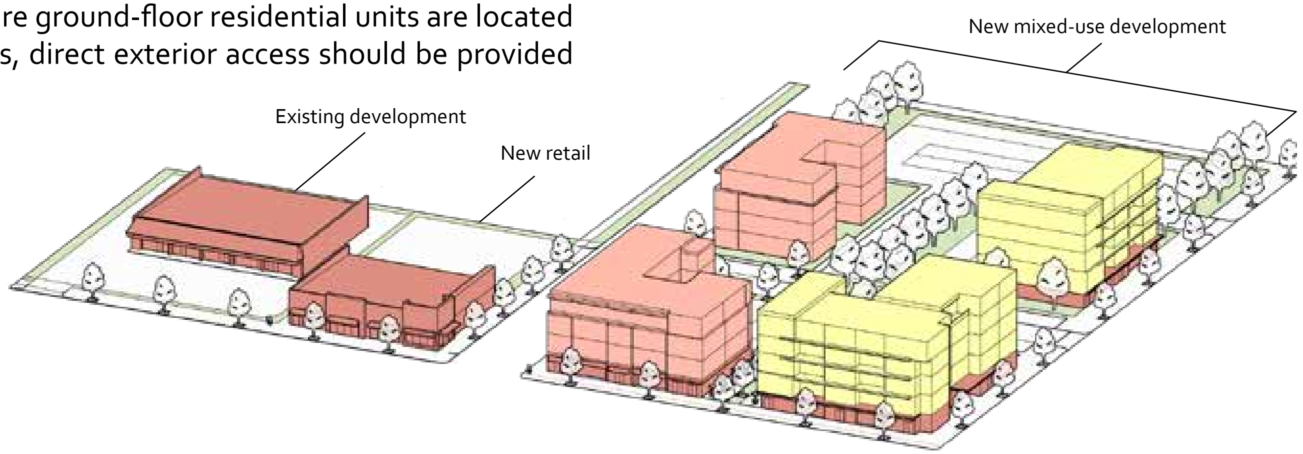
Townhouse: Residential townhouses should only be considered to serve as a transitional use to existing development outside of the Activity Center.

Zoning Districts

- CU, Commercial Urban
- PD-R, Planned Development Residential
- PD-C, Planned Development Commercial
- PD-M, Planned Development Mixed Use

Link + Place Street Types

- Active Streets
- Commercial Mains



ACTIVITY CENTER (con't)

Residential Limitations

The majority of future residential growth is anticipated to occur within the five Activity Centers identified in the Future Land Use Map. Refer to adopted Small Area Plans for specific recommendations on growth in each Activity Center. For Activity Centers for which a Small Area Plan has not yet been adopted, any unified development application within an Activity Center that contains a residential component should have a density of no more than 48 dwelling units per acre. Such developments must offer benefits that support the vision of the Comprehensive Plan for the Activity Center. Such benefits should include the following:

1. A mix of uses within the development site;

2. Contributions toward a connected street grid;

3. Usable open space, and;

4. High quality design.

Should a unified development application fail to offer these benefits, that development may contain no more than 20 dwelling units per acre.

Direct fiscal benefits to the City from residential developments are not typically as strong as those from commercial properties. In order to avoid significant displacement of commercial uses in Activity Centers, new residential development should first focus on lower value commercial or industrial sites unless a significant commercial component is included. Conversion of commercial space in existing buildings into residential space is not generally supported.

ACTIVITY CENTER - OLD TOWN FAIRFAX

The Old Town Fairfax Activity Center ("Old Town Fairfax") encompasses a cultural hub for the City, with a concentration of historic buildings, public services, active open space, and commercial buildings. Old Town Fairfax can also capitalize on its proximity to George Mason University to attract university supported businesses and arts and entertainment venues. The entirety of Old Town Fairfax is within the Old Town Fairfax Historic Overlay District (HOD) or the Old Town Fairfax Transition Overlay District (TOD) and is subject to those provisions of the Zoning Ordinance and the City of Fairfax Design Guidelines.

Refer to the Old Town Fairfax Small Area Plan, dated June 2020, for specific recommendations within Old Town Fairfax, including locations for future streets and open spaces, opportunities for pedestrian connections across Commercial Mains, building form (including appropriate locations for more or less restrictive building heights from the Activity Center standards), and general land use and development limitations. The overall concept plan for Old Town Fairfax, as provided in the Small Area Plan, is shown to the right.

ACTIVITY CENTER - NORTHFAX

The Northfax Activity Center ("Northfax") is considered the most appropriate location in the City to accommodate a regional mixed-use destination. Its location at the intersection of Fairfax Boulevard and Chain Bridge Road, with immediate access to Interstate 66 and a potential future Metro station, is more accessible than other Activity Centers. It is also equidistant from existing regional mixed-use destinations at Merrifield and Fairfax Corner. In order to leverage these characteristics, the City should strive to market Northfax to a wide range of commercial tenants and retail uses in order to take advantage of these benefits. New residential uses and amenities such as open spaces and a pedestrian-friendly multimodal transportation network, should also be leveraged to improve the commercial marketability of the Activity Center.

Refer to the Northfax Small Area Plan, dated June 2020, for specific recommendations within the Northfax Activity Center, including locations for future streets and open spaces, pedestrian connections, building height and form, general land use, and development limitations. The overall concept plan for Northfax, as provided in the Small Area Plan, is shown to the right.

SOCIAL AND CIVIC NETWORK

Definition

The Social and Civic Network Place Type, identified in blue on the Future Land Use Map, includes public and private schools, libraries, places of worship, post offices, and other public facilities There are no specific corresponding Link + Place Street Types for this category because the varying types of Social and Civic Network land uses are appropriate in a variety of conditions. There is no zoning district specifically related to this Place Type. More information on the zoning districts for which uses in this Place Type are permitted, or constitute a special use, is provided in the Principal Use Table in the Zoning Ordinance. In order to support the recommendations of the Housing Guiding Principle in this chapter, residential uses may be considered in conjunction with other uses in the Social and Civic Network Place Type, provided such residential uses are considered affordable.

Physical Characteristics

New development of, or modifications to existing, social and civic uses located in any Residential Neighborhood should complement the character of the surrounding properties and provide transitional screening where necessary. Any new, or modifications to, existing social and civic uses located in an Activity Center should reflect the typical context of the center. New buildings should be oriented towards the street network and provide additional pedestrian connections to surrounding uses as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan.

GREEN NETWORK

Definition

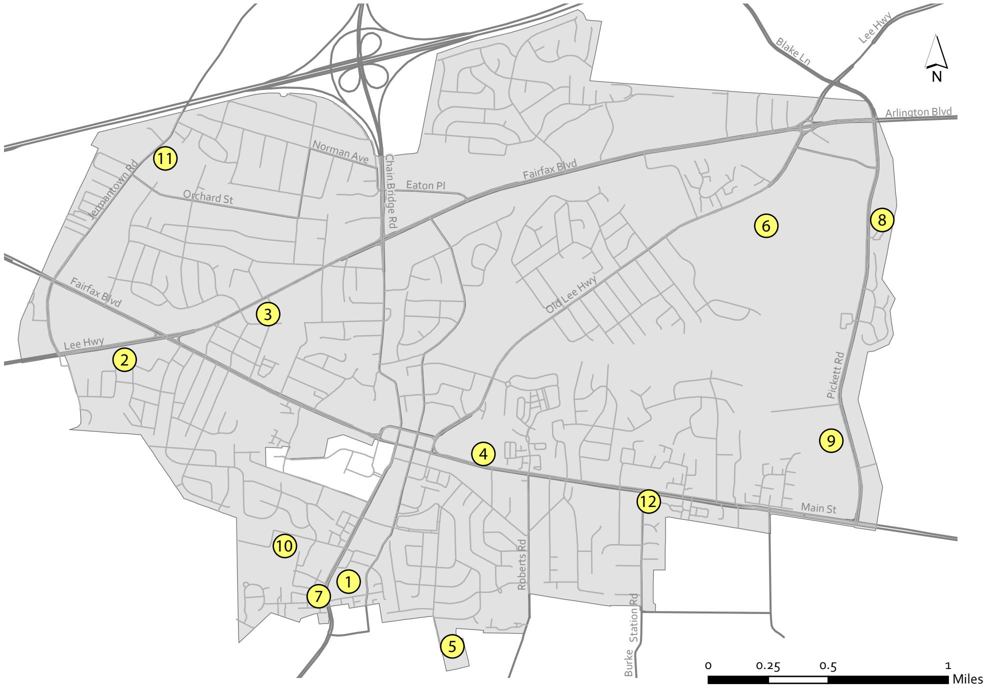
The Green Network Place Type includes public spaces, such as active and passive parks, trails, playing fields, public recreation facilities, cemeteries, open space, and private facilities such as golf courses and private open space. There are currently no zoning districts specifically related to this Place Type. Green Network uses are permitted in the CR, Commercial Retail; CU, Commercial Urban; and CG, Commercial General zoning districts and constitute a special use in all of the residential zoning districts. Outdoor recreational uses, such as tennis courts and golf courses, are permitted as a special use in all of the nonresidential zoning districts except for CL, Commercial Limited.

Physical Characteristics

New recreational facilities shall provide connections to the pedestrian and street network as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan. Proposed connections to other green spaces to complete the network should be prioritized for recreation and transportation purposes as well as ecological benefits. Properties in the network also include natural areas for conservation and protection. Parking facilities for specific recreational uses shall be integrated into the site so as not to prioritize vehicular access over pedestrian connections.

Parcel Specific Considerations

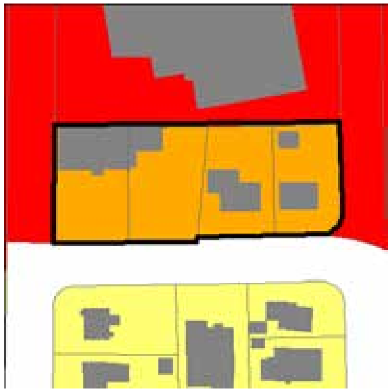
In some cases, the appropriate Place Type for a parcel or group of parcels can vary based on the specifics of design, changes in market demand and variations in surrounding conditions. Several sites in the City have been identified for further consideration of their Place Type designation based on these factors. These sites are identified on the map to the right and described below. While alternatives may be considered, the existing Place Type designation on the Future Land Use Map is the primary recommendation for each site. This list may be expanded in future modifications of this in plan. In particular, potential alternative Place Type designations should be considered for privately-owned sites with a Social and Civic Network designation.



1. Inova and Sunrise Assisted Living

The Inova Emergency Care site, located on Chain Bridge Road, School Street, and George Mason Boulevard, encompasses 9.6 acres and is currently occupied by the Inova Fairfax Emergency Care Center, Sunrise Assisted Living, and the PACE senior medical care center. This site is likely to become available for redevelopment within the next few years. Its unique location makes it suitable for different uses to include commercial, multifamily, and/or townhouse uses. Commercial uses are appropriate along Chain Bridge Road. Any multifamily development should provide substantial buffering to abutting residential uses to the north. Building heights should be no more than three floors along the north, east, and south property lines. Additionally, townhouse uses may be considered as a transition to adjacent, lower-density residential uses.

2. Park Road Properties



Four properties located along Park Road, totaling 0.89 acres, are located within the Westmore Neighborhood but are commercially zoned. Two of the parcels contain a commercial building. The other two parcels contain single-family residential buildings, though one is occupied by a commercial business. Given the location of these lots and their dependence on access from within the neighborhood, alternative uses may be more appropriate than a commercial zoning designation.

Single-family attached residential uses would provide a logical transition between the single-family detached neighborhood to the south and commercial uses to the north. Single-family detached residential uses may also be appropriate. Commercial uses may be appropriate if the properties are consolidated with commercial properties to the north so vehicular access is not dependent on Park Road.

3. Oak Street Properties

Five parcels (059 through 063 on the attached map) located along the west side of Oak Street between Fairfax Boulevard and Cedar Avenue are designated as Single-Family Attached and Single-Family Detached though they are surrounded by higher intensity uses, including the potential Fairfax Garden redevelopment to the west and commercial uses to the north and east. While the Place Type designation supports the current uses, these properties may be appropriate for a Multifamily Neighborhood Place Type designation if they are all included in a parcel consolidation. Alternatively, parcel 063 may be appropriate for a Commercial Corridor designation if it is consolidated with properties with that Place Type designation to the north.

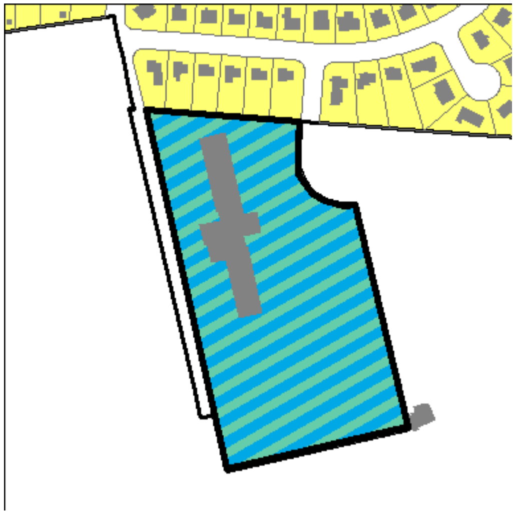
4. Farr Homeplace

This 9.4-acre property located along Main Street between Farrcroft and Main Street Marketplace is privately-owned and the location of the "Farr Homeplace," also known as "Five Chimneys." There is a Resource Protection Area in the rear of the property. Although no historic designation exists, it should be explored for inclusion within a Historic Overlay District. An alternate use may include Single-Family Attached Neighborhood. Any development should retain the existing house, minimize disturbance in the Resource Protection Area, and consider appropriate relationships with the Farrcroft neighborhood to the east.

5. Green Acres

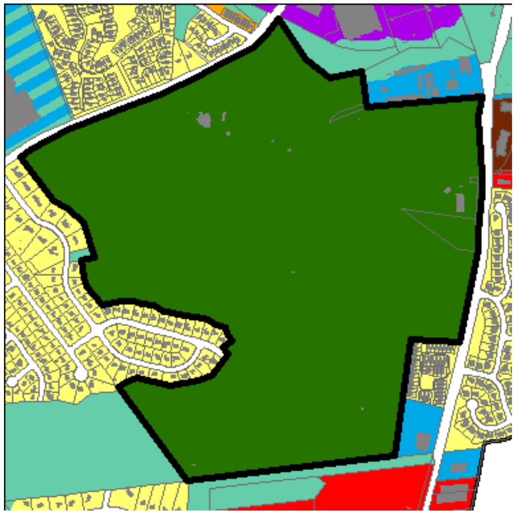
The Green Acres site encompasses 10 acres of land surrounded by George Mason University with one street leading to it through a residential neighborhood. The 2016 Green Acres Feasibility Study found that it is not best suited for the community center use it currently serves and recommended a new community center be constructed elsewhere in the City. The study proposed three alternatives for the future use of the Green Acres site; retaining the entire site for future community uses, selling the entire site, or retaining a portion of the site for community use and selling a portion of the site. The study does not recommend specific uses.

The City of Fairfax School Board reserves the right to retain the site for construction for a future school if necessitated by enrollment demands. This is governed through a covenant on the property. For this reason, the Social and Civic Network Place Type designation should remain. If this covenant is transferred to another property in the City, it would no longer be needed at Green Acres, and the site would become available for other uses.



6. Army Navy Country Club

Covering approximately 234 acres, the Army Navy Country Club is the largest individual property in the City and the largest area of open space. While there are no known plans for the Country Club to vacate or for the property to be developed, and this plan supports continued use of the property for open space, priorities for the future of the site should be considered. Given the wide array of potential implications development of this site could have on the various Guiding Principles for the City, an advisory committee should be formed to conduct a comprehensive analysis and provide recommendations on key priorities if development becomes likely.

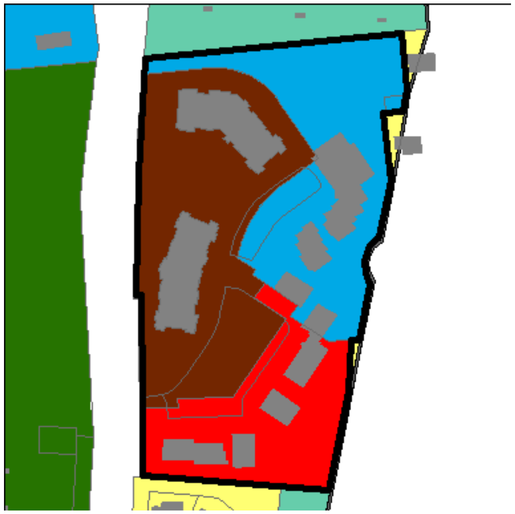


7. 4328 Chain Bridge Road

Encompassing just over half an acre, this site is located on the northwest corner of Chain Bridge Road and School Street. Adjacent properties to the north, west and south are occupied by fairly new townhomes and single-family homes that are not expected to be redeveloped within the timeframe of this plan. Redevelopment on this site should be limited to three stories to integrate with surrounding development. An alternative use for the site could include townhomes for which partial fourth stories could be considered for portions of the site that are not directly adjacent to shorter buildings.

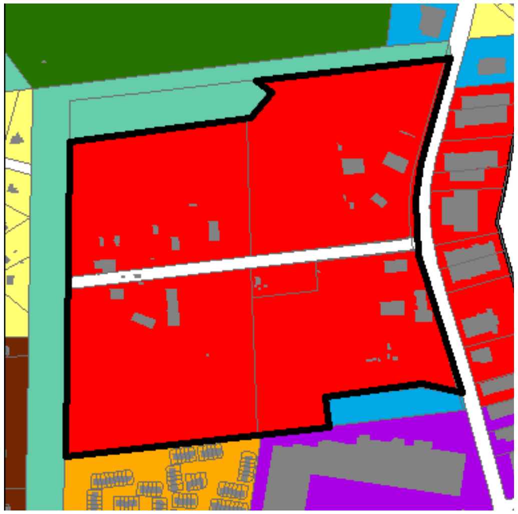
8. Mantua Professional Center

The Mantua Professional Center was originally approved as an office development in 1975, though only a portion of the approved development was ever constructed. Since that time, the original approved plan has been amended several times, including separate amendments that converted portions of the site to be used as a private school and multifamily condominiums. As a result, the current complex is now occupied by three distinct uses. Alternative uses could include multifamily residential or townhomes in the portions of the site currently designated as Commercial Corridor and Social/Civic Network. Any expansion of residential uses in the complex should be cognizant of existing neighborhoods to the south and east and should provide adequate transitions in these areas.



9. Tank Farm

The Pickett Road tank farm comprises above-ground storage for four commercial gasoline and fuel oil facilities and an underground pipeline station on approximately 71 acres. No expansion of the existing heavy industrial uses at this site would be appropriate, and the Commercial Corridor place type is recommended for future development. While there are no known plans for the tank farm to be redeveloped, guidance on development priorities and alternative uses that complement recommendations for the Pickett & Main Activity Center should be established for the site.

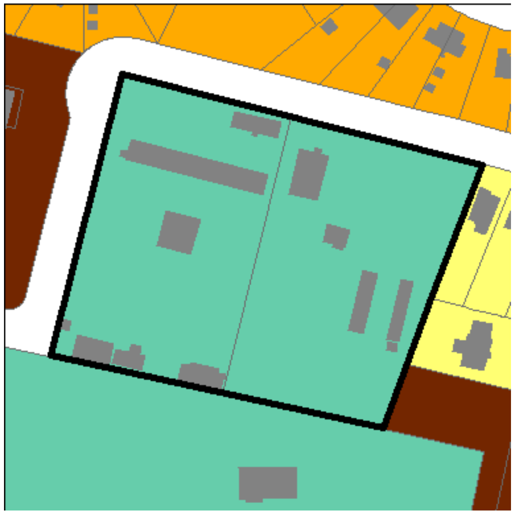


Fairfax County Property Yards

Fairfax County currently owns and manages three property yards within the City, located on West Drive, Jermantown Road, and Main Street. Fairfax County may consider some of these locations for closure in order to provide more efficient services from a consolidated, centralized location. Should Fairfax County choose to vacate any of these locations and dispose of the properties, the City should consider pursuing acquisition. These properties have been identified as potential locations for park uses, open space, affordable housing partnerships between the City and non-profit entities, school sites, property yard functions, or other uses.

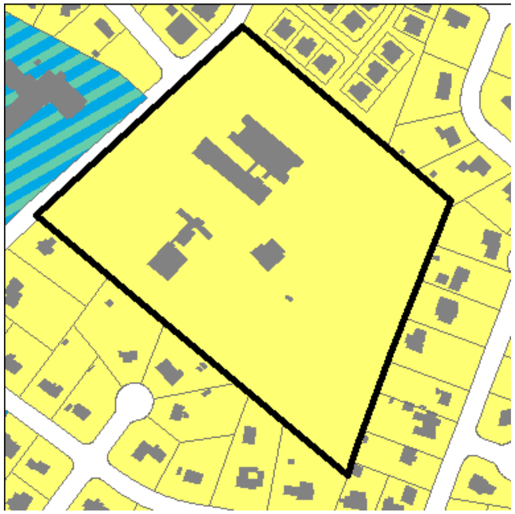
10. West Drive

The two properties that make up the West Drive property yard site encompass 4.2 acres and present a logical extension of the adjacent Providence Park. Their inclusion in the park area would also make Providence Park large enough to host a potential future elementary school in place of the Green Acres site, should that site be desired for other uses. If the City does not acquire this site, it is most suitable for residential development, including single-family detached, single-family attached, or multifamily units. Residential development should provide logical transitions to adjacent uses, particularly along the eastern property line where it abuts existing single-family uses.



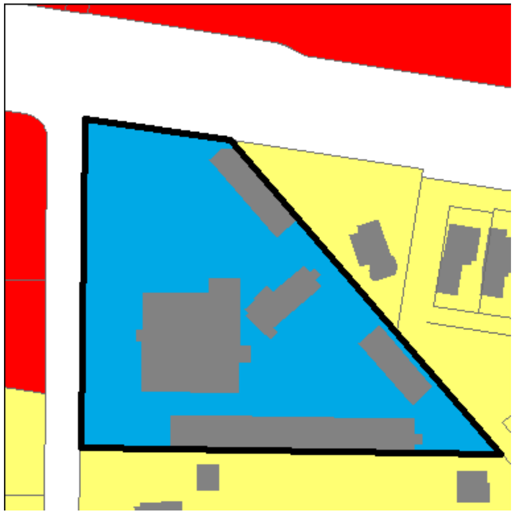
11. Jermantown Road

If this 15-acre property discontinues its function as a property yard and the City does not acquire it, single-family detached residential uses are an appropriate use, consistent with surrounding uses. The cemetery on this parcel should not be impacted by any redevelopment.



12. Main Street

This 2.45-acre parcel is bounded on two sides by roads, Main Street and Burke Station Road. If the City obtains this site, one potential reuse would be a relocation of some of the City's public works services, currently located at the Property Yard on Pickett Road. The existing property yard has flooding issues and diminishing space. The Parks and Recreation Strategic Plan also recommends identification of new potential park sites in the southeast portion of the City. While this site is relatively small, open space uses would provide an amenity in a portion of the City in which open space is not abundant. If the City does not purchase this property, appropriate uses include single-family detached, single-family attached, or commercial uses.



Neighborhoods

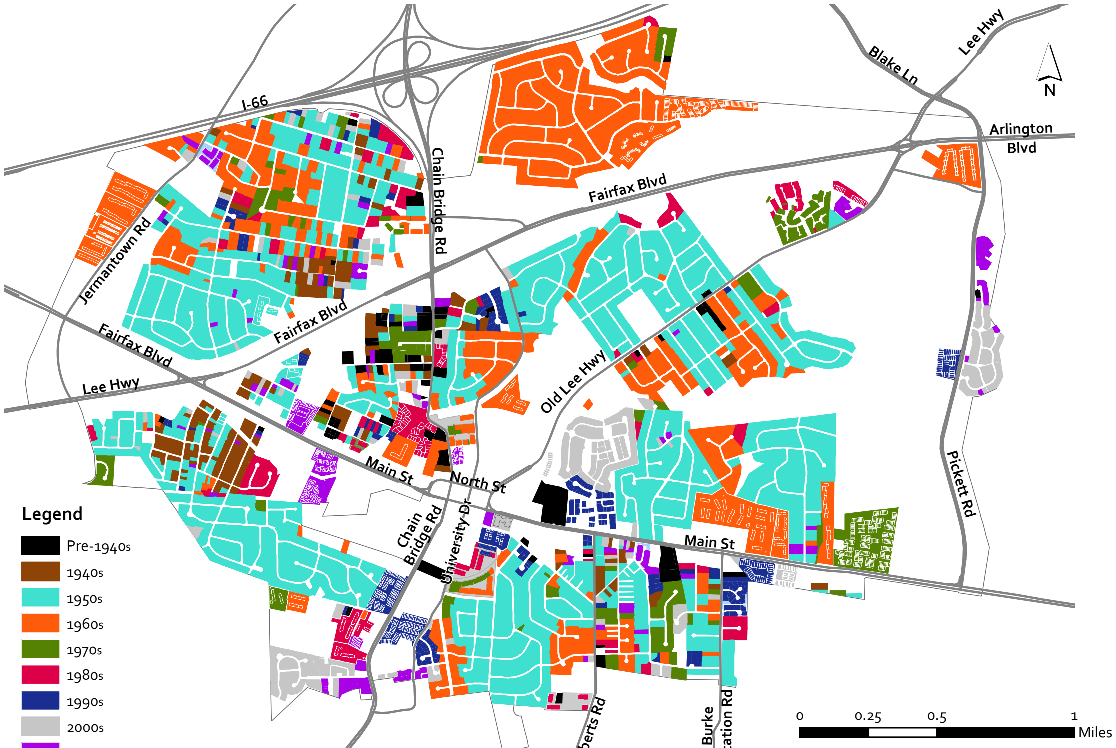
Neighborhoods – the places where we live, learn, play, and increasingly work – constitute the largest geographical use of land in the City, though physical boundaries are not the only defining character trait of a neighborhood. Numerous characteristics define neighborhoods, including the period of building and development (Figure 10), subdivision patterns, architectural style, location of public amenities and services, and presence of social or civic organizations. The City's neighborhoods each have their own unique character and offer a variety of housing and lifestyle opportunities.

Neighborhoods are supported by a separate Guiding Principle in this Plan due to their importance to residents. City growth and development policies must both preserve the quality of neighborhoods and protect neighborhoods from adverse consequences of growth. However, this should not imply that Fairfax's neighborhoods should remain static. Well-designed and properly scaled infill can be an appropriate strategy to foster walkability, better amenities, and housing affordability. This section's goals strive to balance these concerns and take advantage of opportunities through improved policies and regulations, and increased communication with and within the community.

Guiding Principle:

In 2035, Fairfax is a city with...
inviting neighborhoods, each
with its own unique character.

FIGURE 10 HOUSING AGE BY DECADE BUILT



Source: City of Fairfax GIS and Real Estate data 2016

Neighborhoods Goal 1

Enhance neighborhood character.

There is relatively little undeveloped land available in the City for new residential neighborhoods. As the City's housing stock ages, replacements for, or additions to, existing structures will be the prevalent methods of updating housing to meet current market demands. The City should use this as an opportunity to enhance the character and inclusiveness of the City's neighborhoods. Any modification or new construction on residential lots located in established neighborhoods should be compatible with the character of that neighborhood. In order to encourage reinvestment in neighborhoods, the City and civic associations should educate residents about programs available to them (such as Fairfax Renaissance Housing Corporation loans) and the processes involved in updating their homes.

OUTCOME N1.1:	Infill housing that complements the character of surrounding homes in existing neighborhoods.
ACTION N1.1.1	Maintain regulatory standards to ensure infill housing fits in with the surrounding neighborhood context.
OUTCOME N1.2:	Residents have regular communication and positive interactions with other members of their neighborhood as well as the larger City community.
ACTION N1.2.1	Encourage and support community engagement through homeowner, condominium, and civic associations.
ACTION N1.2.2	Establish regular communication with homeowner, condominium, and civic associations and residential property managers as a means to keep individual citizens informed about City business.

Neighborhoods
Goal 2

Provide neighborhood pedestrian connections.

Walkability was frequently cited as a desired attribute of the City during the Comprehensive Plan's public outreach process. Ensuring our neighborhoods are designed to both encourage pedestrian activity and to provide various transportation alternatives will enable people of all abilities to get around the City efficiently and reduce traffic congestion. Improving walkability is not just about adding more sidewalks and trails, but also looking at destinations residents can walk to – such as parks, schools, Commercial Corridors, Activity Centers, and other local destinations – and identifying the condition of the transportation network that can get them there. The strength of a network to get someone from point A to point B is only as good as its weakest link.

OUTCOME N2.1:	Residents of all abilities safely and easily move about the community.
ACTION N2.1.1	Identify opportunities for future open space and trails in neighborhoods that are currently deficient in offering these amenities.
ACTION N2.1.2	Expand existing pedestrian network to increase connectivity within neighborhoods and to other destinations.

Commercial Corridors and Activity Centers

Fairfax's success in achieving the community's vision for future development hinges upon effective growth strategies for the City's areas of highest redevelopment potential. These areas will accommodate the majority of new commercial activity, higher density residential neighborhoods, and transportation improvements. Success in achieving this vision will be measured not by the magnitude of new investment, but rather by the attributes that can transform a disjointed pattern of development into an attractive and welcoming neighborhood. If the City's Commercial Corridors and Activity Centers can be transformed into areas with attractive physical characteristics and a mix of uses, then the City will realize a major aspect of its goal to be a vibrant 21st century community.

While higher intensity mixed-use redevelopment of older commercial properties can provide economic and social benefits to the community, these benefits would be most realized if concentrated in key areas to allow new developments to complement each other, avoid oversaturating the market, and minimize impacts to existing neighborhoods. These types of uses are primarily envisioned in Activity Centers, as indicated on the Future Land Use Map. While a mix of uses and connected street grids are envisioned in all Activity Centers, such development is always encouraged in the Old Town Fairfax and Northfax Activity Centers. More specific guidance is provided for these two areas in the Activity Center Place Type (pages 35-36) and through the goals of this Guiding Principle.

Guiding Principle:

In 2035, Fairfax is a city with...
flourishing centers of commercial and mixed-use activity that include an assortment of grocery stores, restaurants, cafes, entertainment venues, retail stores, offices, and housing.

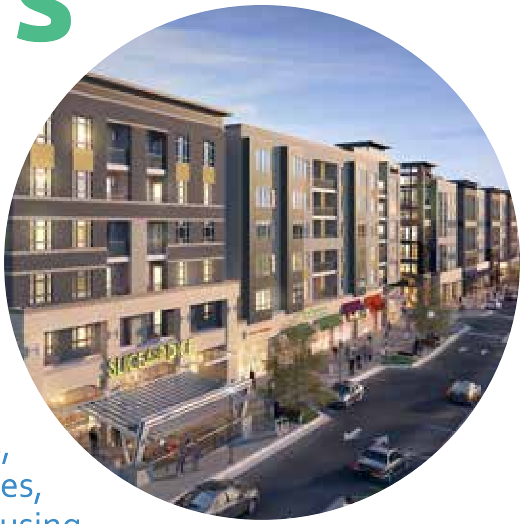


Photo Credit: Hord Coplan Macht

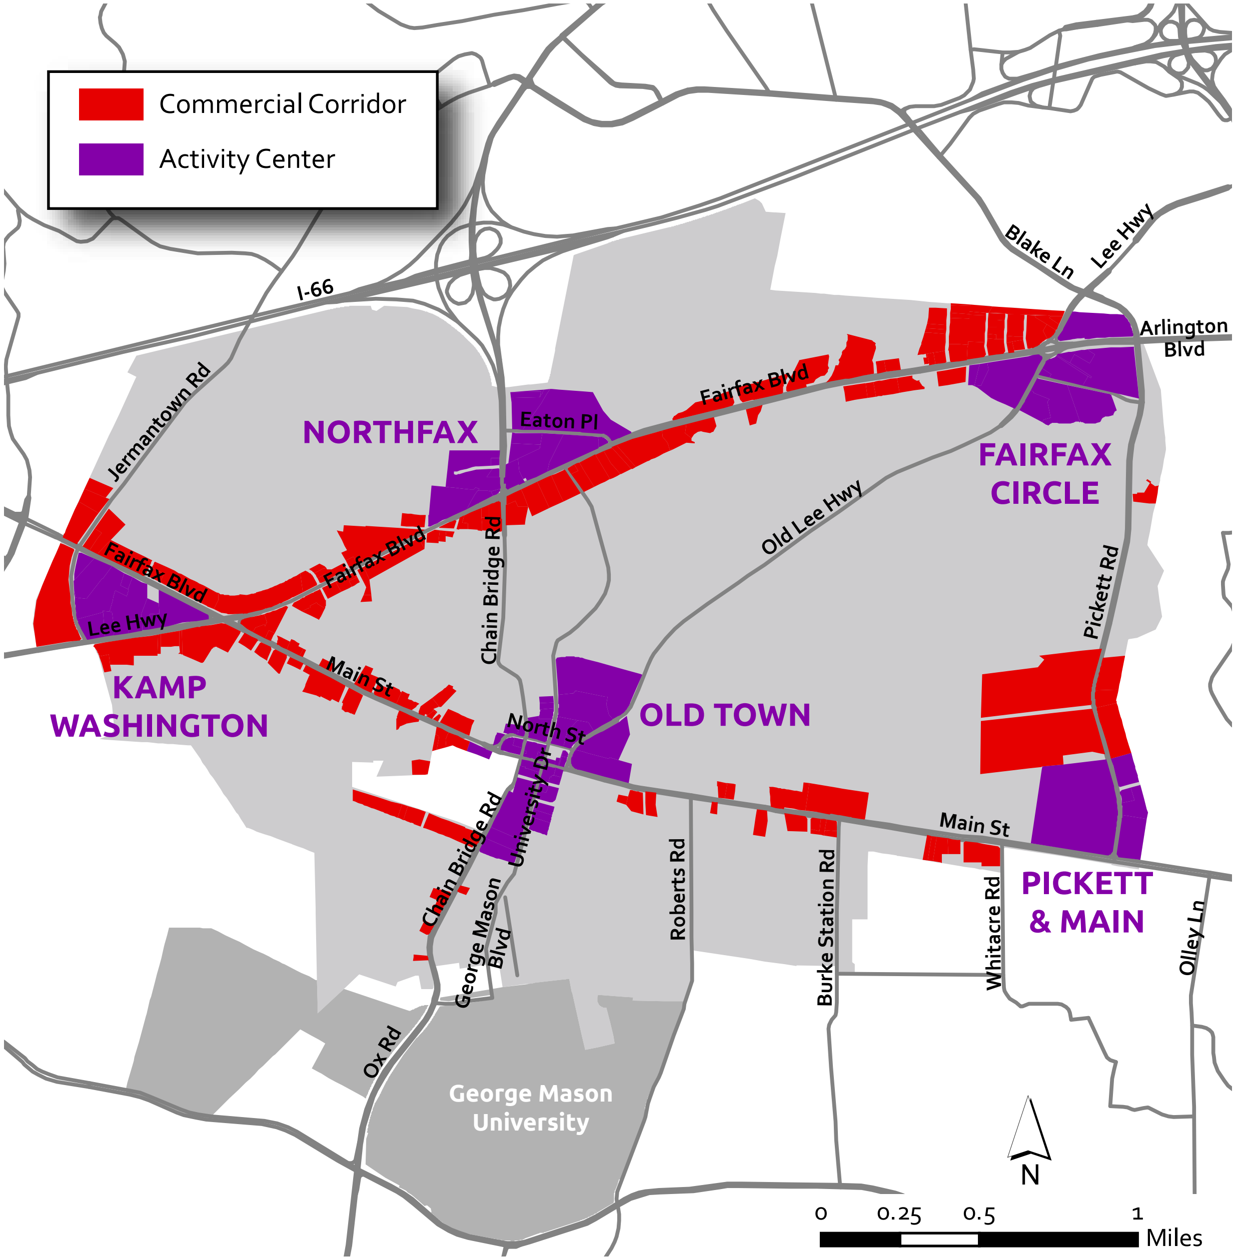
FIGURE 11 ACTIVITY CENTERS AND COMMERCIAL CORRIDORS



While reinvestment and redevelopment of properties in Commercial Corridors is encouraged, incorporation of residential mixed uses is not recommended. Stronger pedestrian orientation and improved aesthetics are encouraged in Commercial Corridors through the physical attributes of the Place Type and recommendations of the City of Fairfax Design Guidelines.

Commercial Corridors and Activity Centers

Goal 1

Enhance Commercial Corridors.

Many commercial properties in the City are underutilized with an overabundance of surface parking. These properties are often suitable for redevelopment, whether to achieve greater use of the land or to make the properties more market competitive. New development and redevelopment must enhance commercial activities along the City's major corridors with a mix of retail, office, and service offerings in an attractive and welcoming setting. Recently-approved projects indicate that there is demand for additional investment in many of these properties.

OUTCOME CCAC1.1:	Commercial Corridors with attractive physical characteristics that provide shopping, dining, services, and other businesses.
ACTION CCAC1.1.1	Encourage commercial redevelopment that offers amenities and atmosphere to attract top-tier commercial tenants.
ACTION CCAC1.1.2	Identify underutilized properties (i.e., buildings assessed at considerably less than the total property value) and, working with the City's Economic Development Authority, encourage redevelopment.
ACTION CCAC1.1.3	Encourage creativity and architectural excellence in new commercial developments.
ACTION CCAC1.1.4	Develop urban design concept diagrams for small block and multi-block areas along the City's Commercial Corridors outside the Activity Centers.
ACTION CCAC1.1.5	Encourage tree-lined and heavily-landscaped property edges, particularly where surface parking is adjacent to the public rights-of-way.
ACTION CCAC1.1.6	Provide pedestrian and bicycle connections to nearby neighborhoods.
OUTCOME CCAC1.2:	Tenants representing diverse business sectors that meet current and emerging trends in neighborhood-serving retail, service, and other business demands.
ACTION CCAC1.2.1	Strengthen existing retail businesses and expand choices to capture retail spending by residents.
ACTION CCAC1.2.2	Create a marketing plan to generate excitement about the current retail and service offerings.

Commercial Corridors and Activity Centers

Goal 2

Promote redevelopment in the City's Activity Centers.

While actions throughout the City will contribute to fulfill the community's vision for the City's future, those pertaining to land use planning in these specific areas carry an outsized importance. The City will promote redevelopment in Activity Centers to strengthen economic vitality; provide retail, office, and residential opportunities for sustained demand; and reinforce the City's regional appeal. Given the potential scope of redevelopment opportunities, new construction in these areas to accommodate various types of housing units and commercial tenants could accomplish many of the goals set forth elsewhere in this Plan's Land Use Chapter.

OUTCOME CCAC2.1:	Old Town Fairfax, including an expanded downtown area to its north and south, is a lively, economically viable, walkable cultural hub for the City.
ACTION CCAC2.1.1	Capitalize on the authenticity and appeal of Old Town Fairfax as an historic place and a shopping, dining, and tourist destination.
ACTION CCAC2.1.2	Attract and retain businesses along Main Street and market it as a primary retail street for Old Town Fairfax.
ACTION CCAC2.1.3	Maximize the use of publicly-owned properties to contribute to the economic and cultural vibrancy of Old Town Fairfax.
ACTION CCAC2.1.4	Encourage redevelopment of privately-owned, underutilized sites north and south of Old Town Fairfax, such as the Courthouse Plaza shopping center and the area west of University Drive between Sager Avenue and Armstrong Street, as mixed-use developments.
ACTION CCAC2.1.5	Market the connection to Old Town Fairfax from George Mason University and emphasize Old Town Fairfax as a desirable place for students and faculty to shop, dine, and live.
ACTION CCAC2.1.6	Support efforts by Fairfax County to develop a Master Plan for the County Courthouse Complex including encouraging improved connections between the complex and surrounding areas, as well as uses that contribute toward, rather than compete with the vibrancy of the Old Town Activity Center.
OUTCOME CCAC2.2:	A pedestrian-oriented, mixed-use destination at Northfax that capitalizes on its location to successfully compete with other regional centers.
ACTION CCAC2.2.1	Pursue feasibility of a public-private partnership to develop parking structures.
ACTION CCAC2.2.2	Consistently articulate expectations for unified developments and support measures that facilitate property consolidation.
ACTION CCAC2.2.3	Encourage the redevelopment of Northfax as a major commercial center and transit-oriented development that capitalizes on a potential future Metrorail station along I-66.

Commercial Corridors and Activity Centers

Goal 2

OUTCOME CCAC2.3:	Old Town Fairfax, Northfax, and the other Activity Centers are well-designed and desirable places to live, work, shop, and dine.
ACTION CCAC2.3.1	Encourage structured parking and minimize surface parking, particularly adjacent to public rights-of-way.
ACTION CCAC2.3.2	Promote the orientation of buildings facing toward streets with architecture that engages street-level activity.
ACTION CCAC2.3.3	Promote active streetscapes with minimal building setbacks, pedestrian amenities, street furniture, on-street parking, landscaping, and other features.
ACTION CCAC2.3.4	Support land planning that balances connectivity for pedestrians, bicyclists, and motorists.
ACTION CCAC2.3.5	Prepare individual Small Area Plans, as defined in Section 15.2-2303.4 of the Code of Virginia, for each of the Activity Centers that clearly demonstrate the desired mix of uses, residential density, building intensity, design aesthetic, specific street locations and multimodal connections, infrastructure improvements, parking, and open space.
ACTION CCAC2.3.6	Target and coordinate public infrastructure improvements with desired infill, reinvestment, and redevelopment areas to encourage and stimulate private development.

Housing

Guiding Principle:

In 2035, Fairfax is a city with... a choice of housing types that meet the needs of our community.

In order to function equitably and inclusively, the City must prioritize the availability of housing units for people of widely varying income levels, ages, and lifestyle choices. While there is great variety among the approximately 9,000 housing units in the City, several types or characteristics of housing may be underrepresented among the current housing mix, especially as other nearby communities undergo redevelopment and expand their offerings.

Although the City is primarily built out, a variety of new housing types can be accommodated through redevelopment on a relatively limited basis to broaden the current offerings and accommodate changing demands. Accordingly, housing that is affordable, housing that is designed for older adults and people with disabilities to accommodate the City's relatively high proportion of older adults, and housing for growing younger families seeking modern single-family housing without leaving the City should be prioritized.

Existing housing units can also accommodate changing demands through renovations and retrofits. Prioritizing additional housing units in underrepresented market segments, improving the functionality of existing housing units, and accommodating in-demand housing types would help to ensure that the City is as welcoming as possible to current and potential residents, regardless of socioeconomic status, age, or other circumstances.

In addition to expanding housing choices, proactive strategies should be taken to ensure that existing housing units that are affordable are preserved and that new units that are affordable are added to the City's overall housing unit mix.

Housing
Goal 1

Support a wide range of housing types.

It is vital that a variety of high-quality, attractive housing choices continue to be available in the City to support differing needs and demands of residents. Housing needs and demands are reflective of the existing housing stock and fluctuating market trends, making them subject to change over time. Specific housing types are identified in the Land Use Strategies Section of the Comprehensive Plan. Current shortages could include multifamily rentals and condominiums, of which the majority of the City's stock was built in the 1960s, and townhomes, of which the City currently has a lower ratio than many surrounding communities in Fairfax County. Although significant single-family development is not anticipated as the City is primarily built-out, potential redevelopment and infill housing that keep up with modern expectations and meet demand are encouraged, provided they comply with the Zoning Ordinance.

OUTCOME H1.1: Continued development of housing types that are underrepresented in the City's existing stock of housing units.

ACTION H1.1.1 Create a housing policy that can best provide for the types of housing units that are most in demand.

1.1.1.1 Conduct a housing assessment to examine the types of housing that are most in demand in the City for a full income range of households, or are most supportive of growing sectors of the local economy.

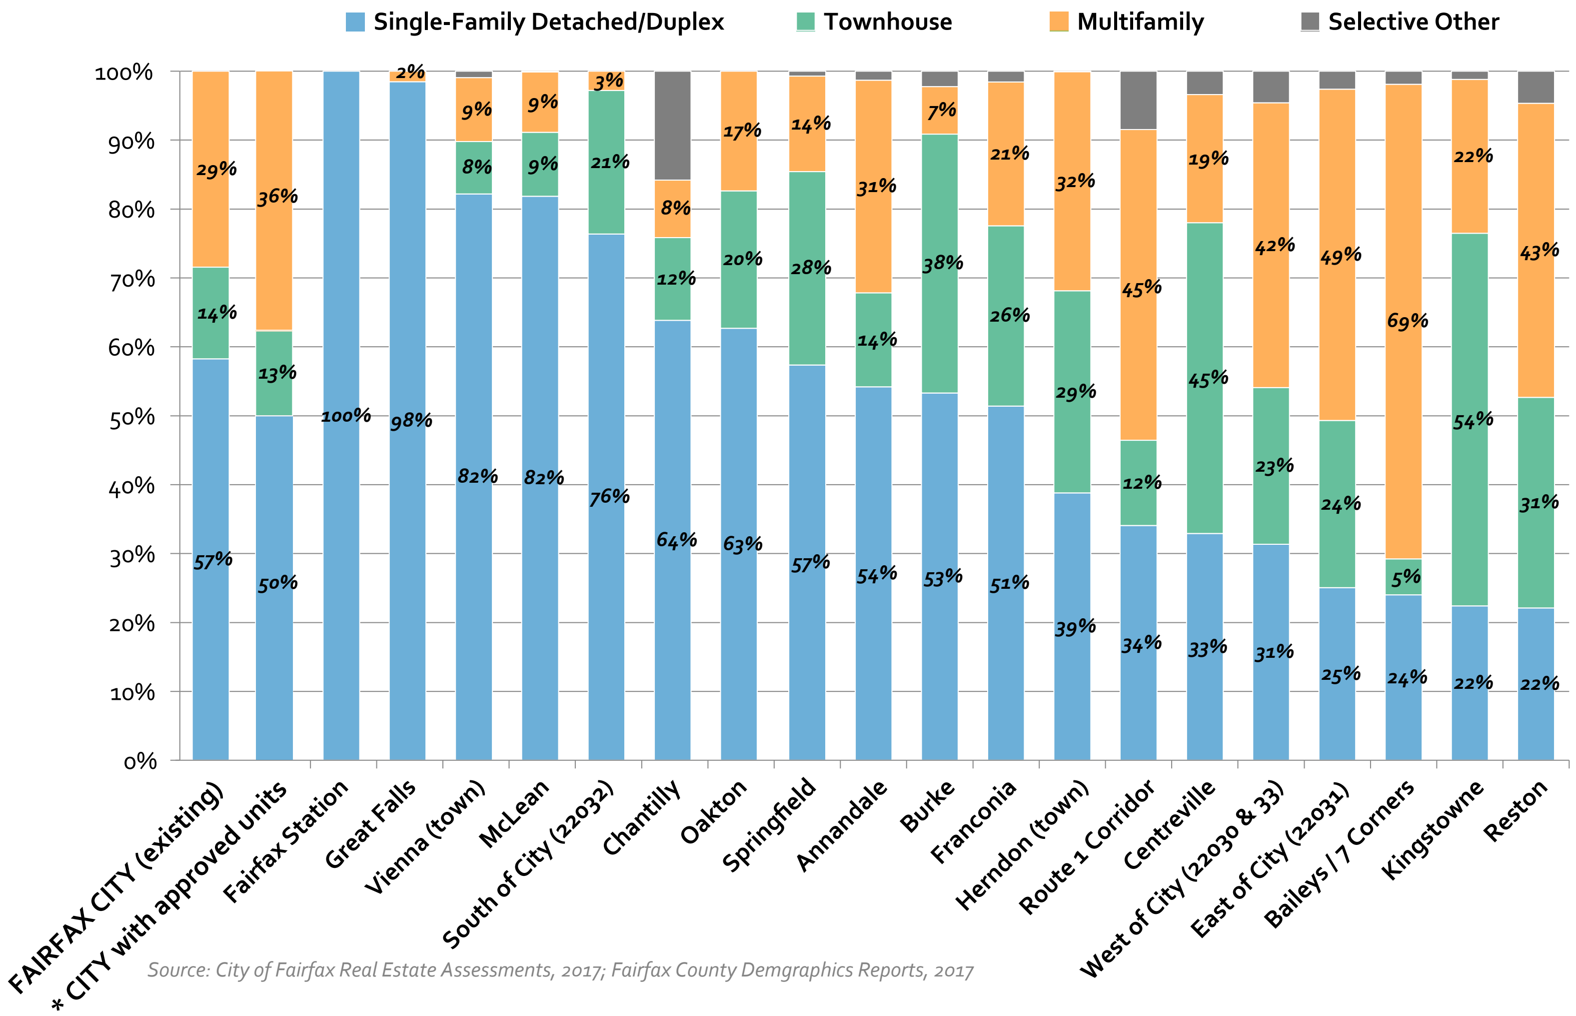
1.1.1.2 Support development of housing types that are not heavily represented in the City's housing stock, as identified in the housing assessment, where reasonable.

1.1.1.3 Consider efforts to market new and existing housing stock in the City to growing sectors of the regional economy.

ACTION H1.1.2 Research changes to the zoning regulations to expand opportunities for accessory dwelling units, while ensuring they do not negatively impact the surrounding neighborhood.

Figure 12 on the following page provides a comparison of housing type percentages between the City (both current and approved) and other parts of Fairfax County.

FIGURE 12 HOUSING UNITS BY TYPE



Source: City of Fairfax Real Estate Assessments, 2017; Fairfax County Demgraphics Reports, 2017

* City with approved units = Approved and unbuilt units as of the adoption of this Comprehensive Plan.

Housing

Goal 2

Ensure availability of housing that is affordable.

During the Comprehensive Plan outreach process, affordable housing was the primary issue that rose to the forefront of the housing discussion. (Code of Virginia Section 15.2-2201 defines affordable housing as housing that is affordable to households with incomes at or below the area median income, provided that the occupant pays no more than thirty percent of his gross income for gross housing costs, including utilities. However, the actions associated with this goal could target households with incomes below the median.) In addition, Code of Virginia Section 15.2-2223 states that the Comprehensive Plan "shall include the designation of areas and implementation of measures for the construction, rehabilitation and maintenance of affordable housing, which is sufficient to meet the current and future needs of residents of all levels of income in the locality." There are a number of tools available to encourage the establishment of new affordable residential units as well as to preserve existing "naturally occurring affordable housing" that is affordable to families earning below the region's median household income. Affordable housing should be encouraged in higher-density areas of the City, particularly in the Activity Centers.

OUTCOME H2.1:	Affordable housing units have been added to the City's housing stock through redevelopment and strategic investments.
ACTION H2.1.1	Maintain a robust housing affordability program and dedicated housing trust fund that could be used to rehabilitate and preserve existing housing that is affordable or to help leverage other funding streams for new construction.
ACTION H2.1.2	Provide regulatory and financial incentives to increase the supply of affordable housing, including amending the City's Zoning Ordinance to include an Affordable Dwelling Unit ordinance.
ACTION H2.1.3	Pursue a contractual partnership with the Fairfax County Department of Housing and Community Development to administer elements of a housing affordability program for the City.
ACTION H2.1.4	Provide alternative means of accommodating new dedicated affordable housing units, such as leveraging vacant or underutilized public land; supporting or partnering with private, non-profit, or faith-based organizations; and co-locating affordable housing with public construction.
OUTCOME H2.2:	Preservation of and reinvestment in the City's existing supply of affordable multifamily rental housing units.
ACTION H2.2.1	Facilitate partnerships between existing property owners and nonprofit organizations to preserve and ensure long-term affordability of existing multifamily complexes.
ACTION H2.2.2	Promote the use of the Low Income Housing Tax Credits, tax abatements, low-interest loans, the PACE (Property Assessed Clean Energy) Program, and other funding sources available to reinvest in and upgrade existing multifamily complexes.

Housing
Goal 3

Provide housing options for older adults and persons with disabilities.

Housing that is designed for older residents and persons with disabilities was another issue that rose to the forefront of the housing discussion during the Comprehensive Plan's public outreach sessions. Given the relatively high concentration of older adults in the City as compared to surrounding jurisdictions, demand for such units from existing City residents could be strong. Housing should be suitable for a range of choices, such as aging in place, accessory dwelling units, dedicated senior housing, and assisted living/nursing care. In addition, options should be available for people with a variety of disabilities and incorporate features of universal design - the design of buildings, products, or environments to make them accessible to all people, regardless of age, disability, or other factors.

OUTCOME H3.1:	A range of accessible housing types with appropriate levels of support and care is available for older adults and persons with disabilities that incorporate the concept of universal design.
ACTION H3.1.1	Express preferences regarding housing units that are appropriate and/or in demand for seniors and those with disabilities and incorporate features of universal design at a range of price points.
ACTION H3.1.2	Encourage development of congregate living facilities - a group of independent dwelling units that have common kitchen and dining areas - to support older adults and persons with disabilities.
ACTION H3.1.3	Review provisions within the City's Zoning Ordinance to identify and amend provisions that impede the ability to construct or modify housing containing minimal physical barriers for people of all ages and abilities, including but not limited to standards of universal design.

Housing
Goal 4

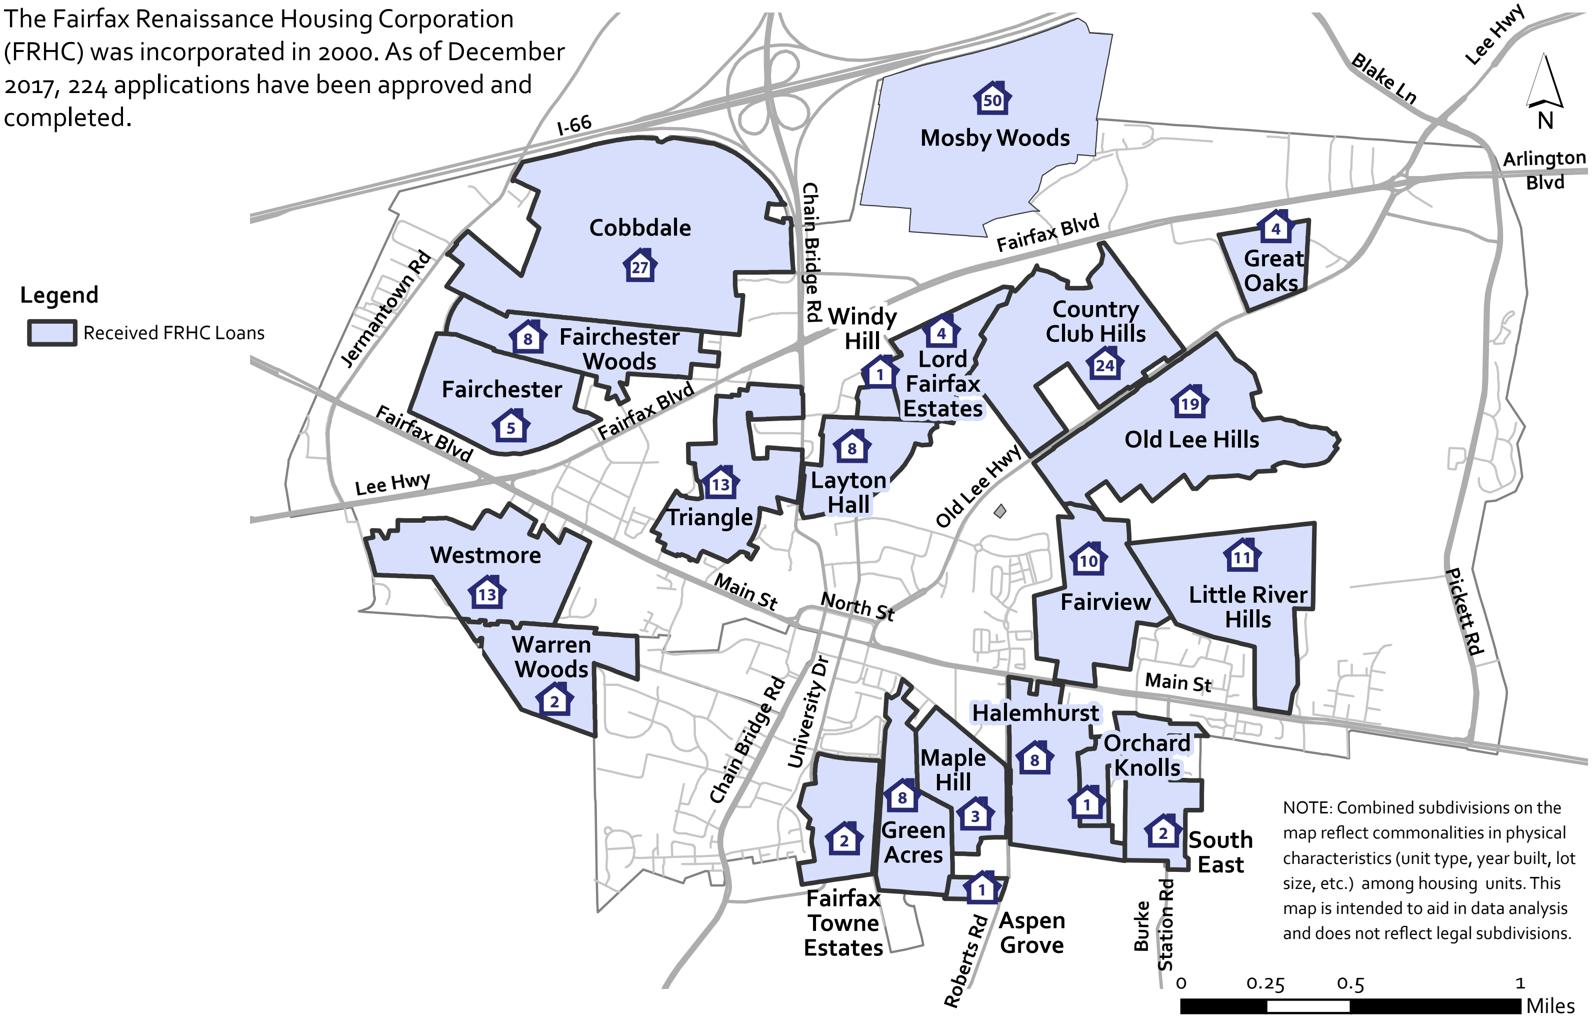
Support residential improvements of existing housing units.

Home renovations and expansions allow existing housing units in the City to keep up with modern expectations, including characteristics such as floor area, layout, style, technological amenities, and sustainable infrastructure. The Fairfax Renaissance Housing Corporation has assisted in such housing improvement projects throughout the City since 2000, as shown in Figure 13. In addition, the City has engaged in other programs, such as Solarize NOVA, to encourage residents to consider sustainable elements in home renovations.

OUTCOME H4.1:	A greater number of renovated housing units.
ACTION H4.1.1	Continue to encourage property owners to undertake residential reinvestment projects that can collectively modernize the City's housing stock.
ACTION H4.1.2	Encourage energy-efficient retrofits that reduce water use and heating and cooling costs.
ACTION H4.1.3	Continue to enforce compliance with building and property maintenance codes to prevent deteriorated, unsafe, and unhealthy housing conditions.
ACTION H4.1.4	Incentivize reinvestment in existing multifamily complexes.
OUTCOME H4.2:	Expanded City-sponsored residential improvement programs.
ACTION H4.2.1	Continue to explore modifications to the FRHC program to encourage greater participation.
ACTION H4.2.2	Encourage further engagement of programs to promote sustainable retrofits and incorporation of sustainable elements in residential renovations.

FIGURE 13 RESIDENTIAL IMPROVEMENT PROJECTS WITH FAIRFAX RENAISSANCE HOUSING CORPORATION (FRHC) LOANS

The Fairfax Renaissance Housing Corporation (FRHC) was incorporated in 2000. As of December 2017, 224 applications have been approved and completed.



NOTE: Combined subdivisions on the map reflect commonalities in physical characteristics (unit type, year built, lot size, etc.) among housing units. This map is intended to aid in data analysis and does not reflect legal subdivisions.

Community Design and Historic Preservation

Guiding Principle:

In 2035, Fairfax is a city with...
architecture that contributes
to a vibrant, creative place and
complements our historic character.

An attractive, well-designed City instills civic pride; improves the visual character of the community; creates a strong, positive image; and attracts quality developments. Community Design relates not just to what buildings look like, but to the spaces between buildings, as well as to the street and public realm. While accommodating new growth and change, consideration must be given to preserving significant elements of the community that contribute to the City's unique character.

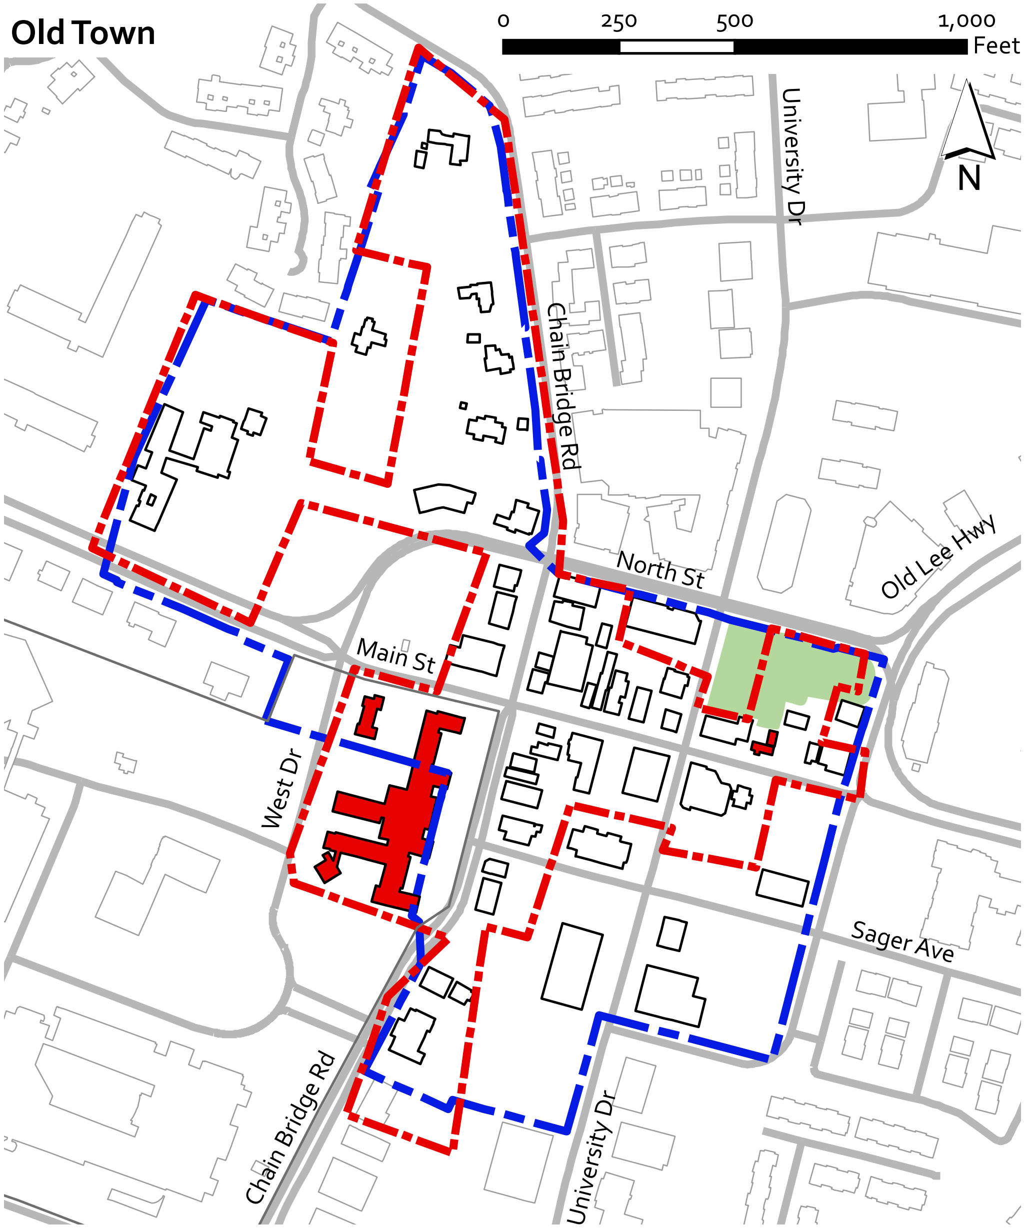
The intent of the Community Design and Historic Preservation Guiding Principle is to capitalize on unique features of the City in a manner reflecting the community's values and its connection to the history and traditions that distinguish it from other communities in the region. This can be accomplished through review and adjustment of planning, regulatory and incentive tools, and by improving coordination among stakeholders who impact the future development of the City, without unreasonably burdening the review process.

The primary resource on design elements for new construction, expansions and renovations is the City of Fairfax Design Guidelines. Separate design characteristics are described in the guidelines for the Old Town Fairfax Historic Overlay District, the Old Town Fairfax Transition Overlay District (both described on the following pages), and the Architectural Control Overlay District (which encompasses all properties within the City except for single-family residential properties and those properties located within one of the other overlay districts). The Board of Architectural Review, along with City staff, reviews development applications to determine if proposals meet the intent of the design guidelines.

Historic Overlay Districts

The majority of the City's historic architectural resources are concentrated in Old Town, the City's traditional core. Old Town is recognized and preserved both nationally as a National Register of Historic Places district as well as through a City preservation district zoning overlay (Figure 14). There are 52 buildings, 10 "other structures," and a monument within the National Register of Historic Places' "City of Fairfax Historic District," many of which are considered "contributing elements." Six of the buildings predate 1850 while others are from the turn of the 20th century to the early 1930s. The City's locally-designated Old Town Fairfax Historic Overlay District is larger in area than the National Register district.

FIGURE 14   HISTORIC DISTRICTS AND BUILDINGS



Source: City of Fairfax GIS 2016 Impervious Surfaces, Zoning Overlays, National Register Districts

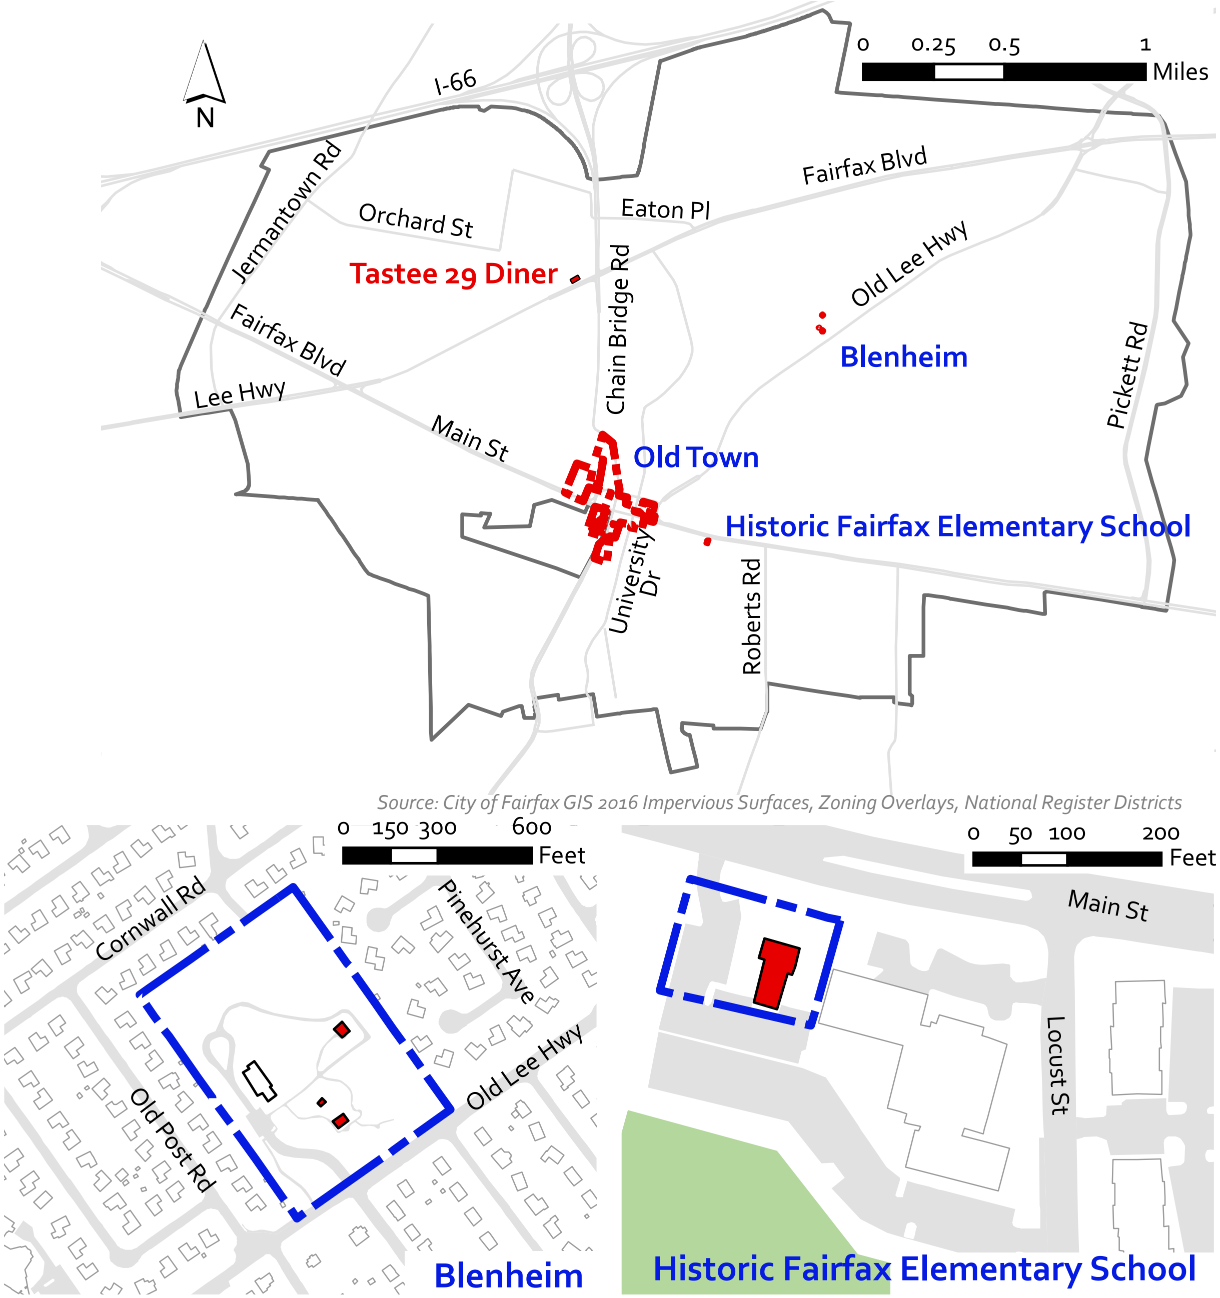
Legend

- 🟥 National Register Historic District
- 🟥 National Register Historic Building
- 🟦 City Historic District
- ☐ Building
- — Centerline of Road
- 🟩 Park

In addition to Old Town, the City has historic zoning overlay districts for two other properties, the Fairfax Public School and Blenheim (Figure 15).

Additionally, there are many properties and structures with historic characteristics that have not been designated at the local, state, or national levels. Over 4,800 structures in the City are 50 years of age or older, one of the criteria to determine eligibility of historic designation. The significance of a given property or structure to architectural history, landscape history, events or activities in the past, or to lives of important people are other criteria for preservation. Remaining large estates such as the Farr Homeplace and the Sisson House may also be considered for preservation, as well as landforms such the Manassas Gap Railroad Bed.

FIGURE 15 HISTORIC DISTRICTS AND BUILDINGS



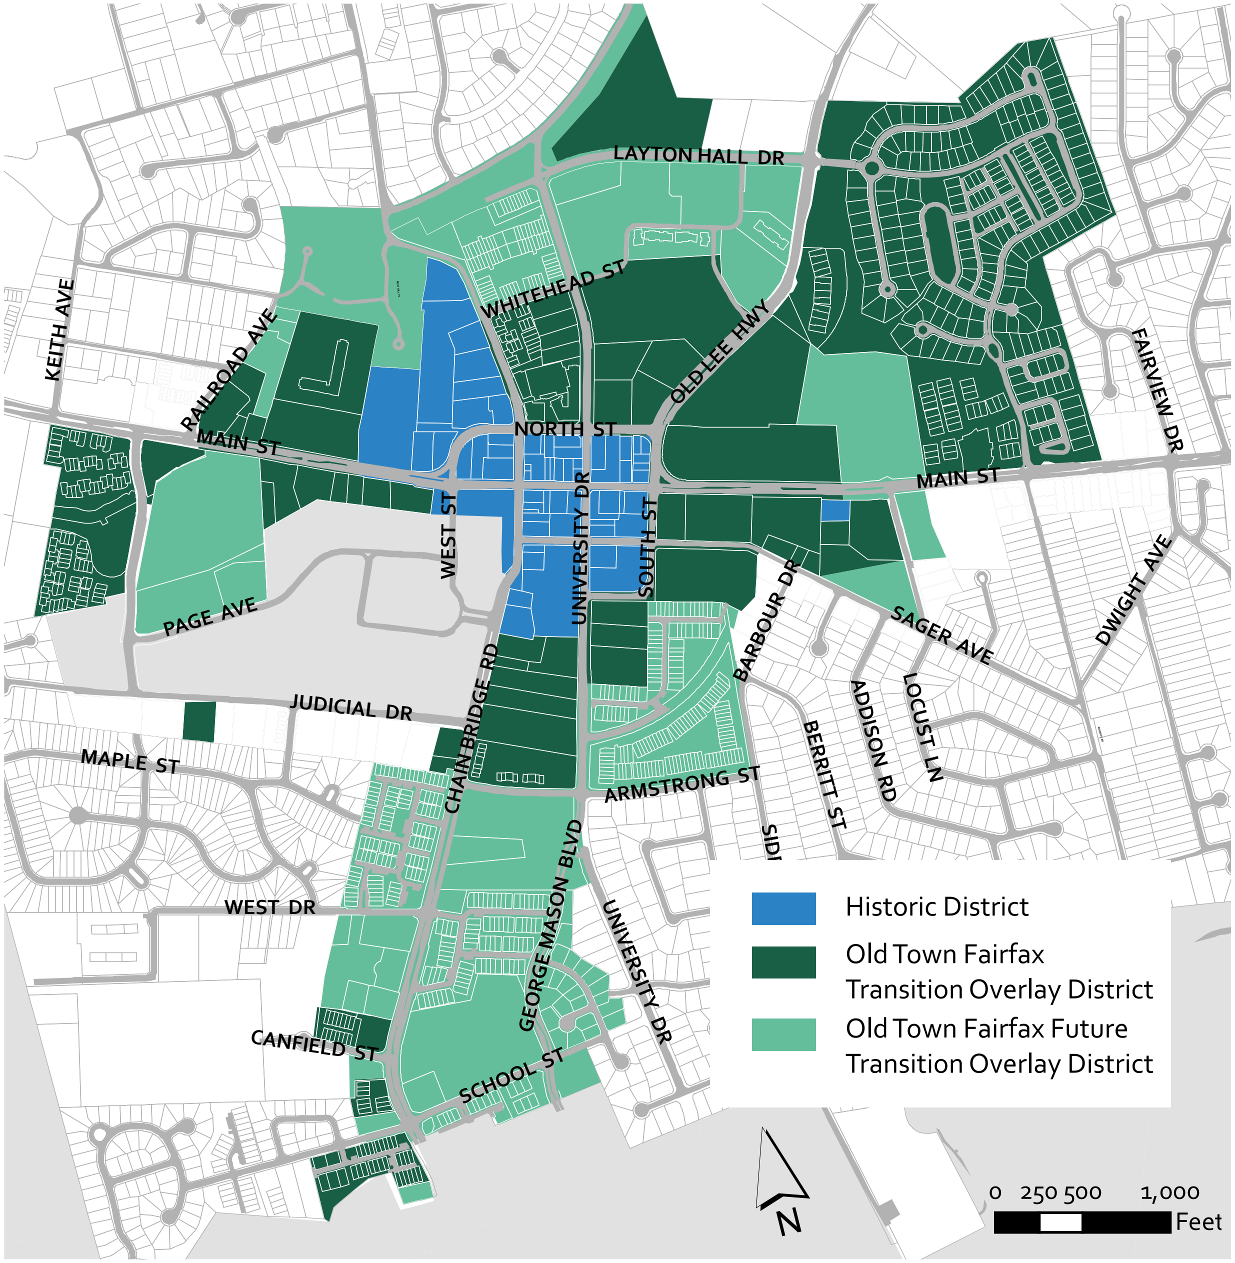
Source: City of Fairfax GIS 2016 Impervious Surfaces, Zoning Overlays, National Register Districts

Old Town Fairfax Transition Overlay District (Transition District)

The Transition District is established in areas surrounding Old Town Fairfax as a means to ensure the character of those areas complements that of the historic districts. This is accomplished through regulations in the Zoning Ordinance limiting the height of new construction, encouraging buildings to be oriented toward the street, and requiring more extensive streetscape improvements than the base standards. The current extent of the Transition District and potential Future Transition Overlay District are provided in Figure 16.

Properties located in the Future Transition Overlay District may be added to the Transition District either upon application from the property owner (typically in conjunction with an individual property rezoning) or as part of a larger City-initiated rezoning. The extent of the potential expansion area for the Transition District stretches farther away from the historic district in order to continue these characteristics along corridors leading into Old Town Fairfax.

FIGURE 16 HISTORIC DISTRICTS AND TRANSITION OVERLAY DISTRICTS



Community Design and Historic Preservation

Goal 1

Require high-quality, sustainable design.

Beyond residential neighborhoods, there is a wide variety of building uses in the City, from office and retail buildings to industrial and institutional buildings. These buildings were constructed over several decades and encompass an array of design styles and architectural influences. The City requires high-quality, sustainable design and construction of new buildings and public spaces along with similarly high-quality modifications and additions to existing buildings and open spaces. The intent of the design review process in areas of the City outside the historic districts is to continue to allow architectural variety while encouraging higher quality materials and design rather than designating specific design styles. The City can further support aesthetic quality through public investment in visible infrastructure, such as streetscapes and signage, and through public-private partnerships to promote desired types of development.

OUTCOME CDHP1.1:	Clear expectations for the required design elements and building materials for the City's historic districts and commercial centers.
ACTION CDHP1.1.1	Determine design aesthetic of Fairfax Boulevard and Main Street with input from City boards and commissions and convey through design documents such as the City of Fairfax Design Guidelines and other documents that may be prepared.
OUTCOME CDHP1.2:	Attractive buildings, inviting public spaces, and welcoming gateways that contribute to our economic vitality and unique character.
ACTION CDHP1.2.1	Identify commercial economic investment areas and provide financial support through the Economic Development Authority.
ACTION CDHP1.2.2	Continue to develop and refine design standards with a menu of options to encourage variety, visual interest, and durability in the design of new development.
ACTION CDHP1.2.3	Explore public-private partnerships to create neighborhood centers inclusive of gathering places.
ACTION CDHP1.2.4	Create attractive gateway features at key City entry points.

Community Design and Historic Preservation

Goal 2

Protect and enhance historic resources.

Inclusion of properties or structures in a local historic district should be based on the criteria described on p. 61. Local protections give the City the ability to designate specific characteristics of a property or district that are intended to be preserved, as well as provide regulatory measures that protect those properties. Local districts can be applied to individual properties or a group of properties, such as a neighborhood. Establishment of any new historic districts should be contingent upon support from owners of the affected properties.

OUTCOME CDHP2.1:	Protection of eligible structures, properties, and neighborhoods through local historic designation and strategic investments.
ACTION CDHP2.1.1	Develop an inventory of historic and archaeological resources readily available on the City's website that is reviewed and updated at least every 10 years.
ACTION CDHP2.1.2	Work with neighborhoods to gain support for new locally-designated historic districts and landmarks, where appropriate.
ACTION CDHP2.1.3	Encourage the preservation of existing buildings of historic or architectural significance whenever feasible.
OUTCOME CDHP2.2:	Redevelopment that respects nearby historic structures and the established architectural pattern.
ACTION CDHP2.2.1	Ensure all new development subject to the requirements of the City of Fairfax Design Guidelines is compliant, and continue to monitor the review process for Certificates of Appropriateness to ensure it is effective.
ACTION CDHP2.2.2	Rezone all properties in the Old Town Fairfax Future Transition Overlay District to the Old Town Fairfax Transition Overlay District, either proactively or as each property seeks land use amendments.
OUTCOME CDHP2.3:	The City's historic resources are utilized to provide educational programs to the community and promote preservation of historic properties.
ACTION CDHP2.3.1	Promote greater awareness of the City's historic resources and the history of the City and surrounding area, identifying educational, economic, and recreational benefits of historic structures, properties, and districts.
ACTION CDHP2.3.2	Evaluate the need to expand the Fairfax Museum and Visitor Center, currently located in the Historic Fairfax Elementary School building.

Preservation and appreciation of historic properties and other historic resources in the City can be supported through events and programs that highlight the history of the City and the importance of the historic properties in historic events. City historic resources, such as the Fairfax Museum and Visitor Center, Blenheim Civil War Interpretive Center, and the Ratcliffe-Allison-Pozer House can be utilized to engage the public through special programs, tours, events, exhibitions, and outreach efforts.

3 Multimodal Transportation

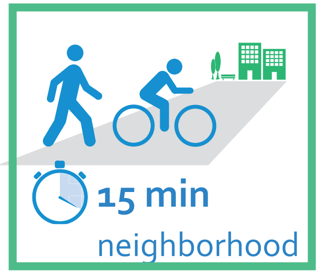
Transportation is about more than mere movement – transportation grants us access to the needs of everyday life. Sustainable, connected, and integrated transportation is fundamental to the success and livability of the City. The intent of the Multimodal Transportation Chapter is to recommend strategies that will improve the operation and safety of the City's transportation system in order to achieve the larger community objectives for a vital, vibrant, and livable City.

This Chapter is based on the Multimodal Transportation Plan, the first comprehensive, multimodal transportation plan completed by the City. ("Multimodal" refers to the multiple ways people use to get around – car, bus, train, bike, walking, etc. – and a multimodal plan incorporates these various transportation modes into an efficient and connected system.) The Multimodal Transportation Plan was developed as a separate effort, but in coordination with the Comprehensive Plan. The four key aspirations shown to the right helped ensure the multimodal aspect of the plan inform many of the recommendations.

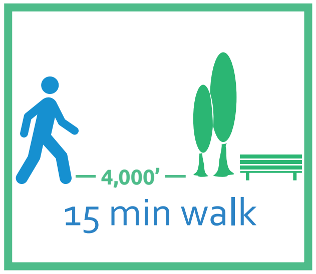
Guiding Principle:

In 2035, Fairfax is a city with...
options for residents to easily, safely, and efficiently move within and between neighborhoods either by walking, bicycling, taking public transportation or driving.

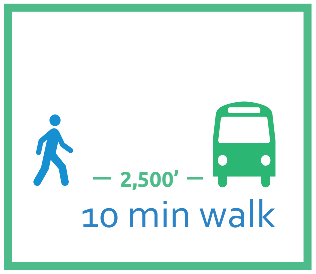
Create a city of **"15-minute neighborhoods"** – ensure that 100% of residents can access a local activity center via a safe 15-minute walk from home (currently 44%).



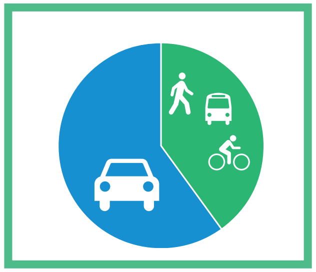
Ensure 100% of residents are connected to green space, trails, or open space via a safe 15-minute walk of home (currently 88%).



Ensure 100% of residents have access to transit by providing a transit stop within a safe 10-minute walk of each residence (currently 79%).



Increase choice, reliability, and efficiency in travel by achieving at least a 40% non-drive alone mode share for commute to work trips (currently 28%).



Fairfax Transportation Facts

The City of Fairfax is centrally located

A **20-minute** drive to Tysons, Falls Church, and Dulles International Airport

Taking transit to these same destinations can take **three times as long**

27% Of households have at least **one child at home**

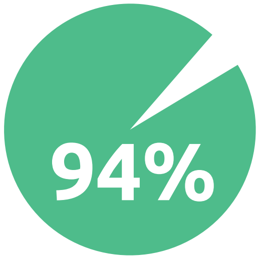
36% Of households include at least **one senior**

68,000 Daily trips are made through the city **without stopping**

In 2015, there were

837

Automobile crashes in the city



94% Of city residents have access to **one or more** cars

6% Of city residents must get by without an automobile

72% Of City of Fairfax commuters **drive alone to work**

66% Of residents surveyed would prefer to travel by a means **other than driving alone** to work or errands

CONGESTION + Safety

are the two most **frequently cited threats** to **livability in the City of Fairfax**

Most transit routes in the city operate from **early morning through evening**

However, most transit routes only operate **once or twice per hour**

1/3 of all household trips

are less than one mile in distance

1/2 Of these short distance trips **are driven**

SOURCE: City of Fairfax Multimodal Transportation Survey, 2015; US Census National Household Travel Survey, 2009; MWCOG; City of Fairfax

Opportunities and Challenges

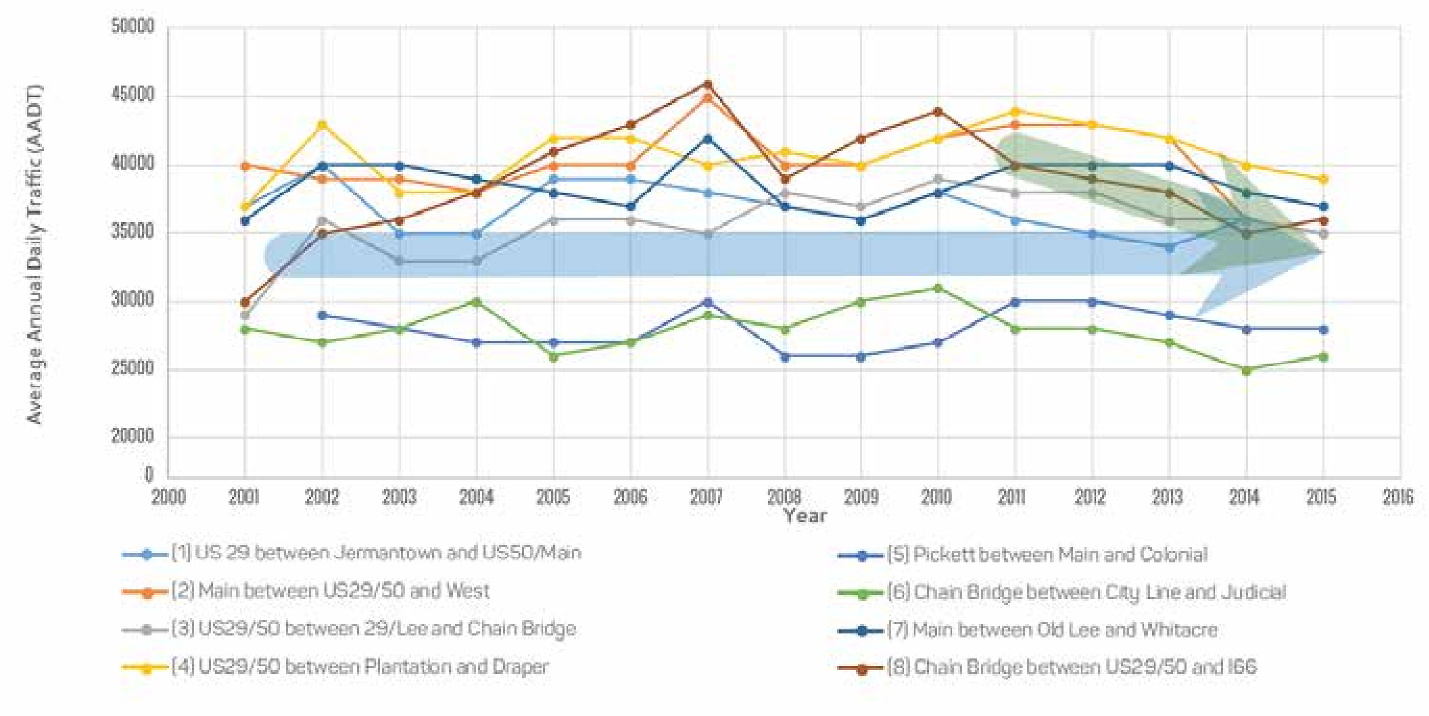
Traffic volumes and peak period congestion

Despite growth in population in the area, daily traffic volumes on the City's 16 miles of arterial roads have remained relatively stable over the past 15 years. However, while traffic volume on several segments has decreased since 2010-2011, vehicular congestion during peak hours continues to present challenges to residents and commuters.

Travel patterns

Currently, the vast majority (72%) of City residents who are employed drive alone to work while 8% carpool, 11% use transit (bus or rail), and 5% work from home. Most households (94%) have at least one automobile. However, 6% of City households make do without owning a personal vehicle. The average City resident who is employed travels 12.6 miles to work — a trip that takes 35 minutes on average. Within the Washington region, approximately one third of all trips are less than a mile, but more than 50% are driven. Many of the short trips in the City could be completed on foot, on transit, or by bike rather than driving.

FIGURE 17 AVERAGE ANNUAL DAILY TRAFFIC



SOURCE: Virginia Department of Transportation, 2001 - 2015

Transportation safety

Traffic congestion is significant along most of the major corridors in the City and concentrated where arterials intersect. These areas also experience high rates of vehicle crashes, with the highest rates concentrated at major intersections.

FIGURE 18 2015 VEHICLE CRASHES BY LOCATION

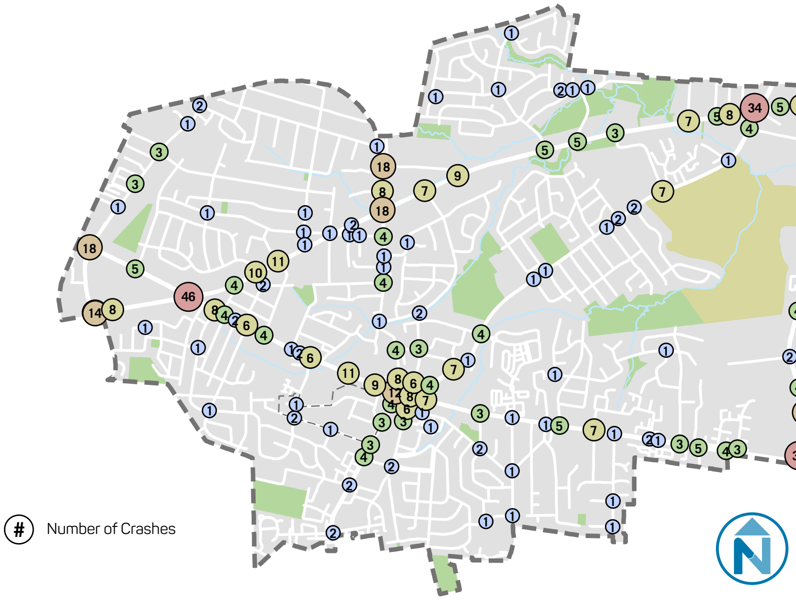


FIGURE 19 2015 VEHICLE CRASH RATES

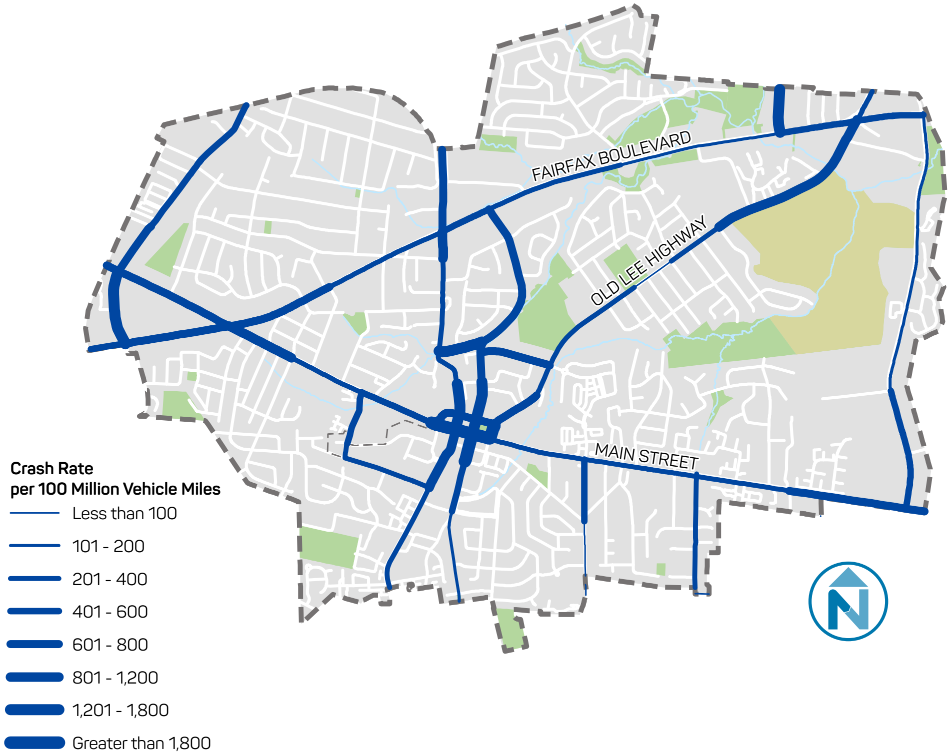
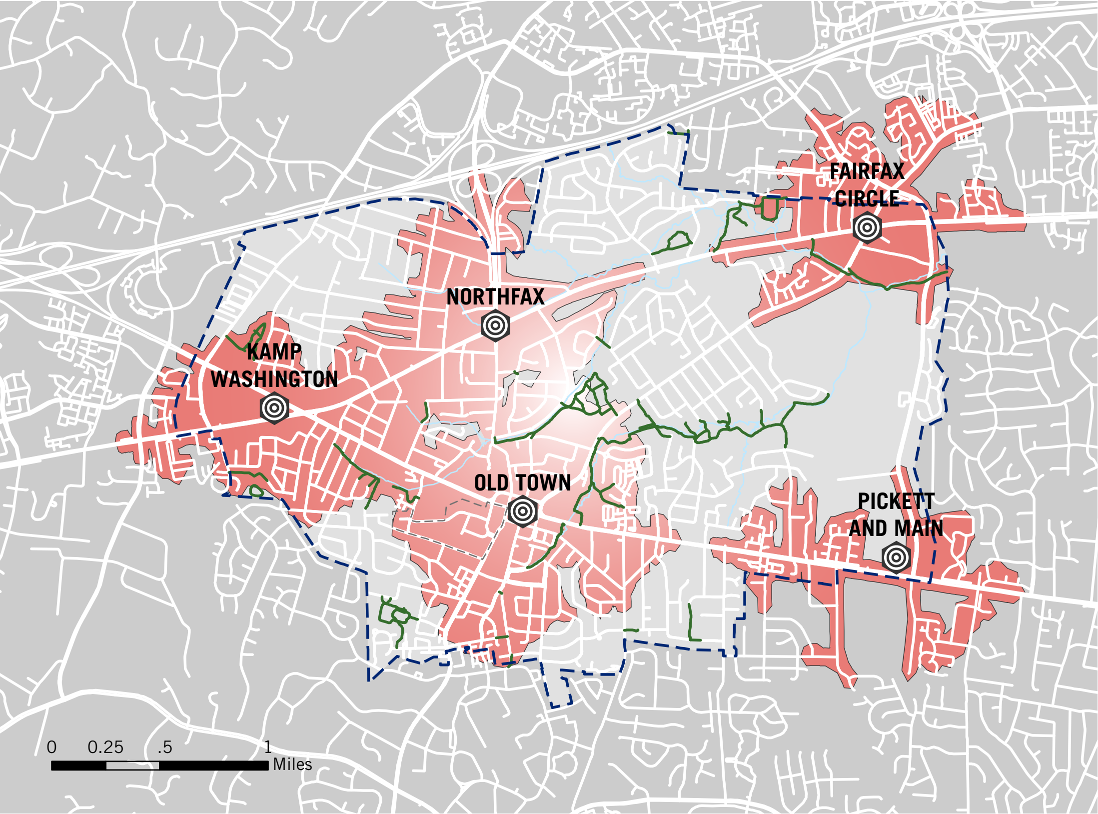


SOURCE: City of Fairfax, 2015

Pedestrian and bicycle access to amenities

Forty-four percent of City housing units are within a 20-minute walk of basic amenities such as shopping, dining, groceries, open space, schools, and other community facilities. Many of these amenities are concentrated within the City's five Activity Centers. Except for Old Town, these centers are generally separated from adjacent residential communities by larger block sizes, busy roadways, and missing or discontinuous pedestrian networks. High-volume roadways are often dangerous for pedestrians to navigate and complicate access to local amenities. While many neighborhoods have relatively complete sidewalk networks, and while the City has a number of bicycle and pedestrian trails, the bicycle and pedestrian network is not well-connected or accessible for all users.

FIGURE 20 ACTIVITY CENTER WALKSHEDS (15 MINUTES)

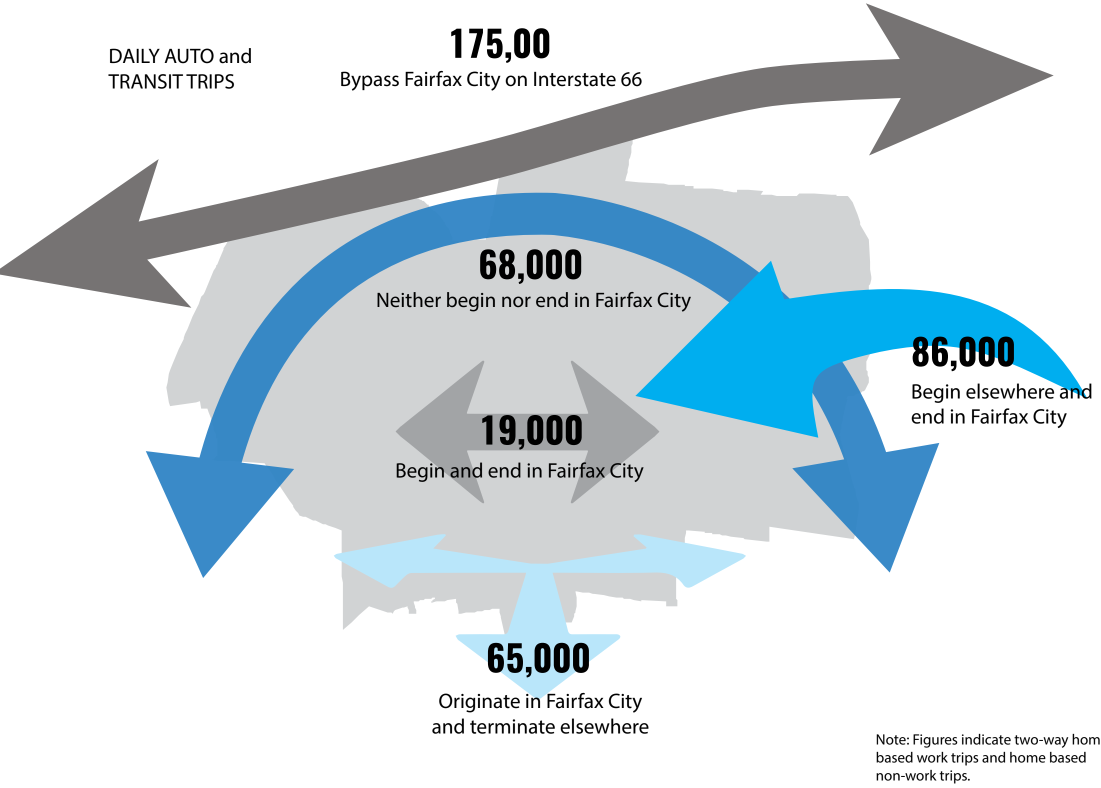


SOURCE: Census Data Set H1, 2010

Regional transportation demand

Every day, 68,000 regional travelers, primarily motorists, travel through the City without making a stop. As traffic congestion continues to increase on major regional corridors such as I-66 and Braddock Road, this regional traffic threatens to similarly increase congestion on City corridors.

FIGURE 21 DAILY TRIPS TO, FROM, AND THROUGH THE CITY

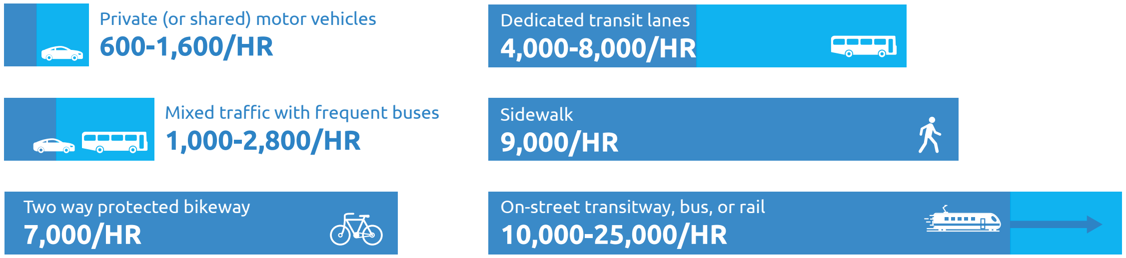


SOURCE: MWCOG 2.3 v57a Model, 2015

Roadway expansion limitations

While the City may continue to add local minor streets to enhance connectivity and access, few opportunities remain to add substantially more vehicle capacity on City streets. As such, the City will need to focus on ways to efficiently move more people within the existing street network. This can be done by encouraging higher occupancy in both private and mass transit vehicles, satisfying more short distance trips with walking and bicycle options, and encouraging people to shift their time of travel away from peak hours to less congested times of the day.

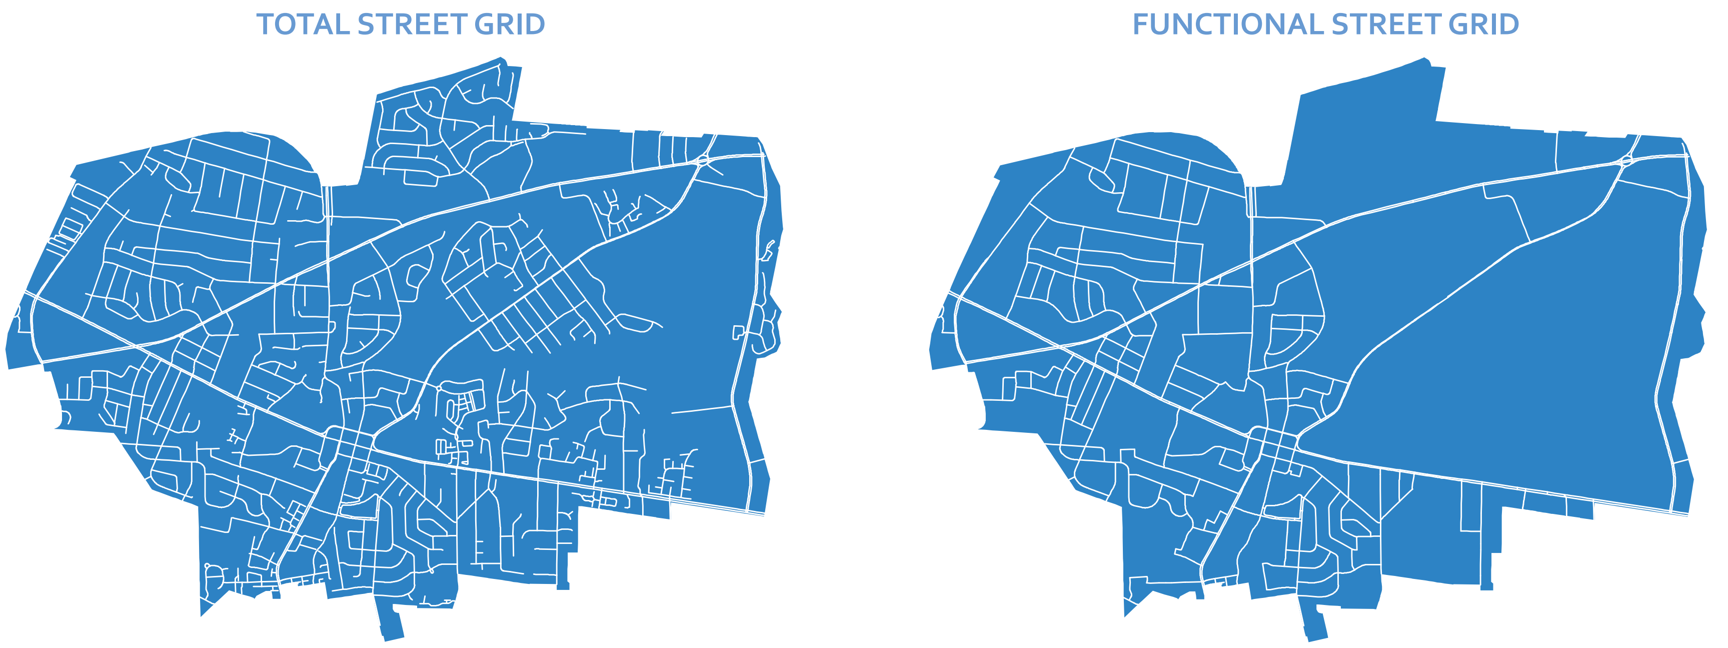
FIGURE 22   PEOPLE MOVING CAPABILITY OF VARIOUS TRANSPORTATION MODES



Street connectivity

The City has 104 centerline miles of streets. However, only 61% of them can connect users to other parts of the City without depending on major corridors. While limited connectivity discourages through traffic on local streets, it also constrains resident access in and out of their neighborhood. Oftentimes bicycle and pedestrian access is equally constrained, causing further conflict, congestion, and potential safety concerns among all road users.

FIGURE 23 TOTAL AND FUNCTIONAL VEHICULAR NETWORKS



TOTAL STREET GRID

FUNCTIONAL STREET GRID

A comparison of the entire City street grid to a functional grid paints a stark picture. The east side of the City consists almost entirely of neighborhoods isolated by physical barriers.

The functional grid is made up of roads that can be used to travel by vehicle to another neighborhood or part of the City. The west side of the City is far more integrated with Old Town and areas immediately northwest, southwest, and south of City boundaries.

Transportation infrastructure, services, and other assets

Among individuals responding to the 2015 City of Fairfax Multimodal Transportation Survey, about two-thirds of residents who currently drive alone to work expressed a desire to have the option to travel by some other means. Current constraints to non-auto travel include limited transit frequency, missing or discontinuous bicycle and pedestrian networks, and general concerns about safety when traveling by non-auto modes.

TRAILS

The City has a 28 mile trail network that provides safe, attractive, and convenient non-motorized access while concurrently promoting physical health and well-being.

CUE

The CUE bus system is well respected and generally well used, and buses generally operate over 16 hours a day on weekdays (with somewhat shorter hours on weekends). Frequency of service is limited, however. Real-time bus tracking and arrival information helps augment the system's usability. Combining transit applications with multimodal trip planning services provides riders with greater choice and convenience to weigh their travel decisions depending on time, cost, or other considerations.

DEVELOPMENT OPPORTUNITIES

The strong Northern Virginia economy continues to make the City an attractive place to live and invest. Following guidance in the Land Use Chapter of this plan, well-designed, concentrated development in Activity Centers can assist in reducing the growth of traffic and congestion. By locating many origins and destinations within a compact, accessible, and walkable area, more residents can fulfill daily needs without depending on driving. Those who drive may take just one vehicle trip and accomplish a number of other errands on foot within the same area. Urban-style development is better able to support more frequent transit service, benefiting travelers across the area.

Evolving shared mobility and technology options

Shared travel options such as carpooling, ride hailing services, or bicycle sharing systems offer opportunities to meet local travel needs conveniently and cost-effectively while reducing single-occupant vehicle travel. Real-time information, intelligent transportation, and other information and technology innovations can also make travel more efficient. Examples of best practices and future trends are shown in Appendix B. Some of these examples may be appropriate components of a sustainable mobility system in the City.

Multimodal Transportation

Goal 1

Connect with the region.

The City is a relatively small jurisdiction within a much larger region. Although regional traffic can congest City streets, City residents rely on the larger region for significant employment, entertainment, and cultural destinations; and City businesses rely on regional patrons and attract employees from the larger area. The City must enhance facilities that connect to the larger region, but do so in a way that supports safety, connection, and robust choices in travel options.

OUTCOME MM1.1:	Corridors for regional travel and better connections to regional networks and destinations are enhanced and improved.
ACTION MM1.1.1	Continue to participate in regional planning efforts to increase connectivity in the regional road, transit, and trail networks.
ACTION MM1.1.2	Collaborate with WMATA and regional partners to support a western extension of Metro's Orange Line, including a station location at I-66 and Route 123 (near Northfax) to benefit City of Fairfax stakeholders with improved access to the Metrorail system.
ACTION MM1.1.3	Increase connectivity to the existing Vienna/Fairfax-GMU Metrorail station including:
1.1.3.1	Improve pedestrian connections from the Fairfax Circle area to the Metro station area.
1.1.3.2	Improve bicycle facility connections and crossings across Fairfax Boulevard from the City to the Metro station.
1.1.3.3	Continue collaboration with George Mason University to enhance bicycle and transit connections between the University and the Metrorail system.
1.1.3.4	Implement the recommendations of the Old Lee Highway "Great Street" conceptual plan.
ACTION MM1.1.4	Expand trail and bicycle networks to connect to regional facilities and destinations, including:
1.1.4.1	Improve connections and logical links to the Cross-County Trail and beyond to the Washington & Old Dominion (W&OD) trail.
1.1.4.2	Improve trail connections south along Route 123 to connect to the Braddock Road Sidepath and on to Lorton.
1.1.4.3	Connect local trails to the planned I-66 trail facility.
1.1.4.4	Coordinate with Fairfax County on the construction of the Main Street/Little River Turnpike bicycle facility.

Multimodal Transportation

Goal 1

Photo Credit: Virginia Department of Transportation

Photo Credit: Ben Schumin

ACTION MM1.1.5	Improve the Blake Lane-Jermantown Road corridor.
1.1.5.1	Complete a transportation study to determine necessary facility improvements and operational plans.
1.1.5.2	Coordinate with Fairfax County and VDOT on improvements to the Jermantown Road bridge over I-66, including additional capacity for vehicles, bicycles, and pedestrians.
1.1.5.3	Pursue a connection from Jermantown Road to Waples Mill Road north of Fairfax Boulevard.
ACTION MM1.1.6	Support Fairfax County in pursuing improvements to Braddock Road to facilitate its operation as a critical regional corridor.
ACTION MM1.1.7	Complete the Government Center Parkway connection.
ACTION MM1.1.8	Improve safety and ensure continued efficiency of Pickett Road as a regional north-south corridor and important truck route.
OUTCOME MM1.2:	Safety and operations in the regional network are improved.
ACTION MM1.2.1	Conduct a detailed study of Fairfax Circle to improve safety and operations, potentially including geometric changes to the existing circle configuration.
ACTION MM1.2.2	Simplify multi-leg and offset intersections, such as the intersection of McLean Avenue, Warwick Avenue, and Fairfax Boulevard.
ACTION MM1.2.3	Address safety and operational deficiencies at major intersections, such as the intersection of Eaton Place and Chain Bridge Road.
ACTION MM1.2.4	Continue City participation on regional transportation boards.
ACTION MM1.2.5	Promote a regional approach to public transportation planning.
ACTION MM1.2.6	Participate in the regional process for evaluation and recommendation of projects to be applied for state and federal funding.

Multimodal Transportation

Goal 2

Provide viable and attractive mobility choices.

At present, the City is heavily dominated by vehicle traffic. Many surveyed residents expressed a desire to make the City more walkable and bikeable, but walking or bicycling on busy streets can be uncomfortable or even dangerous. The City's bus system is well-used and highly regarded, but is often caught in the same traffic as other vehicles. Improving mobility requires providing a balanced system where people can choose the best travel option for them depending on their needs.

OUTCOME MM2.1:	Pedestrian safety is improved.
ACTION MM2.1.1	Fill critical gaps in the pedestrian network. Develop and act on a prioritized list of sidewalk improvements in the commercial areas and provide sidewalks on at least one side of every residential street in neighborhoods that are in agreement.
ACTION MM2.1.2	Ensure the pedestrian network is accessible to all and meets the requirements of the Americans with Disabilities Act (ADA).
ACTION MM2.1.3	Enhance safe routes to school, safe routes to transit, and safe routes to community facilities, completing specific planning efforts as required.
ACTION MM2.1.4	Improve pedestrian crosswalks. Crosswalks should be provided across all legs of all intersections.
ACTION MM2.1.5	Expand the sidewalk network. Sidewalks should be provided with any significant street maintenance, rehabilitation, or reconstruction project and may be constructed independent of a street project.
ACTION MM2.1.6	Increase pedestrian connectivity to the existing Vienna/Fairfax-GMU Metro station, such as through the Fairfax Circle area.
ACTION MM2.1.7	Expand safety education efforts to educate all road users on pedestrian awareness and safety. Educate residents on proper procedures for traveling as a pedestrian, interacting with pedestrians as a driver, and locating and using pedestrian facilities to increase comfort and safety and encourage more walking.

OUTCOME MM2.2:	The City's existing trail system, including the "Green Ribbon" parks and trail network, is connected and expanded.
ACTION MM2.2.1	Identify and fill gaps in the trail network. Find opportunities for future trails, complete connections to existing segments, implement projects proposed by the Parks and Recreation Master Plan, and pursue new trail connections to create a more functional trail network.
ACTION MM2.2.2	Connect the George Snyder Trail to the planned I-66 trail facility.
ACTION MM2.2.3	Improve trail crossings across arterial streets, including Fairfax Boulevard at Pickett Road and Main Street at Main Street Square and Railroad Avenue.

Multimodal Transportation Goal 2

ACTION MM2.2.4	Provide wayfinding, trailblazing, traffic calming/safety, and non-motorized facility improvements to provide connections between parks and trails.
ACTION MM2.2.5	Increase resident awareness of trail networks and connections.
OUTCOME MM2.3	Bicycle network, facilities, and programs are improved.
ACTION MM2.3.1	Develop and adopt a bicycle network plan linking major destinations including George Mason University, Old Town, Metrorail, and the regional trail system.
ACTION MM2.3.2	Review bicycle facility design standards to ensure best practices in design and delivery of facilities.
ACTION MM2.3.3	Expand the provision of bicycle racks for short-term bicycle parking.
ACTION MM2.3.4	Adopt bicycle-supportive policies for development projects where applicable, including expanded provision of short- and long-term bicycle parking, showers, and changing facilities.
ACTION MM2.3.5	Complete a bikeshare feasibility study including definition of necessary station density, recommended "starter system," operating and management structure, and funding program, preferably in partnership with George Mason University.
ACTION MM2.3.6	Provide initial support to establish bikeshare in the City.
ACTION MM2.3.7	Expand safety education efforts to educate all road users on bicycle awareness and safety. Educate casual cyclists on proper procedures to encourage more cycling through an increased comfort level.
ACTION MM2.3.8	Increase connectivity to the existing Vienna/Fairfax-GMU Metrorail station by improving bicycle facility connections and crossings across Fairfax Boulevard north to the Metro station.

Multimodal Transportation

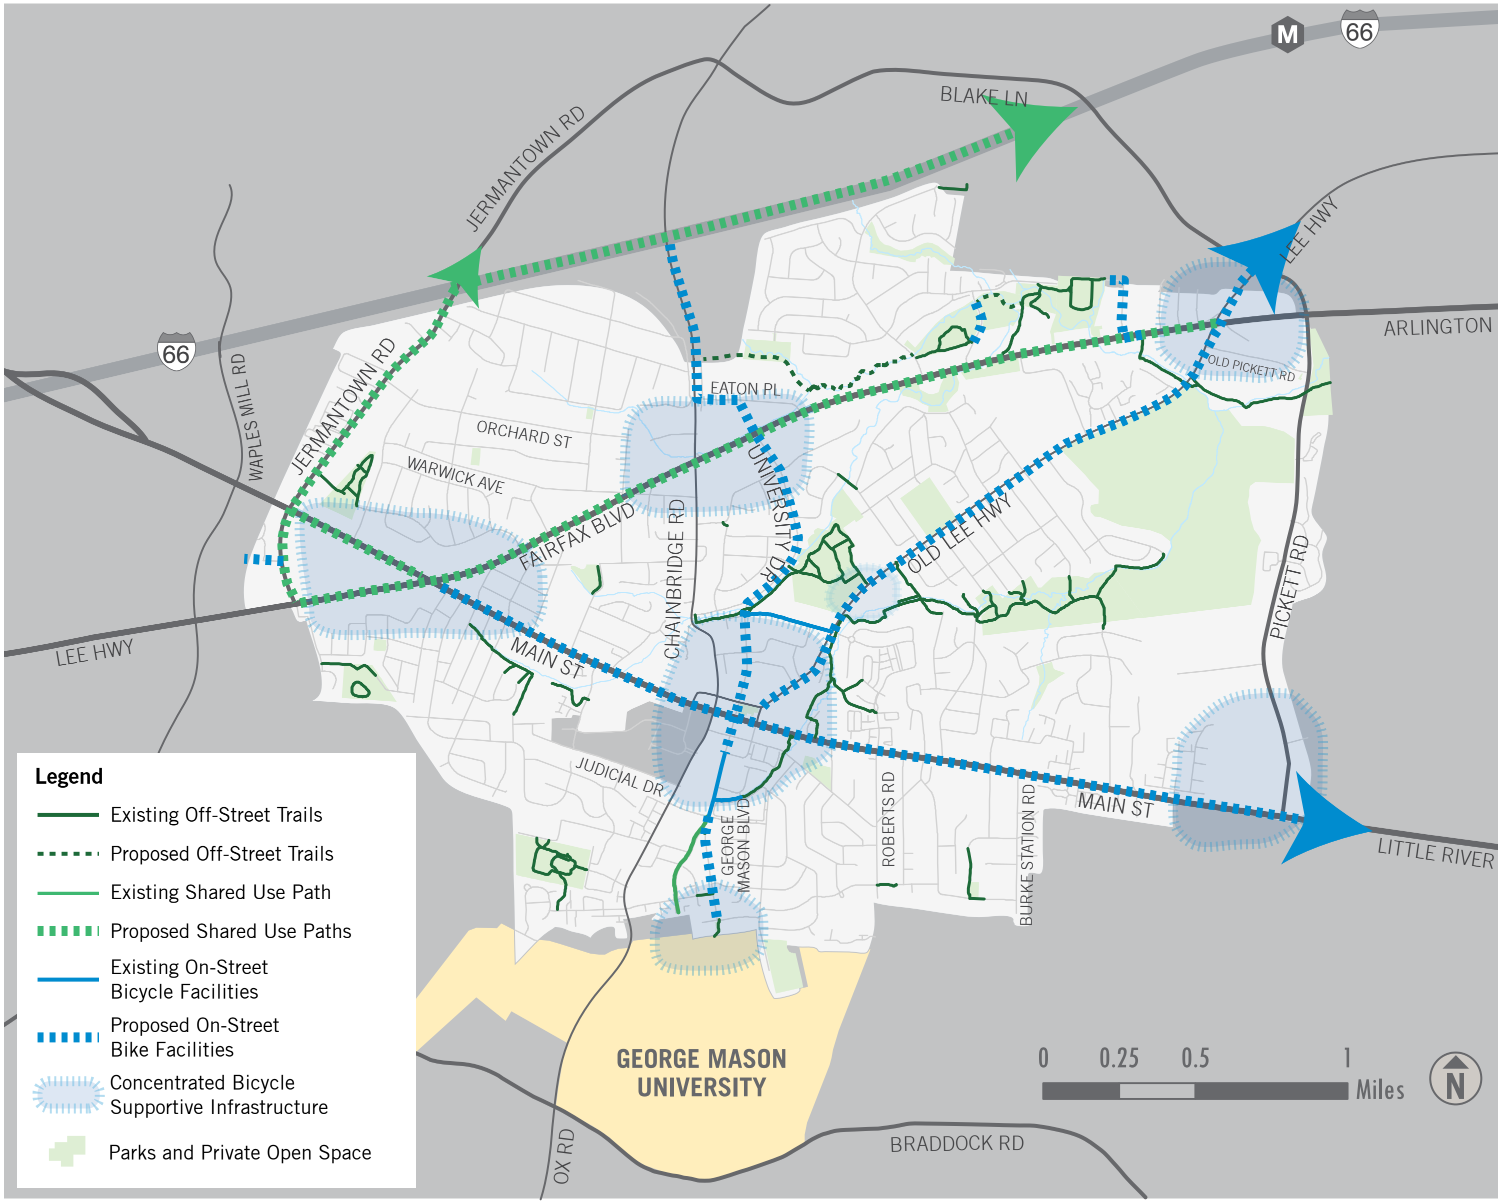
Goal 2

OUTCOME MM2.4	Transit continues to be an effective non-driving alternative.
ACTION MM2.4.1	Improve transit services and facilities.
2.4.1.1	Identify a priority transit network providing enhanced transit operations and more frequent services along key corridors including Main Street, Old Lee Highway, and Fairfax Boulevard.
2.4.1.2	Enhance passenger accommodations to improve comfort and convenience.
2.4.1.3	Improve major transfer locations with quality passenger amenities, expanded information, and improved pedestrian facilities. Significant transfer locations include the Kamp Washington area, Fairfax Circle, Old Town, and Pickett and Main.
2.4.1.4	Implement recommendations of the CUE Transit Development Plan to maintain the highly-valued service of the CUE system.
2.4.1.5	Achieve and maintain 90% on-time performance for the CUE system.
2.4.1.6	Improve connections to other transit routes and facilities through enhancements at significant transfer locations.
2.4.1.7	Promote transit-friendly design features in development projects.
2.4.1.8	Expand ADA-accessible sidewalks and crosswalks serving bus stops.
OUTCOME MM2.5:	Vehicular travel and facilities are effectively managed and maintained.
ACTION MM2.5.1	Design all new facilities and upgrade existing facilities to comply with all federal, state, and local safety standards.
ACTION MM2.5.2	Pursue new technologies that would improve safety on City streets.
ACTION MM2.5.3	Ensure the safety of City streets by incorporating traffic calming measures as needed.
ACTION MM2.5.4	Evaluate opportunities to increase street grid connectivity to distribute traffic and to improve network resiliency. Opportunities for additional connections may be identified at any time but particularly as redevelopment occurs.

FIGURE 24 PROPOSED GREEN RIBBON OF RECREATIONAL TRAILS AND ENVISIONED CONNECTIONS

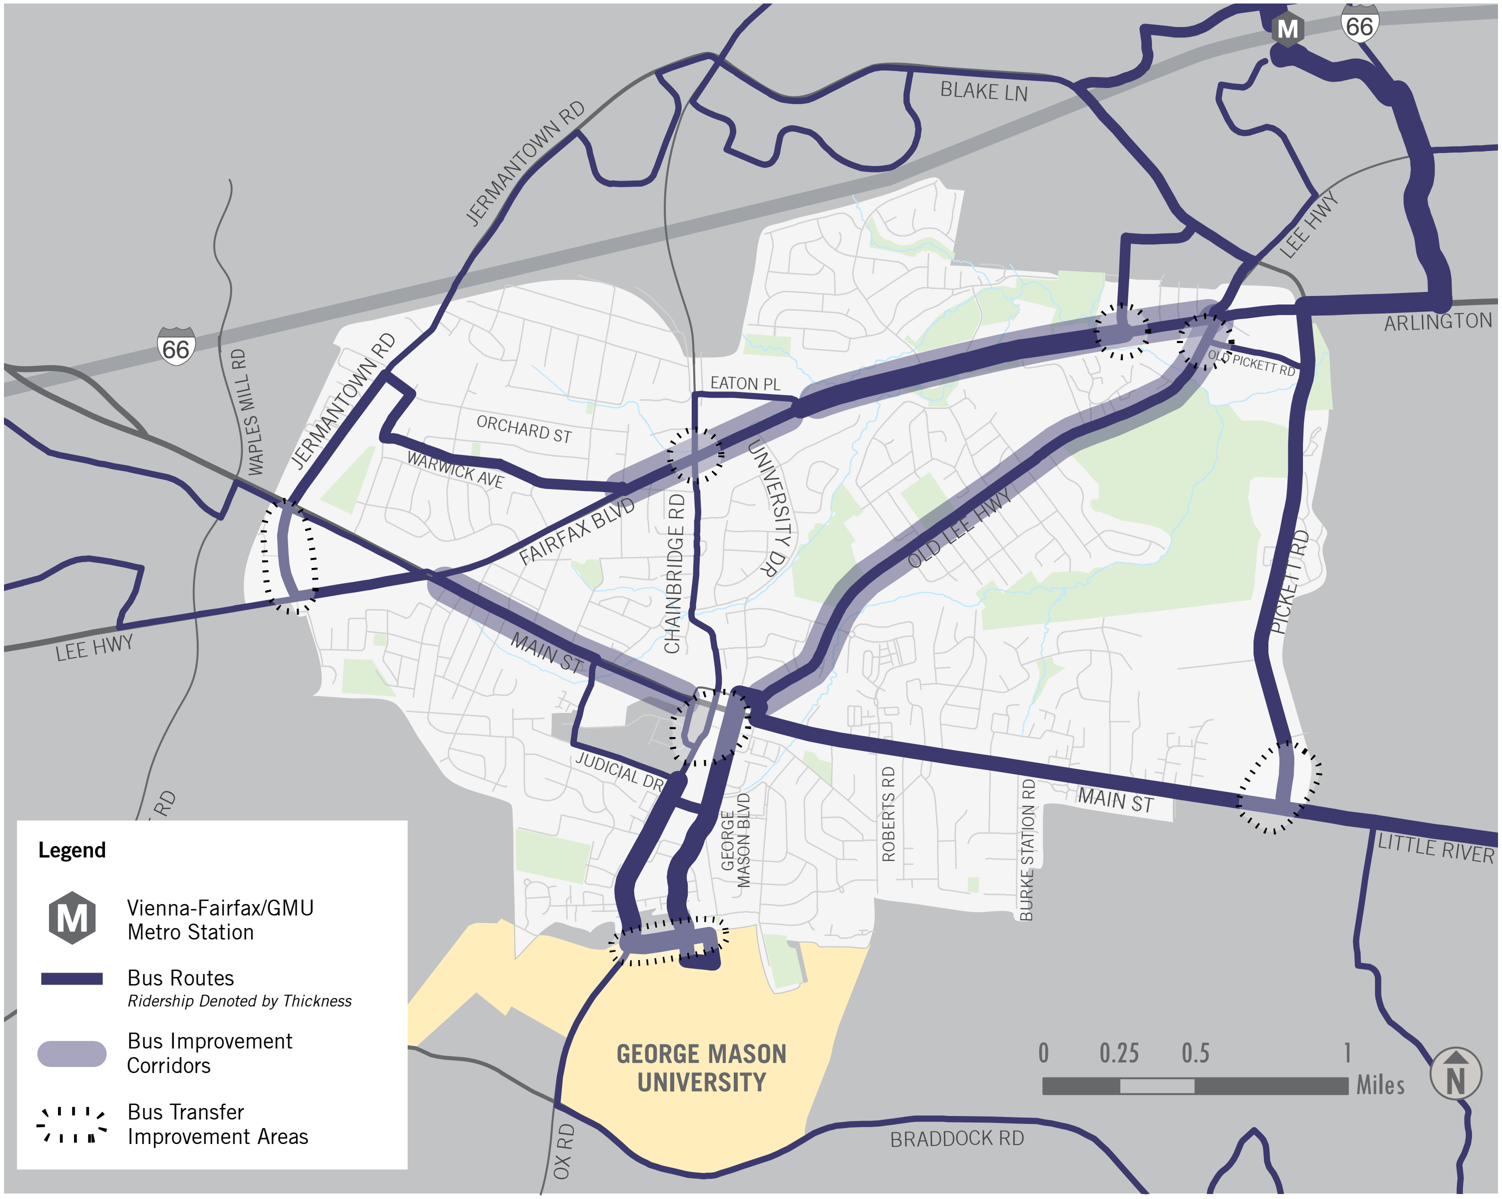
(See Outcome MM2.2)

FIGURE 25   PROPOSED NETWORK FOR BICYCLE TRAVEL



(See Outcome MM2.3)

FIGURE 26 PROPOSED TRANSIT NETWORK ENHANCEMENTS



(See Outcome MM2.4)

Multimodal Transportation Goal 3

Integrate transportation with land use.

Land use and transportation are inextricably linked and must be planned and designed concurrently – the purpose of transportation is to improve access to land use, and development patterns impact the feasibility and attractiveness of mobility choices. Mixing uses in a compact, walkable area – building housing, schools, parks, employment, shops and dining close together – can reduce the need for vehicle trips that contribute to increased congestion and other negative impacts such as eroded air quality and public health. Designing connected street networks increases the accessibility of these areas to surrounding areas. Managing parking and encouraging the use of non-driving modes can further reduce the growth of vehicle traffic while allowing for new development.

OUTCOME MM3.1:	On- and off-street parking and curbside uses are effectively managed.
ACTION MM3.1.1	Effectively locate, design, and manage parking facilities to provide context-appropriate parking availability and accessibility to the surrounding destinations.
ACTION MM3.1.2	Enhance wayfinding and information, with an initial focus on Old Town.
ACTION MM3.1.3	Explore parking pricing and other parking management strategies for public parking spaces and facilities throughout the City.
ACTION MM3.1.4	Explore the creation of parking management districts in Old Town and other Activity Centers to maximize parking resources while minimizing excess parking supply.
ACTION MM3.1.5	Consider policy measures to allow developers to fund public parking or other forms of access infrastructure in lieu of meeting parking requirements on site.
ACTION MM3.1.6	Develop travel marketing material to reduce the demand for long-term commuter/employee parking in the City.
ACTION MM3.1.7	Revise the Residential Parking Permit District Policy to consistently manage on-street public parking in residential neighborhoods.
OUTCOME MM3.2:	Walkability to and within Activity Centers and between neighborhoods is increased.
ACTION MM3.2.1	Whenever possible, increase connections – particularly non-motorized connections – between neighborhoods, community facilities, and Activity Centers.
ACTION MM3.2.2	With development projects, break up large blocks to a more walkable scale. Pursue additional secondary and tertiary street network opportunities. Streets should be well-designed as complete streets and align at regular intersections for a continuous street grid.

Multimodal Transportation Goal 3

The City will improve street design and better guide street management decisions through adoption of a "Link + Place" street typology appropriate to the City's streets and development patterns. The typology provides planners, engineers, and designers with an understanding of the typical and desired users of the street, features to consider for inclusion, and the transportation demands that require accommodation based on the street's size and uses. Link + Place street type designations for all streets in the City are provided in Figure 28, with each street type defined on the following pages.

ACTION MM3.2.3	Increase the number, safety, and frequency of pedestrian crossings, including across major streets. Provide crosswalks at all approaches of all signalized intersections at minimum intervals of 500 feet within Activity Centers. An exception exists in the case where the implementation of a crosswalk would result in operational failure of the corridor.
ACTION MM3.2.4	Improve the overall pedestrian environment, including pedestrian crossings, street trees, and furnishing zones; buffering sidewalk from vehicle travel lanes; improved pedestrian scale lighting; and active ground floor uses along primary street edges.
OUTCOME MM3.3:	Streets are designed to accommodate context and function.
ACTION MM3.3.1	Develop and adopt a "Link + Place" street typology to guide street design and management for public and private streets.
ACTION MM3.3.2	Through community consultation, develop specific design objectives, desired outcomes, and performance metrics for each street type. Link design objectives to the street design and project development process, guidelines, and reference documents.
ACTION MM3.3.3	Ensure quality street design in both the pedestrian zone and travel zone of the street.
ACTION MM3.3.4	Improve access, circulation, walkability, and transportation management in Activity Centers.

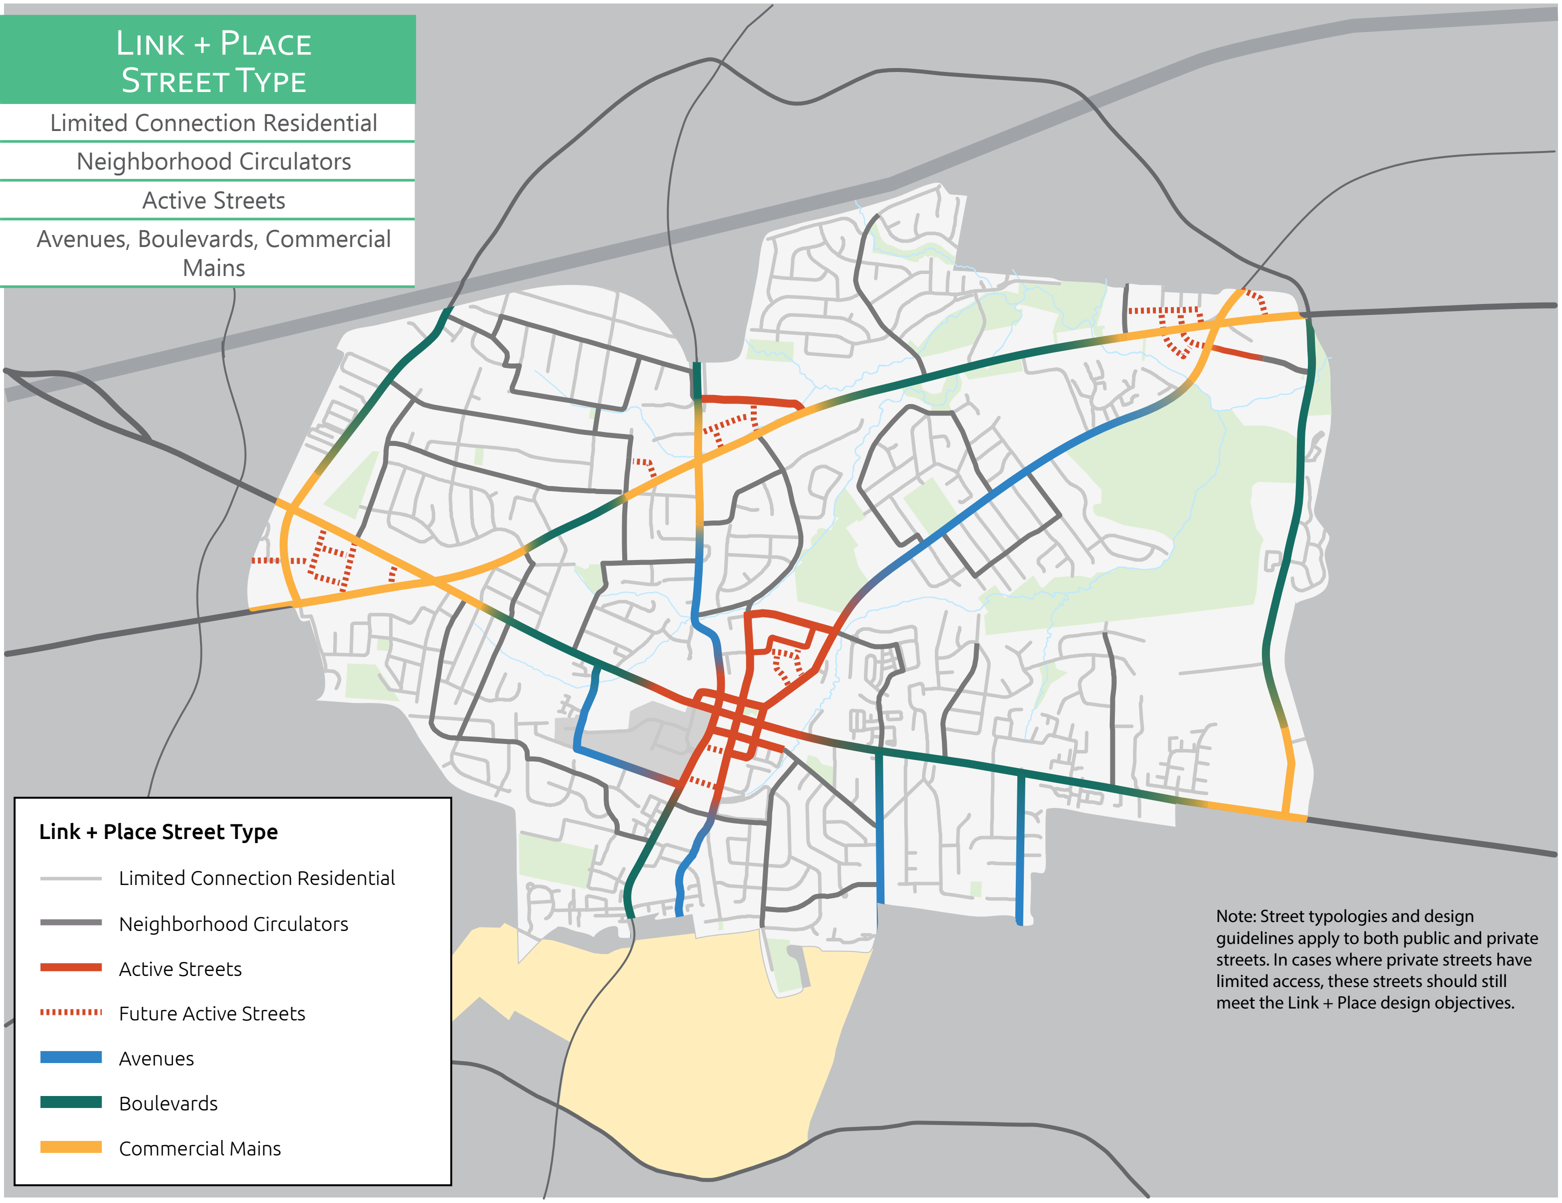
FIGURE 27   PROPOSED ACTIVITY CENTER ENHANCEMENTS

(See Outcome MM3.2)

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

FIGURE 28 PROPOSED STREET TYPOLOGY DESIGNATIONS

VDOT CLASSIFICATION	LINK + PLACE STREET TYPE
Local	Limited Connection Residential
Minor Collector	Neighborhood Circulators
Major Collector	Active Streets
Minor + Major Arterial	Avenues, Boulevards, Commercial Mains



Note: Street typologies and design guidelines apply to both public and private streets. In cases where private streets have limited access, these streets should still meet the Link + Place design objectives.

(See Outcome MM3.23

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

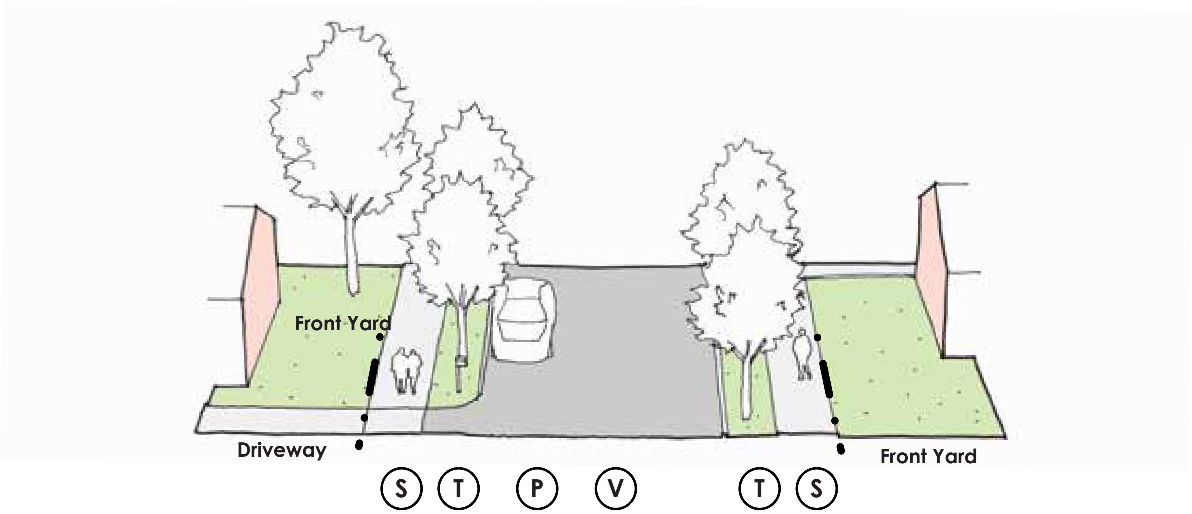
LIMITED CONNECTION RESIDENTIAL STREETS

These are interior neighborhood residential streets that generally do not connect to other streets in the network. These streets are lined with residential front yards and a robust tree canopy, and generally self-regulate both vehicle speeds and volumes.

Typical Transportation Uses

- Local traffic only – typically the home segment of the journey
- Non-motorized trips within the neighborhood
- Bicycles typically share the street with vehicles
- Very low traffic speeds

LIMITED CONNECTION RESIDENTIAL STREETS



TYPICAL ELEMENTS MAY INCLUDE:

- NARROW AND DESIGNED FOR SLOWER SPEEDS
- SINGLE-FAMILY RESIDENTIAL SET BACK WITH DRIVEWAYS
- ON-STREET PARKING (UNMARKED) - WHERE APPLICABLE
- SIDEWALKS

DIAGRAM KEY

Ⓥ	Travel Lanes -10' to 11' Each
Ⓟ	On-Street Parking
Ⓣ	Street Tree Zone - 5'
Ⓢ	Sidewalks - 5'
i	City Right-of-Way

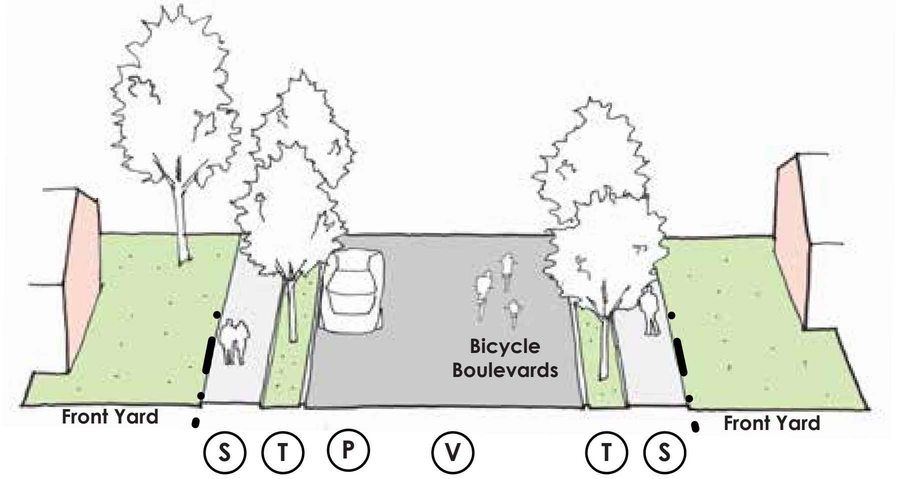
NEIGHBORHOOD CIRCULATORS

Neighborhood Circulators are residential streets that contribute to community connectivity and may include the presence of parks, community centers, schools, or places of worship. Neighborhood Circulators have abundant street trees and open space along them. These streets may need design techniques that reduce travel speeds and traffic volumes.

Typical Transportation Uses

- Mostly local traffic; vehicles from throughout the neighborhood may filter onto these streets
- Some may have transit service
- Non-motorized trips connecting to local destinations (e.g., schools, parks or retail)
- Bicycles typically share the street with vehicles; marked facilities recommended
- Vehicle speeds should be low; speed management may be required

NEIGHBORHOOD CIRCULATORS



Note: Similar to Limited Connection Residential, though provide more connectivity to City street network

TYPICAL ELEMENTS MAY INCLUDE:

- NARROW AND DESIGNED FOR SLOWER SPEEDS
- SINGLE-FAMILY RESIDENTIAL SET BACK WITH DRIVEWAYS
- ON-STREET PARKING (UNMARKED) - WHERE APPLICABLE
- SIDEWALKS
- BICYCLE BOULEVARDS (SEE DEFINITION BELOW)
- STREET LIGHTING

DIAGRAM KEY

Ⓥ	Travel Lanes -10' to 11' Each
Ⓟ	On-Street Parking - 8'
Ⓣ	Street Tree Zone - 5'
Ⓢ	Sidewalks - 5'
i	City Right-of-Way

Bicycle Boulevards are streets with low traffic volumes and speeds, designated and designed to give bicycle travel priority within the travel lane.

-National Association of City Transportation Officials

ACTIVE STREETS

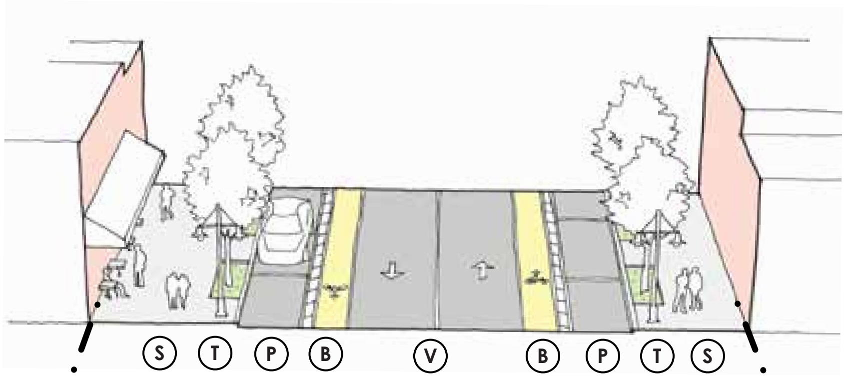
Active Streets connect multiple destinations and are more mixed-use or commercial in nature than residential streets. They are generally the street type for new streets within Activity Centers and are the primary location for commercial property access. Active Streets should be designed to create a comfortable environment for walking while at the same time accommodating circulation by bicyclists, cars, and trucks, and in some cases transit vehicles.

Typical Transportation Uses

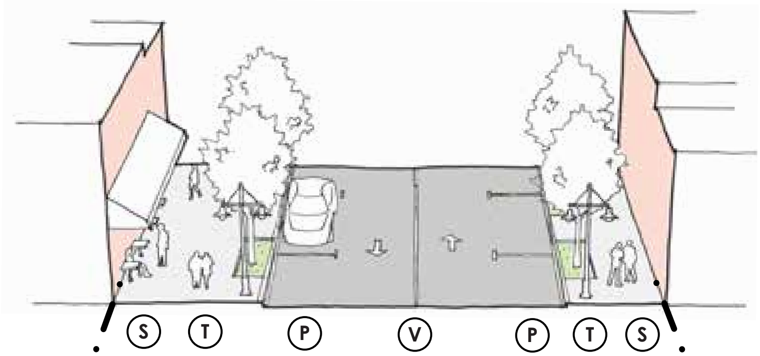
- Mostly local traffic accessing destinations, though some active streets may accommodate regional traffic
- Some may have transit service
- High concentrations of pedestrians
- Bicycles in-street only, preferably on dedicated facilities
- Loading and delivery vehicles need to be accommodated
- Traffic speeds should be low

ACTIVE STREETS

Option 1



Option 2



TYPICAL ELEMENTS MAY INCLUDE:

- NARROW STREETS (TYPICALLY TWO LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- ON-STREET PARKING
- SIDEWALKS
- BICYCLE BOULEVARDS
- STREET LIGHTING
- TREES IN PITS, PLANTERS, OR GRATES

DIAGRAM KEY

Ⓥ	Travel Lanes -10' to 11' Each
Ⓟ	On-Street Parking - 8'
Ⓣ	Street Tree Zone - Min. 5'
Ⓢ	Sidewalks - Varies 6' to 12'
Ⓑ	Bicycle Lanes - Min. 5'
i	City Right-of-Way

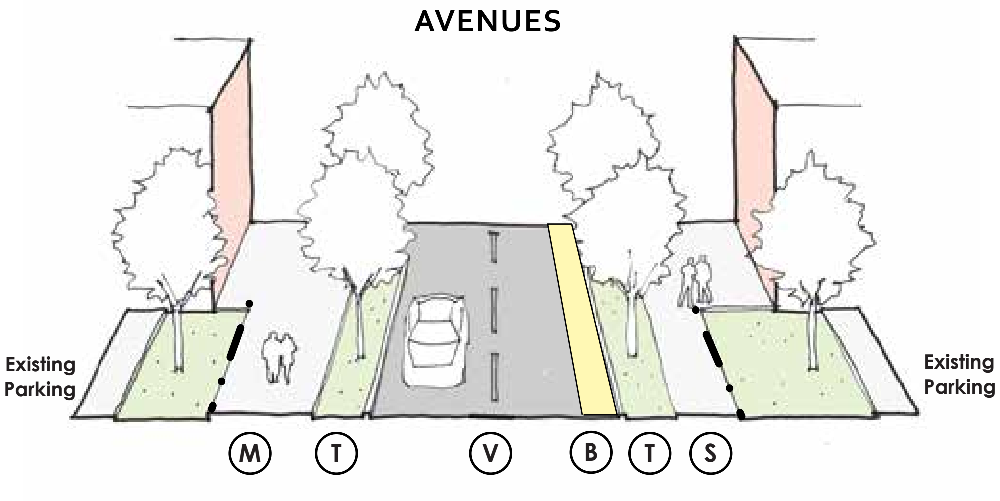
AVENUES

Avenues carry moderate traffic volumes using one travel lane in each direction. As a result, these corridors are more comfortable for transportation users. They include sections of arterial corridors between certain Activity Centers such as Old Lee Highway and Chain Bridge Road. Medians or planted median islands are less common while curb cuts and access drives are numerous. Vehicle throughput can be controlled through these areas due to high volume, naturally lowering traffic speeds to a level consistent with the non-commercial context.

Typical Transportation Uses

- Can be moderate volumes of traffic. Most vehicles are passing through to other local or area destinations
- Transit service is likely
- Moderate concentrations of pedestrians
- Bicycles accommodated on protected or off-street facilities such as shared use paths
- Traffic speeds lower, limited by volume

Image Credit: Google



TYPICAL ELEMENTS MAY INCLUDE:

- LOWER CAPACITY THAN BOULEVARDS (TWO LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- LIMITED OR NO ON-STREET PARKING
- SIDEWALKS OR SHARED USE PATHS
- BICYCLE LANES AND/OR SHARED USE PATHS
- VEGETATED BUFFERS FOR TREE ZONE

DIAGRAM KEY

Ⓥ	Travel Lanes -11' to 12' Each
Ⓣ	Street Tree Zone - Min. 5'
Ⓢ	Sidewalks - Varies 6' to 12'
Ⓜ	Shared Use Paths - Min. 10'
Ⓑ	Bicycle Lanes - Min. 5'
¦	City Right-of-Way

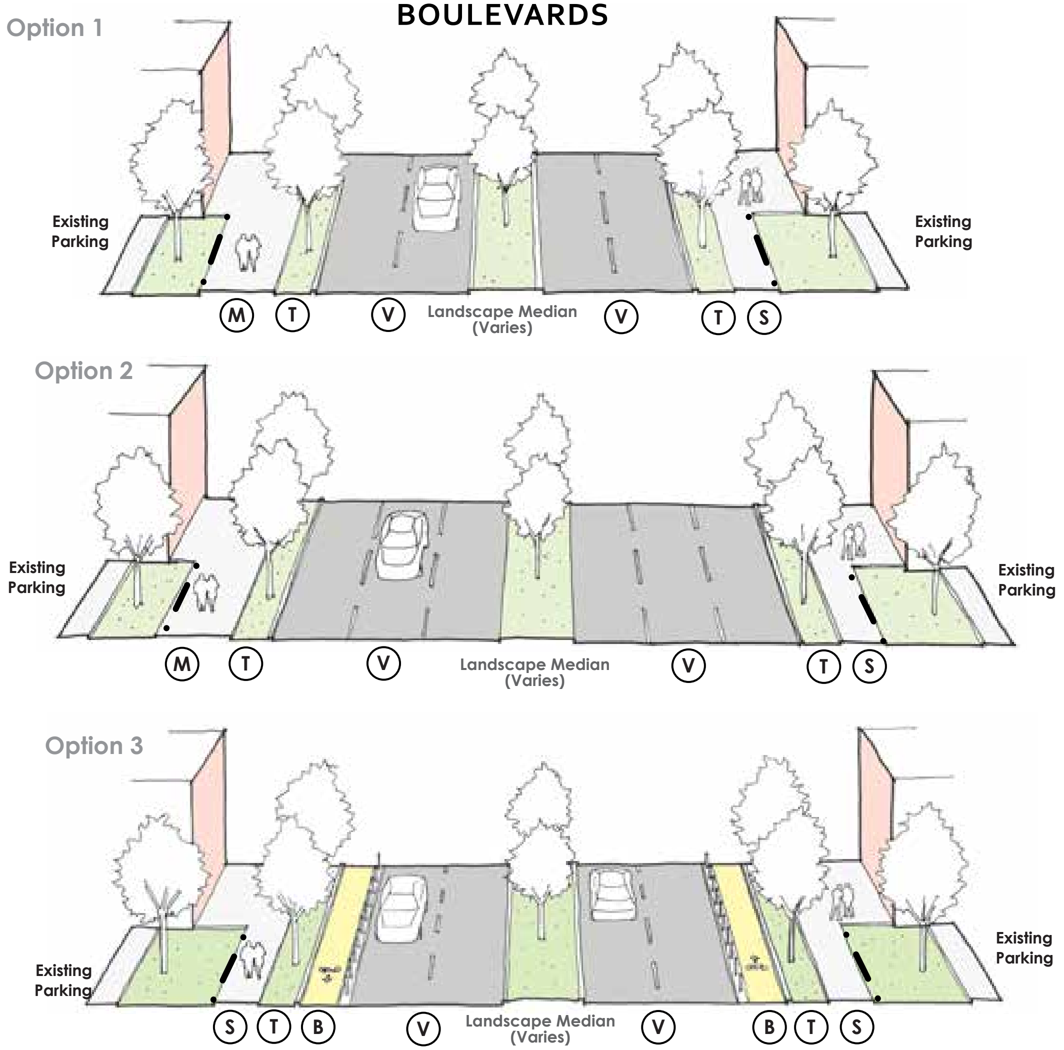
BOULEVARDS

Boulevards carry moderate to high volumes of traffic, but do so through a parkway like setting. They include sections of arterial corridors between the Activity Centers that may be designated as Boulevards, as well as minor arterials such as Pickett Road and Jermantown Road. Medians or planted median islands are common and curb cuts and access drives should be few and far between. While vehicle throughput is generally smooth through these areas, traffic speeds should remain consistent with the residential or park-like setting the streets travel through.

Typical Transportation Uses

- Can be high volumes of traffic. Most vehicles are passing through to other local or area destinations
- Transit service is likely
- Low concentrations of pedestrians
- Bicycles accommodated on protected or off-street facilities such as shared use paths
- Traffic speeds likely higher, but still managed

BOULEVARDS



TYPICAL ELEMENTS MAY INCLUDE:

- MULTI-LANE (TYPICALLY FOUR OR MORE LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- NO ON-STREET PARKING
- SIDEWALKS OR SHARED USE PATHS
- BICYCLE LANES OR SHARED USE PATHS
- VEGETATED BUFFERS FOR TREE ZONE

DIAGRAM KEY

Ⓣ Street Tree Zone - Min. 5′
Ⓢ Sidewalks - Varies 6′ to 12′
Ⓜ Shared Use Paths - Min. 10′
Ⓑ Bicycle Lanes - Min. 5′
/ City Right-of-Way

COMMERCIAL MAINS

Commercial Mains are where commercial activity is concentrated, such as Fairfax Boulevard through Northfax or Main Street around Kamp Washington. Commercial Mains feature high volumes of vehicle traffic that mixes with bicycles, transit vehicles, and pedestrian crossings. Streets should be designed to slow traffic speeds while facilitating traffic flow. The pedestrian zone of the street should buffer pedestrians from the adjacent traffic. Access management on Commercial Mains improves vehicle flow while reducing conflicts with pedestrians or bicyclists.

Typical Transportation Uses

- Can be high volumes of traffic. Many vehicles are passing through to other local or regional destinations
- Transit service is likely
- High concentrations of pedestrians
- Bicycles accommodated in dedicated facilities either in-street or in well-designed shared use paths
- Traffic speeds likely higher, but still managed

Multimodal Transportation

Goal 4

Adopt policies and procedures for strategic transportation decision making.

The City will work with civic leaders, community members, and other stakeholders to develop and adopt clear and consistent policies and processes based on the community's fundamental values and advance the overall vision for sustainable transportation. These policies are aimed at ensuring the safety of all travelers, enhancing the person-trip efficiency of the system, and preserving the characteristics that make the City unique.

OUTCOME MM4.1:	The City's sidewalk policy is updated.
ACTION MM4.1.1	Adopt a formal sidewalk policy, beginning with the best practices and policy recommendations for Pedestrian Accessibility Policy in Appendix B (Section 4), requiring sidewalks on all new, reconstructed, or substantially rehabilitated streets that respond to local needs and community context.
OUTCOME MM4.2:	A Complete Streets policy is adopted and implemented.
ACTION MM4.2.1	Develop and adopt a Complete Streets policy, beginning with the best practices and policy recommendations for Complete Streets Policy in Appendix B (Section 5).
4.2.1.1	Develop an appropriate policy for the City and adopt as formal policy.
4.2.1.2	Examine existing design practices and processes and adjust to ensure implementation of the adopted policy.
4.2.1.3	Set and track evaluation measures for Complete Streets improvements.
ACTION MM4.2.2	Implement Complete Streets improvements on major corridors including Fairfax Boulevard, Chain Bridge Road, University Drive, Old Lee Highway and Main Street.
OUTCOME MM4.3:	A Transportation Demand Management (TDM) Program is adopted and implemented.
ACTION MM4.3.1	Based on best practices (as defined in Appendix B Section 3), establish a Citywide TDM policy and program framework that can be utilized by the City and adapted by businesses and developers.
ACTION MM4.3.2	Require TDM for all large development projects. Require bi-annual monitoring to assess resident/employee travel patterns.

Multimodal Transportation Goal 4

ACTION MM4.3.3	Create a City TDM brand and website to centralize all available travel option information including transit schedules, bicycle maps, ridesharing opportunities, and education tools.
ACTION MM4.3.4	Increase outreach and education to George Mason University, the Central Fairfax Chamber of Commerce, City of Fairfax Schools, and other markets that can provide strong partnerships with the TDM program.
ACTION MM4.3.5	Evaluate a linked TDM fund for in-lieu developer fees related to parking requirements to enhance the transit system and Citywide TDM programs.
ACTION MM4.3.6	Improve access to ridesourcing programs through enhanced coordination with Fairfax County RideSource, Commuter Connections, or initiate a City-based program.
ACTION MM4.3.7	Explore opportunities for carshare services within the City to address "last mile" connections.
ACTION MM4.3.8	Partner with employer-sponsored wellness programs to highlight and market travel options and associated costs.
OUTCOME MM4.4:	Mobility best practices and emerging technologies, including those described in Appendix B, are considered in transportation policies and projects.
ACTION MM4.4.1	Consider methods of implementing and evaluating new transportation concepts, including trial or pilot programs.
ACTION MM4.4.2	Provide real-time information through both apps and visual displays for transit arrivals, parking availability, and shared bicycles and vehicles.
ACTION MM4.4.3	Promote multimodal travel planning applications and services.
ACTION MM4.4.4	Pursue Intelligent Transportation Systems (ITS) such as transit or emergency vehicle priority, dynamic signal timing, and other strategies.

Multimodal Transportation
Goal 4

ACTION MM4.4.5	Participate with state and regional partners to ensure autonomous vehicle policies protect vulnerable street users and reduce overall vehicle miles traveled.
ACTION MM4.4.6	Consider curbside policies and street design to manage curbside carsharing/ridesourcing activities while preserving the safe and efficient flow of travel.
ACTION MM4.4.7	Consider policies to promote technologies and innovations that reduce environmental impacts from transportation.
OUTCOME MM4.5:	A short-term prioritized transportation project list is developed.
ACTION MM4.5.1	Develop a two-year project list that reflects City Council and community priorities.
ACTION MM4.5.2	Provide opportunities for public input on transportation improvements.
ACTION MM4.5.3	Use all available media to provide transportation information to the public.

Recommended Transportation Policies, And Projects And Cost Estimates

The plan's goals are achieved through accomplishing the policies and projects highlighted in Figure 30. Additionally, in accordance with Virginia Code Section 15.2-2223 relating to Comprehensive Plans, the map is accompanied by cost estimates for the specific projects, as shown below in Figure 29. The map and table include only key recommended projects; all projects under consideration to meet the long-term goals of the Multimodal Plan will be considered annually as part of the development of the City's Two-Year Transportation Program.

FIGURE 29 CITY OF FAIRFAX MULTIMODAL TRANSPORTATION PLAN – COST ESTIMATE

PROJECT #	NAME	PROJECT TOTAL COST ESTIMATE
1	Implement multimodal improvements at Warwick Ave and Fairfax Blvd	$ 7,900,000
2	Improve Jermantown Rd corridor	$ 21,000,000
3	Add sidewalk connection on Chain Bridge Rd between Old Town and Fairfax Blvd	$ 4,580,000
4	Implement Old Lee Hwy multimodal improvements	$ 15,000,000
5	Study Main St bicycle facility feasibility	$ 11,200,000
6	Extend trail along Pickett Rd from Fairfax Blvd to the Cross County Trail	$ 3,500,000
7	Complete the George Snyder Trail	$ 14,000,000
8	Support the study of a Metrorail extension	$ 15,260,000
9	Improve intersection at Eaton Place and Chain Bridge Rd	$ 26,000,000
10	Improve vehicular and pedestrian safety at Fairfax Circle	$ 5,760,000
11	Expand the roadway network in Northfax West	$ 5,000,000
12	Extend South St between University Dr and Chain Bridge Rd	$ 19,750,000
13	Complete the Judicial Drive Trail	$ 350,000
14	Implement University Drive traffic calming measures	$ 500,000
15	Complete the Government Center Parkway connection	$ 5,000,000
Citywide, not location specific	Implement pedestrian spot improvements Citywide	$ 400,000
	Conduct a bikeshare feasibility study	$ 60,000
	Improve Transit facilities	$ 965,000
	Implement roadbed improvements	$ 1,000,000
	Develop a Transportation Demand Management Program	$ 60,000
	Maintain pavement condition of primary extension roadways	$ 970,000
		$ 158,255,000

FIGURE 30 TRANSPORTATION POLICIES AND PROJECTS

Regional Corridors

Continue to participate in regional planning efforts to improve vehicle and freight operations and pedestrian, bicyclist and vehicle safety in regional corridors, such as Blake Lane-Jermantown Road, Braddock Road, Government Center Parkway, and Pickett Road.

City Major Corridors

Implement complete streets improvements to safely accommodate all roadway users in the City on all roads, and in particular on arterials including Fairfax Boulevard, Chain Bridge Road, Old Lee Highway and Main Street.

Local Activity Centers

Within Local Activity Centers:

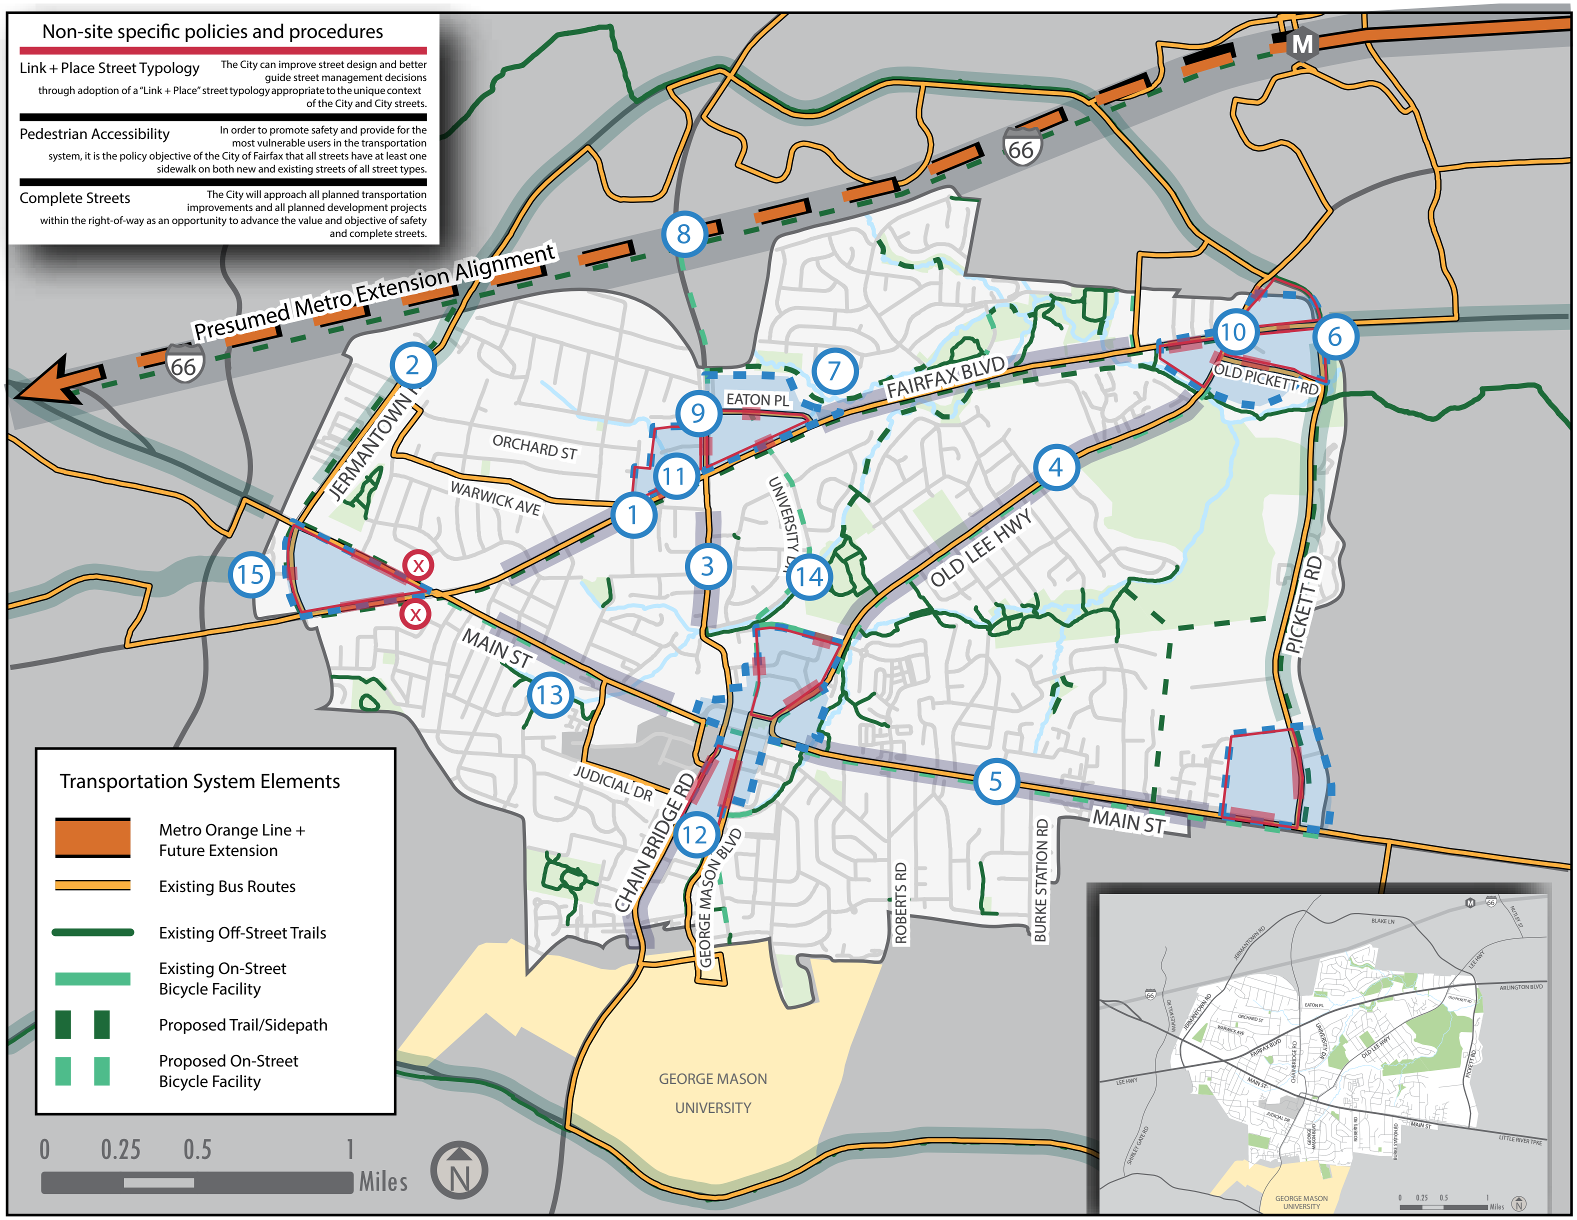
- Break up large blocks to a more walkable scale. Pursue expanded secondary, tertiary, and non-motorized network opportunities.
- Consolidate vehicular access points
- Provide new pedestrian-only connections

Specific Projects

1. Improve Warwick Ave and Fairfax Blvd
2. Improve Jermantown Rd corridor
3. Add sidewalk on Chain Bridge Rd
4. Add Old Lee Hwy multimodal improvements
5. Study Main St bicycle facility feasibility
6. Add Pickett Rd trail connection
7. Complete the George T. Snyder Trail
8. Support the study of a Metrorail extension
9. Improve intersection at Eaton Place and Chain Bridge Rd
10. Improve safety for all users at Fairfax Circle
11. Expand the roadway network in Northfax West
12. Expand the roadway network at South Street
13. Complete the Judicial Drive Trail
14. Implement University Drive traffic calming measures
15. Connect Government Center Parkway

Citywide Projects (Locations TBD)

- Implement pedestrian spot improvements
- Conduct a bikeshare feasibility study
- Improve transit facilities
- Implement roadbed improvements
- Develop a Transportation Demand Management Program
- Maintain pavement condition of primary extension roadways



Non-site specific policies and procedures

Link + Place Street Typology The City can improve street design and better guide street management decisions through adoption of a "Link + Place" street typology appropriate to the unique context of the City and City streets.

Pedestrian Accessibility In order to promote safety and provide for the most vulnerable users in the transportation system, it is the policy objective of the City of Fairfax that all streets have at least one sidewalk on both new and existing streets of all street types.

Complete Streets The City will approach all planned transportation improvements and all planned development projects within the right-of-way as an opportunity to advance the value and objective of safety and complete streets.

Transportation System Elements

- Metro Orange Line + Future Extension
- Existing Bus Routes
- Existing Off-Street Trails
- Existing On-Street Bicycle Facility
- Proposed Trail/Sidepath
- Proposed On-Street Bicycle Facility

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

4 Environment and Sustainability

This Chapter is supported by two Guiding Principles: Natural Environment and Sustainability Initiatives. The Natural Environment Guiding Principle focuses on the physical and geographic context of the City and the impact on local and regional environmental resources. The City has several types of environmental resources that are easily impaired by urban land uses. Encompassing the headwaters of Accotink Creek, measures taken by the City to protect water quality, riparian and floodplain areas, open space, and the urban forest are critical to support regional efforts to improve environmental health. Located within the Chesapeake Bay Watershed, the City is committed to reducing stormwater runoff in order to protect the Bay through the adoption of the Chesapeake Bay Preservation Act (Appendix A) and enforcement of other federal, state, and local stormwater regulations.

The Sustainability Initiatives Guiding Principle focuses on City practices with a more global interest. This includes specific actions that support sustainable practices that can decrease greenhouse gas emissions from both building energy use and transportation; increase energy efficiency; increase utilization of renewable energy; increase waste reduction and recycling; conserve water; and support healthy lifestyles. It is important to recognize that sustainability practices address a broad range of social, economic, and environmental issues, and therefore are incorporated throughout the Comprehensive Plan.

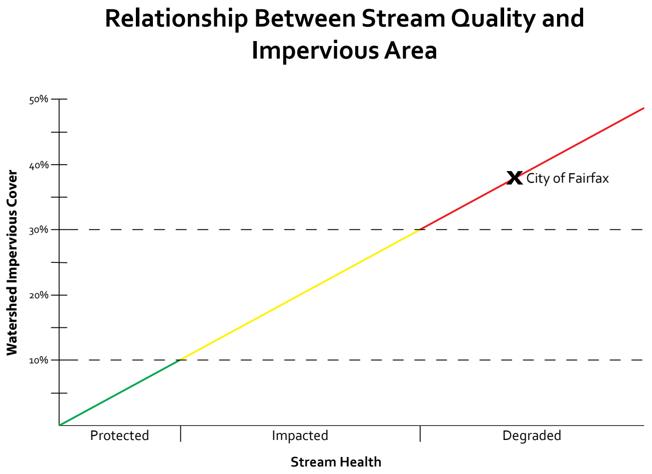
Opportunities and Challenges

Impervious surface

Previous land development has resulted in a large percentage of impervious areas, as shown in Figure 31. Impervious areas have structures such as pavement and buildings that do not allow rainwater to pass through into the ground, and increase the speed and amount of stormwater runoff resulting in negative impacts to streams. As shown in the chart "Relationship Between Stream Quality and Impervious Area," as the percentage of impervious cover in a watershed increases, stream quality declines. At 42.7% impervious cover, the City's streams are classified as "non-supporting streams." Streams in this category are usually so degraded they become a conduit for conveying stormwater and have poor stream quality. As is typical in urban areas, maintaining the health of streams in the City is a continual challenge. The City has an opportunity to increase the amount of pervious areas with redevelopment and to improve the stormwater management system in order to adequately manage stormwater runoff.

FIGURE 31 PERVIOUS AND IMPERVIOUS AREAS

Source: City of Fairfax GIS 2013 Impervious Surfaces



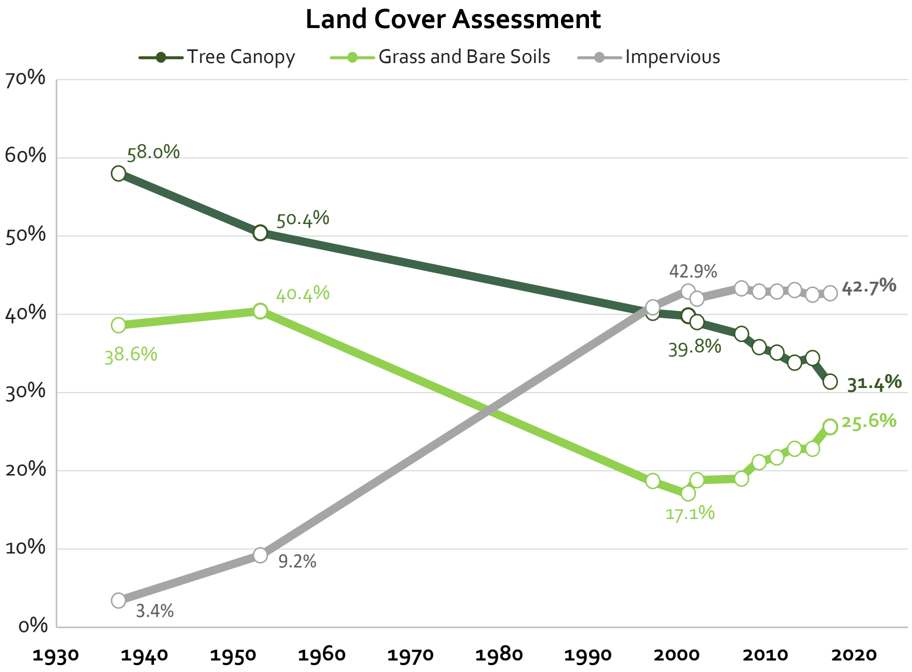
Relationship Between Stream Quality and Impervious Area

As impervious ground cover increases, stream health and quality declines. With 42.% of its ground area covered by impervious surfaces, the City's streams are considered degraded with poor quality.

Tree cover

Due to urbanization, much of which occurred during rapid post World War II development around Washington, D.C., the City's tree canopy decreased from 58% in 1937 to 31.4% in 2017, while impervious areas have increased from 3.4% to 42.7% as shown in Figure 32. Tree canopy coverage offers many benefits, such as conserving energy due to the reduction of temperatures from shading, improving air quality, reducing stormwater run-off, improving property values, and beautifying our community. Because the City is almost entirely developed, few significant forested areas remain. Those that still exist, whether public or private, deserve specific attention so that their aesthetic and ecological benefits to the City are not lost.

FIGURE 32 TREE CANOPY



Source: City of Fairfax conducted a tree canopy assessment using the i-Tree Canopy software developed by the US Forest Service. The i-Tree land cover assessment results were estimated using random sampling statistics and have standard deviations ranging from ±.14 to ±1.53.

Source: Individual municipal websites

Greenhouse gas emissions

Scientific consensus accepts the reality of climate change and recognizes that human activity, especially the combustion of fossil fuels that creates greenhouse gases, is an important driver of climate change. The City, along with the entire Mid-Atlantic region, can anticipate changes in temperature, precipitation, water supply, and air quality as a result of the changing climate. Local governments are responding to new demands on infrastructure as well as impacts to natural resources related to weather instability and changing, uncertain climatic conditions. The City is committed to exploring the potential benefits and costs of adopting policies and participating in programs that promote the long-term goal of greenhouse gas emissions reduction while maximizing economic and social benefits. A summary of greenhouse gas emissions from community activities in the City is provided in Figure 33. The City will explore and prioritize strategies that could best aid in reducing greenhouse gas emissions.

FIGURE 33 GREENHOUSE GAS EMISSIONS

Green building practices

With new public and private development projects, the City has ample opportunity to encourage the use of green building practices (Figure 34). In addition to the environmental benefits of green buildings (e.g., reducing energy use, greenhouse gas emissions, construction waste, etc.), they can also enhance the economics of local development. Recent trends show that office space meeting green building standards generally experiences higher demand and can be a catalyst for bringing new businesses to a community.

Solar installations

In recent years, the City has seen an increase in the number of solar energy installations (Figure 35). Increasing the use of renewable energy sources will benefit the resilience and economic competitiveness of our community. Since 2014, the City has participated in the Solarize NOVA campaign, a yearly effort to encourage incorporation of solar power into individual homes and businesses in Fairfax and several peer jurisdictions. This is accomplished through incentives such as free solar assessments. In 2017, the City received a "Bronze" designation from the national program SolSmart for encouraging solar energy growth and removing obstacles to solar development.

Natural Environment

One of the characteristics of the City that makes it a desirable and healthy place in which to live is the extent, diversity, and quality of its environmental resources. The City's main environmental resources include wetlands, ponds, streams, public parks, open space, and urban forests. As the City continues to grow and redevelop, these resources are at risk of being impaired. Growth and development often cause pollution to the water, air, and soil; degradation to ecosystems; and loss of natural areas that contribute to residents' quality of life. Continuing to preserve and restore our environmental resources ensures a healthy environment by providing access to clean air, clean water, healthy ecosystems, and high quality recreation areas. The City is also at risk from impacts caused by natural and man-made hazards. Reducing threats to the community and environment from these hazards will foster a safer and healthier community.

Guiding Principle:

In 2035, Fairfax is a city with... a healthy ecosystem of naturally flowing streams, native plants, wildlife, contiguous natural habitat areas, and a healthy tree population.

Natural Environment
Goal 1

Preserve, promote, and enhance a healthy environment.

The local environment will be preserved and protected through insightful policies and programs that improve the quality of the City's natural resources. Managing the stormwater that runs off land surfaces is a fundamental practice to mitigate the adverse effects of urban development by reducing flow velocities and enhancing water quality. Several federal, state, and local regulations and the City's adoption of the Chesapeake Bay Preservation Ordinance are enacted to protect the region's water resources.

The City has the opportunity to protect and increase the tree canopy by identifying the greatest challenges facing the urban forest (e.g. development, disease, etc.) and developing and implementing an urban forest management plan that includes detailed strategies for attaining a diverse, well-managed urban forest.

OUTCOME NE1.1:	Clean and protected water resources and watersheds in the City.
ACTION NE1.1.1	Reaffirm and implement the City's Chesapeake Bay Preservation Plan (Appendix A) and zoning regulations.
ACTION NE1.1.2	Enhance zoning regulations and support initiatives that encourage the use of green stormwater infrastructure on private and public property.
ACTION NE1.1.3	Retain and acquire riparian areas as open space or parkland.
OUTCOME NE1.2:	Clean, healthy air that supports plant, animal, aquatic, and human life.
ACTION NE1.2.1	Develop and implement a Climate and Energy Action Plan to achieve regional greenhouse gas emissions reduction goals (20% reduction from 2005 level by 2020, 80% reduction from 2005 level by 2050) as committed to in the Greater Washington 2050 Compact.
ACTION NE1.2.2	Identify and implement strategies to reduce airborne pollutants known to cause health problems.
OUTCOME NE1.3:	A diverse, well-managed urban forest dominated by native species.
ACTION NE1.3.1	Develop and implement an urban forest management plan to protect the City's urban forest and increase the quantity, density, and diversity of trees on public and private land.
ACTION NE1.3.2	Support incentives, provide education, and partner with public and private groups to encourage native tree planting and preservation by private property owners.

Natural Environment Goal 1

ACTION NE1.3.3	Update zoning regulations and public facilities manual for tree preservation, removal, and planting of preferred species of trees located along streets, parking lots, and riparian areas.
OUTCOME NE1.4:	A diverse population of native vegetation protected from invasive plants.
ACTION NE1.4.1	Develop a strategy to control invasive species including identifying and mapping areas impacted by invasive plants.
ACTION NE1.4.2	Support the development of community and habitat gardens on underutilized parcels and public lands.
ACTION NE1.4.3	Provide education and partner with public and private groups to promote the preservation and planting of native plants, sustainable landscaping techniques, and management of invasive plants.
OUTCOME NE1.5:	Restored and preserved natural open spaces and contiguous greenway corridors that provide natural habitats for plants and wildlife.
ACTION NE1.5.1	Restore disturbed areas along streams and in conservation easements with native species.
ACTION NE1.5.2	Pursue opportunities to purchase and preserve in perpetuity privately-owned open space.
ACTION NE1.5.3	Encourage new development that protects and preserves environmentally-sensitive areas and natural features, such as tree cover (especially significant stands of trees and healthy, mature trees), native vegetation, streams, wildlife habitat, and natural topography.

Natural Environment
Goal 2

Prepare for the impacts from natural and man-made hazards.

Extreme weather events such as prolonged heat, hurricanes, and flash flooding have contributed to negative health impacts, damaged homes and businesses, destroyed critical infrastructure, and to interruptions in the region's economic activity. These types of weather events are projected to increase in frequency and magnitude. There is also a risk that the community could be exposed to a variety of pollutants and hazardous chemicals, which may have negative effects on human health and the environment. The City should take steps to prepare for and mitigate these hazards.

OUTCOME NE2.1:	Reduced risk and improved preparedness to meet the challenges associated with natural and man-made hazards.
ACTION NE2.1.1	Participate in the National Flood Insurance Program's (NFIP) Community Rating System, a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements.
ACTION NE2.1.2	Develop a resiliency plan to set priorities and allocate resources to manage risks associated with natural and man-made hazards.
ACTION NE2.1.3	Continue to work with the Northern Virginia Hazard Mitigation Advisory Committee to regularly update the Northern Virginia Hazard Mitigation Plan.
OUTCOME NE2.2:	Reduced exposure to pollutants and hazardous chemicals in the environment.
ACTION NE2.2.1	Enhance exterior lighting standards and pursue certification as an International Dark Sky Community to reduce light pollution and protect nighttime skies.
ACTION NE2.2.2	Continue to enforce noise standards.
ACTION NE2.2.3	Promote the proper disposal or recycling of household hazardous waste.
ACTION NE2.2.4	Educate on the identification, risks, and remediation of hazardous materials in buildings, including but not limited to radon, asbestos and volatile organic compounds.
ACTION NE2.2.5	Develop integrated pest management and nutrient management plans.
ACTION NE2.2.6	Promote the responsible use of pesticides and fertilizers.

Sustainability Initiatives

Guiding Principle:

In 2035, Fairfax is a city with... sustainable practices that preserve, conserve, reuse and recycle resources.

Sustainability can be defined in many ways. In relation to urban planning, sustainability is often defined as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (World Commission on Environment and Development, 1987). The City has a responsibility to future generations to develop sustainably. In 2013, the City executed an energy performance contract to implement energy retrofits at fourteen City-owned buildings. The City pays back the upfront costs of the retrofits using the annual energy cost savings over time.

Sustainability issues extend well beyond City boundaries, so local decisions can impact the region and beyond. The City collaborates with regional partners, such as MWCOG and the Northern Virginia Regional Commission (NVRC) in formulating solutions to sustainability challenges and taking actions to achieve regional goals. In 2010, the Mayor and City Council adopted a resolution endorsing the voluntary Greater Washington 2050 Compact in which the City committed to following the principles and goals set within The Region Forward report, a vision for a more accessible, sustainable, prosperous, and livable metropolitan Washington.

Sustainability Initiatives

Goal 1

Increase the use of sustainable practices, technology, design, and materials.

This City should seize the opportunity to promote energy efficient and sustainable redevelopments and retrofits of aging buildings while also encouraging designs that fit within the context of the existing community. This can involve incentives for privately-owned buildings as well as City investment in public facilities. Education about financing options (such as the Fairfax Renaissance Housing Corporation loans) should be provided to property owners. By improving energy efficiency and sustainable design of civic operations and in the greater community, the City will harmonize resources, investments and technology, help reduce utility costs, support "green collar" jobs, and institutionalize change.

OUTCOME SI1.1:	Minimized energy demand with the application of energy efficient design features, technologies, and best practices.
ACTION SI1.1.1	Promote the efficient use of energy by residents, business owners and government facilities and operations to achieve a 30% reduction in energy use from 2018 baseline levels by 2035; a 40% reduction from 2018 baseline levels by 2040; and a 55% reduction from 2018 baseline levels by 2050.
SI1.1.1.1	Use a data-driven assessment process to deploy energy efficiency technologies throughout all government facilities and operations, and promote energy efficiency best practices among government employees.
SI1.1.1.2	Support incentives, provide education, and partner with public and private groups to promote energy efficiency and sustainability improvements by private property owners.
SI1.1.1.3	Promote voluntary benchmarking for commercial buildings.
SI1.1.1.4	Implement programs that offer clean energy financing solutions for residential and commercial sectors, such as the Solarize NOVA campaign, Property Assessed Clean Energy (PACE) program, and Fairfax Renaissance Housing Corporation (FRHC) Loans.
ACTION SI1.1.2	Develop a green building policy that establishes green building standards and incentives for both private and public sector construction and major renovations.
OUTCOME SI1.2:	Increased use of renewable energy sources and advanced sustainable technologies.
ACTION SI1.2.1	Conduct feasibility studies and subsequent plans for government operations to achieve 100% renewable electricity by 2035 and community-wide 100% renewable electricity by 2050.
ACTION SI1.2.2	Revise applicable codes, zoning regulations, policies, and design guidelines to help facilitate local renewable energy deployment and adoption of sustainable technologies.
ACTION SI1.2.3	Provide education and incentives for residents and businesses to install renewable energy systems and sustainable technologies.
ACTION SI1.2.4	Partner with other local governments, organizations, and individuals on renewable energy planning and implementation.

Sustainability Initiatives Goal 1

OUTCOME SI1.3:	Reduced waste and increased reuse and recycling of materials.
ACTION SI1.3.1	Implement the Solid Waste Management Plan, which establishes waste reduction goals and outlines how the City manages solid waste and recycling.
OUTCOME SI1.4:	Minimized potable water demand in the community.
ACTION SI1.4.1	Develop and provide water conservation education and incentive programs for residents and businesses to promote the use of water efficient practices and products.
ACTION SI1.4.2	Support incentives and revise applicable codes, policies, and design guidelines to encourage water efficiency in new construction and landscaping.

Sustainability Initiatives Goal 2

Support physical activity and healthy lifestyles.

Since the City is mostly built out and infrastructure is already in place, it is an ideal location to provide access to healthy food, community facilities, and recreational opportunities. Smart growth concepts should be incorporated in new development and redevelopment to further enhance the ability of residents to take advantage of public transportation, parks, open space, and trails. The City also strives to improve access to healthy, affordable, and regionally-grown foods to promote public health, reduce environmental impacts, and support economic development (Figure 36).

OUTCOME SI2.1: Access to healthy, regionally-grown foods.

ACTION SI2.1.1 Evaluate regulations that permit urban agriculture on publicly-owned property and/or space for community gardens in new multifamily and mixed-use developments.

ACTION SI2.1.2 Work with Fairfax County to develop a healthy food access plan.

OUTCOME SI2.2: Access to parks, recreation, community facilities, trails, and open space.

ACTION SI2.2.1 Promote walking and trail use as part of a healthy community initiative.

ACTION SI2.2.2 Partner with Fairfax County and NOVA Parks to improve and expand the local and regional park system.

5 Economic Vitality

Guiding Principle:

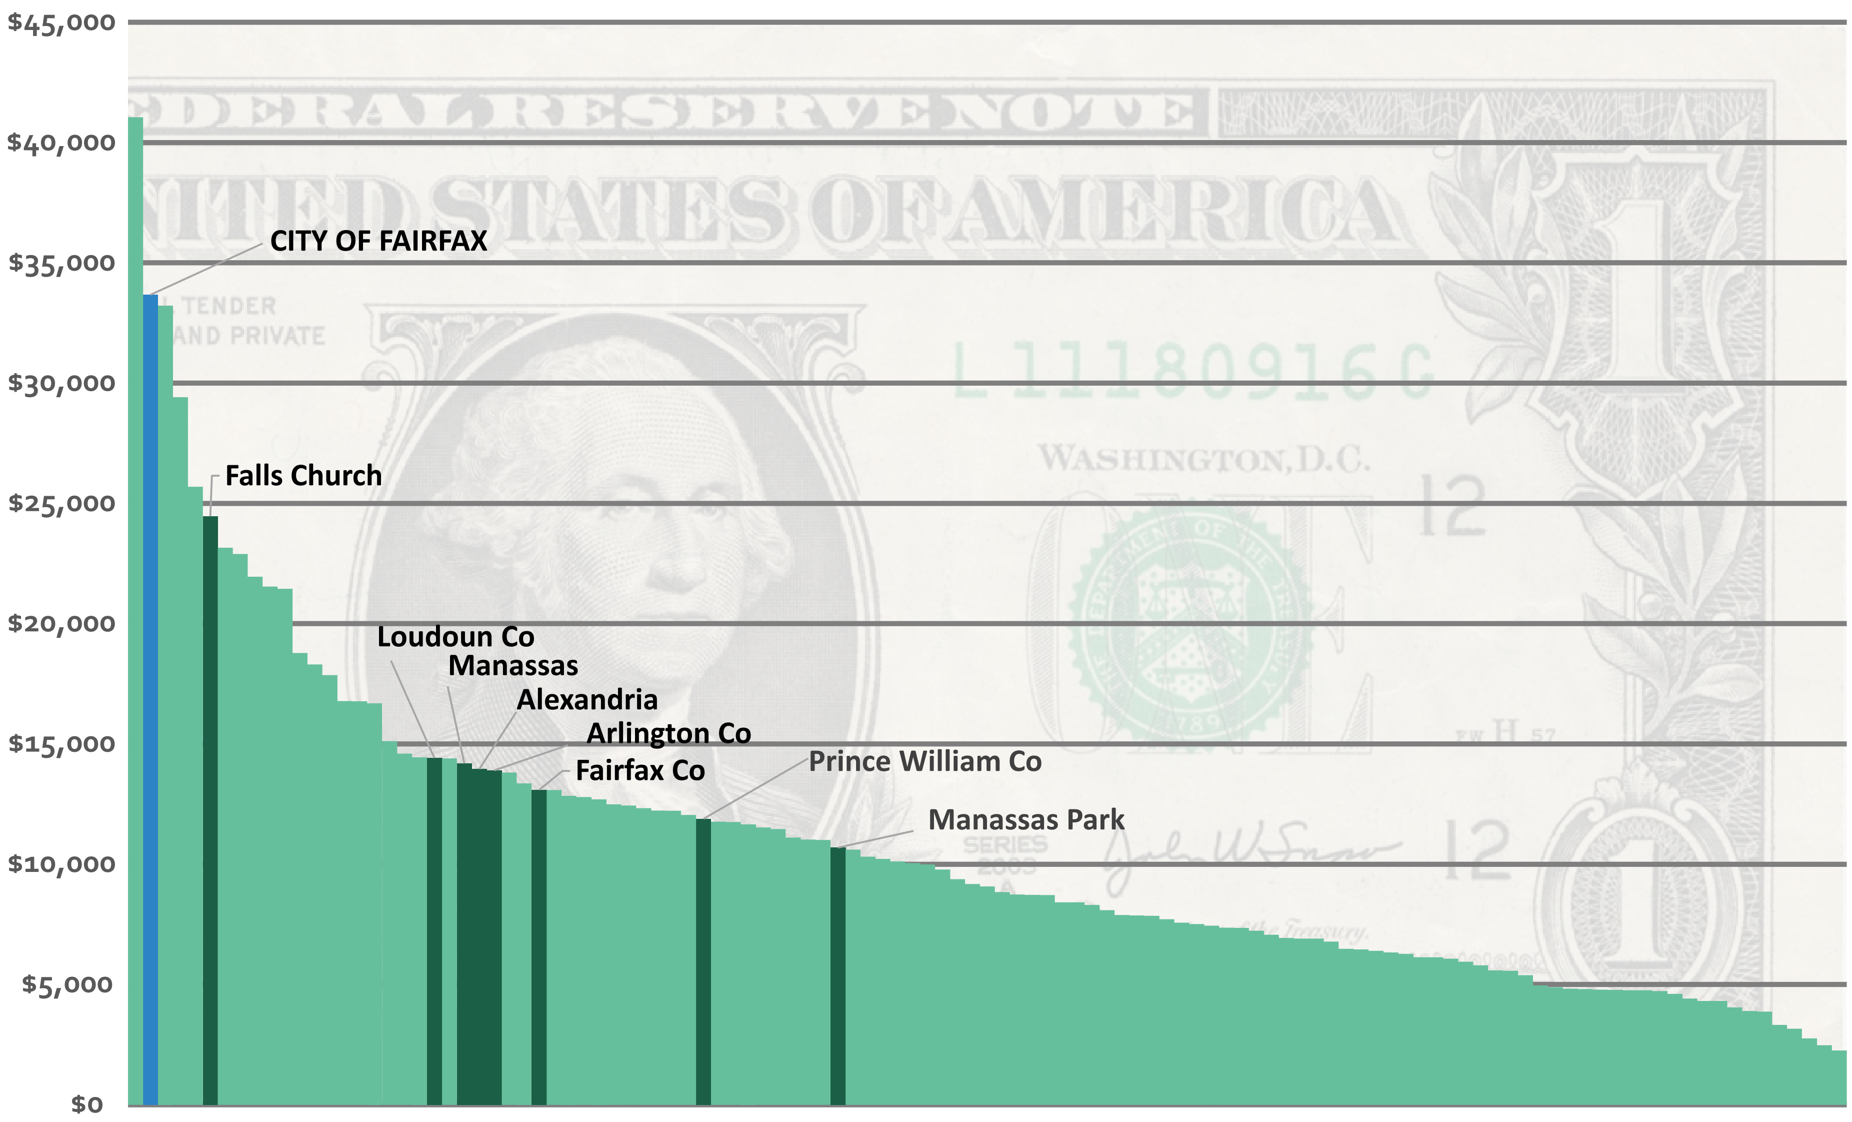
In 2035, Fairfax is a city with... an economy that cultivates and promotes business success and entrepreneurial opportunities for large, small, and independent businesses and capitalizes on national, regional and intellectual partnerships.

The City has long been a hub for economic activity within Northern Virginia. Due to its central location; proximity to regional destinations such as George Mason University, the Fairfax Courts Complex and Inova Fairfax Hospital; and its setting among transportation crossroads, the City has traditionally boasted a larger proportional share of the region's office and retail activity than its relatively small size and population would suggest. This longstanding concentration of economic activity still holds true, with the City achieving the second-highest amount of retail sales per capita of any Virginia jurisdiction (as shown in Figure 37), and a regional share of office space nearly five times the City's share of Northern Virginia's land area.

This cluster of economic vitality provides Fairfax with many benefits, such as a diversified revenue stream that enables the City to rely less on residential tax revenue than do most nearby jurisdictions. Furthermore, a high concentration of office and retail activity enables City residents to have varied employment and shopping opportunities relatively close to home.

Throughout the Comprehensive Planning process, sustaining this historical advantage has emerged as a priority. However, ensuring that the City remains as an economic hub for the region requires both a commitment to maintaining existing commercial infrastructure and positioning the City to be at the forefront of emerging marketplace trends.

FIGURE 37 2016 TAXABLE SALES PER CAPITA FOR VIRGINIA JURISDICTIONS WITH POPULATION OVER 10,000



Source: Virginia Department of Taxation

Opportunities and Challenges

Shifts in the office market

While the City has seen significant increases in office vacancies over the past decade, this trend is present in Fairfax County and Northern Virginia as well. In fact, the City has generally kept a lower office vacancy rate than the region as a whole. With previous regional overbuilding, increases in teleworking and more efficient office space utilization, however, an overall downward trend in office demand is expected to continue for the foreseeable future. The 2013 Fairfax Boulevard Market Analysis only forecasted a net absorption of 50,000 square feet of office space along the corridor over the ten-year study period.

The City office market, while large in size, is overwhelmingly comprised of Class B structures that offer few modern amenities. Given the increasing interdependence and fluidity of Northern Virginia's office market, this can make office space in the City less competitive and less desirable to prospective tenants than Class A office space in surrounding areas, particularly in more rapidly expanding sectors of the economy.

FIGURE 38 OFFICE VACANCY RATE

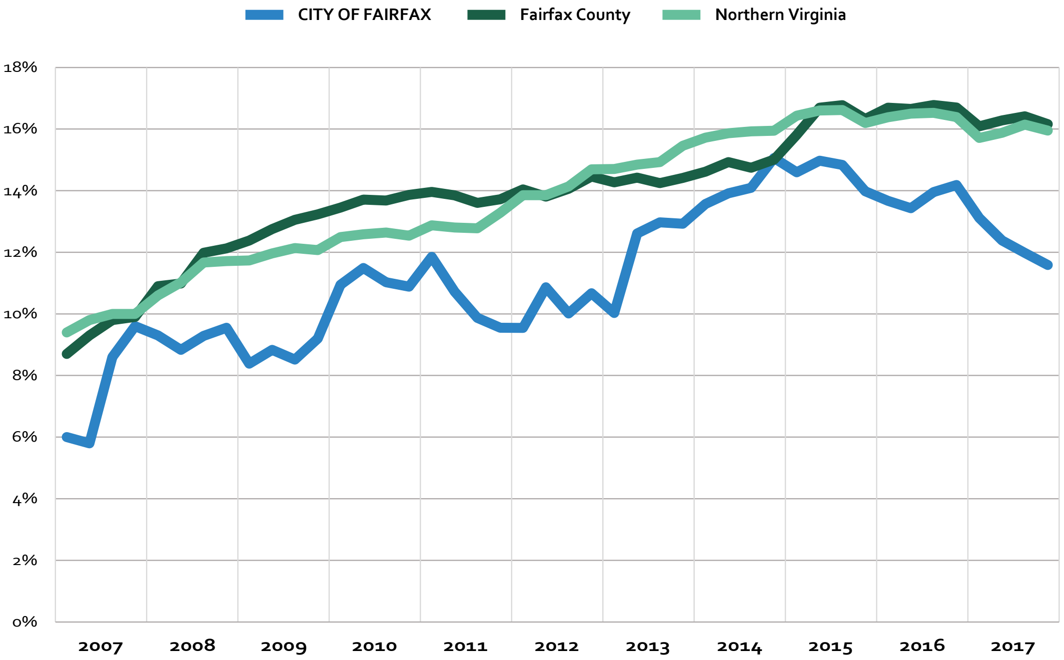


FIGURE 39 OFFICE MARKET BY CLASS, 2017

Source: CoStar, Dec 2017

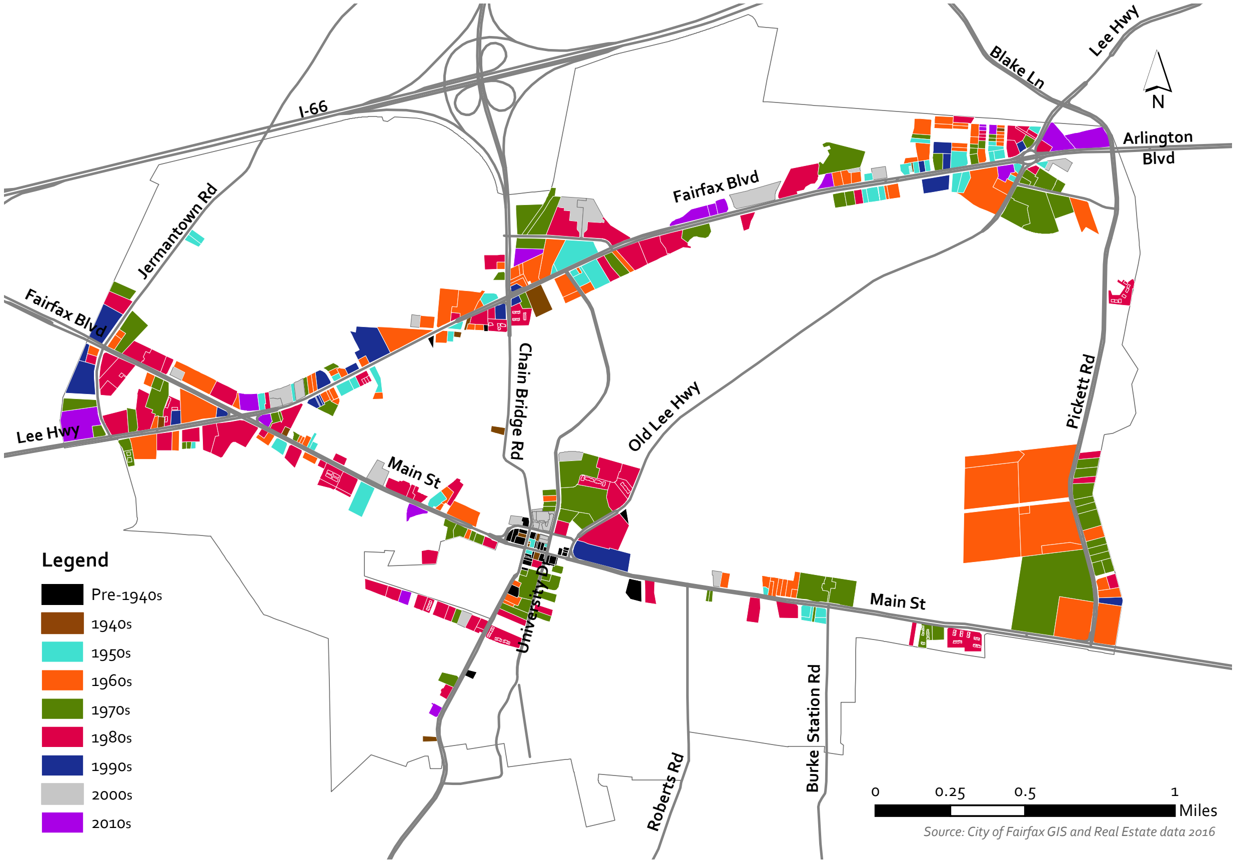
Shifts in the retail market

With consumers gravitating to online purchases and larger format retailers, demand for retail space has been decreasing region-wide in recent years. This has been especially true for older retail spaces that lack modern design requirements. The reduction in demand for traditional retail has been partially offset by increases in demands for food and drink and service type establishments.

These trends have combined to create vigorous regional competition for high-value retailers. As shown in Figure 6 (p. 21), numerous mixed-use centers have been built, or are being planned, within 10 miles of the City. All of these centers use retail as a linchpin to their fiscal success. In order to thrive in this competitive and interdependent retail market, the City must both be mindful of the pragmatic limits of regional retail demand, and must also offer high-quality retail spaces for prospective tenants.

With the vast majority of the City's existing commercial space constructed in the 1960s and 1970s, ensuring that both area consumers and retailers have updated commercial space will greatly enhance the City's retail sector's appeal in this increasingly competitive retail marketplace.

FIGURE 40 COMMERCIAL AND INDUSTRIAL BUILDING AGE BY DECADE BUILT



Source: City of Fairfax GIS and Real Estate data 2016

Economic Vitality

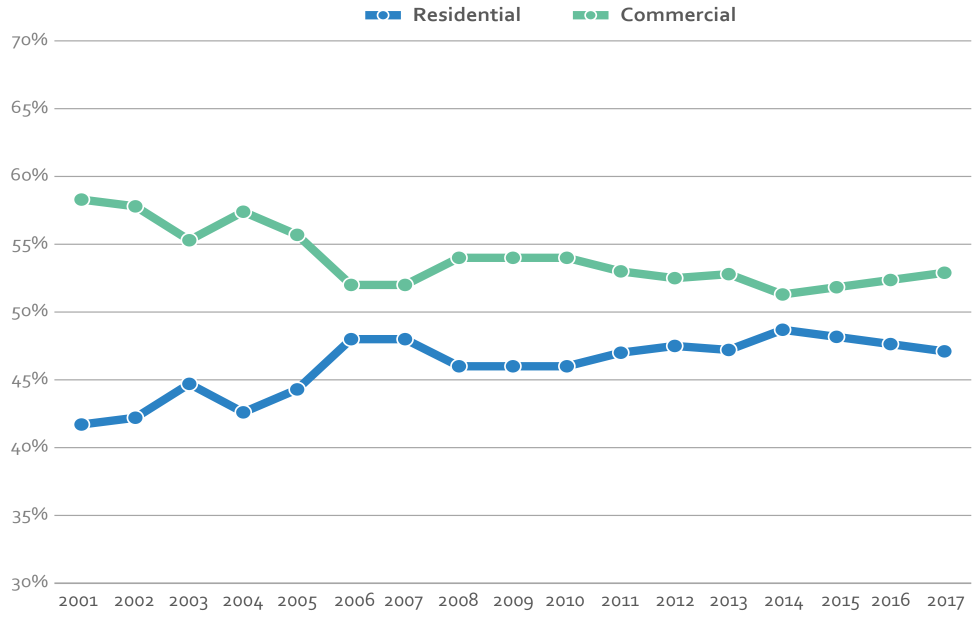
Goal 1

Increase the City's ratio of commercial to residential real estate.

Commercial properties tend to contribute more to the tax base than they consume in public expenditures because of relatively high real estate values and lower dependence on public services. The City has historically benefited from having a high ratio of commercial to residential development, resulting in a lesser tax burden on residences. As commercial properties have aged and new commercial development has slowed, this ratio has begun to shift. The City can offset this shift by supporting measures to increase values of existing commercial properties and encouraging new commercial development so that the value of nonresidential properties continues to comprise a greater proportion of the City's taxable properties.

OUTCOME EV1.1:	New development and redevelopment that maximize revenue generation from nonresidential buildings and uses.
ACTION EV1.1.1	Attract new commercial businesses while supporting and retaining existing businesses.
ACTION EV1.1.2	Leverage proximity to George Mason University to attract university spin-outs and startups.
ACTION EV1.1.3	Capitalize on proximity to Inova Fairfax Hospital to attract health- and wellness-related businesses.
ACTION EV1.1.4	Capitalize on regional growth in the technology-based, creative, and innovative sectors and encourage related businesses to establish in the City.
ACTION EV1.1.5	Pursue corporate headquarters to locate in the City.

FIGURE 41 ESTIMATED REVENUES GENERATED BY COMMERCIAL AND RESIDENTIAL SECTORS



NOTE: 2001-2014 data from City budgets. 2015-2017 data estimated based on revenue allocation assumptions from the City of Fairfax Finance and Accounting Department.

Source: City of Fairfax Budget.

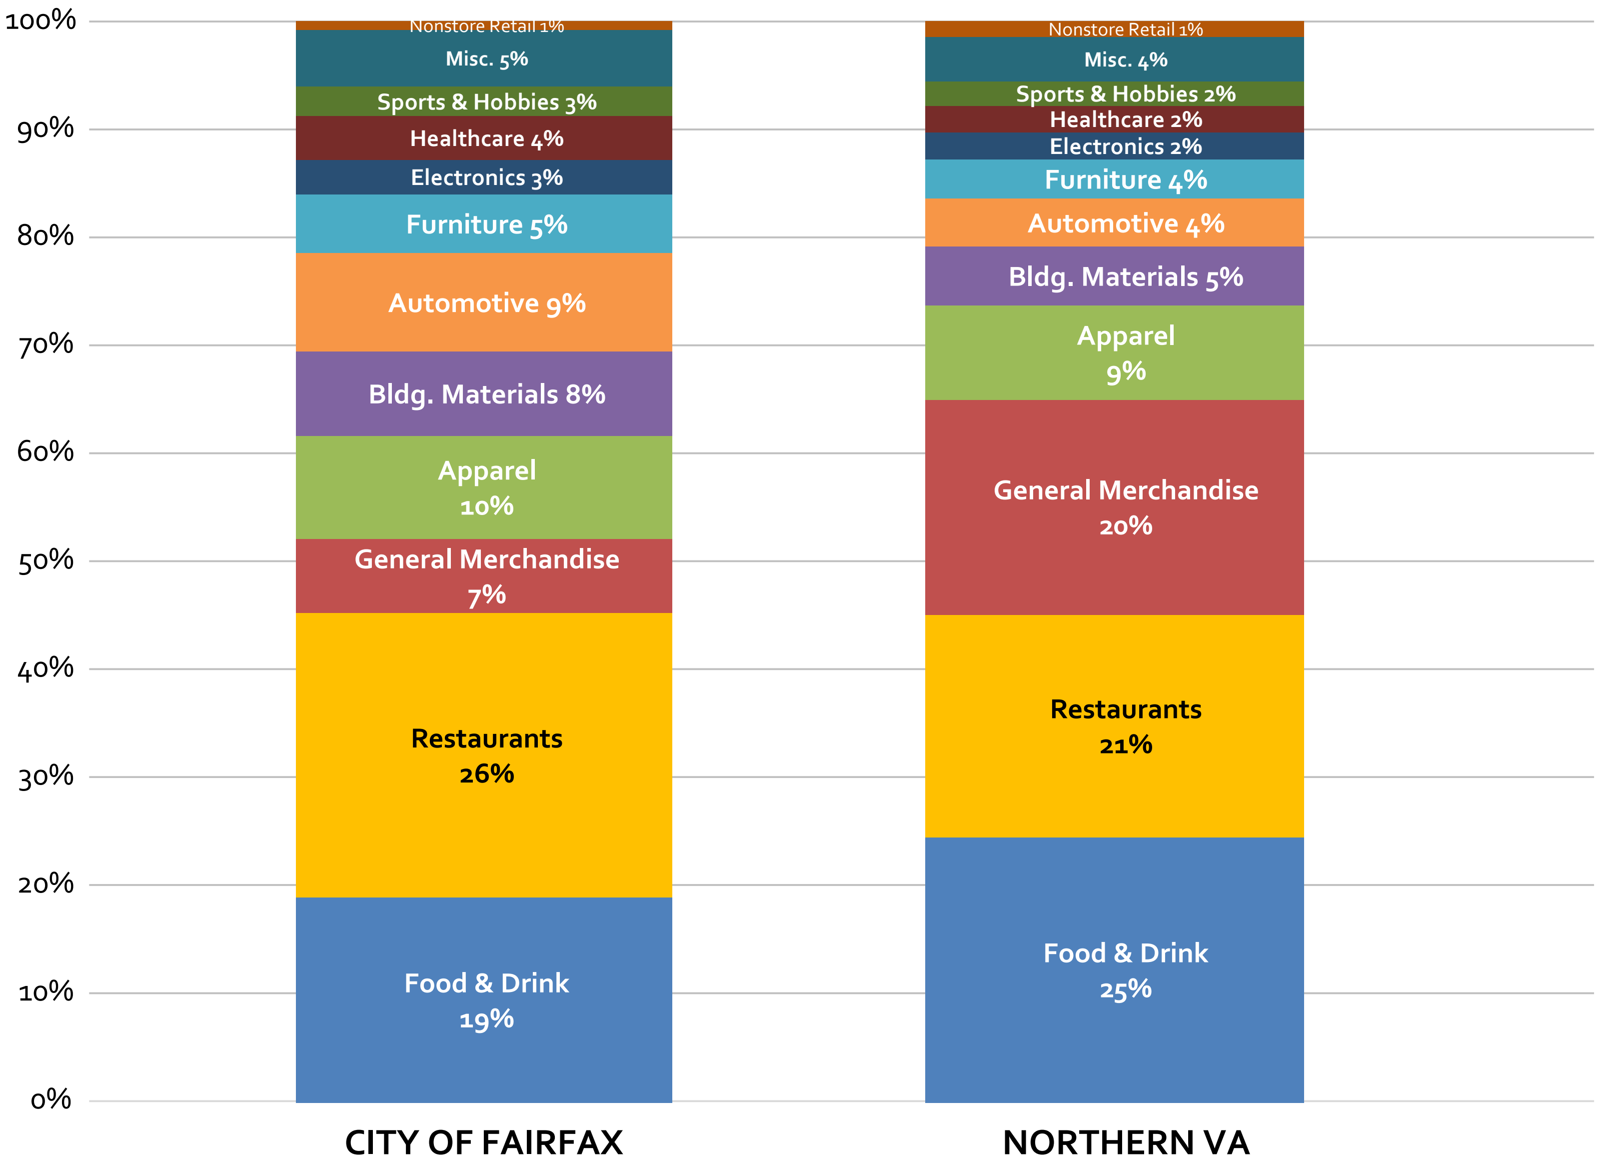
Economic Vitality
Goal 2

Support diversification of the retail, service, and office sectors.

While the City has strong current levels of retail and restaurant sales, some critical sectors are underrepresented in Fairfax's current retail inventory, as shown in Figure 42. This lack of retail diversity – coupled with an inventory of buildings heavily composed of 1960s-70s structures – points to a potential loss of market share to nearby retail areas that are more reflective of current tastes and consumer demand. With a high percentage of Class B office space, the office market in the City may also be less competitive than surrounding office development in Fairfax County. The City will strive to support existing and attract new businesses that fill market or growth opportunities and support an improved office space inventory.

OUTCOME EV2.1:	The retail and service sectors more effectively compete with other regional commercial sectors, resulting in increased desirability as a destination.
ACTION EV2.1.1	Attract new retail and service businesses representing sectors that have the ability to become regional destinations.
ACTION EV2.1.2	Create new commercial areas that contain the amenities and atmosphere necessary to attract top-tier commercial tenants.
OUTCOME EV2.2:	An improved office space inventory attracts high-value tenants.
ACTION EV2.2.1	Work with owners and operators of existing office buildings to encourage property renovations and upgrades needed to bring properties to Class A status.
ACTION EV2.2.2	Encourage the provision of Class A office space in new commercial development projects and renovations.
OUTCOME EV2.3:	A strong relationship with George Mason University is leveraged to support new development and investment that capitalizes on the needs of the University and supports the Comprehensive Plan Vision for the City.
ACTION EV2.3.1	Use the newly-created position of MEC Business Incubator Director to graduate a consistent pipeline of at least one tenant per year to a permanent location within the City.
ACTION EV2.3.2	Explore the establishment of a local development corporation or other formal partnership between the City and George Mason University.

FIGURE 42 PERCENTAGE OF TAXABLE RETAIL SALES BY STORE CLASSIFICATION



Source: Virginia Department of Taxation

Economic Vitality

Goal 3

Transform the Commercial Corridors and Activity Centers.

Being within the economically robust Northern Virginia region presents great opportunity for the City to leverage its many advantages to create and strengthen further economic vitality. The City's varied Commercial Corridors and downtown area provide excellent opportunities to capitalize on the region's growing economy, and to continue being an economic hub for future generations. The City will strive to transform these areas into distinctive regional destinations that can compete effectively with other development and mixed-use centers in Northern Virginia.

OUTCOME EV3.1:	Redevelopment projects in the Commercial Corridors and Activity Centers create destinations that attract tenants, customers, and residents.
ACTION EV3.1.1	Develop a branding and marking strategy for individual Activity Centers.
ACTION EV3.1.2	Create a commercial targeting strategy to focus the City's efforts on attracting businesses that would have the greatest impact in competing with other regional commercial sectors.
ACTION EV3.1.3	Prepare conceptual designs for the Activity Centers and present in dynamic marketing materials that clearly demonstrate the desired mix of uses, residential density, building intensity, design aesthetic, multimodal connections, and parking.

Economic Vitality

Goal 4

Create a single ZIP Code for the City.

The City currently contains portions of three ZIP Codes, all of which contain large portions of Fairfax County in addition to City addresses. This creates a complicated web of addresses, which leads to confusion among residents and businesses regarding which areas are located within the City or Fairfax County. Significantly, this has also led to difficulties in revenue collection, since some businesses have reported their addresses in the incorrect jurisdiction – and with e-commerce based revenue becoming more common, this may become a more noteworthy problem in the future. Creating a common ZIP Code for City addresses mitigates these revenue-related problems with an exclusive way of identifying City addresses and allowing business revenue to be more accurately collected. This would also serve a unifying function to easily distinguish the City from the surrounding portions of Fairfax County in terms of economic competitiveness.

OUTCOME EV4.1:	The U.S. Postal Service designates a ZIP Code that is unique to addresses within City limits.
ACTION EV4.1.1	Conduct a cost-benefit analysis.
ACTION EV4.1.2	If supported by the cost-benefit analysis, request a ZIP Code Boundary Review from the U.S. Postal Service.

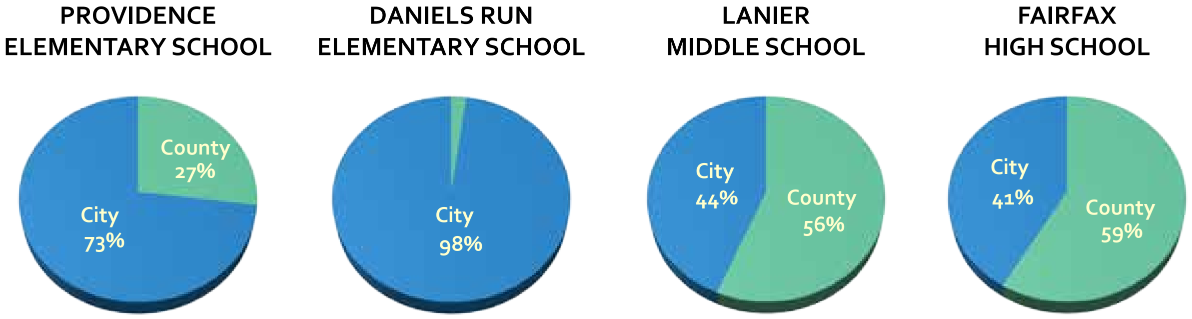
6 Community Services

One of the most crucial elements in the long term desirability of the City is maintaining and improving the high-quality services that residents and businesses have come to expect. This Chapter examines health, safety and welfare issues for which the City provides or facilitates services to its citizens, businesses and visitors. As an independent jurisdiction, Fairfax emphasizes providing quality public facilities and services. Public facilities are the institutions and land intended for the community's general use and benefit. Some of the primary services provided by the City addressed in this Chapter are Education, Parks and Recreation, Cultural Arts, Public Safety, and Utilities and Infrastructure as described below.

Education

Over 3,100 children who are City residents are enrolled in Fairfax County Public Schools (FCPS), with the vast majority of those students attending one of Fairfax's four schools. Through a School Services Agreement with FCPS, the City of Fairfax School Board manages the school buildings, while FCPS hires staff and develops curricula. The agreement also accommodates students from Fairfax County in the City school facilities where capacity allows. The percentage of City and Fairfax County students who attend each of the City's four public schools is provided below.

FIGURE 44 SCHOOL ENROLLMENT BY STUDENTS' PLACE OF RESIDENCE



There are also four private schools currently located in the City. Paul VI Catholic High School serves grades 9-12 with just over 1,000 students currently enrolled. A new location for this school is under construction outside the City, and the current location is anticipated to close once the new location is operable. Saint Leo the Great Catholic School serves grades Pre-K-8 with a current enrollment of 410 students. The New School of Northern Virginia is a private liberal arts and science school serving grades 6-12 with a current enrollment of approximately 150 students. Saint Anthony Academy serves grades K-12 with a current enrollment of over 30 students. All public and private schools currently located in the City are shown in Figure 45.

The City is also surrounded by several higher education facilities. George Mason University's Fairfax Campus began with 356 students in 1964, after the completion of construction of the first four buildings. Today, 21,442 full-time equivalent students come to the Fairfax Campus, which includes 80% of the enrollment of all Mason's campuses. The Annandale campus of Northern Virginia Community College opened in 1967 and is now the largest of all NOVA campuses. The 2014-2015 enrollment for all campuses was 34,586 full-time equivalent students. Virginia International University was founded in 1988 and had 1,876 students enrolled as of the July 2015 - June 2016 semester. Ivy Christian College was founded in March 2006 and received accreditation in May 2014. The reported enrollment for 2013 was 319 students. Osher Lifelong Learning Institute (OLLI) offers classes to Northern Virginia residents in their retirement years.

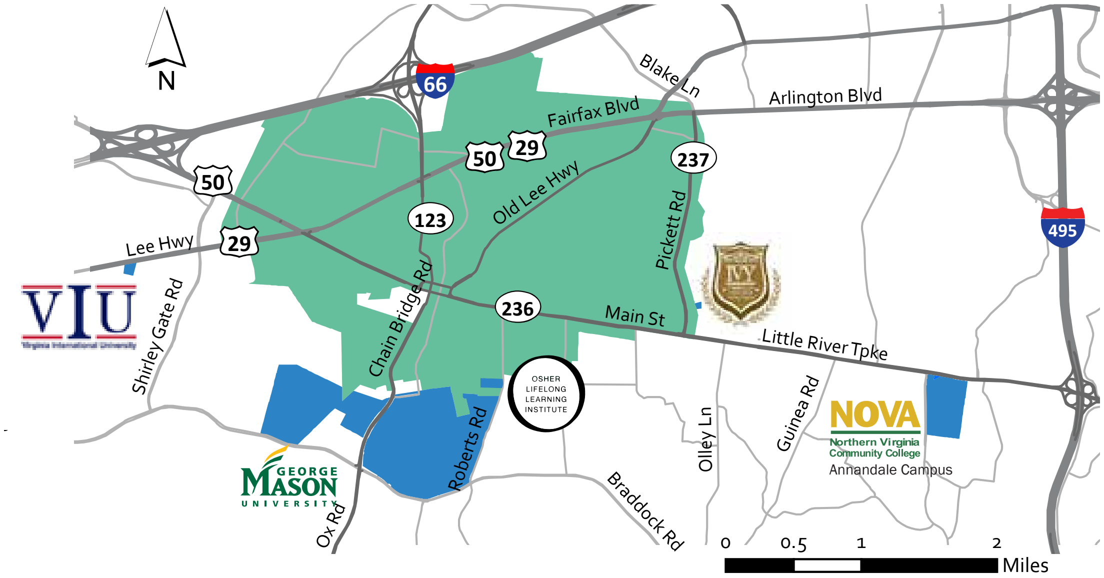
FIGURE 46 LOCAL HIGHER EDUCATION AND LIFELONG LEARNING



Parks and Recreation

A diverse network of public parks and open space areas, including recreation fields, natural areas, informal open spaces, and a trail system is provided throughout the City. Containing approximately 200 acres of land, the City's parks fall into four categories: regional parks, community parks, neighborhood parks, and vest pocket parks as shown in Figure 47. Most trails in the City are multipurpose recreational trails serving the needs of pedestrians, joggers, and bicyclists.

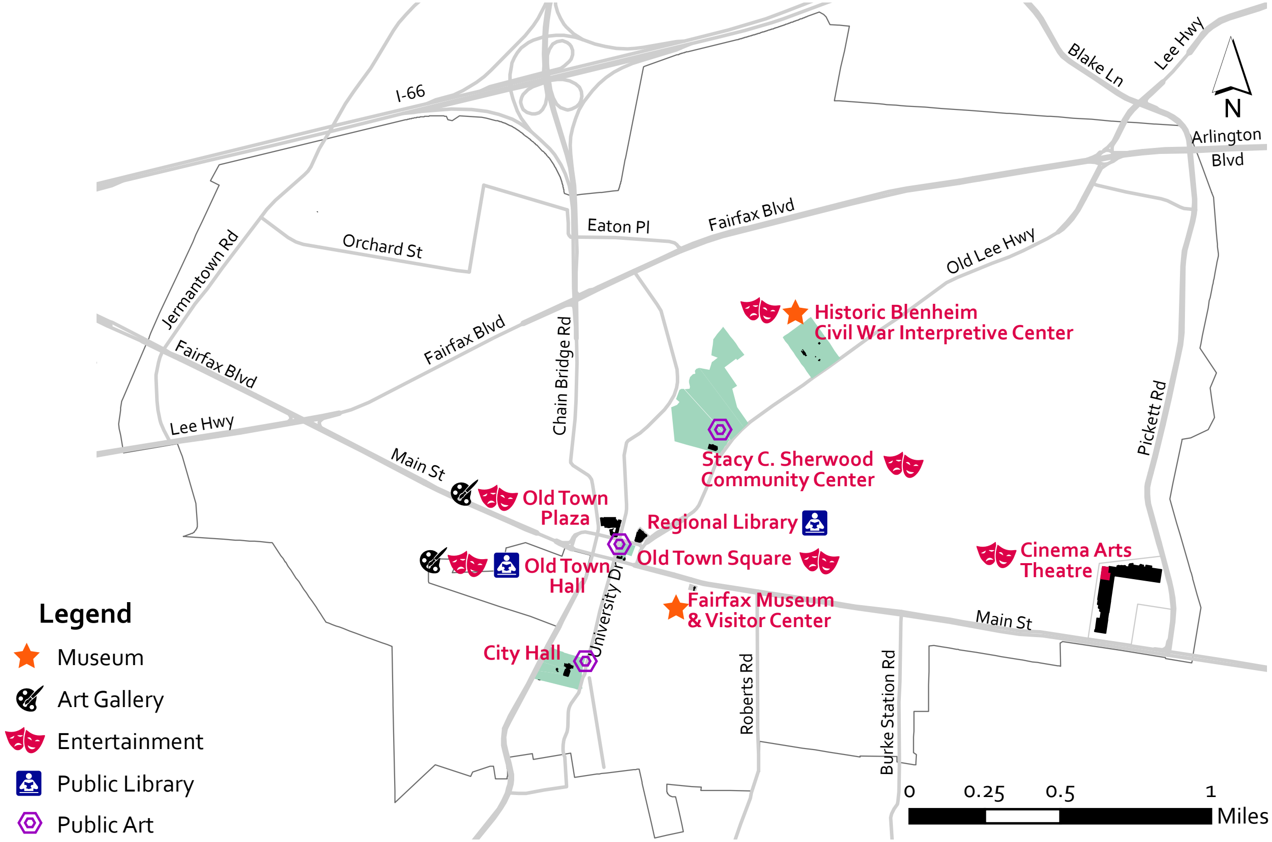
FIGURE 48   CULTURAL FACILITIES AND PUBLIC ART



Source: City of Fairfax GIS and Cultural Arts information

Cultural Arts

The City's cultural arts activities and special events draw people to the City and contribute to the unique sense of place and close-knit community, offering distinctive venues to unite members of the community. Currently, public art and cultural facilities are focused mainly in and around Old Town, as shown in Figure 48. The City has a museum, art galleries, and other performance venues; however, there is a lack of performing arts venues for theater and other performance groups.

Police

The Police Department, the City's primary law enforcement agency, is responsible for protecting life and property, preventing crime, detecting and apprehending criminal suspects, and maintaining order. The ability to anticipate, prevent, and manage crime; minimize threats to property; and minimize damage from environmental hazards all contribute to public safety.

Fire

The Fire Department furnishes fire suppression, rescue, emergency medical services, and emergency medical transportation both within the City and in an approximately 14-square mile area of Fairfax County. In return, Fairfax County provides a computer-aided dispatch (CAD) service for all fire and rescue vehicles as well as "first due" engines and rescue response in the areas along Pickett Road near the tank farm and along Jermantown Road near the schools, as well as backup response in the remainder of the City.

Emergency Management

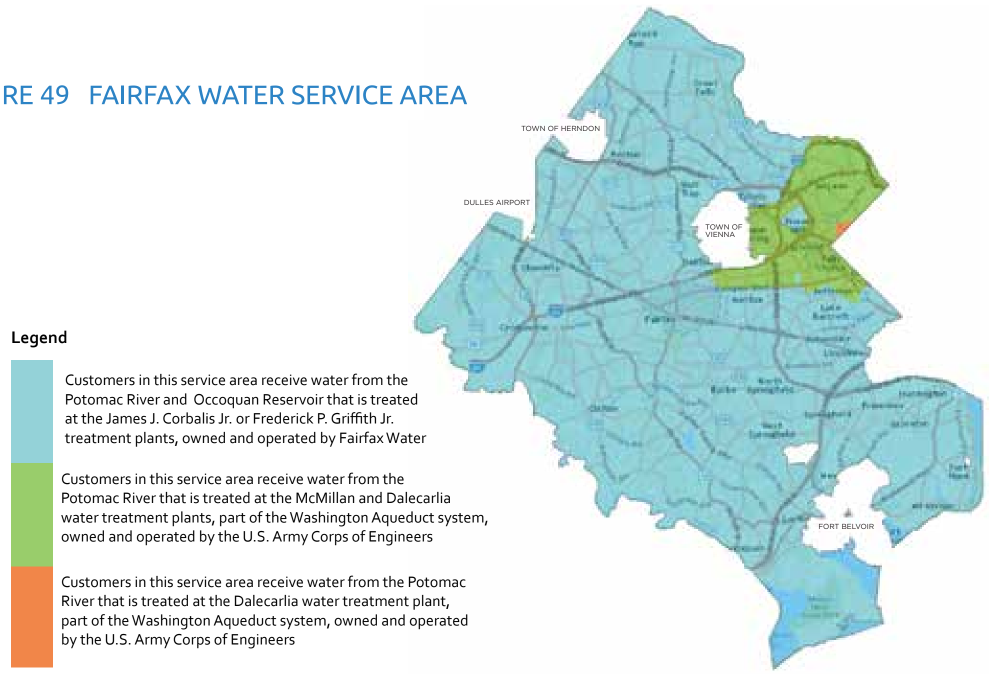
The Office of Emergency Management (OEM) acts as liaison to all emergency response agencies, monitors for and alerts of any impending natural or man-made safety issues, and develops training schedules for emergency personnel. OEM also ensures that safety documents are kept current, such as the state-mandated Comprehensive Emergency Management Plan and the Northern Virginia Hazard Mitigation Plan.

Utilities

The City sold its water system to Fairfax Water on January 2, 2014. Since that sale, Fairfax Water has been providing water services to the City as shown in Figure 49. The City operates its own wastewater collection system as shown in Figure 50. Wastewater originating in the City's wastewater system is treated by Fairfax County at its Noman M. Cole, Jr., Pollution Control Plant by a contractual agreement that provides a guaranteed treatment capacity for the City. The City manages, maintains, and repairs its stormwater system, which consists of approximately 60 miles of storm drain pipe and 3,650 storm sewer structures throughout the City.

The City does not own or operate any electric, telephone or cable utilities. It does, however, own the rights-of-way where transmission lines are located. Approximately 67 miles of City streets contain utility poles supporting overhead electric, telephone, and cable television wires.

FIGURE 49 FAIRFAX WATER SERVICE AREA



Legend

- Customers in this service area receive water from the Potomac River and Occoquan Reservoir that is treated at the James J. Corbalis Jr. or Frederick P. Griffith Jr. treatment plants, owned and operated by Fairfax Water
- Customers in this service area receive water from the Potomac River that is treated at the McMillan and Dalecarlia water treatment plants, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers
- Customers in this service area receive water from the Potomac River that is treated at the Dalecarlia water treatment plant, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers

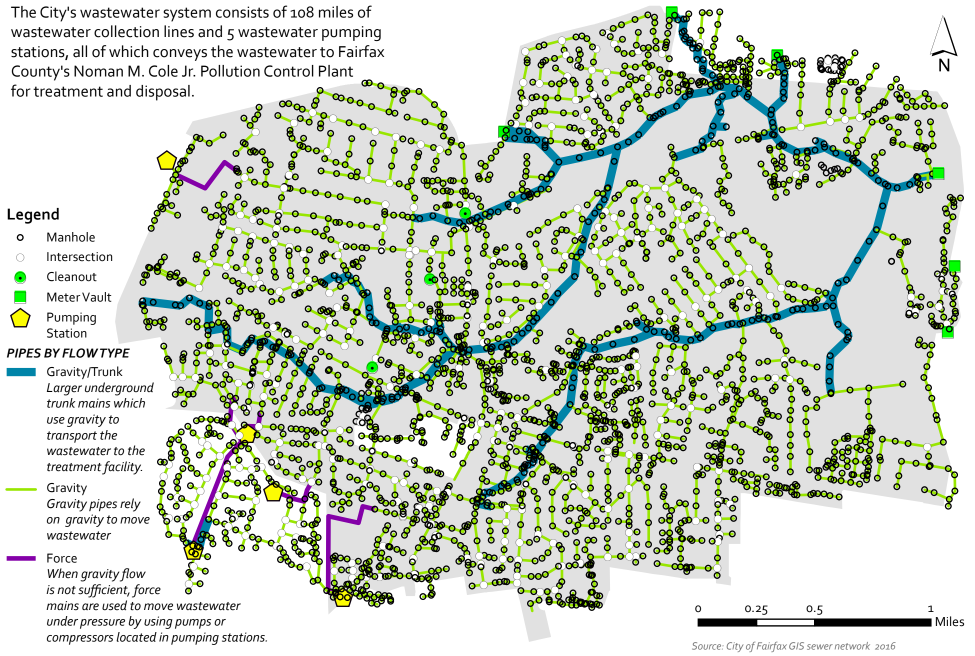
FIGURE 50 WASTEWATER COLLECTION SYSTEM

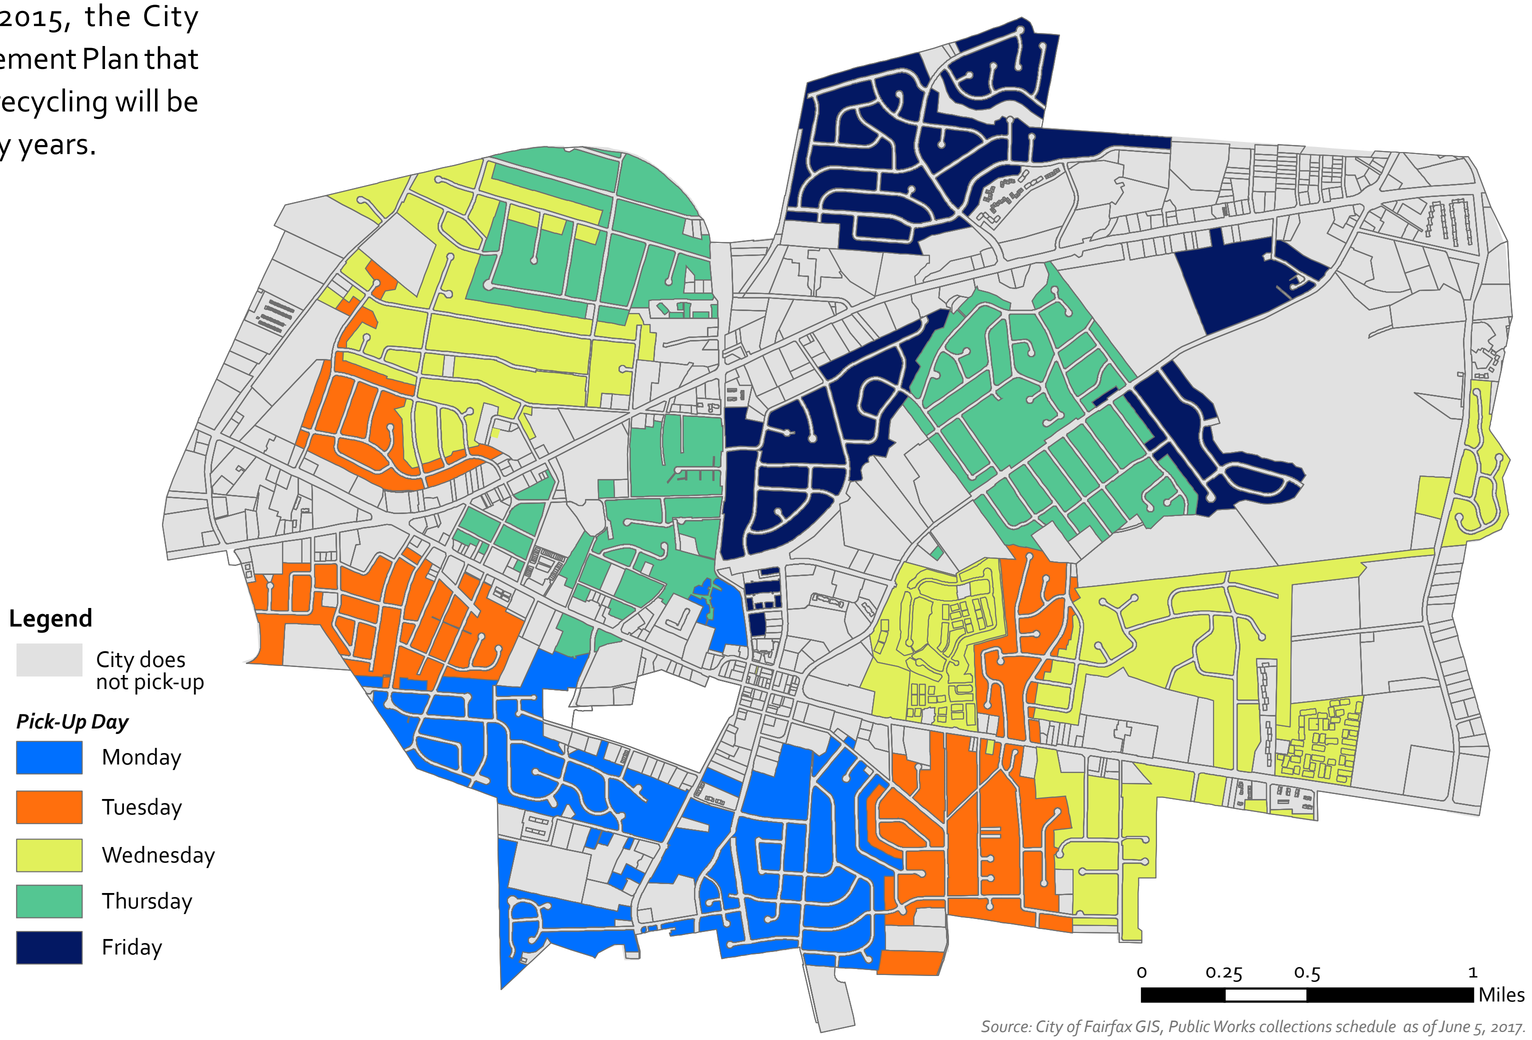


The City's wastewater system consists of 108 miles of wastewater collection lines and 5 wastewater pumping stations, all of which conveys the wastewater to Fairfax County's Noman M. Cole Jr. Pollution Control Plant for treatment and disposal.

Source: City of Fairfax GIS sewer network 2016

The City provides weekly refuse and recycling collection for residents in detached homes, duplexes, and townhouses. Curbside collection service is shown in Figure 51. City businesses and multifamily complexes use private refuse and recycling services. In 2015, the City adopted a Solid Waste Management Plan that outlines how solid waste and recycling will be managed over the next twenty years.

FIGURE 51 RESIDENTIAL REFUSE AND RECYCLING CURBSIDE COLLECTION



Source: City of Fairfax GIS, Public Works collections schedule as of June 5, 2017.

Opportunities and Challenges

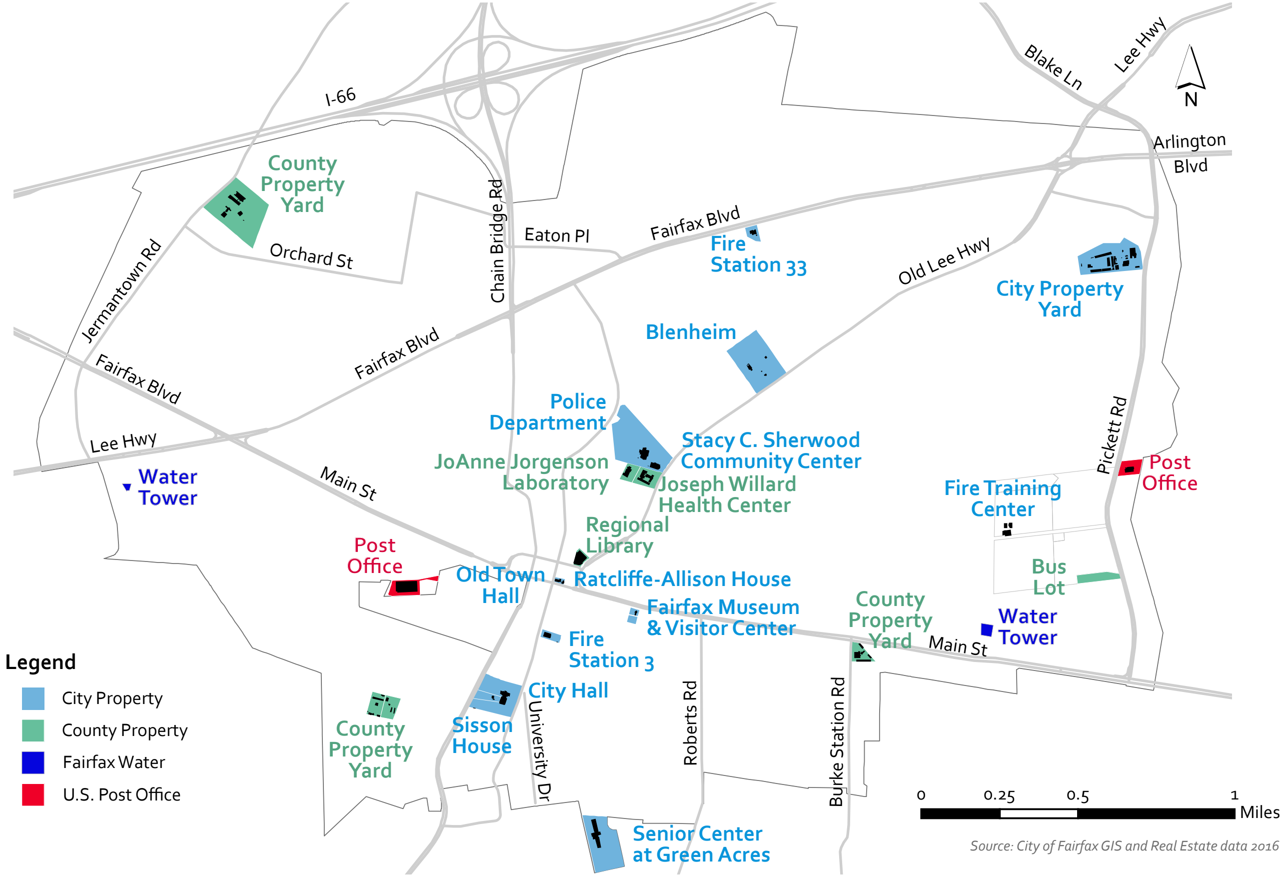
Ongoing maintenance of public facilities

Public facility locations are shown in Figure 52. Several of these facilities in the City are historic structures that have withstood years of service. Ensuring that community services and facilities are phased with changing demand is a major component of facility management, since the quality of public facilities contributes to the City's quality of life.

Service agreements

The relatively small size of the City makes provisions for some public services inefficient. The City provides many services to its citizens through contractual agreements with Fairfax County and regional agencies. This provides for more efficient service delivery while allowing the City to retain some control. Aside from the School Services Agreement with FCPS, City residents may use any of eight regional and fourteen community libraries that compose the Fairfax County library system. Fairfax County also provides health and human services assistance, including environmental health, communicable disease programs, and public health services.

FIGURE 52 PUBLIC FACILITIES



Source: City of Fairfax GIS and Real Estate data 2016

Growth and development

Population growth and new development can impact demands on public facilities and services. Demands, however, can be monitored to ensure that the resulting impacts are realized in advance and factored into the decision-making process for accommodating new development.

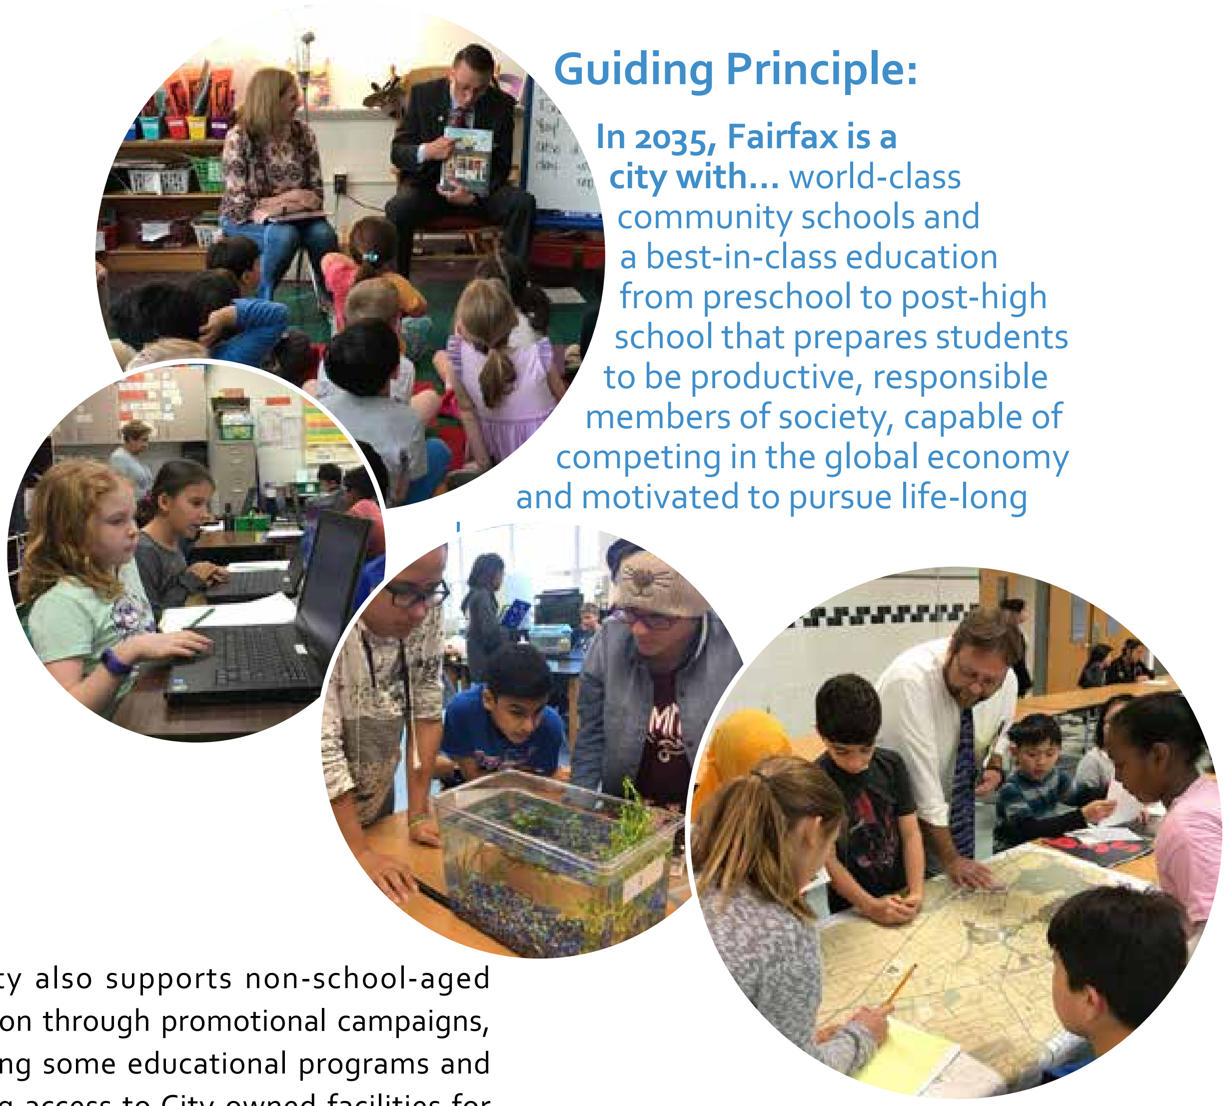
Education

Between the City's public schools, its proximity to higher education institutions, and its accessibility to lifelong learning offerings, education factors heavily into the City's quality of life. Excellent public education is not just a priority for current residents, but is also an investment in the City's future, and City policies should continue to ensure that educational opportunities are prioritized for future generations. The City will strive to provide excellent instructional services and superior facilities, geared to the needs of our evolving and diverse population. The City of Fairfax School Board maintains its own Strategic Plan and is responsible for the School Services Agreement with FCPS, through which the City is able to ensure outstanding facilities and instructional accommodations for the 3,100 public school students who reside within City limits. As the City grows and student needs evolve, both the City government and the City of Fairfax School Board should continue to prioritize educational services in order to provide the highest possible levels of service for the future needs of the City's school-aged population.

The City also supports non-school-aged education through promotional campaigns, operating some educational programs and allowing access to City owned facilities for educational programs provided by other entities.

Guiding Principle:

In 2035, Fairfax is a city with... world-class community schools and a best-in-class education from preschool to post-high school that prepares students to be productive, responsible members of society, capable of competing in the global economy and motivated to pursue life-long



Education
Goal 1

Ensure the City's public education needs are met.

The school services agreement with FCPS has provided outstanding instructional programs for City students, combined with an impressive amount of local control. While all four of the City's public schools have been renovated since 2000, changes in student needs, technology and enrollment must continually be monitored to ensure facilities remain exceptional.

The City School board possesses a deed of covenant on the existing Green Acres site at the south end of the City to accommodate a third elementary school should enrollment increase to a point where Daniels Run and Providence Elementary Schools could not reasonably be expanded to accommodate the growth. The School Board has selected Providence Park as an alternative site for a future school, which would be particularly more appropriate if it is consolidated with the adjacent West Drive Property Yard. Further discussion on this site is provided in the Parcel Specific Recommendations in the Land Use Chapter of this plan.

OUTCOME E1.1:	The School Services Agreement with FCPS, guided by the City of Fairfax School Board, continues to provide City students with the highest quality education.
ACTION E1.1.1	Continue to follow the established guidelines of the School Services Agreement and to monitor its implementation.
ACTION E1.1.2	Maintain a close working relationship with the Mayor, City Council and City staff regarding school needs and continue to provide information to the elected officials and staff.
OUTCOME E1.2:	Public school facilities and grounds meet the current and future needs of the school-aged population.
ACTION E1.2.1	Continue cooperation between City government and the City of Fairfax School Board to assess and plan for impacts from future residential development.
ACTION E1.2.2	Monitor potential Fairfax County school boundary adjustments to anticipate impacts on City school enrollment.
ACTION E1.2.3	Continue to examine potential need for additional school facilities and the best use for the City of Fairfax School Board's Deed of Covenant on Green Acres.
ACTION E1.2.4	Continue to ensure a safe learning environment, proper program capacities, and the availability of the latest technology and functional accommodations.
ACTION E1.2.5	Promote environmentally friendly practices for school facilities and grounds.

Education

Goal 2

Ensure access to educational and training opportunities for all generations.

City residents place a high priority on education at all stages of life – from early childhood education up to continuing education and adult lifelong learning. Prioritizing the continued growth and development of the City's educational offerings and linkages by collaborating with local education providers and institutions will help enhance the City's livability for future generations.

OUTCOME E2.1:	All children will be well-prepared to begin elementary school.
ACTION E2.1.1	Continue to promote Pre-K instructional opportunities for all City Pre-K children.
ACTION E2.1.2	Increase access to early childhood literacy and after school care at the City's community facilities, City of Fairfax Regional Library, and other institutions.
OUTCOME E2.2:	The City's residents will have access to facilities and programs that foster an informed community.
ACTION E2.2.1	Maintain access to the City's community facilities, City of Fairfax Regional Library, and other institutions for ongoing dialogue in educational events and discussions.
ACTION E2.2.2	Continue to provide residents and businesses with access to timely information on City government programs and initiatives via the monthly CityScene newsletter, Cityscreen-12 television station, City website, and email alerts.
OUTCOME E2.3:	Partnerships and community resources provide opportunities for training and continuing education.
ACTION E2.3.1	Continue to foster good relations with nearby education providers such as George Mason University and Osher Lifelong Learning Institute (OLLI).

Parks and Recreation

Recreation and open space make an essential contribution to a healthier population and a greener city. They are integral to the City's quality of life and provide beauty, respite, and opportunity to enjoy the outdoors. In addition, City staff takes pride in providing quality experiences for the community through services and programs that enrich people's lives and contribute to total development of the individual, family, and the community.

In June 2014, the Parks and Recreation Advisory Board (PRAB) presented the City of Fairfax Strategic Master Plan for Parks, Recreation, Trails, Open Space, Events and Cultural Arts to the City Council. Referred to as the Strategic Master Plan, it contains measurable goals, objectives and policies that the City Council, PRAB and the Commission on the Arts use as guidance when determining program and facility needs. The Strategic Master Plan should be referenced for specific contributions toward the actions listed for this Guiding Principle.

Guiding Principle:

In 2035, Fairfax is a city with...
inviting, well-maintained parks, trails, open spaces and multi-generational community centers.

Parks and Recreation

Goal 1

Develop high-quality park infrastructure.

A high-quality park system should serve the community's needs with a range of services and facilities for all age groups and abilities provided in a safe environment. As the City's population grows, new interests and demand for a variety of activities will require periodic evaluation of the facilities the City offers. It is also important to look at the locations of facilities to ensure all neighborhoods are provided with equitable access to parks and recreation amenities and programs. High-quality, accessible parks, facilities, recreation, and open space should be acquired, preserved, developed, and redeveloped throughout the City for public health, enjoyment and environmental purposes. (Actions specifically relating to the City's trail network may be found under Multimodal Transportation Outcomes MM2.2 and MM2.3.)

OUTCOME PR1.1:	A well-connected system of parks that provides citizens with healthy choices for recreation.
ACTION PR1.1.1	Identify and address gaps in the connections between the City's parks and open space.
ACTION PR1.1.2	Identify opportunities for future open space in neighborhoods that are undersupplied in public recreation and open space opportunities.
ACTION PR1.1.3	Enhance public access to parks and recreational facilities by making necessary infrastructure improvements.
ACTION PR1.1.4	Partner with the Department of Public Works on efforts to improve pedestrian and bicycle networks throughout the City.
OUTCOME PR1.2:	A greater awareness of the City's natural resources and commitment to protect and enhance them.
ACTION PR1.2.1	Implement measures to preserve privately-owned land adjacent to parks and trails in perpetuity, e.g., utilizing conservation easements, deed restrictions, etc.
ACTION PR1.2.2	Adopt tree preservation guidelines for parks, open space, and trails.

Parks and Recreation

Goal 2

Provide programs and services that meet the needs of the community.

High-quality programs, facilities, and services – including large-scale community events that draw significant attendance – can improve the tax base, increase property values, attract businesses, produce revenue to offset operating costs, and provide indirect benefits to our economy, contributing to the City's continued growth and development.

OUTCOME PR2.1:	Robust programming of the City's parks and public facilities that provides opportunities for individuals of all ages and abilities to participate.
ACTION PR2.1.1	Conduct a study to determine how the City's long-term needs for a community center and senior center can be best met, and implement the recommendations of this study, including construction of recommended facilities.
ACTION PR2.1.2	Update Parks and Recreation facilities to ensure they are accessible to individuals of all abilities.
ACTION PR2.1.3	Expand and enhance facility, program, and service offerings through innovative funding, management best practices, and cost recovery efforts.
ACTION PR2.1.4	Enhance Old Town Square as a destination and community gathering place by providing a venue for arts, recreation, and green space.
OUTCOME PR2.2:	Expanded and enhanced partnerships with City businesses and other organizations such as City of Fairfax Schools, Fairfax County Park Authority, NOVA Parks, FCPS, George Mason University, Fairfax County Neighborhood and Community Services, and others to complement the services provided by the City.
ACTION PR2.2.1	Identify opportunities to expand partnerships with institutional and business communities.
ACTION PR2.2.2	Establish relationships and partnerships with various underrepresented, underserved, or diverse demographic groups in the City to assist with developing programs and services to meet the needs of these communities.
OUTCOME PR2.3:	Rehabilitation or construction of public facilities to meet the programmatic and recreational needs of the community.
ACTION PR2.3.1	Enhance safety, accessibility, quality of service, and cost effectiveness through comprehensive operations and maintenance programs and services.
ACTION PR2.3.2	Inventory the condition of existing public facilities and identify any necessary updates and repairs.

Parks and Recreation Goal 3

Market programs, special events, facilities, and services.

A broad range of marketing and public relations techniques are necessary to develop public awareness, strengthen community relations, bring a larger audience from outside of the City to our events, and further invigorate the local economy. The City will use innovative promotional and marketing initiatives to increase awareness, participation and support of programs, special events, facilities and services.

OUTCOME PR3.1:	A well-informed community that utilizes the City's quality programs and attends events.
ACTION PR3.1.1	Conduct public opinion surveys of Parks and Recreation customers to identify desired changes in facilities and programming.
ACTION PR3.1.2	Utilize a variety of communications platforms to publicize facilities, programs and events to the community.
OUTCOME PR3.2:	City facilities and events are a regional draw, resulting in increased economic vitality for local businesses.
ACTION PR3.2.1	Increase awareness, participation, and support of programs, facilities, and services using innovative promotional and marketing initiatives.

Cultural Arts

Guiding Principle:

In 2035, Fairfax is a city with...
a thriving cultural arts program that supports a variety of special events, art spaces and performance venues.

The City takes pride in the wide variety of cultural events, programs, and facilities it provides to enhance the quality of life for its residents. The City is committed to preserving and protecting its heritage, recognizing evolving socioeconomic and cultural patterns, and promoting the arts as an integral part of our spirit and vitality with wide ranging economic benefits.

In January 2013, the Commission on the Arts (COA) prepared a Strategic Plan with near-term (one to three years) and long-range objectives for cultural arts in the City. The plan "envisions an economically and culturally booming City with a vibrant arts community serving as a leading arts destination," supporting the Comprehensive Plan Vision. The goals of this Guiding Principle seek to support and build upon the COA Strategic Plan, exploring opportunities for inclusion of the arts as the City develops.

Historically, the arts organizations in our community have been the City of Fairfax Band and the Fairfax Art League. Over the past two decades, four theater companies have emerged, as well as several smaller performance groups. The range of performances is constrained by the lack of theater spaces.

Public art has also sprouted in the last decade with art at the Library, in front of City Hall, and in front of the Sherwood Center. More is planned for Old Town Square.

Cultural Arts

Goal 1

Integrate cultural facilities into the City.

The City currently lacks adequate facilities for performing arts, including a community theater that could provide space for the larger audiences that regional and national artists could bring to the City. Although Fairfax High School and Lanier Middle School have auditorium/theater spaces, theater groups are severely challenged to obtain time in these facilities and are concerned about rental fees. The City must continue to evaluate and expand its cultural venues and to cater to the increasing entertainment expectations of its residents and promote the character and economic vitality of the City, making it a regional arts destination. This should be supported through expanded public art facilities.

OUTCOME CA1.1:	Cultural facilities that provide opportunities for local, regional and national artists to perform for audiences of all sizes.
ACTION CA1.1.1	Create a broad-based special commission charged with the mission of identifying short- and long-term needs for performance spaces and other facilities to support a robust City arts program.
ACTION CA1.1.2	Based on conclusion of CA1.1.1, create a capital program for arts facilities, including a priority for a performing arts facility. This may include upgrading of school arts-related facilities.
ACTION CA1.1.3	Support the creation of Arts and Entertainment Districts with priority to Old Town Fairfax.
ACTION CA1.1.4	Identify underutilized or vacant private facilities that can function as temporary performance spaces.
OUTCOME CA1.2:	Public art such as murals and sculptures displayed to identify, enhance, and promote the cultural nature of the City.
ACTION CA1.2.1	Promote the City's cultural arts identity through public art.
ACTION CA1.2.2	Implement the City of Fairfax Public Art Policy and consider additional policies and practices that promote cultural vitality.
ACTION CA1.2.3	Create a cultural arts bike and pedestrian trail (e.g. Indianapolis Cultural Trail).

Cultural Arts
Goal 2

Encourage a broad representation of arts.

There are a wide variety of interests in arts programs and events resulting from the ever-changing demographics of the City. Strategic partnerships with local institutions, such as George Mason University's Center for the Arts and Northern Virginia Community College's Fine Arts Program should be constantly sought and promoted to expand opportunities for City residents of all ages, ethnicities and abilities. Alternative means of providing and promoting programs must continually be explored as well.

OUTCOME CA2.1:	Collaboration and partnership with local schools, colleges, and universities to provide performance, rehearsal and educational opportunities for artists.
ACTION CA2.1.1	Collaboration and partnerships support establishment of performance, rehearsal and educational opportunities for artists.
ACTION CA2.1.2	Establish a mechanism for continuous collaboration with local schools, colleges, universities and arts organizations on education for artists, and for arts programming.
ACTION CA2.1.3	Explore public-private partnerships to develop performance and rehearsal spaces.
OUTCOME CA2.2:	Cultural programming in the City increases opportunities for a wide range of cultural experiences.
ACTION CA2.2.1	Consider creating a Cultural Affairs office with a full-time director.
ACTION CA2.2.2	Identify and create plan to optimize use of existing and future public facilities for cultural arts programs.
ACTION CA2.2.3	Enhance awareness of current and future programs and facilities.
ACTION CA2.2.4	Develop and execute strategies to increase funds by charging admission to selected events and to increase sponsorships, contributions, and grants.
OUTCOME CA2.3:	Expanded and enhanced partnerships with city businesses and other organizations such as City of Fairfax Schools, Northern Virginia Community College, George Mason University, Virginia Commission for the Arts and other local arts agencies.
ACTION CA2.3.1	Expand partnerships with institutional and business communities for funding and facilities usage.

Government and Public Safety

Guiding Principle:

In 2035, Fairfax is a city with… exceptional governmental, police and fire safety services.

Municipal government services directly affect daily life for residents and businesses including trash pick-up, dog licensing, sign permits, facility rentals, or emergency services. These services not only allow a community to function, but also impact its overall quality of life.

Public safety services include law enforcement, fire protection, emergency medical services and emergency management. The continuity of governmental services offers reassurance that essential services are in place to respond to basic community concerns and needs.

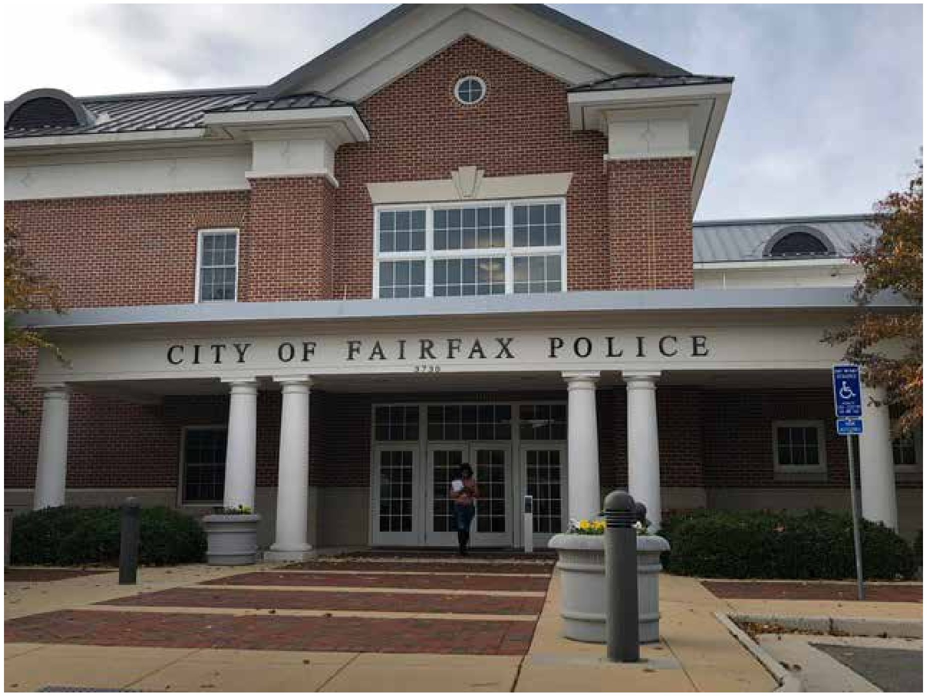
Government and Public Safety

Goal 1

Provide state-of-the-art-facilities for local government and public safety operations.

Anticipating future growth patterns and planning for infrastructure and services to meet the needs of such growth are critical elements in determining the future of the City and its development framework. The City's location in the metropolitan Washington, D.C. area promises to provide the stimulus for continued growth. This growth will affect the resources required to provide the desired level of public services, safety response, and protection. The City must continually monitor demands on government and public safety resources in order to determine needs for facility and service enhancements.

OUTCOME GPS1.1:	Public facilities and equipment that properly support the efficient functioning of City staff to provide valued services to City residents and businesses.
ACTION GPS1.1.1	Maintain and update City facilities to ensure all are safe, accessible to individuals of all abilities, energy efficient, and modernized to meet the changing needs of the community and operations.
ACTION GPS1.1.2	Construct new buildings, when warranted, that are accessible, sustainable, and properly located, including co-locating multiple uses to meet the needs of the community and operations.
ACTION GPS1.1.3	Pursue right of first refusal agreement with Fairfax County on County-owned property located within the City.



Government and Public Safety

Goal 2

Provide high-quality community services.

The City must balance fiscal challenges with the need to maintain public facilities and equipment. Improper maintenance and inadequate facilities can result in disruptive needs for repair and costly replacements. The City will provide high-quality, efficient and cost-effective community services with optimal levels of service to meet public needs on a daily basis, as well as during times of stress.

OUTCOME GPS2.1:	User-friendly and convenient customer service tools using the latest technology available.
ACTION GPS2.1.1	Monitor trends and advancements in technology as they become available to determine if they would benefit City staff's ability to deliver services.
OUTCOME GPS2.2:	Police protection and service that maintain a safe environment for residents, workers and visitors.
ACTION GPS2.2.1	Prevent crime through safe environmental design.
ACTION GPS2.2.2	Support the implementation of the Police Department's long-range plans.
OUTCOME GPS2.3:	Responsive fire and rescue services that protect lives and property.
ACTION GPS2.3.1	Support the implementation of the Fire Department's long-range plans.
ACTION GPS2.3.2	Maintain and update City fire facilities and equipment to ensure all are safe, accessible to individuals of all abilities, energy efficient, and modernized to meet the changing needs of the community and staff.
OUTCOME GPS2.4:	Continued coordination and collaboration with appropriate jurisdictions, agencies and groups for emergency preparedness and response.
ACTION GPS2.4.1	Survey assets and expand upon them to best capitalize on investment in preparedness.
ACTION GPS2.4.2	Continue education programs focused on establishing survivable spaces and promoting emergency preparedness.
OUTCOME GPS2.5:	Essential health and human services are readily available for all community members.
ACTION GPS2.5.1	Improve access and availability to health and human services, amenities, and products.
ACTION GPS2.5.2	Increase transit service options available to destinations where healthy food is sold or distributed such as food banks, farmers markets and grocery stores.
ACTION GPS2.5.3	Recognizing many human services are provided by outside agencies and are not directly marketed for the City, develop a marketing strategy targeting individuals in the City who could benefit from those services.

Infrastructure and Utilities

Guiding Principle:

In 2035, Fairfax is a city with... safe, well-maintained infrastructure and use of advanced technology.

Well-maintained infrastructure and utility systems are critical to the City's continued growth and development. The services covered under this Guiding Principle include water, wastewater, stormwater, energy, telecommunications, and solid waste and recycling. These services support existing and future development and contribute to the health, safety and welfare of the community's residents, businesses and visitors. As technology advances, the City will have greater opportunity to expand the use of information and communications technologies to enhance livability, economic growth, public safety and sustainability.

The proper functioning of infrastructure systems can have major environmental implications. Water, wastewater, and stormwater systems are embedded in the region's hydrology, and the quality of our watersheds is heavily influenced by the operation of these systems. Overhead utility wires are a distracting visual element within the streetscape and present a maintenance concern. Trees must be trimmed away from the overhead lines on a regular basis, resulting in odd-shaped and unnatural-looking trees unable to grow to their fullest potential. Undergrounding utilities can enhance safety, improve aesthetics, reduce maintenance, and improve street tree health.

Infrastructure and Utilities

Goal 1

Provide quality utility services and infrastructure systems.

Utilities and infrastructure will be compliant with applicable federal and state standards and requirements to meet anticipated growth and development needs. The City should continue to ensure its infrastructure and utility systems meet the demand of projected growth and the community's needs. Significant investments in infrastructure (such as stormwater management facilities) will be needed to keep pace with maintenance, regulatory requirements and advancing technology.

OUTCOME IU1.1:	Access to a clean, safe and reliable potable water supply.
ACTION IU1.1.1	Continue to work with Fairfax Water to ensure the City has access to safe and reliable drinking water.
ACTION IU1.1.2	Encourage residents and businesses to conserve water in an effort to protect and preserve the water supply.
OUTCOME IU1.2:	A reliable and efficient wastewater system that collects, conveys and treats wastewater.
ACTION IU1.2.1	Maintain the ability to collect and transmit wastewater.
ACTION IU1.2.2	Continue to perform regular testing, maintenance and improvements to the City's wastewater collection system to ensure compliance with federal and state environmental regulations.
OUTCOME IU1.3:	A sustainable and efficient stormwater system.
ACTION IU1.3.1	Continue to implement the Virginia Stormwater Management Program (VSMP) and the City's stormwater management program to ensure compliance with federal and state regulations.
ACTION IU1.3.2	Continue to maintain and improve the City's stormwater system, utilizing green stormwater infrastructure where practical.
OUTCOME IU1.4:	Access to reliable energy and telecommunications infrastructure.
ACTION IU1.4.1	Partner with utility providers, local municipalities, and regional groups to improve access to utility data and service outage data.
ACTION IU1.4.2	Coordinate upgrades and replacement of non-City provided utilities, including electricity, water, natural gas and communications networks.
ACTION IU1.4.3	Work with utilities, developers, and state agencies to relocate above-ground utility lines underground, where feasible, with an emphasis on major corridors.

Infrastructure and Utilities

Goal 1

ACTION IU1.4.4	Encourage the placement and appearance of utility infrastructure (e.g. substations, transmission towers and lines, and switching boxes) to minimize visual disruption and negative effects on quality of life, and to enhance streetscapes.
ACTION IU1.4.5	Work with utility companies to ensure the reliability and availability of electricity, water, natural gas, and communications services during both normal times and times of stress (e.g. storm events, flooding, extreme heat, etc.).
OUTCOME IU1.5:	A safe and well-connected right-of-way system that provides a functional surface transportation system and utility infrastructure services throughout the City.
ACTION IU1.5.1	Evaluate and ensure that there is adequate lighting along all major streets.
ACTION IU1.5.2	Convert light fixtures and street lights to light emitting diodes (LEDs) and down-cast lighting.
ACTION IU1.5.3	Develop an inventory of existing public right-of-way infrastructure assets (e.g., street lights), current infrastructure conditions, and priorities for maintenance or rehabilitation.
ACTION IU1.5.4	Provide rights-of-way that will permit the expansion of tree planting strips and tree wells to provide more suitable growing conditions for street trees.
OUTCOME IU1.6:	Access to reliable and efficient solid waste and recycling services and infrastructure.
ACTION IU1.6.1	Maintain and enhance solid waste and recycling infrastructure in City parks, trails, sidewalks, and public facilities, and at events.

Infrastructure and Utilities

Goal 2

Expand the use of advanced technology.

Advanced technology infrastructure helps support economic growth and public safety, improve access to information, and ensure a broad range of communications services. Technology is rapidly progressing while the price of these advanced technologies is decreasing. The City will monitor, evaluate, and utilize advances in technology to improve efficiency, connectivity and quality of life.

OUTCOME IU2.1:	All City residences, businesses and institutions have access to reliable and affordable advanced technology and telecommunications infrastructure and services.
ACTION IU2.1.1	Periodically update policies and regulations for the design and siting of telecommunications facilities to ensure they remain applicable with fast-changing technologies.
ACTION IU2.1.2	Explore public-private partnerships as a way to enhance the City's telecommunications infrastructure.
ACTION IU2.1.3	Consider implementing innovative pilot initiatives that advance new technologies (e.g., regenerative power, solar-powered charging stations, etc.).

Appendices

Appendix A: Chesapeake Bay Preservation Plan

Appendix B: Transportation Practices and Policy

A

Chesapeake Bay Preservation Plan

The City recognizes the importance of preserving its valuable water resources for future generations and the need to protect them from the adverse effects of pollution generated by urban land uses. The City also recognizes that land use activities adversely affecting City streams also impact the health and viability of downstream resources, the most important of which is the Chesapeake Bay. The Chesapeake Bay is an economic, social, and ecological resource whose continued health is of benefit to all citizens of the Commonwealth.

The City of Fairfax has a vested interest and a responsibility to maintain and promote a healthy environment, including the protection of local waterways from further degradation as a result of development. In addition, steps must be taken to improve currently degraded resources to ensure the long-term health of both the City's resources and the Chesapeake Bay. The City has risen to the challenge of natural resources and water quality protection and is committed to implementing the Chesapeake Bay Preservation Area Designation and Management Regulations as manifest by the Chesapeake Bay Preservation Act of 1988. These regulations apply to all localities within Tidewater Virginia; however, the individual jurisdictions are responsible for identifying and implementing Chesapeake Bay preservation strategies.

The City has made progress towards maintaining and promoting a healthy environment; nonetheless, significant environmental issues still need to be addressed. This Chesapeake Bay Preservation component to the City's Comprehensive Plan serves as a planning tool for the City Council, the Planning Commission, City agencies, and citizens to help guide the City in its protection of the Chesapeake Bay and the City's natural resources.

Contents

Section 1. Introduction, Purpose, and Legal Authority

Recognizing the economic and social importance of long-term viability of State waters, and in particular the Chesapeake Bay and its tributaries, the Virginia General Assembly enacted the Chesapeake Bay Preservation Act of 1988. The Chesapeake Bay Preservation Area Designation and Management Regulations as adopted in 1989 and amended in 1991, 2001, and in 2012, state that local programs shall contain "a comprehensive plan or revision that incorporates the protection of Chesapeake Bay Preservation Areas and of the quality of state waters, in accordance with criteria set forth in Part V (9VAC25-830-160 et seq.)."

The waters of the Chesapeake Bay have been degraded significantly by many sources of pollution, including nonpoint source pollution from land uses and development. Existing high-quality waters are worthy of protection from degradation to guard against further pollution. Certain lands that are proximate to shorelines have intrinsic water quality value due to the ecological and biological processes that they perform. Other lands have severe development constraints as a result of flooding, erosion, and soil limitations. With proper management, they offer significant ecological benefits by providing water quality maintenance and pollution control, as well as flood and shoreline erosion control.

To achieve these ends, the City Council and the Planning Commission have, in accordance with the Chesapeake Bay Preservation Area Designation and Management Regulations (9VAC25-830), developed a Chesapeake Bay preservation program which is centered around the City's Chesapeake Bay Preservation regulation of the Zoning Ordinance. This Chesapeake Bay Preservation component to the City's Comprehensive Plan builds upon the City's regulation and is designed to protect those qualities of life held important by the citizens of the Commonwealth and the City and to encourage future development that enhances and compliments the growth of the City as well as protects it natural resources.

Section 2. Water Resources Protection Programs and Regulations

The City has made substantial progress towards ensuring the protection and balanced management of its natural resources through the implementation of various City regulations and water quality protection and pollution prevention programs. While the Chesapeake Bay Preservation regulation is the City's primary tool for protecting water resources within the City, water quality and natural resources protection requires an integrated approach.

This involves not only regulation but also citizen participation through the use of public education and volunteer programs. Enforcement of the City's Chesapeake Bay Preservation regulation must be coupled with a comprehensive examination of how the City's various land use regulations, including its Zoning and Subdivision ordinances, may be better utilized to protect the natural environment.

The following is an overview of the City's existing regulations and programs related to water quality and natural resources protection. These regulations and programs are then reexamined and options are presented for their improvement in light of an analysis of the City's water resources (Section 3), existing and potential sources of pollution (Section 4), and constraints to development (Section 5).

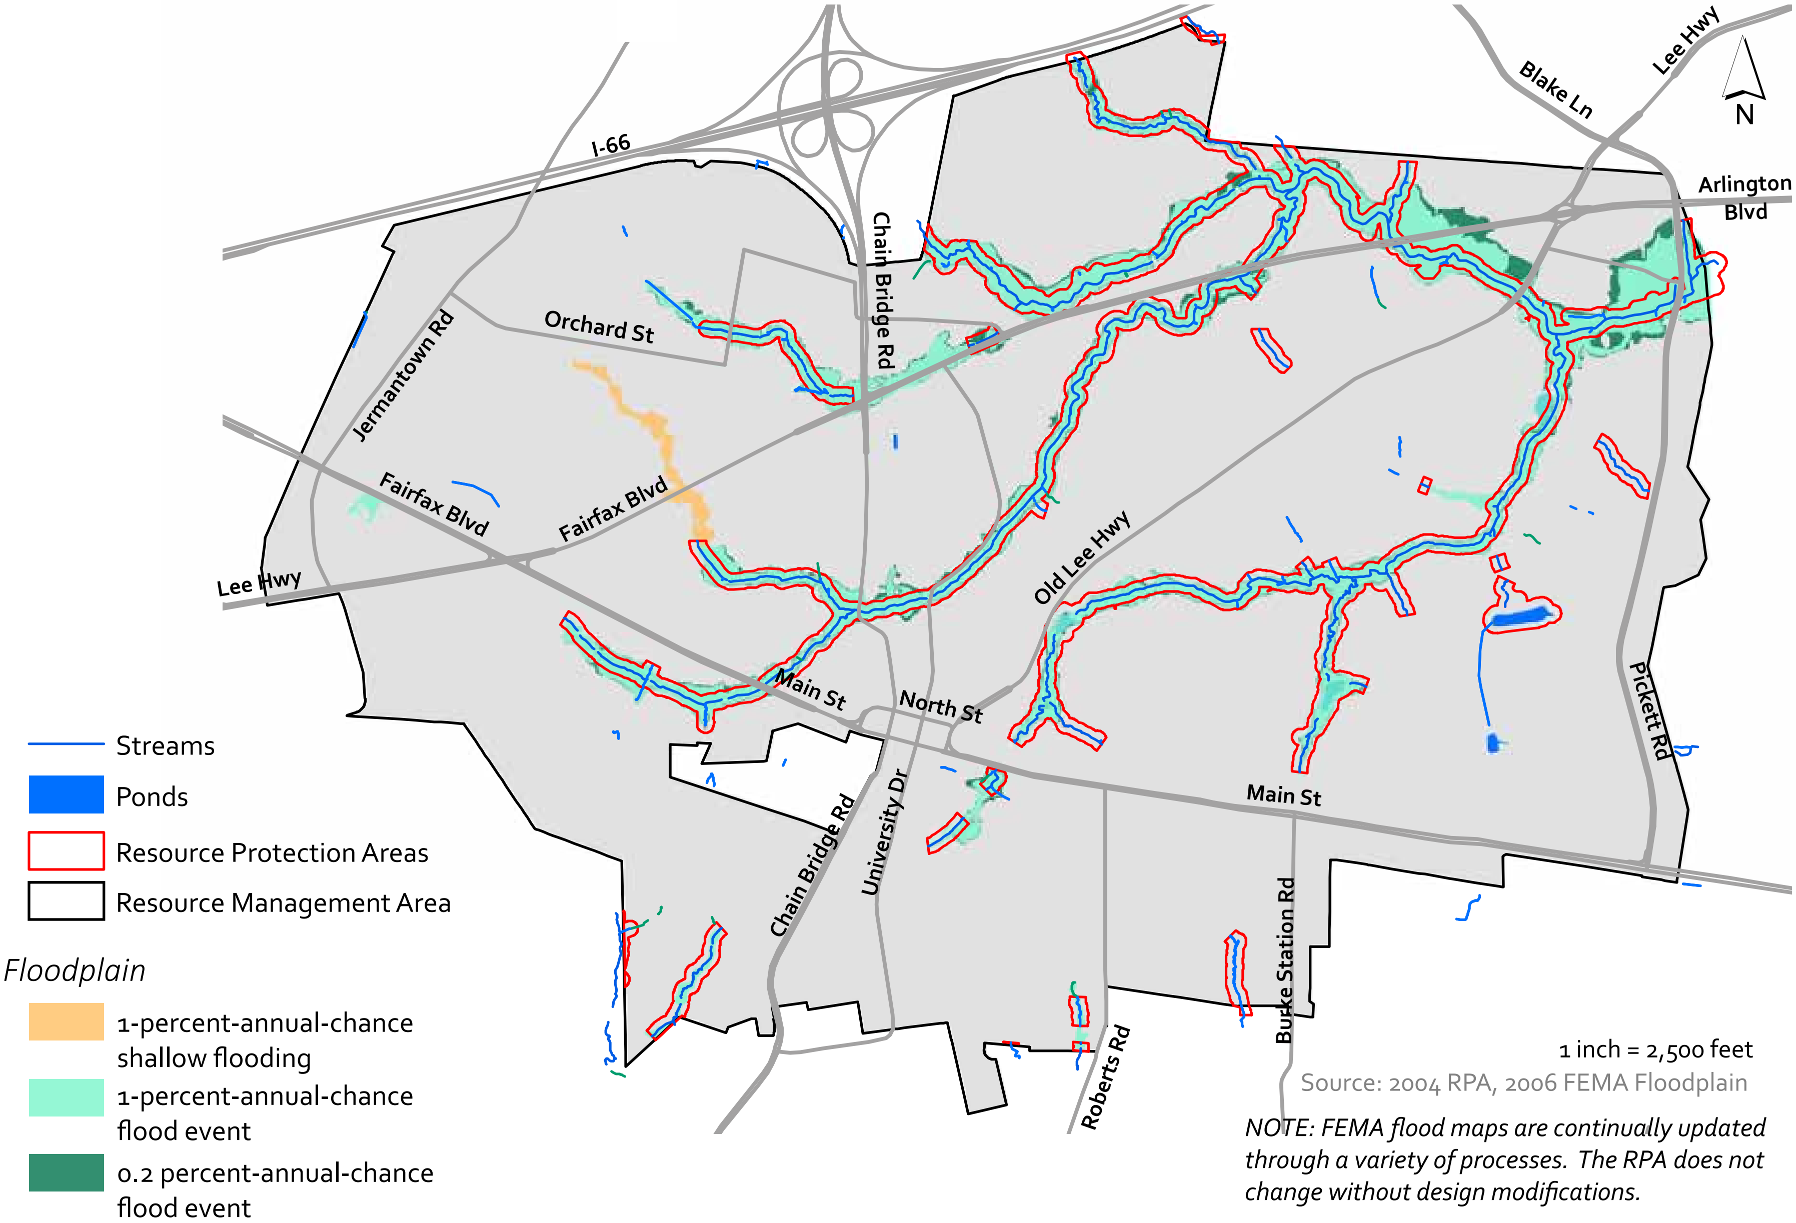
2.1. Chesapeake Bay Preservation Regulation

The Chesapeake Bay Preservation Act (Chapter 3.1 of Title 62.1 of the Code of Virginia) establishes a program to protect environmentally sensitive features which, when disturbed or developed incorrectly, lead to reductions in water quality in the Chesapeake Bay. The Act provides a framework for local government to identify these sensitive areas and to enact regulations to better plan land use activities on and around them. Under the regulations, the City of Fairfax is called to promote the following:

- Protection of existing high quality State waters and restoration of all other State waters to a condition or quality that will permit all reasonable public uses, and will support the propagation and growth of all aquatic life which might reasonably be expected to inhabit them;
- Safeguarding the clean waters of the Commonwealth from pollution;
- Prevention of any increase in pollution;
- Reduction of existing pollution; and,
- Promotion of water resource conservation in order to provide for the health, safety, and welfare of the present and future citizens of the Commonwealth.

In accordance with State guidelines, Chesapeake Bay Preservation Areas (CBPAs) were mapped for the City and the City adopted a Chesapeake Bay preservation area map as part of the City's Zoning Ordinance in October, 1990 and was most recently amended in March, 2015 (§4.18. et seq.). The Chesapeake Bay Preservation Areas were delineated for the city according to criteria established by the State Department of Conservation and Recreation. Figure A1 presents the City's Floodplain and Chesapeake Bay Preservation Area Map.

FIGURE A1 FLOODPLAIN AND CHESAPEAKE BAY PRESERVATION AREA MAP



Source: 2004 RPA, 2006 FEMA Floodplain

NOTE: FEMA flood maps are continually updated through a variety of processes. The RPA does not change without design modifications.

The resource protection area (RPA) includes (1) tidal wetlands; (2) nontidal wetlands connected by surface flow and contiguous to tidal wetlands or water bodies with perennial flow; (3) tidal shores; (4) intermittent streams that remain largely in a natural condition and that have not been significantly impacted by adjacent development; (5) water bodies with perennial flow; and (6) a 100-foot vegetated buffer area located adjacent to and landward of the components listed above, and expanded to include noncontiguous wetlands within the floodplain that are partially located within the buffer, along both sides of any water body with perennial flow.

In general, development within the RPA is limited to water dependent uses, passive recreational uses, utilities and public facilities, and certain types of redevelopment so long as the proposed land use is carried out in accordance with the provisions of the City's Zoning Ordinance.

The resource management area (RMA) includes all lands in the city that are not designated as an RPA. All development or redevelopment within a Chesapeake Bay preservation area exceeding 2,500 square feet of disturbed land area shall be subject to the general performance standards in §4.18.7 of the Zoning Ordinance as well as the development review procedures of §6.13 of the Zoning Ordinance.

The performance standards establish the means to minimize erosion and sedimentation potential, reduce land application of nutrients and toxics, and maximize rainwater infiltration. Natural ground cover, especially woody vegetation, is most effective in holding soil in place and preventing site erosion. Indigenous vegetation, with its adaptability to local conditions without the use of harmful fertilizers or pesticides, filters stormwater runoff. Minimizing impervious cover enhances rainwater infiltration and effectively reduces stormwater runoff potential.

The performance standards are intended to prevent a net increase in nonpoint source pollution from new development and to achieve a 10 percent reduction in nonpoint source pollution from redevelopment.

2.2. Erosion and Sediment Control Regulation

The purpose of the City's Erosion and Sediment Control Regulation is to prevent the degradation of properties, stream channels, waters, and other natural resources by providing that adequate soil erosion and sediment control measures are taken before, during, and after the period of site clearance, development, and construction. The Erosion and Sediment Control Ordinance implements the Virginia Erosion and Sediment Control Law (§ 62.1-44.15:51 et seq of the Code of Virginia (2013)) as well as the Chesapeake Bay Preservation Act.

Under this ordinance, land owners proposing a nonexempt regulated land disturbing activity of greater than 2,500 square feet must first submit an erosion and sediment control plan to the City Department of Public Works. The City's erosion and sediment control requirements are detailed in Erosion and Sediment Control section of the Zoning Ordinance (§4.17).

2.3. Landscaping Regulation

The City's landscaping regulations are intended to encourage the planting and proper care of vegetation and trees throughout the City, to enhance tree canopy, and to provide for appropriate screening. These actions are intended to contribute to the health, safety, and welfare of the city by enhancing pedestrian facilities, decreasing flooding, soil erosion, air pollution and noise, and improving aesthetics.

The regulation controls the removal of trees from public and private property and establishes standards limiting tree removal and ensuring the replacement of trees sufficient to safeguard the ecological and aesthetic integrity of the community's environment. In addition, the regulation was enacted: to prevent the unnecessary clearing and disturbing of land so as to preserve, insofar as is practicable, the natural and existing growth of vegetation; to replace the removed trees with new trees or large shrubs on the same property and in the same general location; to provide protective regulations against hazardous trees and diseased trees or shrubs; to control activities related to trees and plantings upon the streets or public properties of the City; and to establish a permit procedure for tree contractors. The City's landscaping requirements are detailed in the landscape section of the Zoning Ordinance (§4.5).

Tree cover has long been recognized as serving to protect water quality. Tree canopy provides a buffer between precipitation and the soil by slowing the rate and velocity of rainfall.

Tree roots serve to keep soil particles in place and from washing away due to rainfall. Vegetation of all types also extract nutrients from water for use in plant tissues. In addition, tree cover in riparian areas serves to protect aquatic habitat by lowering and stabilizing stream temperature.

2.4. Floodplain Regulation

In 1981, the Federal Emergency Management Agency (FEMA) investigated the existence and severity of flood hazards in the City of Fairfax to aid in the administration of the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973. The study was also meant to be used by local and regional planners in their efforts to promote sound floodplain management. To these ends, the City established a floodplain district as part of the City's Zoning Ordinance in 1982, which has been continually updated. The current Floodplain regulation was adopted by the City in March 2015.

The purpose of the City's floodplain regulation is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services and the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

- Regulating uses, activities, and development which, alone or in combination with their existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies.
- Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding.
- Requiring all those uses, activities, and developments that do occur in flood-prone districts to be protected and/or flood proofed against flooding and flood damage.
- Protecting individuals from buying land and structures which are unsuited for intended purposes because of flood hazards.

In addition to protecting life and property, the floodplain regulation serves to protect water quality by decreasing the potential for stream bank erosion and by providing, in many instances, vegetated stream buffer areas which filter runoff from surrounding impervious areas. Figure A1 on page 3 depicts areas of Fairfax that have been designated as flood prone (the one-hundred year floodplain) for which the City's regulation applies. The City's floodplain regulations are detailed in §4.15 of the Zoning Ordinance.

2.5. Zoning and Subdivision Ordinances

The City's Zoning and Subdivision ordinances provide the City with valuable tools for natural resources protection through better development and redevelopment practices. Many of the City's water quality protection regulations, including the City's Chesapeake Bay Preservation regulation and Floodplain regulation are contained within the City's Zoning Ordinance as overlay districts. Protection of water resources may be accomplished through the application of Zoning Ordinance provisions which relate to impervious coverage requirements, land use densities, etc. For instance, creative parking requirements to minimize impervious areas, including cooperative parking arrangements between businesses, may be used to minimize impervious cover.

2.6. City Source Control Programs

The control of pollutants before they enter stormwater or groundwater is recognized as the most cost effective and environmentally sound method of environmental protection. While the effectiveness of source control programs are difficult to ascertain due to their heavy reliance on human behavior modification, they are nevertheless integral components of the Commonwealth's Chesapeake Bay preservation effort. The City has addressed source control on a number of fronts, many of which are specifically geared at water quality protection and some of which have water quality protection as direct benefit. Among the City's source control programs which benefit water quality are its street sweeping program, curbside leaf and brush pickup service, and recycling program.

Street sweeping is effective in removing harmful pollutants, particularly litter and sand from deicing and snow removal activities. Under the City's street sweeping program, main streets are swept once a week from mid-March through mid-November and subdivision streets are swept three times a year. In order for the City's program to have a more substantial effect on water quality, more frequent and concentrated street sweeping would need to be implemented. Specifically, more intense street sweeping efforts in downtown areas, where nutrients and other pollutants tend to accumulate at higher rates, may be of direct benefit to water quality.

In addition to street sweeping, the City conducts a curbside leaf and brush pickup service which discourages those whose properties lie within a RPA from dumping yard waste near streams where it can kill vegetation. This practice can result in erosion and the leaching of excess nutrients into the local stream. In conducting its program, the City should take care to make sure that leaves are not placed directly in the gutter where they can be washed into the local stream course.

The City has an extensive recycling program which has collections for most recycling materials including plastics, glass, metals, etc. The City also collects potentially hazardous substances such as used oil, oil filters, rechargeable batteries, and car batteries at the Property Yard Recycling Center. The City advertises its recycling program in the Public Works Department's insert to the City's monthly newsletter several times a year. New homeowners are provided with a packet of information on recycling requirements and facilities within the City.

In addition to City source control efforts, the Department of Environmental Quality (DEQ), Water Division, works directly with owners of underground storage tanks (USTs) to ensure that these tanks do not impact on groundwater quality. The DEQ, Water Division, has an extensive monitoring program to detect and mitigate any leaking USTs before substantial groundwater quality degradation can occur.

2.7. Local and Regional Watershed Management Efforts

For many years, the City's stormwater drainage system has been under considerable stress as the result of a rapid increase in the City's jurisdiction-wide imperviousness. Several types of stormwater system problems have been identified within the Accotink Creek watershed including streambank and streambed erosion, sedimentation, localized flooding, deteriorated drainage facilities, limited capacity of the drainage system as originally designed, and finally, pollutants affecting water quality.

In the last few decades, several water quality related regulations, as summarized below, have been enacted that has made it necessary for the City to investigate and address these problems on a watershed-wide basis.

- **National Pollution Discharge Elimination System:** Established by the United States Environmental Protection Agency (EPA) in 1987 as an amendment to the Clean Water Act, the National Pollution Discharge Elimination System requires permits for discharges from municipal separate storm sewer systems to limit pollutant discharges into streams, rivers, and bays. The DEQ administers the program as the Virginia Pollutant Discharge Elimination System.

- **Chesapeake Bay Preservation Act:** Established by the DEQ in 1988 to improve water quality in the Chesapeake Bay. Localities are required to adopt programs to protect water quality in the Chesapeake Bay from excessive nutrients caused by stormwater runoff from impervious surfaces.

- **Virginia Stormwater Management Program:** These regulations were established by the DEQ and include requirements for erosion and sediment control during the construction process and for the installation of BMPs to address stormwater runoff post-construction.

- **MS4 Permits:** Issued by the DEQ and EPA, these regulatory permits require local governments to implement a variety of programs (ranging from detection and correction of illicit discharges to public outreach and education) to lessen the volume of pollutants carried by their municipal stormwater conveyance systems. These permits require consistency with the pollution budgets of applicable total maximum daily loads (TMDLs); and have been issued over time.

- **Local TMDL:** Established by the DEQ and EPA, these TMDLs set target reductions for pollutants (nutrients, sediment, bacteria, trash, and PCBs) in a number of waters in the region that have been designated as 'impaired'.

- **Chesapeake Bay TMDL:** Established by the EPA in December 2010, this historic and comprehensive "pollution diet" requires reductions in nutrient (nitrogen and phosphorus) and sediment pollution throughout the Chesapeake Bay watershed and for major tributaries such as the Potomac River.

To determine how the City will face its watershed challenges, the City completed a Watershed Management Plan in July 2005. The plan evaluated watershed conditions and included recommendations on how to improve watershed health. The City also completed an Accotink Creek Stream Stability Assessment and Prioritization Plan in October 2007 and a supplement report for Daniels Run in October 2008. These reports captured the scale and extent of stream bank erosion in the Accotink Creek watershed and included a prioritization plan for future restoration activities based upon observed conditions.

The City has been continually implementing the recommendations identified in these reports. For example, the City has made significant efforts to stabilize the stream banks to handle the urban stormwater runoff and flows by implementing stream restoration and stabilization improvements at numerous locations on Accotink Creek.

The City also participates in regional efforts by being a member of the Chesapeake Bay Policy Committee, which was established by the MWCOG Board of Directors. Elected officials and staff from MWCOG's member governments, and water and wastewater utilities comprise the committee's membership. The Committee tracks developments under the federal-state Chesapeake Bay Program for implications to local governments and recommends Bay-related policies to the Board.

On June 16, 2014, the Chesapeake Bay Watershed Agreement was signed. Signatories include representatives from the entire watershed, including the Commonwealth of Virginia, committing for the first time the Chesapeake Bay's headwater states to full partnership in the Chesapeake Bay Program. This plan for collaboration across the Bay's political boundaries establishes goals and outcomes for the restoration of the Bay, its tributaries and the lands that surround them.

Section 3. Inventory of Existing Water Resources

The City contains a wealth of natural resources which benefit both residents and businesses within the City. Of its natural resources, the City's water resources are among the most important from an economic, social, and ecological point of view, as well as the most sensitive. Land uses and development, air pollution, and human carelessness all contribute to the degradation of water resources.

The City has been able to protect many stream corridors through the expansion of its public park system and the preservation of vegetative buffers. However, as the population grew from only 1,946 in 1950 to 24,097 in 2017, development pressures resulted in a dramatic increase in the City's impervious acreage and a loss of natural vegetation. While past responses to the pressures of development have resulted in the implementation of erosion and sediment control measures, stormwater quantity measures to control flooding, and floodplain protection, only recently have the post-development effects of urbanization on water quality been fully appreciated and addressed.

With the adoption of the City's Chesapeake Bay Preservation regulation in 1990, the City committed itself to a comprehensive and integrated approach to water quality protection. In order to better plan for future development and redevelopment within the City and to identify ways to enhance the quality of life through the preservation and restoration of the City's water resources, it is important to understand the resources which exist within the City. The following section presents an inventory of the water resources within the City including watersheds and streams, water supplies, water supply protection, and groundwater.

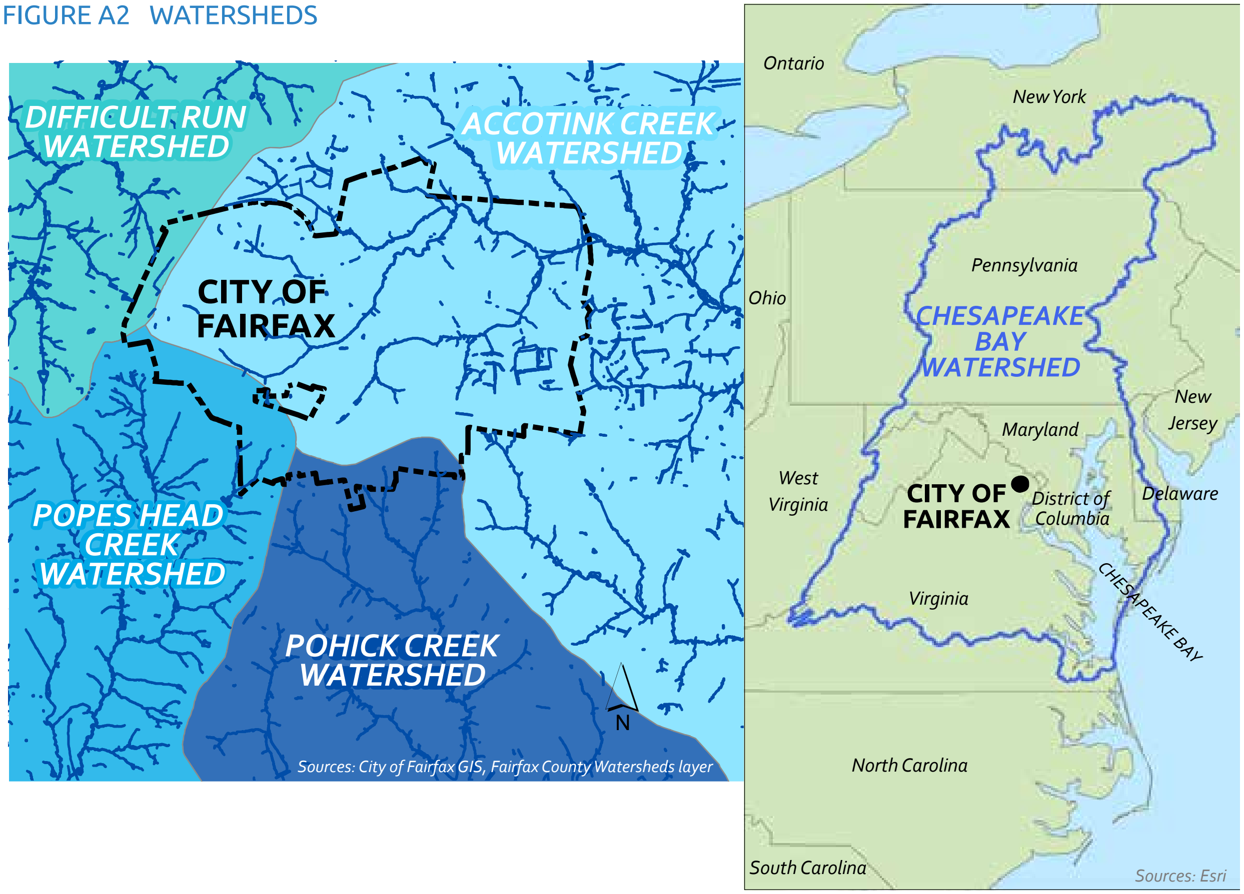
3.1. Streams and Watersheds

The City is located at the confluence of four major drainage divides and includes portions of the Accotink Creek, Pohick Creek, Popes Head Creek, and Difficult Run watersheds. As a unique consequence, practically all watercourses within the City (with the exception of a few tributaries to Accotink Creek in the northeastern portion of the City) originate within its boundaries and are not directly affected by activities from neighboring jurisdictions. This provides a considerable level of control to the City over the water quality of its streams. Major perennial streams which flow through the City include Accotink Creek (north and central forks) and Daniels Run (also known as the south fork of Accotink Creek), which drains to Accotink Creek within the City. Many smaller tributaries drain to Accotink Creek and Daniels Run in a roughly dendritic (branched) pattern which has been substantially modified by development and channelization.

The City contains the headwaters of Accotink Creek, which flows through southern Fairfax County and empties into Accotink Bay and Gunston Cove and then into the Potomac River. Within the City, Accotink Creek is primarily a gravelly bottomed fast flowing stream. However, in some wide, shallow, or slower moving areas, particularly in areas upstream of culverts, thick layers of sediments have been deposited over the gravel as a result of excessive erosion and both natural and man-made stream course blockage. Throughout much of the City, Accotink Creek is only five to ten feet wide and relatively shallow. However, the creek widens to ten to twenty-five feet and is several feet deep where it exits the northeastern edge of the City near the intersection of Pickett Road and Old Pickett Road in Thaiss Park.

According to the Division of Soil and Water Conservation's Hydrologic Units Map of Northern Virginia, the City lies primarily within the Accotink Creek watershed (HUC Code: 020700100402) which drains approximately 90% of the City. The Pohick Creek watershed (HUC Code: 020700100401), which drains the southeastern portion of the City covers approximately 3% of the City. The Difficult Run watershed (HUC Code: 02070081004), which drains the area west of Jermantown Road, covers approximately 3% of the City while the Popes Head Creek watershed (HUC Code: 020700100705), which drains the southwestern portion of the City, covers approximately 4% of the City. Popes Head Creek flows through south-central Fairfax County, bisecting the Town of Clifton, and eventually empties into the Occoquan Reservoir. This is significant due to the fact that the Occoquan serves as a primary drinking water supply for a large percentage Northern Virginians. Figure A2 presents a schematic of the City's major watersheds. Figure A3 presents a schematic of the major streams within the City.

FIGURE A2 WATERSHEDS



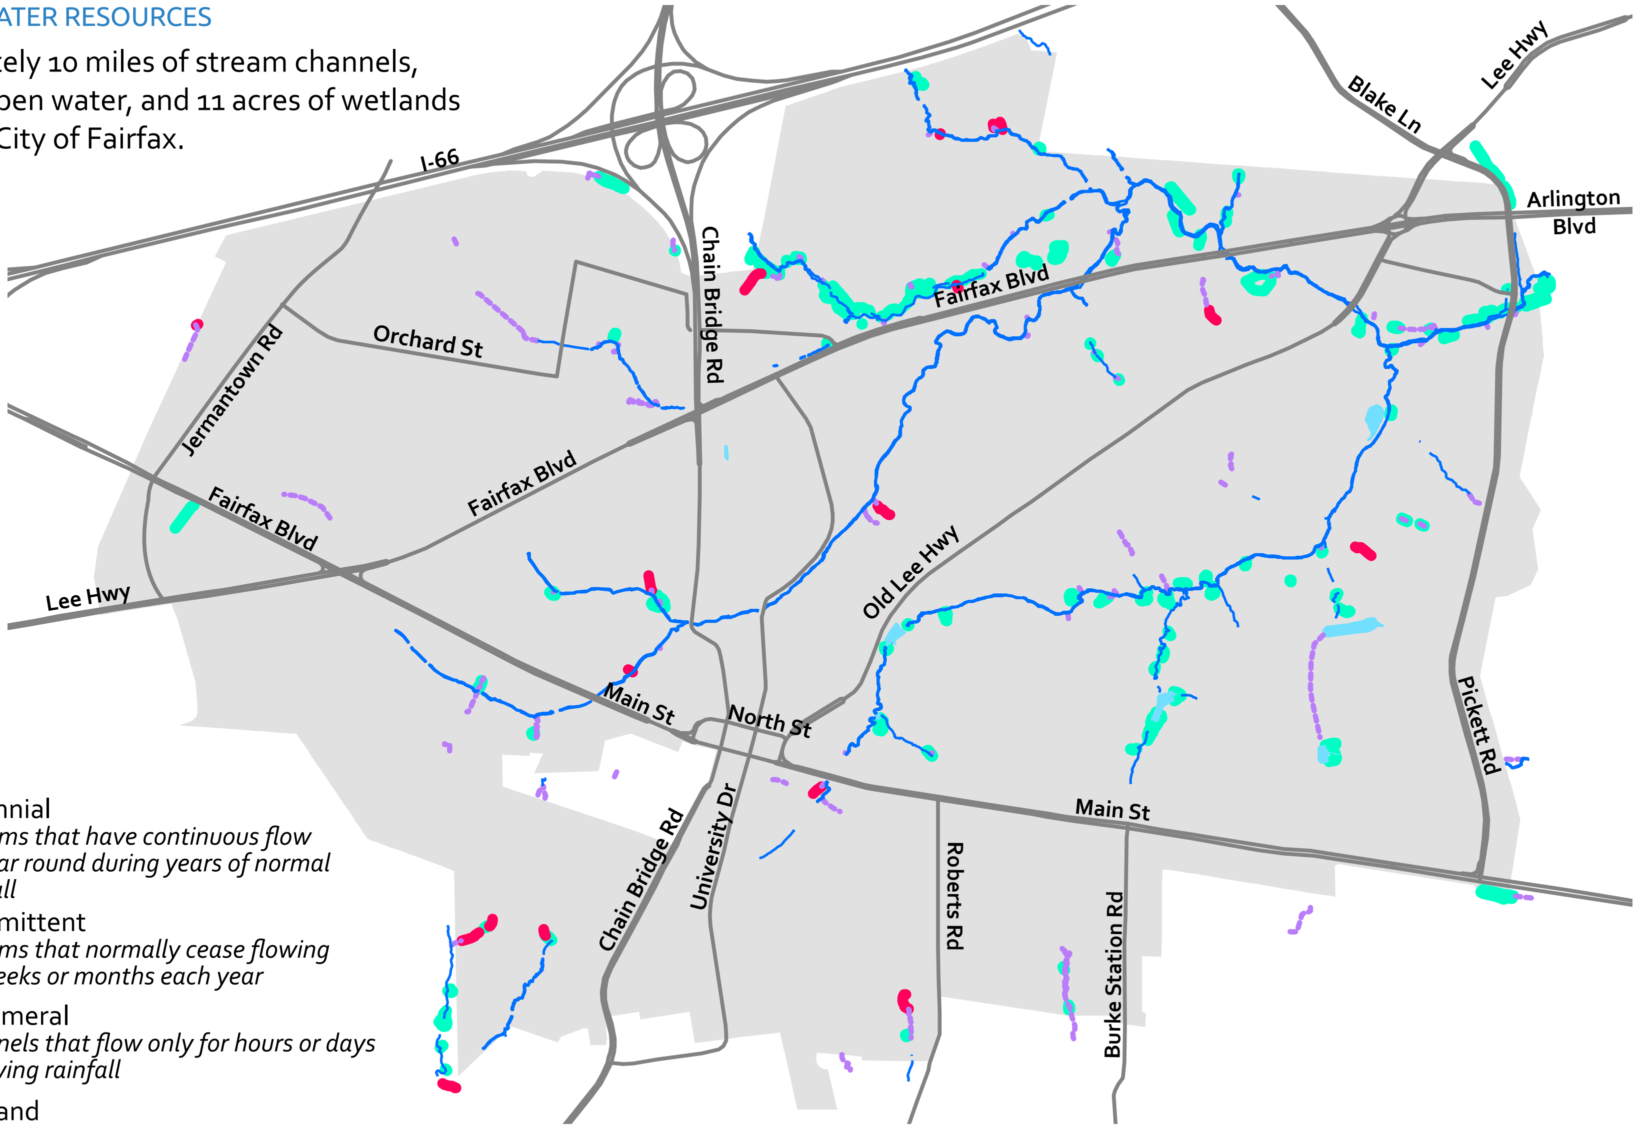
Sources: City of Fairfax GIS, Fairfax County Watersheds layer

Sources: Esri

Tributary streams within the City are subject to runoff from shopping centers, garages, parking lots, and other potentially high pollution areas. Storm drains feed the majority of the streams passing through the City and have been implicated as sources of pollution from improperly disposed petroleum products. Although many tributaries have been cleared to their banks, or have been modified to enhance drainage capacity, only a relatively small proportion of the City's perennial streams have actually been piped or channelized with concrete. The implications that the City's land uses, impervious cover, and human activities have on water quality are further detailed in Section 4.

FIGURE A3 WATER RESOURCES

Approximately 10 miles of stream channels, 9 acres of open water, and 11 acres of wetlands exist in the City of Fairfax.



— **Perennial**
Streams that have continuous flow all year round during years of normal rainfall

┈ **Intermittent**
Streams that normally cease flowing for weeks or months each year

▬ **Ephemeral**
Channels that flow only for hours or days following rainfall

▬ **Wetland**
Land area that is saturated with water, either permanently or seasonally

🟦 **Pond**
A body of standing water (either natural or artificial)

1 inch = 2,500 feet

3.2. Water Supply

The City sold its water system to Fairfax Water on January 2, 2014. Since that sale, Fairfax Water has been providing water services to the City as presented on Figure A4.

Per the Fairfax Water Strategic Plan 2020, "Fairfax Water owns and operates the two largest water treatment facilities in Virginia with an average daily water production of 163 million gallons and combined maximum capacity of 376 million gallons per day. The James J. Corbalis Jr. treatment plant is at the northern tip of Fairfax County and the Frederick P. Griffith Jr. treatment plant is on the southern border of Fairfax County. Fairfax Water also purchases water from the McMillan and Dalecarlia treatment plants in Washington DC. They are part of the Washington Aqueduct, owned and operated by the U.S. Army Corps of Engineers. Fairfax Water draws raw water from two primary sources: the Potomac River and the Occoquan Reservoir, which is fed by the Occoquan River."

The principal source of potable water for the City is the Potomac River and Occoquan Reservoir that is treated at the James J. Corbalis Jr. or Frederick P. Griffith Jr. treatment plants. Fairfax Water continually works to reliably meet the needs of present and future

FIGURE A4 FAIRFAX WATER SERVICE AREAS

🟦 Customers in this service area receive water from the Potomac River and Occoquan Reservoir that is treated at the James J. Corbalis Jr. or Frederick P. Griffith Jr. treatment plants, owned and operated by Fairfax Water

🟩 Customers in this service area receive water from the Potomac River that is treated at the McMillan and Dalecarlia water treatment plants, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers

🟧 Customers in this service area receive water from the Potomac River that is treated at the Dalecarlia water treatment plant, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers customers. The City will continue to work with Fairfax Water to ensure the City has access to safe and reliable drinking water.

In compliance with federal Safe Drinking Water Act, the Virginia Department of Health (VDH) conducts source-water assessments, which consist of figures of the evaluated watershed area, an inventory of known land-use activities, and documentation of known source-water contamination. The Potomac River and the Occoquan Reservoir were determined to be of high susceptibility to contamination.

In addition to protecting the City's water supply from pollution, water conservation practices help conserve and protect it from depletion. Conservation also reduces the amount of potable water that reaches the City's sanitary sewer system and reduces the potential that landscape irrigation and car washing will result in water pollution. The City should develop a program to encourage City residents on a more regular basis to practice water conservation, including the voluntary replacement of water-intensive (or leaky) fixtures in the home with new low consumption fixtures. Incorporation of water conservation into the school curriculum is also an effective approach and has been used elsewhere in Northern Virginia, including Arlington County.

3.3. Water Quality Monitoring

Protecting the quality of surface water resources is a concern for many urban jurisdictions. The removal of tree canopy cover, which serves to stabilize and cool stream temperatures, as well as increased imperviousness of surrounding areas, which increases the volume and velocity of stormwater runoff into local streams, have a generally negative effect on stream water quality. Water quality may be decreased as a result of pesticide and fertilizer-laden runoff from adjacent lawns or by runoff from parking lots which may contain nutrients, heavy metals, and hydrocarbons. Eroding stream banks contribute to urban water quality problems by choking local streams with sediment. Illegal dumping into storm sewers, trash and litter, animal and pet wastes, and leaking above ground and underground storage tanks also take their toll on urban water quality.

The City's established Water Quality Monitoring Program (WQMP) helps the City meet the requirements contained in Section I.B.2.e of the City's Municipal Separate Storm Sewer System (MS4) permit, and Item 9 in the City of Fairfax's DEQ approved TMDL Action Plans. It was designed to assist in assessing the effectiveness of all the City's Local TMDL Action Plans. Under the program, the City collects water quality samples which are analyzed for water quality parameters including Total Suspended Solids (TSS), Bacteria (E. coli), temperature, specific conductance, Dissolved Oxygen (DO), pH, turbidity, nitrate + nitrite, total phosphorus, and volatile suspended solids. Samples are collected twice a year from six representative MS4 outfalls located within the drainage sheds of the impaired reaches of Difficult Run, Accotink Creek, and Popes Head Creek.

The City utilizes the water quality sampling data to address multiple objectives including: screening for potential sources of the pollutants of concern discharging into the City's MS4; targeting locations within the MS4 permit area for implementation of BMPs; educating the public on the potential water quality impacts of their actions and behavior within the MS4 drainage area; and ultimately to aid in assessing the overall effectiveness of the Action Plan in reducing the discharge of the pollutants of concern from the City's MS4.

At the end of each MS4 permit reporting period, the City prepares annual Water Quality Monitoring Reports, which are included with the City's MS4 Annual Report. Once appropriate amounts of sampling data have been collected under the WQMP, the City will analyze the results to determine the next steps to take with the MS4 Permit Program and local TMDL Action Plans.

3.4. Groundwater Resources

While the City no longer relies on groundwater resources for its potable water supply, groundwater is nonetheless an important water resource. An investigation of the groundwater resources of the City is important because groundwater is intimately connected with the ecosystem as it provides the base flow to many rivers, streams, ponds, lakes, and wetlands. Groundwater is also an issue of regional importance due to its dynamic nature, as was shown when a leaking oil storage tank at the Fairfax Tank Farm formed a plume which spread from the eastern edge of the City into the Mantua neighborhood of Fairfax County. Because the City no longer relies on groundwater for its potable water supply, recent data on City-wide groundwater dynamics and quality is not available.

Section 4. Existing and Potential Sources of Water Pollution

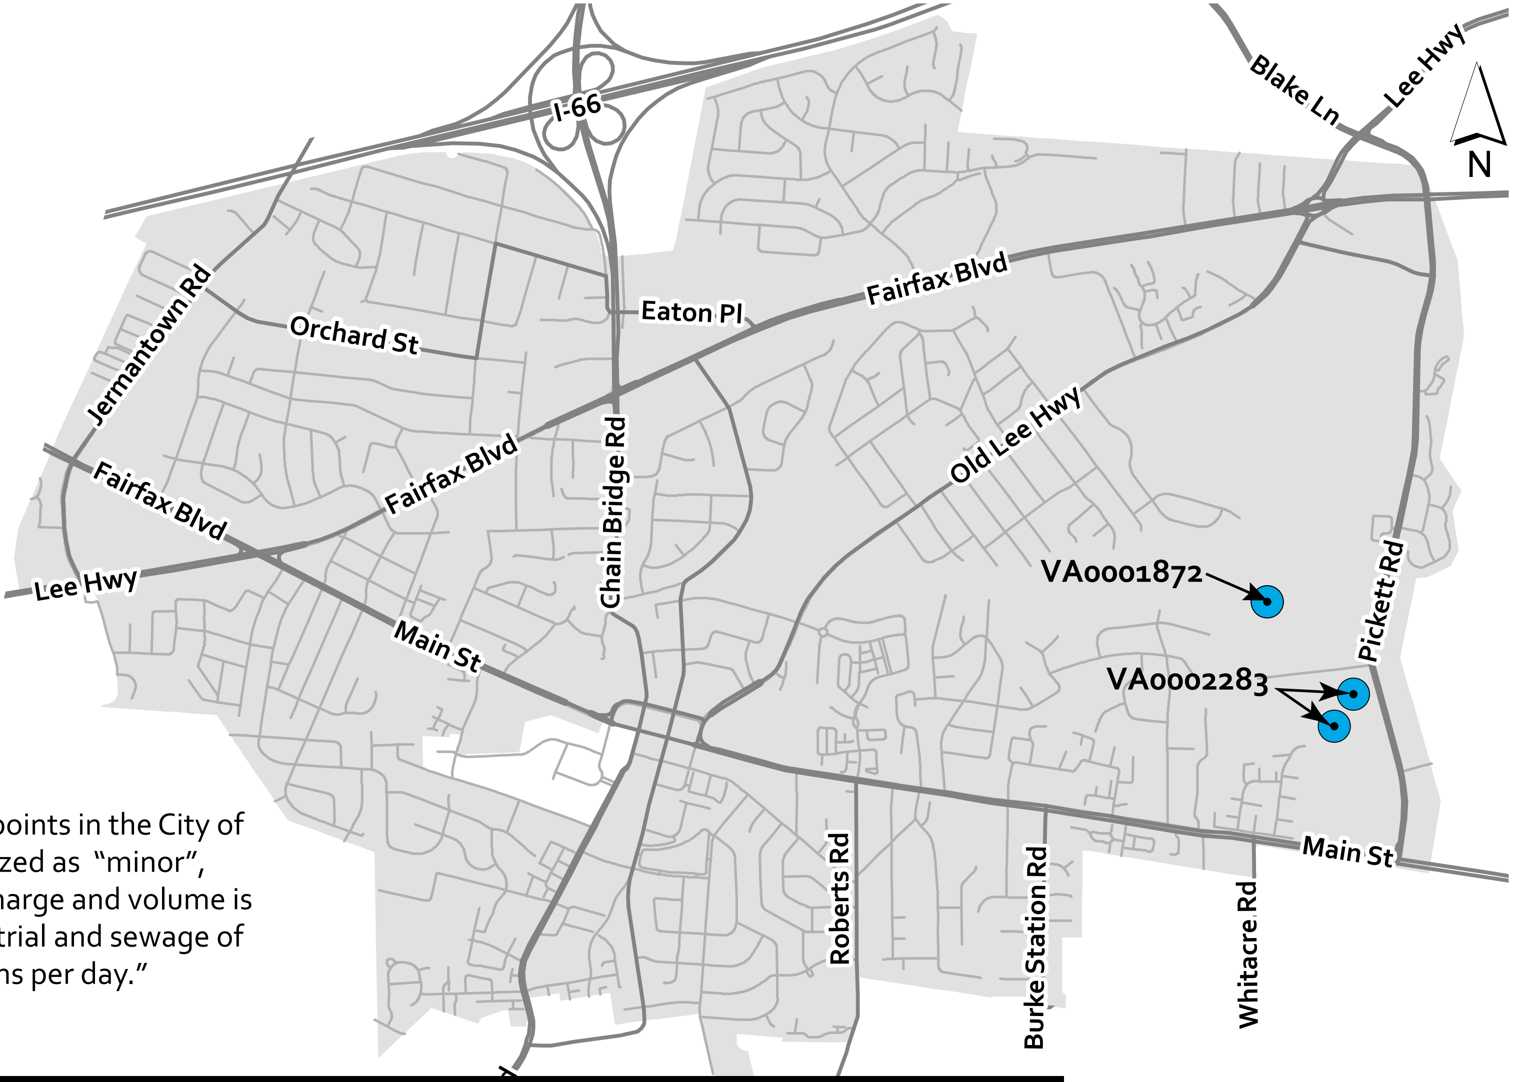
While some level of environmental pollution resulting from human activity may be inevitable, the cost of pollution and its effects on quality of life should not be ignored. Unmanaged pollution can result in surface and groundwater contamination, poor air quality, aesthetic degradation of the landscape, and the destruction of important ecological habitats, all of which detract from the City's basic character. The most cost-effective approach to the problem of pollution is to prevent it at its source. A number of tools are available to the City to aid in pollution prevention, including public education and awareness programs, water conservation, lawn care programs, and recycling efforts, to name only a few. The cost to the City once environmental damage is done includes not only short term clean-up costs, but long-term costs including decreased property values and loss of tax base. The following section describes the City's existing sources of pollution as well as potential sources of pollution which the City may face as it grows and develops.

4.1. Point Source Pollution

Point source pollution is pollution which can be attributed to a specific outfall and is therefore often the most easily recognizable and regulatable form of pollution. Industries and municipalities, under the federal Clean Water Act, National Pollution Discharge Elimination System, are required to report pollution discharges to water courses above a certain threshold, and to the maximum extent practicable, mitigate the effects of the pollution on the environment. The DEQ, Water Division, maintains records on these sources of pollution and is charged with ensuring that environmental regulations are enforced.

There are two National Pollution Discharge Elimination System discharge points located within the City (VA0001872 and VA0002283), both of which drain to tributaries of Accotink Creek (see Figure A5). The discharge points are associated with ongoing activities at the Fairfax Tank Farm Terminal Complex located on Colonial Avenue. The City's water quality is not affected by any upstream point source discharges from surrounding Fairfax County or other jurisdictions. There are currently no municipal discharge points on property owned by the City which fall under the National Pollution Discharge Elimination System

FIGURE A5 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) DISCHARGE POINTS



● VPDES Outfall Individual Permit

There are two discharge points in the City of Fairfax. Both are categorized as "minor", meaning the type of discharge and volume is "commercial, small industrial and sewage of less than 1.0 million gallons per day."

Permit Number	Facility	Address	Permit Expiration
VA0001872	Joint Basin Corporation - Fairfax Terminal Complex	9601 Colonial Ave	11/30/2020
VA0002283	Motiva Enterprises LLC - Fairfax	3800 Pickett Rd	7/25/2018

regulations. Stormwater runoff, which is considered nonpoint source pollution, unless piped, is further discussed under Section 4.2.

4.2. Nonpoint Source Pollution

Nonpoint source pollution is pollution which cannot be attributed to a single source but is the result of many diffuse sources. Considered singularly, each small source would not constitute a problem, but together these nonpoint sources constitute a substantial threat to water quality. Most commonly, nonpoint source pollution is caused by rainfall running off roadways, parking lots, roof tops, and other urban land uses. Urbanization increases the imperviousness of a land area, thereby increasing the amount and velocity of stormwater runoff delivered to nearby streams. Pollutants which would normally settle out or infiltrate through the soil are carried directly to local waterways. On a per acre basis, urban land use including residential development generally produces higher annual nonpoint source pollutant loadings of nutrients, heavy metals, and oxygen-depleting substances than do rural agricultural uses. Oil contamination, sediments, pesticides, metals, and other toxic substances can kill fish and destroy bottom life. In addition to transporting pollution, increased runoff also increases instream flow during and immediately after periods of precipitation. This results in increased soil erosion and the destruction of wildlife habitat.

The effect on local waterways is a general degradation of water quality and a phenomenon known as eutrophication. Eutrophic conditions, caused by excessive nutrients in the water, are characterized by low dissolved oxygen levels and high algal growth. The primary detrimental effect on water resources, particularly on large bodies of water such as the Potomac River and the Chesapeake Bay, is algal blooms, which block sunlight from aquatic life and deplete the dissolved oxygen content during decay. Eutrophication also destroys the recreational use of water resources and results in strong odor and undesirable taste.

Because the City lies within the Tidewater area of Virginia, which has a significant impact on the health of the Chesapeake Bay, controlling nonpoint source pollution is an important aspect of the City's environmental protection efforts. The Virginia Division of Soil and Water Conservation has designated the control of nonpoint source pollution as a high priority for all watersheds within the City.

Nonpoint source pollution from urban areas can be controlled by minimizing impervious areas from new development, reducing impervious areas through redevelopment, utilizing open space and preserving indigenous vegetation, restoring denuded vegetative stream buffers, and by employing the use of structural or nonstructural best management practices (BMPs), which operate by trapping stormwater runoff and detaining it until unwanted nutrients, sediment, and other harmful pollutants are allowed to settle out or be filtered through the underlying soil. The City's Chesapeake Bay Preservation regulation requires the achievement of certain performance standards for any development which takes place in designated Chesapeake Bay Preservation Areas.

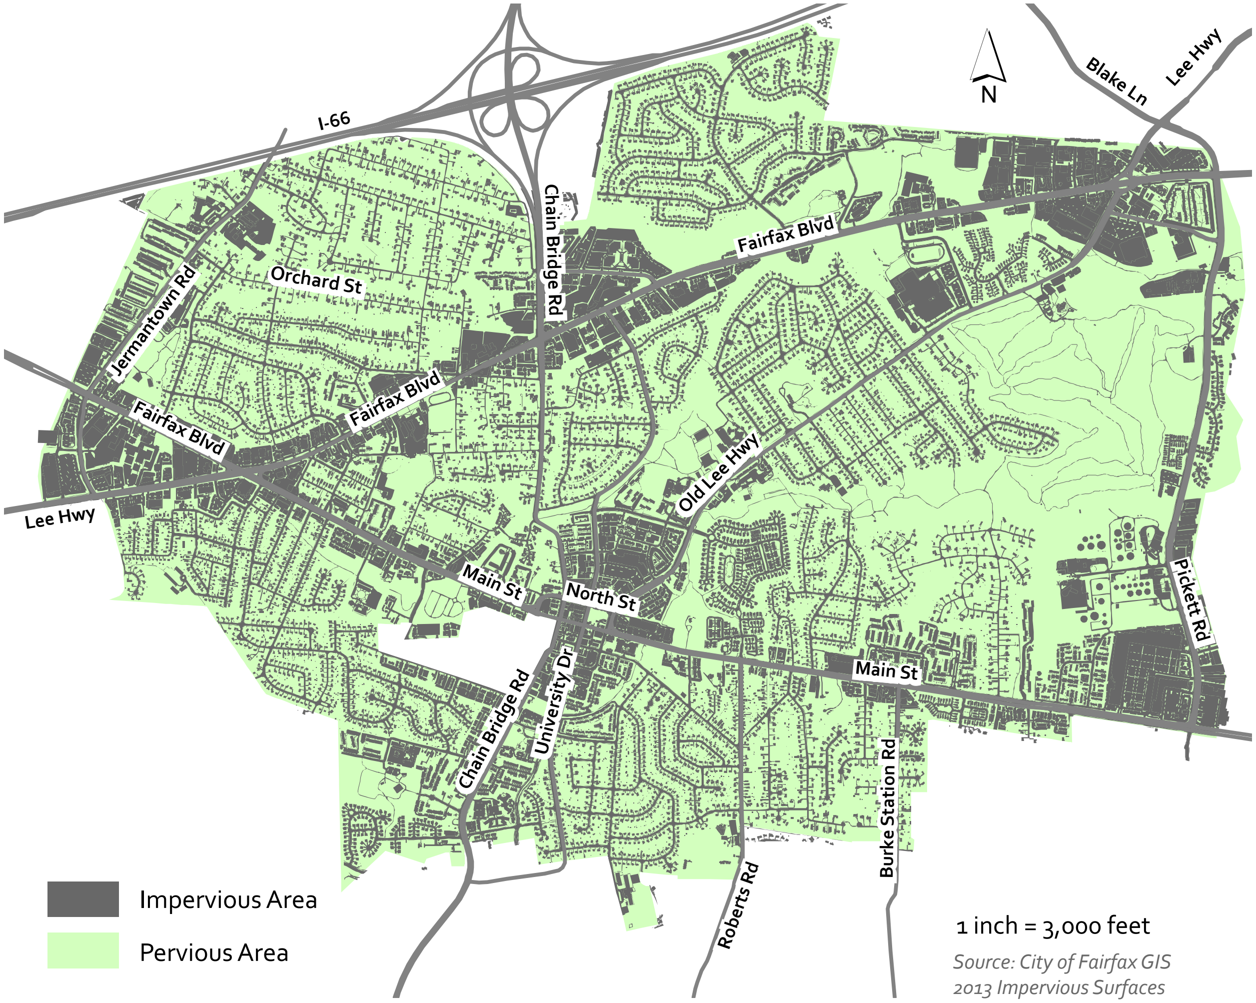
A useful analysis tool in nonpoint source pollution mitigation is to examine where highly impervious areas of the City are in relation to the City's water resources. In this way, various nonpoint source pollution control efforts, from educational programs to redevelopment, can be concentrated on those areas most likely to produce the greatest impact on the quality of City water. Since the City is largely built out, these figures are helpful when considering where to concentrate redevelopment or retrofit to improve water quality. It is also useful in deciding where and what types of public education programs may be beneficial. The City consists of approximately 42.7% impervious land areas and 57.3% pervious land areas (Figure A6).

The City's nonpoint source pollution control program also includes the City's Erosion and Sediment Control Ordinance. This ordinance requires that stormwater management facilities be installed during construction to help control increased stormwater runoff created by development thereby reducing the possibility of downstream flooding and erosion.

4.3. Streambank Erosion and Sedimentation

While streambank and land erosion is a natural process, land development has greatly accelerated this process. As large areas of once forested land have been replaced with impervious land cover, a greater quantity of stormwater is directly piped into local waterways at a much higher velocity. Signs of stormwater erosion include undercut streams and fallen banks, felled bushes and trees which once lined the banks, and exposed sewer and other utility pipes. Suspended sediments choke and muddy local waterways making them uninhabitable to local species of aquatic

FIGURE A6 PERVIOUS AND IMPERVIOUS AREAS



Source: City of Fairfax GIS
2013 Impervious Surfaces

life. In addition, nutrients and other pollutants attach themselves to sediment particles and contribute to eutrophic conditions in the Potomac River and the Chesapeake Bay. Eventually, suspended sediments are deposited in slower moving portions of the stream course, causing buildup, destruction of benthic life forms, and a decreased stream capacity for floodwaters, thus resulting in greater potential for further erosion and property damage.

Completed in 2005, the City's Watershed Management Plan found that overall stream health to be fair to poor in the majority of the City (Figure A7); erosion potential remains at a very high level; there is evidence of sediment deposition which can cause water quality degradation and have negative impacts on aquatic life; and down-cutting streams threaten City utilities and surrounding property.

A bank erosion hazard index (BEHI) assessment was conducted on Accotink Creek (Figure A8) and Daniels Run (Figure A9). The BEHI is a methodology used to assess and predict stream bank erosion potential. Based on the BEHI results, over 90% of studied stream reach length had at least a high potential for stream bank degradation and over half of all stream

Bank Erosion Hazard Index Assessment was conducted on Daniels Run on August 4-7, 2007.

reaches were found to be at a very high or extreme risk for stream bank degradation. It is evident from these results that stream bank erosion is a major impact on the stability and overall health of the City's streams

4.4. Malfunctioning Water Quality BMPs

In response to the water quality requirements of the Chesapeake Bay Preservation Act, many development sites within the City will be called upon to establish water quality best management practices (BMPs). These BMPs are designed to detain polluted stormwater runoff until harmful pollutants have had a chance to settle, at which time the stormwater is slowly released. However, BMPs, like most other structural facilities, will deteriorate over time and require regular maintenance. Adequate maintenance will prolong the expected lifespan of a facility, therefore saving considerable money in the long-run. Further, while a properly functioning facility enhances downstream environments by mitigating the environmental impacts of land development, pollutant removal efficiencies will decline over time if regular maintenance is not performed.

Pursuant to the BMP Maintenance and Monitoring Agreement, Erosion and Sediment Control Plan, or Site Plan governing the facilities throughout the City, it is responsibility of the owner(s) to maintain the BMP facility in good working order. The maintenance agreement, Erosion and Sediment Control plan or Site Plan, provides the City of Fairfax with authority to conduct inspections of BMPs and Stormwater Management Facilities.

The City conducts a Citywide assessment to ensure all facilities are in working order on an annual basis. A representative from the City or an authorized consultant visits the property (or HOA property) to conduct an inspection of the stormwater control measures and BMPs in place to ensure proper maintenance is being performed in accordance with the suggested maintenance schedule for each facility.

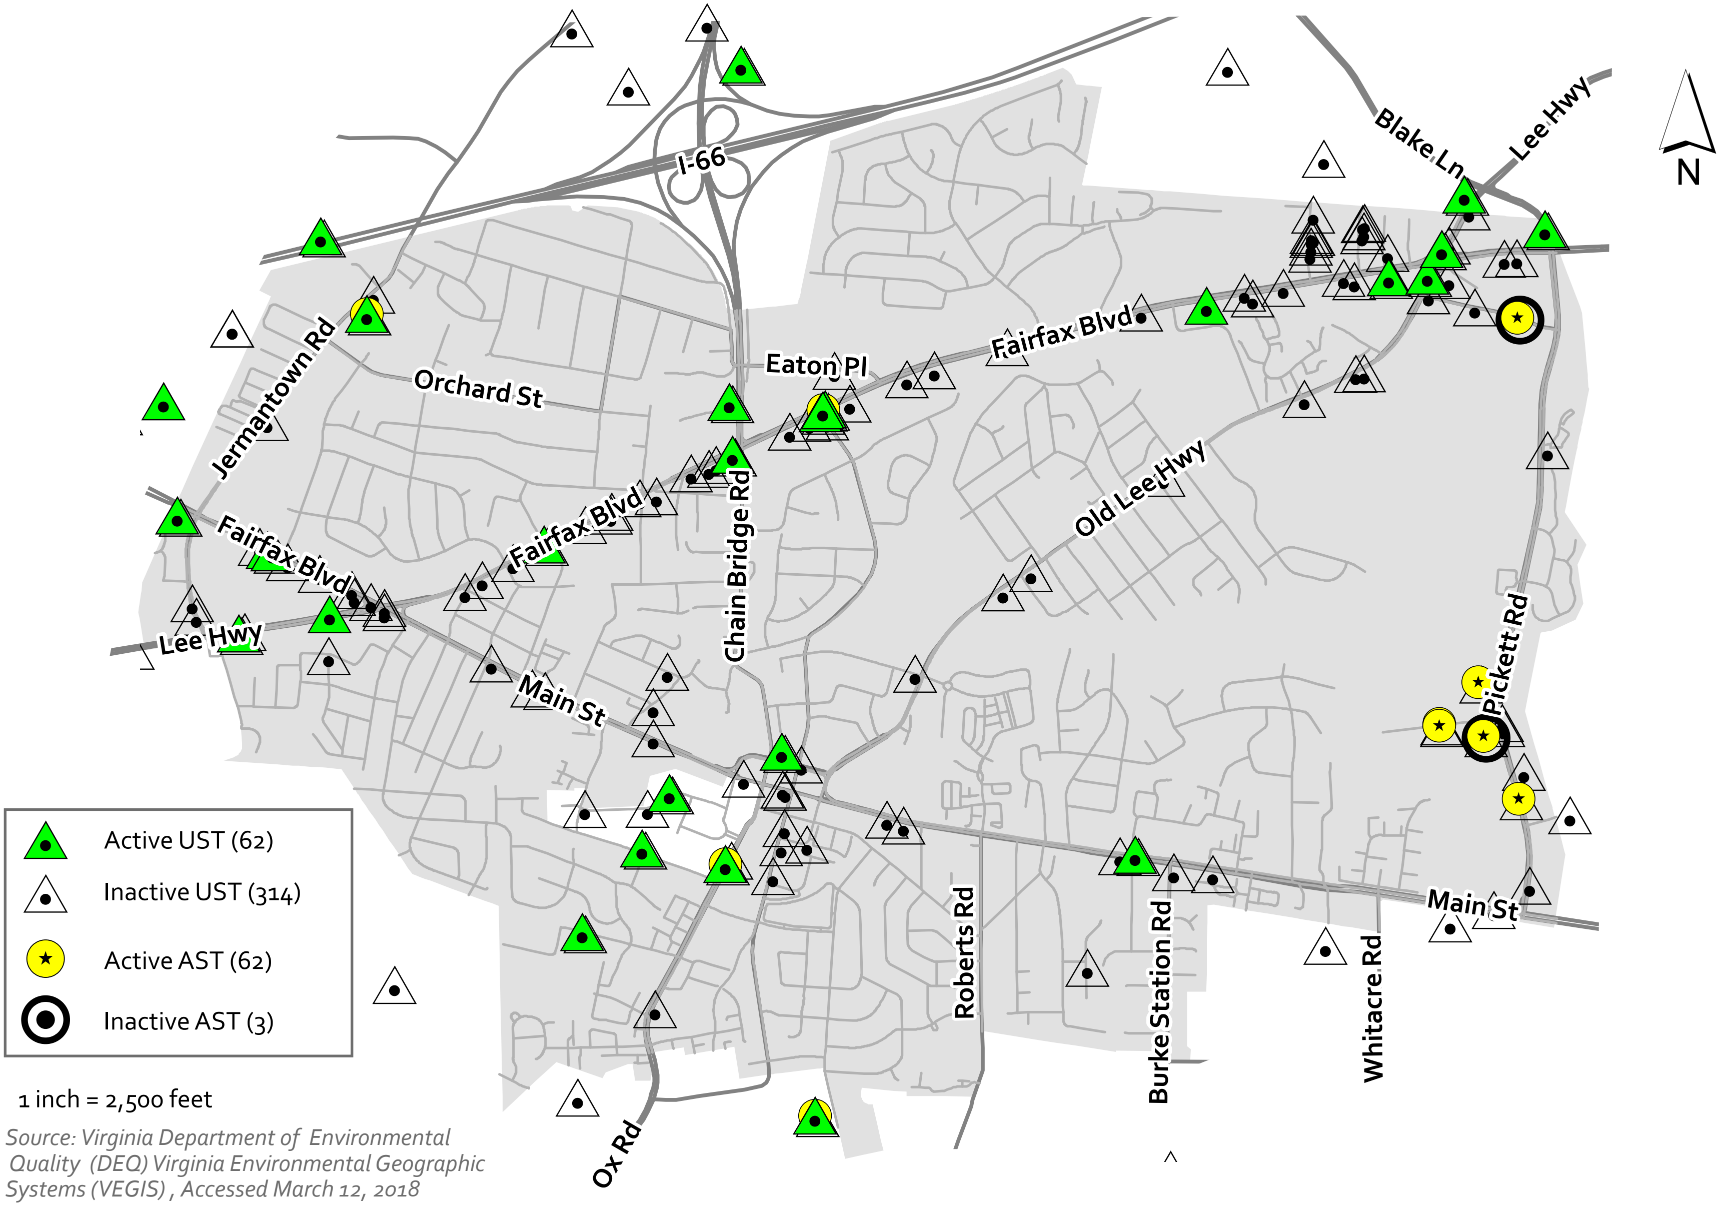
4.5. Underground Storage Tanks

The Virginia Department of Environmental Quality (DEQ), Water Division, is responsible for permitting and tracking underground storage tanks (USTs). Within the City limits, there are approximately 376 USTs of varying capacity at 118 street addresses. Of these USTs, only 62 are still active. The USTs are currently being used to store gasoline, diesel, used oil, heating oil, and other substances. Due to the fact that the City is a major commercial and transportation corridor, the City has a relatively high concentration of USTs for its land area. Underground storage tanks are concentrated along the City's commercial and industrial corridors including lower Pickett Road, Old Town Fairfax, the Kamp Washington area, the intersection of Chain Bridge Road and Fairfax Boulevard, and the Fairfax Circle area (Figure A8).

When properly maintained, underground storage tanks are safe, save space, and are a more aesthetically pleasing alternative than above ground storage tanks. However, leaking tanks are a major source of soil and groundwater contamination. Leaking USTs also have the potential to affect surface waters since many streams are fed by groundwater aquifers. Underground storage tanks often pose a greater threat than other sources of pollution because a leak or spill may not be detected until it has already created extensive damage. Further, there exist many underground storage tanks which were installed before more stringent regulations were applied. The location and condition of these tanks are often unknown.

Another important factor affecting the incidence of leaking tanks is the age of the tanks. Particularly in an area such as Fairfax where soils tend to be acid, older tanks are more likely to be subject to leakage than

FIGURE A10 LOCATION OF UNDERGROUND AND ABOVE GROUND STORAGE TANKS (USTS & ASTS)



Source: Virginia Department of Environmental Quality (DEQ) Virginia Environmental Geographic Systems (VEGIS), Accessed March 12, 2018

newer tanks designed to counter acid soil. Areas where age may be a factor are scattered throughout the City which should be a consideration when targeting areas for further investigation or for public/business education. Another factor to consider is the proximity of USTs to stream sites. Streams which are located near USTs of above average age may be at particular risk to contamination. Most of the commercial areas of the City directly impact on at least one perennial stream.

The City has and will continue to work with the owners of leaking underground storage tanks and the DEQ to ensure that any existing or future contamination is properly addressed and corrected.

4.6. Above Ground Storage Tanks

The Virginia State Water Control Board in 1998 adopted the regulation, 9 VAC 25-91-10 et seq., which consolidated three repealed regulations, that is, (i) Oil Discharge Contingency Plans and Administrative Fees, 9 VAC 25-90-10 et seq. (ii) Facility and Aboveground Storage Tank Registration Requirements, 9 VAC 25-130-10 et seq., and (iii) Aboveground Storage Tanks Pollution Prevention Requirements, 9 VAC 25-140-10 et seq.

The AST regulations were revised primarily to incorporate new performance standards for certain aboveground storage tanks (1 million gallon or more AST facilities) located in the City as mandated by the 2011 General Assembly (CH 884 of the 2011 Acts of Assembly). By July 1, 2021, the impacted facilities must satisfy specific requirements for strength testing, and release prevention barriers.

Individual tanks with a capacity of less than 660 gallons or multiple tanks with an aggregate capacity of less than 1,320 gallons are not currently regulated by the State or the federal government. Within the City limits, there are 65 regulated ASTs of varying capacity at 9 street addresses (Figure A 8). Of these ASTs, 62 are currently active. Most home fuel oil tanks are only 200 to 660 gallons. It is therefore the responsibility of the individual owner to ensure that leaks and spills do not occur. While individual household tanks do not pose a significant risk to the environment, the aggregate of tanks may pose a serious threat if small problems are not taken seriously. Releases from individual tanks may occur as a result of overfill or the tipping over of the tank. To reduce the risk of accidental spill, the homeowner or fuel company should inspect a tank before filling to ensure that it is sturdy and does not exhibit signs of corrosion. An owner should also have the capacity of the tank clearly marked on the tank and specifically indicate the filling cap location.

4.7. Illegal Dumping of Petroleum and Litter

The reported presence of petroleum products in City streams is a major water quality concern. Petroleum can severely damage the ecosystem by destroying plant life and killing aquatic lifeforms. While some petroleum products in the water may be attributable to leaking automobiles on nearby parking areas or leaking underground storage tanks, the most common source of petroleum is illegal dumping by do-it-yourself (DIY) automotive maintenance activities. A DIY is an individual who removes used oil from a motor vehicle, utility engine, or other piece of equipment that he or she operates as opposed to someone who takes the equipment to a lube shop or auto mechanic.

There is a risk that DIYers may pour the oil down a storm drain or throw it out in the trash, resulting in a release of oil into the environment. For areas such as the City of Fairfax, where streams are primarily fed by residential storm drains, only a few careless instances can result in a significant degradation in water quality.

The City provides and advertises for the collection of used oil and oil filters at its Property Yard Recycling Center, implements a storm drain marking program, and works with local civic organizations and volunteers to install storm drain markers, which state "Only rain down the storm drain." These markers are used to educate residents that the storm drain eventually empties to the Chesapeake Bay watershed and to prevent the amount of pollution that reaches local creeks and rivers. The City may wish to consider the implementation of a public education program which not only informs residents what to do with used oil, but also tells them what to do if he/she witnesses a neighbor pouring oil down a storm drain.

4.8. Pet and Animal Wastes

Fecal coliform is a pollutant of concern in the City of Fairfax. While there are several potential sources of fecal coliforms, the most likely source is from pet waste, and particularly dog waste, which is not disposed of properly. City paths and walkways along streams (or near storm drains) provide for public access and scenic areas to walk, run, and bicycle. However, these public areas are also used by some pet owners who leave pet wastes which are then easily transported by the next storm directly into the water course.

Fecal coliform can severely impact on the viability of the City's water resources. Control mechanisms include enforcing local animal waste control provisions, BMPs, and natural stream buffers. While BMPs and natural buffers are established as part of the City's overall Chesapeake Bay Program, the most effective manner of control is through public education and better enforcement of the City's animal waste control regulation. Better enforcement and education can reduce the levels of fecal coliforms and nutrients in stormwater runoff.

The City will continue to promote and maintain the dog waste disposal stations along the park trail. The City will also add brochure holders to each waste station that contain public education / outreach materials related to the water quality impacts of dog waste.

4.9. Air Quality as it Relates to Water Quality

Recent evidence suggests that atmospheric deposition, as a result of poor air quality, has a greater impact on water quality than previously assumed. According to the EPA, air sources contribute about one-third of the total nitrogen loads to the Chesapeake Bay by depositing onto the tidal surface waters of the Bay and Bay watershed. Direct deposition to the Bay's tidal surface waters is estimated to be six to eight percent of the total (air and non-air) nitrogen load delivered to the Bay. Nitrogen deposited onto the land surface of the Bay's watershed and subsequently transported to the Bay is approximately 25 to 28 percent of the total nitrogen load delivered to the Bay.

The Clean Air Act requires significant air quality planning and implementation at local, State, and regional levels. The Clean Air Act regulations and programs are expected to achieve significant decreases in air deposition of nitrogen by 2020.

Nitrogen is the primary pollutant of concern for brackish waterbodies such as the Chesapeake Bay. While very little atmospheric deposition will fall directly into the City's streams, pollutants deposited on impervious surfaces, which make up approximately 42.7% of the City's land area, will be washed into local waterways via curbs, gutters, and storm drains during storm events. This has the potential to contribute significantly to water quality problems within the City and beyond.

The City has already contributed to improving air quality through the establishment of pedestrian and bicycle trails in accordance with the Comprehensive Plan and by keeping CUE bus fares low to encourage ridership. The City also continues to work with George Mason University and Fairfax County to encourage alternative forms of transportation.

Many approaches to improving air quality from mobile source emissions will be implemented at the State and regional levels through transportation control measures such as increased public transportation and high occupancy vehicle lanes. Technological advances such as alternative fuel vehicles and tighter tailpipe standards are other measures whose widespread application is expected. The City continues to contribute to these regional efforts through participation on the Metropolitan Washington Council of Government's Air Quality Committee and The Climate, Energy and Environment Policy Committee (CEEPC).

The City seeks to continue its commitment to clean air by expanding its efforts and adopting policies to increase public awareness of the environmental problems associated with air pollution.

Section 5. Environmentally Sensitive Features and Constraints on Development

Land use planning that takes into account sensitive natural features and water resources has the dual benefit of enhancing quality of life through protecting the environment from degradation as well as protecting businesses and homeowners from potentially harmful environmental hazards. Although land use patterns within much of the City are well established, a few vacant parcels still have development potential. These properties deserve special consideration and should be developed in a manner which integrates the man-made and natural environments.

Most development within the City, however, will take place as a result of redevelopment. Development prior to the late 1980s took place without the benefit of many environmental protection constraints; therefore some existing development is not sensitive to the potential for water quality degradation that development brings. With recent concern raised over environmental degradation, and particularly the effects of increased stormwater runoff on the City's streams, the City has begun to reevaluate past practices. Good planning now prescribes that when possible, development should avoid sensitive environmental features. The following section provides an overview of the sensitive natural resources within the City of Fairfax and an analysis of how these resources are currently being managed and additional management options.

5.1. Floodplains

The relatively flat or low land area adjoining a river, stream, or water course which is subject to partial or complete inundation is known as a floodplain. Encroachment on floodplains, such as artificial fill, reduces a stream's flood-carrying capacity, increases flood heights, and increases flood hazards in areas beyond the encroachment itself. In addition, floodplain soils are often unsuitable for development due to high water table, shrink-swell potential, and highly permeable and hydric soil conditions. Floodplains also provide important habitat for a range of vegetative and animal species.

In 1974, the Federal Emergency Management Agency (FEMA) conducted a study of flooding potential and hazards in the City as part of its national flood insurance program. The plan was also meant to be used as a tool to assist local governments in effective floodplain management. As a result of the study, the City adopted a Floodplain regulation which establishes an overlay as part of the Zoning Ordinance in 1993. As discussed in Section 2.4, the current Floodplain regulation was adopted by the City in March, 2015. The overlay district severely limits the type and location of any development in the floodplain district. The floodplain district includes areas subject to inundation by waters of the one-hundred year flood. The one-hundred year floodplain within the City is associated with areas along the north and central forks of Accotink Creek, Daniels Run, and some major tributaries. A denuded or improperly developed floodplain can result in erosion and a significant reduction in water quality and reduce the effectiveness of the RPA. Figure A1 delineates the approximate extent of the one-hundred year floodplain (1 percent annual chance flood event) in the City.

5.2. Geologic and Sensitive Soil Conditions

It is difficult to overemphasize the importance of geology and soils characteristics when planning for new development and redevelopment. Development should be guided away from sensitive or unstable areas in order to protect the safety of residents, the structural soundness of buildings, and the water quality of Accotink Creek, Pohick Creek, Popes Head Creek, Difficult Run, and eventually the Potomac River and the Chesapeake Bay.

Common constraints placed by geologic conditions or sensitive soils include but are not limited to hydric conditions, shrink-swell potential, wetness, flooding potential, depth to bedrock, and high water table. Proper management of soils will help maintain clean water and will provide areas to recharge groundwater. However, poor management of soils will choke local waterways with silt and sediments and result in the erosion of valuable topsoil as well as spoil the landscape.

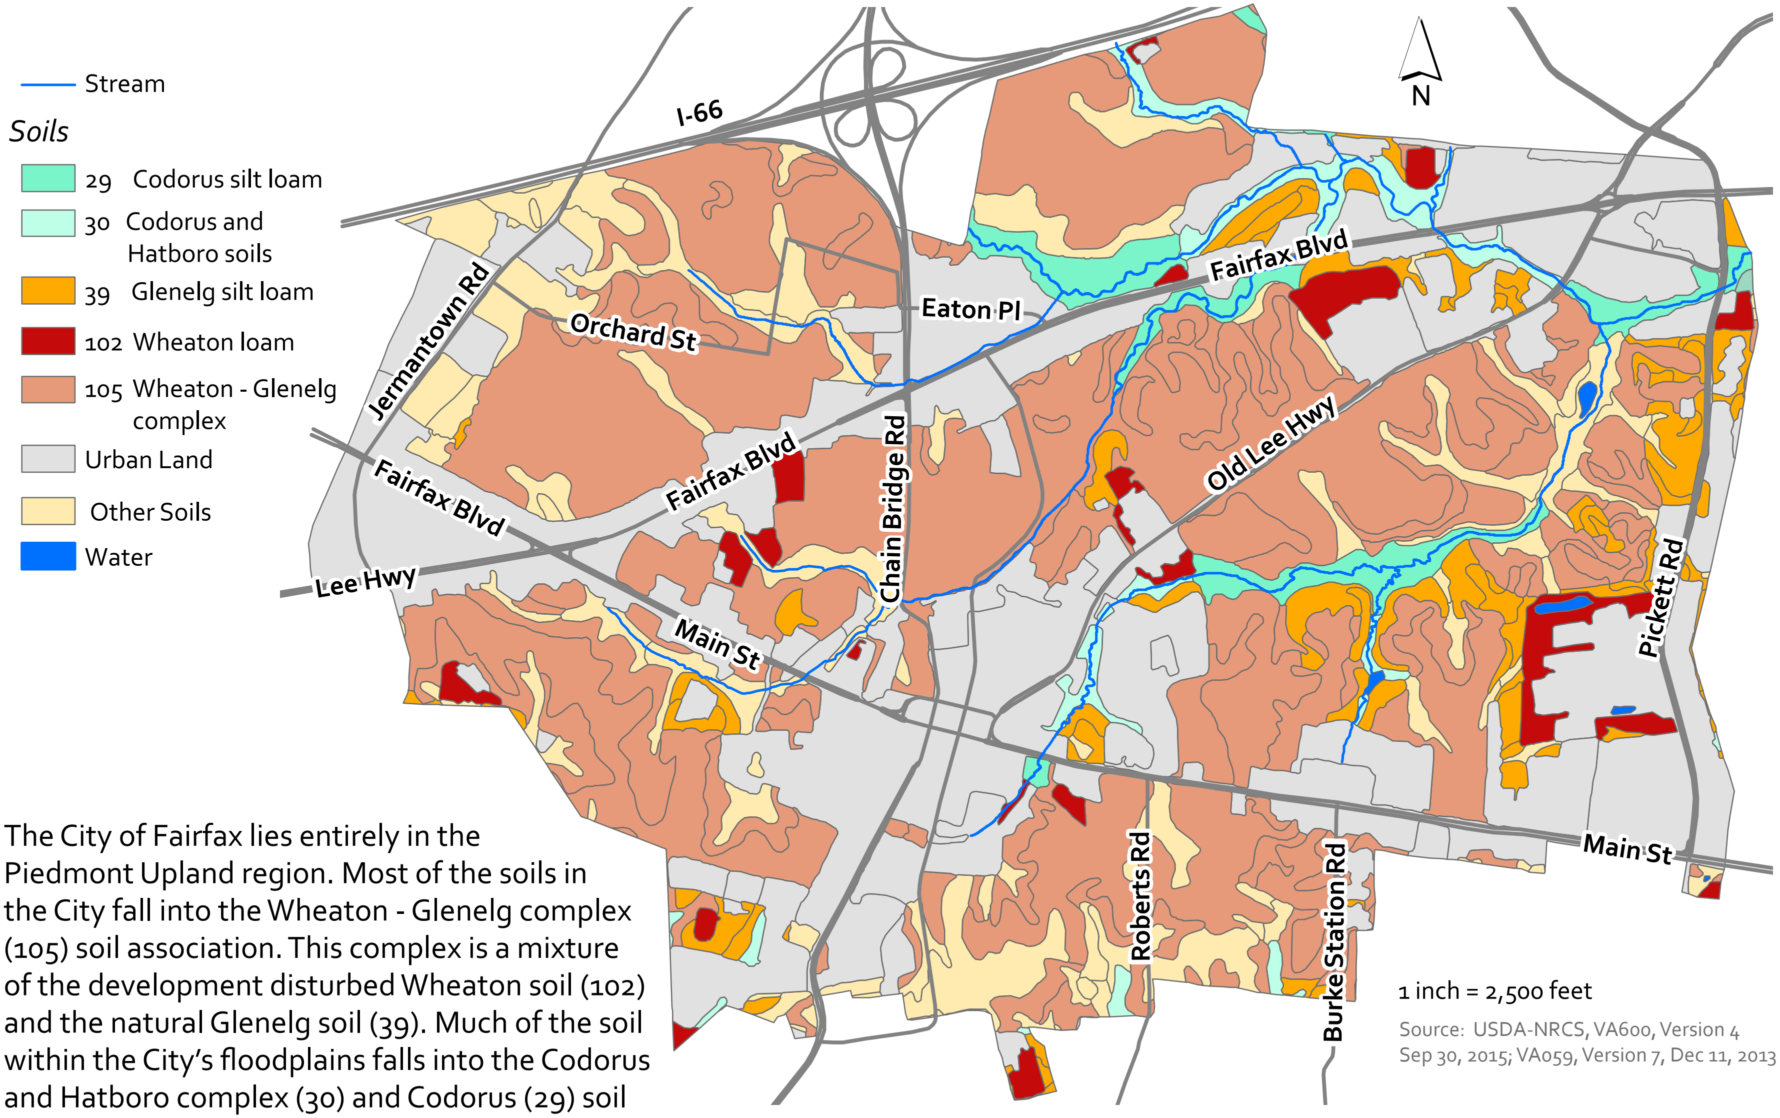
According to the USDA Natural Resources Conservation Service soil survey data (2015), most of the City falls into the Wheaton-Glenelg complex soil association. This complex is a mixture of the development disturbed Wheaton soil and the natural Glenelg soil which is well suited for development. Much of the soil within the City's floodplains falls into the Codorus and Hatboro complex and Codorus silt loam soil associations. These soils are poorly drained, subject to flooding, and not suitable for urban development. Figure A 9 presents the distribution of soil associations in the City.

The underlying geology of the City, along with climate, determines soils characteristics, which offers both constraints and opportunities for development. In order to promote soil conservation and protect water quality, as well as safeguard residents and businesses from potential hazards, including hazards such as radon, it is imperative that future development within the City takes geologic constraints into consideration. Most areas of the City are generally suitable for development purposes if a site is properly engineered. A discussion of the engineering capacity of underlying geology is inappropriate for this Plan due to its technical and detailed nature. Developers must refer to the City's Department of Public Works for more information and recommended resources.

5.3. Vegetative Buffers and Areas with Mature Tree Canopy Cover

To the maximum extent possible, the City wishes to maintain and enhance its urban tree cover. During development, provisions must be made to protect existing trees and replace trees when they are damaged or removed.

FIGURE A11 SOILS



1 inch = 2,500 feet

Source: USDA-NRCS, VA600, Version 4 Sep 30, 2015; VA059, Version 7, Dec 11, 2013

The City of Fairfax lies entirely in the Piedmont Upland region. Most of the soils in the City fall into the Wheaton - Glenelg complex (105) soil association. This complex is a mixture of the development disturbed Wheaton soil (102) and the natural Glenelg soil (39). Much of the soil within the City's floodplains falls into the Codorus and Hatboro complex (30) and Codorus (29) soil associations.

The City's Chesapeake Bay Preservation regulation also requires that a 100-foot buffer area along perennial streams be maintained or established during development or redevelopment in order to protect streams from the adverse effects of increased impervious surfaces and resultant runoff.

Since the City is almost entirely developed, few significant vegetation stands remain. Those that still exist deserve special protection so that their aesthetic and ecological benefits to the City are not lost. The largest City-owned vegetation stand is located at Daniels Run Park. The park covers 48 acres, most of which is in a natural state. It contains deciduous vegetation with an oak canopy and a beech understory. Other tree types found there are hickory, sycamore, tulip poplar, and holly. The 20-acre Van Dyck Park is partially wooded as is the 10-acre Ranger Road Park. The 20-acre Providence Park is largely wooded, and contains many of these same tree types.

The City's concern for trees is reflected in its Arbor Day tree planting activities and its designation every year starting in 1987 as a Tree City by the National Arbor Day Foundation.

5.4. Non-Tidal Wetlands

Wetlands provide a variety of environmental and socio-economical benefits and also serve as important fish and wildlife habitat. Wetlands enhance water quality by filtering water as it passes through, thereby reducing sediments, nutrients, and chemical and organic pollutants flowing to open water. Wetlands also assist with flood control and serve as groundwater discharge and recharge areas. The U.S. Fish and Wildlife Service estimates that up to 43% of the threatened and endangered species rely directly or indirectly on wetlands for their survival.

The City has a total of 11 acres of wetlands. Figure A2 presents the City's water resources, including wetland areas. There are 8.6 acres of woody wetlands, which consist of areas where forest or shrubland vegetation accounts for 25-100 percent of the cover and the soil or substrate is periodically saturated with or covered with water. The remaining 2.4 acres of wetlands are classified as emergent herbaceous wetlands, which consist of areas where perennial herbaceous vegetation accounts for 75-100 percent of the cover and the soil or substrate is periodically saturated with or covered with water.

Pertinent law protecting non-tidal wetlands includes Section 404 of the federal Clean Water Act, which addresses dredge and fill operations and is administered through the Army Corps of Engineers, and the Virginia Water Protection Permit Act. Other programs, such as those under the Virginia Endangered Species Act and various floodplain management regulations, also serve to protect non-tidal wetlands.

Under the City's Chesapeake Bay Preservation regulation, non-tidal wetlands connected by surface flow and contiguous to tidal wetlands or water bodies with perennial flow are designated as RPAs. All other non-tidal wetlands are protected as part of the RMA. Most wetlands within the City are located contiguous to a tributary stream and within the confines of the floodplain.

5.5. Topography

Poorly designed and constructed developments on steep slopes frequently result in substantial costs to the public, either for repairs or for protective measures to prevent further damage. Increased runoff and sedimentation from denuded hillsides require increased public expenditures for flood control and stormwater management. Further, improperly planned development of hillsides affects the equilibrium of vegetation, geology, slope, and soil.

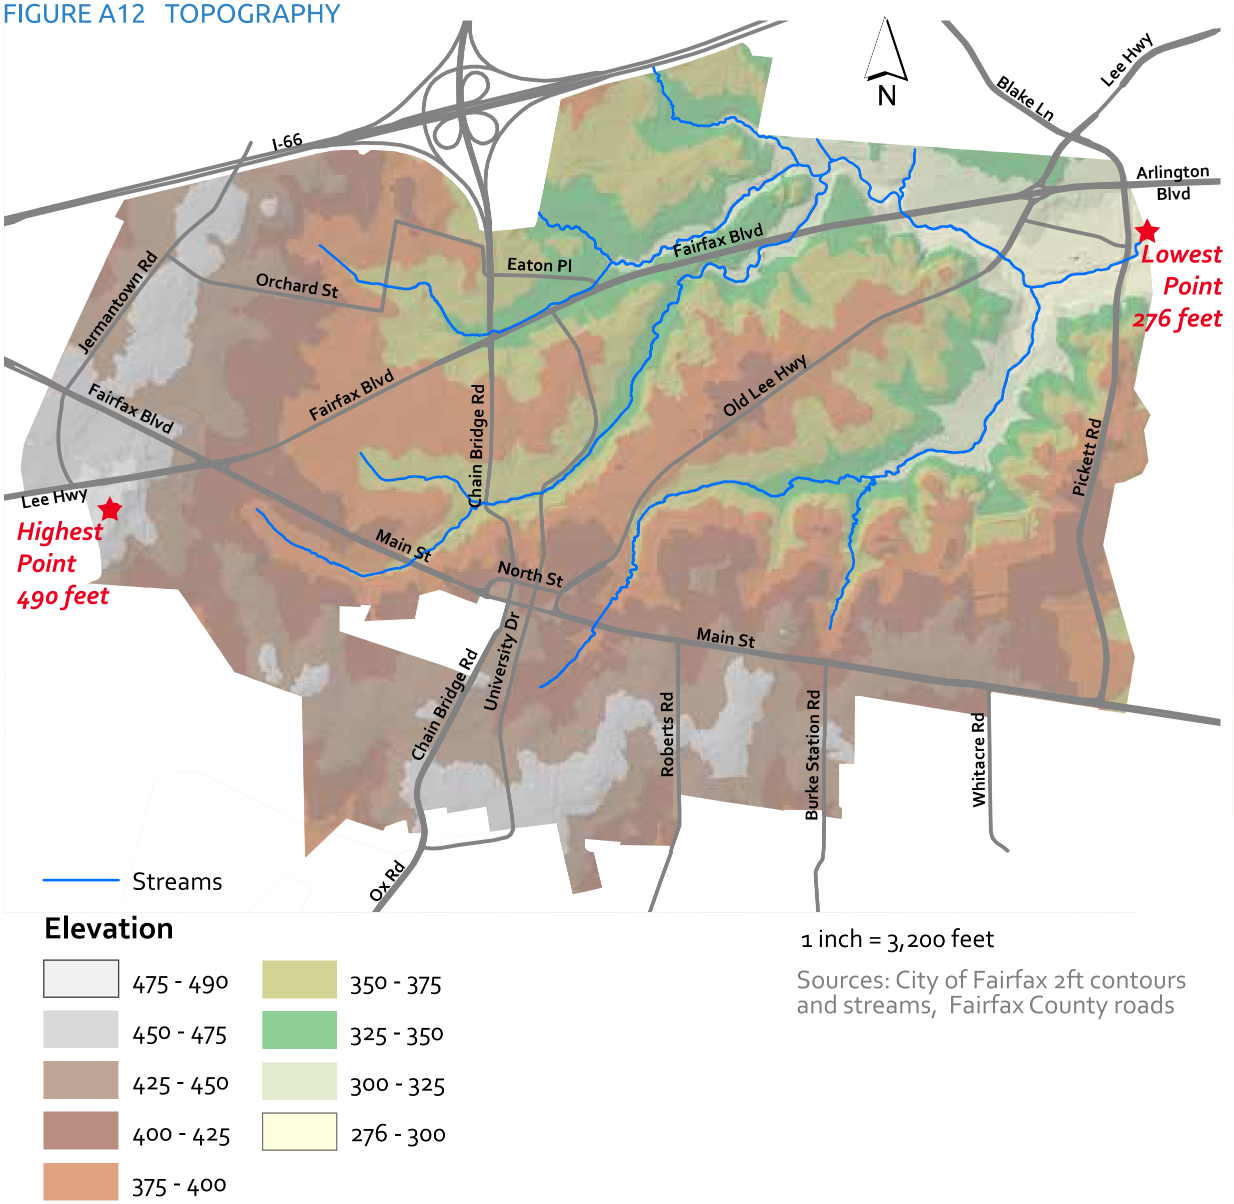
While the City is largely built out, any redevelopment within the City must take topographic constraints into consideration for the following reasons:

- Disturbance of hillsides can result in soil instability and increased erosion.
- Disturbances of hillside can increase runoff.
- Disturbance of hillsides can destroy a community's aesthetic resources.

Steep slopes in excess of 15 percent and slopes located along streams are susceptible to erosion; therefore, particular care must be taken when planning to develop a site with this characteristic. In some instances, special engineering may be required to stabilize slopes. Figure A10 presents a topographic map of the City.

Only a very small portion of the City's land area has slopes of over 15%. These areas are primarily associated with reaches of Accotink Creek and Daniels Run and lie within the City-owned Van Dyck and Daniels Run Parks and in the Army Navy Country Club Property.

FIGURE A12 TOPOGRAPHY



Sources: City of Fairfax 2ft contours and streams, Fairfax County roads

5.6. Groundwater Protection

The importance of groundwater protection was recognized by the Commonwealth of Virginia when the General Assembly enacted the Groundwater Act of 1973 and the Groundwater Management Act of 1992. The Groundwater Management Act reads "... unrestricted usage of groundwater is contributing and will contribute to pollution and shortage of groundwater, thereby jeopardizing the public welfare, safety, and health."

Although the City now receives a treated water supply from the Potomac River and Occoquan Reservoir, protection of the City's groundwater must be a consideration during development and redevelopment. When development occurs, it affects the natural balance of the groundwater flow. Increased imperviousness as a result of development reduces the potential for groundwater recharge and should be taken into consideration when designing a site plan. Generally, high topographic areas are groundwater recharge areas and impervious surface areas in defined groundwater recharge areas should be minimized. By providing recharge areas for stormwater, groundwater equilibrium can be maintained. If recharge areas are not taken into consideration, wells may go dry, base flow to streams is reduced, and wetlands may shrink.

Once contaminated, the usefulness of an aquifer as a resource may be limited or destroyed depending on the toxicity of the contamination and the effort, time, and money involved in clean-up. In most cases it is impractical and sometimes impossible to restore a contaminated aquifer to its original level of purity. Common sources of groundwater contamination include but are not limited to leaking underground storage tanks, antiquated sewer lines, septic systems situated on improper soils, and improperly capped wells. In addition, improperly maintained water quality best management practices may present a groundwater threat. In the City, the most common source of groundwater contamination on record with the DEQ, Water Division, is from petroleum leaks and spills. More stringent underground tank standards enacted in recent years should reduce the level of contamination from these sources.

Recommendations

The City recognizes the importance of the Chesapeake Bay as an economic and social resource and is committed to its protection through the implementation of the Chesapeake Bay Preservation Area Designation and Management Regulations. The following provides the background information and analysis necessary for the City to arrive at informed and proactive policies and goals which address the issue of water quality protection in City streams and the Chesapeake Bay.

These recommendations approach water quality protection from the viewpoint that environmental regulations and healthy economic development are not mutually exclusive, but rather that both may be accomplished simultaneously, and that the result is a better quality of life for all City residents.

Recommendation 1: Protect the quality of the City's surface water resources, the Potomac Estuary, and the Chesapeake Bay from the avoidable impacts of land development.

- **Enforce the provisions of the City's Chesapeake Bay Preservation regulation.**

  The Chesapeake Bay Preservation regulation is the City's primary water quality protection tool. The regulation is designed to protect the overall quality of the City's water resources and the health of the Chesapeake Bay as it relates to impacts from existing and new development.

- **Enforce the City's Erosion and Sediment Control Ordinance.**

  The Erosion and Sediment Control Ordinance serves to protect City streams during site development by minimizing erosion and sedimentation.

- **Maintain strong City oversight of private BMP maintenance programs.**

  Review the effectiveness of the City's current BMP maintenance program and determine whether stronger inspection and maintenance measures are warranted. Make recommendations for how to improve the City's maintenance program, if necessary.

- **Continue implementation of stream restoration and improvement efforts.**

  Continue efforts to stabilize the physical conditions and restore the stream habitat to enable the natural restoration of the streams' biological integrity. The City should continue to prioritize the worst stream reaches, and coordinate improvements with overall watershed strategy.

- **Ensure that development avoids where possible, or minimizes, disturbance of sensitive environmental features, including problem soils.**

  Improper development of sensitive environmental features, and particularly soils, may result not only in structural damage to buildings, but also to a loss of soil to erosion, a decrease in local water quality, and the loss of important habitat and aesthetic resources.

- **Improve the City's ability to identify sensitive environmental features.**

  Readily available information concerning environmentally sensitive features will help the City to better plan for and avoid negative environmental impacts resulting from land disturbing activities. The development and redevelopment processes often result in the generation of substantial information on environmental features. During the development process, the City should take the opportunity to collect information, generated from site plans, reports, etc. on sensitive environmental areas, and particularly on soils.

  The City should arrange a protocol to compile this information to create an overlay map identifying environmentally sensitive features within the City including steep slopes, soils, wetlands, floodplains, undisturbed natural areas, and features that are unique or integral to the City's character.

Recommendation 2: Ensure the adequacy of the City's future stormwater management system while emphasizing the need to protect tributary streams and water quality.

- **Continue to conduct and implement watershed management plans to allow for a holistic approach to local water resource protection.**

  The City should continue to conduct watershed studies and planning to evaluate conditions and identify actions that would improve watershed health. The City should also continue to assess the effectiveness of capital projects and examine long-term trends in the City's water quality.

- **Minimize exposure of the City's natural floodplains to new development.**

  Natural floodplains are essential to the conveyance of stormwater in that they provide extra holding capacity during storms. Floodplains left in their natural condition form a filter for polluted runoff from surrounding land uses. Protection of the City's floodplain is achieved through enforcement of the City's Floodplain regulation.

- **Encourage the use of shared or regional stormwater control measures during development and redevelopment.**

  The implementation of a large number of small, site-specific stormwater quality/quantity management facilities increases maintenance costs and consumes valuable land. The City should seek to facilitate cooperative agreements among developers to encourage the establishment of shared or regional stormwater management facilities.

- **Continue to allocate dedicated and sustainable funding to guarantee the stormwater program's continued viability.**

  Provide the funds necessary to meet MS4 permit and TMDL requirements and to address other stormwater infrastructure needs, such as ensuring adequate capacity for flood control, replacing aging infrastructure, and performing preventive maintenance on all City stormwater management facilities.

  Reassess the Stormwater Fund on a regular basis to ensure that revenue generated adequately covers program needs.

Recommendation 3: Reduce existing sources and prevent potential sources of point and nonpoint source pollution resulting from residential, commercial, and industrial activities within the City.

- **Continue implementation of the City's Water Quality Monitoring Program.**

  At the end of each MS4 permit reporting period, the City prepares annual Water Quality Monitoring Reports, which are included with the City's MS4 Annual Report. Once appropriate amounts of sampling data have been collected under the Water Quality Monitoring Program, the City will analyze the results to determine the next steps (e.g. potentially pinpoint areas that could to be targeted for pollution prevention or source control programs).

- **Encourage the use of green stormwater infrastructure and low impact design on private and public property.**

  Enhance zoning regulations and support initiatives that encourage the use of green stormwater infrastructure and low impact design on private and public property. Consider providing incentives for developers to incorporate green infrastructure and low impact design in their plans.

- **Continue efforts to improve the region's air quality.**

  The City should continue to pursue measures to improve air quality through support of pedestrian access and mass transportation. Since air quality is a regional concern, continued participation on the Metropolitan Washington Air Quality Committee is necessary to achieve many air quality goals.

- **Improve the City's ability to respond to the potential hazards of leaking underground and above ground storage tanks and pipelines.**

  The City should continue to work closely with the DEQ, Water Division, to monitor and enforce clean-up of underground storage tanks.

  The City should support programs to educate residents on how to safely manage above ground storage tanks and should promote policies aimed at providing opportunities to reduce reliance on above ground storage tanks through conversion to alternative forms of fuel.

- **Expand public education and outreach programs.**

  Continue to develop and implement education and outreach programs to improve awareness and encourage the community to protect and improve the quality of area waters. The City will include appropriate public involvement and participation to meet MS4 requirements and satisfy other watershed objectives.

- **Continue to improve upon the City's strong recycling program.**

  A well-publicized recycling program will decrease illegal disposal of materials, and particularly of oil, into the City's storm sewer system.

Recommendation 4: Protect the quality of the City's potable water supply and safeguard the City's groundwater resources against contamination that may adversely affect the ecosystem.

- **Work with the Department of Environmental Quality's Water Division to protect groundwater from contamination from underground storage tanks.**

  The primary threat to the City's groundwater is contamination from underground storage tanks. While the City has no legal authority to regulate underground storage tanks, it should work closely with the DEQ's Water Division to identify areas with high contamination potential and to quickly remediate areas where contamination has already occurred.

B Transportation Practices and Policy

The Multimodal Transportation Chapter of the Comprehensive Plan references several innovative practices that can help the City achieve its goals in improving transportation infrastructure and services. Many of these practices require further study before the proper implementation strategy can be determined. This includes analyses of new advancements in technology as they occur, as well as policy priorities for the City.

Specific actions in the Comprehensive Plan refer to the Transportation Practices and Policy Appendix for more information. This appendix provides detailed information which should be used as an initial step in implementing the recommendations of the Comprehensive Plan that reference these innovative practices.

Contents

Section 1. Best Practices/Future Trends

BIKESHARE

The central jurisdictions of the region (Washington, D.C. and Arlington County) launched Capital Bikeshare (CaBi) in 2010 with 400 bikes and 50 stations. Since that time the system has expanded to 2,500 bikes at over 400 stations across a number of additional jurisdictions in the region, including Fairfax County. City stakeholders and partners expressed an interest in bringing bikeshare to the City, either expanding CaBi or establishing an independent system serving local travel needs.

CARSHARING

Carsharing has been operational in the region for over a decade. Zipcar is the largest operator in the region at the present time, offering round-trip as well as point-to-point or one-way rental options. Round-trip carsharing requires that users return the vehicle to the same designated spot when finished with their rental period.

One-way carshare allows a user to take the car from one point within a service area and leave it at a different legal parking space within the area. Car2go operates within the District of Columbia and Arlington County offering one-way service. The fee for round-trip carshare is typically on an hourly or daily basis while the cost for a one-way carshare trip is typically calculated on a minute and distance basis.

Peer-to-peer carsharing closely mimics the round-trip carshare service provided by carshare companies but is instead provided by individual auto owners listing their personal car available for use to other "members" via an electronic platform.

Photo Credit (all photos): Nelson\Nygaard

RIDESOURCING

Taxis are a traditional form of ridesourcing where a passenger calls into a central dispatch or hails a clearly branded vehicle to provide a one-way ride. Smartphones and app-based services have enabled the rise of Transportation Network Companies (TNCs) such as Uber and Lyft. TNCs use an online mobile platform to connect passengers to drivers, who use their personal vehicles. With less oversight and regulation, the cost of a TNC ride at present is generally lower than that of a taxi trip.

AGGREGATED RIDE SOURCING

The platforms used for ridesourcing have become progressively more sophisticated. Several TNCs now offer riders the option of sharing a ride with others traveling along their general line of travel to further lower trip costs, concurrently increasing travel efficiency with higher vehicle occupancy within the same roadway space. Uber offers "Uber Pool" while Lyft supports "Lyft Line." These aggregated ridesourcing options pool riders, thus lowering travel costs.

Image Credit: Lyft

Photo Credit: Nelson\Nygaard

PRE-ARRANGED OR DYNAMIC CARPOOLING

Multiple web or smartphone based applications facilitate carpooling both on a regular basis (pre-arranged) or sporadically. Apps like Zimride and RideAmigos match drivers with passengers along a pre-determined route and planned time of day. If desired, some applications permit drivers and riders to be matched across complementary characteristics such as employment or student status, gender, age, and even music preferences. Dynamic carpooling is the electronic equivalent of the traditional Washington region practice of "slugging" where drivers can spontaneously be matched with a rider in real time along their intended route. Under both models, drivers and passengers share costs and take advantage of high occupancy lanes by capitalizing on empty seats in their vehicles.

Want some help?
Find out how to make payments, send messages and more.

Image Credit: ZimRide

MICROTRANSIT

Microtransit follows the same principle as aggregated ride sourcing, but generally with more added efficiency. It uses online services to dynamically generate on-demand routes along an efficient travel path. Rather than picking each passenger up at their door of origin, passengers may need to walk a short distance to a collector road and arrive at the designated location shortly before the vehicle arrives. By reducing the amount of circling and the dwell time waiting for passengers, microtransit reduces travel time and delay, increases vehicle efficiency, and reduces individual travel costs.

Image Credit: Via

CONNECTED + AUTONOMOUS VEHICLES

Vehicular technology continues to progress at a rapid rate, and the time is soon coming when human drivers may no longer be needed to operate passenger vehicles. Connected vehicles have the ability to communicate with one another and with the surrounding infrastructure, provided the infrastructure has "smart" capabilities. Autonomous Vehicles can operate independently by observing cues in the built environment. Future vehicles will likely utilize the capabilities of both connected and autonomous technologies. Such vehicles may have the ability to dramatically increase the efficiency and capacity of existing roadway facilities and decrease the need to operate and store (e.g. park) private vehicles. Thus, autonomous vehicles, with the right policy guidance, may reduce vehicle ownership, reduce the need for long-term parking, and increase accessibility and mobility across the economic spectrum.

Section 2. Smart Infrastructure + Real-Time Information

Improved technology in both Intelligent Transportation Systems (ITS) and better information for users provides great promise for more efficiency in mobility systems and greater predictability and control for users. The following system elements have been implemented elsewhere in the greater Washington D.C. area. Some elements may be appropriate for managing traffic and improving trip making in the City.

SMART SIGNALS

These signals are connected to a central control center and may be adjusted either according to a programmed algorithm or by central control. Smart signals can adjust to changing demands in the roadway network and may be used to facilitate the advancement of transit vehicles (transit signal priority or TSP), passively detect pedestrians and bicyclists, and/or meter traffic volumes to even out the flow of traffic and mitigate congestion, improving the operation and efficiency of multiple modes.

DYNAMIC SIGNAGE

Dynamic signage includes variable message boards and variable speed signs such as those found along I-66, and also includes urban signage indicating the location and availability of parking spaces. These signs provide real-time information to motorists without requiring the use of a smartphone or app. Dynamic signage at transit stops can indicate the next bus anticipated to arrive and the time of arrival. Dynamic signage can help to better distribute traffic loads, minimize unnecessary circling of vehicles searching for parking, and increase user confidence with regard to transit. Dynamic signage can reduce traffic volumes by 10% to 30%, particularly in central business areas.

DEMAND-RESPONSIVE PRICING

Applying basic economic principles to encourage more efficient use of the transportation system, demand-responsive pricing uses real time and/or historical information on parking or travel demand to optimize supply and demand. When demand is high and available supply (or capacity) is low, mobility services are priced higher. During periods of low demand, the cost of travel or parking is correspondingly low. Such strategies reduce congestion, increase efficiency in the system, and ensure the availability of reliable capacity (for a price) for essential trips. When coupled with lower cost, higher capacity travel options such as transit, ridesharing/ride sourcing, and safe non-motorized options, demand-responsive pricing can appropriately meet travel needs without necessarily resulting in higher overall transportation costs to users.

TRAVEL PLANNING APPS

The best travel planning apps integrate a number of different travel options including driving (in a personal vehicle or ridesource vehicle), transit, bicycle, walking and/or a combination of multiple modes. These apps provide users with real time information on both travel time and cost, including the probability of travel delay, while some also provide information on personal and environmental health benefits or impacts of various choices. Smart applications link directly to other applications to help the traveler arrange the mode of travel they selected, such as hailing an Uber or reserving a carshare vehicle. Travel apps and mobility service payment systems are evolving such that in the near future, travelers will also be able to pay for their transit trip, bikeshare use, or high-occupancy tolls all from a single point of transaction. This should help to even the playing field of awareness and convenience across all travel options.

Section 3. Transportation Demand Management

Cities have traditionally approached transportation from the supply side of the equation, and this is a critical role for cities to play. Cities have significant control over how much vehicle capacity, bicycle accommodation, or parking is provided in their communities. But some economists advise cities that they must also consider and manage the demand side of the equation as well. Managing demand requires a more nuanced approach, but is, in many ways, more effective than supply-side management alone.

Transportation Demand Management (TDM) provides information and incentives to allow travelers to make the best choices for themselves. It is also a way for jurisdictions to make the most of transportation systems they have already built and optimize investments they have made by encouraging the use of excess capacity before adding additional capacity. Excess capacity exists in the form of empty seats on buses or in cars. It exists on sidewalks, trails, and bike lanes. It exists in the 20 hours of the day outside of the peak hours of traffic congestion. And it exists in the parking spaces that remain empty when the vehicle they are intended for is at another destination.

TDM serves cities, but it also brings benefit to users as well – often saving money on transportation costs, improving reliability and predictability in their travel, giving greater freedom of choice, lowering stress, and perhaps even improving personal health.

Section 4. Pedestrian Accessibility Policy

Best Practice

The best pedestrian-supportive infrastructure policies are applicable to the entire community and focus on safety and connectivity. Best practice policies are compliant with all applicable state and federal regulations, including the Americans with Disabilities Act (ADA) ,and establish a methodology for prioritization and performance evaluation.

The following are potential policies to improve pedestrian-supportive infrastructure.

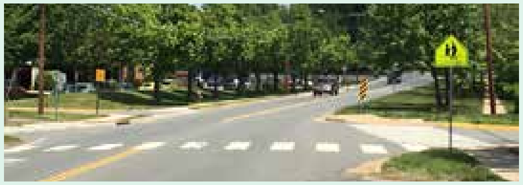
- Prioritize walking connections to transit stops, schools and parks. Implement first-last mile walking connection to transit and prioritize access to transit stops.
- Support projects that improve pedestrian connectivity.
- Improve pedestrian access to destination areas in the City.
- Improve pedestrian routes that connect students to schools.
- Maintain a sidewalk inventory.
- Establish a methodology for project prioritization and performance evaluation.
- Improve pedestrian access across major roadways that create barriers to connecting the network. Comply with all state and federal regulations including the ADA.

Policy Recommendation

The following is a draft recommended policy for the City.

In order to promote safety and provide for the most vulnerable users in the transportation system – children, seniors, and persons with disabilities – it is the policy objective of the City that all streets have at least one sidewalk on both new and existing streets of all street types.

- All new streets should provide sidewalks on both sides of the street irrespective of anticipated traffic volumes, unless explicitly designed as a shared street.
- Sidewalks should be considered with every major maintenance, restoration, or street reconstruction project. Sidewalks may be constructed independent of other street projects.
- Streets with moderate to high vehicle volumes (5,000 or more vehicles per day) should have sidewalks on both sides of the street. Moderate volume streets should have a continuous sidewalk at least along one side. Local streets (less than 5,000 vehicles per day) should have a sidewalk on at least one side of the street, unless specifically designed as a shared street.
- Sidewalks should be a minimum of five feet wide.
- The sidewalk network should be continuous and connected. Curb ramps must be provided at street crossings.



Section 5. Complete Streets Policy

Best Practice

A Complete Streets policy should include a community's vision for transportation, account for many types of uses and community needs, and allow for flexible implementation.

The following are potential policies by which to implement Complete Streets principles:

- Approach every planned transportation improvement as an opportunity to apply the Complete Streets principles.
- Apply Complete Streets policies to all public and private projects and developments that impact the right-of-way.
- Allow Complete Streets elements to be phased over time.
- Identify regional, state, and federal funding for Complete Streets improvements.
- Collaborate and coordinate between departments and transportation agencies to efficiently utilize funds.
- Identify performance measures and report progress annually.
- Maintain an inventory of bicycle and pedestrian infrastructure to identify gaps.
- Identify and prioritize projects based on infrastructure needs.
- Train staff and decision makers on the technical content and best practices of Complete Streets principles.

Policy Recommendation

The City will approach all planned transportation improvements and all development projects with right-of-way impacts as opportunities to advance the value and objective of safety and Complete Streets. It shall be the policy of the city that:

- Every street safely accommodate all users.
- Any street subject to major maintenance, rehabilitation or reconstruction will provide safe accommodation for all users of all abilities.
- The means of accommodation will be appropriate to the street context and developed in consultation with community stakeholders.
- The city will pursue regional, state, and federal funding opportunities to support Complete Streets improvements.
- City agencies and departments will collaborate and coordinate with one another and adjacent jurisdictions to apply Complete Streets principles and provide continuous networks.
- Progress on Complete Streets will be measured in concert with the adopted measures of the City of Fairfax Multimodal Transportation Plan.

United States Census Median Household Income Virginia & City of Fairfax

QuickFacts

Fairfax city, Virginia; Virginia

QuickFacts provides statistics for all states and counties, and for cities and towns with a ***population of 5,000 or more***.

Table

Income & Poverty	Fairfax city, Virginia	Virginia
Total accommodation and food services sales, 2012 ($1,000) (c)	**218,575**	**17,795,901**
PEOPLE		
Income & Poverty		
Median household income (in 2019 dollars), 2015-2019	$116,979	$74,222
Per capita income in past 12 months (in 2019 dollars), 2015-2019	$50,029	$39,278
Persons in poverty, percent	⚠ 9.3%	⚠ 9.2%

About datasets used in this table

Value Notes

⚠ Estimates are not comparable to other geographic levels due to methodology differences that may exist between different data sources.

Some estimates presented here come from sample data, and thus have sampling errors that may render some apparent differences between geographies statistically indistinguishable. Click the Quick Info ⓘ icon to th
row in TABLE view to learn about sampling error.

The vintage year (e.g., V2021) refers to the final year of the series (2020 thru 2021). Different vintage years of estimates are not comparable.

Fact Notes

(a)	Includes persons reporting only one race
(c)	Economic Census - Puerto Rico data are not comparable to U.S. Economic Census data
(b)	Hispanics may be of any race, so also are included in applicable race categories

Value Flags

-	Either no or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest or upper in open ended distribution.
F	Fewer than 25 firms
D	Suppressed to avoid disclosure of confidential information
N	Data for this geographic area cannot be displayed because the number of sample cases is too small.
FN	Footnote on this item in place of data
X	Not applicable
S	Suppressed; does not meet publication standards
NA	Not available
Z	Value greater than zero but less than half unit of measure shown

QuickFacts data are derived from: Population Estimates, American Community Survey, Census of Population and Housing, Current Population Survey, Small Area Health Insurance Estimates, Small Area Income and P
Estimates, State and County Housing Unit Estimates, County Business Patterns, Nonemployer Statistics, Economic Census, Survey of Business Owners, Building Permits.

City of Fairfax - CFPF Grant Application Submittals

1 message

Eto, Satoshi <Satoshi.Eto@fairfaxva.gov> Fri, Apr 8, 2022 at 7:04 AM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>

Good morning,

Please follow this link to download two CFPF grant applications from the City of Fairfax.
https://www.dropbox.com/sh/blwg7yl4zo41nbr/AAAx6EfEfrMXYagxxz5REBgMa?dl=0

The applications could not be attached directly to this email due to file size (50MB/ea).

Please feel free to reach out to me if you have any questions. Thank you!

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☒ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☒ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

- ☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.
- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.
- ☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

- ☐ Floodplain Staff Capacity.
- ☐ Resilience Plan Development
  - ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  - ☐ Resource assessments, planning, strategies and development.
    - o Policy management and/or development.
    - o Stakeholder engagement and strategies.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevation** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevation (BFEs) shown on this map apply only landward of 0.0′ North American Vertical Datum (NAVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Tranverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the Henrico County GIS Department.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

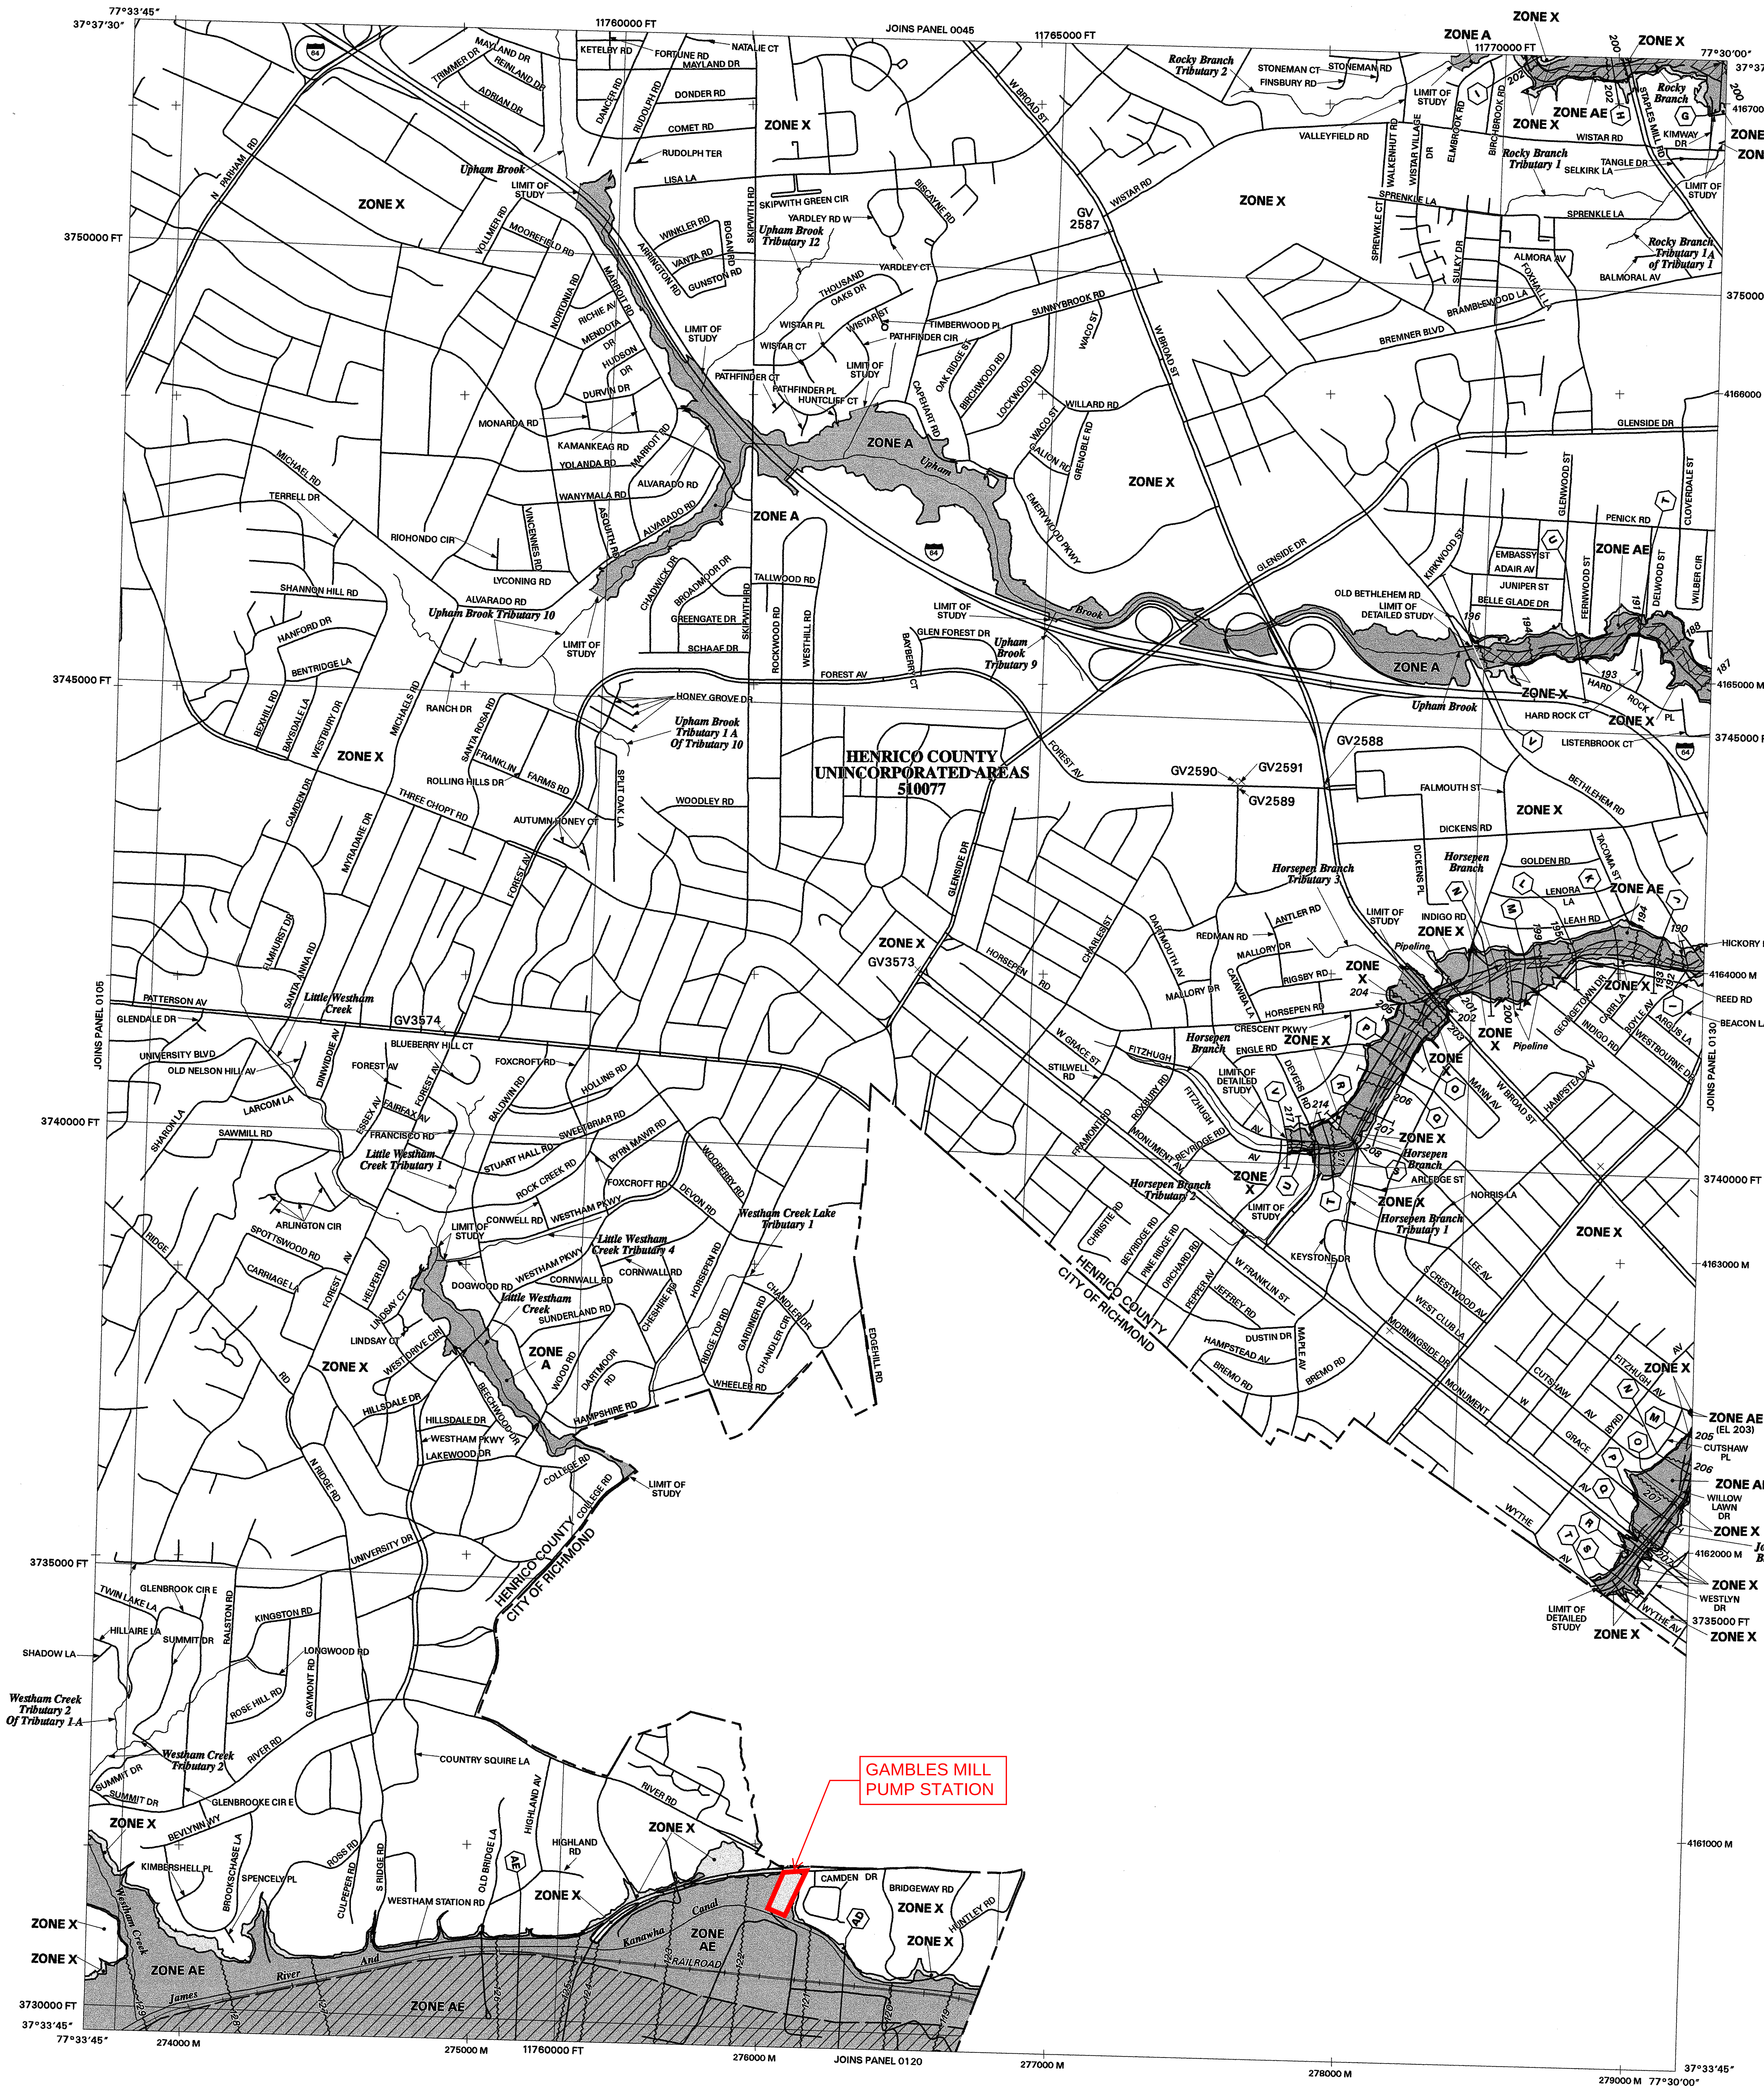
An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for infomation on all related products available from FEMA;

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

CURRENT EFFECTIVE FIRM



GAMBLES MILL PUMP STATION

LEGEND

▩	SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨	FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▩	OTHER FLOOD AREAS
ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐	OTHER AREAS
ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧	COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS
▧	OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	Floodplain boundary
—— —— ——	Floodway boundary
— —— —	Zone D boundary
•••••••••••••••	CBRS and OPA boundary
▩ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.
~~513~~~~	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

⟨A⟩———⟨A⟩	Cross Section Line
(23)- - - - - -(23)	Transect Line
97°07′30″, 32°22′30″	Geographic coordinates referenced to the North American Datum of 1983 (NAD 83)
4276000M	1000-meter Universal Transverse Mercator grid values, zone 18
600000 FT	5000-foot grid ticks
DX5510 ×	Bench mark (see explanation in Notes to Users section of this FIRM panel).

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available effective flood hazard information for your community, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Mapping and Insurance Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be downloaded from the website. Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be acquired directly from the Flood Map Service Center at the website listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards. This map image is void if one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM Issue Date or Effective Date.

Note: Some Special Flood Hazard Areas with elevations may not appear with elevation labels if the Base Flood Elevation or Cross-section line which communicates the elevation for the location appears on the adjacent panel. Please see the Panel Locator Diagram on this map panel to determine the adjacent panel and find the elevation feature there, or alternatively use the Flood Insurance Study report for detailed elevations by flood source.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, MD 20910-3282

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit its website at http://www.ngs.noaa.gov/.

Base map data was obtained from the City of Richmond including transportation, hydrography, and political lines. Basemapping was originally interpreted from the orthophotography flown in March of 1999. Additional information has been derived from other sources.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data*) may reflect stream channel distances that differ from what is shown on this map.

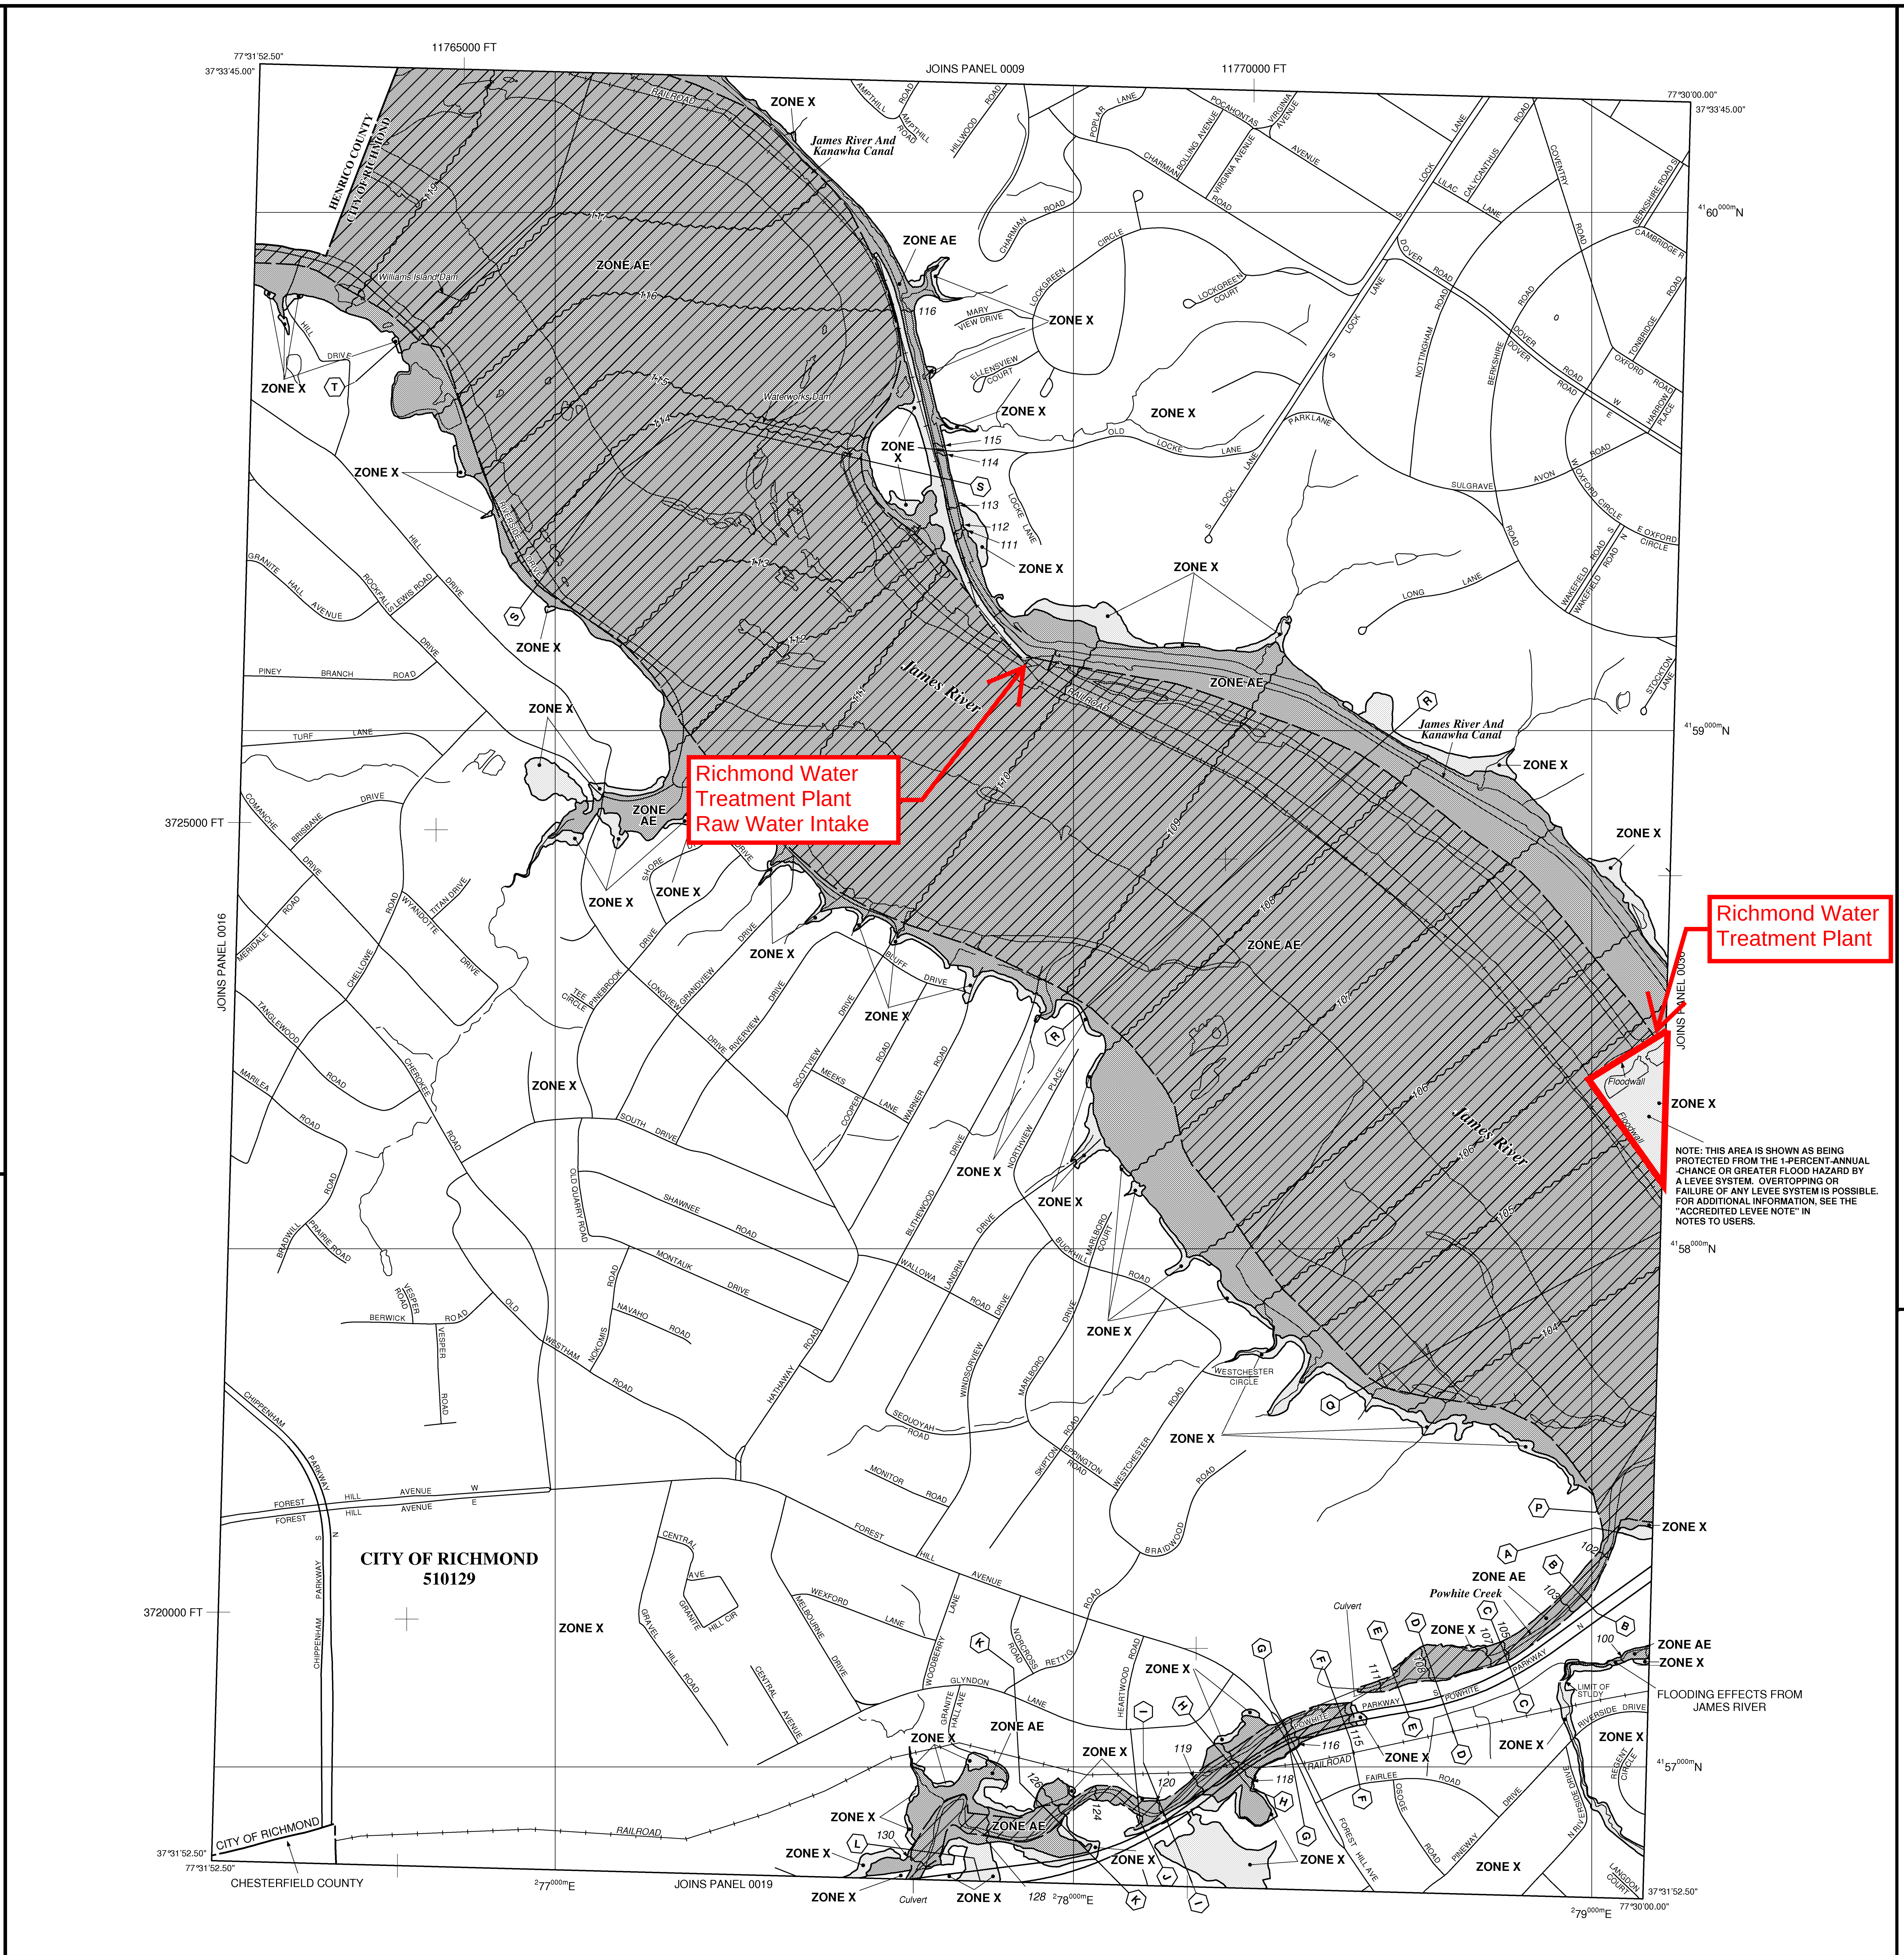
Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map showing the layout of map panels for this jurisdiction.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, *a Flood Insurance Study report*, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/.

Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA website at http://www.fema.gov/business/nfip/index.shtm.



Richmond Water Treatment Plant Raw Water Intake

NOTE: THIS AREA IS SHOWN AS BEING PROTECTED FROM THE 1-PERCENT-ANNUAL-CHANCE OR GREATER FLOOD HAZARD BY A LEVEE SYSTEM. OVERTOPPING OR FAILURE OF ANY LEVEE SYSTEM IS POSSIBLE. FOR ADDITIONAL INFORMATION, SEE THE "ACCREDITED LEVEE NOTE" IN NOTES TO USERS.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

B. Scope of Work Narrative – Flood Prevention and Protection Projects

Project Information and Description:

The Henrico County Department of Public Utilities (DPU) is responsible for providing water, wastewater, and solid waste services throughout the County, portions of the City of Richmond, and neighboring Goochland County. The Gambles Mill Pump Station (Gambles Mill) is a critical component of the County's wastewater conveyance and treatment system; it is also considered a Category III Critical Facility by FEMA (*FEMA 543 Design Guide for Improving Critical Facility Safety from Flooding and High Winds*). Located at 6173 River Road in Richmond, Virginia, the pump station accepts a peak flow of 28 mgd per day from five drainage subbasins and conveys flow to the County's Water Reclamation Facility (WRF).

Gambles Mill currently has two electrical feeds powered from separate Dominion Energy grids. Historical outage data available from the station indicates that simultaneous power loss has occurred on eight separate occasions since 2010. When both electrical feeds are down and the station does not have power, untreated wastewater is discharged into the Kanawha Canal and the James River both of which are Resource Protection Areas as established by the Chesapeake Bay Preservation Act. Untreated wastewater directly impacts the environmental quality of the receiving waters but also puts the City of Richmond's potable water supply at risk, as the Kanawha Canal connects to the raw water intake for the City of Richmond at the City's Water Treatment Plant which serves more than 200,000 citizens. Although the Gambles Mill Pump Station is not located in a qualified opportunity zone and is in an area with a very low social vulnerability index score, the risk that station power loss has on Richmond's potable water supply affects neighborhoods that are qualified opportunity zones and range from very low social vulnerability to very high social vulnerability in Richmond. The risk of significant overflows of untreated wastewater and subsequent environmental and public health impacts is too great to rely on a portable generator for a redundant power supply. In addition to overflow, the risk of power loss warrants a permanent solution for the criticality of the Gambles Mill Pumping.

In 2003, Hurricane Isabel caused the Richmond metropolitan area to lose power for a week, rendering Gambles Mill inoperable. It is estimated that nearly 200 million gallons of untreated wastewater was discharged into the Kanawha Canal and James River from this pump station alone, based on historical flows. In addition to the historical repetitive losses that are described below, the preliminary FIRMs issued in November 2021 maps the facility basin into Zone AE from Zone X.

Description of the Proposed Mitigation Approach:

Henrico County DPU proposes to mitigate future power loss due to extreme weather events at the Gambles Mill Pump Station through implementation of on-site backup power supply. The electrical upgrades for the redundant power supply will include installation of a 2,500kW generator with a sound attenuated enclosure, 20,000-gallon fuel tank with pumps and piping, 4,000A double-ended switchgear, panels, and duct banks.

Included in this package are the contract documents for this mitigation approach. These improvements will allow the pump station to remain fully operational during periods of power loss from existing commercial feeds. The project reduces the risk of potential functional disruption in the DPU wastewater conveyance and treatment system caused by power losses, improving resilience by ensuring that critical services always remain available and operational for the service population.

The DPU's Operations Division will oversee the project maintenance and daily operations upon completion of the construction. Annual maintenance for the project will include load bank testing for the generator and inspections and testing for switchgear, panelboards, and breakers. Should the generator be used in the event of a power outage, the Operations Division will monitor and document the asset's performance.

This project is comprised of two phases, with the first phase being preliminary planning services required before award and notice to proceed of the construction contract. This grant application is only for the first phase of the project which includes the geotechnical investigations, design of the mitigation, surveying services, environmental assessments, and permitting needs.

History of Hazards and Past Damages:

The table below summarizes the facility power outages, duration, and associated financial losses because of the outages.

Date	Duration (days)	Loss	Description
6/16/2016	2.0	$12,177,564	Power loss experienced for duration listed; loss of function experienced at pump station
6/11/2014	0.5	$3,044,391	Power loss experienced for duration listed; loss of function experienced at pump station
5/16/2014	0.5	$3,044,391	Power loss experienced for duration listed; loss of function experienced at pump station
7/13/2013	0.5	$3,044,391	Power loss experienced for duration listed; loss of function experienced at pump station
08/27/2011	0.5	$3,044,391	Power loss experienced for duration listed due to Hurricane Irene; loss of function experienced at pump station
06/29/2011	0.5	$3,044,391	Power loss experienced for duration listed; loss of function experienced at pump station
08/16/2010	0.5	$3,044,391	Power loss experienced for duration listed; loss of function experienced at pump station

C. Budget Narrative

1. **Estimated total project cost:**
   The total estimated cost for Phase A of Gambles Mill PS Emergency Generator project is $1,740,487. This includes all the preliminary planning services required prior to breaking ground and award of the construction contract. This includes the geotechnical investigations, design services, surveying services, environmental assessments, permitting costs, and associated programmatic management costs.

2. **Amount of funds requested from the Fund:**
   Henrico County DPU requests **$870,244** from the Community Flood Preparedness Fund.

3. **Amount of cash funds available:**
   Please find attached statement from the Henrico County DPU indicating the available CIP budget for the year ending June 30, 2022, as **$27.5 million.**

4. **Authorization to request for funding**:
   Please find attached documentation of Henrico County DPU indicating their authorization to request funding.

Phase A Construction Costs

Description	Unit	Price	Subtotal
Phase A			
Geotechnical Investigation (Field, Labs, Analysis)	1	$115,000.00	$115,000.00
Design	1	$1,380,000.00	$1,380,000.00
Surveying	1	$57,500.00	$57,500.00
Environmental Assessment	1	$65,918.89	$65,918.89
Permitting	1	$87,891.84	$87,891.84
Pre-Award Costs	1	$34,176.85	$34,176.85
Phase A Total			**$1,740,487.58**

COMMONWEALTH OF VIRGINIA
COUNTY OF HENRICO

DEPARTMENT OF PUBLIC UTILITIES

April 5, 2022

Virginia Department of Conservation and Recreation
600 East Main Street
24th Floor
Richmond, VA 23219-2094

To whom it may concern:

The total design contract value of the Gambles Mill PS Emergency Generator project is $1,740,487, which includes the design of the emergency generator and electrical improvements at the Gambles Mill PS. The County of Henrico, Department of Public Utilities is an enterprise fund within the County of Henrico. Therefore, Public Utilities has a dedicated revenue stream and is appropriated Capital Improvement funds annually. Those dedicated revenues are projected to be $27.5 million in FY2022 and part of those funds will cover the total estimated project cost prior to DCR grant reimbursement. The DPU is committed to contribute 50% of the project funds and the source of the funds is from the 2019 Water and Sewer Capital Improvement budget (copy enclosed).

Sincerely,

Bentley P. Chan, PE
Director of Public Utilities

WHEREAS, the Virginia Department of Conservation and Recreation's ("DCR") Community Flood Preparedness Fund ("CFPF") was established to provide grant funding for regions and localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change ("Flood Preparedness Projects"); and,

WHEREAS, the CFPF program reimburses eligible recipients up to 90% of the approved costs of Flood Preparedness Projects; and,

WHEREAS, the County must submit applications for CFPF funding through DCR; and,

WHEREAS, the County has identified two Flood Preparedness Projects that are eligible for CFPF funds:

(1) planning for stream restoration and utility rehabilitation at utility stream crossings; and

(2) installation of an emergency generator at the Gambles Mill Sewage Pump Station to provide redundant power for continuous operation of the pump station.

NOW, THEREFORE, BE IT RESOLVED that the Board of Supervisors authorizes the Director of Public Utilities to submit applications for CFPF funding for the projects identified above.

Comment: The Director of Public Utilities recommends approval of the Board paper, and the County Manager concurs.

TOTAL WATER & SEWER ENTERPRISE FUND	$ 33,300,000	$ 33,300,000
TOTAL CAPITAL REQUIREMENTS	$ 235,198,485	$ 235,198,485

BE IT FURTHER RESOLVED that the funds included in the Operating and Capital Annual Fiscal Plans for any County department, office, or agency may be used as participating funds in any Federal or State aid program for like purpose upon appropriation by the Board of Supervisors; and,

BE IT FURTHER RESOLVED that the Schedule of Compensation attached hereto effective at the beginning of FY 2021-22 is approved; and,

BE IT FURTHER RESOLVED that the approved Operating Annual Fiscal Plan for FY 2021-22 includes:

1. An increase in the personnel complement of 13 positions for General Government and 91.5 positions for Schools;
2. Continued funding for a 2% scale adjustment for all employees effective in the fourth quarter of FY 2020-21;
3. Continued funding for market adjustments for certain public safety, education, and other positions effective in the fourth quarter of FY 2020-21;
4. New funding for a 2.372% wage increase for all eligible General Government and Schools employees, to be effective on June 19, 2021; and
5. New funding for a wage increase ranging from 2.372% to 9.831%, based on length of service in Henrico County and other eligibility criteria, to be effective in the second quarter of FY 2021-22.

BE IT FURTHER RESOLVED that in order to implement changes to the Personal Property Tax Relief Act of 1998 (the "PPTRA") made by legislation adopted by the Virginia General Assembly:

1. Any qualifying vehicle, as defined in the PPTRA, sitused within the County commencing January 1, 2021, shall receive personal property tax relief in the following manner:
    a. Qualifying vehicles valued at $1,000 or less shall receive 100% tax relief;
    b. Qualifying vehicles valued at between $1,001 to $20,000 shall receive 48% tax relief;
    c. Qualifying vehicles valued at $20,001 or more shall receive 48% tax relief on the first $20,000 of value only; and
    d. All other vehicles which do not meet the definition of "qualifying vehicles" will not receive any form of tax relief under the PPTRA.
2. The amount of tax relief shall be a specific dollar amount offset against the total personal property taxes that would otherwise be due on a qualifying vehicle but for the PPTRA. The specific dollar amount of relief shall be shown on the tax bill for each qualifying vehicle, together with a general description of the criteria upon which relief has been allocated.

COMMENTS: The Director of Finance recommends approval of the Board paper, and the County Manager concurs.

FY22 SCHEDULE OF COMPENSATION
County of Henrico, Virginia

OFFICE, BOARD, COMMISSION, AUTHORITY OR JOB TITLE	RATE
Board of Supervisors	$ 58,498.11 per annum (1)
Board of Zoning Appeals	$6,600.00 per annum
Electoral Board - General Election (members other than the Secretary)	$4,649.40 per annum (2)
Secretary, Electoral Board - General Election	$9,289.80 per annum (2)
Election Officials	$150.00 base pay per workday (3)
Assistant Chief Election Officials	$180.00 base pay per workday (3)
Chief Election Officials	$200.00 base pay per workday (3)
Planning Commission	$20,000.00 per annum
Richmond Regional Planning District Commission	$3,000.00 per annum
Capital Region Airport Commission	$3,000.00 per annum
Board of Real Estate Review & Equalization	$300.00 per month
School Board	$21,786.60 per annum (4)
Social Services Board	$3,000.00 per annum
Volunteer Firefighters	$2.00 per call
Economic Development Authority	$200.00 per meeting
Parks and Recreation Advisory Commission	$75.00 per meeting
Housing Advisory Committee	$225.00 per meeting

---

(1) Acting pursuant to Va. Code Sec. 15.2-1414.2, on April 23, 2019, the Board set the maximum annual salaries for calendar years 2020-2023 as follows: 2020-$57,142.69; 2021-$58,498.11; 2022-$59,885.69; 2023-$61,306.17, and the Chairman and Vice-Chairman receive the additional sum of 15% and 10%, respectively, of the annual salary prevailing in each calendar year. The Board elected to forgo the increase in its compensation previously authorized for 2021. Effective January 12, 2021 the pay for the Board will be adjusted to reflect the rate previously authorized for 2021.

(2) The annual compensation rate and effective date are set by the General Assembly and subject to the Governor's approval. Salary amounts for FY22 are based upon current salaries and increases approved by the 2020 General Assembly. To date, the General Assembly has agreed to a 5% pay increase on July 1, 2021. However, the FY22 budget has not been approved by the Governor so the salary shown here may change.

(3) Rate approved by the Henrico County Board of Supervisors on October 14, 2008.

(4) Acting pursuant to Va. Code Sec. 22.1-32, on May 9, 2019, the School Board set the maximum annual salary for calendar year 2020 at $21,359.41, and determined, in each calendar year 2021, 2022, and 2023, that each member of the School Board will receive a maximum increase equal to any wage increase established for School Board employees. For FY22, the pay increase is 2%. The Chairman receives an additional sum of $2,000.00 per year.

9)

FY21 SCHEDULE OF COMPENSATION
County of Henrico, Virginia

NAME AND OFFICE OR JOB TITLE	SALARY
Heidi Barshinger Clerk of Circuit Court	$ 172,460.43 (5) (7)
Alisa Gregory Sheriff	$ 171,959.70 (5) (6) (8)
Mark Coakley General Registrar	$ 109,919.76 (6) (9)
Shannon Taylor (10) Attorney for the Commonwealth	$ 195,371.85 (6) (10)

---

(5) The Clerk of the Circuit Court and the Sheriff are elected positions. The General Assembly sets the annual compensation and effective dates subject to the Governor's approval. Salaries for FY22 are based on current salaries and reflect the 5% pay increase effective July 1, 2021 as approved by the General Assembly in the 2021 Special Session I. The County adjusts these salaries if and as required by the General Assembly's actions.

(6) 2012 Va. Acts c. 822 requires persons employed by local government to contribute five percent of their creditable compensation for the employee contribution to the Virginia Retirement System. To comply with 2012 Va. Acts c. 822 and the non-supplant requirement, the current incumbent in this elected/appointed position, who was employed or hired on or before July 1, 2012, receives an additional amount equal to 5% of the salary approved by the General Assembly. Future incumbents in this position will not receive an additional 5% locality supplement for the VRS employee member contribution per 2012 Va. Acts c. 822.

(7) Salary reflects the current Clerk of the Circuit Court's certification.

(8) Consistent with historical pay practice for this position, the current Sheriff will receive the longevity pay adjustment approved by the County Board of Supervisors. Consistent with the approved longevity pay formula, the current position incumbent will receive a pay supplement equal to 3-steps (7.286%) effective September 25, 2021.

(9) Effective June 22, 2019 (FY20), the constitutional position of General Registrar was adopted into the County classification and compensation plan at grade HU.34. However, the General Assembly has approved repositioning the General Registrar classification/salary within the State's compensation system. If the budget approved by the General Assembly is approved by the Governor, the General Assembly's actions may result in this position/classification being returned to the Schedule of Compensation.

(10) Effective June 22, 1988 (FY89), the constitutional position of Attorney for the Commonwealth was adopted into the County classification and compensation plan. The position is currently assigned to pay grade HU.49 and the current elected position incumbent (Taylor) receives the pay increases and wage adjustments approved by the County Board of Supervisors for county pay plans.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Henrico County Department of Public of Utilities**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	-
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	-
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	-
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	-
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	-
N/A	Match not required	-

Project Eligible for Consideration	☒ **Yes** ☐ **No**
Applicant Name:	

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	**-**
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	**-**
1.b. any other nature-based approach	**40**	**-**
All hybrid approaches whose end result is a nature-based solution	**35**	**-**
All other projects	**25**	**25**
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	**-**
High Social Vulnerability (1.0 to 1.5)	**12**	**-**
Moderate Social Vulnerability (0.0 to 1.0)	**8**	**8**
Low Social Vulnerability (-1.0 to 0.0)	**0**	**-**
Very Low Social Vulnerability (Less than -1.0)	**0**	**-**
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	**-**
No	**0**	**0**
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	**10**
No	**0**	**-**
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	**-**
No	**0**	**0**
11. Does this project provide "community scale" benefits?		
Yes	**20**	**20**
No	**0**	**-**
Total Points		**63**

Appendix D: Checklist All Categories

CID_510077 - Henrico County CFPF Round 3 Submission

1 message

Shue, Allen <ashue@greeley-hansen.com> Thu, Apr 7, 2022 at 8:43 PM
To: Virginia Department of Conservation & Recreation <cfpf@dcr.virginia.gov>
Cc: "Chan, Bentley" <cha70@henrico.us>, "Claytor, Ralph" <cla01@henrico.us>, "Sossong, Marchelle" <sos@henrico.us>, "Logue, Kyle" <klogue@greeley-hansen.com>

Hello,

I am a consulting engineer assisting Henrico County (County) with submitting two grant applications for this round of the VA DCR Community Flood Preparedness Fund Grant.

Due to the size of the applications they are not able to be transmitted through email. Please find the following .zip files through the service WeTransfer:

- CID# 510077_HenricoCounty.Gambles_Mill_PS_Flood_Mitigation_and Resiliency_CFPF-1
- CID# 510077_HenricoCounty.Stream_Restoration_at_Utility Xing_CFPF-2

At this link:

- Henrico County - CFPF Round 3 Applications
- Please note that you will need to click through the splash page before clicking the download link.

Thank you very much for the consideration. Looking forward to speaking with you.

Regards,

Allen

GREELEY AND HANSEN

Allen Shue, PE, CFM

Associate

Appendix A: Application Form for Grant Requests for All Categories

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Name of Local Government: Henrico County

Category of Grant Being Applied for (check one):

X **Capacity Building/Planning**

____ **Project**

____ **Study**

NFIP/DCR Community Identification Number (CID) 510077

If a state or federally recognized Indian tribe, Name of tribe N/A

Name of Authorized Official: Bentley Chan, PE
Director, Henrico DPU

Signature of Authorized Official: ____

Mailing Address (1): 4305 E. Parham Road

Mailing Address (2): ____

City: Henrico **State:** Virginia **Zip:** 23228

Telephone Number: (804) 501-4280 **Cell Phone Number:** (____) N/A

Email Address: cha70@henrico.us

Contact Person (If different from authorized official): Allen Shue, PE, CFM Associate, Greeley and Hansen

Mailing Address (1): 9020 Stony Point Parkway

Mailing Address (2): Suite 475

City: Richmond **State:** VA **Zip:** 23235

Telephone Number: (804**)** 204-2425 **Cell Phone Number: (**914**)** 275-2554

Email Address: ashue@greeley-hansen.com

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☒ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Title of Work: "Identifying Restoration Opportunities at Stream Utility Crossings"

Location of Project (Include Maps): Henrico County; County-wide

NFIP Community Identification Number (CID#):(See appendix F 510077

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

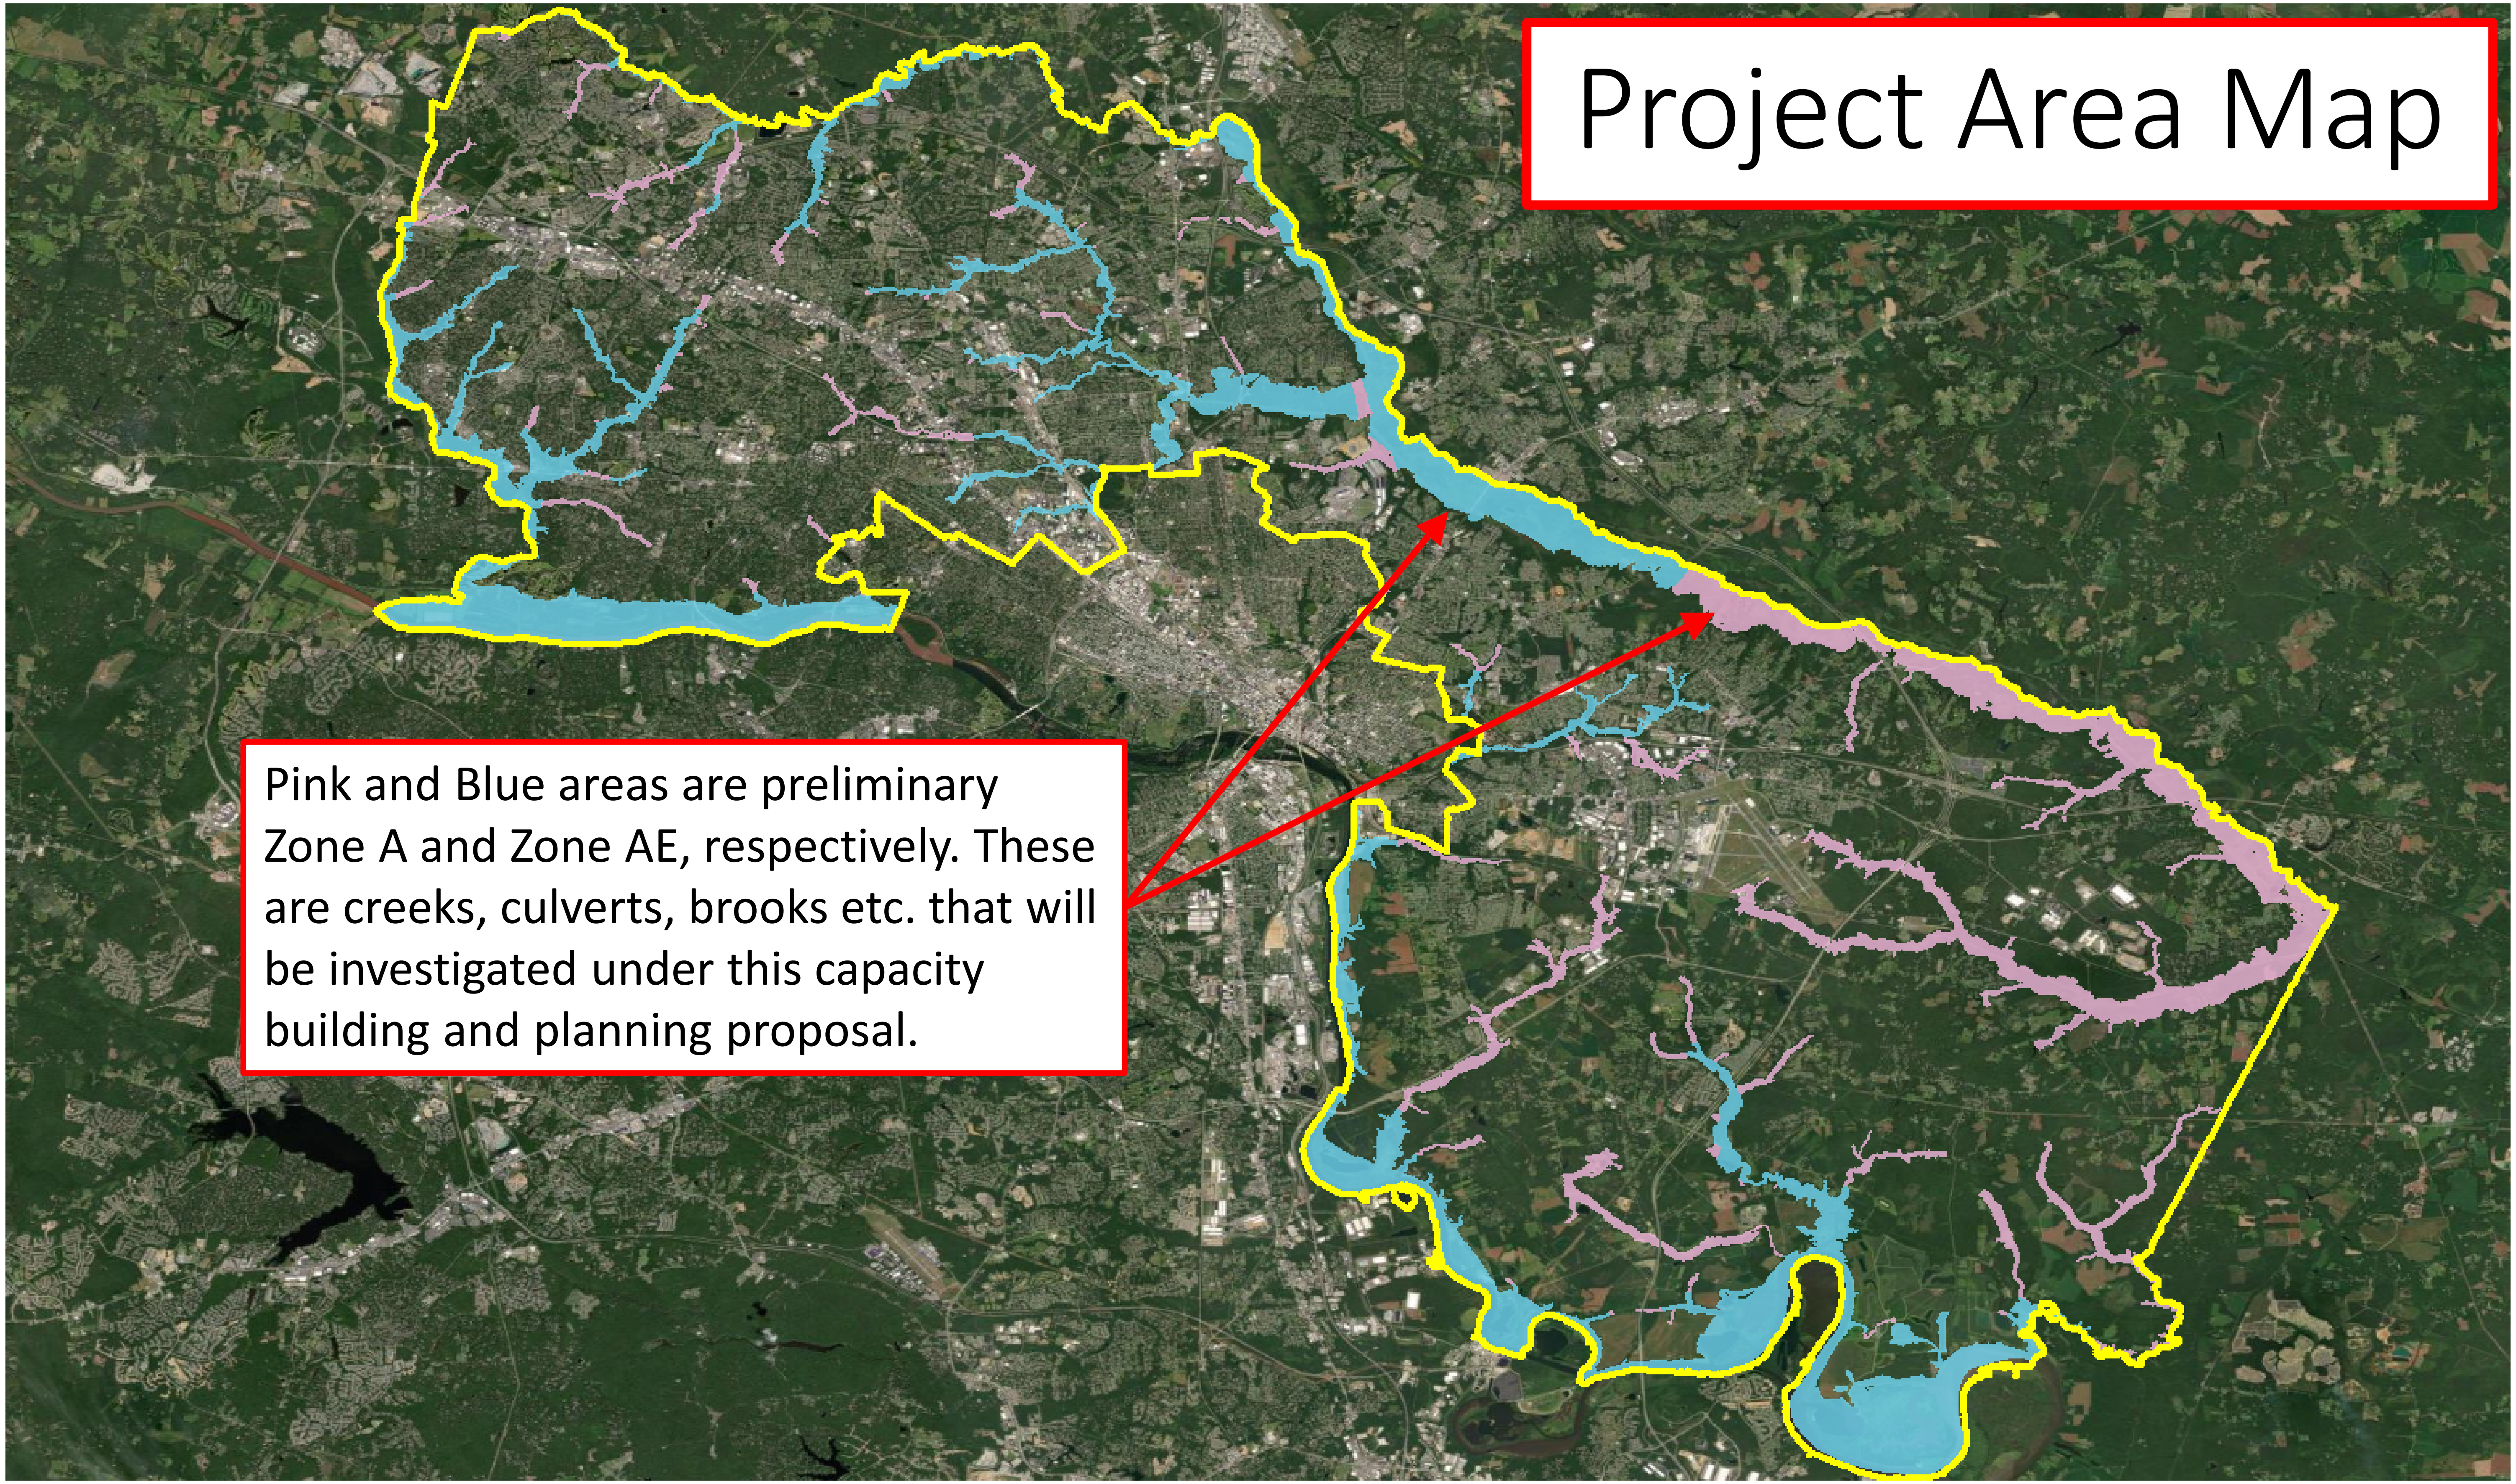
Flood Zone(s) (If Applicable): Preliminary: Zone AE and Zone A

Flood Insurance Rate Map Number(s) (If Applicable): Preliminary Throughout County

Total Cost of Project: $126,060

Total Amount Requested $ 94,545

Project Area Map



Pink and Blue areas are preliminary Zone A and Zone AE, respectively. These are creeks, culverts, brooks etc. that will be investigated under this capacity building and planning proposal.

B. Scope of Work Narrative – Planning and Capacity Building

Title of Work:

"Identifying Restoration Opportunities at Stream Utility Crossings"

Description of the Problem:

Henrico County is home to more than 300,000 residents and spans nearly 250 square miles in central Virginia, with streams, creeks, and brooks coursing throughout serving as vital conduits to convey stormwater away from residents. Additionally, there are miles of storm and sanitary sewers which cross or run parallel to these bodies of water.

Despite their importance, no comprehensive data exists cataloging the condition of the water bodies or the locations of sewers in them. As a result, minimal to no maintenance is performed on these assets which continually degrade over time. Meaning that the conveyance capacity of the water bodies continually decreases worsening flooding conditions and erosion, exposing sewers and manholes. Additionally, because it is unknown what sewer utilities exist in these water bodies, ageing stormwater outfalls can increase the severity of soil erosion, while damaged sanitary sewers with dislodged joints become submerged in stormwater triggering sanitary sewer overflows (SSOs) and backing up into homes.

The accompanying photo log demonstrates only the a few known areas that would benefit from the dual approach restoration and identification, with the assistance of the Fund, a comprehensive approach can be undertaken to identify needs throughout the County.

Proposed Planning and Programmatic Approach:

To restore these water bodies and renew the sewer assets within them, the County must first identify and prioritize the natural and built assets most in need. With this strong data basis in hand, the County will be empowered to pursue a programmatic and efficient strategy to protect its residents from external floods and from within the built infrastructure.

To maximize the benefit of identification and prioritization, the proposed scope of work is to perform a system wide desktop analysis of the sanitary sewer systems near or crossing creeks and other waterways to address two needs at the same time; develop a ranking matrix to prioritize the water bodies and sewer inspections based on the known condition information and risk analysis (both likelihood and consequence of failure); conduct preliminary field investigation to further refine the inspection prioritization; and based on the data collected, develop a list of water bodies and sewers to be further inspected (including CCTV). The following section details the proposed tasks to perform the investigations and prioritization.

Proposed Scope of Work:

Task 1 – Desktop Analysis

1. **Delineation and GIS Basemap:** Perform a system wide desktop analysis of the storm and sanitary sewer systems to identify sewer reaches near or crossing creeks and other waterways. The GIS database, sewer Atlas maps and contour information provided by the County will be used for the delineation.

2. **Review Existing Records:** The following records will be reviewed (if available) to obtain an understanding of the existing system characteristics:
    a. **Contractor Repairs and Improvements:** The data on contractor repairs and improvements, performed by County's crew and County's Annual Services Contractor within the last 5 years will be obtained from the County and analyzed to locate problem areas and rehabilitation histories. This data will be used as one of the indicators for potential problem areas and for developing the priority ranking of the reaches.

    b. **Existing Service Calls History:** The service calls recorded into County's Citizens' Request System (CRS) and Customer Information System (CIS) within the last 5 years will be obtained from County's Department of Information Technology and analyzed to quantify and locate the types and frequencies of sewer problems. This data will be used as one of the indicators for potential problem areas and for developing the priority ranking of the reaches.

    c. **SSO Reports Submitted to DEQ:** SSO reports submitted to DEQ in the last 5 years will be obtained from the County. The results will be used to identify potential capacity and/or O&M related issues within the system.

3. **GIS Mapping:** The sewer problem history based on the evaluation of the above data will be incorporated into project GIS to prepare mapping which will help visualize the extent and location of problems.

4. **Problem Areas Identification and Prioritization:** A GIS map will be used to identify the problem areas in the wastewater collection system near waterways and to prepare a priority ranking of the reaches. Rating criteria will be developed to identify the critical areas and the extent of field investigation within the wastewater collection system.

5. **Field Investigation Plan (FIP):** The results of the desktop analysis will be used to develop a FIP and the proposed extent of the work within the wastewater collection system. The FIP will include tables and field maps, utilizing GIS mapping, to outline the location and types of field investigations required.

6. **County Meeting:** A meeting will be scheduled with the County to review the FIP.

Task 2 - Field Investigations:

The field investigations will be conducted based on the FIP approved by the County in Task 1. Field investigations will be assigned to critical reaches first, followed by non-critical reaches. Information from the field investigations will be used to evaluate the condition of the wastewater collection system near or crossing creeks or other bodies of water. The following types of field investigations will be conducted concurrently:

1. **Checks (aerial creek crossings):** Checks will include visual inspection of the aerial sewer crossing and manholes and may include, but not limited to documentation of the following: condition of pipe/encasement; manhole material type; system flow characteristics; O&M issues; and evidence of surcharging and I/I on a check form included in Appendix A. Digital photos of each aerial crossing and manhole checked will be taken to supplement the documented information. The selection of aerial crossings and manholes to be checked will be based on the results of the desktop analysis and FIP. Checks will be conducted for up to 200 manholes along the aerial sewer crossings. The results of the checks will be used for selection and prioritization of sewer reaches for CCTV inspections.

2. **Inspection (buried creek crossings):** This will include inspection of the manholes using a zoom camera and may include, but not limited to documentation of the following: evidence of surcharging, overflows, infiltration, grease, blockage and direction of flow. Inspections will be conducted for up to 100 manholes along the buried creek crossings. The purpose of a manhole inspection program is to obtain a condition assessment of the mainline sanitary sewer manholes and to identify sewer problems such as surcharging, grease blockages etc. The zoom camera will also be used for identification of major problems in the sewer for approximately 30-50 feet upstream and downstream of the manhole. The condition of the manholes will be documented using the inspection included in Appendix B. The results of the inspections will be used for selection and prioritization of sewer reaches for CCTV inspections.

Task 3 – Recommendation Memorandum and CCTV Assignment Sheets

1. Prepare a draft memorandum summarizing the field investigation data and prioritize sewer reaches in need of CCTV investigation to identify potential rehabilitation needs and stream reaches in need of restoration.
2. Submit the draft memorandum to the County for review and comments. Conduct a meeting with the County to review the draft memorandum.
3. Incorporate the review comments and submit the final memorandum and CCTV assignment sheets to the County.
4. Review of the CCTV has not been included with this work order; CCTV review and rehabilitation recommendation will be authorized as an amendment to this work order (Phase II). Rehabilitation recommendations under this amendment will consider available funding and the overall CSMP implementation schedule. For sewers that need attention immediately or in the next 2-3 years, begin working on obtaining utility easements, either permanent or temporary construction easements. For streams that were identified as stream restoration project candidates, conduct a total maximum daily load (TMDL) credit analysis and incorporate the information in the TMDL action plan development. Prioritization will be developed on the combined benefit of stream restoration and utility failure risk.

Task 4 – Project Management

1. This task will include monthly invoicing; general communications; and coordination for completion of the project.

Task 5 – Schedule

1. The performance of this work is anticipated to take 24 weeks.

C. Budget Narrative

1. **Estimated total project cost:**
   The total estimated cost for the “Identifying Restoration Opportunities at Stream Utility Crossings” project is **$126,060**. Please find attached estimated cost of engineering services to perform this work.

2. **Amount of funds requested from the Fund:**
   Henrico County DPU requests **$94,545** from the Community Flood Preparedness Fund.

3. **Amount of cash funds available:**
   Please find attached statement from the Henrico County DPU indicating the available projected CIP budget for the year ending FY2022 as **$27.5 million**.

4. **Authorization to request for funding**:
   Please find attached documentation Henrico County DPU indicating their authorization to request funding.

COMMONWEALTH OF VIRGINIA
COUNTY OF HENRICO

DEPARTMENT OF PUBLIC UTILITIES
804.501.4517

April 5, 2022

Virginia Department of Conservation and Recreation
600 East Main Street
24th Floor
Richmond, VA 23219-2094

To whom it may concern:

The total design contract value for identifying restoration opportunities at stream utility crossings project is $126,060, which includes the identification and prioritization of sanitary sewers crossing creeks and other waterways. The County of Henrico, Department of Public Utilities is an enterprise fund within the County of Henrico. Therefore, Public Utilities has a dedicated revenue stream and is appropriated Capital Improvement funds annually. Those dedicated revenues are projected to be $27.5 million in FY2022 and part of those funds will cover the total estimated project cost prior to DCR grant reimbursement. The DPU is committed to contribute 25% of the project funds and the source of the funds is from the Sewer Line Rehabilitation project in the 2022 Water and Sewer Capital Improvement budget (copy enclosed).

Sincerely,

Bentley P. Chan, PE
Director of Public Utilities

WHEREAS, the Virginia Department of Conservation and Recreation's ("DCR") Community Flood Preparedness Fund ("CFPF") was established to provide grant funding for regions and localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change ("Flood Preparedness Projects"); and,

WHEREAS, the CFPF program reimburses eligible recipients up to 90% of the approved costs of Flood Preparedness Projects; and,

WHEREAS, the County must submit applications for CFPF funding through DCR; and,

WHEREAS, the County has identified two Flood Preparedness Projects that are eligible for CFPF funds:

(1) planning for stream restoration and utility rehabilitation at utility stream crossings; and

(2) installation of an emergency generator at the Gambles Mill Sewage Pump Station to provide redundant power for continuous operation of the pump station.

NOW, THEREFORE, BE IT RESOLVED that the Board of Supervisors authorizes the Director of Public Utilities to submit applications for CFPF funding for the projects identified above.

Comment: The Director of Public Utilities recommends approval of the Board paper, and the County Manager concurs.

BE IT FURTHER RESOLVED that the funds included in the Operating and Capital Annual Fiscal Plans for any County department, office, or agency may be used as participating funds in any Federal or State aid program for like purpose upon appropriation by the Board of Supervisors; and,

BE IT FURTHER RESOLVED that the Schedule of Compensation attached hereto effective at the beginning of FY 2021-22 is approved; and,

BE IT FURTHER RESOLVED that the approved Operating Annual Fiscal Plan for FY 2021-22 includes:

1. An increase in the personnel complement of 13 positions for General Government and 91.5 positions for Schools;
2. Continued funding for a 2% scale adjustment for all employees effective in the fourth quarter of FY 2020-21;
3. Continued funding for market adjustments for certain public safety, education, and other positions effective in the fourth quarter of FY 2020-21;
4. New funding for a 2.372% wage increase for all eligible General Government and Schools employees, to be effective on June 19, 2021; and
5. New funding for a wage increase ranging from 2.372% to 9.831%, based on length of service in Henrico County and other eligibility criteria, to be effective in the second quarter of FY 2021-22.

BE IT FURTHER RESOLVED that in order to implement changes to the Personal Property Tax Relief Act of 1998 (the "PPTRA") made by legislation adopted by the Virginia General Assembly:

1. Any qualifying vehicle, as defined in the PPTRA, sitused within the County commencing January 1, 2021, shall receive personal property tax relief in the following manner:
    a. Qualifying vehicles valued at $1,000 or less shall receive 100% tax relief;
    b. Qualifying vehicles valued at between $1,001 to $20,000 shall receive 48% tax relief;
    c. Qualifying vehicles valued at $20,001 or more shall receive 48% tax relief on the first $20,000 of value only; and
    d. All other vehicles which do not meet the definition of "qualifying vehicles" will not receive any form of tax relief under the PPTRA.
2. The amount of tax relief shall be a specific dollar amount offset against the total personal property taxes that would otherwise be due on a qualifying vehicle but for the PPTRA. The specific dollar amount of relief shall be shown on the tax bill for each qualifying vehicle, together with a general description of the criteria upon which relief has been allocated.

COMMENTS: The Director of Finance recommends approval of the Board paper, and the County Manager concurs.

FY22 SCHEDULE OF COMPENSATION
County of Henrico, Virginia

OFFICE, BOARD, COMMISSION, AUTHORITY OR JOB TITLE	RATE
Board of Supervisors	$ 58,498.11 per annum (1)
Board of Zoning Appeals	$6,600.00 per annum
Electoral Board - General Election (members other than the Secretary)	$4,649.40 per annum (2)
Secretary, Electoral Board - General Election	$9,289.80 per annum (2)
Election Officials	$150.00 base pay per workday (3)
Assistant Chief Election Officials	$180.00 base pay per workday (3)
Chief Election Officials	$200.00 base pay per workday (3)
Planning Commission	$20,000.00 per annum
Richmond Regional Planning District Commission	$3,000.00 per annum
Capital Region Airport Commission	$3,000.00 per annum
Board of Real Estate Review & Equalization	$300.00 per month
School Board	$21,786.60 per annum (4)
Social Services Board	$3,000.00 per annum
Volunteer Firefighters	$2.00 per call
Economic Development Authority	$200.00 per meeting
Parks and Recreation Advisory Commission	$75.00 per meeting
Housing Advisory Committee	$225.00 per meeting

---

(1) Acting pursuant to Va. Code Sec. 15.2-1414.2, on April 23, 2019, the Board set the maximum annual salaries for calendar years 2020-2023 as follows: 2020-$57,142.69; 2021-$58,498.11; 2022-$59,885.69; 2023-$61,306.17, and the Chairman and Vice-Chairman receive the additional sum of 15% and 10%, respectively, of the annual salary prevailing in each calendar year. The Board elected to forgo the increase in its compensation previously authorized for 2021. Effective January 12, 2021 the pay for the Board will be adjusted to reflect the rate previously authorized for 2021.

(2) The annual compensation rate and effective date are set by the General Assembly and subject to the Governor's approval. Salary amounts for FY22 are based upon current salaries and increases approved by the 2020 General Assembly. To date, the General Assembly has agreed to a 5% pay increase on July 1, 2021. However, the FY22 budget has not been approved by the Governor so the salary shown here may change.

(3) Rate approved by the Henrico County Board of Supervisors on October 14, 2008.

(4) Acting pursuant to Va. Code Sec. 22.1-32, on May 9, 2019, the School Board set the maximum annual salary for calendar year 2020 at $21,359.41, and determined, in each calendar year 2021, 2022, and 2023, that each member of the School Board will receive a maximum increase equal to any wage increase established for School Board employees. For FY22, the pay increase is 2%. The Chairman receives an additional sum of $2,000.00 per year.

Prepared by: County of Henrico Department of Human Resources
Employment and Compensation Services Division
Revised March 31, 2021

9)

FY21 SCHEDULE OF COMPENSATION
County of Henrico, Virginia

NAME AND OFFICE OR JOB TITLE	SALARY
Heidi Barshinger Clerk of Circuit Court	$ 172,460.43 (5)(7)
Alisa Gregory Sheriff	$ 171,959.70 (5)(6)(8)
Mark Coakley General Registrar	$ 109,919.76 (6)(9)
Shannon Taylor (10) Attorney for the Commonwealth	$ 195,371.85 (6)(10)

---

(5) The Clerk of the Circuit Court and the Sheriff are elected positions. The General Assembly sets the annual compensation and effective dates subject to the Governor's approval. Salaries for FY22 are based on current salaries and reflect the 5% pay increase effective July 1, 2021 as approved by the General Assembly in the 2021 Special Session I. The County adjusts these salaries if and as required by the General Assembly's actions.

(6) 2012 Va. Acts c. 822 requires persons employed by local government to contribute five percent of their creditable compensation for the employee contribution to the Virginia Retirement System. To comply with 2012 Va. Acts c. 822 and the non-supplant requirement, the current incumbent in this elected/appointed position, who was employed or hired on or before July 1, 2012, receives an additional amount equal to 5% of the salary approved by the General Assembly. Future incumbents in this position will not receive an additional 5% locality supplement for the VRS employee member contribution per 2012 Va. Acts c. 822.

(7) Salary reflects the current Clerk of the Circuit Court's certification.

(8) Consistent with historical pay practice for this position, the current Sheriff will receive the longevity pay adjustment approved by the County Board of Supervisors. Consistent with the approved longevity pay formula, the current position incumbent will receive a pay supplement equal to 3-steps (7.286%) effective September 25, 2021.

(9) Effective June 22, 2019 (FY20), the constitutional position of General Registrar was adopted into the County classification and compensation plan at grade HU.34. However, the General Assembly has approved repositioning the General Registrar classification/salary within the State's compensation system. If the budget approved by the General Assembly is approved by the Governor, the General Assembly's actions may result in this position/classification being returned to the Schedule of Compensation.

(10) Effective June 22, 1988 (FY89), the constitutional position of Attorney for the Commonwealth was adopted into the County classification and compensation plan. The position is currently assigned to pay grade HU.49 and the current elected position incumbent (Taylor) receives the pay increases and wage adjustments approved by the County Board of Supervisors for county pay plans.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	Henrico County Department of Public of Utilities

Eligibility Information

Criterion	Description	Check One
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
[✓ Yes]	Eligible for consideration	X
No	Not eligible for consideration	-
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
[✓ Yes]	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	-
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	-
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	-
[✓ No]	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
[✓ Yes]	Eligible for consideration	X
No	Not eligible for consideration	-
N/A	Match not required	-

Hello,

I am a consulting engineer assisting Henrico County (County) with submitting two grant applications for this round of the VA DCR Community Flood Preparedness Fund Grant.

Due to the size of the applications they are not able to be transmitted through email. Please find the following .zip files through the service WeTransfer:

- CID# 510077_HenricoCounty.Gambles_Mill_PS_Flood_Mitigation_and Resiliency_CFPF-1
- CID# 510077_HenricoCounty.Stream_Restoration_at_Utility Xing_CFPF-2

At this link:

- Henrico County - CFPF Round 3 Applications
- Please note that you will need to click through the splash page before clicking the download link.

Thank you very much for the consideration. Looking forward to speaking with you.

Regards,

Allen

Department of Conservation and Recreation
600 East Main Street, 24th Floor
Richmond, Virginia 23219

RE: Town of Buchanan Flood Resilience Plan and Staff Training CFPF Application

Ms. Howard-Cooper:

The Town of Buchanan is pleased to submit the following application for funding from the Community Flood Preparedness Fund (CFPF) to develop a Flood Preparedness Resilience Plan and for Town staff to receive training to become a Certified Floodplain Manager. A CFPF Grant will enable the Town to develop a Resilience Plan in accordance with the DCR's five key elements, which will guide the implementation of flood mitigation projects and work towards a more resilient, flood ready community.

The Town of Buchanan is located adjacent to the James River and its economy and identity are closely linked to the river. In the past, the Town has experienced significant flood events, a Resilience Plan will provide a roadmap for our community to prepare for future floods while maintaining our close connection to the river. The plan will include specific community flood preparedness projects to guide our efforts. The Town of Buchanan lacks the financial resources to prepare a Resilience Plan without a CFPF Grant.

Please accept this letter and supporting documents as the Town's application for CFPF funding. Please feel free to reach out to Susan McCulloch, Town Manager, if you have any questions.

Sincerely,

Susan McCulloch, Town Manager
Buchanan, Virginia

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes _**X**_ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

X Floodplain Staff Capacity.

X Resilience Plan Development

- **X** Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- **X** Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Town of Buchanan, Virginia (See Attachment A)

NFIP Community Identification Number (CID#): 510019

Is Project Located in an NFIP Participating Community? **X** Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes **X** No

Flood Zone(s) (If Applicable): Zones AE, AO, and AH

Flood Insurance Rate Map Number(s) (If Applicable): 51023C0264C, 51023C0265C, 51023C0266C, 51023C0268C

Total Cost of Project: **$60,000**

Total Amount Requested **$54,000**

Scope of Work Narrative – Capacity Building and Planning

All applications must include a Scope of Work Narrative that clearly describes the proposed activities, including supporting documentation as necessary and, at a minimum, includes the following.

1. Assess capacity needs and assets to include:
   a. Resource needs identification – financial, human, technical assistance, training.

      Financial – The Town of Buchanan is a small community with a population of 1,196 people (2020 U.S. Census). Buchanan has extremely limited financial resources to address community flood preparedness concerns. Furthermore, Buchanan is a low-income community that has been financially depressed for decades. The Town of Buchanan's Median Household Income ($50,278) is only 69.1% of the surrounding Botetourt County's ($72,719) (2020 U.S. Census).
      Human and Technical Assistance – As a small community, the Town of Buchanan simply does not have the staff resources available to adequately address community flood preparedness concerns on its own. The Town has two staff members whose responsibilities include planning related to flood preparedness. These individuals are the Town Manager and the Community Development Planner. The responsibilities of these positions cover a range of operational and planning issues. These staff members do not have the time or the specialized knowledge to adequately address community flood preparedness concerns. The Town will utilize funds from the Virginia Community Flood Preparedness Fund to contract with qualified planning and engineering professionals. Through a competitive Request for Qualifications procurement process, the Town has selected *Cardno now Stantec* to assist with community flood preparedness and brownfield redevelopment concerns.
      Training – The Town of Buchanan recognizes the need to educate its leaders, staff, and citizens regarding community flood preparedness concerns. Training will include formal training of the Town Manager to become a Certified Floodplain Manager (CFM) in order to better understand, prepare for, and if necessary recover from flood hazards. Local leaders will be invited to participate in an educational exercise emphasizing what can be done to minimize flood hazards, how to prepare for an imminent flood event, and how to best recover from a flood. Citizens will be invited to learn about the Town's efforts and offer input during future planning and project implementation efforts.

   b. Plan for developing, increasing, or strengthening knowledge, skills and abilities of existing or new staff. This may include training of existing staff, hiring personnel, contracting with of expert consultants or advisors.

      The overarching goal of this proposed scope of work is to evaluate existing plans, ordinances, and related policies, address key information gaps, and develop a Resilience Plan, which includes the following five key elements:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a locality regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.

To achieve this goal the Town of Buchanan has contracted with *Cardno now Stantec* to assist the Town in developing a Resilience Plan that will guide the Town's community flood preparedness efforts. Development of the Resilience Plan and future implementation of flood control projects will be a collaborative effort between Town leadership, staff, citizens and selected contractors. In addition, the Town will communicate with adjacent jurisdictions, such as Botetourt County, and relevant state and federal agencies regarding its planning and flood control project implementation decisions.

Specific training for Town staff will include the Town Manager becoming a CFM. This position will become the primary contact for the Town regarding flood related concerns. Local officials will be invited to participate in a table top training exercise to identify flood hazards, discuss strategies and procedures in the event of an imminent flood, and how to mitigate and manage damage after an event. The public will be invited to attend an informational meeting regarding the Town's efforts to develop Resilience Plan and implement future flood preparedness projects. The results of these combined efforts will increase the knowledge and overall level of preparedness for all community stakeholders.

c. Resource development strategies. Where capacity is limited by funding, what strategies will be developed to increase resources in the local government? This may include work with non-governmental organizations, or applying for grants, loans, or other funding sources.

Financial resources to address community flood preparedness efforts are extremely limited for the Town of Buchanan. Projects specified in the Resilience Plan will require funding assistance from various sources. The Town intends to apply for additional funds from the Virginia Community Flood Preparedness Fund for implementation of projects specified in its Resilience Plan. Local funds necessary for future grant matches, to maintain and update the Resilience Plan, and staff time to address citizen concerns will be considered by the Town leadership. Staff will also coordinate with their selected consultants to identify additional grant resources for flood preparedness projects.

d. Policy management and/or development.

As part of the Resilience Plan development process the *Cardno now Stantec* staff will review Town's Comprehensive Plan, local ordinances related to flood management, the Botetourt County Emergency Operations Plan, and other related documents. Based on this review, consultation between the Town's selected consultants and local leaders, input from citizens, and best management practices the Town will revise its policies and ordinances accordingly.

2. Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.

In order to develop a Resilience Plan that includes the five key elements outlined in the *2022 Grant Manual for the Virginia Community Flood Preparedness Fund*, which will guide the Town's approach to community flood preparedness for the foreseeable future, the Town and *Cardno now Stantec* will perform the following tasks:

Baseline Information for Resilience Plan Development

- ***Flood Scenario Modeling*****:** The Town of Buchanan has an existing detailed FEMA flood model that will be obtained to ascertain flood risk and evaluate alternatives. The existing FEMA Flood Insurance Rate Map (FIRM) model for regulatory and non-regulatory data will be requested and purchased within ten (10) days of project start. The model will then be used to develop multiple return periods (up to five) which are likely the 10-year, 50-year, 100-year, 500-year, and 1,000-year. Decisions on which frequencies to include will include research on past events and likely future conditions. Spatial GIS files will be produced to evaluate alternatives including depth grids and water surface elevations. Up to five (5) different flood control options will be evaluated for various return periods as part of this evaluation.
- ***Visual Inspections*****:** The Town's selected consultant will perform visual inspections of features of interest to the community flood preparedness program located along the James River and within the floodway. This effort will also include an inspection of tributary streams and relevant drainage structures to insure localized flooding is not occurring as a result of maintenance related issues.
- ***Review of Flood Related Documents and Coordination with Town Staff*****:** The Town's selected consultant will compile and review relevant local, County, and regional flood related documents to establish a baseline of Town's current community flood preparedness. As part of this effort the consultant will interview Town staff to capture their institutional knowledge.

Resilience Plan Development

- ***Proposed Flood Control Projects*****:** Based on the information learned while compiling the baseline information about the Town's current community flood preparedness, *Cardno now Stantec* will develop a list of specific potential future community flood preparedness projects. Principles from the five key resilience plan elements will guide the inclusion of projects. An initial working list of projects will be developed and may change during the resilience plan development process. The list of projects ultimately included in the Town's Resilience Plan will incorporate input from key stakeholders and will provide the path for the Town's flood preparedness efforts.

- ***Table Top Exercise for Key Stakeholders***: *Cardno now Stantec* will conduct a presentation/training for local officials and other key stakeholders, which is designed to educate and collect input regarding the Town's redevelopment, planning, and community flood preparedness priorities. This event will be limited to two (2) hours in consideration of the stakeholders' schedules. However, if any attendees have additional questions or comments the Town's consultants will conduct follow up discussions with those individuals.
- ***Public Information and Input Meeting***: *Cardno now Stantec* will conduct a public meeting with the goal of educating the citizens of Buchanan about Town's community flood preparedness efforts and soliciting public input on the proposed projects that will be included in the Town's Resilience Plan. This event will be limited to two (2) hours.
- ***Develop Town of Buchanan Resilience Plan***: *Cardno now Stantec* will integrate all the information gathered throughout the information collection, project development, the stakeholder table top exercise, and the public information meeting to develop the Town of Buchanan's Community Flood Preparedness Resilience Plan. The Resilience Plan will be made available to the public through the Town's website and as a hardcopy at the Town Offices.
- ***Town Staff CFM Training***: Training for Town staff will include the Town Manager becoming a Certified Floodplain Manager. This position will become the primary contact for the Town regarding flood related concerns.

3. Stakeholder identification, outreach and education strategies.

   Stakeholders will include the Town's elected officials, key staff members, and interested property owners. The Town will apprise adjacent government jurisdictions of its plans to develop a Resilience Plan. As part of the plan development process the Town staff and *Cardno now Stantec* plan to conduct an in-person and possibly virtual educational table top exercise to provide information and solicit input about the Resilience Plan and future community flood preparedness efforts. Also, a public meeting to educate the Town's citizens about the Resilience Plan and the Town's community flood preparedness efforts will be held prior to finalization of the Resilience Plan. Once completed the Resilience Plan will be available online and in hardcopy for review. Moving forward the Town Manager will be available to address questions and receive comments from interested parties. When determined to be helpful, the Town may hold additional public meetings prior to the start of significant projects.

4. Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.

   In March 2022, the Town of Buchanan issued a Request for Qualifications, reviewed all responses, and selected *Cardno now Stantec* to assist with developing a Resilience Plan for the Town. Once the Town is notified of award of requested the funds it will instruct its selected contractor to commence with the Resilience Plan development process. The approximate timeline to complete the tasks associated with developing the plan are outlined below:

Baseline Information for Resilience Plan Development	
Project Task	**Months from Award Announcement**
Review of Flood Related Documents and Coordination with Town Staff	3
Visual Inspections	3
Flood Scenario Modeling	4
Resilience Plan Development	
Proposed Flood Control Projects	5
Table Top Exercise for Key Stakeholders	6
Public Information and Input Meeting	6
Develop Town of Buchanan Resilience Plan	9
Town Staff CFM Training	9

   Assuming a June 2022 Community Flood Preparedness Fund Grant award, the Town anticipates completing all project tasks including development of a Resilience Plan by March 2023.

5. Parties responsible for capacity building and/or plan development process.

   The **Authorized Official** and **Contact Person** for the Town is the Town Manager, Susan McCulloch. Ms. McCulloch is also the individual designated to become a CFM and manage all future community flood preparedness issues for the Town. Susan will coordinate closely with *Cardno now Stantec*, the Town's selected consultant to develop the Resilience Plan.

   The *Cardno now Stantec* Project Manager is Joe Morici. Mr. Morici is a Professional Engineer and a Senior Principal. He leads the regional efforts to collaborate with local governments to develop programs in their communities. This includes identifying potential project sites, developing community support, authoring successful grant applications, developing work plans, and identifying, obtaining, and leveraging multiple sources of funding. For each project, he partners with the client to develop a tailored solution to ensure the project meets the both the short-term and long-term needs of the client. Mr. Morici will coordinate with a range of qualified professional engineers, planners, and environmental consultants to develop this project.

6. Performance outputs and measures. Describe the expected results and benefits and how success will be measured.

   The primary objectives of this project include the following:

   - Development of a Community Flood Preparedness Resilience Plan that includes the five key elements outlined by the Virginia Department of Conservation and Recreation. The Resilience Plan will serve as a road map for the Town to improve its community flood preparedness in the coming years.
   - Education about community flood preparedness for the key stakeholders and citizens of the Town. Education efforts will prepare local officials regarding next steps to prevent flooding, steps to take to prepare for an impending flood event, and what to do to clean up after a flood.
   - Development of a sustainable community flood preparedness program. Development of Resilience Plan is a first step. In the coming years, the Town will strive to complete projects specified in the plan. The Resilience Plan is also a dynamic document in that the Town will revisit the plan's projects and insure they are still in accordance with the Town's overall priorities.
   - Funds from this grant will also pay for the Town Manager to become a CFM. The CFM certification will insure that there is an individual on staff that is knowledgeable regarding a wide range of flood related issues. This position will become the Town's point of contact regarding all flood related concerns from stakeholders and citizens.

7. Plans for maintaining capacity, as necessary, over the long term.

   Capacity for community flood preparedness will be maintained by integrating responsibility for the program into the duties of the Town Manager. The current Town Manager will become certified as a CFM and recognizes the importance of flood preparedness. Furthermore, the Town will be implementing projects specified in the Resilience Plan in the coming years, and public education and outreach efforts will raise awareness of these issues with the Town's citizens.

Budget Narrative

Estimated Total Project Cost

The total cost of the project outlined in the Scope of Work is $60,000. This cost includes development of the Town of Buchanan's Community Flood Preparedness Resilience Plan and Certified Floodplain Manager training for the Buchanan Town Manager. The estimated costs for tasks to complete the proposed Scope of Work are noted in the following table:

Baseline Information for Resilience Plan Development	
Project Task	**Estimated Cost**
Review of Flood Related Documents and Coordination with Town Staff	$4,000
Visual Inspections	$4,000
Flood Scenario Modeling	$20,000
Resilience Plan Development	
Develop Proposed Flood Control Projects	$10,000
Table Top Exercise for Key Stakeholders	$3,000
Public Information and Input Meeting	$3,000
Develop Town of Buchanan Resilience Plan	$12,000
Town Staff CFM Training	$4,000
Total Cost	**$60,000**

- **Amount of funds requested from the Fund,**
- **Amount of cash funds available,**
- **Authorization to request for funding**

The total amount the Town is requesting from the Virginia Community Flood Preparedness Fund is $54,000. All of these funds will be used to compensate *Cardno now Stantec* to complete the Scope of Work outlined in this application. The Town of Buchanan is providing a local match of $6,000. The authorization for the Town to request funds and the commitment of the $6,000 match has been attached as **Attachment C**.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Buchanan, Virginia**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application? – NOT APPLICABLE		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	**X Yes** **☐ No**

Applicant Name:	**Buchanan, Virginia**

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	**55**	
Development of a new resilience plan.	**55**	**55**
Resource assessments, planning, strategies and development.	**45**	**45**
Policy management and/or development.	**40**	**40**
Stakeholder engagement and strategies.	**25**	**25**
Goal planning, implementation and evaluation.	**25**	**25**
Long term maintenance strategy.	**25**	**25**
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.	**15**	
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	**8**
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	**0**
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	**10**
No	**0**	
10. Does this project provide "community scale" benefits?		
Yes	**20**	**20**
No		
Total Points		**253**

Attachment C

Resolution R22-0314-07

At a regular meeting of the Town Council of the Town of Buchanan held at the Buchanan Town Hall on the 14th day of March 2022 beginning at 7:00 p.m.:

MEMBERS:	VOTE:
Craig Bryant, Mayor	YES
Chris Witt, Vice-Mayor	YES
James Manspile	YES
Chris Petty	YES
Marlon Rickman	YES

On motion of Councilmember Manspile, which carried by a vote of 5 - 0, the following was adopted:

A Resolution

Authorizing Contracting with Stantec to Provide Planning/Engineering Services for the Department of Conservation and Recreation (DCR) Community Flood Preparedness Grant Fund

Whereas, the Town of Buchanan has had challenges in the past with flooding, and

Whereas, there is now a grant program available for Flood Preparedness Planning offered by the Department of Conservation and Recreation;

Whereas, the Town Manager issued a Request for Qualifications that was due March 8, 2022 and Stantec successfully responded and has been working with the Town on brownfield projects;

Now, therefore, be it resolved that the Town of Buchanan does hereby authorize the Town Manager to work with Stantec (formerly Cardno); and

Now, therefore, be it further resolved that the Town authorizes Stantec to apply for a planning grant for Community Flood Preparedness Planning with a Town cash match of up to $6,000 and submit it on or before April 8, 2022.

AYES: 5

NAYS: 0

ABSENT: 0

APPROVED:

Mayor

Table of Contents

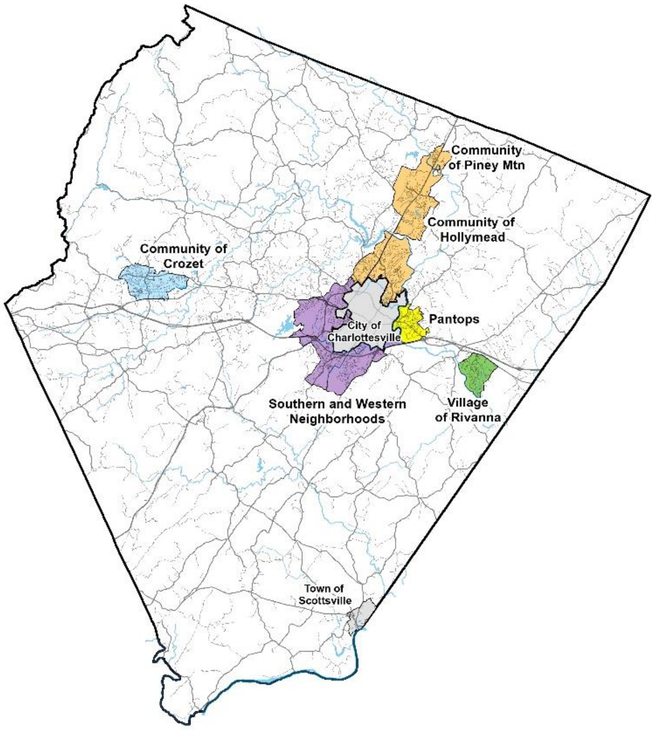
Introduction and Background

Albemarle County is committed to developing a **flood resilience plan** over the course of fiscal year 2023. Our ambition to do this is driven by the alignment of several related priorities that include climate action and drainage infrastructure improvements, described in the following sections. But like many localities, we are constrained by limited resources. While we typically have the funding and staffing necessary to implement and develop our major programs, this is not necessarily the case for emerging demands – such as flood resilience planning. In addition to requiring more staff *capacity* to take on the development of a flood resilience plan, we also lack some of the internal technical expertise required for this type of endeavor.

Therefore, we are grateful for this opportunity to receive grant support from DCR's Community Flood Preparedness Fund (CFPF) that would allow the County to immediately move forward with this matter of increasing importance and urgency.

About Albemarle County

At 726 square miles, Albemarle County is one of the largest counties in Virginia. As early as 1971, the Albemarle County Board of Supervisors (Board) began establishing growth areas with the intent of focusing new development to create quality living areas, avoid sprawl, improve access to services, and protect the remaining rural areas. Today, the Development Areas – designated by the Comprehensive Plan and shown in the figure on the right – make up approximately five percent of the county's geographic area, or 35 square miles. The other 95% of the County is rural and exurban in nature.

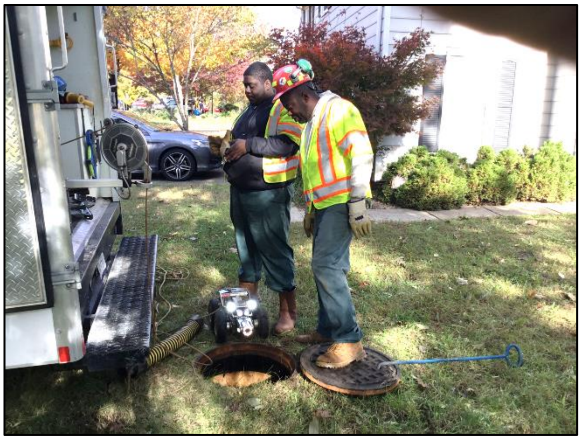


Flood Resilience Planning – A Convergence of Priorities

As indicated in the introduction, Albemarle County is engaged in several initiatives that converge at the commencement of flood resilience planning. Two programs in particular – climate protection and drainage infrastructure – are identified as key priorities in the Board's Strategic Plan for fiscal years 2020 – 2023.

Climate Protection Program – In 2019, the Board adopted community-wide greenhouse gas emission reduction targets. These targets include a 45% reduction from 2008 emission levels by 2030 and achieving zero net emissions by 2050. In 2020, the Board adopted the County's first Climate Action Plan, developed by staff with significant contributions from residents and other community stakeholders. The Climate Action Plan defines objectives and action areas to meet the emission reduction targets and contribute towards the mitigation of global climate change.

The Climate Action Plan also commits to developing a climate adaptation and resilience plan to prepare the community and County operations for the inevitable intensification of rainfall, heat, drought, and other local manifestations of climate change. The County's Comprehensive Plan, adopted in 2015, also calls for the development of a climate resilience plan. Staff are currently working with a consultant – fully supported by a local benefactor – to prepare a climate vulnerability assessment, the first step in developing a resilience plan. The assessment is expected to be completed by June 2022. Much of this assessment is devoted to the evaluation of the increasing risk of flooding due to climate change.



Drainage Infrastructure Program – Out of a concern about the condition of aging drainage infrastructure – particularly in the County's Development Areas, where it is ubiquitous and interconnected – the Board has directed staff to explore a program to proactively manage this infrastructure. Staff have so far invested in creating a GIS-map of this infrastructure and video-assessing a portion large enough to make sound estimates of long-term maintenance costs. However, absent from the current exploration is an analysis of the *adequacy* of this urban drainage system. We do not have a sense of conveyance deficiencies and flood risks.

Flood Study for Branchlands Neighborhood – The County recently received news that it will receive funding assistance from the Federal Emergency Management Agency (FEMA) through the 2020 Building Resilient Infrastructure and Communities (BRIC) grant program. This anticipated grant will support the development of a flood study for a particular urban area that is believed to be at elevated flood risk. The study will include the development of a flood model for the 770-acre watershed and the identification of flood mitigation projects to reduce the risks.

Together, these programs provide a logical path towards – and a sound foundation for – a community-wide flood resilience planning effort. The soon-to-be completed climate vulnerability assessment is a prerequisite to resilience planning, including flood resilience. The County's drainage improvement program will be significantly informed by the flood risks and mitigation projects identified by a flood resilience plan. And the Branchlands neighborhood flood study will allow for a sharper focus within an area of particular concern – both complementing the broader County-wide flood resilience plan and benefitting from its context.

Additionally, an obvious motivation for the County is to receive DCR approval of a flood resilience plan so that we will be eligible to submit future CFPF grant applications in the Project category, furthering the County's ability to implement capital projects and initiatives identified in the flood resilience plan.

Scope of Work

With the climate vulnerability assessment scheduled to be completed by June 2022 (comprising steps 1 and 2 in the adjacent image from the U.S. Climate Resilience Toolkit), the County is prepared to begin the next steps of developing a *climate* resilience plan – **investigate options** and **prioritize and plan**, steps 3 and 4.

The proposed flood resilience plan would be a major component of the climate resilience plan, and we envision these being developed in a single, coordinated process.

Steps to Resilience

1. Explore Hazards ✓
2. Assess Vulnerability & Risks ✓
3. Investigate Options
4. Prioritize & Plan
5. Take Action

Assessment of Capacity Needs and Assets

The County currently employs numerous staff in key roles who are proposed to be involved with this project, including:

- Irtefa Binte-Farid – Coordinator for Equity and Accountability
- Gabe Dayley* – Climate Protection Program Manager
- Serena Gruia – Public Engagement Coordinator
- Greg Harper*, P.E. – Chief of Environmental Services
- John Oprandy – Deputy Chief, Emergency Management (Fire Rescue)
- Frank Pohl, P.E. – County Engineer and Certified Floodplain Manager
- Laurel Williamson* – Watershed Stewardship Manager

** staff of Environmental Services Division*

Nonetheless, these staff do not have the current capacity necessary to successfully administer a planning initiative of this scale and within the desired timeframe. Each of the staff members listed above manage a large portfolio of projects. While they will contribute valuable knowledge and skills to the planning process, extra help with resilience planning project management is sorely needed. The County is therefore requesting CFPF support for hiring a qualified person in a temporary, full-time position to coordinate the overall process of developing a flood resilience plan. This person would work most directly with Gabe Dayley, the Climate Protection Program Manager.

In addition, although the existing staff listed above have a reasonable level of knowledge within their areas of expertise, the goals, strategies, and nature-based projects of the adopted plan will be sounder and more comprehensive with support from risk and resilience planning specialists. To this end, we also request CFPF funding to allow the County to secure technical assistance.

Finally, the best resilience plan will result from a planning process that centers equity and inclusive community engagement. We have identified two gaps in capacity in this regard that grant funds will allow us to fill. First, localities across the country have recognized the need for paid equity advisory groups comprised of residents who are often excluded from planning processes; such groups play a critical role in outreach to historically marginalized groups and in vetting strategies that local government staff develop.[1] Second, the success of such equity advisory groups hinges on adequate and appropriate training in understanding climate change; beyond compensation, this training builds the capacity of participants to engage in the process meaningfully. We include items in our budget to meet these needs for a robust, equity-centered flood resilience plan.

Goals and Objectives

The overall **goal** of the proposed planning effort is to better prepare the Albemarle community for future extreme storms driven by climate change by reducing risks to personal health and safety, to community wellbeing, and to property. This will be accomplished through the development and implementation of a county-wide flood resilience plan that is generally consistent with guidance provided in the *Grant Manual, Appendix G: Elements of Resilience Plans* (repeated in adjacent text box).

Elements of Resilience Plans (from CFPF Grant Manual)

- *is project-based with projects focused on flood control and resilience*
- *incorporates nature-based infrastructure to the maximum extent possible*
- *includes considerations of all parts of a locality regardless of socioeconomics or race*
- *includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation*
- *is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps*

Staff envision the plan incorporating the following **objectives**:

- covers the entire county jurisdiction – Development Areas and Rural Areas
- includes the engagement of local partners and stakeholders, including the City of Charlottesville, the Town of Scottsville, and the Virginia Department of Transportation
- emphasizes strengthening resilience among frontline communities, at-risk groups, lower-income areas, and communities of color
- includes considerable opportunities for community input – through the formation of a stakeholder advisory group and through broad community engagement
- considers and attempts to address historic and existing community inequities
- utilizes and builds on available science, technologies, local plans and analyses, and community knowledge and experiences
- identifies areas of flood risk
- identifies capital investments in infrastructure (nature-based to the extent possible) and policies and other adaptation measures to reduce the risks

Photo by Andrew Shurtleff (Daily Progress)

---

[1] Recent examples include climate action plans developed by Richmond, VA; Portland, OR, Oakland, CA; Washington, DC; and other localities.

- integrates other County goals into risk mitigation measures, such as pollution reduction to address local and Chesapeake Bay TMDLs, enhanced native biodiversity, climate change mitigation, and providing outdoor amenities for residents

Although the Albemarle community is fortunate in not having areas that experience significant, repetitive flood losses, there is still a history of losses across the county due to flooding – ranging from single residential lots to roadways and entire neighborhoods. County staff are aware of locations throughout the county that have experienced damages or are perceived to be at elevated risk. For instance, a very localized and extremely intense storm occurred in the vicinity of Ivy Creek in 2018 – killing two people and washing out Holkham Road, the only access to the neighborhood of Lewis Hill (see adjacent photo).

However, staff don't currently have a good sense of where risks are higher and could lead to greater losses – particularly in the denser Development Areas where risks may be driven by infrastructure deficiencies. One of the first steps in the development of a plan will be identifying knowledge gaps such as this.

Stakeholder Identification, Outreach, and Education Strategies

As mentioned, Albemarle County's climate resilience planning process – and flood resilience planning component – will involve robust, equitable engagement of community stakeholders, prioritizing engagement of historically marginalized communities who often lack the capacity to participate in traditional, centralized public engagement efforts (e.g., town halls at the County office building). We plan to use the results of our climate vulnerability assessment to engage in a three-pronged stakeholder engagement strategy, described below.

First, we will conduct outreach to and relationship-building with residents in areas of greater vulnerability identified in our climate vulnerability assessment, focusing on reaching residents who are lower income, communities of color, single-parent households, older populations, and other frontline communities. Our engagement of these residents will focus on asking questions about their lived experience in the community, drawing out information that is relevant to flood resilience and other climate resilience strategies. Following the example of Richmond, VA, we will ask questions at the level of people's daily lives and do the work ourselves of translating answers into more technical information to support our planning and projects. We will leverage partnerships with community-based organizations to help us reach communities who for a variety of reasons may distrust local government.

To support this crucial element of equity-centered community engagement, we will form a group of 10-12 people to serve on an Equity Working Group of grassroots community leaders. This working group will conduct outreach to frontline and underserved communities and will help to define and vet the plan's strategies. Group members will receive stipends to compensate them for their time and ensure diverse participation. Because this approach will be new for Albemarle County, we will reach out to other localities who have used similar working group formats to help develop our protocols for the Equity Working Group (e.g., attendance expectations, compensation).[2]

Second, we will engage key institutional stakeholders whose operations play a role or have a stake in Albemarle County's flood resilience. Examples include Albemarle County Fire Rescue, the City of Charlottesville, Town of Scottsville, Rivanna Water & Sewer Authority, Albemarle County Service Authority, Virginia Department of Transportation, internet service providers, electric utilities, Charlottesville Gas utility, University of Virginia, and others. Our resilience plan will reflect an understanding of the ways in which our actions to promote flood resilience will have ripple effects on our broader community and its infrastructure, and we will consider the needs, concerns, and ideas of these stakeholders (and the people they represent) when creating our strategies.

Third, we will include a traditional community engagement effort (e.g., town halls, public meetings) to reach a broad swath of interested and concerned residents.

To achieve meaningful involvement for members of the Equity Working Group, focus group participants, partner agencies, and the community as a whole, we need to ensure that participants are sufficiently knowledgeable about climate change.[3] To this end, our proposed project budget also includes funds to contract with a communications consultant well-versed in climate science who can help develop and support broad community engagement and outreach materials, training activities, and focus groups.

Photo by Andrew Shurtleff (Daily Progress)

---

[2] This model was piloted in Virginia by the Richmond 300 Master Plan and RVAgreen 2050 climate action planning process. Other localities across the country have piloted similar approaches, such as Washington, DC's Clean Energy Plan and Oakland, CA's Equitable Climate Action Plan.

[3] See the following EPA glossary for a definition of "meaningful involvement": EJ 2020 Glossary | US EPA

Implementation Plan and Timelines

Staff estimate that the entire process to develop a flood resilience plan – in coordination with the effort to develop a broader *climate* resilience plan – will take approximately 12 months, based on the following list of tasks and approximate date ranges.

Task	**Date**
Document existing social, economic, natural, and other conditions present in Albemarle County	completed
Review flood vulnerabilities, risks, and stressors, both natural and social	completed
Inventory & review of existing County and regional plans, policies, & programs that may influence Flood Resilience Plan (e.g., Comp Plan, Hazard Mitigation Plan, ordinances, dam safety program, TMDL Action Plans)	July 2022
Building on CVA, utilize FEMA's Hazus or comparable tool(s) to create model and identify flooding risks and hotspots	July – Sept
Utilize Hazus, GIS, and other tools to identify potential nature-based projects to mitigate flood risks and other adaptation measures	Aug – Oct
Form Equity Working Group (EWG) through an application and review process	Aug – Sept
Train EWG in principles of climate adaptation and resilience and equity-centered community engagement	Sept – Oct
Facilitate focus groups to explore identified risks and potential projects/measures	Oct – Nov
Broad stakeholder outreach & community engagement (town halls, workshops, digital events)	Nov – Jan 2023
Distill themes from community outreach	Jan 2023
Develop SMART goals and actionable strategies that establish parameters for projects and measures	Jan
Refine and prioritize list of projects and measures based on goals and strategies	Feb
Collect feedback from staff, community, frontline community representatives, and EWG on draft goals, strategies, projects, and measures	Feb – Mar
Conduct Equity Impact Assessment for each project/measure	Mar
Revise and finalize goals, strategies, projects, and measures	Apr
Finalize Flood Resilience Plan	May
Present Flood Resilience Plan to Board of Supervisors	May
Submit Flood Resilience Plan to DCR	Jun
Staff training on Flood Resilience Plan	July 2023

Responsible Party

Greg Harper – working with Gabe Dayley and other Environmental Services staff – will be the designated responsible party overseeing the plan development process.

Performance Outputs and Measures

The output from this initiative will be a county-wide flood resilience plan that will serve as a major component of a climate resilience plan. These two plans will be developed concurrently. The flood resilience plan will complement existing programs and initiatives by revealing currently unrecognized flood risks throughout the County and identifying projects, policies, and other mechanisms to effectively mitigate or adapt to these risks.

A successful project will have the following characteristics:

- the plan is consistent with DCR's guidance on plan elements and is ultimately approved by DCR
- the plan is developed through a process involving key stakeholders and the community at-large, prioritizing the engagement of historically marginalized communities
- the plan development process does not overstretch the current capacity limits of County staff
- the plan development process merges well with the broader process of developing a climate resilience plan
- the plan outcomes (i.e., project and policies) are clear, constructive, and practical and can be easily integrated into existing County programs and plans
- the plan is developed to the satisfaction of the Albemarle County Board of Supervisors

The following table presents a logic model for the County's flood resilience planning process. This model will guide project design, monitoring, and evaluation. A similar logic model will guide the County's overall climate resilience planning. Some elements of this logic model (e.g., goals and impacts) will be refined during the planning process through input from additional staff and community engagement.

Flood Resilience Planning Logic Model

Inputs	Activities	Outputs	Outcomes	Goals/Impacts
People • County staff • broad community • frontline community members • partner and stakeholder organizations • subject matter experts Funding • County funds • grants • partners Other Resources • County plans • model plans • best practices • agency resources • web tools	• vulnerability assessment (quantitative and qualitative) • community engagement (focus groups, town halls, digital) • staff engagement • partner and stakeholder engagement • technical analyses • define goals and impacts based on stakeholder input • draft plan with strategies and projects • seek feedback	Flood resilience plan (within an overall climate resilience plan) with project-based strategies for building resilience.	Projects, programs, policies, and procedures that build resilience and adaptive capacity among people, the built environment, and local ecosystems to increasingly frequent and severe extreme weather events induced by climate change.	Communities, neighborhoods, infrastructure, businesses, and institutions that are resilient to and able to adapt to the impacts of extreme rainfall and flooding caused by climate change.

Building and Maintaining Capacity

While this grant will fill a crucial capacity gap in *developing* an innovative and actionable flood resilience plan, the County has sufficient capacity to *implement* the plan in the long-term – essentially through integrating the plan outcomes into well-resourced existing programs and processes.

Staff capacity-building and training will be an important outcome of the process. Through involvement with this project, the staff identified above – and others as appropriate – will become more knowledgeable regarding community flood risks, the adaptive and resilience measures identified through the process, any tools that may be developed as part of this process, and the policies and other mechanisms put in place to formalize the flood resilience plan. In addition, once the plan is finalized, we will conduct internal training to familiarize appropriate staff with the final Plan and ways to incorporate the elements of the Plan into their roles.

For example, staff anticipate that the resulting plan will be incorporated into existing County and regional plans, including the County's Comprehensive Plan (currently under revision), the County's Climate Resilience and Adaptation Plan (to be developed concurrently with the flood resilience plan), and the regional Hazard Mitigation Plan, managed by the Thomas Jefferson Planning District Commission (currently under revision).

Staff also anticipate that the identified capital projects and other outcomes of the plan will be integrated into existing programs, such as the climate protection program, the drainage infrastructure program, the Total Maximum Daily Load (TMDL) program, and small-area planning processes. Through this assimilation, the plan's resilience and adaptation measures will be sustained by the influence, energy, and funding of these plans and programs.

One example of assimilating the flood resilience plan into an existing program relates to the drainage infrastructure program. If, for instance, a deteriorating culvert needs to be replaced (one such culvert from the recent past is shown in the adjacent image), the flood resilience plan would be referenced to determine whether the culvert is a restriction to sufficient flow and putting areas at increased flood risk. If so, the culvert would be upsized, reconfigured, or augmented with green infrastructure upstream to reduce the flood risk.

Another example relates to the County's long-standing tradition of incorporating green infrastructure into the built environment when opportunities arise. The adjacent image depicts a project in which a simple detention basin was converted into a constructed-wetland system for better water quality treatment. The County implements projects such as this to meet TMDL-driven pollution reduction requirements but also voluntarily in the spirit of the County's vision and values relating to environmental protection. The nature-based projects that will be identified in the flood resilience plan will provide additional inspiration for future projects.

While implementation of the flood resilience plan will be sustained through its integration into existing programs, the County also intends to advance implementation by using the flood resilience plan in the future to support grant applications to the CFPF and other external funding sources.

Outside local government, we also expect our equitable and inclusive planning process to build the capacity of our community members to participate in flood and climate resilience efforts. The process will therefore yield ripple-effect benefits in the community beyond the direct outputs of the plan itself.

Budget Narrative

Estimated Total Project Cost – We estimate that the total cost of this project is **$213,750**. This total includes costs to hire a new temporary staff person, a subject-matter consultant, a communications consultant, and stipends for 12 Equity Working Group members. This total does *not* include any costs associated with existing County staff who will also be working on the project. The level of effort needed to implement each project task is quantified as hours and costs in the table below, divided up among the various project players.

	HOURS				
TASKS	**Existing Staff**	**New Temp Staff**	**Subject-Matter Consultant**	**Communi-cations Consultant**	**Equity Working Group**
Document existing social, economic, natural, and other conditions present in Albemarle County	Completed as part of Climate Vulnerability Assessment (CVA)				
Review flood vulnerabilities, risks, and stressors, both natural and social	Nearly complete, as part of CVA				
Inventory & review of existing County and regional plans, policies, & programs that may influence Flood Resilience Plan (e.g., Comp Plan, Hazard Mitigation Plan, ordinances, dam safety program, TMDL Action Plans)	10	40	10		
Building on CVA, utilize FEMA's Hazus or comparable tool(s) to create model and identify flooding risks and hotspots	20	20	250		
Utilize Hazus, GIS, and other tools to identify potential nature-based projects to mitigate flood risks and other adaptation measures	20	20	100		
Form Equity Working Group (EWG) through an application and review process	80	80			
Train EWG in principles of climate adaptation and resilience and equity-centered community engagement	20	80		40	60
Facilitate focus groups to explore identified risks and potential projects/measures	40	100	20	40	200
Broad stakeholder outreach & community engagement (town halls, workshops, digital events)	40	100		100	400
Distill themes from community outreach	10	40		20	100
Develop SMART goals and actionable strategies that establish parameters for projects and measures	10	50	20	20	200
Refine and prioritize list of projects and measures based on goals and strategies	10	50	80	20	200
Collect feedback from staff, community, frontline community representatives, and EWG on draft goals, strategies, projects, and measures	40	80			200
Conduct Equity Impact Assessment for each project/measure	20	40			200
Revise and finalize goals, strategies, projects, and measures	20	40	60		300
Finalize Flood Resilience Plan	40	150			
Present Flood Resilience Plan to Board of Supervisors	8	20			
Submit Flood Resilience Plan to DCR		20			
Staff training on Flood Resilience Plan	120	40			
Additional project management & coordination	20	80	50		
Estimated HOURS	528	1050	590	240	1860
Estimated RATES* (per hour)		$45	$150	$150	
Equity Working Group STIPEND (per member)					$3,500
# of Equity Working Group members					12
Subtotals	*n/a*	*$47,250*	*$88,500*	*$36,000*	*$42,000*
**New Temp Staff rate includes salary + 30% fringe*			**Total Project Cost**		**$213,750**

Amount of Funds Requested from the Fund – We request **$160,313** from the CFPF, which reflects 75% of the estimated total project cost shown above. We propose that these CFPF grant funds be allocated as such:

Budget Category	CFPF Budget	Notes
Salary (New Temp Staff)	$33,075	CFPF covers New Temp Staff costs
Fringe (New Temp Staff)	$14,175	
Contractual	$71,063	CFPF covers **portion** of consultant costs
Stipends (Equity Working Group)	$42,000	CFPF covers Equity Working Group stipends
TOTAL:	**$160,313**	

Amount of Cash Funds Available – Albemarle County will provide **$53,438** in cash match to cover the 25% remainder of the estimated total project cost. See **Appendix B** for assurance of matching cash funds available. The County's matching funds will be provided through two budgets – an operating budget associated with the climate protection program and a capital budget associated with the drainage infrastructure program.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Application Form CFPF| 2-A

Study Grants (Check All that Apply)

- ☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.
- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.
- ☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

<u>**Capacity Building and Planning Grants**</u>

RE: Authorization to Request Funding / Assurance of County Matching Funds

To Whom it May Concern,

Albemarle County is pleased that Virginia has joined the Regional Greenhouse Gas Initiative (RGGI) and is grateful for the opportunity to submit this application as part of the **third round of** the Community Flood Preparedness Fund grant funding made possible by RGGI.

The enclosed grant application is to seek **$160,313 in CFPF support** for developing a flood resilience plan for Albemarle County. This funding support is particularly timely. A climate vulnerability assessment for Albemarle County will be completed in the next several months and we intend to promptly move into the next phase of climate resilience planning. We envision the flood resilience plan being a major component of a comprehensive *climate* resilience plan. In addition, our drainage maintenance program – which we have been developing for the last couple of years – will be greatly informed by a flood resilience plan.

Our total estimated project budget is $213,750. Per the grant application process, I hereby confirm that the County has identified the necessary funds for the required match of $53,438. This funding presently exists in two budgets – an *operating* budget associated with our climate protection program and a *capital* budget associated with our drainage infrastructure program. These funds have already been appropriated by the County Board of Supervisors and can be utilized at the discretion of staff for uses consistent with the appropriation language.

We look forward to the Virginia Department of Conservation and Recreation's support in moving our community towards greater flood resiliency in a strategic, inclusive, and equitable manner.

Sincerely,

Jeffrey B. Richardson
County Executive

jbr22-003

Appendix C: Supporting Documentation

Albemarle County Floodplain Ordinance	The County's floodplain ordinance is codified in the following ordinance sections: - Zoning Ordinance Section 30.3 – Flood Hazard Overlay District - Subdivision Ordinance Section 14-308 - Floodplain and topographic information; information to demonstrate that damage from flooding will be minimized
Hazard Mitigation Plan	The Natural Hazard Mitigation Plan is developed at a regional level by the Thomas Jefferson Planning District Commission. This Plan was last adopted in 2018 and is currently under revision.
Albemarle County Comprehensive Plan	The County's Comprehensive Plan was last adopted in 2015 and is currently under revision.
Social vulnerability index score(s) for the project area	The social vulnerability index scores range across the county from *very low* to *moderate* (see image below), with the majority of the County being *low*. 
Appendix D: Scoring Criteria for Capacity Building & Planning

Applicant Name:	**County of Albemarle, Virginia**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	XX
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	XX
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	XX
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	XX
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration			Yes No
Applicant Name:	**County of Albemarle, Virginia**		
Scoring Information			
Criterion		**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)			
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans. (Note: proposed flood resilience plan will be used to inform updates to the County's Comprehensive Plan and the regional Hazard Mitigation Plan.)		**55**	**55**
Development of a new resilience plan.		**55**	**55**
Resource assessments, planning, strategies, and development. (Note: intended to be outcomes of proposed flood resilience planning process.)		**45**	**45**
Policy management and/or development. (Note: intended to be outcomes of proposed flood resilience planning process.)		**40**	**40**
Stakeholder engagement and strategies. (Note: will be part of the proposed flood resilience planning process.)		**25**	**25**
Goal planning, implementation, and evaluation. (Note: intended to be outcomes of proposed flood resilience planning process.)		**25**	**25**
Long term maintenance strategy.		**25**	**25**
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.		**15**	n/a
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)			
Very High Social Vulnerability (More than 1.5)		**15**	
High Social Vulnerability (1.0 to 1.5)		**12**	
Moderate Social Vulnerability (0.0 to 1.0)		**8**	2
Low Social Vulnerability (-1.0 to 0.0)		**0**	0
Very Low Social Vulnerability (Less than -1.0)		**0**	0
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?			
Yes		**10**	
No		**0**	**0**

9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	**0**
10. Does this project provide “community scale” benefits?		
Yes	**20**	**20**
No	**0**	
Total Points		**292**

April 7, 2022

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

To Whom it May Concern,

The City of Charlottesville expresses its support of Albemarle County's Community Flood Preparedness Fund (CFPF) grant application to develop a flood resilience plan, as part of its larger climate resilience endeavors.

Local watersheds span across many jurisdictional boundaries and both Albemarle County and the City of Charlottesville are committed stewards of these systems. As such, the City will be an interested and active stakeholder in the development of the County's flood resilience plan and how it may inform our own flood resiliency efforts. The City and County are frequent and seasoned partners, especially when it comes to watershed planning, stormwater management, and climate action. This long history of regional partnership will continue in this new era of flood and climate resilience work.

We believe that Albemarle County has laid out a robust process for developing a flood resilience plan. As it is for the City of Charlottesville, CFPF funding will be crucial for providing the resources necessary to create a thorough and inclusive plan in a timely manner.

We encourage DCR to approve Albemarle County's application for CFPF funding and look forward to working together with the County.

Sincerely,

Andrea Henry

Virginia Department of Conservation and Recreation
Community Flood Preparedness Fund
Richmond

Dear grant review team,

Please accept for your consideration this letter of support from the Town of Scottsville, with regard to the Albemarle County application for the Community Flood Preparedness Fund. The County's proposal for flood resilience planning has substantial benefits to the Town of Scottsville, and we commend the work of the County staff on this project.

The County proposal applies industry best practices to an urgent need, where existing capacity is weak.

The Town is currently working on a grant from this program, awarded in the December round, to update our obsolete floodplain maps. The County's proposal enhances our work and extends it to a much larger service area, over 700 square miles. The resilience plan takes a wider view of both prevention and response priorities, and it connects the disciplines of emergency management and climate science, which suffer from silo thinking.

The County plan will have direct benefits to the Town of Scottsville. Most notably, it will assess aging urban drainage infrastructure. No such study exists for the historical stormwater system in town. The plan is also notable for its very deliberate equity lens. Infrastructure in town has never before been studied this way. I am eager to support a process of inclusive outreach and community engagement.

Please feel free to contact me with any questions about the project, or if I can be of other assistance.

Respectfully,

Matthew Lawless
Town Administrator

To Whom it May Concern,

Albemarle County is pleased to submit this application to the Virginia Department of Conservation and Recreation for grant support from the Community Flood Preparedness Fund (Round 3). Attached you will find a PDF document that includes all the necessary elements of a CFPF application in the "Capacity Building and Planning" category, as described in the grant manual.

I wanted to note that we submitted an application in the last round, but it apparently got lost and wasn't reviewed. So to be safe, could you please confirm that you have received the application?

We greatly appreciate this opportunity!

Sincerely,

Laurel

6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Scoring Criteria Projects 2-B

Yes	**10**	
No	**0**	
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	
No	**0**

Studies Eligible for Consideration	☐ **Yes** ☐ **No**
Applicant Name:	

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Re: Authorization of King George County CFPF Application

To Whom it May Concern,

King George County is pleased to submit this application for capacity building and planning funds to develop a Resiliency Plan. The Plan will fulfill a pressing need for the County to have a plan that addresses flood resiliency. Flooding is a major concern for the County's citizens and until now, there has not been a focused effort to address it directly. Additionally, having a Plan will make the County eligible for future participation in the Community Fund Preparedness Fund (CFPF).

Under the direction of the King George County Board of Supervisors, I, as County Administrator, am authorized to request funding from the CFPF for the development of a Resiliency Plan as outlined in the enclosed application. The application includes a budget narrative containing the estimated cost to develop the Plan, amount of funds requested from the CFPF, and the amount of cash funds available as match. I am reconfirming what is stated therein, that the County will appropriate the requisite 25% or \$10,100 in required local cash match funds, and that these funds will be paid from the County's *Professional Services - Engineering* budget, which currently contains approximately \$50,000. Please note that this budget contains sufficient funds to cover the total costs of the project pending reimbursement of awarded funds.

Sincerely,

Christopher Miller
County Administrator
King George County, VA

KING GEORGE COUNTY

Round 3 Application for the
Virginia Community Flood
Preparedness Fund
2022 Grant Funding

Capacity and Planning
Resiliency Plan Development

DCR
Virginia Department of Conservation & Recreation

Est. 1720

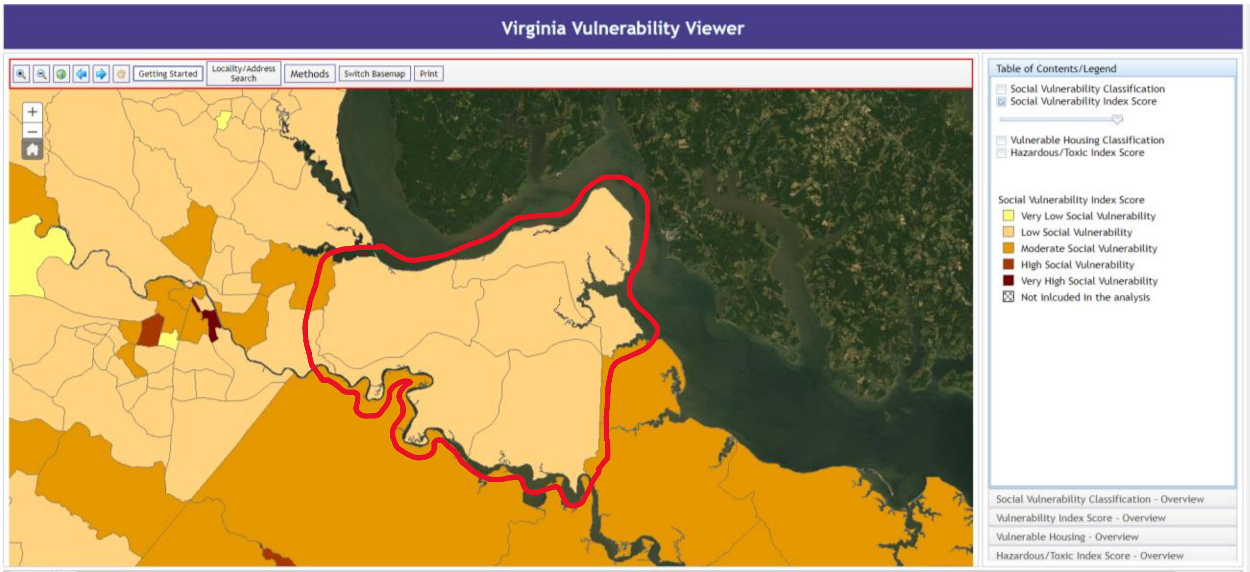
Contents

Introduction

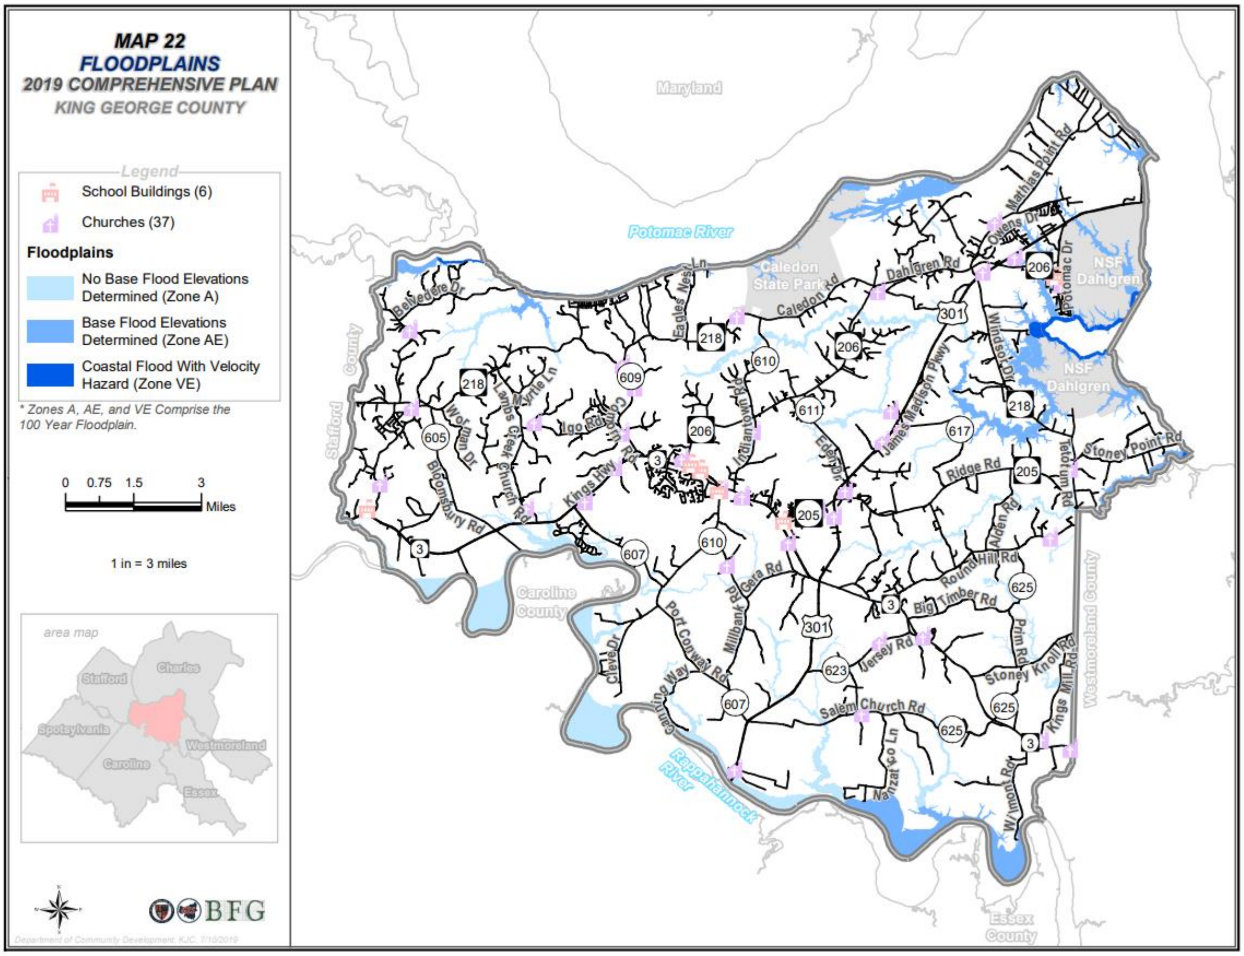
King George County lies between the Potomac and Rappahannock rivers with a population of approximately 27,489 (U.S. Census Quickfacts). It is comprised of a number of designated communities: Courthouse/Courthouse West, Dahlgren, Route 3 West, Fairview Beach, Hopyard, Cleydael, Oakland Park, Rappahannock River/South, and Potomac River/North. The County Comprehensive Plan (link) details the demographic makeup of each of these communities.

The Comprehensive Plan also details the issues of shoreline erosion and flooding in the County. Certain reaches of the Potomac are experiencing 2.2 ft of erosion per year. Due to the adopted Chesapeake Bay Preservation Ordinance, several stormwater BMPs have been installed in the County, which are all relatively new but will require inspection and maintenance. The Plan also discusses the FEMA floodplains and ratings. King George is part of the GW Regional Planning District, and is included in their regional Hazard Mitigation Plan (HMP; link). The HMP covers the threat of flooding in a general sense and illustrates that although the County has relatively fewer flooding problems overall, there are significant problem areas that need addressing.
What the Comprehensive Plan and Hazard Mitigation Plan do not address – and what this Resilience Plan aims to cover – is a more comprehensive overview of the flooding issues in the County, the communities those issues affect and their socioeconomic vulnerability to such threats, prioritization of flood mitigation projects that can address them community-wide, and support for community education on flood resilience goals, objectives, and practices.

According to the AdaptVA Social Vulnerability Tool, Census Tracts in King George County (outlined in red in the image below) have Low Social Vulnerability Index Scores. Additionally, according to the US Census Bureau, the median household income for King George County is $96,711, which is above the state median income ($76,398), meaning the County does not qualify as a low-income geographic area for purposes of the CFPF program.



(Source: AdaptVA Vulnerability Viewer)



(Source: King George County Comprehensive Plan)

In compliance with participation in the NFIP, King George County has also adopted a Floodplain Management Overlay District to address existing buildings and new construction permits within FEMA designated floodplains (link). The Resilience Plan planning process may be useful for crafting policies to support future implementation through zoning.

The Virginia Coastal Resilience Master Plan effort undertaken in 2021 attempted to capture coastal flooding's effect on infrastructure, natural resources, and different populations. However, this undertaking only captured coastal effects (and not riverine/fluvial), and because of time constraints may not have fully captured flooding problems that residents of King George County face. It may also have used methodologies for determining vulnerability that relevant stakeholders might alter based on their local experience. So, whereas this effort, too, found many areas of King George County comparatively less vulnerable (except for some highly vulnerable hotspots), it did not capture the whole story. The Resilience Plan would seek to fill in some of the gaps in identifying communities and flood issues, helping the County to inventory and development a plan to capitalize on opportunities and address issues.

The Resilience Plan can then serve as a tool for public and policymaker education on flooding resiliency and can serve as a formally adopted plan for future grant applications.

Scope of Work Narrative

The development of the King George Resilience Plan will involve three principal tasks:

- Kick-off meeting with County Staff and identified stakeholders to focus the development of the Plan and collect initial input;

- Development of a draft Resilience Plan with consultation and direction from County staff and identified stakeholders, and drawing upon the regional *Hazard Mitigation Plan* and *King George County Comprehensive Plan*. The draft Resilience Plan will describe the County's approach to flooding and meet the following criteria:

  1. It is project-based with projects focused on flood control and resilience.
  2. It incorporates nature-based infrastructure to the maximum extent possible.
  3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
  4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
  5. It is based on the best available science and incorporates climate change and current flood maps.

  Additionally, the Plan will include a project prioritization component.

- Based upon feedback and comments, a final Resilience Plan will be prepared and presented to County Staff for consideration and adoption. Once adopted, the Plan will be submitted to the Virginia Department of Conservation and Recreation for approval.

Development of the Resilience Plan will address the following, as detailed:

1. **The Plan will assess capacity needs and assets to include**:

   a. **Resource needs identification - financial, human, technical assistance, training.** King George County is building off of the Floodplain Management Overlay District ordinance, regional Hazard Mitigation Plan, Coastal Resilience Master Plan, the 2019 Comprehensive Plan update, and local knowledge of flooding issues to provide a more complete look at the flooding problems in the County, the specific communities and geographies they affect, and potential projects to remediate them. King George County is not an MS4 community, and much of the stormwater infrastructure is private, so identifying projects that the County, as well as the local Service Authority, can manage will be a priority.

Organizationally, the County acknowledges the need to prioritize and focus efforts on proactively addressing community flooding issues, and the Resilience Plan will be responsive to these needs. County staff are especially interested in education on how nature-based solutions can alleviate identified concerns.

b. **Plan for developing, increasing, or strengthening knowledge, skills and abilities of existing or new staff. This may include training of existing staff, hiring personnel, contracting with of expert consultants or advisors.** The Plan will identify education or resource capacity needs of the County and its Staff, and present recommendations and best practices to address prioritized issues and opportunities.

c. **Resource development strategies. Where capacity is limited by funding, what strategies will be developed to increase resources in the local government? This may include work with non-governmental organizations, or applying for grants, loans, or other funding sources.** The Plan will work to identify strategies to address identified resource capacity needs. Additionally, the Plan itself will qualify the County for further project funding, and will be leveraged to support other funding opportunities, such as FEMA HMA, BRIC, and FMA, among others.

d. **Policy management and/or development.** The Plan will work to identify and inventory County policies pertaining to flooding and related resilience, and explore the development of new policies based upon identified issues and opportunities.

2. **Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.** The Resilience Plan will identify communities most affected by flooding and use a stakeholder engagement and data-focused approach to identify community-wide and County-wide benefits when selecting potential flood remediation projects. The Resilience Plan will be used as focused guide to addressing flooding within the County.

3. **Stakeholder identification, outreach and education strategies.** Stakeholders will include representatives of County staff and elected and appointed officials, and may also include, with outreach to, emergency managers, the local Service Authority, Naval Support Facility (NSF) Dahlgren, state agency representatives, community champions, HOAs, and other parties. Outreach and meetings will be mostly if not entirely virtual. The Resilience Plan may be disseminated online or otherwise used to inform the public and illustrate the work necessary to alleviate flooding issues.

4. **Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.** After receipt of award

notice, a kick-off meeting will be held within 30 days. A draft of the Resilience Plan will be delivered within 60 days of that kick-off meeting. Based upon feedback and comments from County staff, elected and appointed officials, and the public, a final version of the Plan will be developed within 30 days of the receipt of all comments; this final version of the Plan will be presented to the County's Board of Supervisors for consideration and adoption, with any revisions made as requested. Upon adoption, the Plan will be submitted to the Virginia Department of Conservation and Recreation for approval.

5. **Parties responsible for capacity building and/or plan development process.** King George County will utilize professional and non-professional services consultants to develop the plan in coordination with County staff and other stakeholders.

6. **Performance outputs and measures. Describe the expected results and benefits and how success will be measured.** Success will be measured firstly by adequately meeting the five requirements of a Resilience Plan as outlined by the Community Flood Preparedness Fund Manual, while also providing robust project prioritization metrics and carry-through to local adoption. The Resilience Plan will include a prioritized list of projects, the success of which will be measured by their adoption and utility in leading to flood mitigation.

7. **Planning for maintaining capacity, as necessary, over the long term.** The Resilience Plan is perhaps an initial step in establishing the County's capacity and planning for addressing flooding issues. The County intends to use the opportunity for the Plan to serve as a foundational document to support emerging and future efforts. King George County is committed to helping its member localities tackle the threat to property, lives, and livelihoods resulting from preventable flood damage.

Budget Narrative

ESTIMATED TOTAL PROJECT COST

The estimated total project cost is $40,400 based upon a scope of services provided by The Berkley Group (Attachment 1), along with costs associated with public engagement and advertising to support adoption of the Plan.

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $30,300, or 75% of total project costs, as the project is not located in a low-income geographic area.

AMOUNT OF CASH FUNDS AVAILABLE

King George County will appropriate the requisite 25% or $10,100 in required local cash match funds, to be combined with the $30,300 in grant assistance to equal the total estimated project cost. The County's commitment to the match is addressed in the authorization to request funding, as the Application cover letter. Match funds will be paid from the County's *Professional Services - Engineering* budget; currently this budget contains approximately $50,000. This budget contains sufficient funds to cover the total costs of the project pending reimbursement of awarded funds.

Additionally, while not qualifying as match, County staff time will be dedicated to the project, including that of the Senior Planner, Environmental Inspector, and County Engineer).

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is addressed in the Application cover letter.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X* No ____

*while the County does not qualify as a low-income geographic area, as defined, it is the County's intent for the developed resilience plan to benefit low-income populations within the County.

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☒ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☒ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): King George County

Appendix D: Scoring Criteria for Capacity Building & Planning

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	☑
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	☑
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☑ **Yes** ☐ **No**

Applicant Name:	

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	**55**	
Development of a new resilience plan.	**55**	55
Resource assessments, planning, strategies and development.	**45**	45
Policy management and/or development.	**40**	40
Stakeholder engagement and strategies.	**25**	25
Goal planning, implementation and evaluation.	**25**	25
Long term maintenance strategy.	**25**	25
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.	**15**	15
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based on [ADAPT VA's Social Vulnerability Index Score.)](#)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	0
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	0
10. Does this project provide "community scale" benefits?		
Yes	**20**	20
No		
Total Points		**250**

Appendix D: Checklist All Categories

Scope of Work Narrative

BERKLEY
GROUP

ATTACHMENT 1

February 24, 2022

Ms. Angela (Tina) Turner
Procurement Specialist
King George County
10459 Courthouse Drive, Suite 201
King George, Virginia 22485

RE: Work Order ##: Grant Assistance and Resilience Plan

Dear Ms. Turner:

We are pleased to present the attached scope and fee to prepare an application for a Virginia Community Flood Preparedness Fund grant and to develop a Resilience Plan for King George County.

If you have any questions or need additional information, please feel free to contact me at any time.

Sincerely,

Andrew D. Williams, AICP
Chief Executive Officer

I have reviewed the scope and fee for the associated work order, and I hereby give the consultant notice to proceed for the work described herein.

____ ____________________

Ms. Angela Turner, Procurement Specialist Date

SCOPE OF SERVICES

The Scope of Services will include the following phases, tasks, and deliverables:

Phase 1 - Grant Application

Task 1 - Application Preparation

The Berkley Group will work with the County to prepare an application seeking a grant under Round 3 of the Virginia Community Flood Preparedness Fund for the development of a Resilience Plan for the County.

Deliverables: The Berkley Group will provide the final application to the County no later than April 1, 2022, one week prior to the April 8, 2022 submittal deadline. The County will be responsible for filing the application.

Phase 2 - Development of Resilience Plan

Phase 2 is contingent upon the County being successfully awarded a Community Flood Preparedness Fund grant in the amount requested for the development of a Resilience Plan.

Task 1 - Project Management and Coordination

The Berkley Group will manage the project and coordinate with County staff as needed to collect input, provide updates, and share information related to the project. This scope assumes that all meetings, as well as the associated tasks noted herein, will be conducted virtually.

Task 2 - Kick-Off Meeting

The Berkley Group will conduct a kick-off meeting with County staff to review the scope, expectations, schedule, deliverables, and any additional considerations associated with the development of the Resilience Plan. This kick-off meeting will occur within 30 days of the Berkley Group's receipt of a notice to proceed with Phase 2 from the County (presumed to follow the award of the grant and/or the execution of a contract between the County and the funding agency).

Task 3 - Draft Plan

With consultation and direction from County staff, and associated public engagement, the Berkley Group will prepare a draft of the Resilience Plan for the County. Pursuant to Virginia Department of Conservation and Recreation and Community Flood Preparedness Fund standards and requirements, the draft plan will describe the County's approach to flooding and meet the following criteria:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. It is based on the best available science and incorporates climate change and current flood maps.

Deliverables: The Berkley Group will provide a draft of the Resilience Plan to the County for review. The draft of the Resilience Plan will be provided to the County no later than 60 days following the date of the kick-off meeting conducted under Phase 2, Task 1.

Task 4 - Final Plan
Once all feedback and comments have been received from the County, the Berkley Group will address comments, make final revisions to the Plan, and produce a final Plan.

Deliverables: The Berkley Group will provide a final Resilience Plan to the County for review. The final Resilience Plan will be provided to the County no later than 30 days following the Berkley Group's receipt of feedback and comments from the County.

Task 5 - Plan Adoption
The Berkely Group will assist County staff, as requested, with the presentation of the Resilience Plan to the Commission for adoption. The Berkley Group will make any revisions to the Plan as requested by the Commission. Contingent upon the County's adoption of the Plan, the Berkley Group will assist the County in the submission of the Plan to the Virginia Department of Conservation and Recreation for approval. The Berkley Group will make any revisions to the Plan as requested by the Department of Conservation and Recreation which are necessary for Department approval.

Deliverables: Contingent upon revisions necessary under Phase 2, Task 4, the Berkley Group will provide a final Resilience Plan to the County incorporating revisions requested by the Commission and the Department of Conservation and Recreation.

ASSUMPTIONS

1. **Contact Person:** The County will provide a single staff contact that will be responsible for collecting and transmitting data, resources, and other related information to the Berkley Group.
2. **Deliverables:** Deliverables will be provided in digital format to the County.
3. **Covid-19 Policy:** Berkley Group staff will adhere to all public health best practices as recommended by the Center for Disease Control (CDC) or state/local regulations, whichever is more stringent. When engaging in face-to-face meetings with clients and citizens, The Berkley Group requires adherence with the Commonwealth of Virginia's prevailing guidelines as it pertains to social gatherings for business sectors and/or the locality's, in the event they are more stringent. For meetings where attendance from the general public is expected, the locality should consider if/how the prevailing safety guidelines will be enforced and what acceptable measures will be taken for those refusing compliance and communicate those plans to The Berkley Group prior to the meeting date.

FEE

The fee for the services to be provided under Phase 1 of the Scope of Services will be based upon the hours necessary to complete the work, at the following rates, but shall not exceed $3,600.

Hourly Rates	
Owner/Principal	$175
Executive Manager	$120
Director	$100
Principal Planner	$80
Senior Planner	$65
Planner	$50

The lump sum fee for services to be provided under Phase 2 of the Scope of Services for the development of a Resilience Plan is $38,000.

King George County - Community Flood Preparedness Fund Application

1 message

Louis Pancotti <lpancotti@co.kinggeorge.state.va.us> Thu, Apr 7, 2022 at 3:39 PM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: Heather Hall <heatherh@co.kinggeorge.state.va.us>

Good afternoon,

Attached to this email is King George County’s application for Round 3 of the CFPF program. We are seeking funds for the development of a Resiliency Plan as part of capacity building and planning. We feel that a resiliency plan would be a great planning tool for crafting future policies and identifying potential flooding related issues in the County. Please feel free to contact me with any questions or concerns regarding the application. We look forward to hearing from you soon.

Sincerely,

Louis Pancotti, CZA

Senior Planner

Virginia Community Flood Preparedness Fund Grant Application

2-Dimensional Stormwater Management Model for Meadow Creek and Rivanna River Watersheds

Rivanna River Flooding, May 2018

CITY OF CHARLOTTESVILLE
Department of Public Works
305 4th Street NW • Charlottesville, Virginia 22903
Telephone 434-970-3631

Grant Application Information

This Virginia Community Flood Preparedness Fund (CFPF) grant application is being submitted by the City of Charlottesville, Virginia. Completed copies of the CFPF grant application form (Attachment A) and Study Scoring Sheet (Attachment B) are provided.

The completion of this project will, in conjunction with the City's Round 1 grant award, result in a series of stormwater management models covering the entirety of the City's jurisdictional limits. These models will meet the criteria for studies, as outlined in the 2022 grant manual, including:

- Hydrologic or hydraulic studies of floodplains to clarify or update FEMA Flood Insurance Rate Maps. (Schenks Branch Tributary, Meadow Creek).
- Studies and Data Collection of Statewide or Regional Significance:
    - Updating precipitation data and IDF information
    - Other proposals that will significantly improve protection from flooding on a statewide and regional basis. (informs future conveyance needs to mitigate damage from nuisance flooding)
- Revisions to existing comprehensive and hazard plans, based on the 2008 SWWM model.
- Other relevant flood prevention and protection project or study (the impacts of climate influenced storm events on pluvial flooding in urban environments).

Overview

The City of Charlottesville, Virginia's corporate limits of 10.2 square miles and population of just under 46,786 people are located within the 750 square mile Rivanna River watershed, one of the largest watersheds in Virginia and a major tributary to the Chesapeake Bay.

As stewards of the watershed, the City of Charlottesville manages many components of a stormwater infrastructure system, both natural and built, including the following:

- 35 miles of open waterways
- 130 miles of storm drain
- 8,250 stormwater structures (inlets, manholes, junction boxes, etc.)
- 460 outfalls
- 294 BMPs
- 445 acres of Zone AE floodplain

In 2008, the City of Charlottesville, in partnership with the Army Corp of Engineers (USACE), hired URS to develop a comprehensive stormwater model representing the majority of the City's stormwater management inventory. This model was designed to do the following:

1. Produce an updated technical basis for the City's stormwater management program that could be used to make good management decisions,

2. Create computer models that could be modified in the future as additional field data was collected and future developments were considered, and

3. Identify major flooding points within the City's stormwater and drainage systems for both existing and future land cover conditions.

The existing model represents the input data and best methodology available in 2008. The purpose of this grant application is to update a portion of the existing SWMM model for use as initially intended, as well as expanding the model beyond its originally identified applications. Uses will include analyses of storm sewer capacity issues, identification of special flood hazard zones for major tributaries, identification of problem areas, development and prioritization of solutions, and support for public outreach and education.

Area of Interest

The grant application will focus on the portion of the Meadow Creek and Rivanna River watersheds within City limits, approximately 6.5 square miles and 63% of the City's geographical area.

Because of the increased complexity of the updated model, each watershed will be evaluated in separate models, including the Moores Creek watershed model currently under development.

SWMM Inventory

PCSWMM Version 5.0.11 was originally used by URS in 2008. The model delineated approximately 360 subbasins in order to distribute point sources for inflow throughout the entire area. The entire SWMM model has over 750 nodes and over 800 links, making it an extremely large and complex model for this locality.

The focus of model updates will include the following general categories:

Increased Functionality

The existing model will be imported to the most current version of PCSWMM, running on an EPA SWMM 5.1.015 engine. This will enable the City to take advantage of increased functionality in the model, especially a combined 1D-2D approach to system analysis. The 1D model cannot identify flood at-risk areas due to a lack of infrastructure. Additionally, it cannot support an impact analysis of undersized or non-existent systems. Identifying areas of vulnerability, including roads, residences, and critical facilities, will be important when prioritizing improvement projects and can be accomplished with 2D modeling.

Future areas of vulnerability will be identified based on predictions of climate change- influenced storm events and records of recent storm data. The City will use NOAA Atlas 14 adjusted IDF curves and IDF curves developed specifically for the Chesapeake Bay watersheds. These precipitation events will be important for determine future stormwater conveyance and land use needs.

2D capabilities within the model will now allow the City to develop existing and potential future floodplain delineations for tributaries that are currently unmapped.

Updated Data

Since 2008, the City has been actively updating GIS layers for impervious cover, streams, and the storm drain network. This GIS layer will be compared against the network in the existing SWMM model to identify discrepancies and the model will be updated accordingly. Select areas of the watershed will be surveyed to validate or clarify the GIS data provided by the City.

The City implemented a stormwater utility fee in 2013 and has been implementing a vigorous storm drain rehabilitation program. The updated model will incorporate increased conveyance and alignment changes associated with work done under this program in the last 8 years. Updates from other projects, including private developments and transportation improvements, will also be incorporated into the new model.

Manageable Output

In this iteration of the model buildout, careful consideration will be given to how output data is organized and communicated. While the SWMM model will be run and managed by engineers within the City, the data should be useful to parties beyond experienced SWMM users. Nomenclature in the model should mirror that used by the City’s utility inventory. GIS output should include not only location but useful information for future design and analysis of the system, including inverts, size, material, depth of cover, and percent capture for design storms.

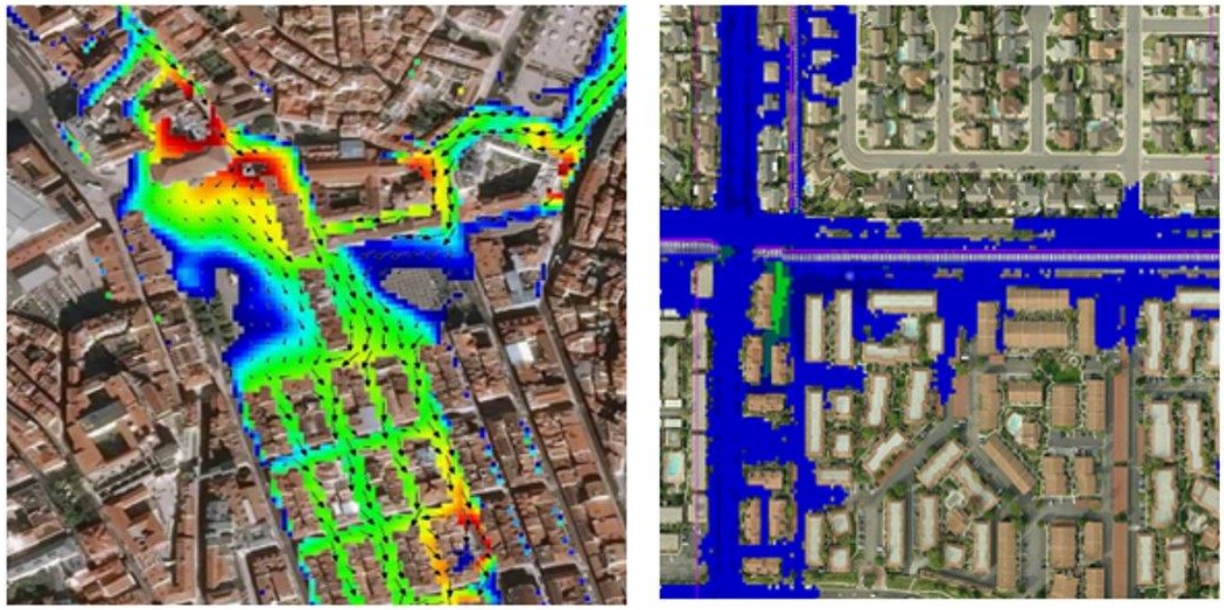
Aggregated sub-basin delineations should match larger delineations for minor and major tributaries, allowing for an infrastructure inventory and flood assessment per receiving water body. This will be especially useful as the City considers simplifying its 38 named drainage areas to less than a dozen drainage areas associated with named tributaries.

Future Uses

Master Planning

The primary function of the SWMM model is to analyze the watershed by using configurations to quantify flooding associated with both existing and future watershed conditions. Potential drainage improvement projects can be geospatially mapped in relation to predicted future flooding, so City staff can make assessments about the value of individual projects. The advantage of this approach is that the entire drainage system can be evaluated on a consistent, system-wide basis.

Consistent and transparent methods of analysis when determining how and where to spend taxpayer money are essential for prioritizing improvements in an equitable manner. Although additional consideration factors, including other master plan objectives, location-specific funding opportunities, a history of underinvestment, etc., can also be incorporated into a system of project selection, the foundation of project prioritization should be the quantification of potential impacts from existing and future flooding events. An objective analysis using industry standard methodology applied over the entire City is a key element to achieving this goal.



2D Flood Modeling output

Images Courtesy of: Montalto, Franco, PE, PhD.(2021), “H&H Modeling 101” from Overwhelmed? Reevaluating Stormwater Modeling in Changing Climate webinar series, Power Point Presentation

Flood Mitigation Projects

The SWMM model can also be used to design improvement projects based on impact analyses and the subsequent development of a prioritization system. The benefit of having larger projects designed within a SWMM model is that the effects of the individual projects on the performance of the entire drainage system can be evaluated holistically, rather than in piecemeal fashion. This approach ensures that monies are well spent, and that each project is truly needed as part of an overall master drainage plan. The model should also be useful for obtaining starting hydraulic grade line elevations for design purposes on smaller development projects, and for designing stormwater management BMPs. Once a level of confidence is achieved for the model, it can be shared with consultants and private developers to support public/private partnerships to improve flood mitigation and water quality.

Allied Street Flooding, Meadow Creek Watershed, August 2008

BMP/Green Infrastructure Performance Assessments

Increased functionality in SWMM will allow for assessment of various green infrastructure techniques with continuous simulation modeling. Existing BMPs can be evaluated for performance over a range of storm events and retrofits can be designed within SWMM to protect treatment volumes from intense, destructive rainfalls.

The City will work collaboratively with a team from the University of Virginia to calibrate the Meadow Creek model to low-flow events so that it may be reliably used for the design of distributed, nature-based infrastructure.

Climate Resilient Stormwater Management

In order to incorporate climate change impacts into stormwater management design standards, a wide range of potential extreme rainfall events must be analyzed. The suite of rainfall events will be derived from multiple methodologies to determine future IDF (intensity-duration-frequency) curve values that best fit Charlottesville's location and geography. These rainfall events will be routed through SWMM to determine confidence intervals around the predictive performance of stormwater management infrastructure. Based on the SWMM results, both storm drain conveyance goals and maintenance routines may be updated to reflect future needs.

Backwater effects from climate change – influenced floodplains can also be modeled in SWMM to determine impacts on stormwater infrastructure performance.

Community Engagement

Using the outputs of these models, comprehensive stormwater management plans can be developed and communicated to the public per City "watershed" to promote a sense of ownership among residents. The stormwater management models can provide visual displays that will be the building blocks for a data driven community outreach plan.

Future Maintenance

Moving forward, the updated PCSWMM models will be an active tool in the City's stormwater management practices. As such, the models will be continuously updated by existing in-house staff. The City's Water Resource Protection (WRP) Administrator is a professional engineer with almost two decades of hydrologic and hydraulic modeling experience. As more data, better methodologies, and updated SWMM versions become available, the Administrator will revise the City's working model. As the confidence in the SWMM model's accuracy increases, the Administrator will also be responsible for sharing model results with other design professionals in the community so that everyone works from a shared point of knowledge.

As-built plans, for both private development and public improvement projects, will be submitted to the City's Stormwater Technician and WRP Administrator so that storm drain infrastructure and BMPs can be added to both the GIS inventory and SWMM model. Additionally, this team will take on the responsibility of utility mapping beyond the scope of survey included in this grant application to identify discrepancies and provide accurate data in areas of the City's storm drain inventory that are less susceptible to flooding.

The grant application also includes SWMM training for up to four professional engineers or engineers in training in the City of Charlottesville to provide overlap in technical skill sets and distributed responsibility of model use and management.

Stakeholders

Model Update

A consulting firm with significant hydrologic and 2D hydraulic modeling experience will be hired with funds from the grant to update the model, incorporate new data, expand analyses to include minor tributaries and select portions of the storm drain network, and introduce future climate change adjustments. It will be important to select a firm with the man-hour capacity to complete the update in a timely manner, so that the model results can be used as soon as possible for master planning.

A technical advisor from the University of Virginia's Department of Engineering Systems and Environment, Dr. Teresa Culver, will be involved to review model extensions, to provide insight into the Meadow Creek system, and to facilitate integration of data collected through the University. Dr. Culver recently received the Margaret S. Petersen Award from the American Society of Civil Engineers for her leadership and contributions to the field of water resource engineering. She and her students have been studying Meadow Creek and its watershed for over a decade. Her work includes modeling to support multi-objective water resource management, including flood reduction.

The WRP Administrator, Andrea Henry, PE will serve as the project manager and City's technical advisor for the model update. The WRP Administrator, along with staff in the Public Works – Engineering Division will provide active, hands-on leadership throughout the 36-month process and manage and direct the selected consultants. The WRP Stormwater Tech will be tasked with data collection, including gathering as-builts, conducting field investigations, and providing pertinent GIS layers.

Future Use

The SWMM model will be used internally for master planning, identification of under-capacity systems, and project design. Public Works Engineering staff will be offered opportunities for training to become proficient in SWMM modeling techniques.

The model will be maintained by the WRP Administrator and used to build a master plan, to be incorporated into the City's resilience plan, and develop annual budgets. The WRP Administrator will communicate the results of modeling efforts and how they will be used in project prioritization efforts to the City's Water Resource Protection Program (WRPP) Advisory Committee. This committee is made up of City residents with a variety of professional experiences that ensure the stormwater utility fee is managed appropriately.

The 1D portion of the model will be available to design professionals in the community and the City will undertake outreach efforts to encourage its use when conducting drainage analyses for site development.

Implementation Plan

Once grant funding is awarded, select stakeholders for the model buildout will meet to develop a detailed scope of work and identify areas that need additional survey data. A request for proposal will be advertised no later than two months after the award agreement is executed.

Efforts to upgrade model methodology and inputs, collect survey data (including select utilities, roadways, and open channels), and conduct field investigations for problematic areas in the terrain data will happen concurrently to build out a draft model within a year of the RFP selection. Once the draft model is finalized and a level of confidence is achieved using standard design storms, stakeholders will conduct a detailed review and identify where additional survey data will be necessary to quantify impacts of flooding. A portion of the funding allocated to survey efforts will be reserved for the final model update.

As the model is upgraded, the technical advisor and stakeholders will determine the appropriate suite of climate-informed storm events to include in an analysis of future flood vulnerability and best methods for communicating the results of climate-informed stormwater management analysis.

The City’s stormwater management models will be used to communicate the potential effects of climate-influenced storm events on existing infrastructure and may support future regional floodplain studies.

Performance Metrics

Once the model is finalized, it will be used in conjunction with visual assessments of stream degradation to identify and prioritize projects, funded in part with the City’s stormwater utility fee, in the following categories: flood mitigation, outfall protection, and BMP development. The model will also be used to develop scopes of work for each project identified in these categories that provides a comprehensive solution to overall stormwater management in the City. For example, an outfall protection project should be designed based on future predicted storm events and necessary conveyance upgrades to the outfall. Flood mitigation projects should evaluate the cost effectiveness and co-benefits of volume reduction techniques such as distributed green infrastructure. These are all design scenarios that can be built and analyzed within SWMM.

Immediate success metrics will include the development of a master plan with a prioritized project list that includes a comprehensive review of vulnerabilities to flooding throughout the City’s watersheds and a transparent pathway to equity-based funding strategies. Maps will be developed for each drainage area contributing to minor and major tributaries, conveying flood vulnerability assessments for both design storms and climate change – informed storm events.

A scope and budget for annual maintenance of grey infrastructure will be developed using the SWMM model as the basis for selection. Model results will be compared against recently identified (within the last 5-years) drainage issues to determine areas prone to flooding as a result of infrastructure clogging.

Budget

The total budget for this grant application is **$550,000**, broken down into the following general categories:

- $255,000: 1D model methodology updates, 2D mesh and model development, incorporation of stormwater infrastructure information from as-built drawings and prior field investigations conducted by the City of Charlottesville and survey and utility mapping conducted during this study. Technical methodology report included.
- $190,000: Survey and utility mapping in select areas.
- $20,000: Incorporation/calibration of flow gauge data in Meadow Creek
- $60,000: Model analyses, technical report, and maps for climate-influenced storm events.
- $15,000: Visual displays and power point for community outreach
- $5,000: PCSWMM license for 4 users within the City of Charlottesville for 1 year.
- $5,000: PCSWMM training for 4 City of Charlottesville staff.

This project falls under the funding category of a flood prevention and protection study. As such, the City of Charlottesville is requesting funding in the amount of $275,000, a cost participation percentage of 50%. These funds will come from money dedicated to the Water Resources Protection Program and are confirmed in the accompanying letter from the Deputy City Manager.

Category	**City of Charlottesville - direct expense**	**CFPF grant reimbursement**	**Total:**
Salary	$0.00	$0.00	$0.00
Fringe Benefits	$0.00	$0.00	$0.00
Travel	$0.00	$0.00	$0.00
Supplies (PCSWMM)	$5,000.00	$0.00	$6,000.00
Other (Staff Training)	$5,000.00	$0.00	$5,000.00
Contractual	$265,000.00	$275,000.00	$285,000.00
TOTAL:	$275,000.00	$275,000.00	**$550,000.00**

Categories (select applicable project):

Project Grants (Check All that Apply)

Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

Wetland restoration.
Floodplain restoration.
Construction of swales and settling ponds.
Living shorelines and vegetated buffers.
Structural floodwalls, levees, berms, flood gates, structural conveyances.
Storm water system upgrades.
Medium and large scale Low Impact Development (LID) in urban areas.
Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
Dam restoration or removal.
Stream bank restoration or stabilization.
Restoration of floodplains to natural and beneficial function.
Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

[✓ Studies and Data Collection of Statewide and Regional Significance.]

[✓ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.]

[✓ Other relevant flood prevention and protection project or study.]

Capacity Building and Planning Grants

Floodplain Staff Capacity.

Resilience Plan Development

Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

Resource assessments, planning, strategies and development.

- Policy management and/or development.
- Stakeholder engagement and strategies.

Scoring Criteria for Studies

Appendix B: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name: City of Charlottesville

Eligibility Information

Criterion	Description	Check One
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration		Yes No
Applicant Name: City of Charlottesville (510033)		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	15
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	45
Regional relative sea level rise projections for use in determining future impacts.	**45**	
Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	45
Flash flood studies and modeling in riverine regions of the state.	**45**	
Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	50
Regional hydrologic and hydraulic studies of floodplains.	**45**	
Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	35
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	
Total Points		190

Authorization to Request Funding, Charlottesville City Manager

CITY OF CHARLOTTESVILLE
"A World Class City"

Office of The City Manager

Post Office Box 911
Charlottesville, Virginia 22902
Telephone 434-970-3101
Fax 434-970-3890
www.charlottesville.gov

April 8, 2022

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

To Whom it May Concern,

The City of Charlottesville is excited for the opportunity to submit this application for the third round of the Community Flood Preparedness Fund grant awards. We have been strong proponents of the Commonwealth of Virginia joining the Regional Greenhouse Gas Initiative and are pleased that funds are now being made available to support our efforts to mitigate and protect against flooding in neighborhoods across our entire community.

The enclosed grant application will assist the City with the development of stormwater management models for the Meadow Creek and Rivanna River watersheds within City limits. This application is the 2nd in a series, the first being our Round 1 CFPF grant award for a model of the Moore's Creek watershed. Combined, these grants will produce models covering Charlottesville's entire jurisdictional limits so that we may identify drainage problems across the City using the same methods of evaluation. The total estimated project budget is $550,000. Per the grant application process, I hereby confirm that the City has identified the necessary resources for the required 50% match of $275,000, which will be composed of cash allocated to our Water Resources Protection Program. Upon Notice of Award of the grant, a resolution will be presented to City Council of Charlottesville for appropriation of the grant funds and the identified matching funds.

We look forward to the VA Department of Conservation and Recreation's support in developing the tools necessary to protect our community in a strategic, equitable, and proactive manner.

Sincerely,

Samuel Sanders, Jr.
Deputy City Manager for Operations

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles, Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 17. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by Albemarle County Department of Planning & Community Development. This information was photogrammetrically compiled at a scale of 1:4,800 from aerial photography dated March 2000.

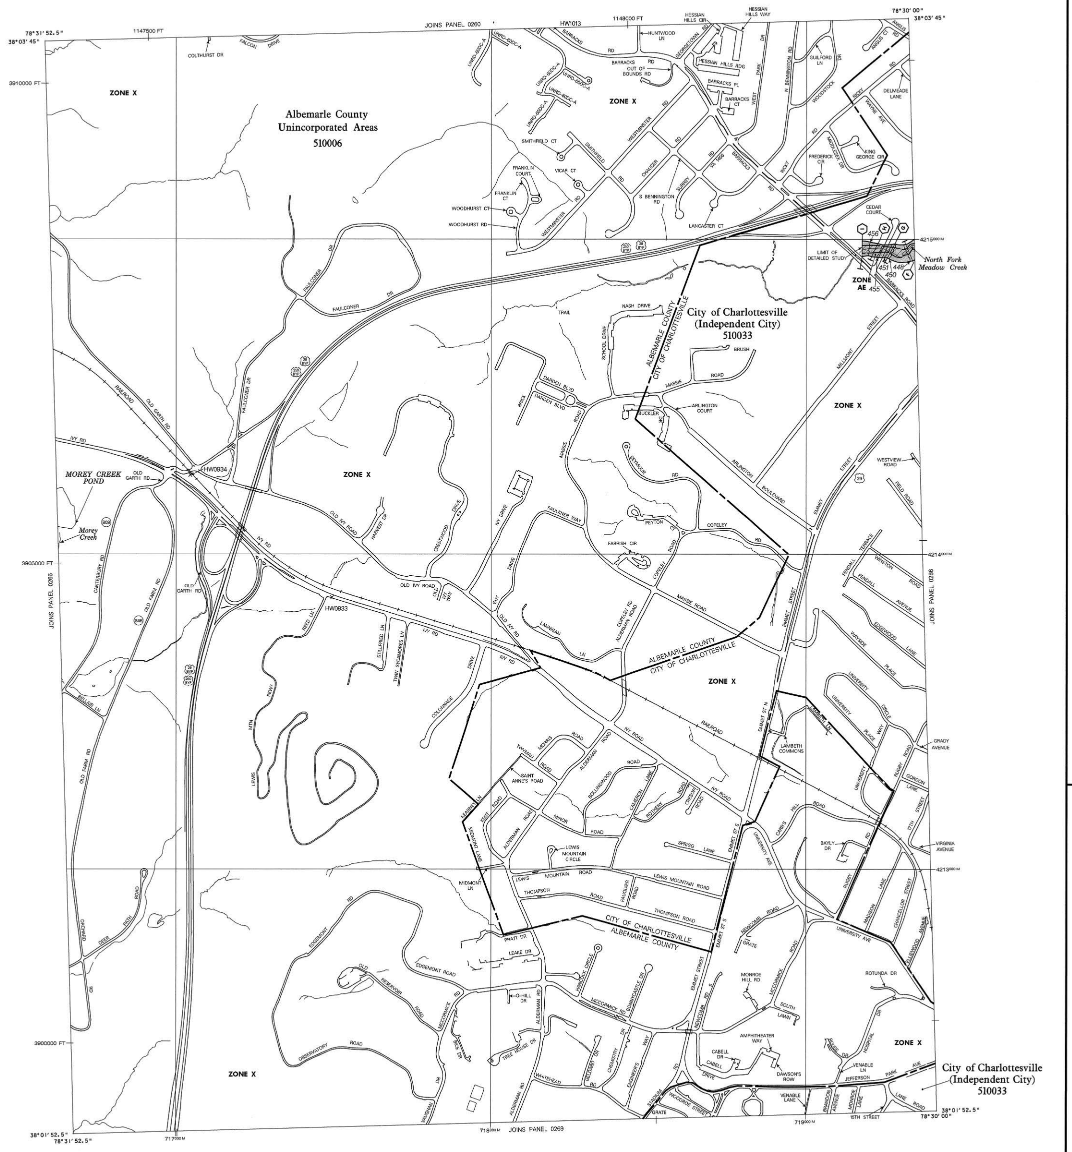
This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contain authoritative hydaulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.



LEGEND

▩	SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨	FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▒	OTHER FLOOD AREAS
ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.
☐	OTHER AREAS
ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.
▧	COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS
▧	OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary

These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 17. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by Albemarle County Department of Planning & Community Development. This information was photogrammetrically compiled at a scale of 1:4,800 from aerial photography dated March 2000.

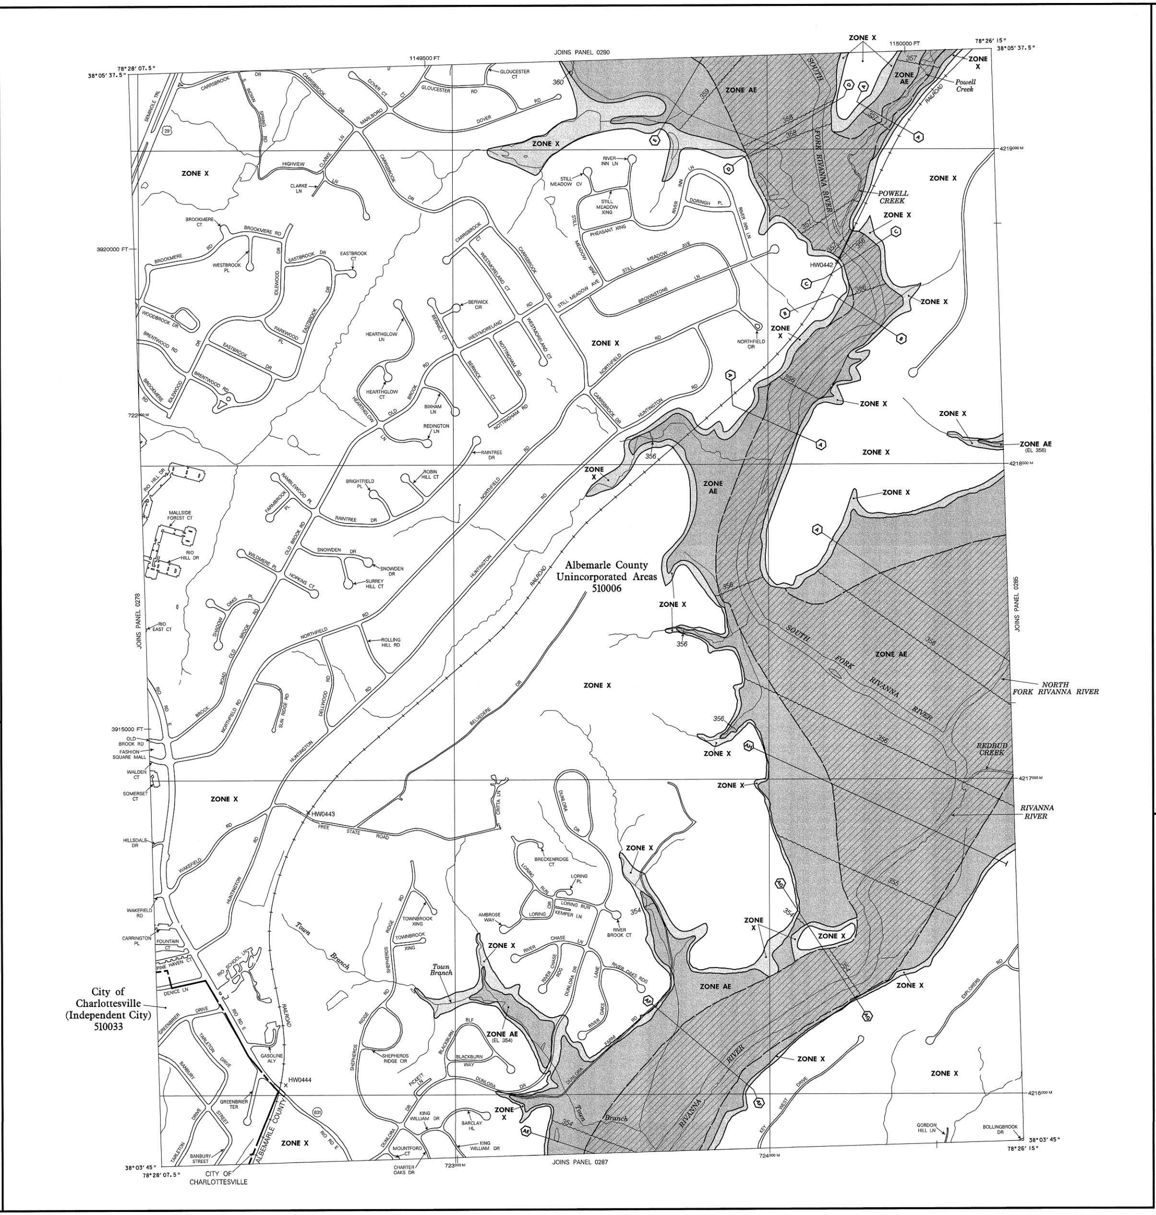
This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contain authoritative hydaulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.



LEGEND

▩	SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨	FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░	OTHER FLOOD AREAS
ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.
☐	OTHER AREAS
ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.
▧	COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS
▧	OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles, Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 17. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by Albemarle County Department of Planning & Community Development. This information was photogrammetrically compiled at a scale of 1:4,800 from aerial photography dated March 2000.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contain authoritative hydaulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles, Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 17. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by Albemarle County Department of Planning & Community Development. This information was photogrammetrically compiled at a scale of 1:4,800 from aerial photography dated March 2000.

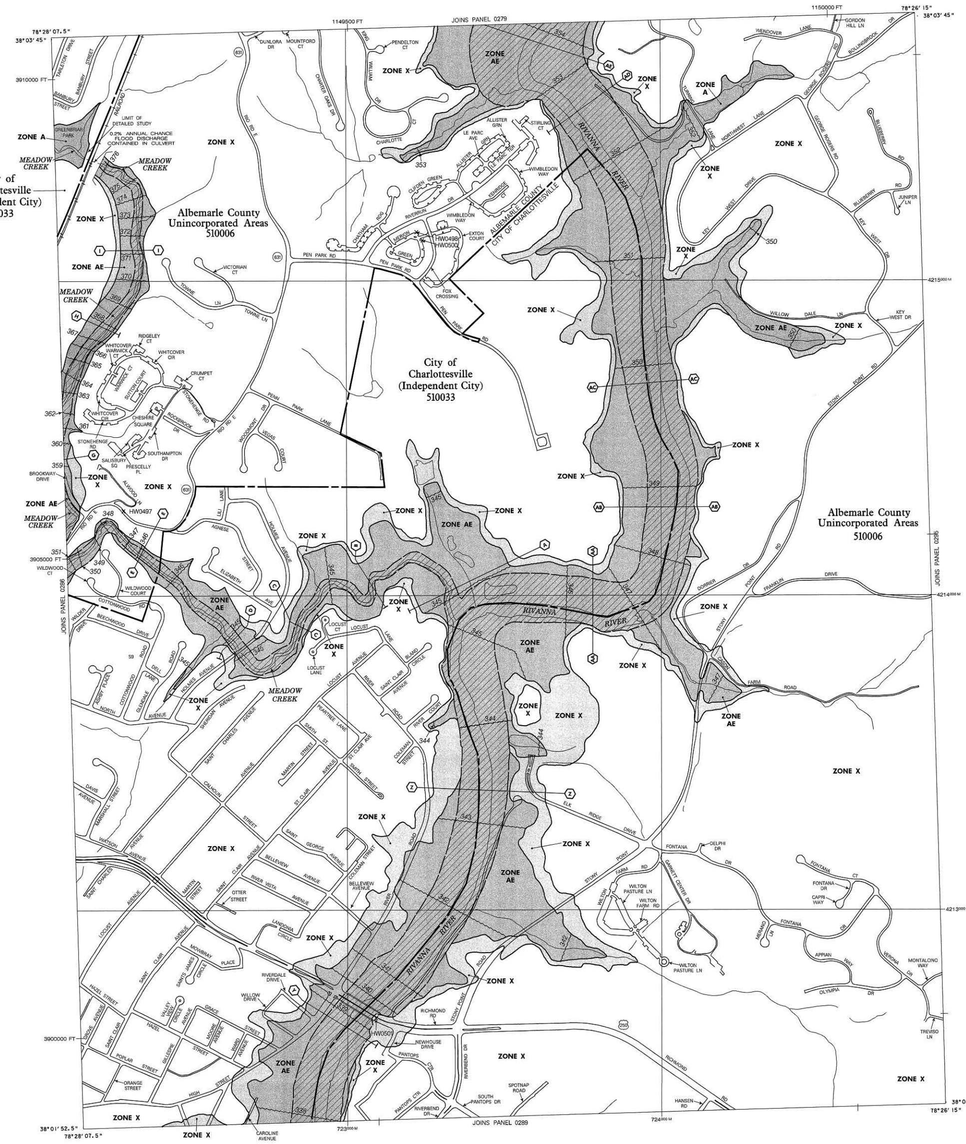
This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contain authoritative hydaulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.



LEGEND

▩	SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.
▨	FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░	OTHER FLOOD AREAS
ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.
☐	OTHER AREAS
ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.
▧	COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS
▧	OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary
- —— —— -	Zone D boundary
••••••••	CBRS and OPA boundary
▩ ←	Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles, Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) Zone 17. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by Albemarle County Department of Planning & Community Development. This information was photogrammetrically compiled at a scale of 1:4,800 from aerial photography dated March 2000.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contain authoritative hydaulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

CFPF Grant Application, City of Charlottesville 4.8.22

1 message

Henry, Andrea E <henrya@charlottesville.gov> Fri, Apr 8, 2022 at 1:13 PM
To: "CFPF, rr" <cfpf@dcr.virginia.gov>
Cc: "Edwards, Tony" <Edwardst@charlottesville.gov>

To Whom It May Concern,

The City of Charlottesville is thrilled to submit our third grant application for the Community Flood Preparedness Fund. This grant is the second in a series of two, aimed at developing a strategic approach to both identifying and prioritizing flood mitigation and protection projects. The City strives to plan projects in an equitable and comprehensive manner, relying on watershed-scale solutions when possible. Development of watershed-scale models is the cornerstone to these future efforts and we are committed to developing stormwater management and resilience plans that reflect the best science and methodology available.

Please let me know if you have any questions or concerns about the attached application.

Have a wonderful day!

Andrea Henry, PE

Water Resources Protection Administrator

Public Works Department

City of Charlottesville

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

✓ **Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.**

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

☐ **Capacity Building and Planning Grants**

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  - ☐ Resource assessments, planning, strategies and development.
    - ○ Policy management and/or development.
    - ○ Stakeholder engagement and strategies.

Location of Project (Include Maps): Goose Creek Watershed, City of Chesapeake, Virginia, Western Branch Elizabeth River, James River Basin (Attachment 1)

NFIP Community Identification Number (CID#): (See appendix F) 510034

Is Project Located in an NFIP Participating Community? ✓ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ✓ Yes ☐ No

Flood Zone(s) (If Applicable): AE, X shaded

Flood Insurance Rate Map Number(s) (If Applicable): 05101560140D, 05100340010D, 05100340011D, 05100340012D, 05100340013D, 05100340019D, 05100340020D, 05100340021D, 05100340022D

Total Cost of Project: $185,000.00

Total Amount Requested $92,500.00

Appendix C: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:		
	Eligibility Information	
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	✓
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	**Submitted for approval**
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	✓
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	✓
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration		✓ **Yes** ☐ **No**
Applicant Name:		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	**35**
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	0
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	0
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
Total Points		35

Scope of Work Narrative – Studies

All applications for proposed studies the applicant should include the following:

1. The specific type of study proposed including whether the study is new or updates a prior study.

Hydraulic and hydrologic study of the Goose Creek watershed/floodplain with historic and predicted floods for the assessment of flood risk and the development of strategies to prevent or mitigate damages from coastal and riverine flooding. The Goose Creek watershed is the uppermost watershed of the Western Branch Elizabeth River in the City of Chesapeake, Virginia with a drainage area of 7,083 acres (11 sq. mi.) with an elongated shape along the east-west directions (approximately 2.2 sq. mi. into the City of Suffolk on the west) discharging into the Western Branch Elizabeth River to the north-east as shown in the attached map. The Goose Creek watershed and the Western Branch Elizabeth River are in the James River Basin.

This is a new study. The City of Chesapeake has been systematically studying the major watersheds throughout the locality since 2008 using current technologies. The Goose Creek watershed has not yet had such a study conducted although has been suffering damages from both riverine flooding during severe storms and coastal flooding via the Western Branch Elizabeth River which has prompted the city to request funding for this watershed and build its resiliency.

The study goal is to develop a computer model of the Goose Creek watershed using the currently industry-accepted Storm Water Management Model (SWMM) of the U.S. Environmental Protection Agency (USEPA) and using watershed characteristic data that the city already has and collecting the missing data through field surveying and observations, and using climate data from the internet considering climate changes resulting increased rainfall depths and sea level rise, and use the model to identify and quantify flooding areas and severity of the flooding, and prepare resilient drainage plans using all the available natural storages and conveyances (nature based) and adding resilient structures wherever needed to mitigate the floodings.

2. The relationship of the study to the local government's needs for flood prevention and protection, equity, community improvement, identification of nature-based solutions or other priorities contained in this manual.

The City of Chesapeake has been systematically studying the major watersheds throughout the locality. The Goose Creek watershed is one of the remaining watersheds that has not yet had a study conducted. The study proposed here is more than the other completed studies. In this study, flood measures in the Goose Creek watershed will be planned and designed to be resilient to climate change and sea level rise scenarios as much as possible.

THE GOOSE CREEK WATERSHED AND ITS ISSUES

As shown in the attached map (Attachment 1) of the Goose Creek watershed, the eastern, north-eastern, and central parts of the watershed along the I-64, I-664, and I-264 corridors are well developed with residential and commercial properties. The western (including the 2.2-sq. mi. area in the City of Suffolk) and the southern farmlands and woodlands have potentials for housing and industrial growths that the City of Chesapeake must be prepared for managing increased coastal and riverine floodings due to the land use changes from woodland and farmlands to impervious lands with housings and industries under the new climate change scenarios.

Three smaller areas of the watershed were studied in 1985 using older (outdated) technology although providing useful background information: (i) a 5.6-sq. mi. westernmost and uppermost area extending to the City of Suffolk (estimated then as 1.85 sq. mi.) flowing easterly with its outfall at Jolliff Road, (ii) A 0.5-sq. mi. area on the north-central part of the watershed flowing south-easterly with its outfall at Old Dock Landing Road, and (iii) a 2.4-sq. mi. easternmost area of the watershed called Bower Hill flowing north-westerly with its outfall at the Airline Blvd. These older (1980s) studies analyzed flooding during design storms up to 50-year return period and recommended drainage improvements or limiting developments. Climate change scenarios were not addresses in those older studies. Therefore, new studies of these areas are needed. Besides, the remaining approximately 2.5-sq. mi. north-eastern and downstream part of the Goose Creek watershed that were not part of 1985 studies but in the special flood hazard area (Zone AE) as shown in the attached FIRMette map (Attachment 2) suffering from both riverine flooding during severe storms and coastal flooding via the Western Branch Elizabeth River, deserving of study and protection.

There are approximately 2,542 residential, 264 commercial, 22 government, and 5 critical facilities (elevated storage tank, Lake Gaston Water Treatment Plant, Jolliff Middle School, Southwestern Elementary School, and Station 10 Fire Station) within the Goose Creek watershed. Both the schools serve as emergency shelters. According to data provided by the Virginia Department of Emergency Management, there are four (4) Repetitive Losses in the Goose Creek Watershed.

The Dock Landing Road between Mariner Drive and Devon Drive within the Goose Creek watershed (Attachment 3 FIRMette map) with the lowest road elevation of 3.6 ft. constantly floods from both rainfall and tidal flooding events. It is becoming part of Hampton Road Planning District Commission's (HRPDC) flood monitoring and warning and road closure sign posting program in cooperation with the City. This critical flooding road location where 6,000 vehicles pass in a day will be addressed in this study, and a permanent solution will be recommended. Attachment 4 shows this site (Location 1) in the Goose Creek watershed as part of HRPDC's plan on installing flood sensors by its contractor XYLEM.

Attachment 5 includes 13 recent Work Orders that City of Chesapeake completed in response to citizens' flooding complaints within the Goose Creek watershed and a flooding image of the Willow Lake in the Goose Creek watershed during a storm on September 30, 2010.

SCOPE OF WORK

This application seeks support for contractual engineering services from a qualified Engineering Consultant with a sub-contractual Surveyor support for developing a computer model and using it to develop flood resilient plans for the Goose Creek watershed in the City of Chesapeake. The deliverables will include SWMM models of the watershed depicting current and future watershed conditions and will identify nature based and infrastructure projects that can be implemented to mitigate existing and future floodings and build resiliency towards climate change scenarios.

This project will conform to the CITY's Resilience Plan that is being developed with support from DCR CFPF Round 1 Grants, current (2014) Hazard Mitigation Plan, floodplain management ordinance, and Federal Emergency Management (FEMA) National Flood Insurance Program (NFIP) requirements, as applicable. The CITY participates in FEMA's Community Rating System, with a current Class 8 rating, and is in good standing with the NFIP.

The CITY will provide to the Consultant the following documents and information for using as input data to the Goose Creek watershed SWMM to be developed:

- Copies of pertinent existing stormwater studies and computations.
- As-built or approved site plans within the watershed.
- Lists of flood-prone areas and problem structures in the watershed.
- GIS data in ESRI-ArcMap-compatible format for the subject watershed and surrounding areas.
- Development plans for projects under construction or expected to be under construction within the watershed before or during 2022, to be modeled as 'existing' conditions.
- Future land cover guidance (imperviousness) and applicable engineering studies or plans for areas expected to be developed or redeveloped.
- Hydraulic boundary conditions, primarily tidal boundary elevations considering sea level rise, to be used in the modeling.

BASIC SERVICES FROM THE CONSULTANT

The Basic Services include analyses of flooding in the Goose Creek watershed, building of the computer models of current and future design storm flooding, and to identify specific nature based and infrastructure projects that could be implemented to reduce the frequency and severity of street and parcel floodings and build resilience to extreme event floodings.

Task 1: Project Management, Coordination, Meetings, Quality Control

This task includes administrative time associated with invoicing, progress reporting, communications (email and phone calls), as well as all internal project planning and setup. The consultant will manage the project workflow and coordinate with the CITY to ensure that the work proceeds in an efficient and cost-effective manner.

Task 2: Assessment of the City Provided data and Surveying of Missing data

The Consultant will evaluate all the data received from the City and identify field-surveying data needed to support the modeling effort and will provide a list of selected locations at which surveying shall be performed by a Subcontracted certified Surveyor to make and report various measurements such as inverts, ground elevations, and culverts and pipe or channel configuration information. Any other required data will be estimated from readily available data sources, such as existing GIS and topographic data and construction plans that will be provided by the CITY. The Consultant will also visit key locations in the watershed to photograph conditions and resolve modeling issues as needed.

The subcontracted Surveyor will carry out the surveying per Consultant's directions and hand over all the surveyed data to the Consultant who will use those in the SWMM model and also submit to the City along with the final deliverables for City's records and future uses.

Task 3: SWMM Modeling

The consultant will prepare a SWMM computer model of the Goose Creek watershed using the popular PCSWMM software to reflect existing and future conditions within the watershed. The model will identify flooding areas under existing conditions and improvement scenarios through nature-based and/or infrastructure modifications to mitigate flooding following Master Drainage Plan methodology that has been used in other Chesapeake watersheds and following the City Resilience Plan that are currently being developed and submitted along with this application.

After putting the base model together using all the City-supplied and newly surveyed data, the Consultant will calibrate the model by running a historical storm and comparing the model predicted flood elevations and flows with any available observed data to ensure those reasonably match, if not, the Consultant will review and revise the model data and parameter values as appropriate until the model predicted and field observed flow and water surface elevations closely match.

The Consultant will evaluate the 2-, 5-, 10-, 25-, 50-, 100-year, and potential higher design storm events using the model developed to check the adequacy of the existing stormwater infrastructure. The Consultant will use available information and professional judgment to define the hydrology to reflect existing and future hydrologic conditions; estimate model parameters; adapt the configurations of the models to reflect future conditions; and make other assumptions required to complete the task.

The consultant will produce and run the PCSWMM models to obtain 'existing' and 'future' conditions results, including the effects of the recommended improvements, considered in three modeling scenarios:

1. Existing Hydrology with Existing Drainage (Calibration),
2. Future Hydrology (Climate Change) with Existing Drainage, and
3. Future Hydrology (Climate Change) with Recommended Improvements.

The scenarios modeled shall reflect existing conditions and future alternatives. Future hydrology will incorporate climate change scenarios adopted in the industry (neighboring communities) and available in the literature.

Eight models shall be constructed for the watershed for each scenario created. Specifically, each scenario will include the 2-, 5-, 10-, 25-, 50-, 100-year, and other higher design storm events. The consultant will work with the CITY to develop the future improvement recommendations by submitting preliminary future recommendations for review and comment by the CITY, then incorporate the CITY's comments and preferences into the final future recommendations scenario.

Task 4: Production of Deliverables

The Consultant will prepare model documentation, in electronic Adobe portable document file (PDF) format. The documentation will contain updated watershed maps in GIS format that clearly depict the layout and construction of the models, overlaid on current CITY-furnished digital orthophotos. The documentation will contain a narrative describing the modeling effort, a description of the computer files and scenarios used, and a list of the recommended improvements and alternatives considered.

The consultant will prepare a cost opinion for the recommended future improvements included in Scenario 3. The cost opinion will be suitable for use in computing future pro-rata shares.

The quarterly and final project reports produced under this application will be submitted to DCR for approval (per the applicable grant requirements). DCR's comments, preferences, and any applicable guidance for the final report will be solicited.

DELIVERABLES

The Consultant will deliver to the CITY the followings:

- Quarterly grant reports.
- A grant reimbursement form.
- A Resilient Drainage Plan report with supporting documentation.

- **All digital engineering files (e.g., PCSWMM, GIS shapefiles and geodatabases, spreadsheets, cost estimates) produced or collected as part of the engineering work for this project.**

Consultant will provide secure downloadable link for all draft and final deliverables.

COMPENSATION: CONTRACTED ENGINEERING CONSULTANT'S AND SURVEYOR SUBCONTRACTOR'S FEE ESTIMATES:

Engineers' salaries and fringe benefits:	**$130,000.00**
GIS Specialist's salaries and fringe benefits:	**3,000.00**
Surveyors' salaries and fringe benefits:	**45,000.00**
Admin/Clerical for Engineering:	**1,500.00**
Admin/Clerical for Surveying:	**1,000.00**
Engineers' Milage:	**500.00**
Surveyors' Milage:	**1,500.00**
Surveyors' Traffic Control:	**2,500.00**
TOTAL PROJECT COST ESTIMATE:	**$185,000.00**

3. The qualifications of the individuals or organizations charged with conducting the study or the elements of any request for proposal that define those qualifications

The City of Chesapeake plans to use a consultant with current Annual Civil Engineering Services Contract, to perform the work for this study. Please refer to *Attachment 6*, City of Chesapeake Request for Proposals Professional Services, Page 39 L. QUALIFICATIONS OF OFFERORS. A consultant with reputable qualifications and experiences performing similar modeling studies successfully for the City will be selected.

4. The expected use of the study results in the context of the local resilience plan or, in the case of regional plans, how the study improves any regional approach.

It is intended that the recommended projects identified as a result of the study shall be added to the City's Resilience Plan in Amendments. Please see the City Preliminary Resilience Plan being submitted with this study and other two (2) project applications.

5. If applicable, how the study may improve Virginia's flood protection and prevention abilities in a statewide context. **N/A**

Supporting Documentation

- Detailed Map of the project area(s)

See *Attachment 1:* Goose Creek Watershed Map, City of Chesapeake, Virginia, within the Western Branch Elizabeth River Basin which is withing the James River Basin.

- FIRMette of the project area(s)

  Attachment 2 is a combined FIRMette of the entire Goose Creek watershed showing the high flood hazard areas and Attachment 3 is a FIRMette at the critical flooding location on the Dock Landing Road.

  A list of all FIRM panels that comprise the study area can be found on the Application Form Page 4.

- Historic flood damage and/or images

***Attachment 4* shows the critical flooding location on Dock Landing Road (6,000 vehicles/day) where HRPDC is installing sensor to monitor flood and post warnings on road closures during rain and tide driven unpassable floods.**

Attachment 5 includes 13 recent Work Orders that City of Chesapeake completed in response to citizens' flooding complaints within the Goose Creek watershed and a flooding image of the Willow Lake in the Goose Creek watershed during a storm on September 30, 2010.

- A link to a copy of the current floodplain ordinance

  ADOPTED+Floodplain+Ordinance--7-16-2013.pdf (cityofchesapeake.net)

- A link to or a copy of the current hazard mitigation plan

  Hampton Roads Hazard Mitigation Plan | Emergency Management | Departments | Departments | Emergency Management | Departments | Departments | Hampton Roads Planning District Commission (hrpdcva.gov)

- A link to or a copy of the current comprehensive plan

  Comprehensive Plan 2035 (cityofchesapeake.net)

- Social vulnerability index score(s) for the project area

Most of the Goose Creek watershed is not socially vulnerable, only the eastern (less than a quarter) is moderately vulnerable. See *Attachment 7* map. Dock Landing Road is the same way, LOW vulnerability (Attachment 8 map).

- Completed Scoring Criteria Sheet

  The completed Appendix C: Scoring Criteria for Studies (Pages 1-C to 3-C) follows the Appendix A: Application Form (Pages A-1 to A-4).

Budget Narrative- Required for All Grant Categories

Each application must include a detailed Budget Narrative explaining all proposed expenditures. A budget narrative is applicable to requests from any category of grants in this manual. The following items must be included in the Budget Narrative:

- *Estimated total project cost*: **$185,000.00**.

  This amount represents to-be-Contracted Consultant Engineers' and it's to-be-Subcontracted Surveyor's fees as tabulated in the Scope of Work Narrative for Studies above (Page 6).

- *Amount of funds requested from the Fund*: **$92,500.00**

  This is the total amount of any grant assistance sought from the Fund. 100% of this is to be provided through a contract with the Consultant.

- *Amount of cash funds available*: **$92,500.00**

  The source of these funds is Project Number: 10-150 Project Title: Stormwater Mapping & Master Drainage Plan III in the City Capital Improvement Plan. See *Attachment 9* for a description of the fund allowable expenditures and funding plan as well as a financial statement indicating sufficient funds to cover the match requirement for this grant application. Also provided is evidence of the City's ability to obtain these funds to complete the project.

Authorization to request for funding: Local governments seeking funding shall also attach signed documentation authorizing the request for funding. (**Supporting Documentation**.)

Provided as *Attachment 10,* a letter authorizing a request for funding through the program.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates, refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October 2020.

This map was exported from FEMA's National Flood Hazard Layer (NFHL) on [illegible] and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time. For additional information, please see the Flood Hazard Mapping Updates Overview Fact Sheet at https://www.fema.gov/media-library/assets/documents/118418

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards. This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date.

City of Chesapeake RFP 18010 Final 8/14/2017 Showing Required Qualifications of Consultants on Page 39

Chesapeake
VIRGINIA

REQUEST FOR PROPOSALS (RFP)
PROFESSIONAL SERVICES

ISSUE DATE: August 20, 2017

RFP No. 18010

TITLE: ANNUAL CIVIL ENGINEERING SERVICES
CONTRACT FOR SMALL PROJECTS

COMMODITY CODE: 925-17

ISSUED BY:
City of Chesapeake
Purchasing Division
306 Cedar Road, 5th Floor
Chesapeake, Virginia 23322

USING DEPARTMENT:
City of Chesapeake
Chesapeake Public Works /Engineering Division
306 Cedar Road, 5th Floor
Chesapeake, Virginia 23322

PERIOD OF CONTRACT: ONE (1) YEAR FROM THE DATE OF EXECUTION WITH OPTION OF FOUR (4) ADDITIONAL ONE-YEAR TERMS. THE CONTRACT SHALL RENEW AUTOMATICALLY, UNLESS THE CITY GIVES WRITTEN NOTICE, SIXTY (60) DAYS IN ADVANCE OF THE EXPIRATION FOR EACH OF THE RENEWAL TERMS.

The City of Chesapeake, Virginia will receive sealed proposals for the above named project until 5:00 PM local time on September 21, 2017 at the office of the Procurement Administrator in the Purchasing Department, 5th Floor, City Hall Building, 306 Cedar Road, Chesapeake, Virginia, 23322. Any Bids received after the specified time and date will not be considered. See Section VI and VII for specific instructions for the completion of proposals.

Inquiries For Information Should Be Directed To: Susan Kenney-Lambert, CPPB, **via email only** at: skenneylambert@cityofchesapeake.net. All questions must be submitted via e-mail **before** 5:00 pm, **August 30, 2017**. **Bid Documents may be examined at the offices of Purchasing Division, located on the 5th Floor, City Hall Building, 306 Cedar Road. Electronic copies of bid documents in PDF format are available for download on the Onvia Demandstar web site at www.demandstar.com or eVA's website at https://eva.virginia.gov/.**

Please refer to City of Chesapeake website at http://www.cityofchesapeake.net/government/City-Departments/Departments/Purchasing-and-Procurement/solicitations.htm for more information.

It shall be the responsibility of the prospective bidder to monitor the City's website for published addenda and to have all addenda signed by an authorized representative of the company. All fully executed addenda must be returned to the City along with the signed bid. The City will NOT accept faxed addenda.

IF PROPOSALS ARE MAILED, SEND DIRECTLY TO THE PURCHASING DIVISION AT THE ADDRESS SHOWN ABOVE. IF HAND-DELIVERED, DELIVER TO: City Hall, Purchasing Division, 306 Cedar Road, 5th Floor, Chesapeake, VA.

In Compliance With This Request for Proposal And To All The Conditions Imposed Therein and Hereby Incorporated By Reference, The Undersigned Offers, And Agrees To Furnish Services requested in the solicitation.

THIS SECTION IS TO BE COMPLETED BY OFFEROR'S AUTHORIZED REPRESENTATIVE.

TABLE OF CONTENTS

REQUEST FOR PROPOSAL NO. 18010
ANNUAL CIVIL ENGINEERING SERVICES FOR SMALL PROJECTS

****This attachment must be fully executed and submitted with the RFP Proposal**

The City of Chesapeake does not discriminate against faith based organizations in accordance with Code of Virginia Section 2.2-4343.1 or against any contractor, bid, or offeror because of race, religion, color, sex, national origin, age, disability or any other basis prohibited by State law relating to discrimination in employment.

I. PURPOSE:

The City of Chesapeake Public Works Department is seeking proposals from consulting engineering firms who wish to be considered to provide professional engineering on an annual basis for the design of various civil engineering projects (roadway, drainage and utility services) on an as needed basis. It is anticipated that award will be made to more than one consultant and contracts will be awarded under the procurement process to cover the requested services. After the discussion stage (oral presentations are generally conducted if two or more Offerors are determined to be fully qualified, responsible, and suitable by the Selection Panel), negotiations shall be conducted as specified in Section XII(D). The successful firms will be required to execute a standard City Architect-Engineer contract. (See Attachment G). **In the event that this contract is awarded to multiple Consultants, task orders will be distributed based on factors other than solely price, such as availability, expertise, and experience.**

II. BACKGROUND:

The selected firms will perform engineering services throughout the year on an "As Needed" basis. **THE CITY OF CHESAPEAKE RESERVES THE RIGHT AT ALL TIMES TO PERFORM WORK IN-HOUSE.** The proposed one-year limited services term contract with optional four (4) one-year renewable terms will not exceed a maximum value of $2,000,000 per contract term and each project will not exceed a maximum value of $100,000. This work is to be accomplished utilizing computerized design and drafting systems compatible with the City of Chesapeake Public Works Department's automated design and drafting systems. The design work will be in 3 dimensions and incorporate Building Information Modeling techniques. Projects will be developed utilizing City of Chesapeake Public Works Department's policies and procedures and incorporate FHWA's guidelines, VDOT specifications, Hampton Roads Regional Construction Standards, and City of Chesapeake's Public Facilities Manual as needed.

This Request for Proposal does not commit the City of Chesapeake Public Works Department to award a contract, to pay any costs incurred in the preparation of a proposal for this request, or to procure or contract for services. The City of Chesapeake Public Works Department reserves the right to award contracts to more than one qualified firm, to accept or reject any or all proposals received as a result of this request, to negotiate with any qualified firm or to modify or cancel in part or in its entirety the Request for Proposal, if it is in the best interest of the City of Chesapeake Public Works Department to do so. Each multiple award contract will be negotiated and awarded sequentially following the same procedures in accordance with Virginia Code §§2.2-4302.2(A)(4) and 2.2-4303.1, Paragraph 3, Procurement of Professional Services; City of Chesapeake Code Section 54-67; and City of Chesapeake Administrative Regulation 4.01.

III. SCOPE OF SERVICES:

The Scope of Services is detailed in an attachment entitled "Attachment C – Detailed Scope of Services".

At any time, the City of Chesapeake Public Works Department may consider projects assigned under this contract to be delivered through a design-build option. If the City of Chesapeake Public Works Department decides to deliver a project through design-build option, the Consultants awarded a contract pursuant to this RFP and any of its team members may not be allowed to participate in ANY subsequent design-build contracts related to that project as determined in the sole discretion of the City. The City of Chesapeake Public Works Department will notify the Consultant(s) awarded a contract pursuant to this RFP if there is a change regarding the City's intended project delivery method in advance of the issuance of an RFP for design-build services. The conflict of interest disqualification determination will be made on a case by case basis at such time.

IV. SCHEDULE OF EVENTS:

The City will make every effort to adhere to the following schedule leading to the award of a contract; however, this schedule is subject to change. Offerors will be notified of significant schedule changes:

Action	Responsibility	Date
Issuance of RFP	Purchasing	August 20, 2017
Submission of Questions	Offerors	August 30, 2017
Submission of Proposal	Offerors	September 21, 2014
Selection of Finalists	Evaluation committee	October, 2017
Finalist Oral Presentations	Eval. Comm./ Potential Offerors	October, 2017
Contract Negotiations	Eval. Comm./ Offeror	November, 2017
Contract Award	City Manager	November, 2017

V. CONFLICTS AND QUESTIONS:

Should there be conflicts between any proposal documents and the final executed contract document; the final executed contract shall take precedence.

Questions regarding this Request for Proposals should be directed in writing to Susan Kenney-Lambert, CPPB, at skenneylambert@cityofchesapeake.net the Purchasing Division. All questions and requests for clarification must be received by the Purchasing Division before 5:00 p.m., **August 30, 2017**.

VI. PROPOSAL PREPARATION AND INSTRUCTIONS:

In order to be considered for selection, offerors must submit a complete response to this solicitation. One (1) original and five (5) copies of the proposal must be submitted to the Purchasing Division. No other distribution of the proposal shall be made by the offeror.

A. Proposals shall be signed by an authorized representative of the offeror. All requested information must be submitted. Failure to submit all information requested may result in the Purchasing Division requiring prompt submission of missing information, giving a lowered evaluation of the proposal, and/or finding the proposal not responsive. Mandatory requirements are those required by law or such that they are determined in the sole discretion of the Procurement Administrator to be formalities that cannot be waived and are not subject to negotiation.

B. Proposals should be prepared simply and economically, providing a straightforward, concise description of capabilities to satisfy the requirements of the RFP. Emphasis should be placed on completeness and clarity of content. Elaborate brochures and excessive promotional materials are not required or desired.

C. Proposals should be organized in the order in which the requirements are presented in the RFP. All pages of the proposal should be numbered. Each paragraph should reference the paragraph number of the corresponding section of the RFP. It is also helpful to cite the paragraph number, sub-number, and repeat the text of the requirement as it appears in the RFP. If a response covers more than one page, the paragraph number and sub-number should be cross repeated at the top of the next page. The proposal should contain a table of contents which cross references the RFP requirements. Information which the Offeror desires to present that does not fall within an area of the requirement of the RFP should be inserted at an appropriate place or be attached at the end of the proposal and designated as additional material. Proposals that are not organized in this manner risk elimination from consideration if the evaluators are unable to find where the RFP requirements are specifically addressed. The Proposal shall be organized in the following order:

1. Transmittal letter.

2. Table of Contents.

3. Understanding of Scope of Work.

4. Response to RFP Items in Section VII, Parts A thru G.

5. Team organization chart.

~~5.~~6. Resume of Key Personnel.

~~6.~~7. Firm Data Sheet.

~~7.~~8. Certification Regarding Debarment forms.

~~8.~~9. Certification of Compliance with Immigration Laws and Regulations.

D. Each copy of the proposal should be bound or contained in a single volume where practical. All documentation submitted with the proposal should be contained in a single volume. The Offeror shall limit the proposal to 30 one-sided typewritten pages. The page limit does not include any tabs or divider sheets. The proposal must be on 8.5 inch by 11 inch paper, and prepared in a 10 to 12 pitch font. Appropriate brochures, photographs or printed materials may be submitted at your option.

E. If more than one firm will participate in the contract, state the type of arrangement between the firms, the names and addresses of all firms, description of the work that each firm will perform, and the percentage of work to be performed by each. Indicate office locations at which the work will be performed. A one page organizational chart showing all firms involved and key personnel assignments and responsibilities is required to be included. It is the intent of this RFP that all services be provided complete in all respects without need for engaging separate technical expertise or professional services.

F. Indicate KEY PERSONNEL ONLY who will be assigned to this project and give the experience record of each. Key personnel are defined as those to whom the project will be assigned and who will be performing the actual design/services. The project manager shall have a minimum of five years' experience in managing similar type and size projects. Indicate the location of the office where the person is currently working if different from where work is to be performed. For part time personnel, personnel not employed on the date of the form, or personnel used on an "as needed basis" must have their status clearly indicated.

G. Furthermore, all individuals identified as key personnel in the proposal shall remain on the Consultant's Team for the duration of the procurement process and, if the Consultant is awarded a contract, the duration of the contract. If extraordinary circumstances require a proposed change, it must be submitted in writing to the City of Chesapeake Public Works Department's Project Manager, who, at his/her sole discretion, will determine whether to authorize a change. Unauthorized changes to the Consultant's Team at any time during the procurement process may result in elimination of the Consultant's Team from further consideration.

H. Give names and detailed addresses of all affiliated and/or subsidiary companies. Indicate which companies are subsidiaries. If uncertain whether another firm is or is not an affiliate, doubt should be resolved in favor of affiliation and the firm should be listed accordingly.

Affiliate - Any business entity which is closely associated to another business entity so that one entity controls or has the power to control the other entity either directly or indirectly; or, when a third party has the power to control or controls both; or where one business entity has been so closely allied with another business entity through an established course of dealings, including but not limited to the lending of financial wherewithal, engaging in joint ventures, etc. as to cause a public perception that the two firms are one entity. Firms which are owned by a holding company or a third party, but otherwise meet the above conditions and do not have interlocking directorships or joint officers serving are not considered affiliates.

VII. SPECIFIC PROPOSAL INSTRUCTIONS:

A. Proposals should be submitted as one (1) bound section, and be as thorough and detailed as possible so that the City may properly evaluate the organization's capabilities to provide required services. Offerors shall submit the following as a complete proposal.

B. In five (5) page(s) or less, discuss the firm's approach for this project.

C. In five (5) page(s) or less, please provide information on your qualifications to perform the required work (evaluation factors 1-4).

D. In two (2) page(s) or less, provide information that will indicate your firm's ability to respond quickly to task assignments, be able to handle multiple tasks concurrently and be able to complete task on accelerated schedules (evaluation factor 5).

E. In addition to the page restrictions listed above, a maximum of 18 additional pages may be included in the proposal. All pages are to be 8 1/2" X 11" and printed on one side with single-spaced type no smaller than 10 font size.

F. Please indicate, by executing and returning the attached Certification Regarding Debarment forms, if your firm, subconsultant, subcontractor, or any person associated therewith in the capacity of owner, partner, director, officer or any position involving the administration of federal or state funds:

1. Is currently under suspension, debarment, voluntary exclusion or determination of ineligibility by any federal agency.
2. Has been suspended, debarred, voluntarily excluded or determined ineligible by any federal agency within the past three years.

3. Has a proposed debarment pending; or has been indicted, convicted, or had a civil judgment rendered against it or them by a court of competent jurisdiction in any matter involving fraud or official misconduct within the past three years.

Any of the above conditions will not necessarily result in denial of award, but it will be considered in determining offeror responsibility. For any condition noted, indicate to whom it applies, initiating agency, and dates of action. Providing false information may result in federal criminal prosecution or administrative sanctions.

G. If the Consultant or subconsultant does not have the in-house capability to provide non-professional services, each with an estimated cost of $5,000 or greater, such as diving services, soil drilling, sampling services or laboratory testing, these services must be subcontracted in accordance with state or local procurement procedures (depending on the source of funds for the particular task order and/or project) once a contract is executed, with no DBE or SWaM credit in the selection of the most qualified firm or team. Clearly indicate these services in the proposal.

H. Administrative:

1. The following services marked with an X will NOT be required:

Surveying ___

Bridge and Structure Plans _X__

Permit Drawings _X__

Hydraulic and Hydrologic Analysis ___

Traffic Data ___

Signs and Signals Plans ___

Scour Analysis _X__

Utility Plans ___

Specifications ___

Materials Analysis ___

Environmental _X__

Road Plans ___

Traffic Analysis ___

Lighting Plans ___

Geotechnical Borings and Analysis __X_

Landscape Plans ___

2. All business entities, except for sole proprietorships, are required to register with the Virginia State Corporation Commission (A Business Registration Guide is available on the Internet at http://www.state.va.us/scc/division/clk/brg.htm). Foreign Professional corporations and Foreign Professional Limited Liability Companies must possess a Commonwealth of Virginia Certificate of Authority from the State Corporation Commission to render professional services. Any business entity other than a professional corporation, professional limited liability company or sole proprietorships that do not employ other individuals for which licensing is required must be registered in the Commonwealth of Virginia with the Department of Professional and Occupational Regulation, Virginia Board for Architects, Professional Engineers, Land Surveyors and Landscape Architects (http://www.state.va.us/dpor). Board regulations require that all professional corporations and business entities that have branch offices located in Virginia which offer or render any professional services relating to the professions regulated by the Board be registered with the Board. Registration involves completing the required application and submitting the required registration fee for each and every branch office location in the commonwealth. All branch offices which offer or render any professional service must have at least one full-time resident professional in responsible

charge who is licensed in the profession offered or rendered at each branch. All firms involved that are to provide professional services must meet this criterion prior to submitting a proposal to the City of Chesapeake Public Works Department. Individual engineers shall meet the requirements of Chapter 4, Title 54.1 of the Code of Virginia.

3. The City of Chesapeake Public Works Department will not consider for award any cost proposals submitted by any consultants and will not consent to subcontracting any portions of the contract to any subconsultants in violation of the provisions of the Federal Immigration Reform and Control Act of 1986, which prohibits employment of illegal aliens. Firms must submit the completed the attached certification form with their proposals.

4. The method of payment for this contract will be lump sum. For purpose of determining the lump sum fee, an overhead rate shall be established in compliance with cost principles contained in the Federal Acquisition Regulations (FAR) of Part 31 of Title 48 of the Code of Federal Regulations. The overhead rate shall be established by an audit by a cognizant government agency or independent CPA firm.

5. All firms submitting Proposals (prime consultants, joint ventures and subconsultants) must have internal control systems in place that meet federal requirements for accounting. These systems must comply with requirements of 48CFR31, "Federal Acquisition Regulations, Contract Cost Principles and Procedures," and 23CFR172, "Administration of Negotiated Contracts." All firms selected for a project (prime consultants, joint ventures and subconsultants) must submit their FAR audit data to the City of Chesapeake Public Works Department within ten work days of being notified of their selection. Should any firm on the Consultant' team fail to submit the required audit data within the ten work days, negotiations will be terminated by the City of Chesapeake Public Works Department and the next most qualified team invited to submit a proposal.

6. Ethics in Public Contracting: By submitting a proposal, an Offeror certifies that its proposal is made without collusion or fraud and that it has not offered or received any kickbacks or inducements from any other Offeror, supplier, manufacturer or subcontractor in connection with its proposal, and that it has not conferred on any public employee having official responsibility for this procurement transaction any payment, loan, subscription, advance, deposit of money, services or anything of more than nominal value, present or promised, unless consideration of substantially equal or greater value was exchanged.

I. Provide detailed resumes for key personnel including subconsultants.

VIII. DISCLOSURE OF PROPOSAL CONTENTS:

Offerors should be aware that the terms of the contract are public information and can be accessed by the public. Except for the selected proposal, all other proposals will be held in confidence and will not be revealed or discussed with competitors, unless disclosure is required to be made by law or by court ruling. The City may use any ideas presented in any proposal. Selection or rejection of the proposal does not affect this provision.

IX. SUBMITTAL PROCESS AND INFORMATION:

A. One (1) original (specifically marked "Original"), and five (5) copies of the proposal shall be submitted to the Purchasing Division and received no later than 5:00 PM on **September 21,**

2017. Responses received after this time will not be considered. Facsimile copies will not be accepted. **Sealed proposals** should be delivered to:

Susan Kenney-Lambert, CPPB
Procurement Specialist II
City of Chesapeake
306 Cedar Road, 5th Floor
Chesapeake, Virginia 23322
RFP 18010, Annual Civil Engineering Services Contract Small Projects

B. Offerors that submit a response to this RFP may be required to make an oral presentation of their proposal with participation by key personnel pursuant to Section X(B). The City reserves the right to request clarification of information submitted. Failure to provide this additional information within a reasonable time period, as specified by the City, shall be reason for the offeror's proposal to be considered non-responsive.

C. The City of Chesapeake shall not be responsible for any expense incurred by the offeror in preparing and submitting a proposal, for answering any subsequent inquiries, interviews for evaluation, or contract negotiations. All submissions are final.

D. Any Offeror who desires to protest the award of a contract shall submit such protest in writing to the City of Chesapeake Purchasing Division no later than ten days after the announcement of the award. Public announcement of the award shall be posted on the City of Chesapeake's website.

E. The City of Chesapeake Public Works Department assures compliance with Title VI of the Civil Rights Act of 1964, as amended. The consultant and all subconsultants selected for this project may be required to submit a Title VI Evaluation Report (EEO-D2) within ten work days of notification of selection when requested by the City. This requirement applies to all consulting firms when the contract amount equals or exceeds $10,000.

F. Withdrawal of proposal due to error.

A proposal for a public construction contract, other than a contract for construction, or maintenance of public highways, or a proposal for an other than construction contract may withdraw his proposal from consideration if the price in the proposal was substantially lower than the other proposals due solely to a mistake in the proposal, provided the proposal was submitted in good faith, and the mistake was a clerical mistake as opposed to a judgment mistake, and was actually due to an unintentional arithmetic error or an unintentional omission of a quantity of work, labor or material made directly in the compilation of a proposal, which unintentional arithmetic error or unintentional omission can be clearly shown by objective evidence drawn from inspection of original work paper, documents and materials used in the preparation of the proposal sought to be withdrawn. In order to make a valid withdrawal from consideration, the proposer must follow the procedure for withdrawal set forth in the request for proposal (RFP).

The proposer shall give notice in writing of his or her claim of right to withdraw his or her proposal within two business days after the conclusion of the proposal opening procedure, and shall within the following two business days provide the objective evidence described in this section to satisfy the procurement administrator or designee that the grounds for such withdrawal do exist.

The Procurement Administrator shall notify the proposer in writing within five business days of its decision regarding the proposer's request to withdraw its proposal. If the public body denies the withdrawal of a proposal under the provisions of this section, it shall state in such notice the reason or its decision and award the contract to such proposer at the proposal price, provided such proposer is a responsible and responsive bidder. At the same time that the notice is provided, the public body shall return all work papers and copies thereof that have been submitted by the proposer.

G. Ownership of all data, materials and documentation originated and prepared for the City pursuant to the RFP shall belong exclusively to the City and shall be subject to public inspection in accordance with the Virginia Freedom of Information Act and Virginia Public Procurement Act. Data, materials, and documents prepared in furtherance of any contract issued as a result of this RFP shall not be distributed to any third parties without the City's authorization. Any requests for data, materials, and documents by third parties (other than approved sub-consultants) made to a Consultant prepared in furtherance of any contract issued as a result of this RFP should be redirected to the City as the owner and custodian of the records.

Trade secrets or proprietary information submitted by the Offeror shall not be subject to public disclosure under the Virginia Freedom of Information Act, provided that the Offeror invokes the protection of Section 2.2-4342 of the Code of Virginia, in writing, either before or at the time the data is submitted. The written notice must specifically identify the data or materials to be protected and state the reasons why protection is necessary. The proprietary or trade secret material submitted must be identified by some distinct method such as highlighting or underlining and must be indicated on the specific words, figures, or paragraphs that constitute trade secret or proprietary information. The classification of an entire proposal as proprietary or trade secrets is not acceptable and will result in rejection and return of the proposal.

H. The City will only provide information (or access to the same) which is readily available, and does not propose to prepare any further special reports. The City reserves the right to charge its normal fees for materials copied.

I. The right is reserved, as the interests of the City may require, to revise and/or amend the specifications prior to the date set for acceptance of proposals; the acceptance date may be postponed if deemed necessary by the Procurement Administrator. Such revisions and amendments, if any, will be announced by an addendum to this solicitation and posted on the City's website.

J. Late Proposals: To be considered for selection, proposals must be received in the City's Purchasing Office by the designated date and hour. Proposals received in the issuing office after the date and hour designated may be disqualified and may not be considered. The City is not responsible for delays in the delivery of mail by the U.S. Postal Service or private couriers. It is the sole responsibility of the Offeror to insure that its proposal reaches the Purchasing office by the designated date and hour. Receipt of proposals scheduled during a period of suspended City business operations will be rescheduled for processing at the same time on the next business day.

X. SELECTION CRITERIA:

A. Evaluation of proposals will be under the complete jurisdiction of the City of Chesapeake and shall be in accordance with Virginia Code § 2.2-4302.2(A)(4); City of Chesapeake Code Section

54-67(3); and City of Chesapeake Administrative Regulation 4.01. A Selection Committee composed of representatives from the City of Chesapeake will evaluate each proposal received and submit a recommendation to the City Manager. The City will evaluate each proposal pursuant to its standard procurement procedures consistent with the procurement of services through competitive negotiation. Selection will be made on the basis of responsive/responsible determination, qualifications and experience, references, resources and cost of services. All factors will be scored based solely on the City's evaluation.

B. **Evaluation of Proposals and Shortlisted Firms**

The evaluation of the proposals and subsequent interview evaluations of the shortlisted firms will focus on the following:

	Factors		**Point Value**
1.	Firm Qualification & Experience	Specialized experience, expertise and qualifications of the firm and sub-consultant firms to be used on this contract.	25%
2.	Qualifications of Key Personnel	Specialized experience, expertise and qualifications and depth of key project team members who will be assigned to this contract.	25%
3.	Record of the Firm	Record of the firm in accomplishing work on other projects in the required time and within estimated consultant cost and construction cost.	15%
4.	Quality of Work	Quality of work previously performed by the firm for municipalities. If there is no experiences with municipalities, please provide comparable experiences.~~Quality of work previously performed by the firm for the City (Work reviewed by the City for others may also be used.)~~	15%
5.	Use of Resources	Time frame to complete work on typical on-call civil engineering projects (typical design fees ranging from $50,000 to $200,000) and availability of personnel to perform the work within a limited period of time following request for such work.	10%
6	Compliance of RFP	Completeness of the proposal, including whether the proposal is responsive to the outline of services in the RFP.	10%
		Total	100%

C. After the review and rating of proposal(s) by the Selection Committee, the individual scores will be averaged and ranked. Offerors will be ranked in descending order of numerical predominance.

XI. ORAL PRESENTATIONS:

Offerors who submit a proposal in response to this RFP may be required to give an oral presentation of their proposal. This will provide an opportunity for the offeror to clarify or elaborate on the proposal. This is a fact finding and explanation session only and will not include negotiation. The City will schedule the time and location of these presentations. Oral presentations are an option of the issuing agency and may or may not be conducted. Should an Offeror receive a request for an oral presentation, the evaluation criteria relative to the oral presentation will be detailed in a written notice of the request.

XII. AWARD OF CONTRACT:

A. The City Manager shall appoint a Selection Committee in accordance with City Administrative Regulation 4.01. The Selection Committee shall consider proposals that comply with the requirements contained in this RFP. Based on analysis of the proposals submitted by the Offerors, the Committee shall rank the Offerors considered to be the most qualified based on the evaluation factors specified above.

B. Any and all costs associated with the preparation of responses to this Request for Proposals, including site visits, oral presentations and any other costs shall be entirely the responsibility of the offeror and shall not be reimbursable in any manner by the City.

C. The City reserves the right to reject any or all proposals, to waive any technicalities in proposals received, and to negotiate and to accept the proposal which shall be in the City's best interest.

D. The City may cancel this Request for Proposals at any time prior to an award, and is not required to furnish a reason why a particular proposal was not deemed the most advantageous.

E. The Selection Committee shall conduct interviews as follows:

1. The Committee shall hold an individual interview with at least the top two offerors deemed most qualified, responsible, and suitable on the basis of the initial responses to the RFP.
2. The offerors shall be encouraged to elaborate on their qualifications and performance data, or staff expertise pertinent to the proposed project, as well as alternative concepts.
3. The offerors shall also be encouraged to present the methodology for approaching the work specified in the Request for Proposals.
4. At the interview stage, the Selection Committee may discuss with the offerors nonbinding estimates of total project costs, including nonbinding estimates of price of services. Further, the City may discuss all issues related to the qualifications and expectations for the work to be performed. Proprietary information from competing offerors shall not be disclosed to the public or to competitors.
5. At the conclusion of interviews, on the basis of evaluation factors published in the Request for Proposals and all information developed in the selection process, the committee shall select in the order of preference two or more offerors whose professional qualifications and proposed services are deemed most meritorious.

6. Upon a decision of the Selection Committee, the Committee Chairperson shall prepare a report to the committee including a listing of the names of the offerors in the order in which they are recommended for the specific work.

The Selection Panel may elect to interview three or more Offerors. Based on the interviews, the Committee shall rank the Offerors considered to be the most qualified based on the evaluation factors specified above.

Following the interviews (if any), negotiations shall be conducted as follows:

1. Negotiations shall be conducted by the Chairperson, or designee(s), with the offeror ranked first. If a contract satisfactory and advantageous to the City can be negotiated at a price considered fair and reasonable, and which defines precisely the scope of services to be provided, conditions of the professional agreement, work plan and schedule, personnel and method of payment, the award of the contract shall be made to that offeror, otherwise, negotiations with the offeror ranked first shall be formally terminated as set forth below, and negotiation conducted with offeror ranked second, and so on until such a contract (or multiple contracts, if in the City's best interest) can be negotiated at a fair and reasonable price.

2. If negotiations with the offeror ranked first are to be terminated, the Chairperson of the Selection Committee shall forward a notice of intent to terminate negotiations to the Procurement Administrator, with an explanation of the points which cannot be agreed upon, requesting the Procurement Administrator's concurrence in this action. Upon receipt of the Procurement Administrator's concurrence, the Chairperson of the Selection committee shall promptly notify the offeror in writing and then begin negotiations with the offeror chosen second. If the City and any offeror cannot reach agreement, their negotiations shall be terminated in writing.

3. Should the committee determine in writing and in its sole discretion that only one offeror is fully qualified, or that one offeror is clearly more highly qualified and suitable that the others under consideration, a contract may be negotiated and awarded to that offeror.

XIII. CONTRACT LIMITS:

A. One (1) year from the date of execution with option of four (4) additional one-year terms.

ATTACHMENT A

CERTIFICATION OF COMPLIANCE WITH IMMIGRATION LAWS AND REGULATIONS

Section 54-72.2 of the Chesapeake City Code requires that any person or entity doing business with the City of Chesapeake, including its boards and commissions, shall include a sworn certification by the contractor or vendor of compliance with all federal immigration laws and regulations. These laws include the Federal Immigration Reform and Control Act, which makes it unlawful for a person or other entity to hire, recruit or refer for a fee for employment in the United States, an alien knowing the alien is unauthorized, and Section 40.1-11.1 of the Code of Virginia, which makes it unlawful for any employer to knowingly employ an alien who cannot provide documents indicating that he or she is legally eligible for employment in the United States. The state law, in particular, places an affirmative duty on employers to ensure that aliens have proof of eligibility for employment.

Accordingly this certification shall be completed and attached to all contracts and agreements for goods and services made by the City of Chesapeake or any of its boards and commissions. Failure to attach a completed certification shall render the contract or agreement void. A copy of the fully executed certification may be attached if an original certification is on file with Procurement for the current fiscal year.

Type or print legibly when completing this form.

1. Legal Name of Contractor or Vendor:
   (Note: This is your name as reported to the IRS. This should match your Social Security card or Federal ID number.)

2. Type of Business Entity:

   A. Sole proprietorship (Provide full name and address of owner):

   B. Limited Partnership (Provide full name and address of all partners):

   C. General Partnership (Provide full name and address of all partners):

   D. Limited Liability Company (Provide full name and address of all managing members):

   E. Corporation (Provide full name and address of all officers):

3. Doing Business As:
If Applicable (Note: This is the name that appears on your invoices but is not used as your reporting name.)

4. Name and Position of Person Completing this Certificate:

5. Physical Business Address:

6. Primary Correspondence Address (If different from physical address):

7. Number of Employees:

8. Are all Employees Who Work in the United States Eligible for Employment in the United States?

Yes_______

No________

Under penalties of perjury, I declare on behalf of the contractor/vendor listed above that to the best of my knowledge and based upon reasonable inquiry, each and every one of the contractor's/vendor's employees who work in the United States are eligible for employment in the United States as required by the Federal Immigration Reform and Control Act of 1986 and Section 40.1-11.1 of the Code of Virginia. I further declare on behalf of the contractor/vendor that it shall use due care and diligence to ensure that all employees hired in the future who will work in the United States will be eligible for employment in the United States. I affirm that the information provided herein is true, correct, and complete.

Sworn this ____ day of ________________, 201__ on behalf of ___________________ as evidenced by the following signature and seal:

ATTACHMENT B

LITIGATION DISCLOSURE FORM

Respond to each of the questions below by checking the appropriate box. Failure to fully and truthfully disclose the information required by this Litigation Disclosure Form may result in the disqualification of your bid or proposal from consideration or termination of the contract, once awarded. For purposes of this disclosure form, "you" means the individual or entity in whose name the bid or proposal is submitted.

1. Have you or any principal, officer or director of your company, or any individual who will be assigned to work under any contract awarded pursuant to this solicitation, been convicted of a felony, or a misdemeanor involving moral turpitude, during the last seven (7) years?

Yes ☐ No ☐

2. Have you or any principal, officer or director of your company, or any individual who will be assigned to work under any contract awarded pursuant to this solicitation, been terminated from any work being performed for the City of Chesapeake or any other governmental entity in the Commonwealth of Virginia during the last seven (7) years?

Yes ☐ No ☐

3. Have you or any principal, officer or director of your company, or any individual who will be assigned to work under any contract awarded pursuant to this solicitation, been involved in any claim or litigation with the City of Chesapeake or any other governmental entity in the Commonwealth of Virginia during the last seven (7) years?

Yes ☐ No ☐

4. Has any parent company or wholly owned subsidiary of your company been involved in any claim or litigation with the City of Chesapeake or any other governmental entity in the Commonwealth of Virginia during the last seven (7)?

Yes ☐ No ☐

If you answered "Yes" to any of the above questions, please state the name(s) of the person(s), the nature, and the status and/or outcome of the conviction, termination, claim or litigation, as applicable. Any such information should be provided on a separate page, attached to this form and submitted with your bid or proposal.

VIRGINIA STATE CORPORATION COMMISSION (SCC)
REGISTRATION INFORMATION FORM

AUTHORIZATION TO CONDUCT BUSINESS IN THE COMMONWEALTH: A contractor organized as a stock or non-stock corporation, limited liability company, business trust, or limited partnership or registered as a registered limited liability partnership shall be authorized to transact business in the Commonwealth as a domestic or foreign business entity if so required by Title 13.1 or Title 50 of the Code of Virginia or as otherwise required by law. Any business entity described above that enters into a contract with a public body pursuant to the Virginia Public Procurement Act shall not allow its existence to lapse or its certificate of authority or registration to transact business in the Commonwealth, if so required under Title 13.1 or Title 50, to be revoked or cancelled at any time during the term of the contract. A public body may void any contract with a business entity if the business entity fails to remain in compliance with the provisions of this section.

Pursuant to Code of Virginia,§2.2-4311.2 subsection B, a bidder or offeror organized or authorized to transact business in the Commonwealth pursuant to Title 13.1 or Title 50 is required to include in its bid or proposal the identification number issued to it by the State Corporation Commission (SCC). Any bidder or offeror that is not required to be authorized to transact business in the Commonwealth as a foreign business entity under Title 13.1 or Title 50 or as otherwise required by law must indicate by selecting one of the following reasons why the bidder or offeror is not required to be so authorized:

☐ is a corporation or other business entity with the following SCC identification number:

____

OR-

• is not a corporation, limited liability company, limited partnership, registered limited liability partnership, or business trust -

OR-

☐ is an out-of-state business entity that does not regularly and continuously maintain as part of its ordinary and customary business any employees, agents, offices, facilities, or inventories in Virginia (not counting any employees or agents in Virginia who merely solicit orders that require acceptance outside Virginia before they become contracts, and not counting any incidental presence of the bidder in Virginia that is needed in order to assemble, maintain, and repair goods in accordance with the contracts by which such goods were sold and shipped into Virginia from bidder's out-of-state location) -

OR-

• is an out-of-state business entity that is including with this bid an opinion of legal counsel which accurately and completely discloses the undersigned bidder's current contacts with Virginia and describes why those contacts do not constitute the transaction of business in Virginia within the meaning of § 13.1-757 or other similar provisions in Titles 13.1 or 50 of the Code of Virginia.

OR-

☐ If the business entity has not completed any of the foregoing options but currently have pending before the SCC an application for authority to transact business in the Commonwealth of Virginia and wish to be considered for a waiver to allow you to submit the SCC identification number after the due date for bids (The City of Chesapeake reserves the right to determine in its sole discretion whether to allow such waiver).

ATTACHMENT C

CITY OF CHESAPEAKE
DETAILED SCOPE OF SERVICES
CIVIL ENGINEERING CONTRACT FOR SMALL PROJECTS

I. SCOPE OF SERVICES

A. Roadway Projects:

The City wishes to improve the transportation network within the City by improving certain existing roadway facilities and constructing new roadway facilities. In order to complete these projects, the City will initiate work orders for engineering and inspection services under this contract.

The Consultant(s) shall provide the City with necessary plans, specifications, contract documents, and final applications for environmental permits in order that the City may solicit competitive bids for the improvements and/or construction of the roadway facilities. Said plans and specifications shall include, but not necessarily be limited to the following items:

1. Earthwork (Excavations/Fill)
2. Roadway Design (Horizontal and Vertical)
3. Pavement Design
4. Storm Water Drainage
5. Utility Designation and Relocation
6. Erosion/Sediment Control
7. Maintenance of Traffic

In addition, the Consultant may be required to perform inspection, analysis, and evaluation of existing roadway structures. The Consultant may be called on to provide personnel, diagrams, plans, and informational materials to assist the City in the preparation and the conduct of public hearings, depending on the particular project.

B. Drainage Projects:

The City wishes to improve the conveyance of storm drainage in selected areas and at specific locations throughout the City of Chesapeake. In order to complete these projects, the City will initiate work orders for engineering services under this contract.

The Consultant(s) shall provide the City with the necessary plans, specifications, contract documents, and final applications for environmental permits in order that the City may solicit competitive bids for construction of the drainage improvements. Said plans and specifications shall include, but not necessarily be limited to the following items:

1. Earthwork
2. Enclosed Storm Sewer Design
3. Open Channel Design
4. Flood Routing
5. Utility Designation and Relocation
6. Erosion/Sediment Control

The Consultant(s) may be called on to provide personnel, diagrams, plans and informational materials to assist the City in the preparation and the conduct of public hearings, depending on the particular project.

The Consultant(s) may be called on to perform various tasks related to stormwater management within the City, these tasks will include the development and / or the update of stormwater management models (SWMM).The watershed modeling will be developed using SWMM program and be GIS based utilizing the latest available digital planimetrics and digital orthophotos in the selected watershed.

The Consultant(s) understanding of the City's Master Drainage Plan with its engineering analysis and financial components are important in the update and development of the watershed models. The Consultant(s) expertise in the GIS field is critical in the incorporation of city provided data into the watershed models and in the update and / or gathering of the City's stormwater inventory / stormwater GIS layer and the delivery of all completed tasks to the city based on current standards.

C. Utility Projects:

The City wishes to improve the sanitary sewer or water distribution systems in selected areas and at specific locations throughout the City of Chesapeake. In order to complete these projects, the City will award contracts for engineering services.

The Consultant(s) shall provide the City with the necessary plans, specifications, contract documents, and final applications for environmental permits in order that the City may solicit competitive bids for construction of the drainage improvements. Said plans and specifications shall include, but not necessarily be limited to the following items:

1. Earthwork
2. Sanitary Sewer Design
3. Water Distribution Piping Design
4. Hydraulic Flow Analyses
5. Utility Designation and Relocation
6. Erosion/Sediment Control

The Consultant(s) may be called on to provide personnel, diagrams, plans, and informational materials to assist the City in the preparation and the conduct of public hearings, depending on the particular project.

II. BASIC SERVICES OF CONSULTANT

A. Basic Services

The Consultant(s) shall perform professional engineering services as hereinafter stated which includes normal civil engineering services, normal surveying services incidental thereto and environmental work necessary to obtain environmental permits required for project construction. The Consultant(s) represents that they will perform all tasks in accordance with generally accepted professional standards and the Consultant(s) further represents that they will provide the City advice and consultation within the Consultant(s) authority and capacity as a professional engineer. The Consultant(s) will comply with the regulations, laws, ordinances, and requirements of all governmental environmental impact statements applicable to the project.

B. Study and Preliminary Design Phase

Prior to issuance of an individual Work Order the Consultant shall:

1. Meet with City personnel to define a scope of services, establish time constraints, and to review available plans and data.

2. After determining a scope of services, and if it is determined that the work can be performed successfully, in a timely manner, and at a total cost negotiated and considered to be fair and reasonable, the Consultant will be assigned the project and an individual work order be issued. If a fee cannot be negotiated with the Consultant, then discussions will be terminated and negotiations conducted with the second consultant, etc. until an agreement can be reached.

3. The specific projects typically include all necessary research, field, and survey work. On most projects, the Consultant will be required to prepare preliminary design documents and/or draft study.

4. Plans will be submitted electronically in Autocad Civil 3D format that can be read and edited with free viewer. Plans will be in 3D format with building information data.

5. Based on the information contained in the preliminary design documents, the Consultant will be expected to submit an opinion of the estimated project cost including, but not limited to design and construction costs and contingencies. The Consultant will be expected to meet with City representatives and review the preliminary design/study.

6. The Consultant shall furnish all such documents, plans and design data as may be required for, and assist City in the preparation of the documents for submittal to the appropriate local, State, or Federal agency. The Consultant shall attend and participate in meetings and hearings as authorized by City.

C. Final Design Phase

Upon completion of the Preliminary Design Phase and notification from the City that the preliminary design documents are acceptable, the Consultant shall:

1. Prepare the final construction plans and specifications using VDOT Specifications, Hampton Roads Regional Standards, the City of Chesapeake PFM right of way/easement plats, and, prepare the Contract Documents (in such form acceptable to the Purchasing Division and City Attorney's Office) and assist in the preparation of associated documents. It is expected that each project will have a 30%, 60%, 90%, and 100% submittal. Plans will be submitted electronically in Autocad format that can be read and edited with free viewer. Plans will be in 3D format with building information data.

2. Furnish all such documents, plans, studies, and design data as may be required and assist in the preparation of any required documents so that City may obtain approval from appropriate local, State, or Federal agencies. The Consultant shall attend and participate in administrative hearings and meetings as authorized by City.

3. Furnish a revised estimate of project costs based on the final plans and specifications and other related documents.

4. Prepare revisions/addendum as required.

D. Bidding Phase

After authorization to proceed with the Bidding Phase the Consultant shall:

1. Assist in obtaining bids (or negotiating proposals) for each project.

2. Consult and advice as to the acceptability of substitute materials and equipment proposed by the contractor.

3. Consult and advice as to the acceptability of prime contractors and other persons and organizations proposed by the prime contractor.

4. Assist in the evaluation of bids or proposals.

5. If necessary, prepare bid tabulations, recommendations for award, and assist in the preparation of the final contract document.

E. Construction Phase

The Consultant may be responsible for providing control staking, easement and right-of-way staking, and general consultation during the construction phase. Control staking may include setting iron pins at property corners (including easements), providing one or more elevation bench marks at the site and providing centerline offset stakes for water and sewer main construction. Detailed daily inspections of the construction work will generally be performed by City. The Consultant's responsibilities during the construction phase may include but not be limited to the following:

1. Furnish City and the contractor with additional sets of plans and specifications as needed.

2. Consult with and advise City on matters relating to the construction activities.

3. Make periodic visits, as authorized, to the job site to observe as an experienced and qualified design professional the progress and quality of the executed work and to determine if the work is proceeding in accordance with the final plans, specifications and contract documents. During such visits and on the basis of on-site observations, the consultant shall keep City informed in writing of the progress of work, shall endeavor to guard against defects and deficiencies in the work of the contractor, shall notify City of any observed defects or deficiencies in the work of the contractor and shall recommend disapproval or rejection of work failing to conform with the final plans, specifications and contract documents.

4. Review and approve shop drawings and samples, the results of test and inspections and other data which the contractor is required to submit, for conformance with the design concept of the project and compliance with the information given in the final plans. Specifications and contract documents; determine the acceptability of substitute materials and equipment proposed by the contactor; and receive and review maintenance and operating instructions. Schedules, guarantees, bonds, and certificates of inspection which

are to be assembled by the contractor in accordance with the final plans, specifications and contract documents.

5. Issue directives of City pertaining to change orders (as authorized). The Consultant may, as City's representative, require special inspection or testing of the work and shall act as an interpreter of the requirements of the final plans, specifications and contract documents.

6. Based on the Consultant's on-site observations as an experienced and qualified design professional and on its review of the contractor's applications for payment and the accompanying data and schedules, the Consultant shall advise as to the amount owing to the contractor and shall indicate whether the amount requested is approved (subject to an evaluation of the work as a functioning project upon substantial completion and to the results of any subsequent tests called for in the final plans, specifications, and contract documents.)

7. Participate in a final inspection to determine if the project has been completed in accordance with the final plans, specifications and contract documents. Provide a written report summarizing the findings.

8. Provide a set of reproducible mylar record drawings to City and electronic file format if required.

EE. TERM OF CONTRACT

A. **PROCUREMENT ORDINANCE:** This solicitation is subject to the provisions of the City of Chesapeake Procurement Ordinance and applicable provisions of the Virginia Public Procurement Act, including and consistent with Virginia Code Section 2.2-4343(12). A copy of the City's ordinance is available for review at the purchasing office or accessible on the Internet at www.cityofchesapeake.net under "Ordinances."

B. **APPLICABLE LAWS AND COURTS:** This solicitation and any resulting contract shall be governed in all respects by the laws of the Commonwealth of Virginia, and any litigation with respect thereto shall be brought in in the courts of the City of Chesapeake, Virginia, or the United States District Court for the Eastern District of Virginia, if independent federal jurisdiction exists. The Consultant shall comply with all applicable federal, state and local laws, rules and regulations. This solicitation is also governed by provisions of Chapter 54 of the Chesapeake City Code, and any revisions thereto, which are hereby incorporated into this contract by reference. Contact the Purchasing Division at (757) 382-6359, for more information or to review Chapter 54 of the Chesapeake City Code. The City Code may also be read online at http://www.municode.com.

C. **ANTI-DISCRIMINATION:** By submitting their proposals, offerors certify to the City that they will conform to the provisions of the Federal Civil Rights Act of 1964, as amended, as well as the Virginia Fair Employment Contracting Act of 1975, as amended, where applicable, the Virginians With Disabilities Act, the Americans With

Disabilities Act and § 2.2-4311 of the *Virginia Public Procurement Act (VPPA).* If the award is made to a faith-based organization, the organization shall not discriminate against any recipient of goods, services, or disbursements made pursuant to the contract on the basis of the recipient's religion, religious belief, refusal to participate in a religious practice, or on the basis of race, age, color, gender or national origin and shall be subject to the same rules as other organizations that contract with public bodies to account for the use of the funds provided; however, if the faith-based organization segregates public funds into separate accounts, only the accounts and programs funded with public funds shall be subject to audit by the public body (*Code of Virginia*, § 2.2-4343.1E).

D. **ETHICS IN PUBLIC CONTRACTING:** By submitting their proposals, offerors certify that their proposals are made without collusion or fraud and that they have not offered or received any kickbacks or inducements from any other offeror, supplier, manufacturer or subcontractor in connection with their proposal, and that they have not conferred on any public employee having official responsibility for this procurement transaction any payment, loan, subscription, advance, deposit of money, services or anything of more than nominal value, present or promised, unless consideration of substantially equal or greater value was exchanged.

E. **IMMIGRATION REFORM AND CONTROL ACT OF 1986:** By submitting their (bids/proposals), (bidders/offerors) certify that they do not and will not during the performance of this contract employ illegal alien workers or otherwise violate the provisions of the federal Immigration Reform and Control Act of 1986.

F. **DEBARMENT STATUS:** By submitting their proposals, offerors certify that they are not currently debarred by the Commonwealth of Virginia from submitting proposals on contracts for the type of services covered by this solicitation, nor are they an agent of any person or entity that is currently so debarred.

G. **ANTITRUST:** By entering into a contract, the Consultant conveys, sells, assigns, and transfers to the City of Chesapeake all rights, title and interest in and to all causes of action it may now have or hereafter acquire under the antitrust laws of the United States and the Commonwealth of Virginia, relating to the particular services purchased or acquired by the City of Chesapeake under said contract.

H. **MANDATORY USE OF CITY FORM:** Failure to submit a proposal on the official form provided for that purpose may be a cause for rejection of the proposal. Modification of or additions to the General Terms and Conditions of the solicitation may be cause for rejection of the proposal; however, the City reserves the right to decide, on a case by case basis, in its sole discretion, whether to reject such a proposal.

I. **CLARIFICATION OF TERMS:** If any prospective offeror has questions about the specifications or other solicitation documents, the prospective offeror should contact the buyer whose name appears on the face of the solicitation no later than 5 working days before the due date. Any revisions to the solicitation will be made only by addendum issued by the buyer.

J. **PAYMENT:**

1. To Prime Consultant:

   a. Invoices for items ordered, delivered and accepted shall be submitted by the Consultant directly to the payment address shown on the purchase order/contract. All invoices shall show the City contract number and/or purchase order number; social security number (for individual Consultants) or the federal employer identification number (for proprietorships, partnerships, and corporations).

   b. Any payment terms requiring payment in less than 30 days will be regarded as requiring payment 30 days after invoice or delivery, whichever occurs last. This shall not affect offers of discounts for payment in less than 30 days, however.

   c. All services provided under this contract or purchase order, that are to be paid for with public funds, shall be billed by the Consultant at the contract price, regardless of which City department is being billed.

d. The following shall be deemed to be the date of payment: the date of postmark in all cases where payment is made by mail, or the date of offset when offset proceedings have been instituted as authorized under the Virginia Debt Collection Act.

e. **Unreasonable Charges**. Under certain emergency procurements and for most time and material purchases, final job costs cannot be accurately determined at the time orders are placed. In such cases, Consultants should be put on notice that final payment in full is contingent on a determination of reasonableness with respect to all invoiced charges. Charges which appear to be unreasonable will be researched and challenged, and that portion of the invoice held in abeyance until a settlement can be reached. Upon determining that invoiced charges are not reasonable, the City shall promptly notify the Consultant, in writing, as to those charges which it considers unreasonable and the basis for the determination. A Consultant may not institute legal action unless a settlement cannot be reached within 30 days of notification. The provisions of this section do not relieve a department of its prompt payment obligations with respect to those charges which are not in dispute (*Code of Virginia*, § 2.2-4363).

2. To Subcontractors:

a. A Consultant awarded a contract under this solicitation is hereby obligated:

(1) To pay the subcontractor(s) within 7 days of the Consultant's receipt of payment from the City for the proportionate share of the payment received for work performed by the subcontractor(s) under the contract; or

(2) To notify the Purchasing department and the subcontractor(s), in writing, of the Consultant's intention to withhold payment and the reason.

b. The Consultant is obligated to pay the subcontractor(s) interest at the rate of one percent per month (unless otherwise provided under the terms of the contract) on all amounts owed by the Consultant that remain unpaid 7 days following receipt of payment from the City, except for amounts withheld as stated in (2) above. The date of mailing of any payment by U.S. Mail is deemed to be payment to the addressee. These provisions apply to each sub-tier contractor performing under the primary contract. A Consultant's obligation to pay an interest charge to a subcontractor may not be construed to be an obligation of the City.

K. **PRECEDENCE OF TERMS:** Paragraphs A-J of these General Terms and Conditions shall apply in all instances. In the event there is a conflict between any of the other General Terms and Conditions and any Special Terms and Conditions in this solicitation, the Special Terms and Conditions shall apply.

L. **QUALIFICATIONS OF OFFERORS:** The City may make such reasonable investigations as deemed proper and necessary to determine the ability of the offeror to perform the services and the offeror shall furnish to the City all such information and data for this purpose as may be requested. The City reserves the right to inspect offeror's physical facilities prior to award to satisfy questions regarding the offeror's capabilities. The City further reserves the right to reject any proposal if the evidence submitted by, or investigations of, such offeror fails to satisfy the City that such offeror is properly qualified to carry out the obligations of the contract and to provide the services contemplated therein.

M. **TESTING AND INSPECTION:** The City reserves the right to conduct any test or inspection it may deem advisable to assure services conform to the specifications.

N. **ASSIGNMENT OF CONTRACT:** A contract shall not be assignable by the Consultant in whole or in part without the written consent of the City.

O. **CHANGES TO THE CONTRACT:** Changes can be made to the contract in any of the following ways:

1. The parties may agree in writing to modify the terms, conditions, or scope of the contract. Any additional services to be provided shall be of a sort that is ancillary to the contract services, or within the same broad

10-150: Stormwater Mapping & Master Drainage Plan III

Department:	**Storm Water Capital Projects**		
Project Type:	Study	Comprehensive Plan Goal Area:	Stormwater Management
Year identified:	2011	Planning Area:	Citywide
Start Date:	7/1/2012	Project Status:	Adopted
Est. Completion Date:	7/30/2023		

Description:

This project will continue the updating of the Stormwater Inventory Mapping and Master Drainage Plan.

Justification:

The updating of the Stormwater Inventory Mapping and Master Drainage Plan is essential in providing quick, accurate information to City staff, consultants, and the general public. This will provide inventory mapping to support emergency responses and GASB 34 accounting.

Comments:

On May 28, 2019, City Council transferred $48,876 from this project to CIP 70-230 "Crestwood Watershed Master Drainage Plan" to provide the local match for a grant award.

Project Forecast:

Year	Total Expense	Total Revenue	Difference
2022			0
2023	100,000	100,000	0
	100,000	**100,000**	**0**

Letter of Matching Fund Authorization

Chesapeake
VIRGINIA
PUBLIC WORKS

MEMORANDUM

TO: Crystal Bloom, P.E., Assistant City Engineer

FROM: Deva Borah, PhD, P.E., Senior Project Engineer

DATE: April 7, 2022

SUBJECT: **AUTHORIZATION TO REQUEST FUNDING THROUGH COMMUNITY FLOOD PREPAREDNESS FUND (CFPF) GRANT PROGRAM FOR GOOSE CREEK WATERSHED STUDY**

The City of Chesapeake requests funding through the Community Flood Preparedness Fund (CFPF) grant program for the above-referenced study in accordance with the grant program requirements as provided in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund.

The City has dedicated funding for this specific type of study in the Capital Improvement Budget (CIB) that will be used to provide the required local match, see Project #10-150 Stormwater Mapping & Master Drainage Plan III. The CIB Project Summary page and documentation to verify the availability of adequate funding to cover the local match amount are provided for your records.

The total project cost is $185,000. The amount of funding requested through the CFPF is 50% of the project cost or $92,500. The remaining cost of $92,500 will be a local match funded through Project #10-150 Stormwater Mapping & Master Drainage Plan III.

Should you have any questions or need additional information, please contact me at extension 6472.

Crystal Bloom, P.E., Assistant City Engineer

CID510034_ChesapeakeCity_CFPF-3: CFPF 2022 Grant Application on the Goose Creek Watershed STUDY

1 message

Deva K. Borah <dborah@cityofchesapeake.net> Fri, Apr 8, 2022 at 3:32 PM
To: Virginia Department of Conservation & Recreation <cfpf@dcr.virginia.gov>
Cc: Sam Sawan <sawan@cityofchesapeake.net>, "Crystal V. Bloom" <cbloom@cityofchesapeake.net>

Dear DCR CFPF Program Manager,

Attached please find the City of Chesapeake's Grant Application **CID510034_ChesapeakeCity_CFPF-3** on the Goose Creek watershed **STUDY** for 2022 CFPF Grant Funding.

We look forward to hearing from you with an acknowledgement of receipt of this application.

Sincerely,

Deva

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ✓

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ✓ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ✓ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Greenbrier business corridor, Indian River City Watershed, Eastern Branch Elizabeth River, James River Basin

NFIP Community Identification Number (CID#):(See appendix F 510034

Is Project Located in an NFIP Participating Community? ✓ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes ✓ No

Flood Zone(s) (If Applicable): majority X (Shaded) and Zone X (0.2% chance) at towards outfall along length of improvements

Flood Insurance Rate Map Number(s) (If Applicable): 5100340016D, 5100340017D, 5100340018D, 5100340025D. 5100340026D, 5100340027D

Total Cost of Project: $1,975,398

Total Amount Requested $1,185,238

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**City of Chesapeake**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	✓
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	**Submitted for approval**
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	✓
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	✓
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration		✓ **Yes** ☐ **No**
Applicant Name:	**City of Chesapeake**	
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	35
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	X ¼ = 2
Low Social Vulnerability (-1.0 to 0.0)	**0**	X ¾ = 0
Very Low Social Vulnerability (Less than -1.0)	**0**	

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	0
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		**57**

Appendix D: Checklist All Categories

Community Flood Preparedness Fund Grant Program

Scope of Work Narrative	
Supporting Documentation	**Included**
Detailed map of the project area(s) (Projects/Studies)	✓ Yes ☐ No ☐ N/A
FIRMette of the project area(s) (Projects/Studies)	✓ Yes ☐ No ☐ N/A
Historic flood damage data and/or images (Projects/Studies)	✓ Yes ☐ No ☐ N/A
A link to or a copy of the current floodplain ordinance	✓ Yes ☐ No ☐ N/A
Non-Fund financed maintenance and management plan for project extending a minimum of 5 years from project close	✓ Yes ☐ No ☐ N/A
A link to or a copy of the current hazard mitigation plan	✓ Yes ☐ No ☐ N/A
A link to or a copy of the current comprehensive plan	✓ Yes ☐ No ☐ N/A
Social vulnerability index score(s) for the project area from ADAPT VA's Virginia Vulnerability Viewer	✓ Yes ☐ No ☐ N/A
If applicant is not a town, city, or county, letters of support from affected communities	☐ Yes ☐ No ✓ N/A
Completed Scoring Criteria Sheet in Appendix B, C, or D	✓ Yes ☐ No ☐ N/A
Budget Narrative	
Supporting Documentation	**Included**
Authorization to request funding from the Fund from governing body or chief executive of the local government	✓ Yes ☐ No ☐ N/A
Signed pledge agreement from each contributing organization	☐ Yes ☐ No ✓ N/A

A. Scope of Work Narrative – Projects

All applications must include a Scope of Work Narrative that clearly describes the proposed project or study, including supporting documentation as necessary. It may be helpful to review the checklist in Appendix C to ensure that the application includes all the required elements. The Scope of Work narrative for all applications should address the following elements.

1. ***Project Information***: Describe in detail the area to be studied or protected including the following. _Note that information should be provided on the local government(s) in which the project is taking place, even if that local government it is not the grant applicant_. Projects undertaken by municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these, must be consistent with resilience plans and efforts in the local government where the project takes place. Letters of support from affected local governments must be included with the application.

This application is for the project known as Greenbrier Outfall Resiliency Improvements Phase I & II. This project was included in the Chesapeake Preliminary Resilience Plan submitted for approval concurrent with this application. The City of Chesapeake has engaged a consultant, GKY & Associated, to study this area and identify improvements to alleviate flooding during extreme storm events. GKY performed hydrologic and hydraulic analysis and developed the Greenbrier Resiliency Plan in late 2020. The Plan has been included as *Attachment 1*.

***Attachment 1* provides a detailed description of the project, background, site, analysis, and recommended improvements. Detailed map of the project area including drainage area and area to be protected by this project can be found in the Figures section starting on page 34 of this document.**

- Population
  - Provide population data for the local government in which the project is taking place, including identification of any low-income geographic area and the estimated number of residents that will be impacted by this project.

Population data for Chesapeake – 249,422 as of 2020 Census

Identification of any low-income geographic area that will be impacted by the project: none

The estimate number of residents impacted by the project: 10,620

- Historic flooding data and hydrologic studies projecting flood frequency
  - Provide information on the flood risk of the project area, including whether the project is in a mapped floodplain, what flood zone it is in, and when it was last mapped. If the property or area around it has been flooded before, share information on the dates of past flood events and the amount of damage sustained.

Flood risk of the project area: The majority of the drainage area is in flood zone X (Shaded) with the most downstream portion in Flood Zone X (0.2% chance) where the two (2) improvements will be made. The area was last mapped in 2014. See *Attachment 2* for the FIRMette of the project area.

Information on the dates of past flood events and the amount of damage sustained: The GKY study used flooding data from Hurricane Matthew in October 2016 for calibration. That documentation is provided on pages 20 & 21 of *Attachment 1*.

Other flooding data has been packaged and provided as *Attachment 3*. These include a map of known flooding locations where high water signs have been installed as well as records of work orders that have been generated based on flooding complaints.

- The ability of the local government to provide its share of the cost
  - This must include an estimate of the total project cost, a description of the source of the funds being used, evidence of the local government's ability to pay for the project in full or quarterly prior to reimbursement, and a signed pledge agreement from each contributing organization.

Estimate of total project cost: $1,975,398

Source of the funds being used: Capital Improvement Budget funds encumbered to CIB 29-230

Evidence of Ability to Pay: See Budget Narrative and referenced Attachments

Signed Pledge Agreement: N/A

- The administration of local floodplain management regulations
  - The Department will determine if the community is in good standing with the NFIP. If applicable, provide the Department with a link to the current floodplain ordinance, or attach a PDF or Word document of the ordinance.

Link to a copy of the current floodplain ordinance:

ADOPTED+Floodplain+Ordinance--7-16-2013.pdf (cityofchesapeake.net)

- Other necessary information to establish project or study priority
  - Repetitive Loss and/or Severe Repetitive Loss Properties
    - Do not provide the addresses for these properties, but include an exact number of repetitive loss and/or severe repetitive loss structures within the project area. Work with the local floodplain administrator or emergency manager to find this information. If they do not have a list of repetitive loss/severe repetitive loss structures, the Department can assist them in accessing these lists.

Exact number of repetitive loss /severe repetitive loss structures within the project area: 0

  - Residential and/or Commercial Structures
    - Describe the residential and commercial structures impacted by this project, including how they contribute to the community such as historic, economic, or social value. Provide an exact number of residential structures and commercial structures in the project area.

Description of the Area: The majority of the area impacted by the project is commercial in nature. It is one of the City's major business corridors. However, there are some residential properties within the drainage area as well.

Exact number of residential structures and commercial structures within the project area: There are 3,848 residential structures and 700 commercial structures in the project area. There are also 32 government buildings.

- Critical Facilities
  - If there are critical facilities within the project area, describe each facility. Critical facilities are those that provide services and functions essential to the community, including hospitals, fire stations, police stations, storage facilities for critical records, power plants, and wastewater treatment plants, among others.

There are 7 critical facility in the project area:

1. **Station – 5th Precinct - Greenbrier, police station**
2. **Childrens Health Systems Inc, medical**
3. **Southeastern Virginia Training Center, special needs**
4. **Public Works Operations Center**
5. **Davita Ches Dialysis Center, medical**
6. **Indian River High School, shelter**
7. **Station 14, fire station**

2. ***Need for Assistance***: Identify and describe any relevant issues or problems that will be addressed by the project.

   - Explain the local government's financial and staff resources. How many relevant staff members (floodplain administrators, planners, emergency managers, building officials, engineers) does the local government have? To what relevant software does the local government have access? What are the local government's capabilities?

The majority of City infrastructure improvements are funded through the Capital Improvement Budget. The approved FY22 CIB is available at: Adopted+CIP+Document+FY+22-26+update.pdf (cityofchesapeake.net)

Number of relevant staff members:

- **1 Floodplain Administrator**
- **1 additional Certified Floodplain Manager**
- **7 Stormwater Engineers**
- **1 Plan Review & Codes Administrator**
- **1 Permit Services Administrator**
- **1 Principal Planner**
- **2 Senior Planners**
- **1 Deputy Coordinator of Emergency Management**

Relevant Software: Accela for plan review, numerous stormwater modeling programs (SWMM, Autodesk Hydraflow, Autodesk Storm & Sewer Analysis, Bentley Civil Storm, Culvert Master, etc.), Microsoft Office Suite, ArcGIS

Capabilities: The City has several teams within Public Works to manage the study, design and construction work performed by consultants and contractors. One of the teams also takes on in-house design for small projects that can be accomplished using on-call contractors. There is a team that focuses solely on managing construction and includes engineers as well as inspectors.

- The Department will prioritize low-income geographic areas for funding. Low-income geographic area means any locality or geographic area within a locality that may cross municipal or county boundaries, that has a median household income that is not greater than 80 percent of the local median household income, or any area in the Commonwealth designated as a qualified opportunity zone by the U.S. Secretary of the Treasury via his delegation of authority to the Internal Revenue Service.

This project DOES NOT impact low-income geographic areas.

- The Department will consider the project area's social vulnerability index score when reviewing grant applications. The Social Vulnerability Index, available through ADAPT Virginia's Virginia Vulnerability Viewer, will be used for this review.
- This index is based on census tract data; the index score for the census tract that contains the project area should be used. If the project area falls within multiple census tracts, please provide the scores for all census tracts. The average score for the project area will be used for scoring the application.
  - For more information on social vulnerability, please see ADAPT Virginia's fact sheet.

This map has been provided as *Attachment 4.* The project area spans several census tracts, three (3) of which have a low social vulnerability score while one (1) scores as medium.

2. ***Alternatives***: If the project proposed does not employ a nature-based or hybrid solution and the total project cost is greater than $3 million, describe at least one alternative that could reasonably address the issue identified. Please also consider the No Action Option as a third alternative as part of the analysis. Explain these alternatives and the reason the proposed project was selected.

Not applicable since the total project cost is less than $3M dollars.

3. ***Goals and Objectives:*** Identify and describe the goals and objectives of the project. Include a description of the expected results of the completed project and explain the expected benefits of the project. This may include financial benefits, increased awareness, decreased risk, etc.

Lower Indian River High School lake weir and upsize existing poor-condition box culvert under S. Military Hwy to lower upstream hydraulic grade line and provide additional flood storage in Greenbrier business corridor.

Goal 1. Reduce the frequency and severity of flooding impacts to the project area during extreme storm events. A combination of these improvements along with an additional future phase provide protection equivalent to a 1000-yr storm event. Details of the analysis can be found in *Attachment 1.*

- **Objective 1.1 Increase water storage by lowering the weir at Indian River High School.**
- **Objective 1.2 Increase water storage capacity by upsizing the existing box culvert under S. Military Highway.**

The expected results and benefits of the project are in line with the project goals to decrease flooding risk. Additional benefits include decreased financial burden and loss associated with flooding as well as increased circulation in the business district leading to reduced loss of business.

4. ***Approach, Milestones, and Deliverables*****:** Outline a plan of action laying out the scope and detail of how the proposed work will be accomplished with a timeline identifying expected completion dates. Determine milestones for the project that will be used to track progress. Explain what deliverables can be expected at each milestone, and what the final project deliverables will be. Identify other potential project partners.
    - If assistance is sought for a project that will be carried out in concert with a federal agency, provide evidence of an agreement with the federal agency endorsing the project.

The design has not yet started for this project.

Once the grant has been awarded, the City will engage one of their on-call consultants to develop a scope of work to design the project. The following is the anticipated schedule including milestones – used to track progress – and dates through construction of the project.

Milestone	**Period Of Performance**	**Delivery After Grant Award**
Design Consultant NTP	**3 months**	**3 months**
Development of Construction Docs	**15 months**	**18 months**
Environmental Permitting	**N/A**	**Concurrent with design**
Advertise for Bid	**2 Months**	**20 months**
Construction NTP	**4 months**	**24 months**
Construction Completion	**9 months**	**33 months**

5. ***Relationship to Other Projects*:** Where applicable, briefly describe the relationship between this project and other past, current, or future resilience projects. If the applicant has received or applied for any other grants or loans, please identify those projects, and, if applicable, describe any problems that arose with meeting the obligations of the grant and how the obligations of this project will be met.

This project has been identified in the City of Chesapeake Preliminary Resilience Plan that was submitted concurrent with this application. There is another phase of this project planned. It has also been included in the City Resilience Plan but the work for Phases I & II will be done prior to the future Phase III project. This project is not currently under consideration for any other grants or loans.

6. ***Maintenance Plan:*** For ongoing projects or projects that will require future maintenance, such as infrastructure, flood warning and response systems, signs, websites, or flood risk applications, a maintenance and management plan for the projects must be provided demonstrating how they will be maintained after the lifespan of this grant for a minimum of five years. Ongoing operation and maintenance will be the financial responsibility of the grantee and will not be eligible for monies from the Fund.

Annual inspection and maintenance for this project shall be performed by City staff as is required by the City of Chesapeake Phase I MS4 permit. The City follows standard operating & maintenance procedures established internally and by state organizations including DEQ and VDOT for O&M of stormwater infrastructure. See *Attachment 5* for the following documents:

- **Drainage Infrastructure Management (Storm Pipe/Cave-In/Ditch) - see attached PW Regulation 755.**
- **Stormwater Operation Plan (BMP) - see attached PW Regulation 756, which references the PFM that refers to the DEQ BMP Design Specifications.**
- **Weir structures - see excerpt for the Principal Spillway from DEQ BMP Design Specs**
- **Box Culvert - see excerpt from VDOT Maintenance Best Practices .**

The total project cost as identified in the application is for design and construction only. Funding for maintenance is non-fund financed.

7. ***Criteria:*** Describe how the project meets each of the applicable scoring criteria contained in Appendix B, and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application. Appendix B must be completed and submitted with the application.

   For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

   1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by

the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?

The applicant, the City of Chesapeake, is a local government.

2. Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?

The applicant received grant funding in a previous CFPF grant round to develop a Resilience Plan. The Preliminary Resilience Plan developed under that scope of Word has been submitted for approval along with this project grant application and has been included as *Attachment 6.*

3. For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?

N/A.

4. Has the applicant provided evidence of an ability to provide the required match funds?

Yes, see Budget Narrative and referenced Attachments.

5. Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?

Yes, see Scope of Work Narrative A.3. Goals and Objectives and reference Attachments.

- A link to or a copy of the current comprehensive plan

  Comprehensive Plan 2035 (cityofchesapeake.net)

- Completed Scoring Criteria Sheet

  The Completed Appendix B: Scoring Criteria for Flood Prevention and Protection Projects follows the Appendix A: Application Form.

B. Budget Narrative- Required for All Grant Categories

Each application must include a detailed Budget Narrative explaining all proposed expenditures. A budget narrative is applicable to requests from any category of grants in this manual. The following items must be included in the Budget Narrative:

● *Estimated total project cost*: **$1,975,398**

> **This amount represents the estimated total project cost including engineering ($355,702) and construction ($1,619,696). See pages 50 and 51 of *Attachment 1* for a detailed breakdown of the estimated total project cost. A 20% increase was applied to these values to account for present day costs as well as observed increases in the construction industry.**

● *Amount of funds requested from the Fund*: **$1,185,238**

> **This is the total amount of any grant assistance sought from the Fund. It represents 60% of the estimated total project cost.**
>
> **Estimated Funding Request Breakdown**
> - **Salaries, 0**
> - **Fringe Benefits, 0**
> - **Travel, 0**
> - **Equipment, 0**
> - **Supplies, 0**
> - **Construction, $971,818**
> - **Contracts, $213,420**

Acronyms & Definitions

The following acronyms apply to this document and ancillary material:

BRIC	Building Resilient Infrastructure and Communities (a FEMA grant program)
CIP	Capital Improvement Program
City	unless specifically stated otherwise, the City of Chesapeake, Virginia
CLOMR	Conditional Letter of Map Revision
CWA	Clean Water Act
CRS	Community Rating System
DCR	Virginia Department of Conservation and Recreation
DEM	Digital Elevation Model
DEQ	Virginia Department of Environmental Quality
DSFPPAF	Dam Safety, Flood Prevention and Protection Assistance Fund (administered by DCR)
EPA	U.S. Environmental Protection Agency
ESA	Engdangered Species Act
FIRM	Flood Insurance Rate Map
FIS	Flood Insurance Study
FHWA	U.S. Federal Highway Administration
FMA	Flood Mitigation Assitance (a FEMA grant program)
GKY	GKY & Associates, Inc. (see www.gky.com)
JPA	Joint Permit Application
LOMR	Letter of Map Revision
MDP	Master Drainage Plan
MDPU	Master Drainage Plan Update
MS4	Municipal Separate Storm Sewer System
MTD	Manufactured Treatment Devices
NAVD88	North American Vertical Datum of 1988
NEPA	National Environmental Policy Act
NFIP	National Flood Insurance Program
NGVD29	National Geodetic Vertical Datum of 1929
NHPA	National Historical Preservation Act of 1966
NOAA	National Oceanic and Atmospheric Administration
NRCS	Natural Resources Conservation Service
PCSWMM	an enhanced graphical user interface to the SWMM engine produced and marketed by Computational Hydraulics International. PCSWMM runs the EPA SWMM engine and provides a wide assortment of add-on utilities and tools.
PDF	Portable Document Format—the Adobe Acrobat file format used for this (and many other) electronic documents
ROG	Rain-on-Grid
SLAF	Stormwater Local Assistance Fund (administered by DEQ)
SWCB	Virginia State Water Control Board
SWMM	Storm Water Management Model, originally developed (and currently authorized) by EPA.
TMDL	Total Maximum Daily Load
VDOT	Virginia Department of Transportation
VERTCON	datum conversion tool produced by NOAA (https://www.ngs.noaa.gov/cgi-bin/VERTCON/vert_con.prl)
VMRC	Virginia Marine Resoucres Comission
VPDES	Virginia Pollutant Discharge Elimination System
VRA	Virginia Resources Authority
VRRM	Virginia Runoff Reduction Method, administered by DEQ
VSMP	Virginia Stormwater Management Program
WOTUS	Waters of the United States

The following rainfall event definitions apply to this document:

D6	Six inches of effective rainfall applied to the watershed in the shape of a 24-hour, NOAA Type C hyetograph. This event is analogous to a 100-year storm event.
D9	Nine inches of effective rainfall applied to the watershed in the shape of a 24-hour, NOAA Type C hyetograph. This event is analogous to a 1,000-year storm event.
D12	Twelve inches of effective rainfall applied to the watershed in the shape of a 24-hour, NOAA Type C hyetograph. This event is analogous to an event that is much more severe than a 1,000-year storm event.
Matthew	Effective rainfall constructed from rain gage data collected at City Hall on October 8 and 9, 2016.

GREENBRIER RESILIENCY PLAN

November 2020

1. Executive Summary

Engineers from the City of Chesapeake, Department of Public Works, and GKY & Associates, Inc. have completed a Resiliency Plan for the Greenbrier Drainage Area, within the Indian River Creek Watershed.

The need for this plan was demonstrated during Hurricane Matthew[1]. Although the existing drainage system functions reasonably well during heavy rainfall events, key roadway intersections experience prolonged flooding during extraordinary storms. Eden Way North, Executive Boulevard, Greenbrier Parkway, Volvo Parkway, and other streets became impassible during Matthew, and the floodwaters were slow to recede.

The goal of this study is to identify potential projects to lower flood elevations and reduce the duration of flooding during an extreme storm event. The engineering approach is different from routine master drainage plans and stormwater management designs because the scale of the problem is so much larger. This study evaluated rainfall events having average recurrence intervals on the order of 100 to well over 1,000 years.[2]

GKY engineers created computer models of existing watershed conditions and incorporated potential projects to evaluate their resilience potential. The models were built using recent 3D LiDAR-derived terrain data, so flood depths and overland flows are much more reliably computed than using simpler methods.

Aerial photographs were taken during Hurricane Matthew at 7:00 a.m. on October 9, 2016 showing flooding on the ground at that time. Rainfall was reliably recorded at Chesapeake City Hall, 3½ miles from the center of the drainage area. GKY used the rainfall record and aerial photographs to calibrate the computer model, which was then used to configure and evaluate the benefits of potential flood improvement projects.

The modeling highlights the challenges of making cost-effective improvements to reduce flood levels and durations in an urbanized watershed. The results are useful not only for showing what would work, but also for avoiding projects that would not provide any appreciable benefits.

After analyzing existing problems in this watershed, the engineering team has identified three potential improvement projects (indicated with green shading in Figure 9) that can alleviate future flooding, including:

1. **Indian River High School Lake Weir:** Lower the existing weir at Indian River High School Lake from a crest elevation of 8.1 to 6.1 feet—which will lower hydraulic grade lines and provide additional flood storage;
2. **South Military Highway Culvert Replacement:** Replace the existing 6'Hx10'W box culvert under South Military Highway with a double 8'x8' box culvert, which will lower hydraulic grade lines; and
3. **I-64 Additional Culvert:** Add a 60" circular culvert under I-64, just to the east of the existing triple 9'x9' box culvert—which will lower the permanent pool elevations of upstream impoundments to create 350 acre-feet or so of new flood storage.

These three potential projects are documented below and in the report figures that follow. The projects may be implemented with some assurance that the impacts on the watershed have been adequately considered.

---

[1] Hurricane Matthew dropped over 11 inches of rain on October 8 and 9, 2016.

[2] Drainage and stormwater management designs typically accommodate storms that have an average recurrence interval of 10 to 100 years.

Some of the conceptual designs may need to be modified—as wetlands regulations, development sequencing, flooding issues, soil properties, risk tolerance, and economic considerations come into play.

Virginia has undertaken several initiatives in recent years to improve flood resiliency and incorporated them into a comprehensive 2020 guidance document entitled *Virginia Coastal Resilience Master Planning Framework*[3]. The projects identified in this Greenbrier Resiliency Plan should fit nicely within the goals and objectives laid out in the State's framework and should qualify for grant funding to some degree.

Appendix A provides conceptual cost opinions for all three projects, and potential grant opportunities are noted in Section 9 and Table 4. Project costs can be refined when preliminary engineering plans are prepared. The cost of the most expensive project, the I-64 Additional Culvert, is dependent upon two factors that are currently unknown. First, the additional culvert is priced for installation by microtunneling, which works better in poor soil conditions and is less likely to cause subsidence problems under I-64 than a jack-and-bore installation. If geotechnical engineering can demonstrate that jack-and-bore construction would be acceptable to the City and VDOT, the cost of the project could be reduced by as much as $1,000,000. Secondly, the modeling conducted for this study shows that one 60" circular culvert would significantly improve the resilience of the Greenbrier system, but the City may choose to use a larger culvert, or add a second new barrel, to reduce the risk of blockages and to shorten the drawdown time in the upstream drainage system. Section 8, below, describes the potential benefit of increased discharge capacity under I-64.

There are many combinations of drainage improvements that can be evaluated in any watershed. While a substantial effort has been applied to develop this study, it is by no means exhaustive. The intent of this undertaking was not only to develop sound alternatives for resilience improvements but also to leave the underlying data files and computer models so that they can be used in the future.

The maximum computed water surface elevations for existing and future conditions at key locations are presented in Table 2 and shown for the D9 design storm in Figures 10 through 12. Table 2 quantifies the reduced flood elevations that can be achieved through construction of the three improvement projects for three specific design scenarios (i.e., the D6, D8, D12 storms, described in Section 4, below).

FEMA flood insurance studies and rate maps are the definitive sources of floodplain limits and elevations in all cases. The models developed for this plan are specific design scenarios—THESE RESULTS ARE NOT TO BE CONSTRUED AS INDICATIVE OF EXPECTED WATER SURFACE ELEVATIONS FOR THE PURPOSES OF FLOODPLAIN MANAGEMENT AND/OR INSURANCE REQUIREMENTS. The models developed for this plan could be adapted for use in the National Flood Insurance Program and submitted to FEMA for approval, but until they are vetted and approved through that process, the published flood insurance studies and rate maps remain fully in effect.

2. Background

The purpose of this study is to identify specific potential improvement projects that could be constructed to improve flood resilience. The Greenbrier Drainage Area was selected because the drainage and stormwater management systems generally work well for storms up to approximately the 100-year level, but extraordinary storms, such as Hurricane Matthew, flood roadway intersections that can take many hours to become passible.

URS Corporation prepared a master drainage plan update for the Indian River Watershed (which includes the Greenbrier Drainage Area) in 2011. The underlying modeling was completed using 1D SWMM methodology and focused on design rainfall events having average recurrence intervals from 10 to 100 years. City crews performed field surveying to support the 2011 update, documenting major culvert crossing geometry and invert elevations. GKY has used the modeling and surveying data from that effort to build the models for the

---

[3] See https://www.governor.virginia.gov/media/governorvirginiagov/governor-of-virginia/pdf/Virginia-Coastal-Resilience-Master-Planning-Framework-October-2020.pdf.

current study. Although the focus of this 2020 study is on extreme storm events, and the technical modeling approach is very different, the results of the two studies are consistent. In context, both studies show that increasing the conveyance of the Greenbrier backbone drainage system by increasing culvert capacity at strategic locations will lower future flood levels. The 2020 study further shows that lowering the permanent pool elevations of the Greenbrier impoundments will provide substantial volumes of new, useful flood storage that will improve the resiliency of the watershed for extreme storm events.

The City is actively engaged in the NFIP and CRS programs and complies with laws and regulatory initiatives, such as the Chesapeake Bay Act, the Chesapeake Bay TMDL, the Virginia Stormwater Management Act, the Virginia Erosion and Sediment Control Law, and the Virginia Stormwater Management Program. These and other regulatory programs require considerable non-structural approaches to reduce flooding—such as requiring runoff reduction for development and redevelopment, setting minimum standards for structure locations and elevations, and educating citizens and soliciting their input and participation in programs to reduce the generation of stormwater runoff and minimize exposure to flooding.

These initiatives are invaluable and extremely cost-effective, particularly concerning future development. However, where older infrastructure meets sea level rise and climate change, structural improvements are a vital part of the City's overall approach to flood mitigation. This study focuses on identifying specific potential improvement projects and opportunities.

Significant climate change has occurred since the drainage systems in this watershed were originally constructed. Sea level rise and higher annual rainfall volumes, coupled with increases in impervious cover (that lead to increased runoff), have contributed to increases in the magnitude and frequency of flooding over the past 60 years. These issues were not well understood in the past and were not fully addressed in drainage design and stormwater management planning. Modern engineering tools, a better understanding of climate processes, and higher design standards—all of which the City now employs—were not available when many of the Greenbrier drainage systems were designed and built. As a result, some of the pipe and channel systems are undersized for current conditions.

3. Technical Approach

GKY used the U.S. Army Corps of Engineers HEC-RAS software to perform the ROG modeling. This software is free to the public and can be readily downloaded and used by City engineers without paying any fees. The software is available to download from https://www.hec.usace.army.mil/software/hec-ras/download.aspx, and manuals and reference documents—including 2D references—are at https://www.hec.usace.army.mil/software/hec-ras/documentation.aspx.

Construction of the models required careful terrain processing and data entry of approximately 50 significant culvert crossings. Secondary underground drainage system components were not included in the modeling. This type of ROG approach offers appreciable advantages over 1D SWMM modeling because surface flooding and flow routing are computed using a 3D surface model. The substantial assumptions required in 1D SWMM modeling when hydraulic grade lines rise above the ground are eliminated in ROG modeling. Likewise, flows are computed over the entire terrain, not merely along assumed 1D flow paths.

2013 Digital Elevation Model (DEM) data served by the Virginia Geographic Information Network (VGIN) division of the Virginia Information Technologies Agency was used to create a 3D surface model of the subject watershed. GKY refined this surface model to incorporate grading changes that have occurred since the 2013 data was flown and that could affect flood mapping—such as the Dollar Tree development between Volvo Parkway and Eden Way North. Figures 1 and 4 depict the modified terrain.

GKY constructed finite element mesh components on the modified terrain and input major culverts (plotted as maroon lines in Figure 5) along the backbone drainage system. Existing culvert geometry was taken from the 2011 MDPU SWMM model. Different modeling scenarios had different culvert configurations; the configuration shown in Figure 5 includes a new culvert crossing under I-64 just to the east of the triple 9'x9' box culverts.

It is neither cost-effective nor prudent to model underground drainage pipes for this type of analysis—because flows in smaller drainage pipes are insignificant when the system is overwhelmed or completely submerged by extremely heavy rainfall. Likewise, FEMA does not typically model smaller pipe systems in producing flood insurance rate maps.

HEC-RAS does not, as of fall 2020, address infiltration and other losses from rainfall. Instead, the rainfall applied in the model is the 'effective' rainfall—i.e., that portion of rainfall that is not lost to infiltration, evaporation, transpiration, and abstractions. The approach used to develop effective rainfall for these models is described in the following section.

For this analysis, the rain-on-grid models will use 6-, 9-, and 12-inches of effective rainfall in the form of a NOAA 24-hour, Type C hyetograph. GKY also used rainfall and anecdotal water depth information for Hurricane Matthew to check the ROG, existing condition model, as described in the following section.

Methodology, data sources, and approaches used in this modeling include:

- NRCS Type C design storm hyetographs;
- Hurricane Matthew rainfall (provided by the City) and anecdotal information on flooding locations and levels (most helpfully in the form of aerial photographs taken at 7:00 a.m., October 9, 2016)
- FHWA culvert methodology for all culverts included in the models;
- Full momentum equation solutions for overland flow routing on the 2D mesh surfaces;
- A three-second computational time step;
- "No-Rain" models to generate restart (*.rst) files with initial water surface elevations in the drainage system at the start of each simulation;
- Simulation times up to 144 hours (to evaluate drawdowns of the impoundments);
- GIS data served through ArcGIS online and the City's Open GIS Data Portal; and
- HEC-RAS Version 5.07 software.

4. Effective Rainfall

Most drainage and stormwater management studies and designs employ some estimate of average recurrence interval as the basis for calculations. For example, engineers use a rainfall depth deemed statistically to have an average recurrence interval of 10- or 100-years to compute flood elevations and flows. Many assumptions and intermediate calculations are involved, but the resulting product is said to be a 10- or 100-year design. The expectation is that these designs can accommodate storm events that will be exceeded, on average, only once every 10 or 100 years.

The Rational Formula, developed over 130 years ago, is still the most widely used and trusted method to compute design flows in drainage pipes. It's longevity and popularity derive from its simplicity and the fact that designs built using the Rational Formula seem to have worked well. A simple 'C' coefficient converts the applied rainfall into surface runoff. Hydrologic processes in the watershed—such as infiltration, abstractions, evapotranspiration, and interception—are lumped into the C coefficient.

As engineering capabilities progressed, new formulas and methods were developed to compute surface runoff from applied rainfall. Soil equations, overland flow and culvert hydraulics, and design rainfall hyetographs were developed to increasing levels of complexity—all requiring additional levels of input data. The onset of computer modeling tools and geographic information systems made it possible to carry the computations and methods to deeper levels. As the complexity grew, so did the assumptions in the computational processes.

However, with climate change and increased impervious cover from development activities, what has worked in the past does not necessarily work well today. Assigning average recurrence intervals to designs can give citizens and policy makers a false sense of security and create a great deal of confusion with the public—who mistakenly assume that they will almost never be affected by such events. When heavy rainfalls happen, municipal engineers and officials must deal with unmet public expectations.

HEC-RAS does not currently compute losses from rainfall. The rainfall applied in the model is the 'effective' rainfall—i.e., that portion of rainfall that is not lost to infiltration, abstractions, evapotranspiration, and interception. What is simplified in terms of hydrology is more than made up for in surface hydraulics capabilities. Soils can be modeled for infiltration effects using other software, but soil modeling involves assumptions about physical soil properties and antecedent conditions that are difficult to justify in highly developed areas like Greenbrier where the native soils have been covered and compacted with imported topsoil.

GKY recommends basing resiliency modeling on design storm events that are specified as *inches of effective rainfall*, without specifying the return period. For example, 6-, 9-, and 12-inch, 24-hour NOAA Type C effective rainfall design storms can be used for resiliency analyses and the results reported without return periods. GKY uses this approach with other clients who are working on resiliency modeling.

To give some perspective, Hurricane Matthew produced 11.96 inches of rainfall over 27.5 hours (recorded at City Hall and plotted in Figure 3). A 6-inch effective rainfall would be on the order of a 100-year event, a 9-inch effective rainfall would be on the order of a 1,000-year event, and a 12-inch effective rainfall would have an average recurrence interval well in excess of 1,000 years. However, GKY believes it is best not attempt to link effective rainfall depths to average recurrence intervals.

For this analysis, the ROG models used 6-, 9-, and 12-inches of effective rainfall in the form of a NOAA 24-hour, Type C hyetograph. Anecdotal flood depth information for Hurricane Matthew provided by the City, as listed in Table 1, was used to check the validity of the ROG existing condition model. This validity check involved adjusting the recorded rainfall and HEC-RAS modeling parameters until a good match was achieved between the model results and anecdotal data. Figures 6, 7, and 8 show very close agreement between the aerial photographs (taken at 7:00 a.m. on October 9, 2016) and the ROG model results. Trial-and-error modeling showed that a conversion factor of 81% (i.e., assuming that 81% of the recorded rainfall contributed to runoff) produced the best match.

5. Vertical Datum

The **National Vertical Datum of 1988 (NAVD88)** was used throughout this study. All elevations used in the modeling and improvement alternatives are referenced to the NAVD88 datum.

6. Modeling Configurations (Scenarios)

GKY created three groups of HEC-RAS modeling scenarios for this analysis:

- Hurricane Matthew,
- Unimproved (Existing Conditions for D6, D9, and D12 rainfalls), and
- Improved (Proposed Conditions for D6, D9, and D12 rainfalls).

Due to differing geometry files, each scenario required a "no-rain" model run to set initial heads and flows in the Greenbrier drainage system. The results of the no-rain runs were used as initial conditions in the subsequent modeling.

As described elsewhere in this report, scores of runs were made during the resiliency analysis. HEC-RAS automatically assigns file extensions, and after multiple runs the file extensions can become somewhat random looking. Given the complexity of relationships between the different files, and that many of them occur in more than one scenario, best practice is to track the filenames carefully and not rename them. Starting over to create a clean slate of file names is not practical because the run times involved are so long—and because files occur in multiple scenarios, HEC-RAS will not name them consistently anyway. You may or may not, for example, end up with a run that has file extensions g06, p06, u06, etc. because geometry, terrain, roughness, unsteady flow, and restart files are often shared between scenarios.

Table 2 lists the computed high water elevations for the three design storm events (D6, D9, and D12) for the unimproved and improved scenarios. Table 5 documents the HEC-RAS files used in each scenario with the modeler's log notes.

When Hurricane Matthew occurred in October 2016, two of the three culvert barrels under Greenbrier Parkway were blocked with sediment and debris—a condition reflected in the Hurricane Matthew run geometry[4]. These barrels were subsequently cleaned by the City and were modeled as clean and unobstructed for both design scenarios (unimproved and improved).

7. Modeling Results

Whereas 1D SWMM models typically run in a few minutes, ROG models take several hours. Depending on the length of the simulation and the computational capability of the computer used, run times for this project ranged from 3 to 22 hours. Run times must be considered carefully when investigating alternative scenarios.

The models and data files prepared for this study are very large. Each scenario has a combination of underlying linked data files, and scenarios share common files. The total storage capacity required for all the archived HEC-RAS runs exceeds 14 GB.

Stable modeling runs were obtained for all modeling scenarios. Continuity errors were low and Courant-condition and high-velocity checks consistently indicated numerically stable results. GKY engineers used HEC-RAS' RAS Mapper module to review the results, checking the hydraulic routing for potential stability problems or any type of flow anomaly.

After scores of trial-and-error model runs, two engineering conclusions can be supported using the profile plots in Figures 10 through 12. First, most of the existing culvert crossings have small head losses, even for very large storms. The head losses are small because the velocities through the backbone drainage system are low—typically less than 3 feet per second. The drainage profiles are very flat and the major culvert crossings occur in series, so they "hold back" the flows. Culvert improvements at these locations are unnecessary because the existing barrel capacity is sufficient to avoid causing a significant rise in the hydraulic grade line.

Secondly, as indicated in Table 6 and Figure 10, the culvert invert at I-64 sets the permanent pool elevation for 130.5 acres of upstream impoundments. If a new low-flow culvert could be installed under I-64, the permanent pool elevations in these lakes and canals would be lowered accordingly. The trial-and-error model runs demonstrated that this single improvement would generate the greatest resilience benefits, due to the additional flood storage that would be created. That additional volume is significant and would make a difference.

The ROG models produced for this study have exceptional capabilities for computing flood elevations and flows through culverts, but they are not like other urban drainage models that include flows in smaller pipes. However, profiles can be generated precisely, as plotted in Figures 10 through 12. The real benefit of these profiles is the graphical depiction of the effects of each scenario. GKY engineers focused on culvert crossings where the profiles show the largest head loss. Improving culvert crossings by adding conveyance capacity (in the form of additional culvert barrels or replacing the old barrels with a larger cross section) is unnecessary

---

[4] Collins Engineers, Inc. prepared an inspection report, dated December 15, 2016, of selected structures in the Greenbrier Drainage system. GKY used information from this report to prepare the Hurricane Matthew scenario.

where the existing culverts have relatively minor head losses. In this respect, the City can avoid wasting money on costly resilience projects that would produce little hydraulic improvement.

As with all models of this size and complexity, a great amount of detailed input data is required. Because it is not feasible to collect all the required data in the field, it becomes necessary to make educated guesses about inverts and pipe and channel dimensions and geometries in some locations. GKY used data from the City's 2011 Indian River MDPU, which had surveying data for many of the significant culvert crossings. Where future designs and studies will be based on these models, engineers are strongly encouraged to field-verify all items that may critically impact their designs.

The maximum computed water surface elevations at the reference nodes (shown in Figure 1) are listed in Table 2, with the peak 100-year design storm elevations computed using the SWMM model in the 2011 Indian River MDPU. The table lists D6, D9, and D12 peak water surface elevations for improved and unimproved conditions.

The improved-condition modeling results presented in this report assume that the drainage and stormwater systems will be well maintained. If debris builds up to block drainage structures, or channels fill with silt, flooding will likely be more severe than computed and represented in this report. Debris can be a significant problem in natural channel outfall systems and should be monitored carefully to ensure that these systems function properly. Likewise, dense vegetation growth can significantly worsen local flooding. Channels that are relatively free from vegetation problems in the winter months can have significantly less conveyance capacity in the summer months. Depending on the type of plant growth, the change in conditions can be dramatic.

Table 5 documents the HEC-RAS scenario files and run log for this project.

8. Potential Improvement Projects

GKY and the City have identified the following potential improvement projects, indicated by the green polygons in Figure 9, to reduce street and parcel flooding in the Greenbrier Drainage Area:

1. **Indian River High School Lake Weir:** Lower the existing weir at Indian River High School Lake from a crest elevation of 8.1 to 6.1 feet;
2. **South Military Highway Culvert Replacement:** Replace the existing 6'Hx10'W box culvert under South Military Highway with a double 8'x8' box culvert at new invert elevations 6.20 (upstream) to 6.00 (downstream); and
3. **I-64 Additional Culvert:** Add a 60" circular culvert under I-64, just to the east of the existing triple 9'x9' box culvert, from invert 6.39 (upstream) to 5.0 (downstream).

Table 3 contains a brief synopsis of each project with comments and construction and implementation issues. Appendix A contains the cost opinions in 2020 dollars.

The existing South Military Highway culvert is nearing the end of its useful life and has been identified as a hydraulic bottleneck in previous studies, including the 2011 Indian River Master Drainage Plan Update. The unimproved scenario profile in Figure 10 clearly indicates this location is a chokepoint.

The modeling results demonstrate that a new 60" circular culvert under I-64 will produce the resiliency improvements sought by the City. These three improvement projects can drop peak flood elevations versus existing conditions by more than 1.5 feet in upstream areas (Table 2) and reduce the time that roadways and intersections are flooded and impassable by more than 33 hours (Figure 14). These results are obtainable because more than 350 acre-feet of usable flood storage can be created by lowering the permanent pool elevations of the Greenbrier impoundments. A 60" diameter was used in the modeling because it is the upper limit, according to VDOT, for jack-and-bore construction.[5] This HEC-RAS modeling indicates that six days after the peak of the D9 design storm event, the water surface elevation just upstream from I-64 would be 8.96 feet. Table 6 computes the drawdown from 8.96 to 7.42 feet at an additional five days, albeit along a flat, asymptotic curve. As water surface elevations drop, the controlling inverts shift from location to location. Figure 10 shows existing culverts with dark gray shading. 7.42 feet—at the north Greenbrier Mall entrance—would be the new controlling invert for most the Greenbrier impoundment system when the proposed new barrel is added under I-64.

The 60” culvert provides the resilience required by this project. However, if the culvert were to become blocked before the upstream impoundments drop to their new permanent pool elevations, the 350 acre-feet of new flood storage could be compromised. Adding a second, parallel culvert would provide redundancy for maintenance purposes, and would reduce the drawdown time computed in Table 6 (as would using a larger diameter culvert). However, the likelihood of encountering back-to-back D9 or higher storm events is very small, and the key would be for City maintenance crews to ensure that impoundment levels are reasonably low during the dry-weather days before a forecast major storm event. If upstream impoundment levels are elevated and the new culvert is not flowing, maintenance should be performed promptly. The construction of a parallel culvert is a matter of redundancy and risk reduction. The desired results can be achieved with a single, 60” barrel.

GKY and City engineers considered many alternatives to reduce the elevation and duration of flooding in the Greenbrier Drainage Area. Some were discussed and removed from consideration for anticipated feasibility issues (such as re-routing and diverting runoff to adjacent watersheds), some were investigated in more detail but not modeled (such as using portable pumps to lower lake levels ahead of forecast storms), and many were modeled to investigate their effectiveness. The list of alternatives identified in this report is not exhaustive, however, they do constitute potential projects that offer reasonable potential to meet resilience objectives. Lots of potential projects were dropped from further consideration because the simply would not produce enough improvement to warrant their likely expense.

Pumping lake levels ahead of forecast storms is one example of a non-modeled alternative that was ruled out from further consideration. The City currently uses trailer pumps to draw impoundment water levels down ahead of forecast major storm events in the Forest Lake and Elmwood Landing drainage systems. GKY investigated options to pump the Greenbrier impoundments using a Godwin Dri-Prime CD225M Pump (the same pump used elsewhere by the City). The Greenbrier Lake and canal system has a 130.54 acres of surface area upstream from I-64 with permanent pool elevations set by the I-64 culvert invert. The Godwin pump has a maximum capacity of 3,240 gpm. Assuming the average delivery in the field would be around 2,500 gpm, it would take 8 pumps to achieve a 72-hour drawdown of 2 feet. A manifold system would have to be constructed for the force mains, which would significantly affect the pump curves. Fuel consumption for 8 pumps for 72 hours would be almost 3,400 gallons. A 24- or 30-inch force main (or equivalent), a parking area for pumping operations, and debris-resistant inlet and outlet structures would have to be constructed. The cost to build the force main and intake station(s) could be nearly as great, if not greater, than the cost of a culvert crossing improvement—particularly if the $330,000 or so cost to purchase the pumps, hoses, and supporting equipment is added. Figure 13 shows the drawdown rates and pump specifications involved in this approximation.

Other improvement project concepts that GKY discarded included:

- Installing a new culvert under I-64 from Greenbrier Lake using a new outfall northeast of Montauk Lane—which would be much more expensive than the 60” culvert described above; and

---

[5] VDOT generally consider two types of construction for the installation of a new culvert under an existing highway: jack-and-bore or microtunneling. If soils are suitable (having suitable water table, strength, and cohesive properties) jack and-bore installation may be allowed. However, microtunneling is more accurate, produces less problems with roadway subsidence, and works far better in poor soil and high water table conditions.

- Enlarging the culverts under Eden Way North just east of the intersection with Greenbrier Parkway—which would lower upstream water levels by approximately 0.3 feet but would cost over $1,000,000 and would not be needed given the other three recommended improvements.

9. Grant Opportunities

The potential projects identified in this study could improve flood protection by reducing the elevation and duration of street and parcel flooding in the Greenbrier Drainage Area. Some enhancements could be made to provide water quality benefits, as described in Section 11, below. However, the conceptual configurations and cost opinions in this study are focused to provide flood protection and resilience benefits. Adding water quality enhancements would increase costs but may be worthwhile to obtain grant funding.

Under normal circumstances, these projects could qualify for grant funding, like those listed in Table 4. However, at the time this write-up is being prepared[6], an unusual degree of uncertainty surrounds grant funding for public works projects in Virginia. The Covid-19 pandemic has led to high rates of unemployment and business closings, and tax revenues have been directly impacted. The Virginia State Legislature was called into special session to deal with a $2.7 billion projected budget shortfall. Line items in the State's budget that were previously approved have been held up, deleted, or otherwise scrutinized. For example, DEQ pulled its intended, annual solicitation for SLAF grant applications. Likewise, the federal government is struggling with unprecedented deficits during the final stages of presidential, senatorial, and congressional elections. At the federal level, pandemic relief thus far has focused on business and individual payouts—not on public works projects.

Two new grant opportunities merit careful monitoring. First, FEMA's BRIC grants (https://www.fema.gov/bric) incentivize state agencies and local governments to undertake hazard mitigation projects to reduce risks from disasters and natural hazards. BRIC replaces FEMA's Pre-Disaster Mitigation program and is aggressively funded by a 6% set-aside tied to federal post-disaster grants. The BRIC program has the potential to fund large-scale resilience projects, such as those identified in this Greenbrier Resilience Plan. On August 7, 2020, VDEM announced that it was opening the application period for FY2020 BRIC and FMA grants, both of which are nationally competitive[7]. In FY2019, FEMA identified $34 million in projects for further review in Virginia. Award announcements were expected to begin in the fall of 2020. Information on FY2020 BRIC and FMA grants can be reviewed at https://www.fema.gov/sites/default/files/2020-09/fema_nofo-overview-webinar_presentation_August_2020.pdf. Nationally, $500 million and $160 million have been budgeted for FY2020.

Secondly, the Commonwealth of Virginia recently continued the Virginia Shoreline Resiliency Fund as the Virginia Community Flood Preparedness Fund[8], to be administered by VRA and DCR. The fund is intended to mitigate future flood damage, with priority given to projects that implement community-scale mitigation activities or use nature-based solutions. Details remain to be worked out, but this fund is expected to have $40 to $50 Million annually for grants and loans focused on flood resilience projects. Funding will be generated from Virginia's Regional Greenhouse Gas Initiative carbon auctions, with 45% of those proceeds going to CFPF. The enabling legislation requires that 25% of the CFPF awards be used to help low-income communities—which could make the Greenbrier improvement projects less competitive because the drainage area is mostly commercial and not low-income.

It will take the City some time to vet these potential flood resilience projects in sufficient detail to schedule them for construction—most likely as capital improvement projects. Design and permitting issues must be worked through, and projects involving VDOT or private property impacts require additional coordination. The

---

[6] Fall, 2020.

[7] The application period for BRIC and FMA grants was set to close on November 10, 2020. Generally, these grants are expected to cycle in the late summer or fall.

[8] See https://lis.virginia.gov/cgi-bin/legp604.exe?201+sum+SB320 for legislative summary information.

combination of design, permitting, budgeting, right-of-way acquisition, utility conflict resolution, public involvement, matching requirement approval by City Council, and other processes may take several years. When the City decides to fully commit to building a project, grants should be considered. Some grants can be used for design and planning work, in which cases the City may consider offsetting those expenses with grants. Sometimes, once local governments anticipate that a project is going forward, and that grants can be applied for, the application deadlines may help move these processes along. Given the size and complexity of the potential projects identified in this study, and the pandemic budget impacts, it may be that currently-authorized-and-available grants will not be available for use. Nevertheless, certain opportunities can be monitored so that, at the right time, the City can submit grant applications.

A well-developed benefit-cost analysis will be crucial for grant applications. Because Virginia has a mandated emphasis on social justice criteria in grant awards, these Greenbrier grant applications will compete against proposals for projects that will undoubtedly be more attractive from a social justice perspective. Greenbrier is a thriving commercial district with housing pockets that would be unlikely to qualify for social justice points. Doing a good job with benefit-cost analyses should make the Greenbrier projects more competitive and time and effort must be allotted accordingly.

Table 4 identifies the types of grant funding opportunities that may be applicable to the projects identified in this study. These sources include both federal and state grant funds, and most have some history as recurring offerings (or are new vehicles for retired opportunities). The funding source programs focus on flood mitigation and prevention, flood resilience, water quality improvement, and creating innovative flood solutions.

Other agencies were evaluated for applicable source funding and the list in Table 4 is not exhaustive. Some agencies reviewed do not provide grants to support the specific flood improvement and water quality projects identified in this report, and grant opportunities expected to pay less than $100,000 were generally omitted—because the cost of pursuing and complying with the terms of small grants is typically too high for the benefits received.

10. Potential Permitting Issues

Permitting for these projects should be straightforward. For culvert crossing and structural improvements, the permitting requirements should be the same as for similar projects undertaken by the City in recent years. Permitting processes typically involve JPAs; agency coordination through a pre-application meeting; field delineation and regulatory confirmation of jurisdictional wetlands, streams, and WOTUS; interaction with VMRC, DEQ, and the Corps of Engineers; preparation of Erosion and Sediment Control and Storm Water Pollution Prevention Plans to apply for a VSMP permit; and payment of applicable fees.

If federal funds are involved—for example if federal grant money is used for a project—additional permitting requirements would be applicable, potentially involving cultural resources surveys, heightened NHPA and ESA investigations, and enhanced environmental investigations (such as those required under NEPA).

The City often uses in-house staff to obtain permits for these types of projects, with outside support for surveying of wetland markers and preparation of exhibits. City staff has developed a good rapport with regulators and is fully capable of handling the permit applications for these projects.

Depending on the project scale, lowering permanent pool elevations of the impoundments could be accomplished using a general or nationwide permit. Regional Permit 16-RP-05[9] authorizes all aspects of pond construction, such as mechanized land clearing, dam construction, placement of water control structures and spillways, and flooding. The impacted area of WOTUS includes the wetlands, streams, and other waters of the United States that are permanently (and/or temporarily) filled, flooded, cleared, ***or drained*** as a result of the regulated activity. 16-RP-05 is restricted to projects that will not cause the loss of greater than one-half

---

[9] 16-RP-05 expires on June 9, 2022, which may affect how and when the City pursues these projects. Re-authorization of this permit may or may not occur.

acre of non-tidal waters, including the loss of no more than 1,000 linear feet of stream bed. The District Engineer (of the Norfolk District Corps of Engineers) may grant waivers to the 1,000-foot limit if the proposed activity will result in no more than minimal adverse direct and indirect effects. The potential projects identified in this Greenbrier Resiliency Plan report are unlikely to create a significant reduction of non-tidal waters—subject to regulatory interpretation and agreement. Permitting under 16-RP-05 would significantly shorten the regulatory approval process compared to options involving any type of general permit.

If projects involve mitigation to offset wetland impacts, five years of monitoring will be required, including spraying for invasive species—which should be considered when developing budgets. However, depending on the amount and type of planting, these projects could increase wetland coverage in the watershed.

Generally, regulators react favorably to these types of projects, particularly where environmental benefits result—such as from benching and planting new wetland cover. Increased public safety, through flood reduction, will provide a basis for the purpose and need justifications. Involving regulators early in the planning and engineering processes leads to better regulatory outcomes.

Work at the Indian River High School Lake may best be approached as a BMP retrofit rather than for other uses, such as recreation or habitat creation. This lake has been in the City's BMP inventory since the 1980s, and modifications should not be approached as entirely new construction.

Much of the impoundment shoreline in the Greenbrier Drainage Area is located along roadways and in commercial districts. Where residences abut the impoundments, the City may offer shoreline enhancements, such as the creation of benches and plant treatments to avoid the appearance of bare soil at the water's edge. Rational citizens should be supportive of these projects, given the additional flood protection benefits they will receive. Eventually, flood insurance premiums should be lower as a result of these projects.

The City's Flood Insurance Rate Maps (effective 12/16/2014) do not have mapped flood zones in the Greenbrier Drainage Area south of I-64. Between I-64 and the outfall from Indian River High School Lake to the north, the main drainageway is mapped as Zone X[10]. Between the outfall from Indian River High School Lake and Indian River the floodplain is mapped as Zone AE[11]. There is no regulatory floodway in any of these areas. However, strictly speaking and according to NFIP requirements, whenever a proposed project will cause a vertical or horizontal shift in the floodplain, a CLOMR application to FEMA is required. CLOMR and LOMR processes can be expensive and take many months to complete. The City's floodplain administrator will have to decide whether a CLOMR application should be filed. If so, the implementation schedule and budget for each project should be adjusted accordingly.

11. Water Quality Credit Potential

The potential improvement projects identified in this study could enhance flooding resiliency in the Greenbrier watershed—by lowering permanent pool elevations in the backbone system of lakes and canals, and increasing the conveyance capacity of the culvert crossings at hydraulic choke points (such as the South Military Highway culvert). Because the projects involve replacing or modifying existing culverts and control structures—rather than creating new impoundments—they will not directly generate water quality benefits themselves. However, there are opportunities to generate water quality benefits.

Lowering the weir crest, and permanent pool, at Indian River High School Lake (from 8.2 to 6.2 feet) creates an opportunity to retrofit the lake to meet DEQ's design criteria for a Level 1 or Level 2 wet pond—which would provide substantial nutrient reduction credits towards the City's required Chesapeake Bay TMDL reductions. The area draining to the lake is approximately 3,800 acres with an imperviousness of approximately 48 percent. DEQ's VRRM spreadsheet indicates the treatment volume required to convert the

---

[10] Zone X is sometimes casually referred to as the 500-year floodplain. It includes the 0.2% annual chance event, areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile.

[11] Zone AE is commonly called the "100-year floodplain." It includes a base flood elevation for the 1% annual chance flood.

lake to a Level 1 pond is 174 acre-feet. Using hydrographic survey information provided by the City, the lake volume at elevation 6.2 is approximately 209 acre-feet. The lake would require the construction of a sediment forebay with a volume of approximately 26 acre-feet at the south end, and the creation of aquatic benches. City staff indicated in prior discussions that cutting trees on the edge of the lake and excavating out from the normal pool to create benches was not an option. Dredge material from the forebay creation could be used along the lake edge to create aquatic benches, but without lowering the elevation of the lake, some type of containment wall—possibly made using sheet piles, gabions, or placed riprap—would likely be required to contain the fill and create the benches, adding significant cost to the retrofit. Lowering the lake would expose the bottom around the edge of the lake that could be excavated or graded and planted to create an aquatic bench.

Preliminary calculations show that as a Level 1 wet pond, Indian River High School Lake would provide nitrogen and phosphorus reductions in excess of 5,600 and 1,800 pounds respectively, and almost 900,000 pounds of sediment using DEQ's established removal efficiencies of 20%, 45%, and 60% for nitrogen, phosphorus and total suspended solids. However, it is unlikely that the City would be allowed to take full credit for the nutrient reductions as if the retrofitted lake were a new BMP, despite it not being reported to DEQ as an existing stormwater BMP. Based on the experience of other localities that have retrofitted large water bodies for nutrient reduction credit, DEQ will require the existing lake efficiencies to be computed, and the City would be allowed to take credit for the difference between the reductions provided as a Level 1 wet pond, and the calculated reductions in its existing state. Using the methodology outlined in DEQ's Chesapeake Bay TMDL Action Plan Guidance Memorandum No. 15-2005 dated May 18, 2015, a case could be made for a 40-percent reduction in nutrient removal efficiencies for the existing pond due to the age of the lake, and missing water quality features such as a sediment forebay and aquatic benches. Even with the reduced credits allowed by DEQ, a Level 1 retrofit of the lake would provide enough nitrogen and phosphorus credits to meet half of the City's Chesapeake Bay TMDL reductions required during its second VSWMP permit cycle.

If the City considers retrofitting this lake, it should first meet with DEQ to discuss the project and the nutrient reductions the City expects to receive from the project. While DEQ's guidance document is straightforward concerning the nutrient credits allowed through BMP retrofits, given the size of the upstream watershed and the significant nutrient credits the City could claim, getting DEQ's blessing on the project will be a very important first step.

There are dozens of large impoundments linked to the backbone drainage system in this watershed. As indicated in Figure 10, the culvert crossing under I-64 is sufficiently elevated to establish minimum permanent pool elevations above 9.63 feet in the upstream lakes and canals. If a new culvert crossing can be built under I-64 at lower invert elevations, the permanent pool elevations would be lowered in the upstream impoundments. This lowering would provide increased flood storage capacity that could significantly reduce flood impacts from extreme events.

Where permanent pool elevations are lowered, there can be opportunities to establish aquatic benching and potentially generate water quality credits. However, the degree to which credits could be generated would depend upon detailed subaqueous surveys and soils testing and engineering yet to be performed. Given the potential impact of retrofitting Indian River High School Lake to a Level I wet pond and the potential straightforward nature of that project, constructing benches elsewhere in the watershed would be more expensive and problematic. Still, as planning moves forward for resilience projects, such potential can be considered.

Given the relatively steep side slopes of the lakes, canals, and roadway embankments along the backbone system, it may not be feasible to create aquatic benches in locations with narrow rights-of-way. The opportunity for water quality credits is therefore limited by the side slopes of the lakes. Aquatic benching along the perimeters would be difficult without major excavation along the banks or placing sheet pile walls and backfilling behind them, and because the lakes tend to be narrow, creating sediment forebays could restrict flood flows and have negative impacts upstream. For example, creating a sediment forebay in the Indian

River High School Lake may require the construction of a weir between 500 and 700 feet long that could pass large flows with minimal impacts upstream.

The lowering of the I-64 culvert crossing could also impact wetland BMPs within VDOT's right-of-way. Because the City and VDOT have interconnected MS4 service areas, they are encouraged to collaborate on water quality BMPs and can share the costs and nutrient credits from water quality BMP projects.

12. Caveats

The modeling produced for this study is built on limited data and was prepared for a specific purpose (to identify potential flood reduction improvements for a resiliency plan). Some input data was estimated using engineering judgment for modeling purposes. These models should not be used for other engineering or planning purposes without first verifying any data that may affect the outcome.

The HEC-RAS software used for this study is not an urban drainage model. While it can compute—very handily—flows in channels, ditches, creeks, and rivers, it does not perform pipe network calculations. GKY has adapted it for urban modeling by constructing culverts (using FHWA methodology) to link low spots in the terrain, but HEC-RAS cannot process flows through pipe *networks*. It is, however, extremely good at computing 2D overland flow on a 3D terrain—something 1D models like SWMM cannot do at all. While it is possible to perform combined 1D/2D modeling, that work is quite involved and expensive. HEC-RAS produced very good results for this study, but engineers must appreciate certain limits to interpret them correctly.

- Flood depths and water surface elevations in locations that **are** hydraulically connected to the outfall—such as the backbone system of canal-sized ditches and impoundments along Greenbrier Parkway and Eden Way North—should be interpreted just as with 1D models. They have been computed using robust engineering equations based on the input data.
- Flood depths and water surface elevations in locations that **are not** hydraulically connected to the outfall—such as low spots in roadway gutter lines or along unmodeled, upstream drainage systems—are the result of ponding (or puddling) after the rainfall has been applied and overland flow equations have been solved. These results could be expected if the drainage pipes were blocked. For extreme events, such as the design storms modeled for resiliency planning in this study, the smaller pipe systems do not have a significant effect on the outcome. Incorporating them would require switching to a combined 1D/2D model at considerable added expense.

The goal of this type of study is not to relieve all flooding, but rather to identify potential improvements that can be feasibly constructed. Areas such as wetlands, woodlands, deep ravines, large open spaces, ball fields and parks, and along elevated railroad or highway embankments often do not require improvements unless there is a specific reason to construct them. Neighborhood and commercial parcel drainage and stormwater systems are neither required nor designed to accommodate flooding from extreme events such as the 50-year storm.

Grant funding opportunities are in constant flux and should be monitored continually—particularly those that have significant funding potential. CIP projects typically take years to progress from conception to construction, and lead times for grant applications should be accommodated in the project schedule.

The backbone drainage system, as modeled for this study, assumes a well-maintained system. Debris, sediment, pipe collapses, and other maintenance issues can cause very real flooding that must be addressed. In this respect, this study highlights capacity issues rather than maintenance issues (which are best resolved from inspection or citizen reports). There is good reason to create the models in this manner. If poor maintenance conditions are modeled, the capacity problems could easily be masked to the extent that public funds could be spent unnecessarily.

GKY is providing the models completed for this study to the City in the hope that future engineering efforts will build upon this effort. The responsibility for appropriate use of these models rests with the engineers who modify and adapt the data for specific uses. HEC-RAS ROG models are not like 1D SWMM models, because smaller drainage pipes are generally omitted in 2D resiliency models. Anyone adapting these models must be aware of the limitations and assumptions and make changes appropriately.

Where improvements identified in this study occur in series, such projects must be constructed in the correct sequence. Generally, downstream improvements must be made before upstream improvements are constructed to prevent flooding that could result if conveyance is improved upstream before increased flows can be accommodated in the downstream system.

The potential improvements identified in this study will need further investigation before they can be carried forward as feasible projects. While (seemingly) reasonable assumptions have been used to estimate the expense of each project, there is significant budget uncertainty due to the degree and complexity of the required construction. There can be substantial utility conflicts to resolve, and the data required to develop accurate improvement plans and cost estimates is not yet available.

FEMA flood insurance studies and rate maps are the definitive sources of floodplain limits and elevations in all cases. The models developed for this plan are specific design scenarios—THESE RESULTS ARE NOT TO BE CONSTRUED AS INDICATIVE OF EXPECTED WATER SURFACE ELEVATIONS FOR THE PURPOSES OF FLOODPLAIN MANAGEMENT AND/OR INSURANCE REQUIREMENTS. The models developed for this plan could be adapted for use in the National Flood Insurance Program and submitted to FEMA for approval, but until they are vetted and approved through that process, the published flood insurance studies and rate maps remain fully in effect.

13. Contact Information

Liz Scheessele, PE, CFM, ENV SP and Crystal Bloom, PE, LEED GA (757.382.6393) managed this project for the City, and Jake Lewis, PE, Chad Brittle, EIT, and Olive Morrill provided engineering support. Sean Bradberry, ENV SP served as the project engineer, and John Paine, PE, PH, CFM (757.346.4422) served as the project manager for GKY.

NOTES

1) This table is a summary of data provided by the City. GKY used this data to calibrate the Hurricane Matthew HEC-RAS model.
2) The City provided other data, such as maps with point locations of flooding, that do not contain specific information that can be used for model calibration.
3) The information listed above was helpful in producing a calibrated model that matches reported conditions on the ground.
4) See source files for full-size items.

NOTES

1) See Figure 1 for reference node locations.
2) This watershed has undergone changes in its drainage infrastructure since the 2011 SWMM models were created.
3) Methodology differences between HEC-RAS Rain-on-Grid and SWMM modeling are described in the report text, and are significant. Comparisons are for information purposes only.
4) The 100-yr existing condition 2011 SWMM model produced 5.2 inches of runoff, and indicated widespread surface flooding.
5) The channel downstream from S Military Highway is steep and wider than the existing roadway culvert; HEC-RAS computes the 2D flow spread that is otherwise ignored in 1D SWMM.
6) The 2011 SWMM models used a constant downstream tailwater elevation as a boundary condition. The HEC-RAS runs use a friction slope boundary (because event durations were as long as 6 days and elevations below Providence Road do not affect the results upstream from the Indian River High School Lake outfall.

Table 3. Potential Improvement Projects

Potential Improvement	Comments	Implementation and Feasibility Notes
1. Indian River High School Lake Weir (Lower the existing Indian River High School weir crest approximately 2 feet from elevation 8.1 to 6.1)	Lowering the weir approximately 2 feet reduces the lake volume by approximately 50 Acre-feet which could be used for flood storage. Lowering the weir would make the creation of aquatic benches easier if the lake were to be retrofitted to meet DEQ's design criteria for a Level 1 wet pond, and does not reduce the total volume below the required treatment volume for a Level 1 wet pond. Modeling assumes the weir crest is lowered to 6.1 with the six existing 48" culvert pipes in place.	The exact construction of the existing spillway structure is unknown, but it appears to be an approximately 50-foot long, 1-foot wide concrete weir between concrete wingwalls at either end. The top of weir elevation is 8.1 and is located approximately 6 to 8 feet upstream from a headwall with six 48" culvert pipes. There is an approximate 2-foot drop from the top of the weir to a concrete apron sloping down to the culvert openings. Culvert inverts range from 4.24 to 5.55. Some dredging of the lake will be needed upstream of the weir where the lake has silted in. Dredging from a barge shouldn't be necessary as the dredging could be performed from land with a long-reach excavator or crane.
2. South Military Highway Culvert Replacement (Replace the existing 6’Hx10’W box culvert under South Military Highway with a double 8’x8’ box culvert at new invert elevations 6.20 to 6.00)	The existing culvert is nearing the end of its service life. The existing upstream and downstream culvert invert elevations are 7.08 and 6.13, respectively. The replacement culvert was modeled with invert elevations of 6.20 upstream and 6.00 downstream. Inverts were lowered to minimize conflicts with utilities above the culvert.	The downstream channel was widened recently as recommended in the 2011 Indian River MDPU. The downstream channel is approximately 22 to 27 feet wide between bulkheads which should accommodate a culvert with an outside-to-outside width of approximately 18 feet. Wingwalls may not be needed at the downstream end due to the existing bulkheads along the channel. Traffic control will be a major issue due to the high volume on South Military Highway.
3. I-64 Additional Culvert (Add a 60” circular culvert under I-64, just to the east of the existing triple 9’x9’ box culvert, from invert 6.39 to 5.0)	The existing triple 9'x9' box culvert under I-64 was installed 2.2 feet higher than upstream culvert inverts (see Figure 10). This 'perched' culvert crossing creates approximately 350 acre-feet of dead storage in the upstream impoundments. Installing a lower culvert will draw down permanent pool levels and create approximately 350 acre-feet of new, usable flood storage.	VDOT owns the intersection right-of-way, and will have to approve the construction of the new culvert crossing. If jack-and-bore installation can be used instead of microtunneling, the project cost could be significantly reduced. The City will have to coordinate with parcel owners regarding the lowering of permanent pool levels, but rational citizens should appreciate the flood risk reduction resulting from this project. Most of the impoundment shorelines are in a commercial district and along roadways.

NOTES

1) Invert elevations in this table and report refer to the NAVD88 vertical datum.

2) Conceptual design and construction cost opinions are documented in Appendix A.

Table 4. Grant Opportunities

Information updated as of **10/30/2020**

Funding Agency ***Grant Name***	**Description**	**Prior Grant Cycle FY**	**Availability**	**Minimum Amount**	**Maximum Amount**	**Match Percentage**	**Type**	**Eligibility**		**Restrictions**	**Potential Burdens**	**Expected Application Timeline**	**Contact (Webpage)**	**Comments**
							FR = Flood Resilience WQ = Water Quality	**SE= Social Economic TW = Target Waterheds**	**Other**					
Federal Emergency Management Agency *Building Resilient Infrastructure and Communities (BRIC)*	Federal funds are made available to states, local communities, tribes and territories for pre-disaster mitigation activities.	N/A	Open. Closes 11/10/2020	Not listed	$500 million (entire program)	75% federal, 25% non-federal cost share	FR	Neither	Research supported proactive investments in community resilience.	Must have a current FEMA-approved Hazard Mitigation Plan. Period of Performance start date: date of recipients federal award - End date: 36 months from start date for all other sub applications.	Must use the new FEMA Grants Outcome (FEMA GO) system.	Annually	https://www.fema.gov/grants/mitigation/building-resilient-infrastructure-communities	BRIC is funded by a 6% set-aside from Federal post-disaster grant funding. Pre-Award Selection Notice: 06/2021.
Virginia Department of Conservation and Recreation *Virginia Community Flood Preparedness Fund*	New fund intended to mitigate future flood damage, with priority given to projects that implement community-scale mitigation activities or use nature-based solutions.	N/A	2021	TBD	~$50 million (entire program)	TBD	FR	SE	TBD	TBD	TBD	Annually	https://www.pewtrusts.org/en/about/news-room/opinion/2020/07/07/virginias-new-flood-preparedness-program-is-a-statewide-win	This is a new fund with revenue coming from Virginia's RGGI carbon auctions. The State is preparing to administer this program, but has not yet worked out details.
National Fish and Wildlife Foundation *National Coastal Resilience Fund*	The National Coastal Resilience Fund invests in conservation projects that restore or expand natural features such as coastal marshes and wetlands, dune and beach systems, oyster and coral reefs forests, coastal rivers and floodplains, and barrier islands that minimize the impacts of storms and other naturally occurring events on nearby communities.	2020	Closed. Next grant slate will open in Spring 2021	Funding levels are described in the RFP; not less than $125,000	Funding levels are described in the RFP; no maximum award size.	Required 1:1 non-federal match	FR	Neither	Based on Community Capacity Building and Planning focus area.	This fund is investing to restore and strengthen natural systems so they can protect coastal communities from the impacts of storms, floods, and other natural hazards and enable them to recover more quickly, and enhance habitats for fish and wildlife.	Projects are expected to be completed within 24 months of the start of the grant.	Annually	https://www.nfwf.org/programs/national-coastal-resilience-fund?activeTab=tab-2	Four focus areas: Community Capacity Building and Planning, Project Site Assessment and Preliminary Design, Project Final Design and Permitting, and Restoration and Monitoring.
Virginia Department of Conservation and Recreation *Dam Safety, Flood Prevention and Protection Assistance Fund*	The fund was established to provide grants to public and private dam owners whose dams are under state regulation and also to help local governments improve methods for flood prevention and protection.	2020	Open	Determined based on amounts requested from eligible projects, application scores and available funds.	Determined based on amounts requested from eligible projects, application scores and available funds. Depending on State budgeting, the award amounts can be small.	50%	FR	SE	Flood prevention and protection.	If applicant conducts hydrologic and hydraulic studies of floodplains and create new maps, they must apply for a letter of Map Revision or a Physical Map Revision through FEMA. Grant scores can be weighted based on prior awards, as Chesapeake received in 2019.	Grant funds will be disbursed on a reimbursement basis and only after the completion of the approved project.	11/1/2020 through 2/26/2021	https://www.dcr.virginia.gov/dam-safety-and-floodplains/dsfpm-grants	Fund is managed by the Virginia Resources Authority on behalf of the Virginia Department of Conservation and Recreation. Grants are awarded through a competitive application process. Awards are approved by the Virginia Soil and Water Conservation Board. Director of DCR will determine the type and amounts of funding available prior to each funding period and will specify the categories that will be considered for grant assistance.
Federal Emergency Management Agency *Flood Mitigation Assistance Grant (FMA)*	The intent of FMA is to take action to reduce the risk of future flooding to structures that are insured through the National Flood Insurance Program (NFIP).	2020	Open. VDEM closes 1/29/2020 for FEMA's deadline of 1/29/2021.	Not listed	$160 million (entire program)	75% federal, 25% non-federal cost share	FR	Neither	This grant is for structures that are insured through NFIP and are at risk for repetitive flood damage.	Must have a current FEMA-approved Hazard Mitigation Plan. Project must be identified in the mitigation strategy; structural projects must be cost effective and comply with program regulations in the Hazard Mitigation Assistance Guidance.	Cost effective structural projects must be demonstrated through a benefit cost analysis (BCA).	Application start 09/30/2020 - application submission deadline 01/29/2021	https://www.vaemergency.gov/job/flood-mitigation-assistance-grant/	FEMA Hazard Mitigation Assistance has 5 grant programs, including Hazard Mitigation Grant Program; Flood Mitigation Assistance Program and Building Resilient Infrastructure & Communities (BRIC). Virginia is preparing to administer these grants (as of 10/30/2020).
Federal Emergency Management Agency *Hazard Mitigation Grant Program (HMGP)*	The intent of HMGP is to provide funding for state, local, tribal and territorial governments so they can rebuild in a way that reduces or mitigates disaster losses.	2020	Depends on disaster declaration	Up to 15% of the first $2 billion	Up to 20% for amounts not to exceed $35.333 billion (entire program)	75% federal, 25% non-federal cost share	FR	Neither	This grant provides funding after a presidentially declared disaster.	Grant recipients have 36 months or three years from the close of the application period to complete the project.	Submit a letter of intent to FEMA within 30 days after a disaster declaration.	Depends on disaster declaration	https://www.fema.gov/grants/mitigation/hazard-mitigation	Funding is based on the estimated total cost of disaster assistance.
RISE Resilience Innovation (Non-profit organization) *Flood Management Resilience Challenge*	Funds are for areas in need of innovative solutions identified by entities operating in Hampton Roads.	2020	Closed	Not listed	250000	Non-equity funding	FR, WQ	TW	Must focus on a Hampton Roads need while demonstrating the ability to scale to other communities.	Must be either small businesses or non-profit entities.	Particularly interested in innovative solutions for cost-effective management of ground, storm, or tidal water.	TBD	https://riseresilience.org/current-challenges/	RIF awards come in two forms: 1) loans (revenue based or 0 interest fixed payment) and 2) reimbursement grants.
Virginia Department of Environmental Quality *Stormwater Local Assistance Fund (SLAF)*	Provides matching grants to help localities install efficient and effective pollution-control measures.	2019	On hold pending review of Commonwealth debt capacity.	50000	Disbursements shall be held at 95% of the total grant amount to ensure satisfactory completion of the project.	Grant will be awarded and the grantee may begin requesting monthly reimbursement for 50% of eligible costs incurred.	WQ	TW	Reduce non-point source pollution from stormwater runoff.	Must complete the program requirements, advertise for construction bids and develop and receive approval of a final grant budget based on as-bid construction and contractual engineering costs.	Several submittal packages must be reviewed and approved by DEQ CWFAP staff.	Annually	https://www.deq.virginia.gov/Programs/Water/CleanWaterFinancingAssistance/StormwaterLoan.aspx	SLAF projects are awarded primarily on the basis of cost efficiency and pollutant removal benefit.

Information updated as of **10/30/2020**

Funding Agency ***Grant Name***	**Description**	**Prior Grant Cycle FY**	**Availability**	**Minimum Amount**	**Maximum Amount**	**Match Percentage**	**Type**	**Eligibility**		**Restrictions**	**Potential Burdens**	**Expected Application Timeline**	**Contact (Webpage)**	**Comments**
							FR = Flood Resilience WQ = Water Quality	**SE= Social Economic TW = Target Waterheds**	**Other**					
United State Environmental Protection Agency *Multipurpose Grants to States and Tribes*	Funds are intended to be used at state and tribal discretion, for high-priority activities to complement activities funded under established environmental statutes.	2020	Closed	25000	Minimum grant amount plus supplemental amount based on FY2019 funding.	None	WQ	Neither	Eligible recipients are generally state agencies that carry out federally funded environmental programs.	Funds may be used to support several activities associated with categorical grant programs such as water pollution control, nonpoint source management, pollution prevention, Wetlands development - which are eligible for inclusion in a Performance Partnership Grant.	May accept funds through an existing PPG, by establishing a new PPG, or through a standalone grant. Steps may be required to decide which grant vehicle is most appropriate.	Summer 2021?	https://www.epa.gov/grants/specific-epa-grant-programs	Grant funding is authorized by the Further Consolidated Appropriations Act, 2020 (P.L. 116-94); Recipients have flexibility to direct funds to priority areas.
Grant Opportunities Reviewed But Not Applicable														
Natural Resources Conservation Service/United States Department of Agriculture *Agricultural Management Assistance, Conservation Stewardship Program, Environmental Quality Incentives Program, Water Bank Program*	Grant funding specifically for agricultural producers or grant funding only available in certain states.													
Virginia Department of Forestry *Economic Development, Fire Prevention and Urban and Community Forestry Grants*	Grant funding specifically for agriculture and forestry development projects, potential threats from wildfires or fire-related assistance, and specific forestry projects.													
Virginia Department of Conservation and Recreation *Virginial Land Conservation Foundation/Land and Water Conservation Fund State and Local Assistance Program*	Grant funding specifically for the acquisition and development of public outdoor recreation areas.													
Virginia Department of Environmental Quality *Stormwater Loan Program*	Provides a long term source of low interest financing for constructing facilities or structures or implementing best management practices that reduce stormwater runoff.													

NOTES

1) Grant opportunities are in constant flux. These grant sources should be monitored and updated as the Greenbrier Resiliency Plan projects move forward.
2) Small grants, having anticipated awards less than $100,000, are not detailed here (unless they have potential for increased funding) because application and administration costs tend to be high compared to the value of the grant.
3) The large grant amounts listed are for the total program, not individual projects (because individual project funding is not specifically limited).

NOTES

1) Many other runs were made during the course of this project. This table summarizes those runs that are described in the report.
2) These HEC-RAS file sizes are very large, totaling over 10.8 GB.
3) HEC-RAS automatically assigns the plan file summary (file extensions) for each run, and maps extension numbers to multiple scenarios as applicable. Likewise, it shortens and abbreviates descriptions. Modelers are cautioned not to rename these files.
4) Model run times vary significantly between computers.

Table 6. Impoundment System Extended Drawdown

Start Time (hrs)	144	
Time Increment (hrs)	1	
Starting Surface Area (ac)	130.54	(does not include lake system along Joe's Crab Shack because there is a controlling structure there.)
Starting Surface Elevation (ft)	8.96	(at end of HEC-RAS simulation)
Drawdown Limit Elevation (ft)	7.42	(invert elevation at Greenbrier Mall entrance)
Assumed Bottom Area (ac)	124.01	(bathymetric survey required to determine this number; we are estimating a 5% reduction from the top surface area.)

Initial Conic Values

A_{top} = 5,686,322 ft2 D_{top} = 2690.73

A_{bot} = 5,402,006 ft2 D_{bot} = 2622.60

h_0 = 1.54 ft

z = 22.12 hor/vert (side slope of equivalent cone; this is not the 'bank' side slope, it accounts for unsurveyed sediment)

Culvert Headwater Curve Coefficients

$= C5x^5 + C4x^4 + C3x^3 + C2x^2 + C1x$

C5	0.0378020
C4	-1.3785580
C3	18.861380
C2	-111.982910
C1	242.085527

Eqn. 1

$$z = \frac{1}{2\Delta h}(D_{Top} - D_{Bot}) \Rightarrow \boxed{\frac{(D_{Top} - D_{Bot})}{2z} - \Delta h = 0}$$

Eqn. 2

$$V = \frac{\pi\,\Delta h\,(D_{Bot}^2 + D_{Bot}D_{Top} + D_{Top}^2)}{12} \Rightarrow \boxed{\frac{12V}{\pi\,(D_{Bot}^2 + D_{Bot}D_{Top} + D_{Top}^2)} - \Delta h = 0}$$

Figure 1. Greenbrier Drainage Area with Reference Nodes

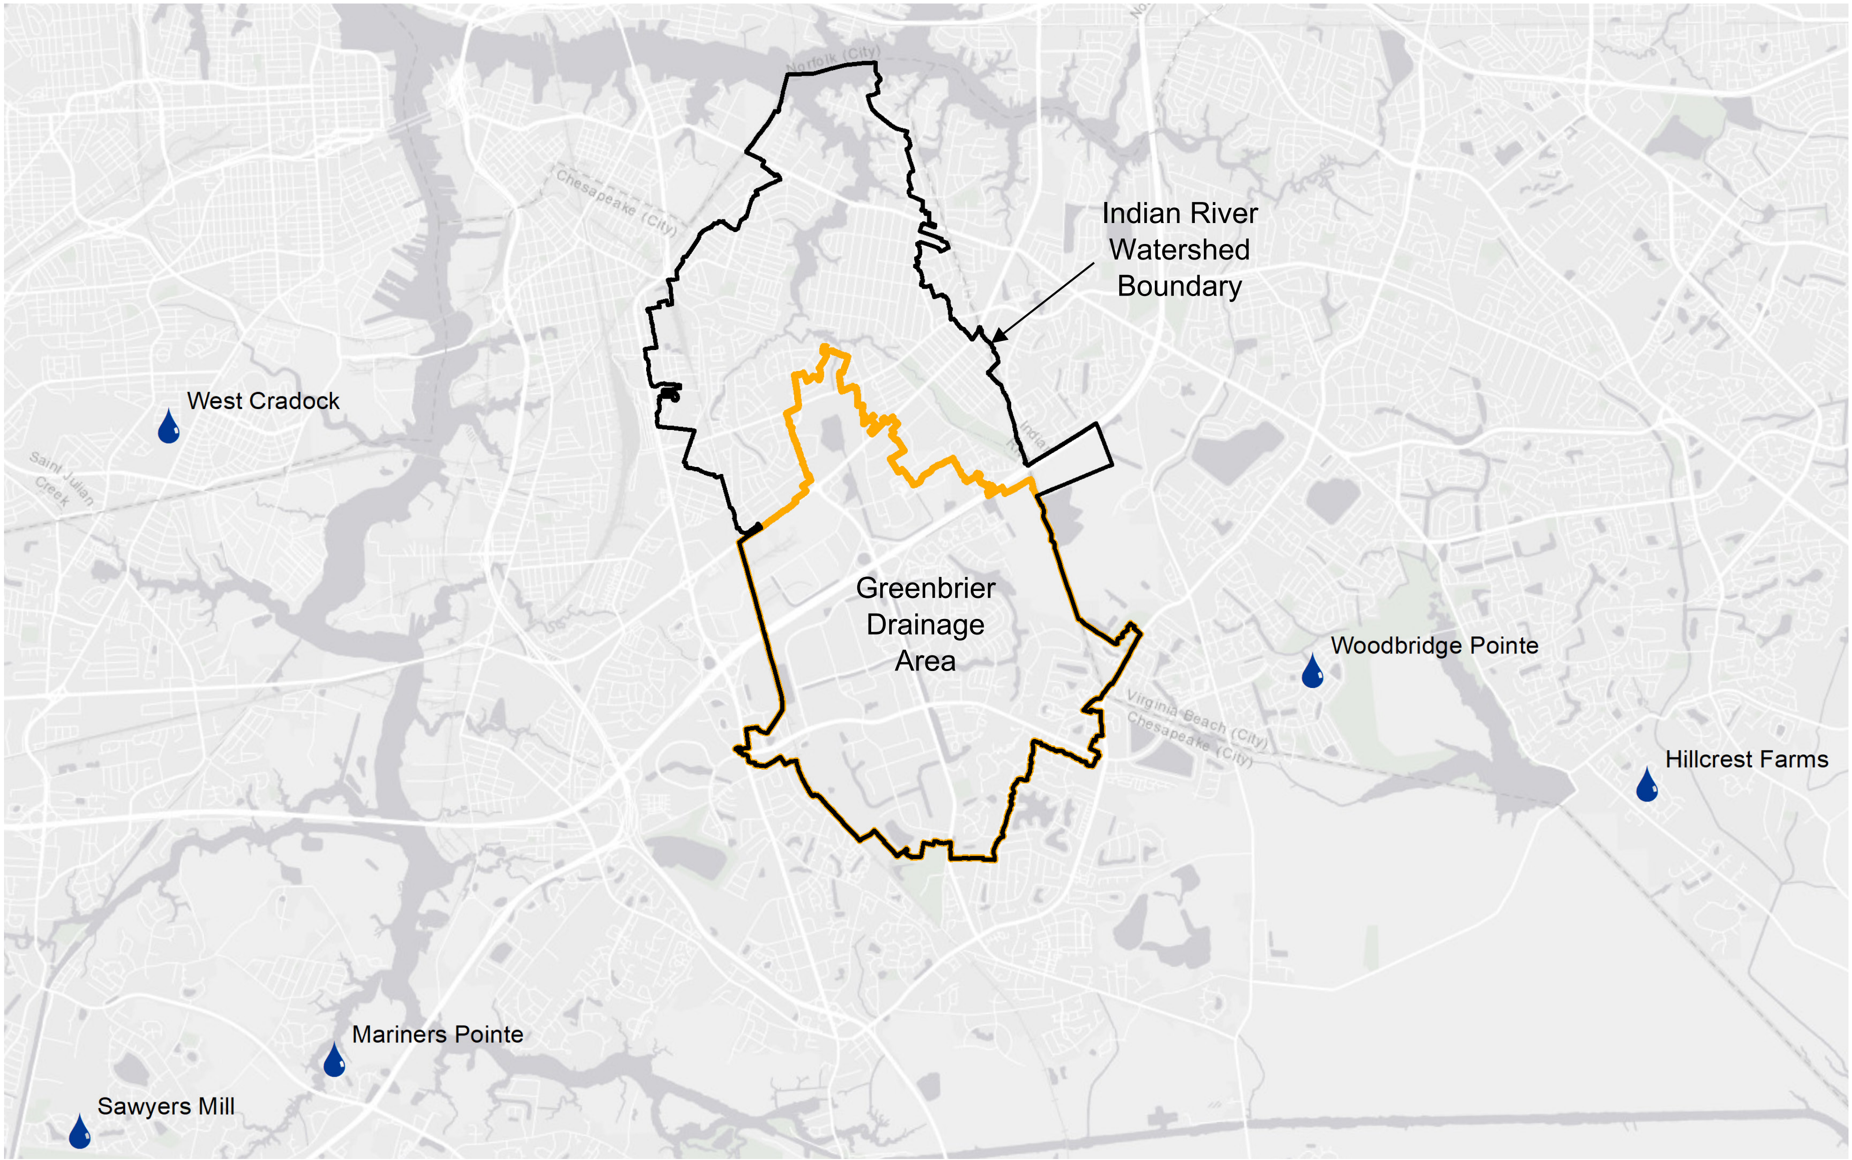

Figure 2. Hurricane Matthew Precipitation Sources

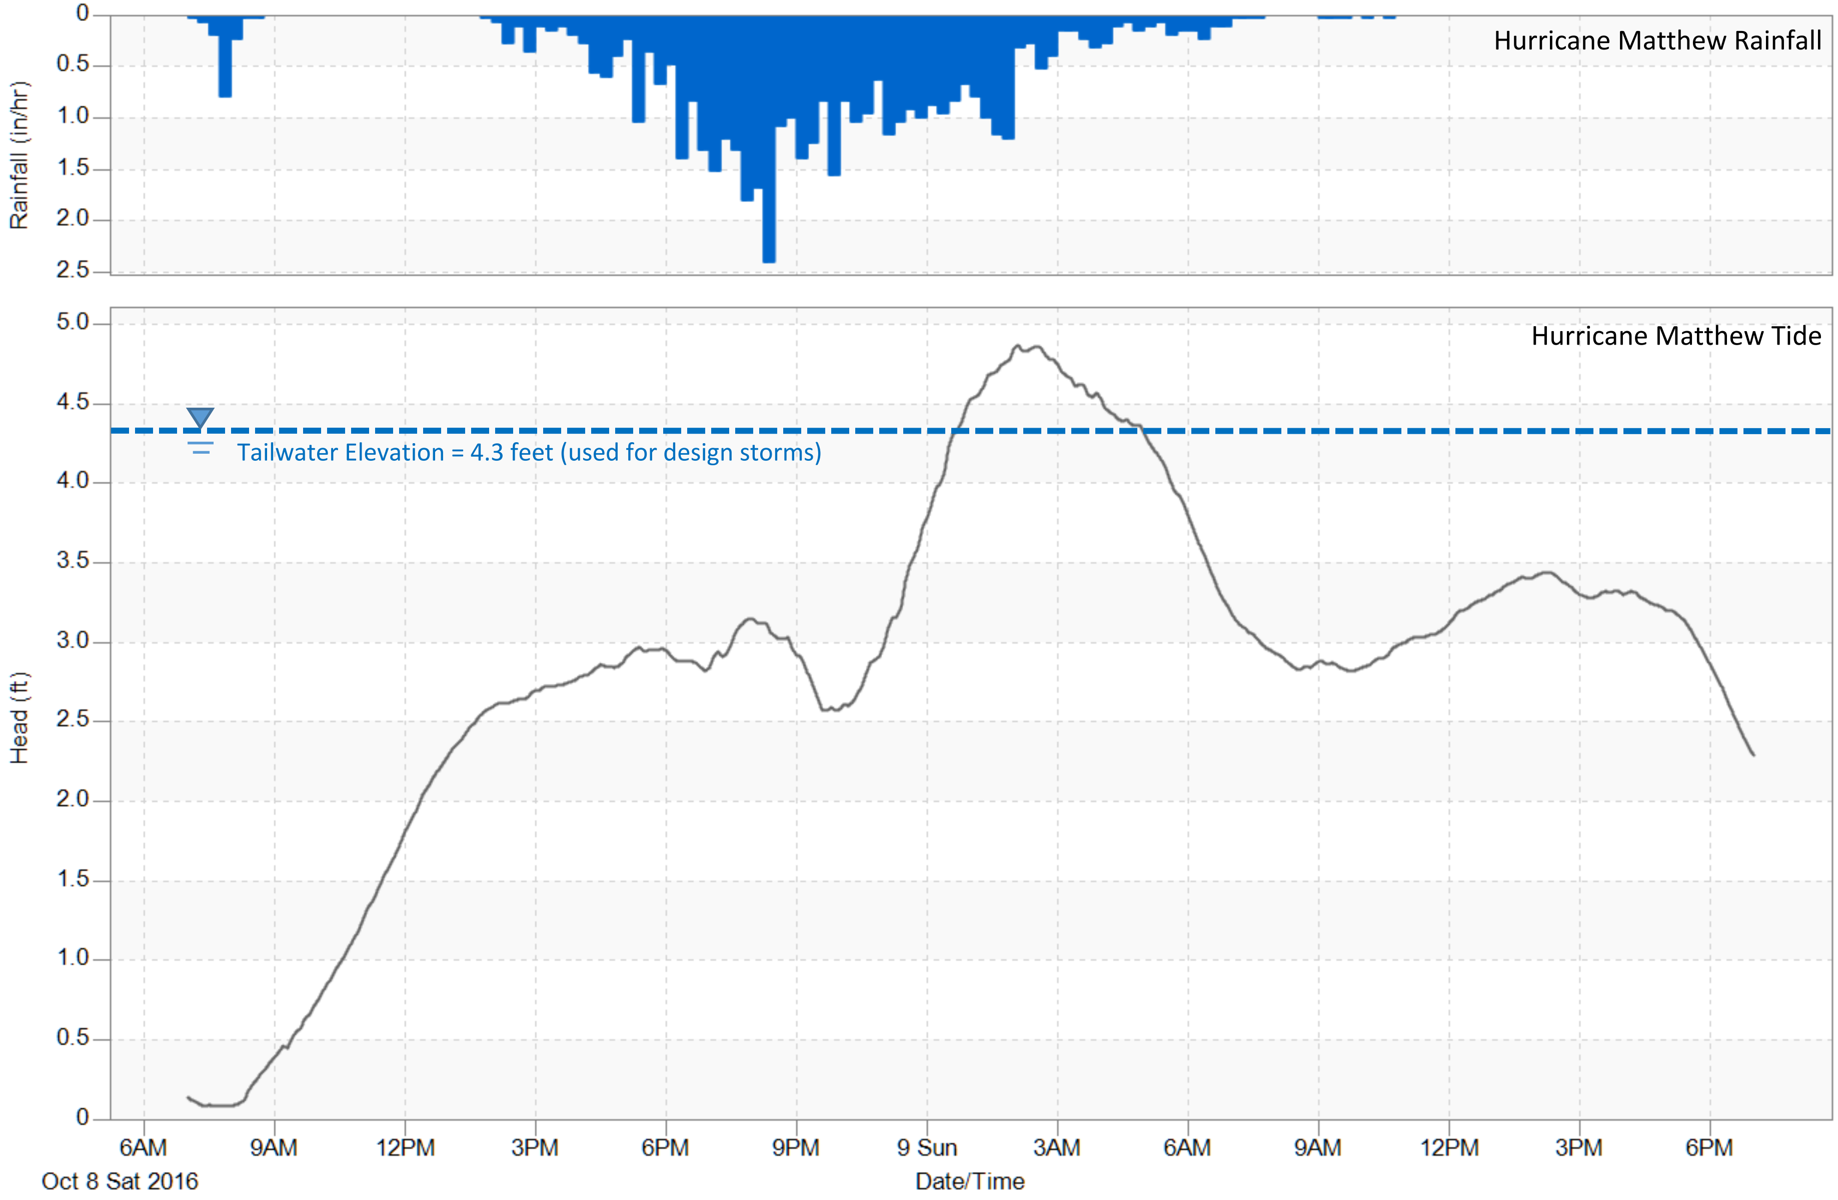

Rainfall was recorded at City Hall.
Tide was recorded at Money Point, shown for general reference.
Vertical Datum = NAVD88

Figure 3. Hurricane Matthew Rainfall and Tide

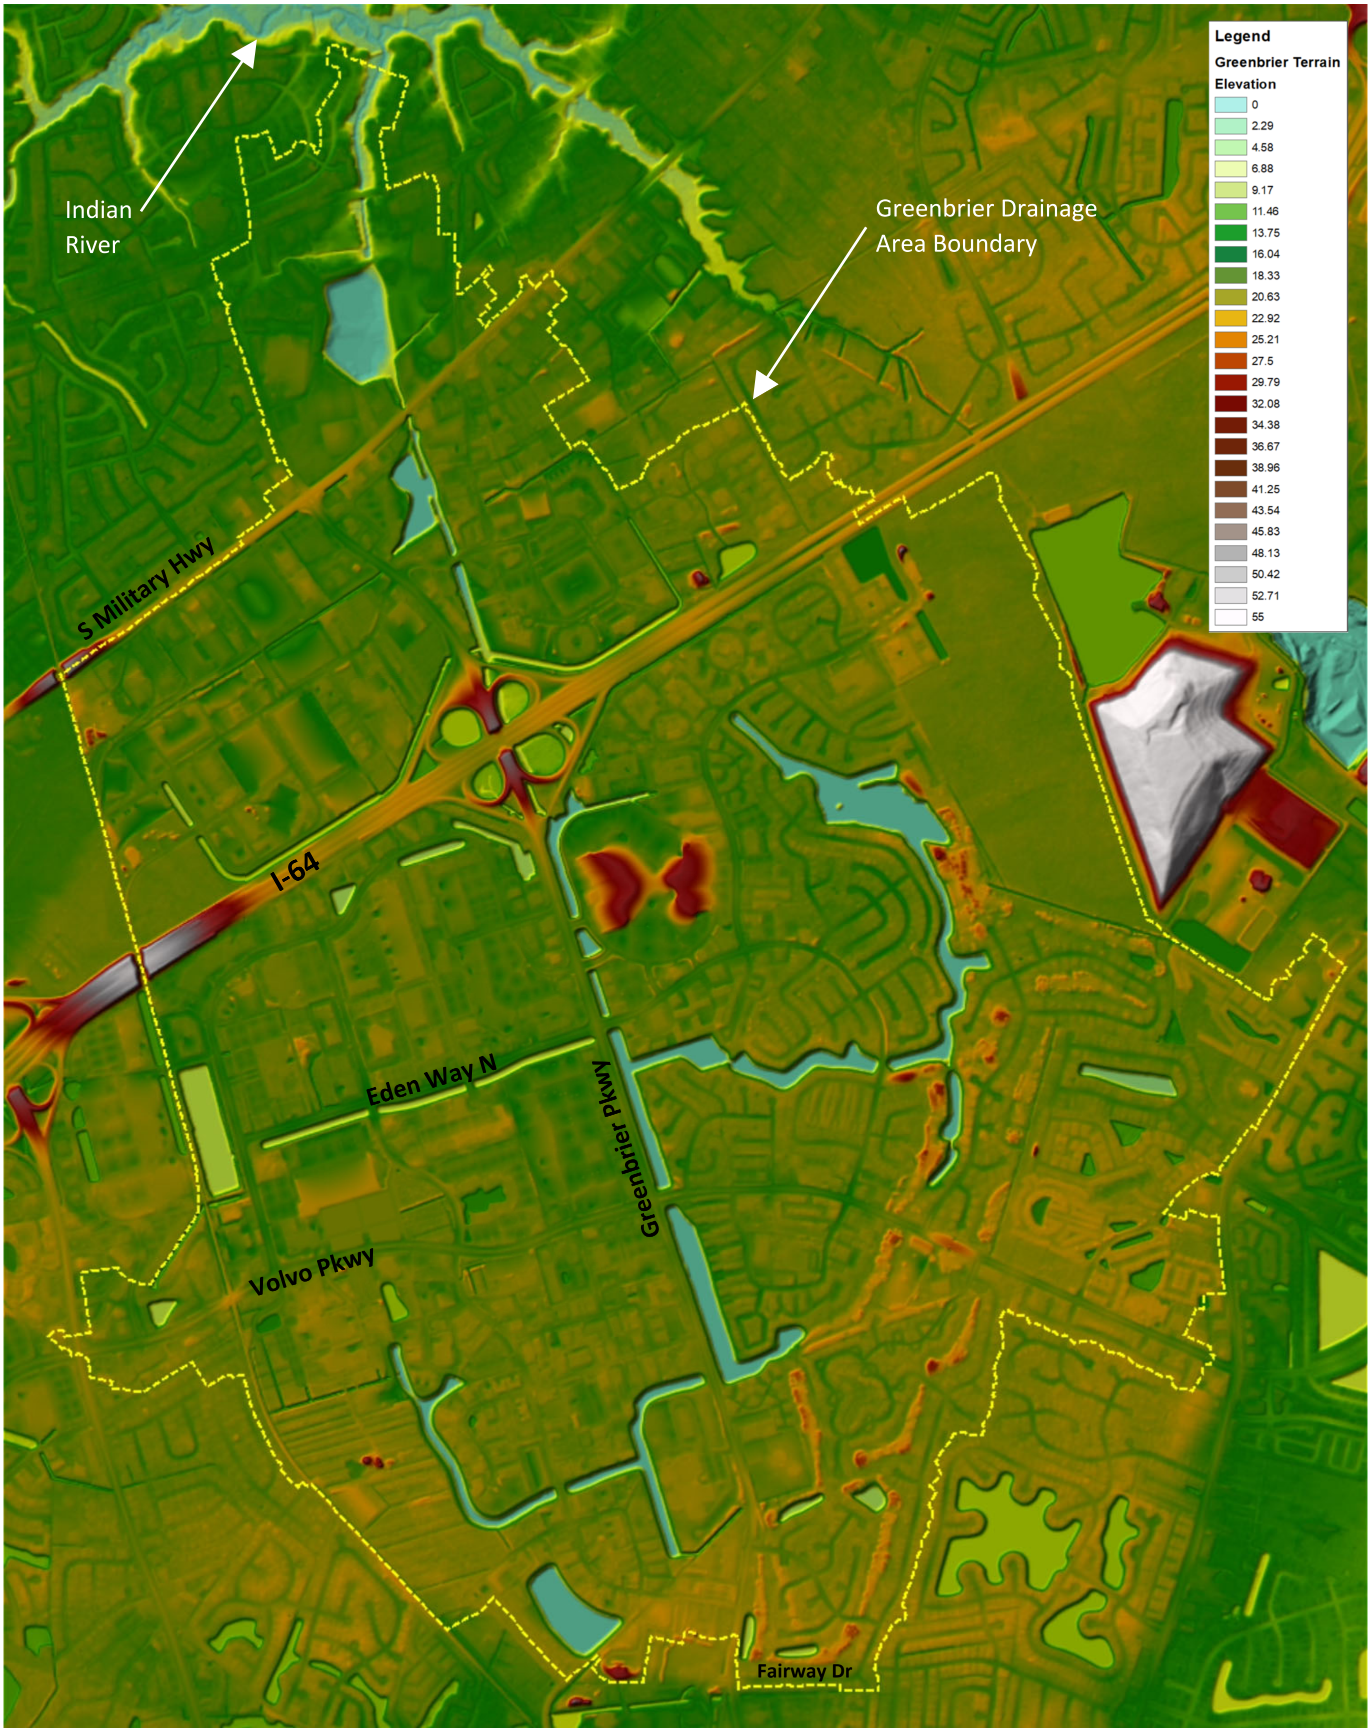

Figure 4. Rain-on-Grid Model Construction, Terrain

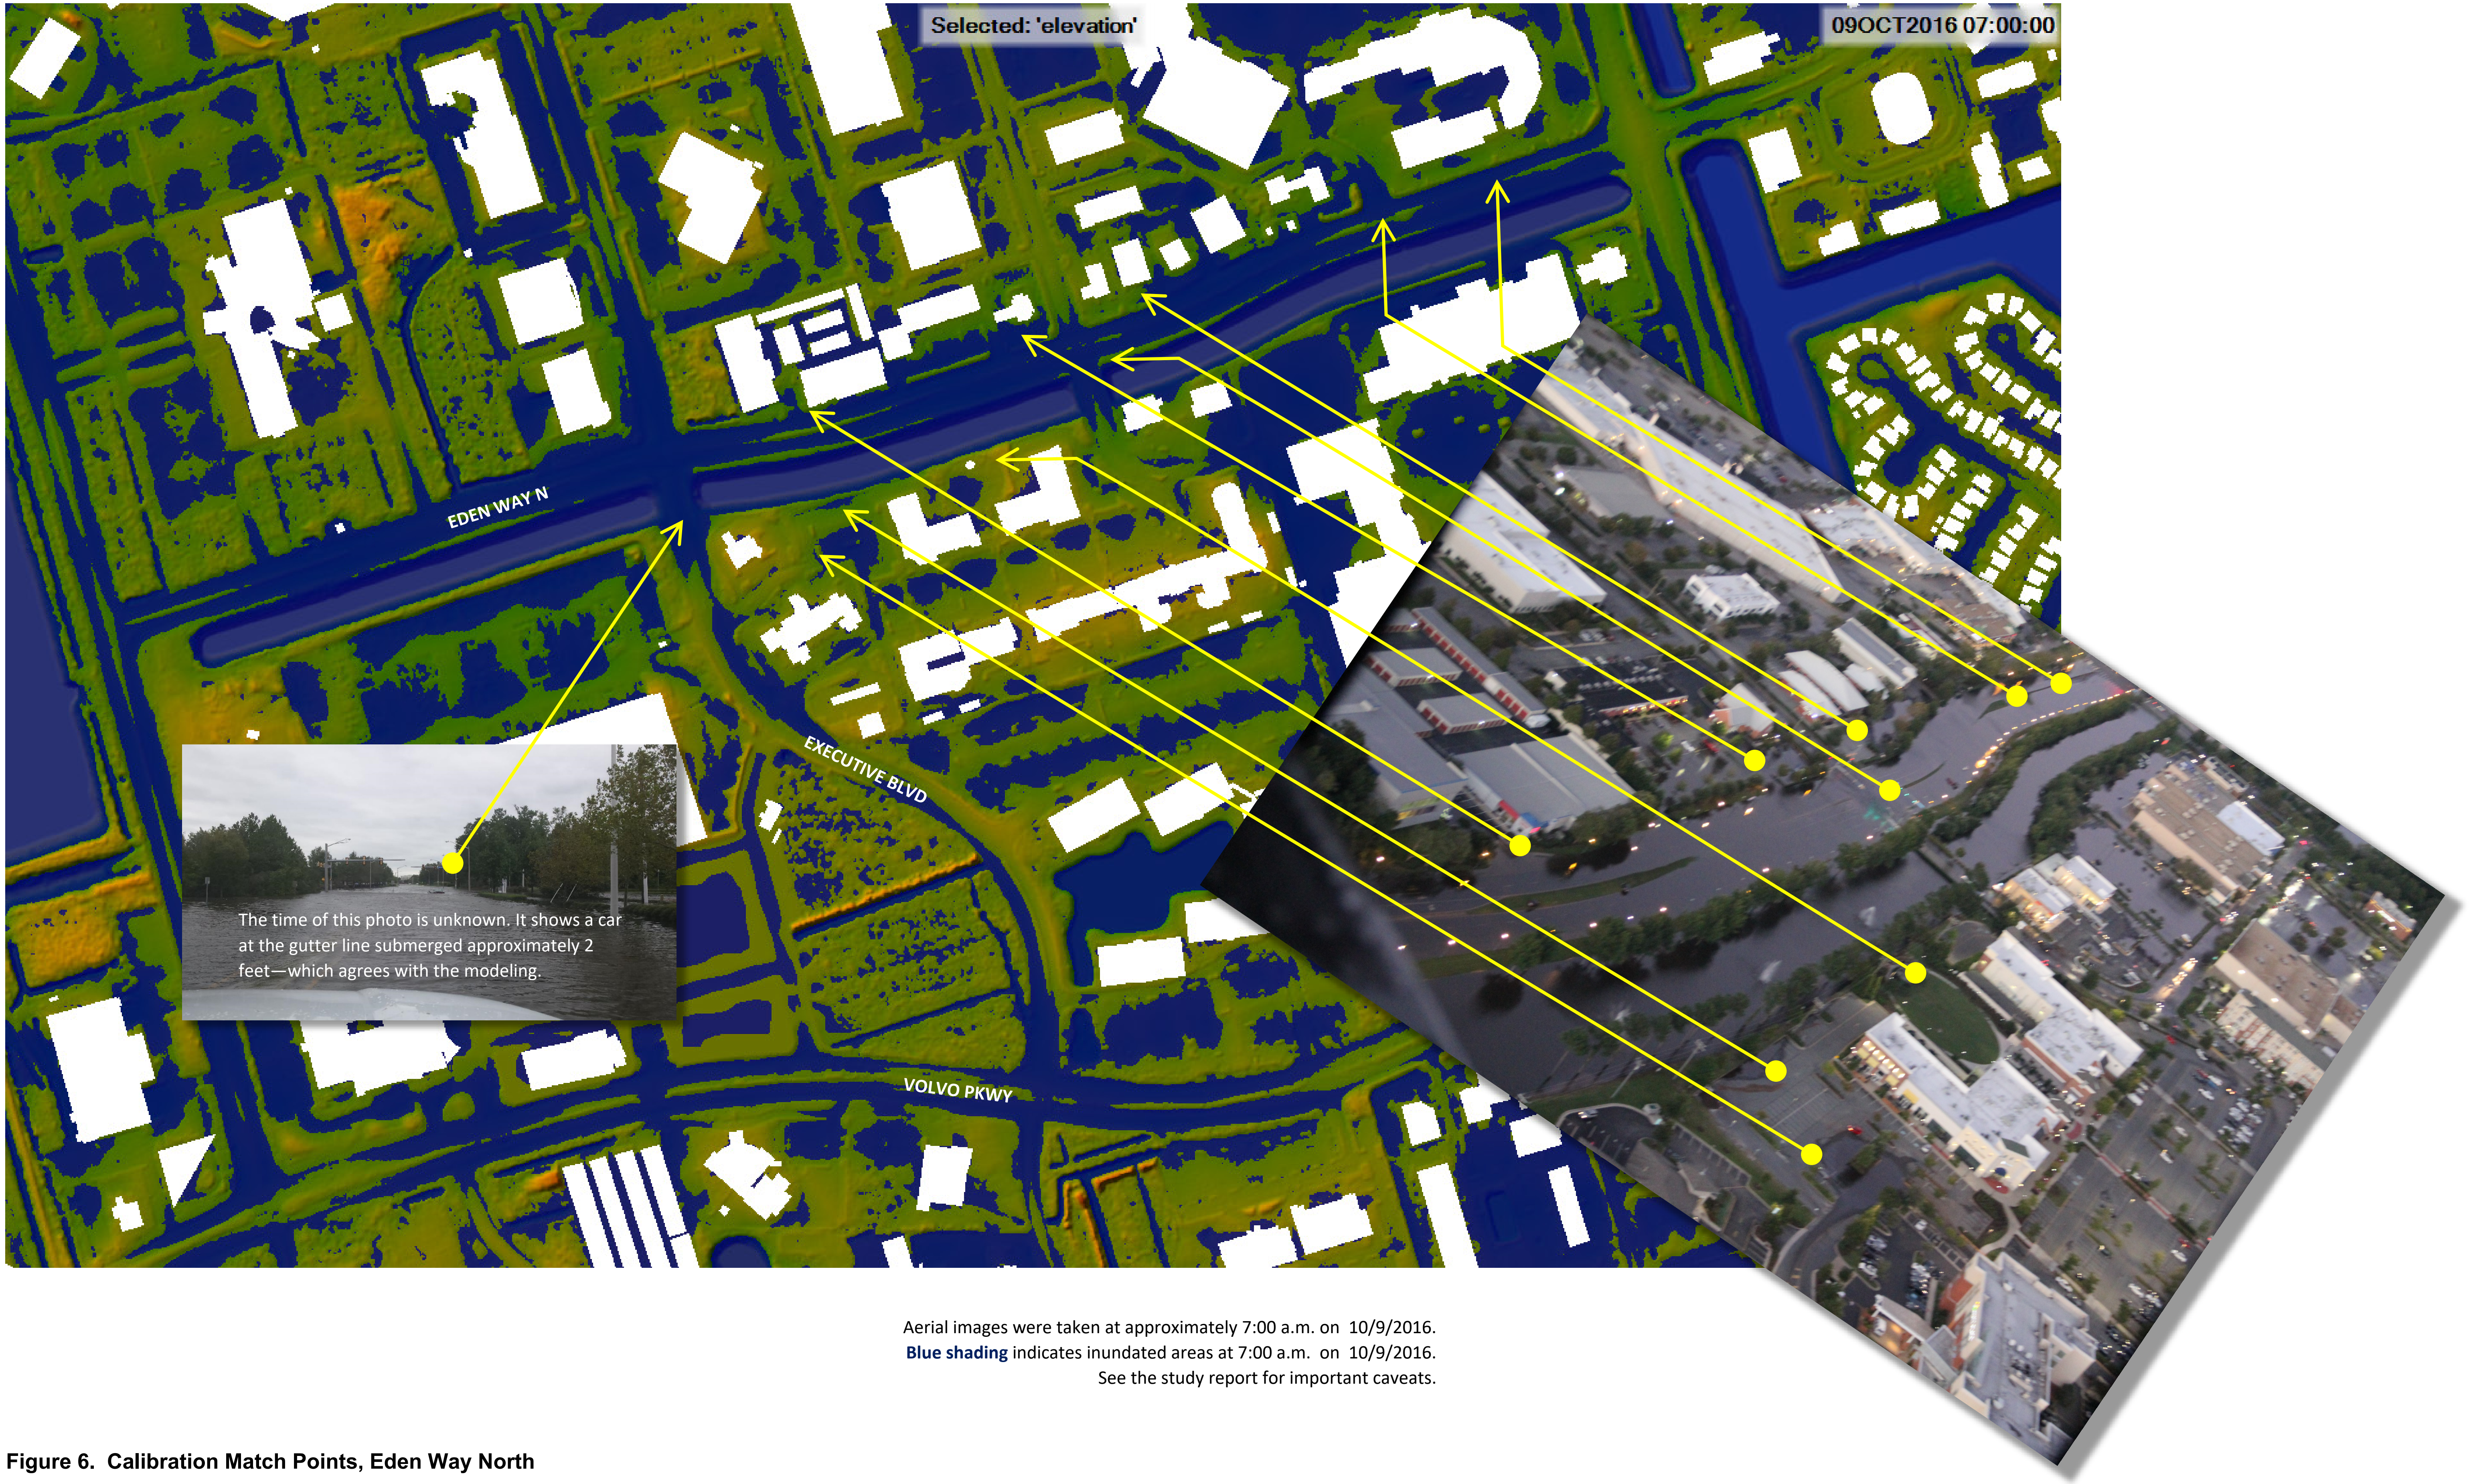
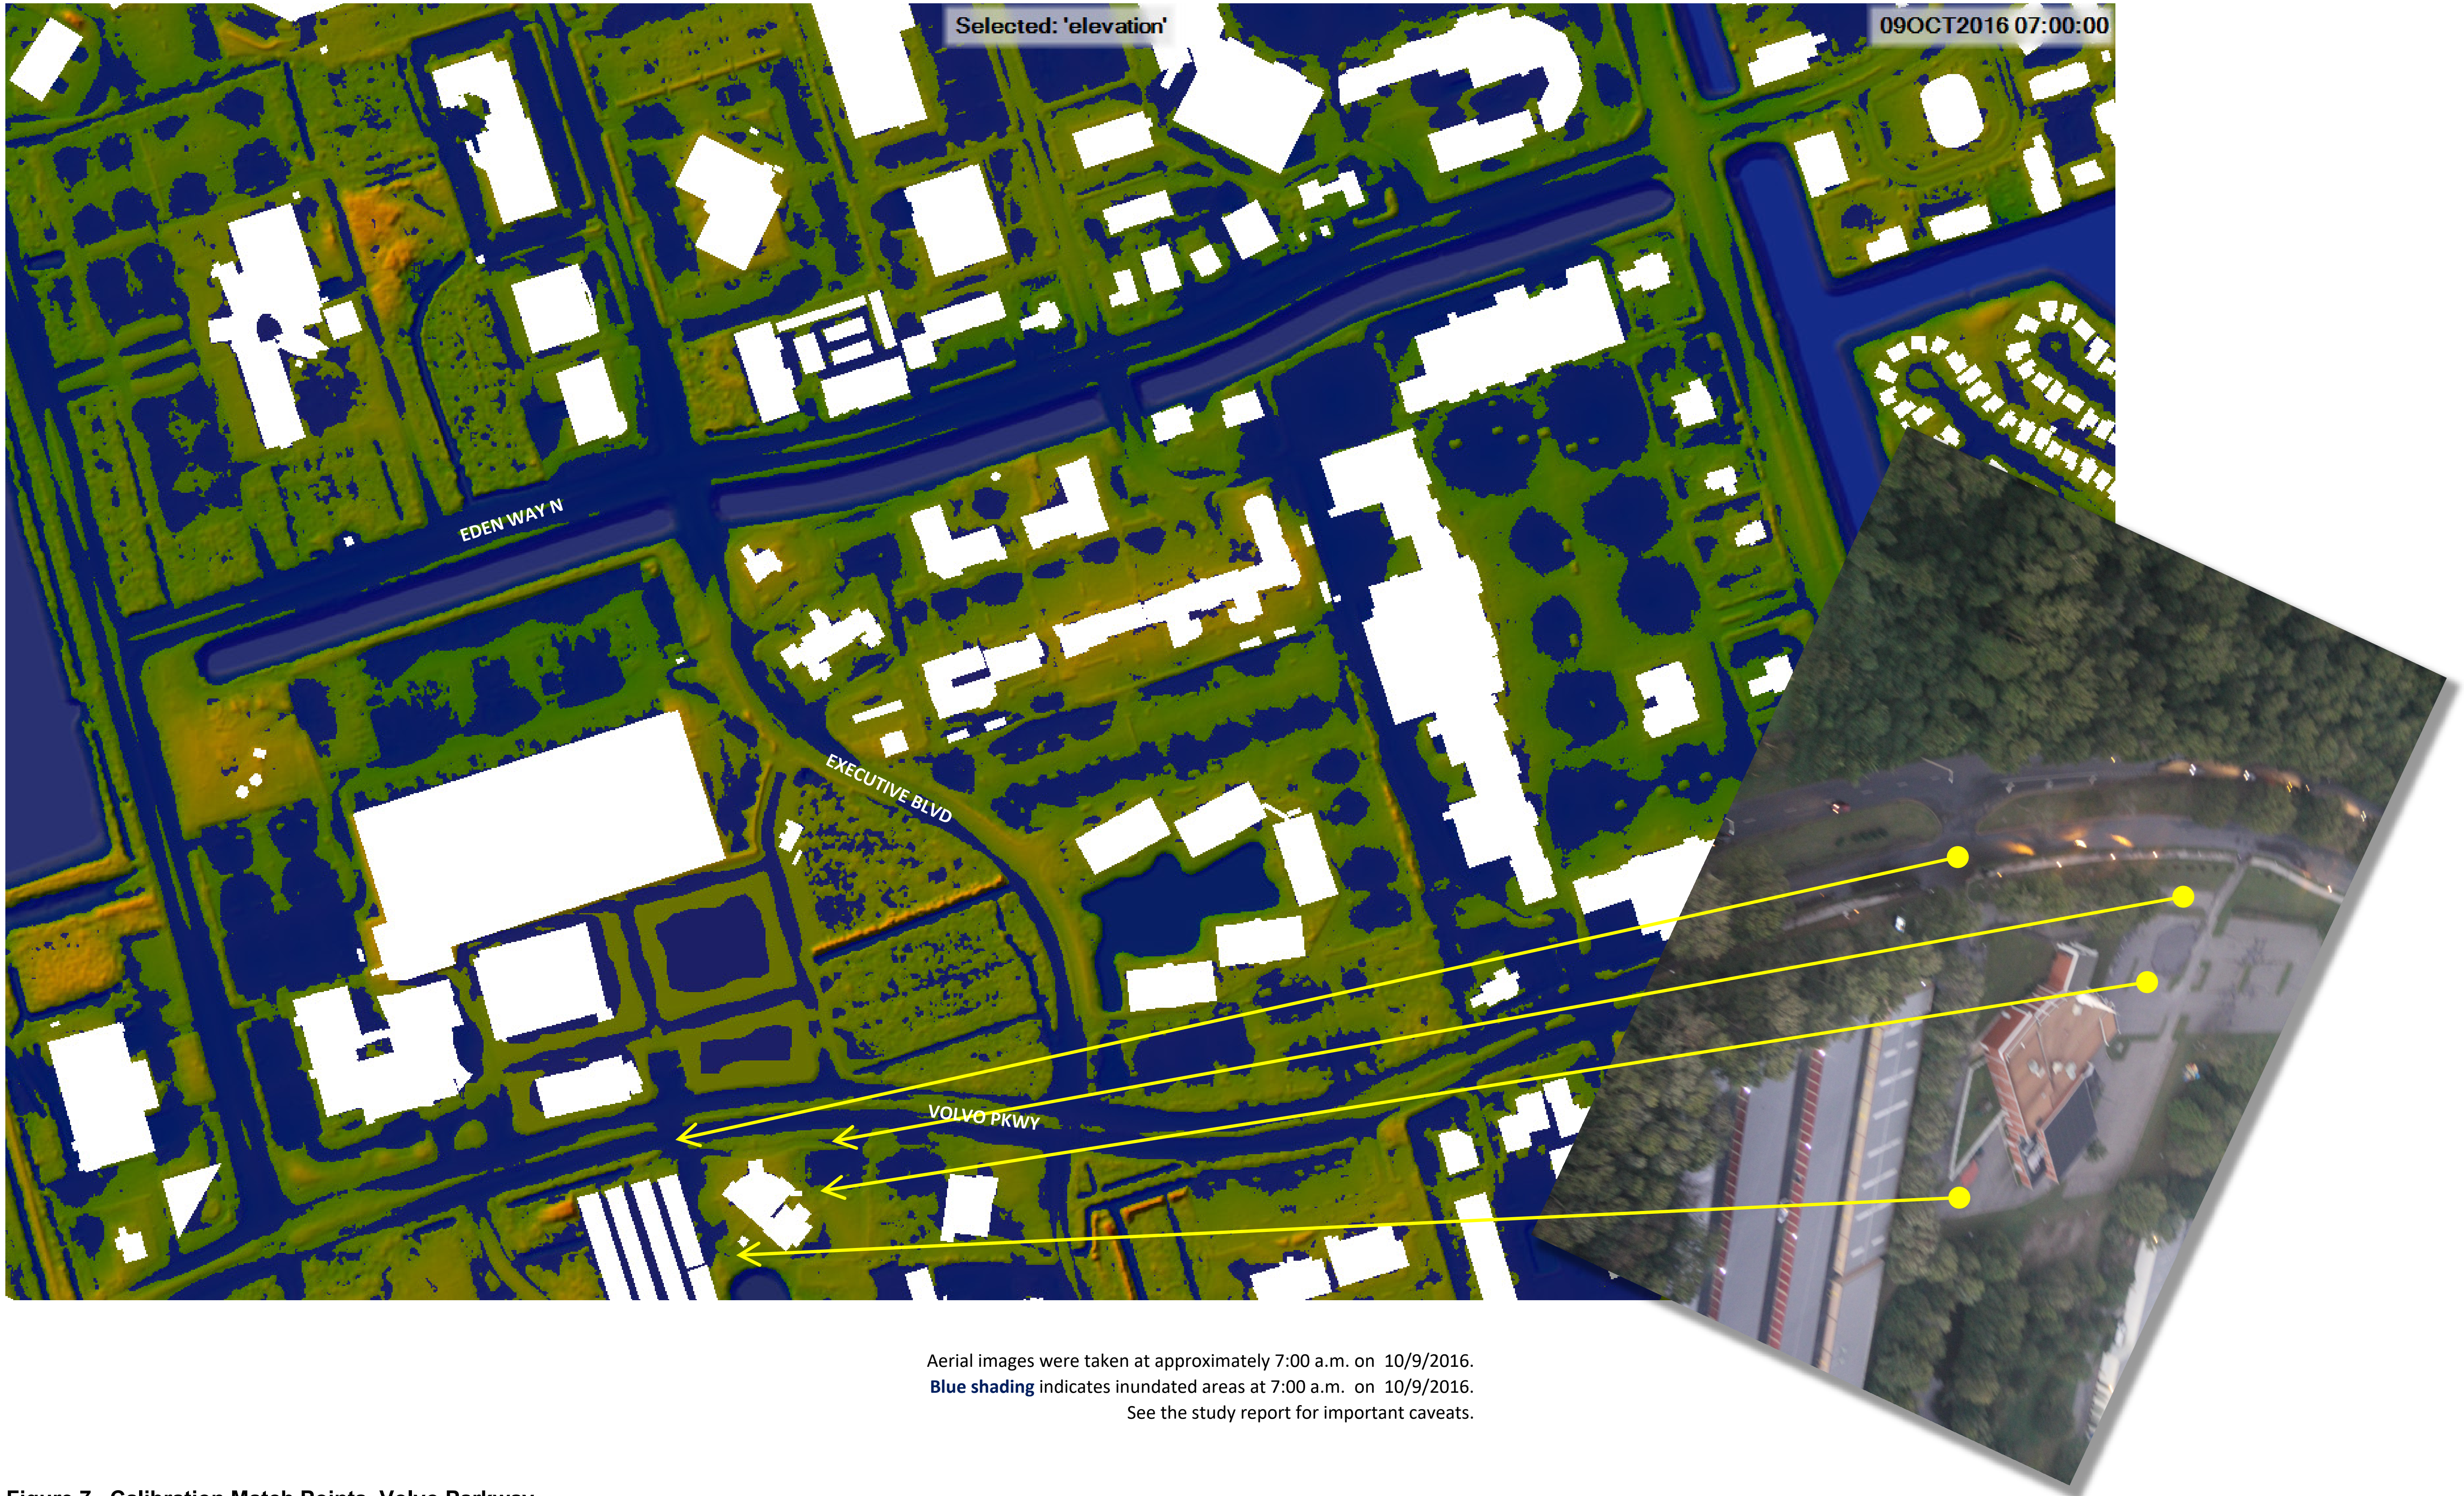
Note: This figure shows mesh geometry for the improved scenario with an added culvert under I-64. Buildings are removed for clarity.

Figure 5. Rain-on-Grid Model Construction, 2D Mesh Geometry



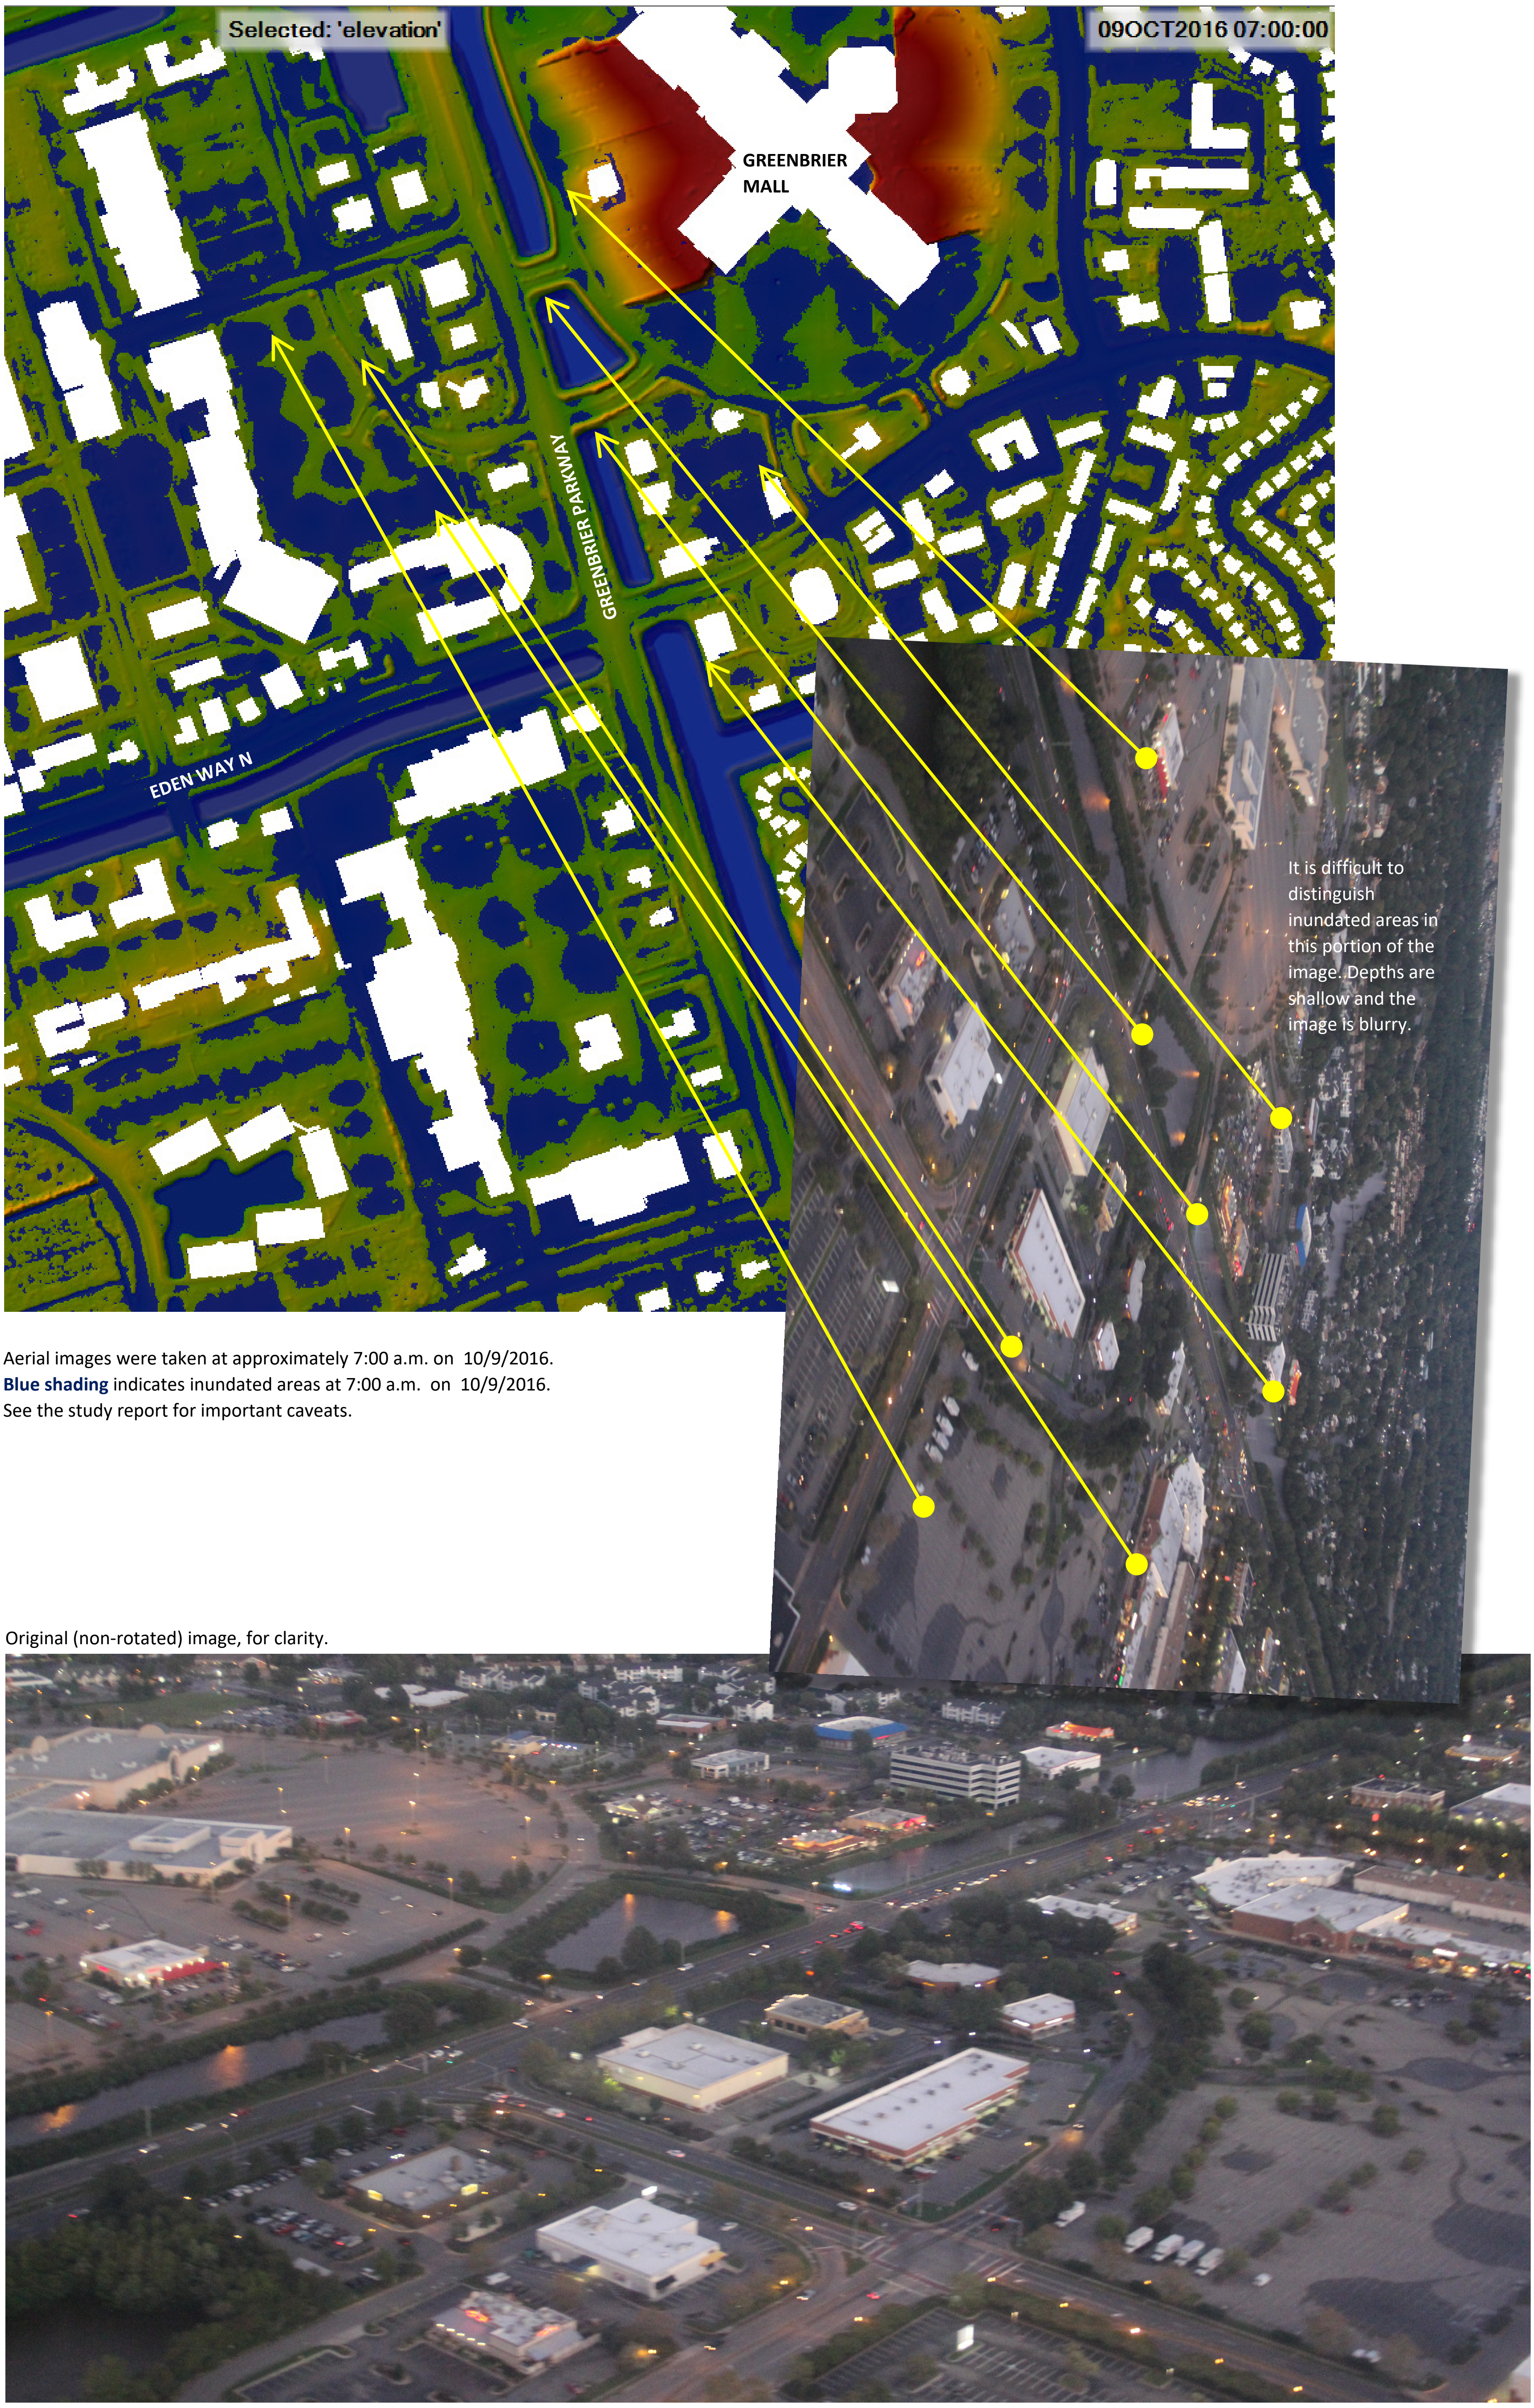
Aerial images were taken at approximately 7:00 a.m. on 10/9/2016.
Blue shading indicates inundated areas at 7:00 a.m. on 10/9/2016.
See the study report for important caveats.

Figure 6. Calibration Match Points, Eden Way North



Aerial images were taken at approximately 7:00 a.m. on 10/9/2016.
Blue shading indicates inundated areas at 7:00 a.m. on 10/9/2016.
See the study report for important caveats.

Figure 7. Calibration Match Points, Volvo Parkway

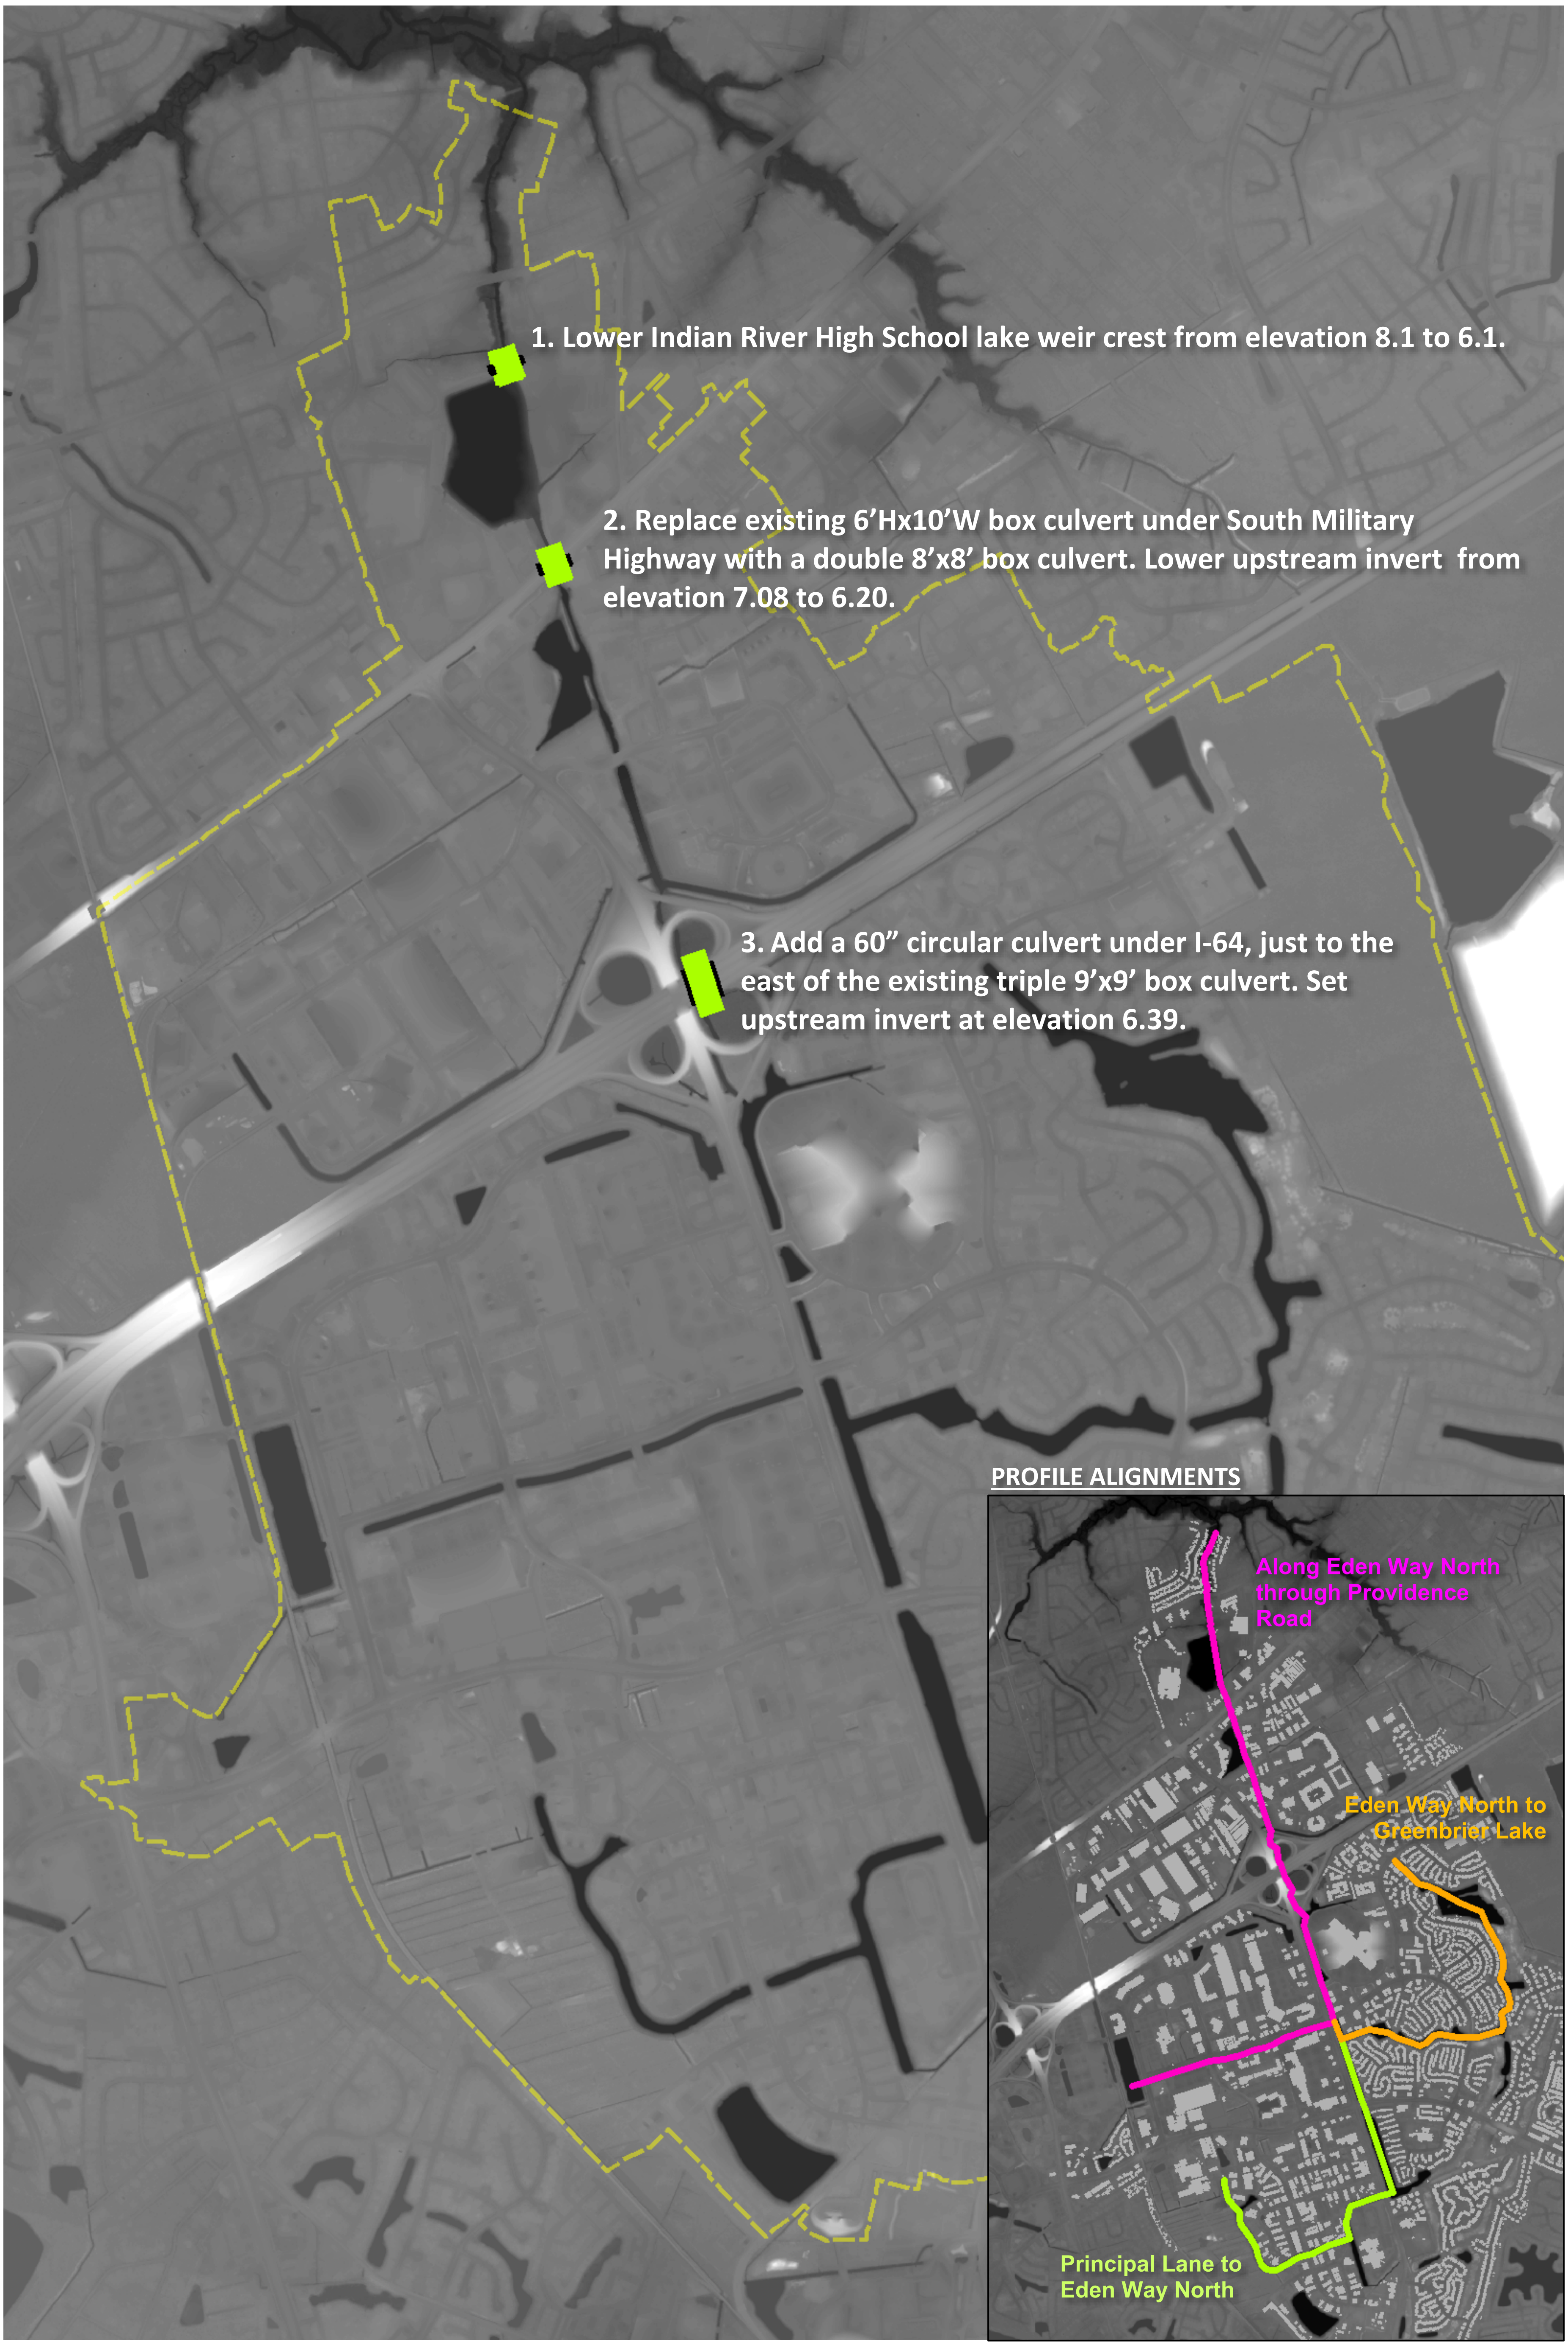


It is difficult to distinguish inundated areas in this portion of the image. Depths are shallow and the image is blurry.

Aerial images were taken at approximately 7:00 a.m. on 10/9/2016.
Blue shading indicates inundated areas at 7:00 a.m. on 10/9/2016.
See the study report for important caveats.

Original (non-rotated) image, for clarity.

Figure 8. Calibration Match Points, Greenbrier Parkway

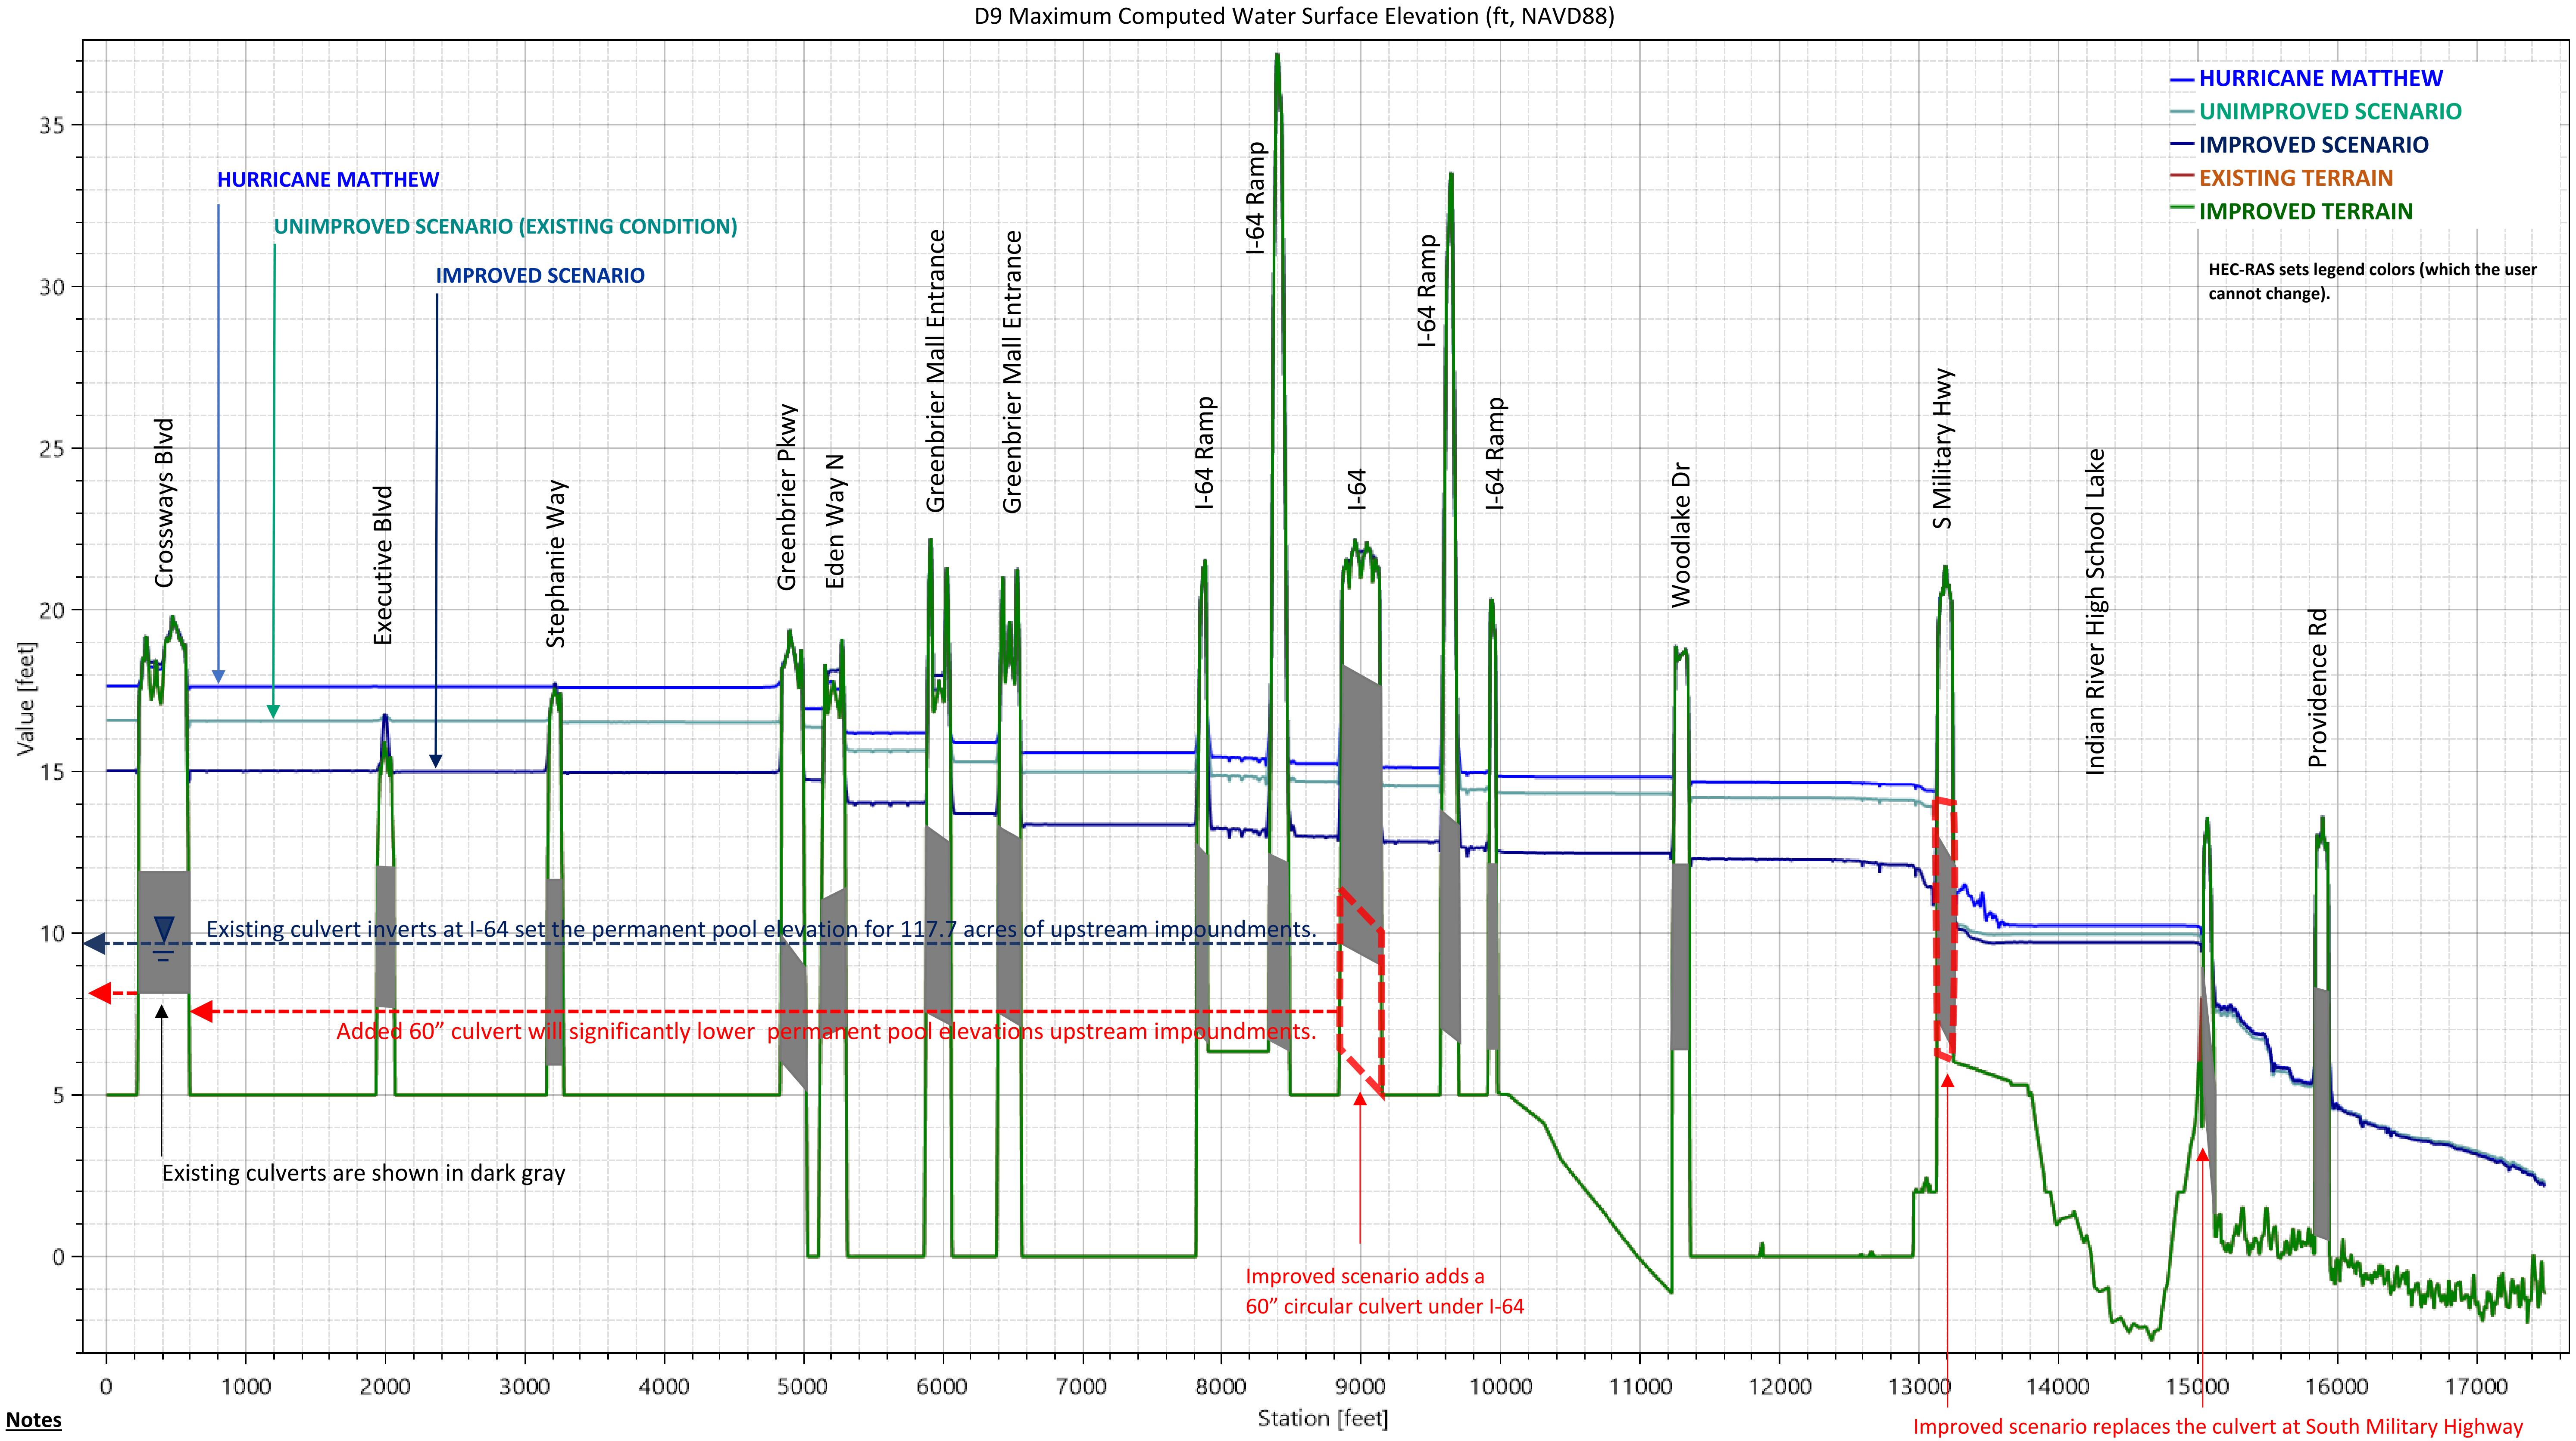


1. Lower Indian River High School lake weir crest from elevation 8.1 to 6.1.

2. Replace existing 6’Hx10’W box culvert under South Military Highway with a double 8’x8’ box culvert. Lower upstream invert from elevation 7.08 to 6.20.

3. Add a 60” circular culvert under I-64, just to the east of the existing triple 9’x9’ box culvert. Set upstream invert at elevation 6.39.

Figure 9. Potential Improvement Projects



Improved scenario replaces the culvert at South Military Highway and lowers the Indian River High School lake weir crest

Notes

The unimproved and improved scenarios use 9 inches of applied, excess rainfall (designated '**D9**').

The unimproved and improved scenarios have the blockages removed from the pipes under Eden Way N.

All culverts are assumed to be clean in the unimproved and improved scenarios.

The existing and improved terrains are coincident lines along this profile, except for the lowering of the weir at Indian River High School lake.

Figure 10. Maximum Hydraulic Grade Lines, Along Eden Way North through Providence Road

Notes

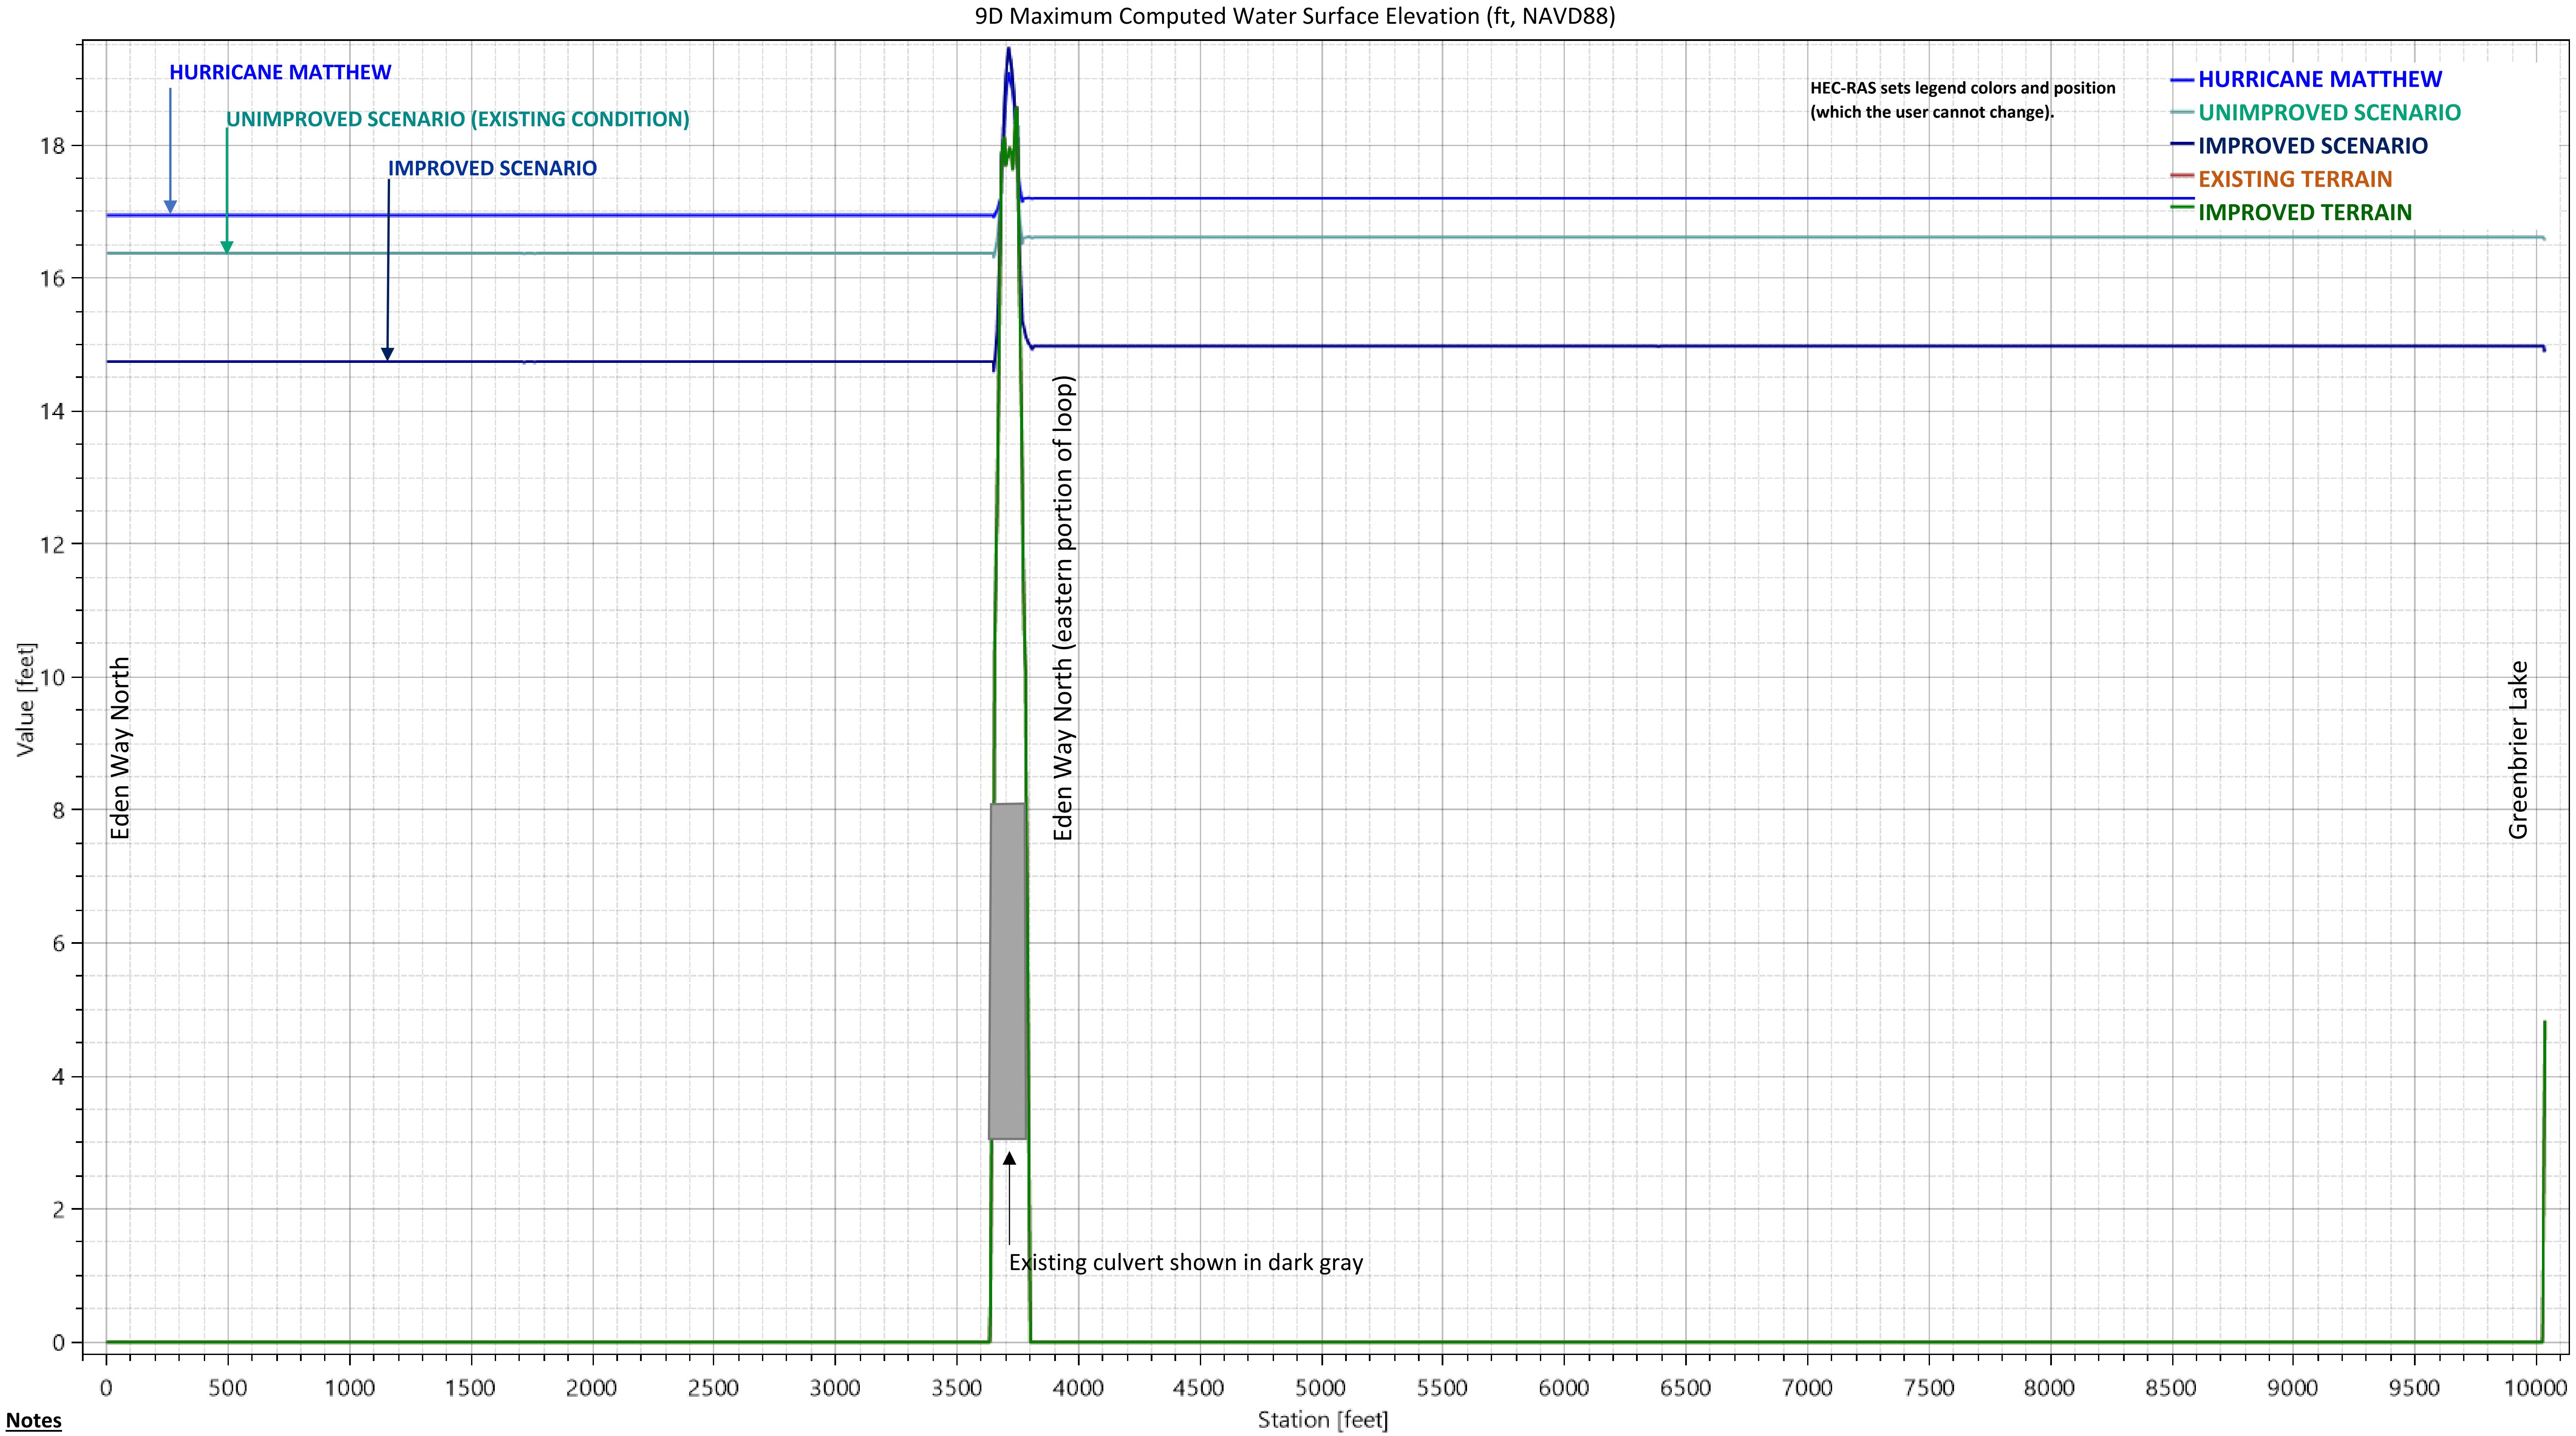
The unimproved and improved scenarios use 9 inches of applied, excess rainfall (designated ‘**D9**’).

The unimproved and improved scenarios have the blockages removed from the pipes under Eden Way N.

All culverts are assumed to be clean in the unimproved and improved scenarios.

The existing and improved terrains are coincident lines along this profile.

Figure 11. Maximum Hydraulic Grade Lines, Principal Lane to Eden Way North



Notes

The unimproved and improved scenarios use 9 inches of applied, excess rainfall (designated '**D9**').

The unimproved and improved scenarios have the blockages removed from the pipes under Eden Way N.

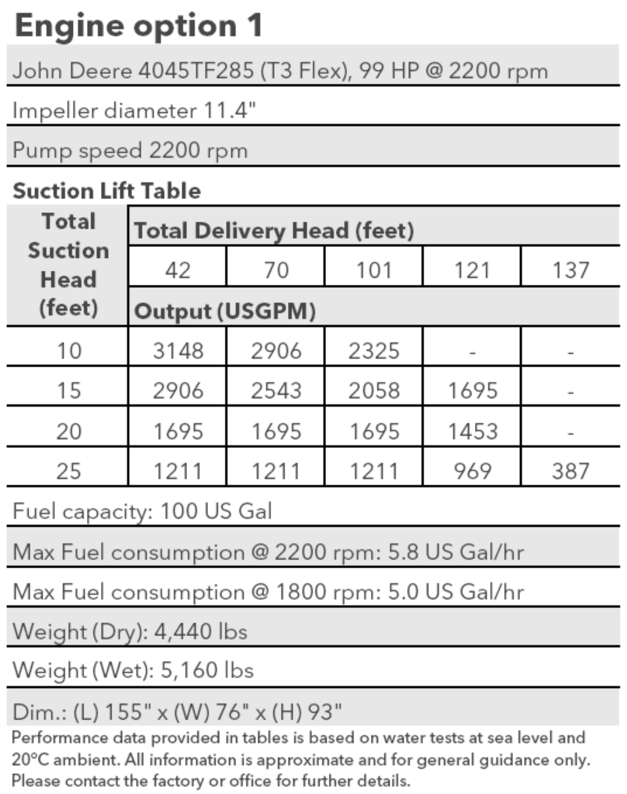
All culverts are assumed to be clean in the unimproved and improved scenarios.

The existing and improved terrains are coincident lines along this profile.

Figure 12. Maximum Hydraulic Grade Lines, Eden Way North to Greenbrier Lake

Godwin Dri-Prime CD225M Pump

Assume average output would be 2,500 gpm = 5.6 cfs



Engine option 1

John Deere 4045TF285 (T3 Flex), 99 HP @ 2200 rpm

Impeller diameter 11.4"

Pump speed 2200 rpm

Suction Lift Table

Total Suction Head (feet)	Total Delivery Head (feet)				
	42	70	101	121	137
	Output (USGPM)				
10	3148	2906	2325	-	-
15	2906	2543	2058	1695	-
20	1695	1695	1695	1453	-
25	1211	1211	1211	969	387

Fuel capacity: 100 US Gal

Max Fuel consumption @ 2200 rpm: 5.8 US Gal/hr

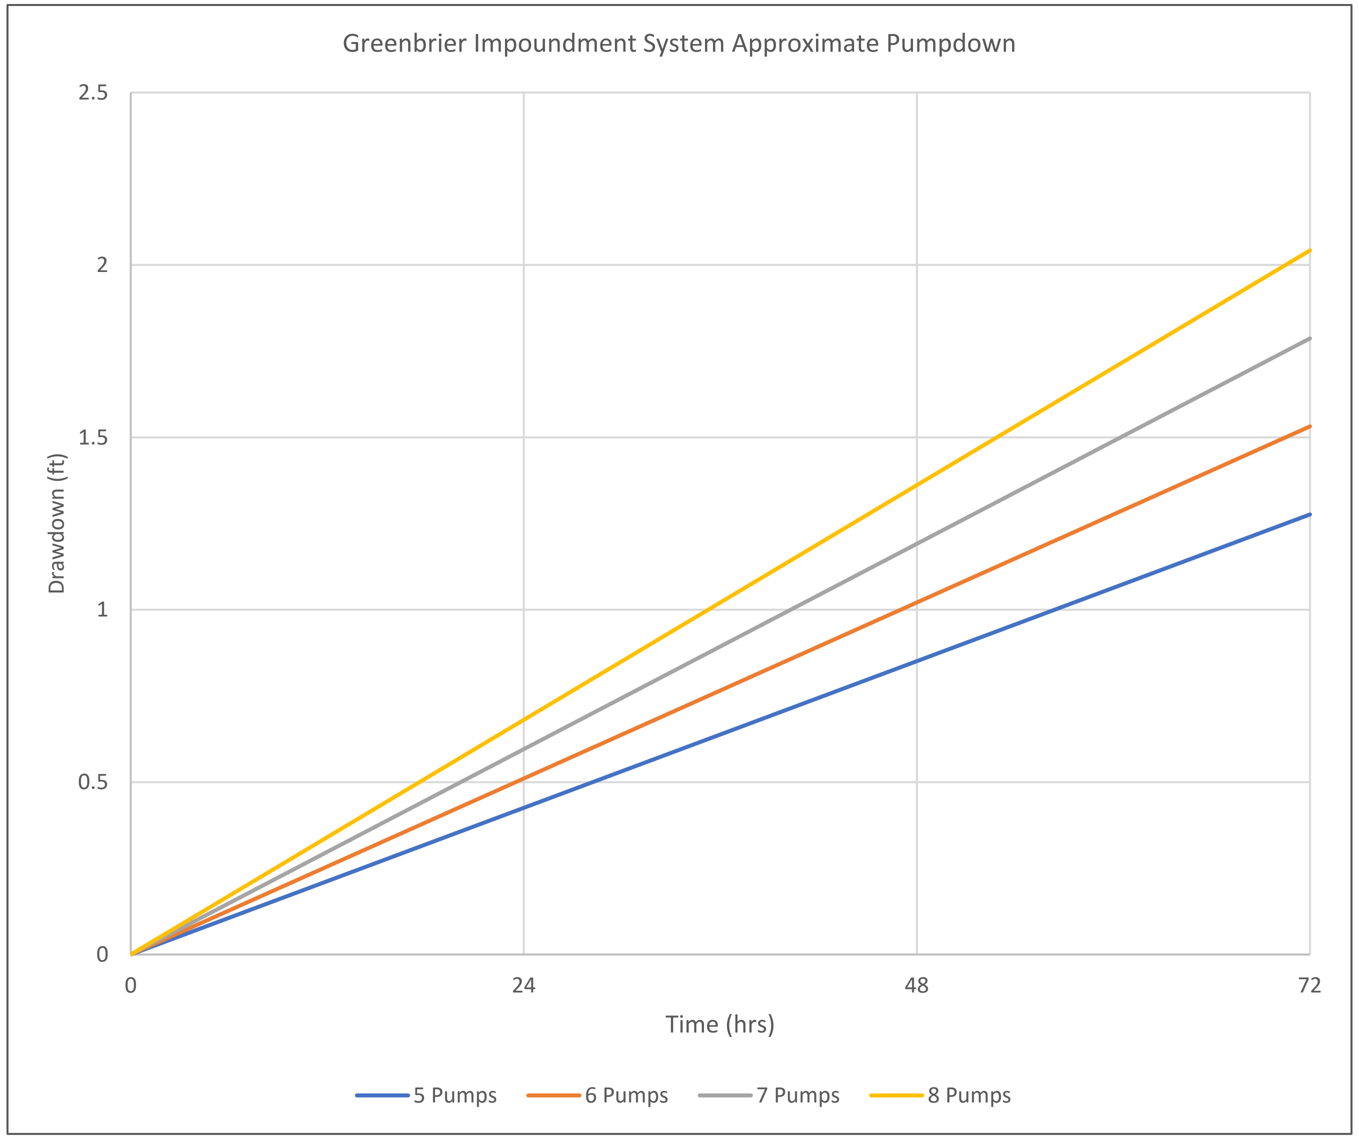
Max Fuel consumption @ 1800 rpm: 5.0 US Gal/hr

Weight (Dry): 4,440 lbs

Weight (Wet): 5,160 lbs

Dim.: (L) 155" x (W) 76" x (H) 93"

Performance data provided in tables is based on water tests at sea level and 20ºC ambient. All information is approximate and for general guidance only. Please contact the factory or office for further details.



Notes

These pumps would require a manifold force main system, the details of which would significantly affect the pump performance curves. These are approximate calculations, only for feasibility consideration purposes.

18	Remove/Reinstall Existing Wooden Bulkhead	LS	1	$ 12,000.00	$ 12,000
19	Relocating or Modifying Existing Miscellaneous Items	LS	1	$ 8,000.00	$ 8,000
20	Offset/Relocate Existing Utilities	LS	1	$ 50,000.00	$ 50,000
21	Existing Pavement Demolition	SY	260	$ 14.00	$ 3,640
22	Aggregate Base Material (8" VDOT 21A or 21B)	SY	260	$ 19.00	$ 4,940
23	Asphalt Concrete - 2" SM-2A Surface Course	SY	260	$ 15.00	$ 3,900
24	Asphalt Concrete - 2" IM-1A Intermediate Course	SY	260	$ 15.00	$ 3,900
25	Asphalt Concrete - 8" BM-2 Base Course	SY	260	$ 60.00	$ 15,600
				Total of All Prices (Base Bid):	**$ 1,016,789**

	Engineering and Design Services	LS	1	$ 122,014.69	$ 122,015
	Survey/Utility Location	LS	1	$ 40,000.00	$ 40,000
				Project Subtotal	**$ 1,178,804**
				20% Contingency	$ 235,761
				PROJECT TOTAL	**$ 1,414,565**

Table A-3. Cost Opinion, I-64 Additional Culvert

Pricing in 2020 Dollars

Number	Item	Unit	Quantity	Unit Price	Extended Price
1	Mobilization/Demobilization	LS	1	$ 119,314.80	$ 119,315
2	Maintaining Traffic	LS	1	$ 100,000.00	$ 100,000
3	Clearing and Grubbing	AC	1.5	$ 40,000.00	$ 60,000
4	Erosion and Sediment Control to Include Maintenance	LS	1	$ 105,000.00	$ 105,000
5	Undercut Excavation for EW-2 Endwalls and Dispose Offsite	CY	32	$ 60.00	$ 1,920
6	Backfill of Undercut Excavation for EW-2 Endwalls.	CY	32	$ 130.00	$ 4,160
6	Regular Excavation	CY	3,500	$ 50.00	$ 175,000
7	Regular Fill	CY	975	$ 20.00	$ 19,500
8	Microtunnel 60" Outfall Pipe	LF	348	$ 4,000.00	$ 1,392,000
9	VDOT EW-2 Endwall for 60" RCP	EA	2	$ 10,000.00	$ 20,000
10	VDOT Riprap EC-1, Class I, 24" Thick w/ Geotextile Fabric	TONS	110	$ 100.00	$ 11,000
11	Upstream Impoundment Bank Treatments	LS	1	$ 100,000.00	$ 100,000
				Total of All Prices (Base Bid):	**$ 2,107,895**

	Engineering and Design Services	LS	1	$ 150,000.00	$ 150,000
	Geotechnical Engineering	LS	1	$ 50,000.00	$ 50,000
	Survey/Utility Location	LS	1	$ 40,000.00	$ 40,000
				Project Subtotal	**$ 2,347,895**
				20% Contingency	$ 469,579
				PROJECT TOTAL	**$ 2,817,474**

Note: If 60" culvert could be jack-and-bored, project cost could drop by as much as $1,000,000. If multiple culverts are installed, price could increase.

📍 The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 4/5/2022 at 5:57 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Department of Public Works	Chesapeake VIRGINIA	
Directive: Departmental Regulation	Number: 755	
Subject: **Drainage Infrastructure Management**	Supersedes: 10/15/14	Next Review: 10/30/20
Approved: Director of Public Works	Effective Date: 10/30/18 Initiator: Ali Asgharpour	

I. Purpose

The purpose of this Departmental Regulation is to establish policy and procedures to manage the City's street drainage infrastructure.

II. Policy

A. Public Works shall maintain the open and closed drainage systems within the City's rights of way and easements to provide for the original design capacity to the extent possible.

B. Open systems are defined as roadside ditches, lead or perimeter ditches within rights of way or existing easements. Closed systems include inlet structures, manholes, catch basins, pipes, and culverts.

C. Public lakes and ponds that serve as holding facilities to temporarily store and gradually release stormwater shall be maintained to provide for positive flow. The maintenance activities shall be limited to the outfall structures. All other maintenance work such as mowing and bank restoration shall be the property owner's responsibility. Public Works is not responsible for dredging of recreational or navigational purposes.

D. The placement of new driveway culverts or the extension of existing driveway culverts is the responsibility of the property owner. The property owner must obtain a permit from the Department of Development and Permits, prior to installing new culverts or extending existing culverts.

E. All non-emergency repairs shall be coordinated within Planning/Scheduling team to ensure resources are adequately estimated in advance.

Related Regulations: City of Chesapeake City Code Chapter 26, Article VIII.

III. Procedures

Cave Ins or Structural Repairs

The Planner Scheduler Group handles securing safety issues for cave ins or structures and investigating the location to determine whether the repairs will be performed by city crews or an outside contractor.

Securing and/or filling cave ins or structures, when necessary, shall be performed by a cave in crew assigned to the Planner Scheduler Group within twenty-four (24) hours of receiving the report. Securing may consist of placing cones, barrels, safety signs, safety fencing or filling the location with dirt and/or crush & run.

The Planner Scheduler Group cave in crew will fill out a Maximo Log Entry Form for each cave in and/or structure noting the pipe or structure material, pipe diameter, invert depth, number of cave ins, type of structure, number of pictures taken (there should at least be two showing the structure & street view), location of the cave in, and whether asphalt, concrete, curb & gutter or driveway apron repairs will be needed. The estimated amount of and material for asphalt, concrete, curb & gutter, and driveway apron repairs will also be provided.

If the cave in, damaged section of pipe or structure is not easily visible or if further investigation is needed, the Planner Scheduler Group will coordinate with the Stormwater Superintendent or the General Supervisor (in charge of the job) to have either a pole camera or CCTV truck used.

If flushing is needed to assist with determining the amount of damage or the location is flooded due to the damaged pipe and/or cave in, the Planner Scheduler Group will coordinate with the Stormwater Superintendent or the General Supervisor (in charge of the job) to have the pipes flushed or cleared of water.

The Planner Scheduler Group Cave In Coordinator shall estimate the schedule for cave in repairs by coordinating with the Stormwater Superintendent or the General Supervisor (in charge of the job). The Planner Scheduler Group shall evaluate the severity of the cave in and determine whether the repair shall be performed by city crews or given to a contractor.

Any structure that needs to be immediately repaired (broken basin tops, broken brickwork, etc.) because it is a danger to the public and/or vehicles shall be scheduled by the Planner Scheduler Group. If a specially sized structure cover is needed, the Planner Scheduler Group will coordinate the ordering and purchase of the item with the Public Works Storeroom.

Cave Ins – To Be Repaired by City Crews

If the damaged pipe section is less than six (6) feet deep (measured from the ground surface to the invert), and pipe access does not pose an undue risk for city crews, a Stormwater crew shall excavate around the damaged pipe section and assess whether the section needs to be replaced or repaired.

If the cave in is caused by a separation of less than four (4) inches between pipe joints, a brick collar will be placed around the pipe, filter fabric shall be placed around the separated joint and the area will be backfilled. Separations greater than four (4) inches shall require that the separated pipe joints be re-laid or replaced.

If the pipe is large enough to crawl into, Stormwater may choose to perform the repair by placing mortar on the damaged section from inside the pipe. Confined space entry procedures MUST be followed for this type of repair. The Public Work Safety Office shall be consulted BEFORE the work begins.

If the pipe or culvert repair requires pavement to be removed, Stormwater shall backfill and compact the repair area with select fill and/or crusher run in compacted six (6) inch lifts so that the final grade is between one (1) and one and half (1 ½) below the adjacent pavement edges. The Stormwater Superintendent or the General Supervisor (in charge of the job) shall coordinate with the Planner Scheduler Group to ensure that Streets & Highways has been scheduled to perform the replacement of asphalt, curb & gutter, etc.

It shall be the responsibility of the Stormwater Superintendent or the General Supervisor (in charge of the job) to provide the size of the repair in length, width and depth and the Maximo work order number used for the job. This will assist the Planner Scheduler Group with the creation of a child work order for Streets & Highways.

If the pipe or culvert repair is made in an unpaved area, Stormwater shall restore the area by compacting the sub-grade fill in six (6) inch lifts and placing at least two (2) inches of topsoil. The topsoil shall be seeded and stabilized with straw, jute mesh, or other landscaping measures to reduce the likelihood of erosion, while the grass seed germinates and becomes established.

It will NOT be the responsibility of city crews to replace illegally placed fencing, sprinkler systems, or other landscape features located in the city drainage easement or right-of-way. The Stormwater Superintendent or the General Supervisor (in charge of the job) shall leave a door hanger advising the citizen that the item (fence, bush, etc.) will be removed and not replaced. If there are multiple items or further notification to residents is needed, the Planner Scheduler Group will send letters to those residents affected by the repair.

Updating Inventory & GIS – Stormwater Structures

Discrepancies in inventory information noted during repair work shall be provided to the Operations GIS analyst for updating the system.

As part of a continual updating of the Stormwater structures and information in Arc GIS, the structures throughout the city (catch basins, manholes, drop inlets, junction boxes, pipes, etc.) shall be inspected (by either pole camera or CCTV truck) every six (6) to eight (8) years.

During the investigation, the crew shall annotate the pipe size, depth, structural material, any conflicts, flow direction, etc. A still picture and/or video shall be taken to capture the condition of the structure and pipe.

Any cave ins or defects in the structure shall be noted and the information provided to the Planner Scheduler Group for review and/or to have a work order created.

Cave Ins – To Be Repaired By A Contractor

If the cave in and/or structure repair work will be given to an outside contractor, the Planner Scheduler Group will update the Maximo work order, assign it to Contractual Services and add the information to the contractor's spreadsheet located in Sharepoint.

The following conditions must be met in order to assign the work to a contractor:

1. Excavation required is greater than six (6) feet deep and/or exceeds the pipe diameter of forty-eight (48) inches.
2. Extensive or complicated confined space entry will be needed.
3. Major reconstruction of structure walls or basin is needed.
4. A long stretch of pipe, more than one hundred (100) feet, with a diameter greater than twelve (12) inches, will need to be slip-lined.
5. There are multiple cave ins along a stretch of pipe.
6. Cave in(s) are located under a high volume roadway (i.e. Battlefield Blvd, Greenbrier Parkway, etc.).

7. The existing workload is such that service level agreements cannot be met by city forces.

Plans or Requests for New Pipes or Structures

Any plans and/or requests for new pipes and/or structures requested through the Drainage Engineer's Office or other city department shall be reviewed by the Planner Scheduler Group.

The Planner Scheduler Group shall determine whether the work will be performed by city crews or given to a contractor to handle.

Pipe washing Requests

When a report of a clogged structure (catch basin, drop inlet, driveway pipe, etc.) is received, the Planner Scheduler Group will schedule a pipe washer to respond.

If there is a flooding situation due to a heavy rain event, and a structure is suspected of being blocked, a pipe washer will be dispatched immediately.

Pipe washers may be scheduled at the request of the CCTVing crew to flush a pipe thereby allowing them to TV the pipe and/or structure, or at the cave in crew to flush a basin or pipe to assist with cave in repairs. These instances will be scheduled through the Planner Scheduler Group.

Ditches

Ditch requests are broken into two categories for investigation. Roadside ditch requests are divided amongst the General Supervisors for investigation and recommendation of work (cleaning, regrading, etc.). Side, lead and rear ditch requests are investigated by the Planner Scheduler Group. The Planner Scheduler Group will provide pertinent information – if the ditch private or public, or if there are any easements, access issues, or other special instructions (wetlands, if permits are needed, railroad approval, etc.).

Once the investigation is completed, the work order is assigned to a General Supervisor. The Planner Scheduler Group Ditch Coordinator will work closely with the Stormwater Superintendent and the General Supervisor (in charge of the job) and schedule the work.

There are various types of ditch work that can take place – cleaning & clearing (blockage removal), regrading (small area or large area), and erosion repairs. The location – concrete or earthen ditch, wetlands area, stretch of road needing traffic control – will have an impact on what type of work may be performed and when it should be scheduled (eg. - some ditch cleaning has to be scheduled when school is out).

The Planner Scheduler Group will review any plans or requests that are submitted by the Drainage Engineer's Office or any other city department to determine if the work will be performed by city crews or given to a contractor to handle.

City crews are not responsible for removing leaf and lawn debris that is placed or has fallen into the ditches, unless there is a blockage causing flooding or the ditch is over three (3) feet deep. Citizens shall be responsible for removing leaves and other debris (lawn clippings, etc.) that may be blocking ditches that are three (3) feet and under.

Lead ditch cleaning will be performed in compliance with the MS-4 permit. The Planner Scheduler Group Ditch Coordinator will maintain a list of the lead ditches that have been cleaned, the date, and the date of the next cleaning. A map showing the ditch to be cleaned, along with any pertinent information (easements, wetlands, etc.) shall be attached to the Maximo work order.

Roadside ditches on a preventive maintenance schedule will be cleaned in compliance with the MS-4 permit, depending on the backlog of work orders.

Citizen Requests – Driveway Pipes & Piping In Ditches

A property owner wishing to install a new driveway pipe or extend an existing driveway pipe within the city right-of-way or drainage easement abutting their property, shall be responsible for obtaining a permit from the Department of Development & Permits (382-6304) and for purchasing and installing the pipe in accordance with the permit.

Any public or private utility work required for, or resulting from the pipe or culvert work shall be paid for by the property owner. Replacement pipes must be the same material, sized equal to, or greater than, the existing culvert.

A property owner wishing to pipe a ditch that carries public water shall obtain a permit from the Department of Development & Permits. The design for the piping and structures shall conform to the City's Public Facilities Manual and be approved by the Public Works Engineering Division. The property owner shall be responsible for purchasing and installing the piping and structures, in accordance with the approved design. Any public or private utility work required for, or resulting from, the pipe or culvert work shall be paid for by the property owner.

Department of Public Works

Chesapeake
VIRGINIA

Directive: Departmental Regulation	Number: 756	
Subject: **Stormwater Operation Plan**	Supersedes: 10/15/14	Next Review: 10/30/20
Approved: Director of Public Works	Effective Date: 10/30/18 Initiator: Ali Asgharpour	

I. Purpose

The purpose of this Departmental Regulation is to establish a policy for the maintenance of Stormwater and flood control facilities.

II. Policy

All Stormwater infrastructures in the City of Chesapeake shall be maintained following the standards in Chapter 5 of the City's most recent Public Facilities Manual.

Related Regulations: City of Chesapeake, City Code, Chapter 26

SECTION B-12: OPERATION AND MAINTENANCE

This section presents general operation, maintenance and inspection guidelines for principal spillways and components. However, these guidelines are not intended to be all-inclusive. Specific structures may require special measures not discussed here. The engineer is responsible for determining what, if any, additional items are necessary.

1. Spillway structures should be cleared of debris periodically and after any significant rainfall event where inspection reveals a significant blockage.

2. During low water conditions, concrete spillway structures should be inspected to decide if water is passing through any joints or other structure contacts and to identify any cracks, spalling, broken or loose sections. Any cracked, spalled, broken or loose sections should be cleaned and refilled with an appropriate concrete patching material. A professional engineer should be consulted to repair extensive leakage, spalls or fractures.

3. Outlet protection (stilling basins) and discharge channels should be cleared of brush at least once per year.

4. Trash racks and locking mechanisms should be inspected and tested periodically to make sure they are intact and operative.

5. All sluice gates (or other types of gates or valves used to drain an impoundment) should be operated periodically to insure proper function. The gate and stem should be periodically lubricated and all exposed metal should be painted to protect it from corrosion.

6. Any repairs made to the principal spillway (riser or barrel) should be reviewed by a professional engineer. Vertical trenching to expose the barrel should not be allowed under any circumstances. The trench side slopes should be stepped back at a 2:1 slope, minimum.

5. ROADWAY DRAINAGE

Asset Type: **ROADWAY DRAINAGE**

Policy: *The Department shall maintain drainage facilities to; 1) Provide safety and protection to the traveling motorist; and 2) Provide reasonably adequate drainage of the roadway surfaces, shoulders, and other drainage items; and 3) Preserve the structural integrity of the roadway.*

5.1 Cleaning and Flushing of Pipes and Culverts (Machine or Hand Cleaning)

5.1.1 Activity Description: The inspection and machine or hand cleaning of all drainage structures. May include water jetting of drainage structures, using a water pump to flush out debris.

5.1.2 Purpose of Activity: To identify and promptly remove sediment deposits or obstructions in order to keep culverts and other drainage structures clean and unimpeded. Critical areas should be patrolled during periods of severe storms and any evidence of drainage problems should be corrected immediately.

5.1.3 General Guidelines:

A. Patrol, identify, and evaluate evidence of blockage of drainage structures during routine maintenance activities, especially after rain events.

B. Patrol critical areas during or after periods of severe rain events, particularly those where backed up water would cause property damage.

C. Any evidence of drainage problems should be corrected as soon as feasible.

5.1.4 Procedure to Conduct Maintenance Activity:

A. Identify and adhere to applicable environmental requirements and regulations.

B. Verify the limits of state right of way (R.O.W.) and drainage easements.

C. Determine the need for and type of Erosion and Sedimentation (E & S) controls prior to starting work.

D. Check that all required permits, tools, and materials have been loaded prior to leaving area headquarters.

E. Place traffic control devices in accordance with current Virginia Work Area Protection Manual.

F. Install E & S Controls where necessary.

G. Clean drainage structure using machine cleaning, hand cleaning, or pressure washer as appropriate.

H. After pipe is clean, inspect for rust, deterioration, bituminous coating, and structural integrity, and report any deficiencies to Area HQ Manager.

I. Remove and dispose of any accumulated debris in accordance with current Department guidelines.

   1. Do not place debris on private property.

   2. Avoid placing debris upslope from drainage structures.

   3. Any abnormal oil sheen odors or water colors shall be investigated and reported as necessary. Refer to best management practices for Illicit Discharge Detection and Elimination (IDEE).

J. Recover traffic control devices.

K. Remove E & S Controls when appropriate.

<u>Type of Staffing</u>	<u>Suggested Equipment</u>	<u>Materials</u>
• 1 Lead Crewperson • 2 Operators • 1-2 Laborers	• 1 Dump Truck • 1 Gradall/Backhoe • 1 Water Tank and Pump	• Appropriate Personal Protective Equipment(PPE) • Water • Hand tools
<u>Include as required</u>: • 2 Flaggers	<u>Include as required</u>: • 1 MicroTrax Machine • Truck Mounted Attenuator (TMA)	<u>Include as required</u>: • E & S Controls

Note: Staffing, equipment, and materials are based on general guidelines. Terrain, vegetation and other factors may create a need for modification to the information above. Appropriate VDOT staff is expected to make logical informed decisions on the needs of the maintenance activity being performed.

5.2 Sweeping of Curbs and Gutters

5.2.1 <u>Activity Description</u>: The inspection and removal of sediment deposits or obstructions from curbs, gutters, and shoulders. May also include intersections or other surfaces.

5.2.2 <u>Purpose of Activity</u>: To clean curb and gutter, paved ditches, drop inlets, and drainage elements constructed along shoulders, sidewalks or trails in order to remove collected debris which impedes the flow of water.

10. STRUCTURES

Asset Type: **STRUCTURES**

Policy: The Department shall maintain all structures to the level of service they were initially constructed to or better by subsequent improvements. This objective will be achieved by performing regular preventive maintenance activities, providing regularly scheduled inspections to determine structural deficiencies, and performing restorative maintenance and repair activities as needed.

10.1 Preventative Maintenance

10.1.1 Activity Description: Preventive maintenance (PM) includes any planned cyclical activity performed in advance of a critical need for repair, to reduce or arrest the rate of future deterioration. Preventive maintenance activities consist of the following characteristics: planned and cyclical; proactive (not reactive); and activities that are condition based as determined in safety inspections.

10.1.2 Purpose of Activity: The purpose of preventive maintenance is to extend the useful life of VDOT's assets and to preserve their related public investment. The activities may correct minor defects as a secondary benefit, but are not typically initiated based upon an observed deterioration.

10.1.3 General Guidelines for Preventative Maintenance:

A. Responsibility for Correction of Structure Defects

1. Structure defects and their correction can be classified as major or minor.

   a. Minor repairs may be made by field maintenance forces through routine ordinary maintenance or preventative maintenance activities, which typically do not require plan development and thus does not need a review by the S&B Engineer. Minor repairs should be made upon discovery of defects, subject to compliance with all appropriate environmental regulations, and the work may be performed by the State Forces or Contractors.

   b. Major repairs require the review by the State Structure and Bridge Engineer and usually require the development of engineering plans, and specialized equipment, or a specific allocation.

B. Guidelines for Minor Repair

1. Keeping bridges cleared of debris is an important routine maintenance item in preventing or curtailing structural repairs.

    - a. Abrasives and chemicals used in snow removal should be flushed from the bridge after each storm, if possible.
    - b. The bridge should receive a thorough cleaning at the end of the winter season.
    - c. Bridge seats, bearing assemblies, all joints and the lower chord of trusses shall be kept clean.
    - d. All scuppers and down drains should receive frequent attention to ensure proper functioning at all times.
    - e. Environmental considerations shall be addressed before bridge washings.
  - 2. Brush should be kept cut under all bridges over land to reduce the fire hazard, and all debris accumulated against piers and abutments shall be removed as soon as possible.
  - 3. Debris and vegetation build-up should be removed from culverts and channels to ensure the proper hydraulic opening is maintained.

- C. Guidelines for Defects Requiring Major Repairs
  - 1. Examples of defects requiring major repairs
    - a. Large spalls/potholes in concrete deck,
    - b. Complete replacement of timber decks,
    - c. Extensive washouts of approaches,
    - d. Damaged beams, girders or truss members,
    - e. Corroded steel members, and
    - f. Settlement of piers and abutments.
  - 2. In emergencies, the District S&B Engineer should be contacted immediately to determine the procedure to follow to restore the structure to a practical and safe level of service as soon as possible.

D. Recommended Frequency for Various Maintenance Tasks

Maintenance Tasks for all Systems by recommended yearly frequency

TASK	**Recommended Frequency***
Bridge Deck Washing	Every year
Deck Sweeping	Every year
Seat and Beam Ends Washing	Every 2 years
Cutting and Removing Vegetation	Every 2 years
Routine Maintenance of Timber Structures	Every 2 years
Lubricate Bearing Devices	Every 4 years
Removing Debris from Culverts	Every 5 years
Scheduled Replacement of Pourable Joints	Every 6 years
Scheduled Replacement of Compression Seal Joints	Every 10 years
Beam Ends Painting	Every 10 years (At years 10 and 20. Replace paint system at year 30)
Scheduled Installation of Thin Epoxy Concrete Overlay	Every 15 years

*Or as necessary and determined from recommendations in the specific structure's safety inspection report

10.1.4 <u>Procedure to Conduct Preventative Maintenance Activities</u>:

A. Bridge Deck Washing

1. Include the removal and disposal of debris and pressure washing of the bridge roadway surface, joints, sidewalks, curbs, parapet walls, drainage grates, scuppers, and drain pipes.

2. All concrete decks and slabs without asphalt overlay.

3. Environmental Operating Procedures shall apply to State Forces and contractors during bridge washing procedures.

        a. Primary Requirements

            i. Wash-water must not be allowed to discharge directly to the underlying waterbody. Discharges of this sort require an environmental permit from the Virginia Department of Environmental Quality (VDEQ).

            ii. Sediments and debris accumulated during the bridge washing procedures must not be disposed of in the underlying water body or on adjacent wetlands, if they exist.

        b. Environmental Protection Procedures

            i. Utilize water from the underlying water body as wash water, whenever possible, unless there are drought conditions or your withdrawal would “dry” the water body.

            ii. Accumulated sediments or other debris must not be disposed within the underlying water body or adjacent wetlands. Sediments that have been swept or shoveled off the bridge deck may be placed along the right-of-way in a vegetated area along the bridge approach.

            iii. Wash-water shall be prevented from directly discharging to the underlying water body. All deck drains, scuppers, inlets and flumes on the structure shall be blocked during washing operations. For open-sided bridges such as corral-style (Kansas-style) bridges, berms must be placed along the sides to prevent wash-water from flowing over the sides and into the underlying water body. Wash-water may be directed to a vegetated area within the right-of-way, along the bridge approach; however, it must not be discharged to wetlands.

            iv. Painted surfaces must not be power-washed; however they may be “rinsed” at water pressures that will not cause paint chips to flake off.

B. Deck Sweeping

    1. Include the removal and disposal of debris and sweeping of the bridge roadway surface, joints, sidewalks, and curbs.

    2. All concrete decks and slabs with asphalt, metal decks, and timber decks and slabs.

C. Seat and Beam Ends Washing

   1. Include the removal and disposal of debris and pressure washing of the bridge seat and bearing areas. Bridge seat and bearing areas to be cleaned include abutment seats, pier seats, bearing devices, the end five feet of beams and girders, and end diaphragms.

D. Cutting and Removing Vegetation

   1. Include cutting, removing and disposing of vegetation, brush and trees that are on, adjacent to, or under bridges that cross over waterways.

E. Routine Maintenance of Timber Structures

   1. Include tightening and/or replacing fasteners such as those used on timber decks, railing systems, and other miscellaneous connections. Sealing end sections of timber elements, such as deck boards, bent caps, railings, posts, etc.

F. Lubricate Bearing Devices

   1. Include removal and disposal of debris, and lubricating moveable type of bearings.

G. Removing Debris From Culverts

   1. Include the removal and disposal of debris that is collected inside and/or at inlets or outlets of box and pipe culverts.

H. Scheduled Replacement of Pourable Joints

   1. Include removal of existing joint material, prepare and install new joint material.

   2. For planning and budgeting purposes for this type of joints in the PM program, only joints that are in good condition will be considered. Joints that are not in good condition will be accounted for and addressed in Pontis (BMS).

I. Scheduled Replacement of Compression Seal Joints

   1. Include removal of existing joint material, prepare and install new joint material.

2. For planning and budgeting purposes for this type of joints in the PM program, only joints that are in good condition will be considered. Joints that are not in good condition will be accounted for and addressed in Pontis (BMS).

J. Beam Ends Painting

1. Include preparing and over coating the end 5 feet of painted steel beams or girders that are located under open joints, except for bridges with timber decks.

2. For planning and budgeting purposes in this program, only steel members that are in overall good condition will be considered. Steel members that are not in good condition will be accounted for and addressed in Pontis (BMS).

K. Scheduled Installation of Thin Epoxy Concrete Overlay

1. Include the installation of new overlay system and or replacement of existing overlay systems.

2. Only bridge decks that are in overall good condition are considered in this program.

10.1.5 Maintenance Responsibility for Structures within Towns, Cities, and Counties: Where the Interstate, Arterial, or Toll Road system provides an interchange within a municipality charged with the responsibility for maintenance of its street systems, the Department will be responsible for the maintenance of the complete highway facility within the interchange. Under this provision, maintenance payment will not be paid to any municipality for street or road mileage maintained by VDOT. Municipalities desiring to maintain municipal streets passing through Interstate, Arterial, or toll interchanges may maintain such streets in accordance with following Bridge Maintenance Reasonability Table.

The maintenance of interchanges and grade separation bridges at all intersections of Interstate and Primary routes, including Arlington and Henrico counties, will be the responsibility of VDOT.

PRELIMINARY RESILIENCE PLAN

CITY OF CHESAPEAKE, VIRGINIA

April 2022

PREPARED FOR:

THE CITY OF CHESAPEAKE

List of Tables & Figures

Executive Summary

The City of Chesapeake has developed this Preliminary Resilience Plan (Plan) to meet the requirements of the Department of Conservation and Recreation (DCR) Community Flood Preparedness Fund (CFPF) grant program. The Plan was developed using funding awarded during the inaugural round of the CFPF program. The Plan was crafted to incorporate all Resilience Plan requirements and criteria as provided in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund.

In addition to the overarching five (5) requirements for the Plan as provided below, the Plan incorporates all elements of Resilience Plans (as provided in Appendix B of the Grant Manual), hereafter referred to as criteria. A guide those criteria and associated reference documents can be found in Appendix A, while Plan content that addresses corresponding criteria is referenced throughout the Plan as (C#) at the end of applicable statements.

- It is project-based with projects focused on flood control and resilience
- It incorporates nature-based infrastructure to the maximum extent possible
- It includes considerations of all parts of a local government regardless of socioeconomics or race
- It includes coordination with other local and interjurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation
- Is based on the best available science, and incorporates climate change, SLR, storm surge (where appropriate), and current flood maps

This Plan was developed by combining a wide range of existing City of Chesapeake and regional documents and was done in collaboration with multiple City departments, though sponsored by the Department of Public Works. The Plan provides narrative on the requirements defined in the CFPF Grant Manual and has been organized into four (4) main sections:

Section 1: Introduction, provides a description of the plan development process and a brief history of Chesapeake with respect to flooding.

Section 2: Natural Hazards & Vulnerabilities, describes those hazards that threaten the City as well as where socially vulnerable populations intersect with those hazards.

Section 3: Current Efforts to Reduce Flooding & Develop Resilience, details the various efforts already undertaken or underway by the City and regional partners that relate to flooding and resilience.

Section 4: A Plan for Resilience, provides information on ongoing coordination efforts, the current science guiding resilience efforts, and those study, program, and project opportunities that the City of Chesapeake plans to explore looking forward. At this time, the City has identified twenty-six (26) projects representing planned improvements to improve flooding resilience. These projects vary in scope, cost, funding availability, and anticipated implementation.

Ultimately, the City of Chesapeake seeks continued participation in the CFPF program through identification and application for funding assistance for opportunities as they are identified and vetted.

1.0 Introduction

As a coastal community, the City of Chesapeake has the benefit of enjoying the habitat associated with shore access. Unfortunately, life in coastal regions also comes at a cost. Flooding vulnerabilities not only threaten the safety of residents, but also have the potential to damage or destroy property and disrupt the local economy and overall quality of life. While impending natural hazards are impossible to prevent, designing for resilience can minimize the damage done and prepare the City to bounce back better.

1.1 Plan Development Process

The City of Chesapeake intends to participate in the CFPF grant program. This funding program was established to provide support for Virginia's localities efforts in reducing impacts of flooding, including flooding driven by climate change. The CFPF program intends to prioritize projects coinciding with local, state, and federal floodplain management standards, local resilience plans, and the Virginia Coastal Resilience Master Plan. This Fund will empower communities to complete studies and implement programs to bolster flood preparedness and resilience.

According to the CFPF program, a Resilience Plan describes the entire local government's approach to flooding and addresses the following five (5) requirements:

- It is project-based with projects focused on flood control and resilience
- It incorporates nature-based infrastructure to the maximum extent possible
- It includes considerations of all parts of a local government regardless of socioeconomics or race
- It includes coordination with other local and interjurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation
- Is based on the best available science, and incorporates climate change, SLR, storm surge (where appropriate), and current flood maps

Intended to elaborate on the City's intentions to establish a resilient community, this plan identifies the vulnerabilities (physical, natural, and social) due to flooding, reviews the previous and ongoing efforts, and provides information related to future opportunities to combat flooding and develop resilience. The aim of the proposed projects included in the plan is to strengthen flood management systems to reduce damage caused by flooding. These projects identify opportunities to address weaknesses or provide additional hazard reduction in the City of Chesapeake.

To assist in the development of this plan, a document review process was undertaken to identify documents or portions thereof that could be combined to meet the requirements of a resilience plan as presented in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund. The list of documents reviewed can be found in Appendix B.

In addition to addressing the overarching five (5) requirements for the plan as listed above, the plan incorporates all fifteen (15) elements of Resilience Plans (as provided in Appendix □ of the Grant Manual), hereafter referred to as criteria. A guide those criteria and associated reference documents can be found in Appendix A, while plan content that addresses corresponding criteria is referenced throughout the plan as (c□) at the end of applicable statements.

Development of the Plan was sponsored by the Department of Publics Works. However, other City departments (including Planning, Development and Permits, and Emergency Management) were invited to participate and had the opportunity to provide input and review and comment on the Plan. Supporting documents were sourced from departments throughout the City as well as from regional partners including the Hampton Roads Planning District Commission.

1.2 Chesapeake's History

The banks of the Elizabeth River were first settled by the British around 1620 beginning Chesapeake's history (c14). In the early 1900's, the northern sector of the Chesapeake region began to develop as a Southern Norfolk suburb outside the growing City of Norfolk. By 1900, South Suffolk had independent waterworks, public schools, and post office. Today's Chesapeake grew from residential and commercial development of community crossroads, some still referred to with established names such as Deep Creek, Fentress, Great Bridge, Hickory, Indian River, Oak Grove, Pleasant Grove, South Norfolk, Portlock, and Western Branch. In June of 1962, the citizens voted to select the name of the new city, Chesapeake, as both Norfolk County and Southern Norfolk agreed to merge. The present City of Chesapeake was established in 1963 through the consolidation of the City of South Norfolk and Norfolk County[1].

The City of Chesapeake is a diverse and growing community with a heritage deeply rooted in the history of our developing nation. Chesapeake's landmarks and communities have a long and diverse history, stretching back to the early days of the Colony of Virginia. Over the last fifty (50) years, the City of Chesapeake has experienced unprecedented changes in population and land use, the majority of new housing units being single-family units. In 2017 the 224,640-acre community had a population of around 222,000 individuals, or approximately 1 person per acre of land area (c14). Although the growth rate has declined in recent years, the City continues to grow at a rate of approximately 1% each year. An increase in flooding and natural hazards has accompanied growth experienced by the City[2]. Chesapeake is located partially in the Elizabeth River Watershed, a tributary of the James River Watershed, which can be seen in Figure 1, along with the Southern Watershed. Approximately 58,880 acres of the City (or 26%) drains to the Chesapeake Bay, primarily through the Elizabeth River. Approximately 167,040 acres (or 74%) of the City lies within the Southern Watershed area.

For decades, the City has been committed to stormwater management. Chesapeake was one of the first in Hampton Roads to become a Municipal Separate Storm Sewer System (MS4) in 1996 through the Virginia Pollutant Discharge Elimination System (VPDES) Program as well as abiding by their Virginia Stormwater Management Program (VSMP) in place since 1991 (c11). The City's Master Drainage Plans for specified regions and MS4 documents address the quality and quantity of our stormwater runoff while meeting state and federal regulations[3].

Upon observing tide elevation data for the last 100-years, it is evident the City is facing escalating danger from SLR[4]. The Code of Virginia mandates localities to plan for and address flooding and SLR. Flooding, SLR, coastal storms, and shoreline erosion are considered the most significant hazards that threaten Hampton Roads Region[5] (c3). Floodplain management plans which cover floodplains and City studies that cover broad areas of the City combine

together to create a unified pattern of identified hazards beyond those just identified in the National Flood Insurance Program (NFIP). These examine issues such as causations of localized flooding, identify vulnerabilities due to flooding, analyze the locality flood management practices, and provide feasible solutions to strengthen the flood management system, reducing damages caused by flooding[6].

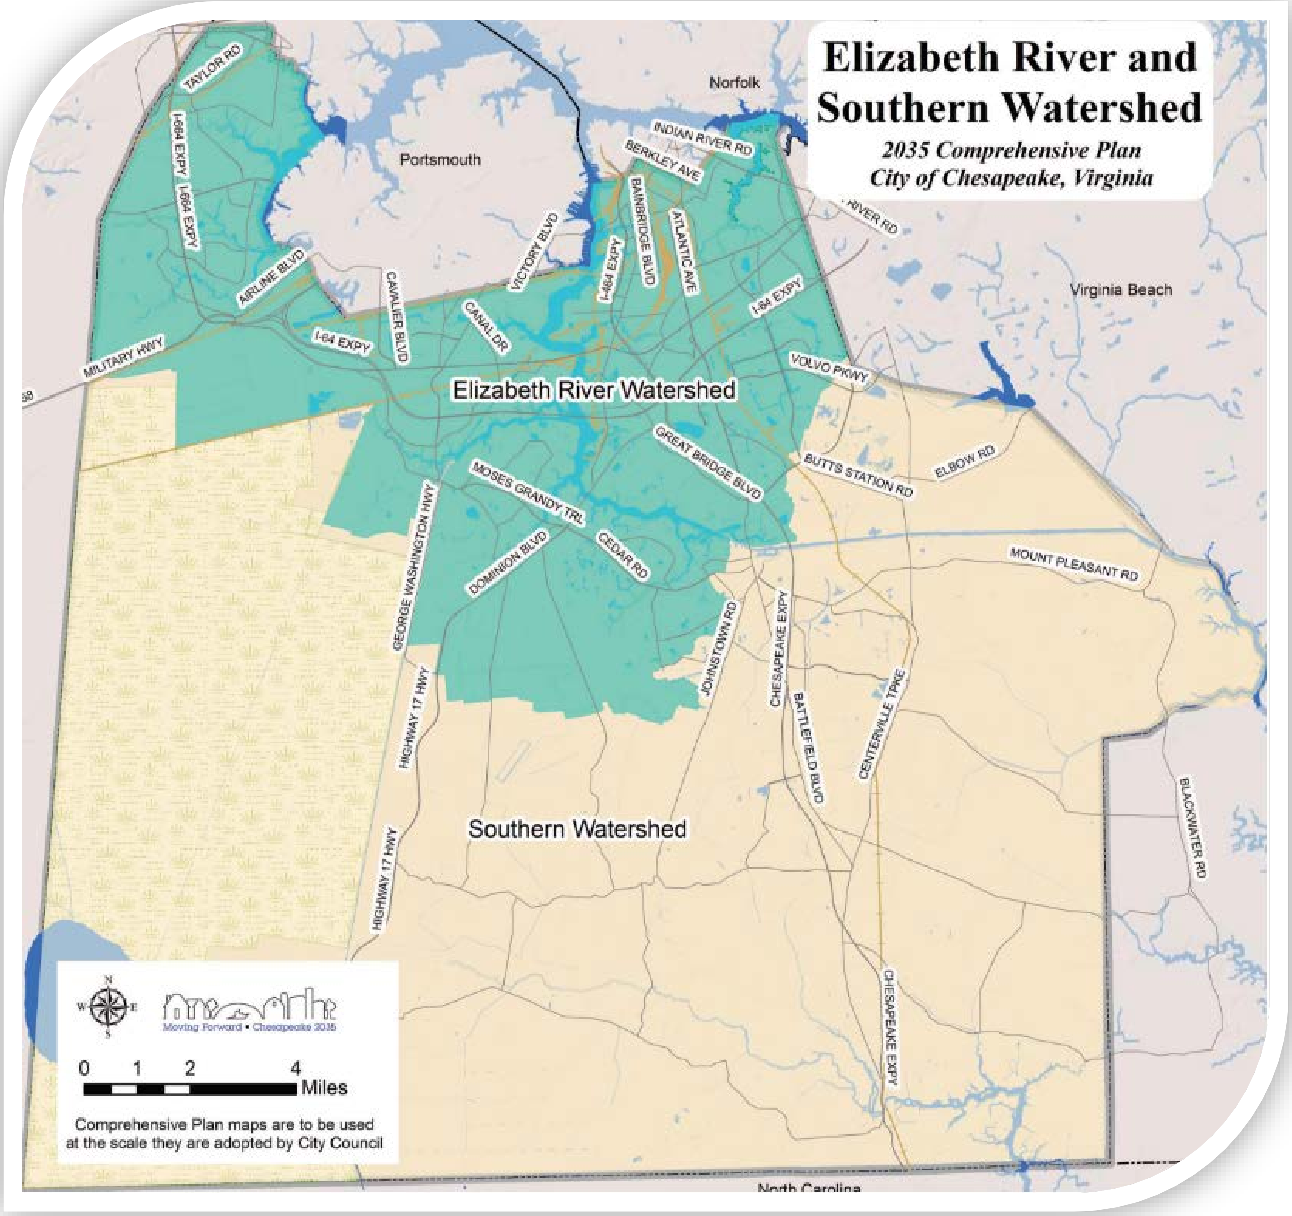

Figure 1: Elizabeth and Southern Watershed

[6] (Hampton Roads Planning District Comission, 2017)

2.0 Natural Hazards & Vulnerabilities

While natural hazards can be unavoidable, projects can be implemented to minimize the damage felt by the communities disturbed. Unfortunately, living in a coastal region means the likelihood of flooding events is elevated. Where communities most vulnerable to natural hazards coincide with societally vulnerable populations, addressing flooding in an equitable manner is essential. (c1)

2.1 Flooding & Related Hazards

Flooding is a major concern for a coastal city and has the potential to exacerbate other hazards and vulnerabilities. The City of Chesapeake experiences precipitation and tidal flooding, as well as the two in concert. The frequency and intensity of storms and consequently flooding events are increasing as a result of climate change, including sea level rise (SLR). In coastal areas, flood zones established by FEMA represent both riverine and coastal flooding hazards. However, what is often missing from these established data are localized areas of inland flooding. Chesapeake's floodplain can be seen in Figure 2[7]. (c3, c14)

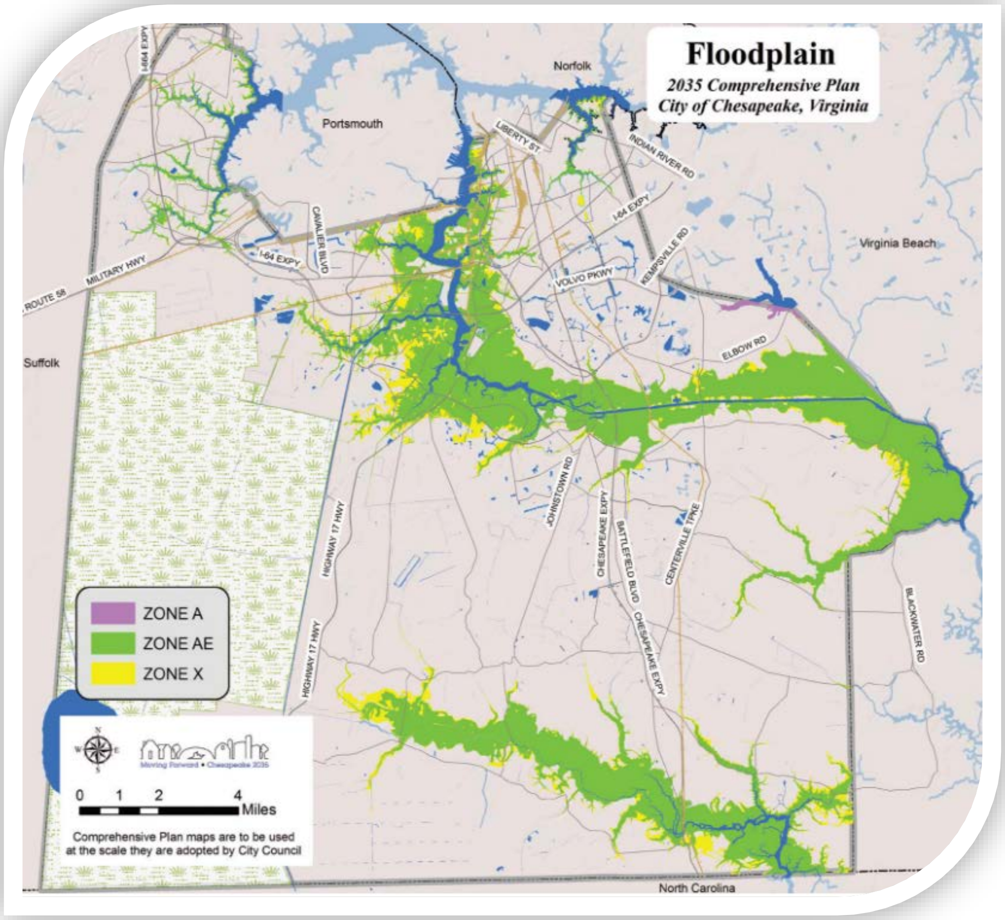

Figure 2: Floodplains in the City of Chesapeake

---

[7] (City of Chesapeake Planning Department, 2016)

- Zones A and AE shown are high flood risk areas, referred to as a 100-year (1%) chance floodplain
- Zone X (shaded) regions pose a moderate flood risk and is referred to as a 500-year (0.2%) chance floodplain.

Additionally, the city sees negative impacts of beavers and dams restricting flow in major outfall systems that results in flooding.

2.1.1 Precipitation Flooding

Old, undersized, stormwater infrastructure or lack thereof is a leading contributor to flooding issues, the capacity to which infrastructure is designed to convey relative quantities of water is essential to managing flooding. Policies and regulations pertaining to stormwater management requirements have changed over time. Depending on when a neighborhood or other development was established, the formal drainage system could be nonexistent or undersized compared to today's design standards. Systems designed to convey smaller storms will experience flooding more frequently. Since the 1990s, the City of Chesapeake has worked to develop and update studies throughout the City to identify and recommend improvements for undersized infrastructure. [c1] These studies will be discussed in greater detail in Section 3.3.4.

2.1.2 Tidal Flooding

Flat terrain, low ground elevation and minimal slope aid in the impact of flooding, including on sunny days, where there is no rain event, but water is backed up in the system due to high tides, storm events, or as a result of SLR. Downstream portions of drainage systems that connect to tidal water bodies often experience water backups due to tidal influence.

Wind-driven can impact non-coastal areas. In the Southern Watershed of Chesapeake, southerly winds influence water levels and can lead to flooding of inland areas.

2.1.3 Storm Events

Coastal regions, like Chesapeake, are especially vulnerable to flooding from extreme weather events including hurricanes and nor'easters. Between 1851 and 2005, 78 storms have passed within 75-miles of the region. Of these, two were Category 3 hurricanes, eight were Category 2 hurricanes, 16 were Category 1 hurricanes and 49 were tropical storms. The remainder were tropical or extratropical depressions. An image of storm paths since 2005 within 75 miles of Hampton Roads can be seen in Figure 3 on the following page. These various tropical cyclones have caused approximately 230 deaths and cost the Commonwealth more than one billion dollars in damages[8].

The main destructive elements of these storms are high-level sustained winds, heavy precipitation, and tornadoes. Coastal regions are specifically prone to storm surge, wind-driven waves, and tidal flooding that could prove more damaging than cyclone wind[9]. A storm surge is a large dome of water often 50 to 100-miles wide and rising anywhere from 4 to 20-feet. A storm surge arrives in advance of the storm's landfall, the greater the storm is, the earlier the surge arrives. Water rise is extremely rapid, posing severe hazard to those who have not evacuated flood-prone areas. Such a surge of high water topped by waves driven by storm force winds are devastating to coastal regions, inflicting extreme beach erosion and property damage[10].

[9] (Hampton Roads Planning District Commission, 2017)
[10] (Hampton Roads Planning District Commission, 2017)

2035 Comprehensive Plan

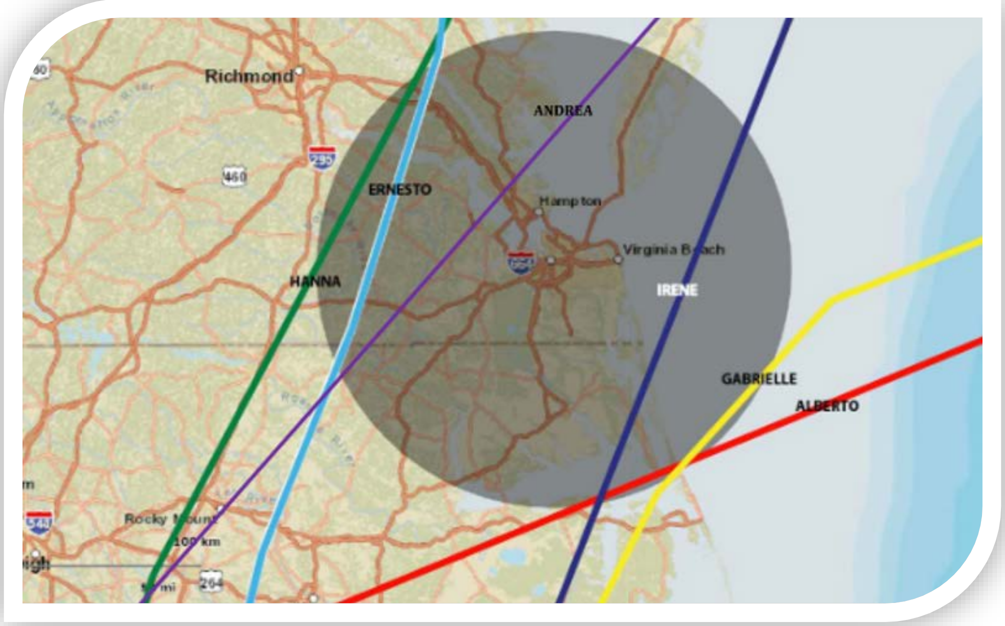

Figure 3: Storm Tracks in 75 miles of Hampton Roads since 2005

Wind damage in the area from events, in most recent accounts, have been marked by a wide variety of downed trees, damage to roofs, siding and signs, power outages due to downed power lines and trees across lines, and wind-blown debris accumulation. Since wind and flood events generally occur simultaneously, the combined effects are greater in flood-inclined regions. Roof damage from wind can also result in rain damage to structures as well. Combined storm surge and wind affects to shorefront regions make some homes and businesses uninhabitable for days to weeks at a time[11].

The probability of Chesapeake experiencing a hurricane or tropical storm in the future is high. The Atlantic hurricane season typically runs from August 15th to Nov 30, peaking in mid-September. In Hampton Roads, it is uncommon to experience the direct affects from hurricanes category 3 and 4. This is a result of historical tracks remaining offshore or impacting land earlier than arriving in the Hampton Roads. Additionally, cooler Atlantic Ocean water temperatures north of Cape Hatteras decrease a storm's capacity to maintain intensity. A Category 5 hurricane is considered unlikely in Hampton Roads because of the cooler water temperatures mentioned above. The effects of smaller hurricanes and tropical storms will be frequent, as storms making landfall along the North Carolina and Virginia coastlines could impact the region in any given year[12].

Nor'easters are also a primary cause of coastal flooding as the wind's direction pushes water up into smaller creeks and tributaries, overwhelming their capacity for rainwater.

---

[11] (Hampton Roads Planning District Commission, 2017)
[12] (Hampton Roads Planning District Commission, 2017)

2.1.4 Shoreline Erosion

Shoreline erosion along the banks of the Elizabeth River is a concerning natural hazard pressing Chesapeake's community. Shoreline erosion is often correlated with extreme storm events and the impacts are expected to increase as sea level rises. Human activities can worsen erosion as well. While it is ideal to avoid sensitive regions entirely, it is imperative designs for land disturbing activities along the shore incorporate resilience[13].

2.2 Other Hazards

There are other natural and manmade hazards that could cause, affect, or result from flooding events. Strategies to address these hazards can be found in the Hampton Roads Hazard Mitigation Plan.[14] (c15)

2.2.1 Earthquakes & Landslides

An earthquake is the trembling of the ground produced by sudden displacement of rock in the Earth's crust. Earthquakes result from crustal strain, volcanism, landslides or the collapse of caverns. Hampton Roads is in an area which could feel effects of earthquakes in the Central Virginia Seismic Zone, an area of frequent, yet very weak earthquake activity. Since 1774, there have been only three earthquake epicenters within 65 miles of Hampton Roads, two in the Hampton Roads area and one on the Delmarva Peninsula. Earthquakes of significant magnitude are unlikely occurrences for Hampton Roads, though the proximity of the region to the Charleston Fault could increase the possibility of feeling some impact of a large earthquake if it were to occur along that fault line[15] .

Only minor structural damage as a result of these earthquakes has been reported in the region. If a significant earthquake were to occur, damage to local structures would likely be severe because buildings in the region are not typically designed to withstand high magnitude quakes. Underground infrastructure damage is also expected to be severe and could cause long-term power, water, and sewer service interruptions in the region. Likewise, damage to bridges, tunnels and roads could disrupt transportation routes for much of the population[16].

2.2.2 Wildfires

With the exception of fire under prescription, a wildfire is any fire occurring in a wildland area. Wildfires are part of the natural management of the Earth's ecosystems; they may be caused by natural or human factors. Over 80% of forest fires are started by negligent human behavior such as improperly extinguishing campfires or smoking in wooded areas. The second most common cause for wildfire is lightning. Fire probability depends on local weather conditions, outdoor activities, debris burning, construction, and the degree of public cooperation with fire prevention measures. Drought conditions and other natural disasters (such as hurricanes, tornadoes, and lightning) increase the probability of wildfires by producing fuel in both urban and rural settings.

Great Dismal Swamp National Wildlife Refuge was struck by lightning on August 4, 2011 that hit land primed for wildfire due to drought. The Lateral West fire has burned a minimum of 2,000

[13] (Hampton Roads Planning District Commission, 2017)
[14] (Hampton Roads Planning District Commission, 2017)
[15] (Hampton Roads Planning District Commission, 2017)
[16] (Hampton Roads Planning District Commission, 2017)

acres. Forest damage from hurricanes and tornadoes may block interior access roads and fire breaks, pull down overhead power lines, or damage pavement and underground utilities[17].

The impacts of wildfire in the Hampton Roads region are both economic and environmental. From an economic perspective, fires destroy homes, businesses and infrastructure; communities in the region spend significant capital funds fighting wildfires, training staff, and preparing equipment to fight wildfire. Loss of life is a possible impact of severe wildfire in the region, although the lack of mountainous terrain makes escape somewhat easier. Environmentally, wildfires raise the temperature of forest soils, potentially eliminating organic value of the soil. Although soils eventually recover, impacts on watersheds in the interim can be detrimental to water bodies of the region. Burned soils may negatively affect infiltration and percolation, making soil surfaces water repellant; infiltration to groundwater decreases and runoff quantity increases. Both factors may negatively impact water quality downstream. Wildfires remain a highly likely occurrence for the region, though most will likely continue to occur in less urban areas and be small in size before being contained and suppressed[18].

2.2.3 Hazardous Material Incidents

Chesapeake's Code of Ordinances Sec. 26-606 prohibits storage or deposit of contaminants or hazardous, radioactive, nuclear or industrial waste in watershed areas[19]. (c15) Hazardous Material (HAZMAT) incidents can apply to fixed facilities as well as mobile, transportation-related accidents in the air, by rail, on the Nation's highways, and on the water. HAZMAT incidents can happen anywhere at any time. Per the Federal Emergency Management Agency (FEMA), approximately seven thousand HAZMAT events occur each year, 81% of those are highway incidents. In the Hampton Roads Region from 1988-2015, 454 documented HAZMAT events occurred, 73% of these HAZMAT incidents were in Chesapeake. HAZMAT incidents consist of solid, liquid, and/or gaseous contaminants released from their proper vessel. These events can have far reaching effects on the surrounding communities. In tandem with an extreme storm, the severity of the situation can escalate even further. A HAZMAT incident can last hours to days, while some chemicals can be corrosive or otherwise damaging over longer periods of time. In addition to the primary release, explosions and/or fires can result from a release and contaminants can be extended beyond the initial area by persons, vehicles, water, wind, and wildlife[20].

HAZMAT incidents can also occur as a result of or in tandem with natural hazard events which can also hinder response efforts. HAZMAT incidents can include the spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment of a hazardous material, but exclude:

- Any release which results in exposure to poisons solely within the workplace
- Emissions from the engine exhaust of a motor vehicle, rolling stock, aircraft, vessel, or pipeline pumping station engine
- Release of source, byproduct, or special nuclear material from a nuclear incident
- The proper application of fertilizer

---

[17] (Hampton Roads Planning District Commission, 2017)
[18] (Hampton Roads Planning District Commission, 2017)
[19] (Chesapeake, Code of Ordinances IV, VII, IX, X, and XI, 2013)
[20] (Hampton Roads Planning District Commission, 2017)

Negative impacts of hazardous materials incidents are dependent on the nature of the materials involved. While each chemical transported has unique qualities, there are generally three types of impacts:

1. Economic
2. Environmental
3. Safety of residents and first responders

In cases where evacuations are necessary to protect human life and safety, lost wages can be significant. Environmental impacts of highest concern in Hampton Roads include spills of petroleum products into the region's waterways. The region's emergency managers have contingency plans in place with the U.S. Coast Guard and others. However, a spill could still impact water quality, aquatic life, and valuable wetlands along the shoreline. Future occurrences of HAZMAT incidents, accidents, or issues within Hampton Roads are considered highly likely[21].

2.3 Critical Facilities

Impacts from flooding and other hazards can reduce or block access to emergency response activities, effects on roadways can prevent personnel from traveling and limit access to critical facilities (c3). Critical facilities can be considered as those essential for delivery of critical services and crisis management, those identified by Chesapeake can be seen in the map provided in Appendix C. (c8)

Critical facilities can be broken into 6 categories, seen below in Figure 4[22] (c8).

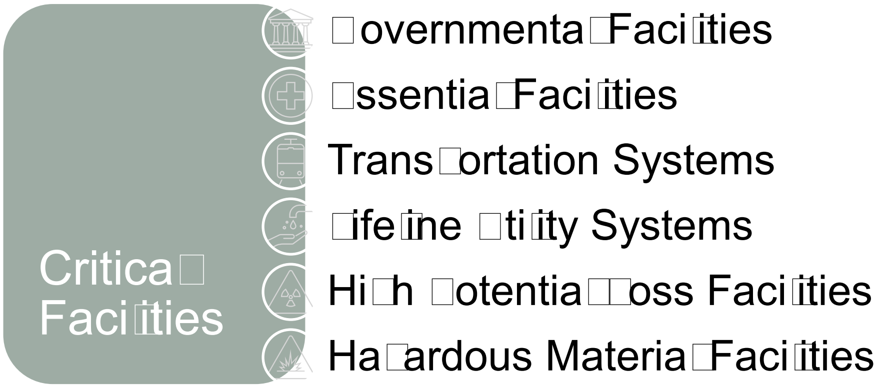

Figure 4: Critical Facilities

These facilities include data and communication centers, key government complexes, and similar facilities as determined by the floodplain administrator and emergency management department staff, those vital to health and welfare of entire populations, including hospitals and other medical facilities, retirement homes, police and fire facilities, emergency operations centers, prisons, evacuation shelters, schools, and any other facilities such as:

- Systems necessary for transport of people and resources
- Facilities vital to public health and safety, including potable water, wastewater, oil, natural gas, electric power, communication systems, and similar facilities

---

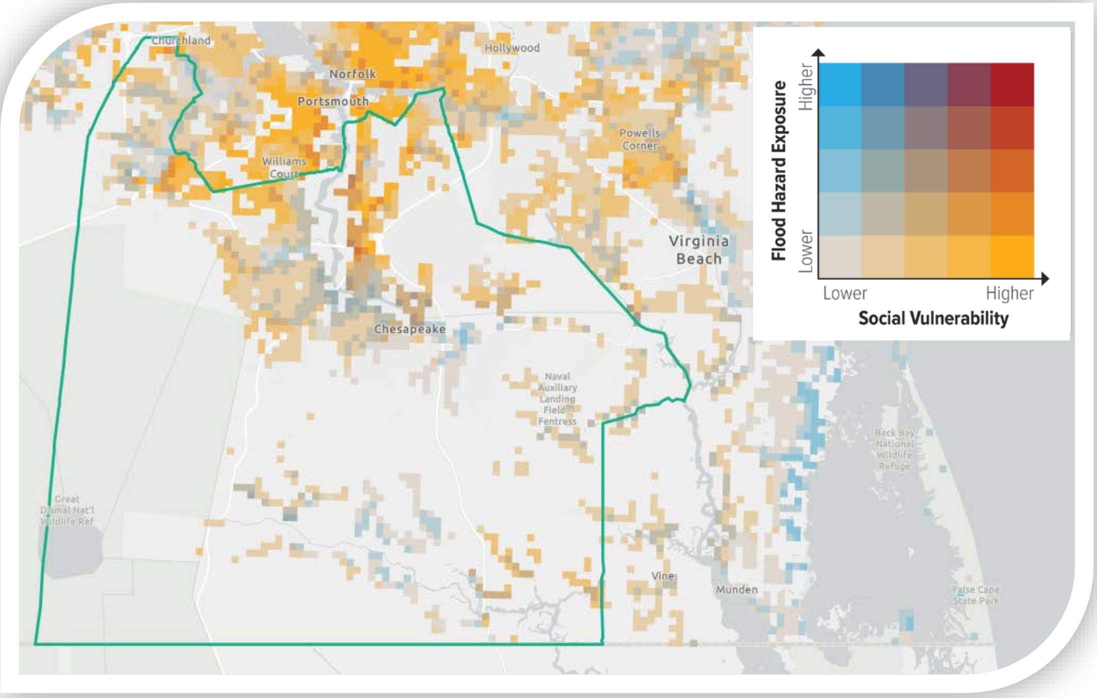
[21] (Hampton Roads Planning District Commission, 2017)
[22] (Hampton Roads Planning District Commission, 2021)

- Facilities whose disruption may significantly impact neighboring communities, including nuclear power plants, high hazard dams, and military installations
- Facilities involved in production, storage, and/or transport of hazardous materials

2.4 Vulnerable Populations

Flood damage and harm are more likely to occur in communities where many residents share economic and social traits that hinder their ability to prepare for and recover from flooding catastrophes. Disadvantaged groups and those with lesser incomes suffer the most from the physical and economic consequences of disasters, making recovery even more difficult. Flood-prone residents are more likely to suffer the direct consequences of coastal flooding, such as compromised health and safety, flooded highways, and school and business closures. Flooded properties may become hazardous or inconvenient to live in, making it impossible for residents to stay. Flooding that is severe or regular may force residents and businesses to relocate. (c4)

When addressing natural hazards, the communities facing the largest impending threats should be a focal point. Flood-affected citizens in Hampton Roads are more likely to be urban dwellers, economically pressured families, and individuals of color. The following graphic, borrowed from the Virginia Coastal Resilience Web Explorer, depicts the interaction of community socioeconomic vulnerability and coastal flood hazard exposure. Neighborhoods in red have a high level of social vulnerability (based on 2020 demographics) as well as a high level of exposure to coastal flood threats (based on a modeled 2080 flood scenarios).[23] (c3)



(https://experience.arcgis.com/experience/9e32e928ed304fa98518b71905e43085/page/Community-Context/)

Figure 5: Social Vulnerability and Flood Hazard Exposure in Chesapeake

---

[23] (Commonwealth of Virginia Department of Conservation and Recreation, 2021)

3.0 Current Efforts to Reduce Flooding & Develop Resilience

The City of Chesapeake has already established a myriad of processes, programs, and plans that address flooding and resilience.

3.1 Community Involvement, Outreach, and Notification

The City of Chesapeake strives to ensure that resilience efforts are all-inclusive of the locality regardless of socioeconomics or race. Individual citizen involvement provides the City with a greater understanding of local concerns and increases the success of resilient efforts by developing an invested community and by involving those directly affected by public policy and future development.

3.1.1 Involvement

The City intends to continue encouraging its citizens to become more involved in decisions that affect their life and safety. Knowledge of the natural hazards present in their community will aid in the process of the community taking personal steps to reduce hazard impacts. Public awareness is a key component of an overall mitigation strategy aimed at making a home, neighborhood, school, business, or city safer from the effects of natural hazards[24]. (c12)

The City currently sponsors several committees or working groups that engage residents and create community leaders (c11, c12).

- Chesapeake Environmental Improvement Council (CEIC), comprised of 18 volunteers appointed by the Mayor to promote interest in improving the environment of Chesapeake, Virginia thereby making Chesapeake a greener, cleaner, and healthier city in which to live, work, and visit. The CEIC will accomplish its purpose through outreach, education, and volunteer efforts to include litter and pollution prevention, waste reduction and recycling, beautification, conservation, landscaping, and other environmental and conservation issues.

- Chesapeake Stormwater Committee – comprised of 11 City Council appointed representatives and 3 Ex-Officio members from City staff, their duties include:
  - Reviewing the status of City-wide drainage projects, study areas, maintenance operations and issues of wetlands permitting
  - Reviewing rates and providing utility rate recommendations to the City Manager
  - Preparing drainage and stormwater utility-rated recommendations for the City Manager
  - Serving as a sounding board for citizens concerned about drainage in neighborhoods and subdivisions
  - Reviewing recommendations from Public Works to improve drainage and maintenance operations
  - Providing recommendations on changes to the Stormwater Utility Fee, Capital Improvement Projects, and Level of Services

- Natural Event Mitigation Advisory Committee (NEMAC), the committee monitors the efficiency and effectiveness of various natural hazard mitigation strategies and makes recommendations to city council for additional improvements.

---

[24] (Hampton Roads Planning District Commission, 2017)

3.1.2 Outreach

The City currently implements public education and outreach programs to help educate the community, focusing on impacts of stormwater discharge to surrounding water bodies[25]. The program provides information on how the community can help reduce these impacts and protect the waters quality. In order to promote public reporting of illicit discharges, the City provides stormwater education to the public through multiple media outlets such as web sites, radio, cable television, local television, publications, and a Customer Service Center.

Through a partnership with the HRPDC, the City participates in askHRgreen.org, a public awareness campaign administered by HRPDC. The website is a resource for environmental stewardship, including green landscaping practices and other topics related to stormwater quality and the MS4 permit. Beginning in 2011, HRPDC environmental programs were combined into a single public awareness program and central resource for environmental education in Hampton Roads known as askHRgreen.org; this and other resources are provided below[26] (c11, c12).

http://askhrgreen.org/

http://www.cityofchesapeake.net/government/City-Departments/Departments/Public-Works-Department/stormwatermanagement-publiceducation.htm

http://www.cityofchesapeake.net/online-Services.htm

3.1.3 Notification

Chesapeake Alert was developed to establish a combine policy for the authorized use, administration, and support for the City of Chesapeake's Emergency notification/Citizen Information/Employee Notification System. The system has three designated purposes, as follows[27] (c12):

- Citizen Information
- Emergency Notification
- Employee Notification

Utilizing a variety of telecommunications paths, Chesapeake Alert provides information to targeted recipients rapidly. Messaging may be in voice or text-data forms, depending upon the situation, capabilities of the receiving device(s), and choice(s) of the recipient[28].

3.2 Participation in State and Federal Programs

Regulations differ from a state and federal level. Localities must be sure to fall within both state and federal limits. Participation in both forms of programs is an active mode of ensuring this result.

---

[25] (City of Chesapeake, 2017)
[26] (Southern Rivers TMDL Action Plan, 2018)
[27] (City of Chesapeake, 2011)
[28] (City of Chesapeake, 2011)

3.2.1 FEMA

The City assists residents with acquiring federally funded hazard mitigation grants, including but not limited to FEMA's Hazard Mitigation Grant to acquire repetitive loss properties through the OEM Property Buyout Program City assistance. (c5, c7)

3.2.2 Community Rating System (CRS)

City of Chesapeake participates in the CRS and recently graduated to a class 7 rating. This incentive program encourages communities to undertake defined flood mitigation activities that go above and beyond the minimum requirements of the NFIP, adding extra local measures to provide protection from flooding. The CRS mitigation activities are assigned a range of point values. As these points are accumulated and thresholds are reached, communities can apply for an improved CRS class rating. Class ratings, which run from 10 to 1, are tied to flood insurance premium reductions[29]. Currently, the City has been successful in acquiring points in the following activities: (c5)

- 310 Elevation Certificates
- 330 Outreach Projects
- 350 Flood Protection Information
- 420 Open Space Preservation
- 430 Higher Regulatory Standards
- 440 Flood Data Maintenance
- 450 Stormwater Management
- 510 Floodplain Management Planning
- 520 Acquisition and Relocation
- Flood Damage Reduction
- Mapping & Regulations

3.2.3 MS4

The City of Chesapeake is a Phase I MS4 and was first permitted in 1996 under the VPDES program administered by DEQ. As it relates to flooding, the City must manage construction site runoff as well as quantity and quality of post-construction site runoff. Chesapeake also manages various public outreach and education campaigns through the MS4 program. Through the HRPDC, the Regional Stormwater Management Program coordinates actions and leverages funding for technical and advisory assistance to help localities meet the requirements of state-issued stormwater permits. The program includes cooperative initiatives in the following areas[30]:

- Construction runoff control
- Environmental education
- Illicit discharge detection & elimination
- Post-construction impacts management
- Monitoring of regulatory changes
- Municipal pollution prevention
- Regional cooperative data tracking
- Regional cooperative monitoring

---

[29] (Hampton Roads Planning District Commission, 2017)
[30] (City of Chesapeake, 2017)

3.3 City Planning Policies and Guidance

Planning and regulatory capabilities are based on implementation of plans, ordinances, and programs which demonstrate the City's commitment to guiding and managing growth, including:

- Capital improvements planning
- Comprehensive land use planning
- Emergency response
- Enforcement of zoning or subdivision ordinances and building codes
- Mitigation and recovery planning
- Reconstruction after disaster
- Transportation planning

These planning initiatives present significant opportunities to integrate hazard mitigation principles and practices into local decision-making processes. Conservation efforts have far reaching benefits to affected ecosystems as well as surrounding populations. Abiding by and maintaining resilient goals and objectives is crucial to ensuring the success of the City's existing and future effort. Types of action can be interrelated and broken down into the categories seen in Figure 6 (4).

Figure 6: Chesapeake's Action Efforts

The focus of parking strategies includes improving parking utilization and connectivity, managed properly including internal and external installations. Parking lots create ample impervious space; runoff increases with percentage of impervious groundcover. Multimodal strategies highlight an expanded and improved transit and improving cyclist/pedestrian access; flood mitigation strategies identify approaches to combat flooding along critical corridors for accessing installations and providing important network functionality. Improving accessibility enables ease of access during emergency situations. Controlling land use and development targets using recommended joint use planning efforts to manage responsible growth, reuse, and redevelopment considering both local and federal lands. Responsible growth is critical to a resilient community. Access strategies focus on improving installation access points and enhancing directional signage and information to assist commuters and visitors. Access is beneficial in everyday life and especially under emergency circumstances. Utility strategies focus on improving resiliency for installations and local economic development opportunities. Resilience is the way to ensure longevity in a community.

Chesapeake has multiple policies and programs in place to benefit the community, as follows[31]:

- Building and Fire Code
- Capital Improvements Plan
- Comprehensive Land Use Plan
- Continuity of Operations Plan
- Disaster Recovery Plan
- Economic Development Program
- Emergency Operations Plan
- Evacuation Plan
- Flood Damage
- Hazard Mitigation Plan
- Historic Preservation Plan
- National Flood Insurance Program
- NFIP Community Rating System
- Open Space Management Plan
- Prevention Ordinance
- Radiological Emergency Plan
- SARA Title III Plan
- Storm Water Management Program
- Subdivision Ordinance
- Zoning Ordinance

3.3.1 Comprehensive Plan

The City's current growth management system has evolved during the past two decades or so since adoption of the 1990 Comprehensive Plan. It is now firmly rooted in a three-pronged approach addressing timing, form, and funding of new development. City Council recognized that all three factors have to be integrated and be in relative harmony to create and sustain a community that is resilient, viable, healthy, and livable now and into the future[32].

The central component of the City's system is the process of controlling the approval of new development projects (rezoning applications) based upon the levels of service (LOS) available for major public facilities. The LOS policies were adopted in 1995 and subsequently amended in 1997, 2001, 2004 and 2009. Current City LOS standards address three areas of adequate public facilities: school capacity, road capacity and sewer utility capacity. Responsible land development is a major component in creating a resilient community. In terms of growth management, Chesapeake puts forth good effort – particularly with its use of a LOS approach for managing growth. LOS standards focus on the two most critical aspects of growth management: timing and funding of new development[33].

Responsible timing can be seen through the City's ability to plan density and intensity of land development generally to be highest in areas with utilities. These include public water and sewer service, as well as good roads and transit access; in this regard, the City will design and locate its future utility and transportation facilities in an effort to guide location, pattern, character and timing of growth (c5). Targeted funding is the City's objective. Chesapeake plans to enact this through coordination and balance of policy for funding and construction of public facilities. This includes maintaining a reasonable, moderate tax rate to support an optimum level of City services[34] (c1).

The City will achieve an economic development base that is both flexible and resilient by supporting a diverse work force that takes advantage of Chesapeake's economic and physical assets. The City will educate residents and business owners concerning environmental contamination and will investigate and prosecute environmental crimes. Chesapeake will enhance citizen preparedness through expanded public outreach and education programs[35].

---

[31] (Hampton Roads Planning District Commission, 2017)
[32] (City of Chesapeake Planning Department, 2016)
[33] (City of Chesapeake Planning Department, 2016)
[34] (City of Chesapeake Planning Department, 2016)
[35] (City of Chesapeake Planning Department, 2016)

The City will protect, maintain, and improve the quality of the natural environmental systems – air, water, natural habitats, and wetlands. (c9, c10) In order to fulfill its resource conservation goals and objectives set forth in the Comprehensive Plan, the City must continue to work toward implementing a comprehensive environmental program; suggested action strategies and recommendations from the City of Chesapeake Sustainability Plan should be incorporated into this program. To properly gauge the success in fulfilling these goals and objectives, a primary component of this program should include a periodic update of the natural resource inventory, as well as a report to be issued to City Council on the status of the health of the City's natural resources. The Chesapeake City Council generated a list to contribute to ecological stewardship; that list is as follows[36] (c11, c12):

1. Provides for renewal of the environment through reducing, reusing, and recycling
2. Encourages energy conservation and green initiatives through incentives, awareness, education, and community involvement
3. Ensures preservation of green and open spaces, protects its natural resources, and safeguards its agricultural lands
4. Develops, regulates, and maintains a clean and orderly community
5. Mitigates factors which impact the environmental quality of its water and air

The City will continue to promote water quality protection by implementing its existing protection program as well as seeking new solutions as additional information and technology become available. Although the City currently implements a variety of water quality protection programs, surface water quality in the City continues to show signs of impairment, potentially threatening human and environmental health[37].

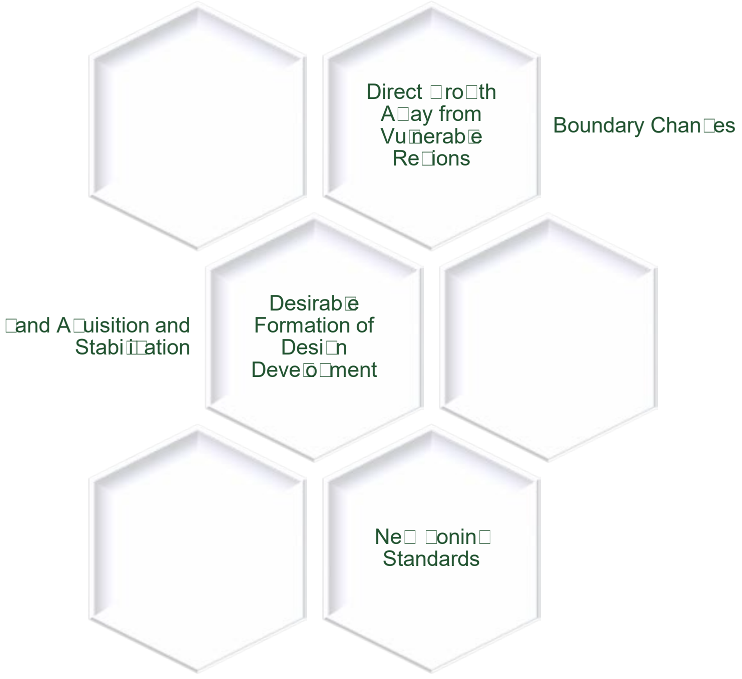


Figure 7: 2035 Action Strategies

---

[36] (City of Chesapeake Planning Department, 2016)

[37] (City of Chesapeake Planning Department, 2016)

Chesapeake has 6 Action Strategies seen above in Figure 7. The City will direct growth to areas as designated on the 2035 Land Use Plan (c5). Orderly expansions of utilities will be encouraged to avoid scattered or leapfrog development. Changes to the boundaries of either the Suburban Overlay District or the Public Utilities Franchise Area, approved by City Council, shall be co-terminus; impacts of the extension of both shall be considered in the decision. The City will amend its Zoning Ordinance provisions to reflect necessary changes in the Overlay District standards to be consistent with this Plan. The City will implement a land acquisition and stabilization (purchase, or lease of conservation easements such as OSA). (c6) Design of development (clustered housing development with residual open space and "conservation design" for rural subdivisions) should be used as a tool to develop a desirable form for the City[38]. (c5)

Provided there is capacity for such development, infill development complementing existing communities will be encouraged in developed areas to maximize the use of existing public facilities, utilities, buildings, and services. Planning for density and intensity of land development to be aligned with areas having existing public water and sewer service, good roads, and transit access – thus the City will use the design and location of its future utility and transport to guide local pattern, character, and timing of growth. Implementation of proper infrastructure and a revitalization of established neighborhoods in conjunction with preservation and creation of open space places a focus on balanced growth[39].

3.3.2 Code of Ordinances

Land disturbance activities provide opportunities for compromised water bodies. The city council has determined natural ground cover, especially woody vegetation, to be most effective in preventing site erosion and holding soil in place. Natural vegetation, with its adaptability to local conditions and without the use of harmful fertilizers or pesticides, serves the important function of filtering stormwater runoff. Additionally, minimizing impervious cover enhances rainwater infiltration and effectively reduces stormwater runoff[40].

The Chesapeake Code of Ordinances has 9 sections relating to creating open space and flood mitigation seen in Table 1[41]. (c6)(c9)

Table 1: Code of Ordinances Relating to Flooding

Sec. 19-600	Zoning and landscaping throughout Chesapeake
Sec. 19-701	Properly zoned recreational space in subdivisions
Sec. 19-702	Standard for determining zoning percentages
Sec. 19-704	Characteristics of recreational land a part of subdivision
Sec. 26-513	Creation of the CBPA District
Sec. 26-517	Interpretation of CBPA boundaries

---

[38] (City of Chesapeake Planning Department, 2016)
[39] (City of Chesapeake Planning Department, 2016)
[40] (Chesapeake, Code of Ordinances IV, VII, IX, X, and XI, 2013)
[41] (Chesapeake, Code of Ordinances IV, VII, IX, X, and XI, 2013)

Sec. 26-519	Permitted development in the RPA
Sec. 26-520	General Performance standards for the RPA, RMA, and IDA
Sec. 26-522-2	Relationship of CBPA standards to other ordinances

The Chesapeake Bay Preservation Area District (CBPA) of the city was created and then adopted by city council on January 21, 1992 as part of the city zoning ordinance. Any person contemplating development or land-disturbing activities within the city should consult the CBPA map prior to engaging in the proposed activity. All land disturbance, uses, development and redevelopment in the CBPA District are required to retain an undisturbed vegetated 100-foot buffer area around resource protection area (RPA) features, such as wetlands, shorelines and along waterbodies with perennial flow (c10). The following figure presents the City CBPA.

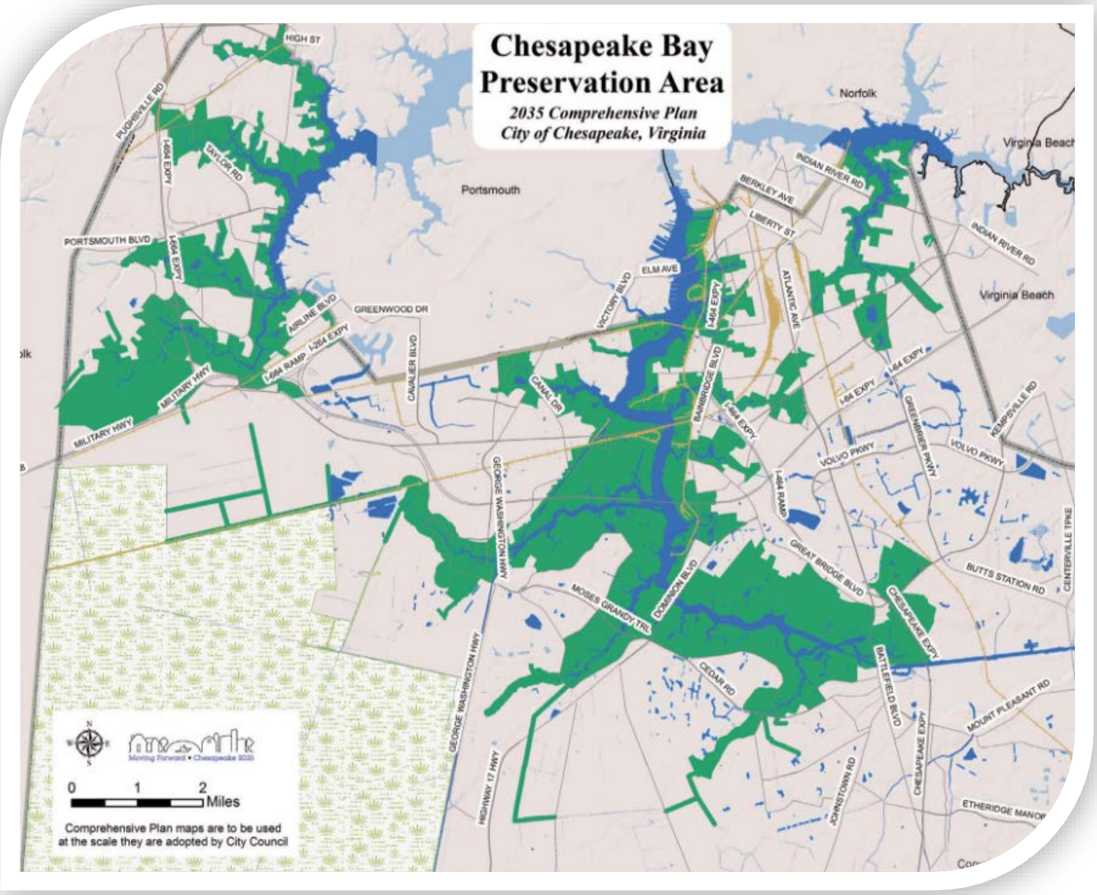

Figure 8: Chesapeake CBPA

The City of Chesapeake also offers owners of non-residential property an opportunity to qualify for a credit on their utility fee by utilizing BMPs. BMPs are practices used for on-site control of stormwater runoff and to provide water quality improvements. These BMPs include, but are not limited to, detention lakes, retention ponds, vegetated buffer strips, and grassed swales. The

City of Chesapeake has established a Stormwater Utility Credit Criteria in accordance with City Code. (c10)

3.3.3 City Public Facilities Manual (PFM)

Chapter 5 in the PFM references stormwater design standards and requirements. Current City standards meet or are more stringent than State requirements or industry standards and require the use of a downstream tailwater elevation that is variable depending on location. The design storm for system capacity also increases with increased contributory drainage area.

The City is able to fund some stormwater infrastructure improvements through the Pro Rata Program which is defined in the City PFM as responsibility of cost in development of suitable stormwater infrastructure is shared by the City and developers. The City accepts portions of improvements required by existing developments and areas to remain undisturbed; the developer is required to pay their share of improvements based on rate of runoff generated by given development. The developer has an option to pay into a fund in lieu of making improvements and the City must use that funding to benefit the area local to the development.

3.3.4 City-wide Master Drainage Plans and Other Focused Studies

Much of Chesapeake has been studied as part of a Master Drainage Plan (MDP) or other focused study. The goal of the MDPs is to identify capacity improvements for the City's major drainage facilities. The City started preparing MDPs in the 1980s and subsequent updates (or MDPUs) have been developed in the 2000s and more recently in the past decade. Appendix C contains a map depicting the status of MDP development as of late 2021. The map also shows the progress of implementation of some of the resulting improvement projects. The City considerations of all parts of the locality regardless of socioeconomics or race. (c4)

In addition to the MDPs, the City has also developed dozens of more detailed, localized studies to look at chronic flooding issues that cannot be adequately assessed at the coarser watershed-scale of the MDPs.

The full list of MDPs, MDPUs, and other studies undertaken by the City can be found in the list of documents reviewed prior to developing this plan, included as Appendix B.

Studies are beneficial in providing the science to back sound programs and projects to combat flooding. Most of the projects listed in Section 4 come from these MDPUs and studies.

3.3.5 Total Maximum Daily Load (TMDL) Action Plans

A TMDL Action Plan is a plan that is developed to identify projects and programs that should be undertaken to reduce the loading of a pollutant of concern into a waterbody. The City of Chesapeake has developed several TMDL Action Plans as follows:

- Chesapeake Bay TMDL Action Plan (2021)
- Southern Rivers TMDL Action Plan (2018)
- Southern Rivers TMDL Action Plan Conceptual Water Quality Projects (2018)
- Elizabeth River Bacteria TMDL Action Plan (2018)

Though all projects identified in TMDL Action Plans address water quality, some may also have a flood reduction benefit. Many are also nature-based. Those multiple benefit, nature-based projects are more advantageous to move through the CFPF program. Several of the projects presented in Section 4 were recommended in City TMDL Action Plans.

The City also partners with the Elizabeth River Project, an independent non-profit environmental group that is dedicated to improving water quality in the Elizabeth River through public education and outreach. The Elizabeth River Project recruits residents into a pledge program to encourage environmental stewardship and facilitates implementation of water quality BMPs on individual residential lots. The City's stormwater utility fee helps fund the design and construction of these BMPs recommended in the Chesapeake Bay TMDL Action Plan[42]. (c11)

3.4 Regional Efforts

3.4.1 Joint Land Use Study (JLUS)

The Portsmouth and Chesapeake JLUS focuses on reducing flood impacts to the transportation network, expanding access opportunities for getting to installations, reducing impacts on neighborhoods related to congestion and parking, promoting compatible and managed growth and redevelopment that also benefits the local tax base, and fostering improved coordination among JLUS partners to advance regional priorities..

3.4.2 Hampton Roads Hazard Mitigation Plan

Execution of hazard mitigation activities involves a broad range of professions. Stakeholders may include local planners, public works officials, economic development specialists, and others. Concurrent local planning efforts complement hazard mitigation goals even though they may not be designed as such. Balanced growth is a large component of establishing resilience within the community and providing proper infrastructure is essential for good quality of life. Restricting growth in sensitive regions is ideal, while incentivizing growth in non-sensitive regions is ideal from a quality-of-life standpoint and an environmental one[43]. (c5)

The City will continue to devote available and applicable resources to implementing the identified Hazard Mitigation Actions. Chesapeake Mitigation Action Items 2, 3, 13, and 14 involve efforts to mitigate flooding damage; these are elaborated on in the following[44] (c15):

1. Maintain participation in NFIP and Community Rating System. Continue enforcement of standards in existing ordinance that meet and exceed NFIP minimum requirements.
2. Actions which may include Climate Resilient Mitigation Activities (CRMA) such as Mitigation Reconstruction projects, minor localized flood reduction projects. These may include activities such as relocating, and retrofitting floodproof structures in flood prone areas.
3. Cross referencing of homes and parks correlated with repetitive flood loss areas and new FEMA 100-year floodplains. (c8) This is done by reviewing their vulnerability to flood and wind hazards. Solutions include implementation of measures to retrofit, relocate, or acquire vulnerable properties. (c15) This action may include Mitigation Reconstruction projects. The Emergency Management Department, with support from the Geographic Information System (GIS) and Engineering Division, are responsible for this action.

---

[42] (AECOM, 2021)

[43] (Hampton Roads Planning District Commission, 2017)

[44] (City of Chesapeake Planning Department, 2016)

4. Replace structures or implement retrofits, which may include but are not limited to: installation of emergency backup power, elevation of structure or components, relocation or retrofit of building components. (c5)

5. Flow test and inspect existing City-owned and grant-funded dry hydrants annually to help maintain operability.

6. Seek and use additional revenue sources and local matching funds for mitigation planning and projects.

7. Develop and implement a Pre-Disaster Homeowner Tree Preventative Maintenance and Hazard Awareness Program.

8. Improving stormwater management infrastructure, preparing, and implementing preventive maintenance schedule, and providing a replacement schedule for stormwater management and inspection equipment and vehicles. It also aims to implement updates on older stormwater infrastructure that was repaired previously and should be examined to ensure it is up to current standards.

9. Part I: Maximize training and educational opportunities for the National Event Management Advisory Committee (NEMAC), City staff, elected officials, Central Emergency Response Team (CERT) members and citizen neighborhood leaders regarding hazard mitigation, disaster preparedness and the relationship of mitigation to reduced recovery needs. Part II: Accommodate training and related support for at least two staff in the Department of Department and Permits to receive and maintain Certified Floodplain Manager (CFM) certification through the ASFPM.

10. Conduct Hazardous Environmental Action Team (HEAT) program to industrial facilities, particularly hazardous facilities, to discuss hazards and mitigation alternatives.

11. Support and maintain City's new Reverse-911 system. Prepare messages to release to citizens before and after a natural hazard event.

12. Prevent sanitary sewer inflows to the system during flood events. Smoke test public and private sanitary sewer infrastructure to determine priorities.

13. Continuation of the lease and maintenance of facilities along the Dismal Swamp Canal Trail. This is a high priority action. Parks and Recreation is the department responsible.

14. Continue outreach efforts through a strategically developed Plan for Public Information (PPI) using the 7 actions seen below:
    a) Create a PPI Committee
    b) Assess public information needs
    c) Formulate multi-hazard messages
    d) Identify outreach projects
    e) Examine public information initiatives
    f) Prepare PPI document
    g) Implement, monitor, and evaluate program

15. Acquire open space sites capable of providing multi-objective management. Some objectives of this action are flood control, water quality, public access to waterways, preserving or creating tree canopy, and preserving diverse ecological and cultural heritage sites (c10). CRMA may be included in this action.

16. Identify/create database and plan uses for data regarding vulnerable populations. Uses may include target outreach, emergency notification and specialized evacuation planning.

Flooding, SLR, coastal storms, and winter storms are some of the hazards addressed by these actions. There are approximately 400 properties and 2,000 structures identified as being within repetitive loss areas[45] (C7).

3.4.3 Other HRPDC Efforts

Resilience related participation from the City on other Hampton Roads Planning District Commission (HRPDC) items include:

- Coastal Resilience Committee and Working Group
- Floodfluent Program
- Hampton Roads All-Hazards Advisory Committee (AHAC)
- Regional Environmental Committee
- Stormwater Committee
- Watershed Technical Workgroup
- Coastal Resiliency Committee and Working Group
- Regional Stormwater Management Workgroup

3.5 Preparation for Severe Weather Events

3.5.1 Public Works Emergency Operations Center (PWEOC) Hurricane Preparation

The City has a policy and procedures in place to assure an efficient and coordinated response pre-, during, and post-emergencies. The PWEOC defines tasks and responsibilities of the Department of Public Works (DPW) and designated Mosquito Control and Parks, Recreation and Tourism crews to assist in restoring essential City services as quickly and safely as possible. DPW maintains traffic flow, streets and drainage clearance, public infrastructure, and debris removal. Staff conduct an annual mock emergency condition drill and maintain a manual. (c15)

3.5.2 Emergency Management Disaster Training

Emergency Management staff both initiate and take part in regular training and exercises on disasters. The City has a robust Training & Exercise Program which is managed through the Office of Emergency Management (OEM). The training is developed to coincide with hazards that are recognized at both the federal and state level. OEM staff routinely attend training on flooding, natural and manmade disasters (hurricanes, and tropical storms) as well as city preparedness activities to ready city response and recovery operations before the start of the season. Staff also take part in webinars, meetings, and training courses geared around flood and mitigation efforts, that tie into the Community Rating System, Sea Level Rise/Resiliency, and City related projects that have a mitigation focus or nexus to them. Training and meetings are attended by all staff within the department. (c11)

---

[45] (Hampton Roads Planning District Commission, 2017)

3.5.3 Power Franchisees

The City will work with power franchisees to improve the safety, efficiency, dependability, and aesthetic impact of power utilities. The traditional method of providing electrical service has been via a network of poles to support power lines. The conventional method of supplying electrical service has been through a network of poles to support power lines. These are affected by extreme weather, car accidents and interference from growing trees. Minor storms can cause inconvenient power outages while more major storms can cause an extensive amount of damage and loss of power for days at a time. For these reasons, it is preferable to have utilities located underground whenever possible[46]. (c15)

---

[46] (City of Chesapeake Planning Department, 2016)

4.0 A Plan for Resilience

The City of Chesapeake is committed to continuing those efforts already underway to improve resilience as descried in the previous section. Additionally, there are programs, studies, and projects that the City is considering to further advance efforts towards developing resilience for the entire locality.

Successful projects grow out of scientifically sound studies derived from firmly rooted programs. The following subsections will discuss Chesapeake's efforts to contribute quality projects, programs, and studies in order to fight flooding and increase the resiliency of the City.

4.1 Continued Coordination with other Entities

Partnership with neighboring localities and other entities is essential for a successful resilient community. As seen in Figure 9, watersheds cross locality borders. Therefore, it is impossible to address their vulnerabilities without collaboration. To be resilient, we all must work together.

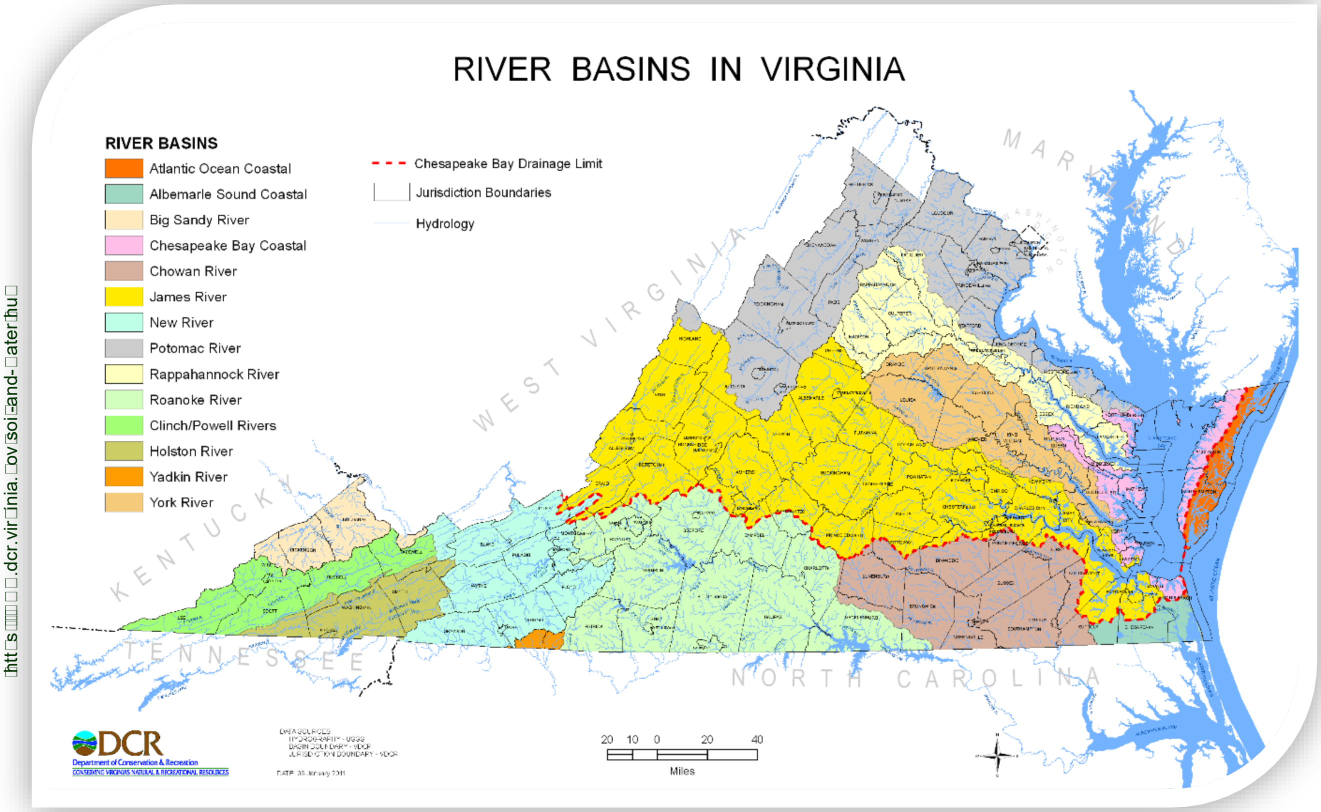

Figure 9: River Basins in Virginia

The City has and will continue to coordinate with adjacent localities when watershed boundaries overlap governmental boundaries.

The City also plans to continue its participation on several regional workgroups and committees hosted by the HRPDC, discussed in Section 3.1.

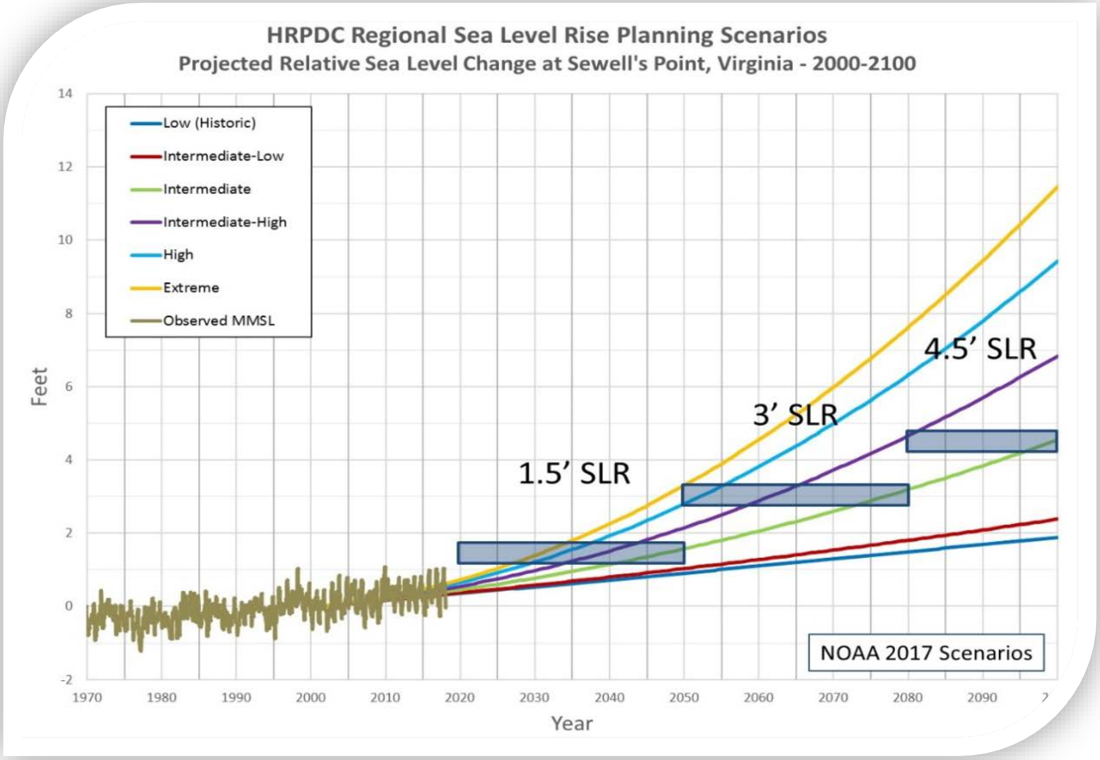
The City of Chesapeake is committing to building, maintaining, and strengthening its relationships with other entities as it works toward greater community resilience.

4.2 The Science

One of the guiding principles of the CFPF program is to acknowledge climate change and its consequences, and base decision making on the best available science.[47] To that end, the City will endeavor to use current flood maps and incorporate climate change (SLR) and storm surge, where appropriate, into proposed initiatives.

Projections of SLR are available from various sources, based on varying underlying assumptions and climate models. An October 18, 2018, resolution by the HRPDC localities recommended three different SLR scenario values for planning purpose. Each had an associated future planning horizon, summarized below and shown in Figure 10. The □□□S utilized the near- and mid-term SLR values consistent with the HRPDC guidance[48].

- 1.5-feet of SLR for near-term planning, represented by the timeframe 2018–2050
- 3.0-feet of SLR for medium-term planning, represented by the timeframe 2050–2080
- 4.5-feet of SLR for long-term planning relevant to timeframes beyond year 2080



(https://www.hrpdcva.gov/departments/water-resources/policy-guidance-)

Figure 10: Projected SLR

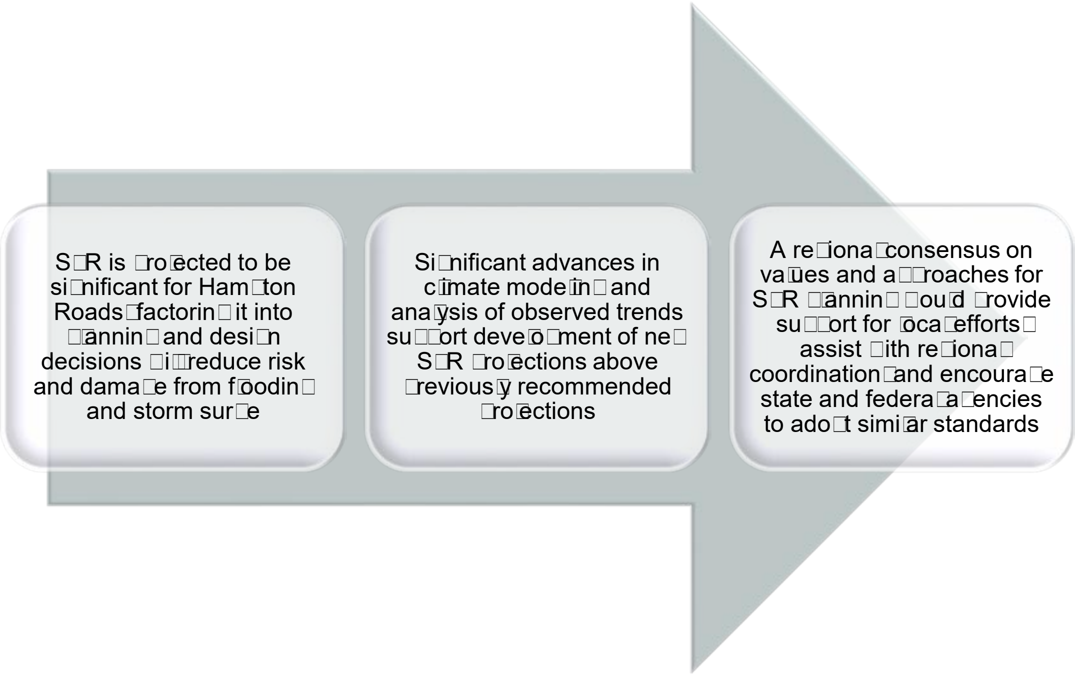
---

[47] (Commonwealth of Virginia Department of Conservation and Recreation, 2022)
[48] (Hampton Roads Planning District Commission, 2021)

Figure 2: Rationale Behind HRPDC SLR

Rationale behind this study can be seen in Figure 11. Recommendations from the HRPDC SLR are as follows:

- Localities should plan for SLR using 1.5-feet of relative SLR above current mean higher high water (MHHW) for near-term planning, 3-feet of relative SLR above current MHHW for medium-term planning, and 4.5-feet of relative SLR above current MHHW for long-term planning.
- For engineering and design, localities should calculate project-appropriate SLR scenarios by using a tool such as the U.S. Army Corps of Engineers (USACE) Sea Level Change Calculator and conduct a benefit-cost analysis of various adaptation strategies to determine an appropriate amount of SLR for a specific project.
- These scenarios should be reevaluated as appropriate based upon new information developed by the NOAA, USACE, or Virginia Institute of Marine Science (VIMS).



SLR is projected to be significant for Hampton Roads, factoring it into planning and design decisions will reduce risk and damage from flooding and storm surge

Significant advances in climate modeling and analysis of observed trends support development of new SLR projections above previously recommended projections

A regional consensus on values and approaches for SLR planning would provide support for local efforts, assist with regional coordination and encourage state and federal agencies to adopt similar standards

Figure 11: Rationale Behind HRPDC SLR

In January 2017, NOAA partnered with the U.S. Geological Survey, the U.S. Environmental Protection Agency (USEPA), and Rutgers University, and published a report updating regional and global SLR scenarios for the United States. This report takes advantage of additional observations of sea level change and ongoing research into global and regional drivers of SLR including rapid ice melt, ice sheet instability, shifts in ocean circulation patterns, changes in the Earth's gravitational field, and vertical land movement[49].

---

[49] (City of Chesapeake, 2017)

The overall result is that the upper bound of plausible global SLR is higher than considered in the NOAA's 2012 report. In addition, regional drivers (such as vertical land movement, ocean circulation, and shifts in the gravitational field) account for a significant amount of projected SLR in Hampton Roads. Overall, the report projects between 1.9-feet of SLR in Hampton Roads between 2000 and 2100 at best and 11.5-feet of SLR at worst. According to the report's most statistically probably assessment, the predicted outcome is approximately 4.5-feet of SLR by 2100[50].

Sea level trends are continuously being monitored and updated by both federal (NOAA, USACE) and state (VIMS) entities. In addition, research, and analysis into the dynamics of sea level and how it responds to changing climatic conditions are also ongoing. The HRPDC recommends that the HRPDC staff and localities reevaluate and consider updating these scenarios as appropriate based upon new information developed by NOAA, USACE, or VIMS[51].

4.3 Studies

The CFPF defines a flood prevention or protection study as any hydraulic or hydrologic study of a floodplain with historical and predicted floods, the assessment of flood risk, and the development of strategies to prevent or mitigate damage from coastal or riverine flooding. Utilizing the most recent flood maps, engineering software, and ensuring minimal human error when collecting and recording data are just a few components to producing a scientifically sound study.

Some studies may be the result of a recommendation from large-scale MDPs. Others include opportunities for coordination with other entities in Hampton Roads or as a result of citizen input.

The City will continue to look for opportunities to identify and conduct additional studies. Future studies may:

- Conducting large-scale master plans of areas of the City that have not been previously covered
- Updating existing studies and large-scale master plans to incorporate additional resilience/equity features
- Look at community scale flooding issues not addressed by large-scale studies

There may be an opportunity to modify the scope of these planned studies to incorporate flooding and resilience:

- Greenbrier Redevelopment Study
- Industrial Waterfront Study
- Western Branch Redevelopment Study
- Joint planning study of St. Juliens Creek corridor and/or Blows Creek corridor to explore options for expanded public recreation access to the water around St. Juliens Creek Annex
- Study options for interconnecting water service to St. Juliens Creek Annex and evaluate alternatives for extending water and sewer service eastward towards the Elizabeth River to support future development

---

[50] (City of Chesapeake, 2017)

[51] (City of Chesapeake, 2017)

As opportunities are identified and vetted, the City plans to seek grant funding though the CFPF program.

4.4 Programs

The CFPF program defines capacity building programs as improving the ability of a local government through training of existing staff, hiring personnel, contracting with expert consultants or advisors, and other related actions that allow a local government to identify and mitigate risk and flood impacts[52]. A program could be considered essential to a sustainable community that is economically, socially, and environmentally based.

A possible program is a modification to the OSAP program. This project would supplement the existing, city-wide competitive OSAP program. This program allows the City to purchase development rights from willing landowners in exchange for preservation easement on their property. In addition to capacity building, programs can also be considered preparation for the future. The City will review opportunities to be involved in planning programs. For example, the City will look into and identify types of staff support that may be helping in planning future needs such as staff capacity, on-call contracts, and training.

The City will seek to ensure an equitable and proportionate share of public facility and infrastructure improvements attributable, in whole or part, to a proposed development project which will be financed by the owners, developers, users or beneficiaries. Development and redevelopment will be designed in such a way as to mitigate for the potential impacts from flooding and SLR[53]. (c1)

The City continues to explore different strategies of flood mitigation, including tidal flooding, such as removing structures and preserving properties subject to repetitive losses from flooding, in part by exploring funding mechanisms for purchasing such properties. New development, redevelopment, and critical infrastructure will be directed towards higher ground to the greatest extent practicable (c9). Chesapeake will continue to work with businesses and community organizations, such as civic leagues, potentially affected by SLR to proactively adapt to future conditions (c4, c12).

Natural resource protection activities reduce the impact of natural hazards by preserving or restoring natural areas and their protective functions (c10). Natural areas could include floodplains, wetlands, streams, steep slopes, barrier islands and sand dunes. Parks, recreation or conservation agencies and organizations often implement these measures, examples include[54]:

- Beach and dune preservation
- Erosion and sediment control
- Floodplain protection
- Forest and vegetation management
  - i.e., fire resistant landscaping, fuel breaks
- Habitat preservation
- Historic properties and archaeological site preservation

---

[52] (Commonwealth of Virginia Department of Conservation and Recreation, 2022)

[53] (City of Chesapeake Planning Department, 2016)

[54] (Hampton Roads Planning District Commission, 2017)

- Land acquisition
- Riparian buffers
- Slope stabilization
- Watershed management
- Wetland preservation and restoration

Chesapeake is also considering establishing forested buffers on conserved properties, providing stormwater filtering to receiving waters. The City currently plants trees as a part of municipal projects and based on expert panel recommendations, tree plantings can reduce the total phosphorous load by 24% for tree canopy over lawn and 11% for canopy over impervious surfaces. In 2018, the City planted 2,000 loblolly pine seedlings in the TMDL watersheds[55].

Moving residential living away from sensitive regions does not mean their beauty cannot be appreciated. By creating public access, people can visit and live more [illegible]in other regions. Thus, acquisition of new public waterfront access sites, such as those identified in the City's 2026 Comprehensive Plan and the Private and Public Waterfront Access Study, will be pursued including:

- Continue efforts to expand and enhance multi-purpose trail along Dismal Swamp Canal;
- Increase shoreline pedestrian and boating access to the Albemarle and Chesapeake Canal by means of a proposed hiking trail on the northeast side of the Canal;
- Pocaty Creek and St. Julian Creek
- The abandoned Route-168 bridge over the Northwest River could be used to provide an additional boat ramp, as could a portion of Northwest Preserve No. 1
- The Eastern Branch of the Elizabeth River and the Indian River should also be further explored for future public waterfront access points
- The Western Branch area of the City should be further explored for future access points; possible sites include Western Branch Park and former Lake Ahoy site

Land deemed probable for acquisition include properties which are currently leased for agricultural use; however, City policy allows the City to prioritize these lands for recreational use, BMPs, or debris sites during storm events. Specifically, the City will evaluate converting the following leased properties from agriculture to forest in future permit terms[56] (c6,7):

- 1564 Mount Pleasant Road, 8-acres, North Landing River (AS12)
- 1653 Mt Pleasant Road, 16-acres, North Landing River (AS12)
- 1736 Mount Pleasant Road, 17-acres, North Landing River (AS12)
- 1102 Centerville Turnpike South, 15-acres, Pocaty River (AS15)
- 2500 Land of Promise Road, 133-acres, Pocaty River (AS15)
- Ballahack Road, 404-acres, Northwest River (AS09)

As opportunities are identified and vetted, the City plans to seek grant funding though the CFPF program.

4.5 Projects

Projects can be defined, for the CFPF program, as activities which include the development of flood protection facilities, acquisition of land, restoration of natural features or other activities

---

[55] "Southern Rivers TMDL Action Plan," 2018.
[56] "Southern Rivers TMDL Action Plan," 2018.

that involve design, construction, or installation of facilities[57]. As opportunities are identified and vetted, the City plans to seek grant funding though the CFPF program.

The City of Chesapeake is blessed with ample water access, this critical resource needs to be protected from anthropomorphic pollutants. Proper utilization of land, identifying incentives for restoring riparian and wetland vegetation, and incorporation of nature-based infrastructure are some of the key factors in deeming a project as resilient. Forward-looking projects designed for resilience are critical to mitigating impacts of climate change on infrastructure, specifically in coastal regions.

As has been presented in Section 3, the City of Chesapeake has developed Master Drainage Plans and, in some instances, more detailed neighborhood studies for the majority of the locality. Through a review of approximately 40 of these studies and other documents, approximately 200 discrete projects were identified. The City has selected the following 26 projects to include in the Preliminary Resilience Plan, listed in order implementation status and anticipated construction start. Project details can be found in Appendix D.

- Under Design
    1. Oakdale Area BMP and Drainage Improvements
    2. Norfolk Highlands Drainage Improvements
    3. Welch Ln Drainage Improvements – Phase I – II
    4. Cooper's Ditch – Phase II
    5. Washington Manor Outfall Improvements
    6. Hickory Ridge Outfall Improvements
    7. Herring Ditch Outfall Improvements
    8. Royce Dr Drainage Outfall Improvements – Phase II
    9. Lamberts Trail Area Drainage Improvements – Phase II
    10. Pughsville Area Outfall Improvements

- Design Scoping Underway
    11. Elmwood Landing Area Drainage Improvements – Phase I – II
    12. Providence Rd Crossing Replacement
    13. Mount Pleasant Rd Crossing Replacement
    14. Shell Rd Drainage Improvements

- Not Yet Under Design
    15. Greenbrier Outfall Resiliency Improvements – Phase I – II
    16. Greenbrier Outfall Resiliency Improvements – Phase III
    17. Drum Creek Farms Drainage Improvements – Phase II
    18. Poplar Branch Ditch Regrading
    19. Buskey Rd Crossing Replacement
    20. Carawan Ln Drainage Improvements
    21. Weiss Lane Outfall Improvements
    22. Pleasant View Drainage Improvements
    23. Mount Pleasant Rd Outfall Improvements
    24. Homemont Outfall Improvements
    25. Forest Lakes Outfall Improvements – Phase II
    26. Scenic Blvd Drainage Improvements

Resilience Plan Project Table

Resilience Plan Project Table				
Parameter Name of Project:	Oakdale Area BMP and Drainage Improvements	Norfolk Highlands Drainage Improvements (5 Improvement Phases)	Welch Lane Drainage Improvement Phase I & II	Cooper's Ditch Phase II
On Virginia Costal Resilience Web Explorer?	Yes	Yes	Yes	No
Name of the Document the Project is included in:	Approved Capital Improvement Plan; Oakdale Area Drainage Study	Approved Capital Improvement Plan; Norfolk Highlands Area Drainage Study	SW CIP Progress Report	Approved Capital Improvement Plan
Date the Document was published:	March 2021; July 2020	March 2021; ?	March 2022	March 2021
Chesapeake River Basin Watershed is located in (see master drainage map on Chesapeake watershed page):	Eastern Branch Elizabeth River	Eastern Branch Elizabeth River	Southern Branch Elizabeth River	Albemarle and Chesapeake Canal
Name of the Watershed the Project is located in:	Berkley (BK)	Indian River (IR)	Oak Grove (OG)	Coopers Ditch (CD), Coopers Ditch (CD-1)
Rain Fall Events (for 24hr storms) Analyzed:	2-, 5-, 10-, 100-yr	2-, 5-, 10-yr	2-, 5-, 10-yr	50-, 100-yr
Tailwater (or water surface elevation) Analyzed:	Current PFM Std	Current PFM Std	Current PFM Std	Current PFM Std
Short Summary of Project (I.E. Storm System Upgrades, Detention Basin, Channel/Channel widening):	Construct wet pond, dry pond, storm sewer pipe upgrades to reduce flooding in surrounding neighborhood and enhance water quality in Cloverdale area of South Norfolk.	Replace, upsize, and realign pipe and ditch conveyance systems to reduce flooding in surrounding neighborhood.	Construct new drainage conveyance system along Welch Lane including storm structures, storm pipe, curb & gutter, re-sloping of pavement to reduce flooding in surrounding neighborhood.	Restore hydraulic capacity of Cooper's Ditch needed to serve the watershed by removing significant amounts of silt and sediment between Gloria Dr and Forest Rd.
Is the Project Nature-based?	Yes	No	No	No
What issues or problems are being addressed by the project?	Flooding, Pollution	Flooding	Flooding	Flooding
Does the proposed Project enable communities to adapt to and thrive through natural or human hazards?	Yes	Yes	Yes	Yes
Does the Project include forward-looking goals, actionable strategies, and priorities as seen through an equity-based lens?	Yes	Yes	Yes	Yes
Level of Protection / Design Storm	100-yr for ponds	10-yr	10-yr	50-yr
Size of the Drainage Area related to the Project if listed	~ 228 AC	Varies for each phase (< 200 AC)	~ 10 AC	> 200 AC
How many alternatives were developed/analyzed for the issues being solved	3	3	3	None
Does this Project require future maintenance	Yes	Yes	Yes	Yes
Estimated total project cost (includes Engineering, Land Acq, Construction as appropriate)	$7,567,485	$1,200,000	$1,280,000	$1,500,000
Does the Project have funding available at present?	Yes (Partial)	Yes (Partial)	Yes (Partial)	Yes (Partial)
Timing for implementation (contingent on funding availability)	Active (Construction start 2022)	Active (Construction start 2022)	Active (Construction Start 2023)	Active (Construction start 2023)
What other project(s) must be completed prior to installation of this Project?	None	None	None	None
Project Status - Completed, Under Construction, Design Complete (not yet constructed), Under Design, Scoping (design not yet started), On Hold, Future (not yet started & MAY have funding in a future year)	Under Design	Under Design	Under Design	Under Design
	1	2	3	4

Resilience Plan Project Table				
Parameter Name of Project:	Washington Manor Drainage Improvements	Hickory Ridge Outfall Improvements	Herring Ditch Outfall Improvements	Royce Dr Drainage Outfall Improvements Phase II
On Virginia Costal Resilience Web Explorer?	Yes (previously called Meads Court BMP/Drainage Improvements)	Yes	Yes	Yes
Name of the Document the Project is included in:	Approved Capital Improvement Plan; Washington Manor Outfall (GL-1) Watershed Study	Approved Capital Improvement Plan	Bells Mill Creek Watershed MDPU	SW CIP Progress Report
Date the Document was published:	March 2021; ?	March 2021	January 2010	March 2022
Chesapeake River Basin Watershed is located in (see master drainage map on Chesapeake watershed page):	Southern Branch Elizabeth River	Northwest River	Southern Branch Elizabeth River	Albemarle and Chesapeake Canal
Name of the Watershed the Project is located in:	Gilmerton Canal (GL), Washington Manor (GL-1)	Southern Chesapeake (SC), St. Brides Ditch (SC-3)	Bells Mill Creek (BM), Herring Ditch (BM-1)	Coopers Ditch (CD), Poplars Branch (CD-2)
Rain Fall Events (for 24hr storms) Analyzed:	2-,10-, 50-, 100-year	10-, 50-yr	2-, 10-, 50-, 100-year	2-, 5-, 10-yr
Tailwater (or water surface elevation) Analyzed:	Current PFM Std	Current PFM Std	Current PFM Std	Current PFM Std
Short Summary of Project (I.E. Storm System Upgrades, Detention Basin, Channel/Channel widening):	Replace and upsize pipes along Old George Washington Hwy and re-grade eastern outfall ditch to increase system capacity and reduce area flooding.	Correct erosion, increase outfall ditch capacity, replace pipes with box culvert in the conveyance system between Battlefield Blvd S. and Benefit Rd to reduce area flooding.	Widen outfall ditch and upsize culverts east of Shillelagh Rd to increase system capacity and reduce area flooding.	Regrade roadside ditches and replace driveway culverts to increase capacity and reduce flooding in surrounding neighborhood.
Is the Project Nature-based?	No	Yes	Yes	No
What issues or problems are being addressed by the project?	Flooding	Flooding, Erosion	Flooding	Flooding
Does the proposed Project enable communities to adapt to and thrive through natural or human hazards?	Yes	Yes	Yes	Yes
Does the Project include forward-looking goals, actionable strategies, and priorities as seen through an equity-based lens?	Yes	Yes	Yes	Yes
Level of Protection / Design Storm	50-yr	10-yr	50-yr	5-yr
Size of the Drainage Area related to the Project if listed	~ 560 AC	~140 AC	~ 1,500 AC	~ 20 AC
How many alternatives were developed/analyzed for the issues being solved	3	None	1	1
Does this Project require future maintenance	Yes	Yes	Yes	Yes
Estimated total project cost (includes Engineering, Land Acq, Construction as appropriate)	$1,550,000	$850,000	$2,500,000	$750,000
Does the Project have funding available at present?	Yes (Partial)	Yes (Partial)	No	No
Timing for implementation (contingent on funding availability)	Active (Construction start 2023)	Active (Construction start 2024)	Active	Active
What other project(s) must be completed prior to installation of this Project?	None	None	None	Phase I
Project Status - Completed, Under Construction, Design Complete (not yet constructed), Under Design, Scoping (design not yet started), On Hold, Future (not yet started & MAY have funding in a future year)	Under Design	Under Design	Under Design	Under Design

Resilience Plan Project Table				
Parameter Name of Project:	Lamberts Trail Area Drainage Improvements Phase II	Pughsville Area Outfall Improvements	Elmwood Landing Area Drainage Improvements Phases I & II	Providence Rd Crossing Replacement
On Virginia Costal Resilience Web Explorer?	Yes	No	Yes	No
Name of the Document the Project is included in:	SW CIP Progress Report	PW SW Eng Unfunded Project List	SW CIP Progress Report; Elmwood Landing Drainage Study Elmwood Landing Offsite Drainage Analysis	PW SW Eng Unfunded Project List; PW Ops Condition Report
Date the Document was published:	December 2021	March 2022	March 2022; December 2021; January 2020	March 2022
Chesapeake River Basin Watershed is located in (see master drainage map on Chesapeake watershed page):	Southern Branch Elizabeth River	Western Branch Elizabeth River	Southern Branch Elizabeth River	Eastern Branch Elizabeth River
Name of the Watershed the Project is located in:	St. Julian Creek (SJ), Camelot (SJ-1)	Drum Point Creek (DP), Pughsville (DP-1)	Deep Creek (DC), Deep Creek (DC-2)	Indian River (IR), Georgetown (IR-1)
Rain Fall Events (for 24hr storms) Analyzed:	2-, 5-, 10-yr	50-yr, 100-yr	2-1000-yr	10-, 50-yr
Tailwater (or water surface elevation) Analyzed:	Current PFM Std	Current PFM Std	Current PFM Std / road elevation	Current PFM Std
Short Summary of Project (I.E. Storm System Upgrades, Detention Basin, Channel/Channel widening):	Replace aging storm pipes and improve ditches to increase system capacity and provide a higher level of protection	Regrade major outfall channel and remove beaver dams to restore hydraulic capacity.	A new neighborhood outfall pipe. Also, replace existing poor-condition cross pipes under both Martin Johnson Rd and Cookes Mill Rd to provide a higher level of protection.	Replace existing poor-condition cross pipes under Providence Rd near Georgetown Blvd with a new box culvert to provide a higher level of protection, for both flood events and transportation network.
Is the Project Nature-based?	Hybrid	Yes	No	No
What issues or problems are being addressed by the project?	Flooding	Flooding	Flooding, Erosion	Flooding, Erosion, Road Stability, Cave-Ins
Does the proposed Project enable communities to adapt to and thrive through natural or human hazards?	Yes	Yes	Yes	Yes
Does the Project include forward-looking goals, actionable strategies, and priorities as seen through an equity-based lens?	Yes	Yes	Yes	Yes
Level of Protection / Design Storm	10-yr	100-yr	50-yr for neighborhood, 1000-yr for culvert crossings	50-yr
Size of the Drainage Area related to the Project if listed	~ 100 AC	> 200 AC	94 AC fo neighborhood, 92,000 AC for culvert crossings	~200 AC
How many alternatives were developed/analyzed for the issues being solved	1	None	Multiple	None
Does this Project require future maintenance	Yes	Yes	Yes	Yes
Estimated total project cost (includes Engineering, Land Acq, Construction as appropriate)	$1,250,000	$1,544,055	$3,000,000	$1,400,000
Does the Project have funding available at present?	No	Yes (partial)	Yes (partial)	No
Timing for implementation (contingent on funding availability)	Active	Active	2023	Active
What other project(s) must be completed prior to installation of this Project?	Phase I	None	None	None
Project Status - Completed, Under Construction, Design Complete (not yet constructed), Under Design, Scoping (design not yet started), On Hold, Future (not yet started & MAY have funding in a future year)	Under Design	Under Design	Scoping	Scoping

Chesapeake
VIRGINIA
PUBLIC WORKS

MEMORANDUM

TO: Crystal Bloom, P.E., Assistant City Engineer
Jay Tate, P.E., CFM, Director of Development and Permits

FROM: Deva Borah, PhD, P.E., Senior Project Engineer

DATE: April 7, 2022

SUBJECT: **AUTHORIZATION TO REQUEST FUNDING THROUGH COMMUNITY FLOOD PREPAREDNESS FUND (CFPF) GRANT PROGRAM FOR GREENBRIER OUTFALL RESILIENCY IMPROVEMENTS PHASE I & II**

The City of Chesapeake requests funding through the Community Flood Preparedness Fund (CFPF) grant program for the above-referenced flood prevention and protection project in accordance with the grant program requirements as provided in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund.

The City has dedicated funding for this specific type of project in the Capital Improvement Budget (CIB) that will be used to provide the required local match, see Project #29-230 Resiliency & Reliability Program. The CIB Project Summary page and documentation to verify the availability of adequate funding to cover the local match amount are provided for your records.

The total project cost is $1,975,398. The amount of funding requested through the CFPF is 60% of the project cost or $1,185,238. The remaining cost of $790,160 will be a local match funded through Project #29-230 Resiliency & Reliability Program.

The grant program also requires a locality-certified floodplain manager (CFM) to confirm the project area is subject to recurrent flooding to ensure moneys from the program will be utilized for the primary purpose of implementing flood prevention and protection projects. This confirmation by the City's designated CFM is requested below.

Should you have any questions or need additional information, please contact me at extension 6472.

4/8/22

Crystal Bloom, P.E., Assistant City Engineer

29-230: Resiliency & Reliability Program

Department:	**Storm Water Capital Projects**		
Project Type:	Addition or Expansion	Comprehensive Plan Goal Area:	Stormwater Management
Year identified:	2019	Planning Area:	Greenbrier
Start Date:	7/1/2018	Project Status:	Adopted
Est. Completion Date:	12/30/2024		

Description:

This project will provide for drainage improvements with related acquisition of easements, replacement of pipes, re-grading of ditches, and associated activities to provide a higher level of protection and improved stormwater systems in city areas with inter-connected lake systems that are dependent on a single outlet control structure. This program will look at providing an improved outlet control structure in areas such as the Greenbrier lakes system, Etheridge lakes system, Stonegate lakes system, and other lake systems with drainage deficiencies. This project will also include the replacement of downstream culverts.

Justification:

Major investments in improvements are necessary to increase drainage capacity and upgrade deficient drainage systems in these areas.

Comments:

The frequency and intensity of storms impacting the City of Chesapeake and the region as a whole have been observed to be much greater than in the past. These project improvements will provide critical systems with added levels of protection that will help reduce the impact of flooding during major storm events.

Project Forecast:

Dear DCR CFPF Program Manager,

Please find the City of Chesapeake's Grant Application **CID510034_ChesapeakeCity_CFPF-2** on Greenbrier Outfall Resiliency Improvements Phase I & II **PROJECT** for 2022 CFPF Grant Funding in the **downloadable link provided below** as the file size is too large to attach.

We look forward to hearing from you if you are able to download the application with no issues and also as an acknowledgement of receipt of this application.

Sincerely,

Deva

600 East Main Street, 24th Floor
Richmond, VA 23219

RE: Authorization of City of Covington CFPF Studies Application

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

Please accept this written correspondence as signed documentation authorizing the City of Covington's request for funding from Round 3 of the 2022 Virginia Community Flood Preparedness Fund (CFPF). As the City only recently became aware of this funding and does not have funding established in our currently budget, we respectfully request the Department of Conservation and Recreation waive our match requirement for a City-wide Drainage Study.

In addition to the City's application for Capacity Building and Planning, we have also assembled the attached Studies Grant application to request CFPF grant assistance to complete a comprehensive City-wide Drainage Study and complete updates to the City's existing Floodplain Ordinance.

The City of Covington routinely experiences pluvial flooding in numerous locations throughout the City. In some locations, roadway underpasses are regularly flooded, which severely limit emergency access routes for hundreds of residents and businesses. More intense rainfall events in recent years have overwhelmed the City's existing storm system capacity and exacerbated flooding issues in areas with deteriorated stormwater piping. With limited resources, the City does not have an electronically mapped storm sewer network, and information can be found in numerous paper records, reports and maps. Having clear knowledge of the location, size, pipe material, and condition of the existing system is critical to identify the system improvements that must be made to alleviate recurrent flooding throughout the City.

The outcomes of this Drainage Study will inform the project-based Resilience Plan for the City. We believe that the implementation of a City-wide Drainage Study and Resilience Plan will better prepare the City to address its long history of problematic and recurrent flooding and plan for future mitigation efforts.

Thank you for your consideration of this grant proposal. If you have any questions about this proposal, please contact Patrick Madigan at (540) 965-3911 or pmadigan@covington.va.us.

Sincerely,

K. Onaitis

Krystal M. Onaitis

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ☐ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Robens

NFIP Community Identification Number (CID#):(See appendix F ____________________

Is Project Located in an NFIP Participating Community? ☐ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes ☐ No

Flood Zone(s) (If Applicable): The project is located on the upper Ware River in Gloucester County. The low bank shoreline faces north-northwest and has an average fetch of 0.7 miles with a long fetch to the northwest of 1.3 miles. The tide range is 2.5 ft. A marsh fringe with an eroding edge exists along the shoreline. To increase the level of shore protection and longer-term coastal resiliency, a living shoreline project was designed with 1 rock sill, sand fill, and Spartina patens and Spartina alterniflora marsh grass plantings. The structure (sill 4A) is part of a system designed for an overall living shoreline project on adjacent properties to provide shore protection with a reach approach. Coastal resiliency is enhanced by the reach approach because adjacent systems work together to provide an enhanced level of shore and habitat protection. Along the Robens properties, approximately 7,600 square feet

Flood Insurance Rate Map Number(s) (If Applicable): ______________________________

Total Cost of Project:
Gloucester-Mathews Gazette-Journal
P.O. Box 2060
Gloucester, Va. 23061

Appendix C: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	Although 5,400 square feet of subaqueous land will be covered, the sills need to be slightly farther offshore to accommodate the beach fill that provides a level of protection. Bringing the structures closer to the shore would steepen the fill and reduce wetland plantings. No clearing, grading or excavating will occur. No SAV occurs in the area.	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	☐
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	☐
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	☐
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
N/A	Match not required	✓

Studies Eligible for Consideration	☐ **Yes** ☐ **No**

Applicant Name:	The primary purpose of the project is shore protection. The existing marsh and the upland, where exposed, is eroding. A stable marsh will be create to protect the upland property through the installation of a living shoreline. A secondary purpose is to provide coastal resiliency for the affected shoreline from flooding and sea-level rise.

Scoring Information

Criterion	Point Value	Points Awarded
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	30
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	15
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	45
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	50
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☑ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	40
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	8
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0

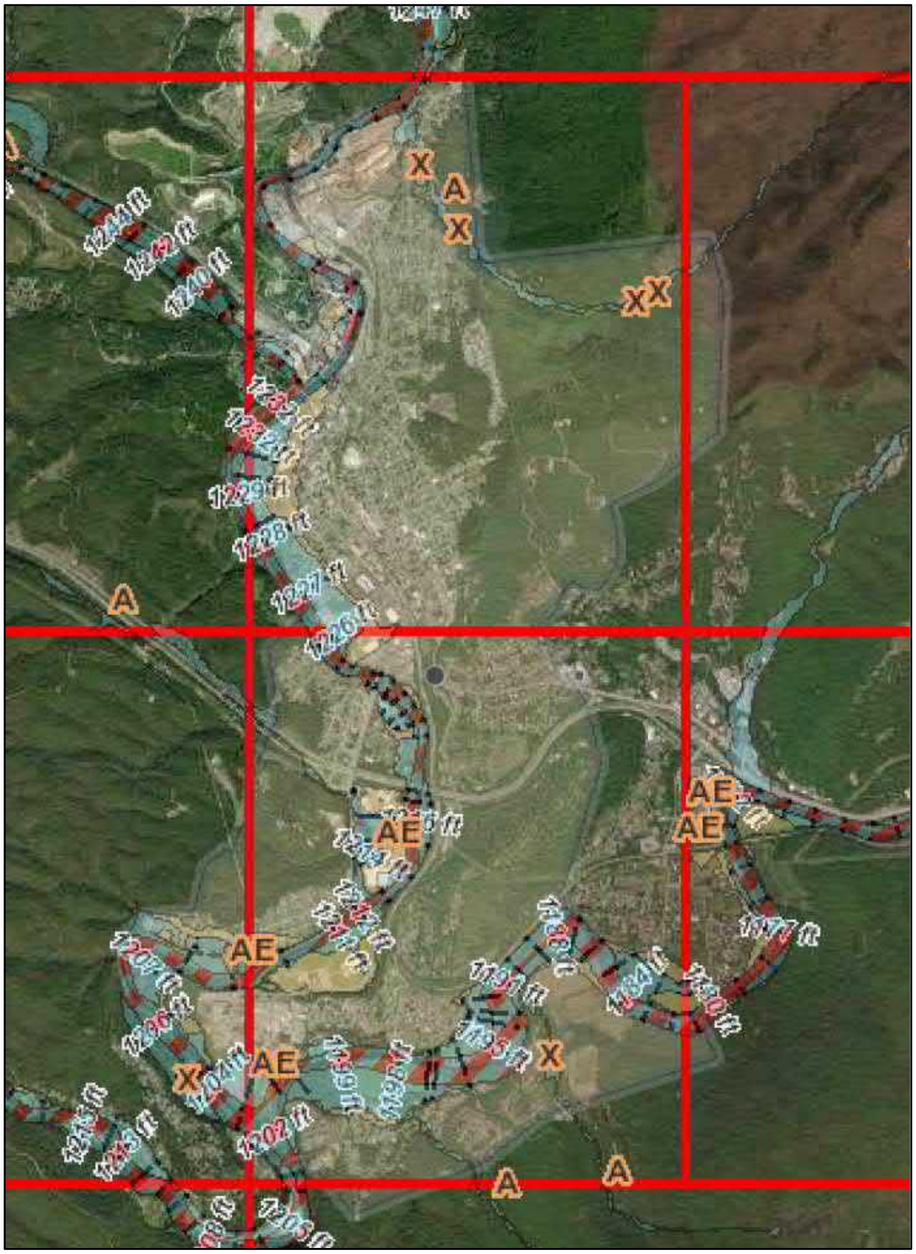
Studies Grant Application



City of Covington, VA
Community Identification Number: 510040
Submitted: April 8, 2022

THE CITY OF COVINGTON

Scope of Work Narrative

The City of Covington, Virginia is subject to riverine flooding from the Jackson River as well as pluvial flooding due to inadequate and antiquated storm sewer systems. The recurrence of higher intensity storms in recent years has stressed the stormwater conveyance system throughout the City causing local urbanized flooding that is detrimental to the residents and critical infrastructure. There are two underpasses below the CSX railroad tracks at N. Monroe Avenue and E. Chestnut Street that regularly flood after heavy rainfall, which severely limit access for emergency services to residents and businesses on the west side of the railroad tracks see Figure 1 below). **Attachment 1** contains additional links, photos, and other documentation of flooding issues within the City.

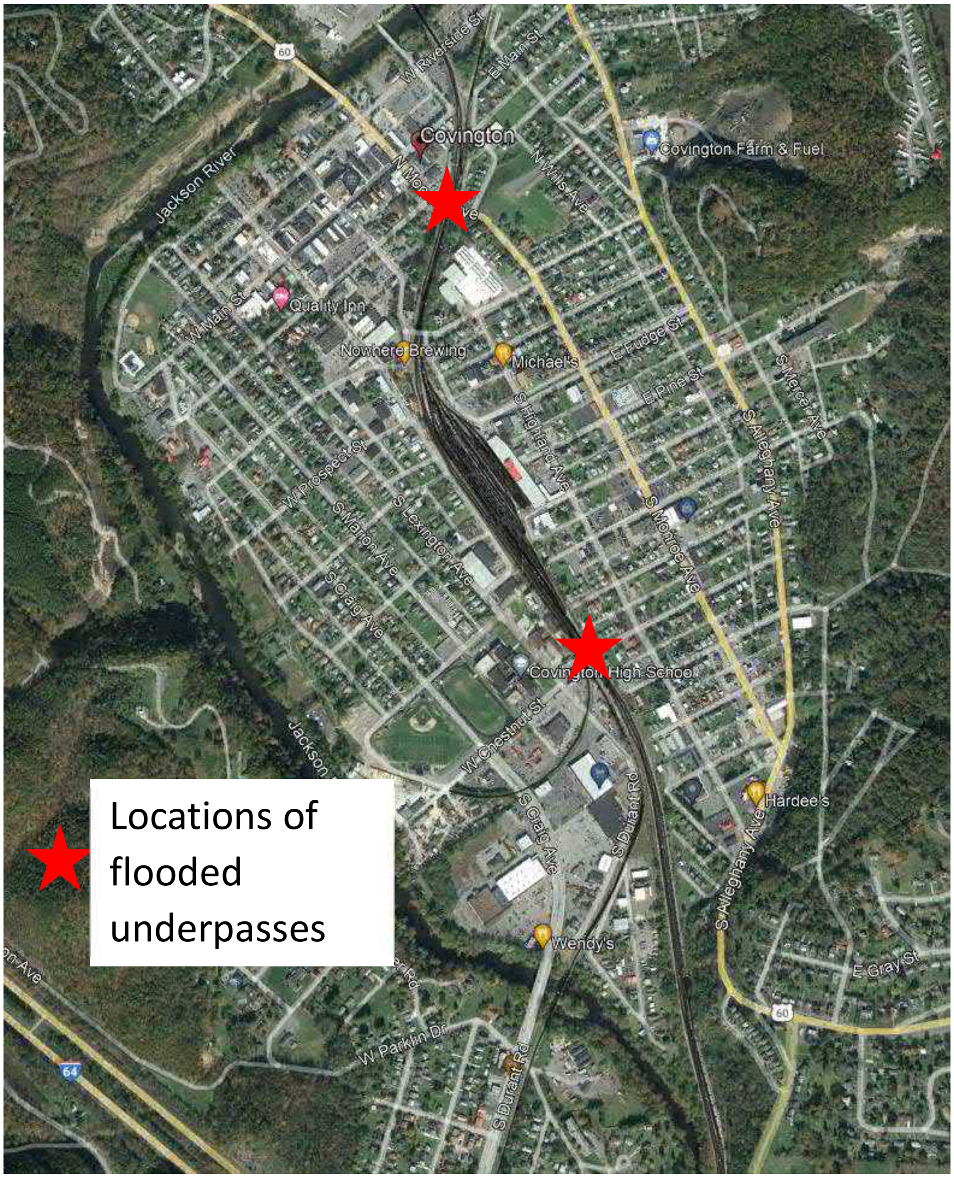


Figure 1 – Locations of Underpasses that Regularly Flood

More intense rainfall events in recent years have overwhelmed the City's existing storm system capacity and exacerbated flooding issues in areas with deteriorated stormwater piping. With limited resources, the City does not have an electronically mapped storm sewer network, and information can be found in numerous paper records, reports and maps. Having clear knowledge of the location, size, pipe material, and condition of the existing system is critical to identify the system improvements that must be made to alleviate recurrent flooding throughout the City.

The results of the Drainage Study will inform the City's Resilience Plan, for which a CFPF grant application for Capacity Building and Planning is also being submitted.

Limited resources in the City and a focus on sanitary sewer infiltration and overflow issues have prevented the City from investing in flood mitigation planning and project implementation. The City is a low-income geographic area, as defined in the CFPF Grant Manual, as an area where the median household income ($41,024) is significantly less than 80% of the local median household income ($76,398 in Virginia), according to the US Census Data in 2020[1]. Further, portions of the City are classified as Moderately Socially Vulnerable, according to the ADAPT Virginia's Virginia Vulnerability Viewer (see Figure 1 in **Attachment 2**). Finally, several areas in the City are designated as Qualified Opportunity Zones (see Figure 2 in **Attachment 2**).

The City understands that the CFPF grants must be used in accordance with the following guiding principles:

- Acknowledge climate change and its consequences; and base decision making on the best available science.
- Identify and address socioeconomic inequities and work to enhance equity through adaptation and protection efforts.
- Utilize community and regional scale planning to maximum extent possible, seeking region-specific approaches tailored to the needs of individual communities.
- Understand the fiscal realities and focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The solutions wilt, to the extent possible, prioritize effective natural solutions.
- Recognize the importance of protecting and enhancing nature based-solutions in all regions, natural coastal barriers, and fish and wildlife habitat by prioritizing nature-based solutions.

1.0 Specific Type of Studies Proposed

The City is proposing a new City-wide Drainage Study and an update of the existing Floodplain Management Ordinance. In addition, an evaluation of regional rainfall data will be conducted as part of the Drainage Study effort to determine if changes in heavy rainfall and intensity are occurring over time in the Covington/Alleghany Highlands region of Virginia. The results of this

---

[1] https://www.census.gov/quickfacts/fact/table/covingtoncityvirginia,VA,US/PST045221

evaluation will be used in the hydrologic and hydraulic model of the City's current stormwater drainage system.

2.0 Relationship of the Study to Priorities in Grant Manual

The City has been exploring options to fund a City-wide Drainage Study for several years; however, resources are limited, and existing resources have focused on improvements to the sanitary sewer system to reduce or eliminate sanitary sewer overflows. The City Department of Public Works routinely responds to flooding concerns after rainfall events and responds to storm sewer maintenance needs as they arise – in a reactive, emergency response manner. The City is aware that portions of the storm sewer network are deteriorated and potentially undersized, and some large culverts are either collapsed or blocked, which significantly restricts flow during rainfall events. Many of the areas of the City that routinely flood are socially and economically vulnerable neighborhoods, and flooding in these areas cause damage to personal property and homes. This project will allow the City to inventory the antiquated storm sewer system, conduct condition assessments of critical locations within the system, model the existing conditions of the closed and open storm sewer systems and provide drainage improvement recommendations that will provide flood prevention and protection in an equitable manner throughout the City.

3.0 Qualifications of Organizations Conducting the Study

The City has received input from a qualified, current on-call consultant regarding the scope and fee to conduct the Drainage Study and update the Floodplain Ordinance. The qualifications of the consultant were reviewed during the procurement phase for the annual services contract. A copy of proposal for the selected A/E firm is included in **Attachment 3**.

4.0 Expected Use of Study in Resilience Plan

The outcomes of both the City-wide Drainage Study and the updated Floodplain Ordinance will be directly relevant and incorporated into the Resilience Plan. The City is planning to develop the Resilience Plan concurrently with the development of the Drainage Study; therefore, the two projects will be closely tracked. The projects that are developed and prioritized as part of the Drainage Study will be directly incorporated into the Resilience Plan.

In addition, the regional rainfall analysis will be useful for regional resilience planning efforts as localities across the state are considering changes to their drainage design standards to account for larger and more intense rainfall events.

5.0 Additional Supporting Documentation

- Detailed Map of the Project Area: See **Attachment 4**. City of Covington WebGIS Viewer can be found here: https://covingtonva.maps.arcgis.com/apps/webappviewer/index.html?id=b4c12fb539e34a47a3db289f8c11c6d3
- FIRMette of the Project Area – Because the project area for the proposed Drainage Study is the entire City, the preliminary Flood Insurance Rate Maps are provided in **Attachment 5**.
- City of Covington Current Floodplain Ordinance: https://library.municode.com/va/covington/codes/code_of_ordinances?nodeId=PTIICOOR_APXBZO_ARTXIII-AFLDI
- Current Hazard Mitigation Plan: https://rvarc.org/community/hazard-mitigation/
- Current Comprehensive Plan: https://public.3.basecamp.com/p/UmJw2ghsfpj3enw4RDLGN43f

Budget Narrative

Per the CFPF Grant Manual, the following budget narrative was created for the activities contained in this grant application.

Task	Project Budget	Source of Estimate
Drainage Study ***Including Evaluation of Regional Rainfall Data and Floodplain Ordinance Updates***	**$357,800**	Consultant Cost Estimate (see **Attachment 6**)
Total Requested Grant Amount	**$357,800**	

The total amount of funds requested is $357,800. Per the instructions in the Grant Manual (page 24), "for local governments designated as low-income geographic areas, 100 percent of the estimated total project costs should be included." The City does not have cash funds available for a match, and requests full funding of this project, per the authorization letter signed by the City Manager.

Attn: David C. Bryant, Jr., Director of Finance and Administration

RE: Request for Proposals: Professional Engineering Services for General Services Term Contract Agreement

Dear Mr. Bryant:

AECOM Technical Services, Inc. (AECOM) is pleased to submit three (3) copies of our proposal, in response to the City of Covington, VA (the City) request for proposals titled "Professional Engineering Services for General Services Term Contract Agreement".

We are excited about the opportunity to express our interest in this contract and to continue the relationship between AECOM and the City. AECOM offers the City:

- **Experienced management.** AECOM's management team understands the City, term contracts, the need for responsiveness, and how to perform as an extension to your staff. Our Project Manager, Shane Powers has extensive Virginia local government term contract experience and they are both linked to AECOM's long-standing relationship with the City having most recently completed the Industrial Park Industrial Study.
- **Readily accessible and experienced staff members.** This contract will be managed and task orders executed from our Roanoke office. Every member of our Roanoke-based project team has local Virginia government experience and a significant number of our team members have worked on project in Alleghany County.
- **Depth of Resources.** AECOM has the depth and breadth of resources to provide specialized expertise needed for this contract and the ability to respond in a flexible manner through our local office to readily adapt to the City's unique needs.

Our qualifications make AECOM the right choice to meet all of the City's requirements for this engineering services term contract.

Thank you for the opportunity to submit our qualifications and express our interest in this contract. We look forward to the opportunity to meet with you and members of the City's selection committee to: expand upon our qualifications, express our desire to serve the City of Covington and to answer your questions. For additional information on AECOM's capabilities and experience, please contact our proposed contract manager, Shane Powers, PLP at 540.529. 1356 or Shane.Powers@aecom.com or Ron Smith at 540.857.3374 or ronald.smith2@aecom.com.

Sincerely,

Ronald B. Smith, PE
Vice President

Shane Powers, PLP
Contract Manager

Evaluation Criteria

EVALUATION CRITERIA

Please see AECOM's response to the evaluation criteria below.

1. **Ability to perform the subject work**

AECOM has examined the current and projected workloads of all proposed team members and have determined that they have no obligations, either present or future, that would prevent them from performing with excellence on any task assigned to AECOM under this contract. One of the advantages of being a large firm with significant depth of manpower is that we can handle new projects without compromising our existing commitments. AECOM's current and projected backlog office-wide is moderate, and our staff has ample capacity for the additional work that will be generated by this contract.

2. **Current workload or agreements with the City**

AECOM's current workload with the City is too provide construction administration services for the Alleghany Courthouse renovations. This workload will not impact any new work that would be awarded in this contract.

3. **Current workload on projects other than with the City as illustrated below for our key staff.**

Name	Role	Workload/ Availability
Shane Powers, PLP	Contract Manger	55% | **45%**
Ian Camper, PE	Quality Control	70% | **30%**
Mark Garland, PE	Civil Projects Lead	75% | **25%**
Scott Hodge, PE	Transportation Lead	60% | **40%**
Brian Fisher, PE	Plan Development/ Utility Lead	60% | **40%**
John Wissinger, AIA	Architecture Lead	65% | **35%**
Michael Lauman, PE	MEP Services Lead	50% | **50%**
Andy Freeland, PE	Stormwater/ E&SC Review Lead	65% | **35%**
Todd Wheatly,PE	HVAC Mechanical	65% | **35%**
Rob Dean, PE	Bridge/PER	65% | **35%**
Stuart Martin, PE	Traffic Studies	75% | **25%**

4. **Past performance on similar projects**

The following client references demonstrate our successful performance on similar projects.

a. **Alleghany County**
Jonathan Lanford, County Administrator

E. RESUMES OF KEY PERSONNEL PROPOSED FOR THIS CONTRACT

12. NAME	13. ROLE IN THIS CONTRACT	14. YEARS EXPERIENCE	
		a. TOTAL	b. WITH CURRENT FIRM
Shane Powers, PLP	**Contract Manager**	31	31

15. FIRM NAME AND LOCATION (City and State) AECOM (Roanoke, VA)

16. EDUCATION (Degree and Specialization)	17. CURRENT PROFESSIONAL REGISTRATION (State and Discipline)
BS/ Surveying Engineering Technology AS/Construction Engineering Technology	Certified Construction Contract Administrator; Certified Cost Consultant; Construction Documents Technician

18. OTHER PROFESSIONAL QUALIFICATIONS (Publications, Organizations, Training, Awards)

Mr. Powers' experience includes: managing of site/civil, geotechnical, survey, water storage and distribution; storm drainage; and environmental investigation, remediation, and permitting. His projects involve site/civil, site master planning, building designs, parking, roadways, pedestrian walk way trails, water and sanitary sewer systems and complete site design packages for building projects.

19. RELEVANT PROJECTS

a. (1) TITLE AND LOCATION *(City and State)* **See Project 2 in Section F**

Site Evaluation Study for E911 Center, Alleghany/Clifton Forge/Covington, VA

(2) YEAR COMPLETED	
PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
2015	N/A

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE

☒ Check if project performed with current firm

Project Manager. In charge for developing the site selection grading criteria for the new Alleghany E911 facility. The document was adapted to meet the needs of Alleghany County and to incorporate AECOM's experience in site selection process for other facilities. Selection criteria that was downplayed or removed were those that applied to more urban environments or those that compared existing buildings. Other sections were added or emphasized that are important to Alleghany County such as radio connectivity and cost.

b. (1) TITLE AND LOCATION *(City and State)* **See Project 3 in Section F**

Drone Zone, City of Covington and Alleghany County, VA

(2) YEAR COMPLETED	
PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
2018	N/A

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE

☒ Check if project performed with current firm

Project Manager. PM in charge to provide a comprehensive study to analyze the confluence of requirements for a business plan, business operations, marketing plan and infrastructure land and building assessment to help create a framework for successful implementation of the envisioned by the Alleghany Highlands Drone Zone committee. The preselected sites were within the County. Based on the evaluations, and proposed development for the subject sites, recommendations were offered in the comprehensive study. Cost estimates were provided to perform the work.

c. (1) TITLE AND LOCATION *(City and State)* **See Project 8 in Section F**

Storm Drain Installation at the Riverside Corporate Center
Roanoke, VA

(2) YEAR COMPLETED	
PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
2011	2016

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE

☒ Check if project performed with current firm

Project Manager. PM in charge to provide design for the Storm Drain Installation project located at the Riverside Corporate Center. The project involved coordination construction of 950 linear feet of 48" RCP storm drain piping from starting at Riverside Street running to the edge of Roanoke River. The property was owned by the City of Roanoke. In addition, construction administration services were provided to support the construction phase.

d. (1) TITLE AND LOCATION *(City and State)* **See Project 10 in Section F**

South Jefferson Redevelopment Area Virginia
Roanoke, VA

(2) YEAR COMPLETED	
PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
2005	Ongoing

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE

☒ Check if project performed with current firm

Civil Support Technical Leader: Served as lead to summarize the existing site infrastructure and available utilities located at the Site in order to share the property data with potential investors. These investigations were prepared for Roanoke City and were based on desktop investigations, GIS, site observations and contact with the local utility providers.. The site infrastructure included water supply, sanitary sewer, power, gas, telecommunications, and transportation access to the site.

E. RESUMES OF KEY PERSONNEL PROPOSED FOR THIS CONTRACT

12. NAME	13. ROLE IN THIS CONTRACT	14. YEARS EXPERIENCE a. TOTAL	14. YEARS EXPERIENCE b. WITH CURRENT FIRM
Ian Camper, PE	**Quality Control**	14	14

15. FIRM NAME AND LOCATION (City and State): AECOM (Roanoke, VA)

16. EDUCATION (Degree and Specialization)	17. CURRENT PROFESSIONAL REGISTRATION (State and Discipline)
BS/Civil and Environmental Engineering	Professional Engineer: VA

18. OTHER PROFESSIONAL QUALIFICATIONS (Publications, Organizations, Training, Awards)

Ian is an Associate Vice President, project manager and senior engineering manager responsible for the preparation of technical deliverables in accordance with AECOM's ISO 9001 Quality Control Procedures. His responsibilities include the development of project QA/QC procedures, scheduling and overseeing QA/QC reviews, and documenting QA/QC efforts in accordance with AECOM and client requirements. Ian also serves as the Lead Verifier for AECOM Roanoke's civil engineering practice, with responsibilities to verify QC reviews were carried out in accordance with AECOM procedures.

19. RELEVANT PROJECTS

a. (1) TITLE AND LOCATION *(City and State)* **See Project 9 in Section F**	(2) YEAR COMPLETED PROFESSIONAL SERVICES	(2) YEAR COMPLETED CONSTRUCTION (If applicable)
Virginia Department of Transportation, Route 11, 220, & 220A – Access Management Project at Exit 150, Botetourt County, VA	2014	2018

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Quality Control. Provided quality control reviews for utility relocation design in support of improvements to the Interstate I-81 Exit 150 interchange. Verified that construction documents were prepared in accordance with VDOT, VDH, VDEQ, and Botetourt County technical requirements and design was coordinated across multiple disciplines. Verified that stakeholder comments were adequately addressed and closed out.

b. (1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED PROFESSIONAL SERVICES	(2) YEAR COMPLETED CONSTRUCTION (If applicable)
Prince William County, Locust Shade Waterline Replacement, Prince William County, VA	2017	2021

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Quality Control. Provided quality control reviews for the design of the replacement of 1.5 miles of waterline to service the Locust Shade Park. Provided review of a water distribution system hydraulic model developed to determine design alternatives for replacement. Verified that construction documents were prepared in accordance with PWCSA, VDOT and VDH requirements. Verified stakeholder comments were adequately addressed and closed out.

c. (1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED PROFESSIONAL SERVICES	(2) YEAR COMPLETED CONSTRUCTION (If applicable)
Alleghany County, Lower Jackson River Regional WWTP, Alleghany County, VA	2011	2012

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Engineer. Lead design engineer for the design of a new 2.6 mgd wastewater treatment plant for enhanced nutrient removal. Design engineer for the aeration basins, secondary clarifiers, effluent filtration, UV disinfection, aerobic sludge digestion, non-potable water system, and plantwide SCADA system.

d. (1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED PROFESSIONAL SERVICES	(2) YEAR COMPLETED CONSTRUCTION (If applicable)
Hampton Roads Sanitation District, James River Treatment Plan – SWIFT Upgrades, Newport News, VA	2020	2023 (Est)

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Quality Control. Provided quality reviews for wastewater treatment process improvements at the James River Treatment Plant as part of HRSD's SWIFT program. Reviewed design-build RFP documents for technical adequacy, discipline coordination, and compliance with HRSD and VDEQ requirements. Coordinated with the designers for resolution of reviewer and stakeholder comments before issuance of the final RFP documents.

e. (1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED PROFESSIONAL SERVICES	(2) YEAR COMPLETED CONSTRUCTION (If applicable)
Alleghany County, Clifton Forge WWTP Conversion to Pump Station, Clifton Forge, VA	2011	2012

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Quality Review. Provided quality reviews for the design of a new 5.0 mgd pump station and closure of the existing 2.0 mgd Clifton Forge WWTP. Verified construction documents were prepared in accordance with VDEQ and WQIF requirements and the design was coordinated across multiple disciplines. Verified that internal and external comments were resolved and addressed.

BS/Civil Engineering	Professional Engineer: VA

18. OTHER PROFESSIONAL QUALIFICATIONS (Publications, Organizations, Training, Awards)

Mr. Hodge is experienced in the project management, preliminary and final site layouts for bridge and highway projects. His experience also includes preliminary highway and railroad designs; location studies and environmental impact statement oversight; final rural and urban highway designs; final passenger and freight railroad designs; design/build projects; and industrial park layout and infrastructure design. Mr. Hodge has additional experience in surveying, plat descriptions, site layouts, and rights-of-way.

19. RELEVANT PROJECTS

a.	(1) TITLE AND LOCATION *(City and State)* **See Project 7 in Section F**	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	City of Roanoke, Franklin Road Bridge Replacement, Roanoke, VA	2016	2019

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Manager. Provided engineering services for this project to completely replace the 550-ft long bridge on Franklin Road over ten tracks of Norfolk Southern Railway and Route 220 Expressway Ramp. The new structure includes haunched steel plate girders with decorative railing and lighting details. Services provided include study of alternatives for the replacement structure, bridge and roadway design, traffic management plans, aesthetic enhancements, and coordination with key stakeholders including NS Railway, VDHR, and utility owners. AECOM is currently providing construction phase services. Brief description of what you did on this project.

b.	(1) TITLE AND LOCATION *(City and State)* **See Project 9 in Section F**	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	VDOT, Route 11, 220, 220A Access Management at Exit 150 at I-81, Botetourt County, VA	2014	2018

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Manager. Provided the concept study and final design phases of improvements to Route 11 at the I-81 Exit 150 interchange including a hybrid roundabout and loop road connection from Route 11 to Route 220A. Services included coordinated traffic modeling, roadway design, multiple intersection designs, drainage design, application of access management criteria, signal design, Transportation Management Plan, landscaping design, signage and pavement marking plans, ITS and geotechnical services.

c.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	City of Lynchburg, Midtown Connector, Lynchburg, VA	2011	2018

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Manager. Provided engineering services for the proposed new one-mile-long roadway along with a roundabout. The proposed 3-lane context-sensitive roadway is classified an urban roadway. Responsible for providing roadway design, roadway drainage, stormwater management basins, erosion and sediment plans, water and sanitary sewer design, signal design, environmental review, geotechnical, and maintenance of traffic plans.

d.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	Roanoke County, Merriman Road Roundabout, Roanoke County, VA	2010	2011

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Manager. Provided construction plans for a 5-legged roundabout that connects the nearby elementary school, the new county library, and heavily traveled Merriman Road. Also performed roadway drainage calculations, storm drain systems, stormwater management facilities, and E&S measures.

BS/Civil Engineering	Professional Engineer: VA, NC, SC, IL, IN, WI

18. OTHER PROFESSIONAL QUALIFICATIONS (Publications, Organizations, Training, Awards)

Mr. Fisher has designed many large, complex sites overcoming challenges of topography, access, utility locations, regulatory issues, vehicular and pedestrian circulation, security concerns, storm water management, and other site requirements. He has served as the Lead Civil Engineer or performed Quality Control checking on projects for schools, hospitals, office complexes, parking garages, firing ranges, manufacturing facilities, and others.

19. RELEVANT PROJECTS

a.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	Fallowater Lane Extension, Roanoke County, VA	2019	N/A
	(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE	☒ Check if project performed with current firm	

Project Engineer. Responsible for the water and sanitary line designs to support the Fallowater Lane Road Extension located in Roanoke County, Va. The road was approximately 0.25 miles had an urban local designation with curb and gutter and sidewalk on one side. The existing pavement was incorporated into the new road. A very important as aspect of the project was to maintain access and water/sanitary supplies to the existing businesses during construction and to minimize any adverse impacts to them. A design exception was needed from VDOT due to the proximity of the existing business entrances. The estimated construction cost is $1.8M. The project was being performed as a Locally Administered Project (LAP) with VDOT (no federal funding). Roanoke County administer the Preliminary Engineering (PE) phase and VDOT administer the Right of Way (ROW) phase.

b.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	ATFP Project – Private Client	2019	N/A
	(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE	☒ Check if project performed with current firm	

Project Engineer. Responsible for conducting a site investigation and gathered existing documentation. Those included, site geometry, passive and active vehicle control barriers, security fencing and gates, personnel protection, traffic considerations, lane requirements, pavement geometry, speed management, traffic control devices, inspection facilities, utility systems, and operational practices. Mr. Fisher met with the stakeholders to understand their concerns and expectations. Mr. Fisher identified threat vulnerabilities and develop recommendations for short-term improvements to improve the site's security posture. He and developed a cost-effective plan with exhibits and a descriptive narrative for the ATFP that will comply with the requirements of the physical security standards. He then developed design documents.

c.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	Western Virginia Water Authority, Roanoke City, VA	2020	N/A
	(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE	☒ Check if project performed with current firm	

Project Engineer. Responsible for the preliminary masterplanning and site development for the new maintenance facility. Several site development alternatives were developed during the charrette process. GIS and local utility data was used to generate the alternative approaches that included building, maintenance shed, fueling pads, road, and parking areas. An important as aspect of the project was to maintain circular access to all the existing site functions within the client's property boundaries. Additionally, phasing was necessary to maintain use of existing administration facilities.

d.	(1) TITLE AND LOCATION *(City and State)*	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	Government Confidential Client, Parking Garage Infill/Parking Lot, Chantilly, VA	2019	Ongoing
	(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE	☒ Check if project performed with current firm	

Civil Engineering Lead. Lead for the design of the project which included a Parking Garage expansion and a new 158 space parking lot and necessary appurtenances. Sitework included clearing, select site demolition, utility adjustments, grading, parking lot improvements, walking trail relocation and storm water management. He is also providing construction administration services (i.e., reviewing the shop drawings, site visits and RFI reviews).

Lead Traffic Engineer. Lead Traffic Engineer for the planning, alternatives analysis and conceptual design of intersections improvements at an intersection with high crash rates. Responsibilities include sensitivity analysis of intersection and interchange design concepts, traffic operations analysis using HCS+, turn lane warrant analysis, conceptual design and design year traffic volume projections. Mr. Martin leads the effort to develop the technical report to the Town of Blacksburg summarizing the study.

c.	(1) TITLE AND LOCATION (*City and State*)	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	City of Lynchburg, Midtown Connector, Lynchburg, VA	2016	Ongoing

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Lead Traffic Engineer. Served as Lead Traffic Engineer for this LAP project in Lynchburg for the proposed new one-mile-long roadway along with a roundabout. The proposed 3-lane context-sensitive roadway is classified an urban roadway that involved roadway and drainage design, SWM, erosion and sediment plans, water and sanitary sewer design, signal design, environmental review, geotechnical, and maintenance of traffic plans. Responsibilities included quality control of signage, pavement marking and maintenance of traffic plans, traffic signal design, roundabout operations analysis, and construction administration.

d.	(1) TITLE AND LOCATION (*City and State*)	(2) YEAR COMPLETED	
		PROFESSIONAL SERVICES	CONSTRUCTION (If applicable)
	VDOT On-Call Design-Build/P3 Support: I-581/Elm Avenue Interchange, Roanoke, VA	Ongoing	N/A

(3) BRIEF DESCRIPTION (Brief scope, size, cost, etc.) AND SPECIFIC ROLE ☒ Check if project performed with current firm

Project Engineer. Scope of services includes RFP development and project management, proof of concept plans, and an Interchange Modification Report for VDOT/FHWA approval. Mr. Martin is responsible for technical portions of the RFP, coordinating with local agencies/utilities, preliminary traffic signal design, preliminary signage and pavement marking plans, traffic operational analysis, signal timing plans, drafting of special provisions, and Synchro/SimTraffic traffic modeling.

F. EXAMPLE PROJECTS WHICH BEST ILLUSTRATE PROPOSED TEAM'S QUALIFICATIONS FOR THIS CONTRACT

20. EXAMPLE PROJECT KEY NUMBER		**1**	
21. TITLE AND LOCATION (City and State)		22. YEAR COMPLETED	
Alleghany County COVID-19 Renovations Alleghany County, VA		PROFESSIONAL SERVICES 2020	CONSTRUCTION (if applicable) 2021

23. PROJECT OWNER'S INFORMATION

a. PROJECT OWNER	b. POINT OF CONTACT NAME	c. POINT OF CONTACT TELEPHONE NUMBER
Alleghany County	Jonathan Lanford	540.969.6774

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

AECOM provided Alleghany County schematic design and construction documentation services for renovations related to health and safety protocols that have been caused by the COVID-19 pandemic. Full construction phase services are currently being provided as well. In total, eight specific areas were addressed through this project which impacted the County Courthouse and the Parks and Recreation Suite.

1. Building Entry & Security
2. Clerk's Office
3. Commonwealth Attorney's Offices
4. Witness protection Offices
5. Parks and Recreation Office
6. County Treasury Office
7. District Courtroom
8. District Clerk's Office

Areas were thoughtfully designed in order to integrate with the historic character of the courthouse building. Some interventions are temporary and designed for removal, while the majority provide long term solutions.

Relevance to the City:

☑ Security Planning

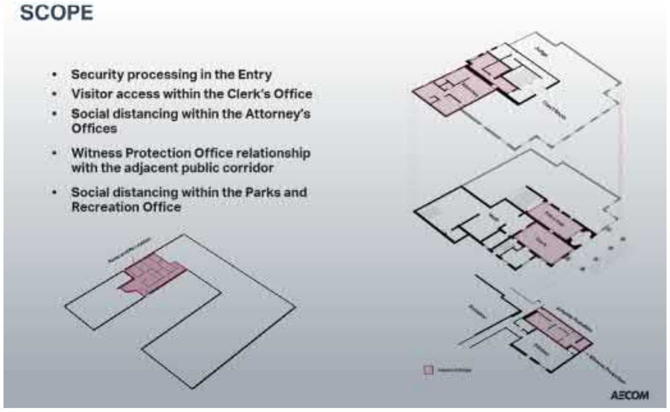
☑ Architecture and Interiors

☑ Mechanical Engineering

☑ Electrical Engineering

☑ Communications

Key Personnel: John Wissinger, AIA; Shane Powers, PE; Daniel DiMarco, AIA, LEED AP BD+C; Michael Lauman, PE; Mary Silcox, Michael Lauman, PE; Todd Wheatley, PE



SCOPE

- Security processing in the Entry
- Visitor access within the Clerk's Office
- Social distancing within the Attorney's Offices
- Witness Protection Office relationship with the adjacent public corridor
- Social distancing within the Parks and Recreation Office

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

Relevance to the City:

- ☑ Master / Site Planning
- ☑ Civil Engineering
- ☑ Architecture and Interiors
- ☑ Mechanical Engineering
- ☑ Electrical Engineering
- ☑ Communications

Key Personnel: Shane Powers, PLP; Ian Camper, PE; Andy Freeland, PE, LEED AP

AECOM provided design services to develop and construct a new regional Emergency Call Center (E-911) Facility to serve Alleghany County and the City of Covington. The new E-911 facility will be owned and operated by Alleghany County. The County's original intent was to use land currently owned by the County on Pitzer Ridge Road as the site for the proposed E911 facility. AECOM provided architectural, communications technology and building engineering services for the siting study of the E911 facility. Additionally, AECOM conducted a communications technology evaluation study and prepared a space programming/planning study for the proposed E-911 facility.

As part of those services, AECOM and Sekiv Solutions presented preliminary opinions of probable construction cost to Alleghany County for the proposed E-911 facility at the Pitzer Ridge Road site. After evaluating those costs, the County determined that the cost to develop the Pitzer Ridge site was prohibitively high and desired to consider other locations. To accomplish this, the County requested that AECOM and Sekiv Solutions conduct a siting study to look for new alternative potential E-911 sites (both developed for renovation and greenfield/ undeveloped). Sekiv Solutions provided civil engineering services as a subconsultant to AECOM.

The E-911 Siting Study included the following tasks: Develop Site Evaluation Criteria and a Weighted Ranking System looking at topography, parcel size and shape, zoning, proximity to public utilities, site accessibility, suitable tower location can connectivity, interferences, impacts of potential vulnerabilities, and adaptability of existing structures. It also included a line of sight evaluation for connectivity to the existing County and City E-911 communication towers. A matrix ranking table was developed for evaluating the proposed sites.

The evaluation team, along with County staff, visited eleven sites and ranked each site using the matrix. These sites were previously chosen by the County as having the best potential to locate an E-911 facility. The evaluation team also included a structural engineer who visited the Falling Spring Elementary School site and observed existing conditions and reviewed design drawings for the last addition to the facility in 2003. A lead and asbestos specialist also visited the sites and observed facilities where access was available for signs of asbestos and lead paint to aid in developing a rough order of magnitude (ROM) cost for abatement should the facility be selected for renovations or demolition.

Site rankings were reviewed with County Staff to confirm ranking evaluations and to select up to four sites to carry forward to develop a concept level ROM preliminary opinion of probable construction cost. AECOM provided a ROM estimate cost differential for each of the preferred sites selected by the County, which included:

- Falling Springs Elementary School
- Adams Asphalt

- Mountain View Elementary School
- Nettleton Foundation Sites

Cost factors considered included building construction, site development, off site utilities, site-specific technology and connectivity, land, and contingency. The Falling Springs Elementary School was ranked the lowest cost location of the four sites evaluated.

City of Covington, Alleghany County & the Alleghany Highlands Economic Development Corporation	Jonathan Lanford	540.969.6774

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

AECOM and Drone Life (Subcontractor) provided Comprehensive Consulting Services to the City of Covington, Alleghany County & the Alleghany Highlands Economic Development Corporation. The project was funded by an Appalachian Regional Commission Planning Grant from the Virginia Department of Housing and Community Development for planning, needs assessment, marketing, and infrastructure approach for the Alleghany Highlands Drone Zone destination. The destination will help promote the Alleghany Highlands area for the emerging drone industry for R&D, Training and Recreational purposes.

The primary elements of the comprehensive strategy included: 1) Business Plan; 2) Business Operations; 3) Marketing Plan; and 4) Infrastructure Land & Building Site.

Key to the development of the strategy was engagement, collaboration and consensus building amongst a broad range of stakeholders including local government, key community leaders, higher education institutions, industry experts, industry entrepreneurs, and related economic partners. These workshops were conducted in person and virtually to bring as many people together as possible.

Relevance to the City:

- ☑ Civil Engineering
- ☑ Marketing Plans
- ☑ Architecture
- ☑ Funding Procurement

Key Personnel: Shane Powers, PLP; John Wissinger, AIA, LEED AP; Ian Camper, PE

The facilities proposed to support the Drone Zone include an old School, Field Site, and an abandoned Mine. High level analysis of each facility was conducted in order to ascertain the approximate level of investment required to meet the objectives for the project. Investment in each site will be phased as funding allows and consistent with the growth of the Drone Zone.

Carilion Clinic Center	Curtis Mills	540.981.7001

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

For more than 20 years AECOM has provided comprehensive design services for Carilion Clinic, meeting their needs for feasibility studies, small one room renovations and large new construction projects. All civil and utility infrastructure ensures that all buildings are fully services and resilient.

Center for Research, Simulation and Patient Safety: AECOM provided design services and construction administration services for the renovation of the Trolley Barn located at 15 Old Woods Avenue in Roanoke, VA. The historical trolley maintenance warehouse was re-purposed to accommodate the Carilion Simulation Center in approximately one half of the building footprint and provisions made for future use in the other half. The project includes the interior renovation area of approximately 10,620 DGSF to include distribution of existing engineering systems to support the new purpose.
The electrical design was able to make use of the existing power service. A high-end lighting design was used to celebrate the historical identity of the building. Security and telecommunication systems were also provided. Task orders included the following.

OPM Laboratory and Hokie Wellness Renovation: DS & CA services for renovation of a portion of the second floor of Riverside One in Riverside Center to include space for VTCRI MEG Lab and other spaces. The lab will include shielding requirements; 5,000 s.f.

Riverside 1 Bickle Suite Upfit: offices, meeting rooms and dry laboratories; 3,500 s.f.

Riverside One Medical Office Building Biosciences Suite Upfit: AECOM provided services for the Riverside One Medical Office Building (MOB) Biosciences Space upfit. The Virginia Tech Carilion Research Institute (VTCRI) is renovating an area of the 2nd floor of Carilion Clinic's Riverside One MOB, which is adjacent to the VTCRI building, to be upfitted for additional faculty offices and collaboration space for the Department of Biomedical Sciences. AECOM prepared a draft sketch of the proposed layout for the new upfit, which totals approximately 5,000 square feet for the new suite and associated corridor.

Relevance to the City:

☑ Surveying
☑ Civil Engineering
☑ Architecture and Interiors
☑ Mechanical Engineering
☑ Electrical Engineering
☑ Communications
☑ Security
☑ Geotechnical

Key Personnel: Shane Powers, PLP; John Wissinger, PE, AIA; Daniel DiMarco, AIA, LEED AP BD+C; Ian Camper, PE; Andy Freeland, PE, LEED AP; Mark Lawson, PLS; Mark Garland, PE; Michael Lauman, PE; Kyle Dobbins; Mary Silcox

Riverside 3 Generator Study: AECOM prepared a generator study for Carilion Riverside Clinic.

Translational Biology Medicine & Health Upfit: AECOM provided programming, planning and design services for a new College of Health Sciences for Virginia Tech (VT). The college was originally conceived by the director of the Virginia Tech Carilion Research Institute (VTCRI) and approved by the VT Board of Visitors in 2013. The College of Health

Sciences needed a new home for the inaugural class of 30 students slated to arrive in Roanoke in August 2014. Having successfully completed the VTC Research Institute in 2010, as well as several laboratory customizations for newly hired principal investigators since then, AECOM was selected to program, plan, and develop construction documents for this fast-paced, 6,000-square-foot project that needed to be open in less than seven months.

The design included a collaborative student area, a large lecture room, medium and small classrooms, audiovisual room, offices, break room, and support spaces. Sustainable design principles were also incorporated into the design. The facility is a higher education space with high quality finishes that are both durable and aesthetically pleasing. A rich color palette was developed that emphasized accent walls to provide a vibrant environment that would stimulate learning and collaboration. Carpet and acoustic ceiling tiles were used and the walls were designed to mitigate sound transfer. These features help provide an acoustically quiet environment that will support the facility's mission.

Simulation Center Concept Study: AECOM provided conceptual design services for a new 12,000 sf Simulation Center at the Virginia Tech Carilion (VTC) School of Medicine and Research Institute. VTC needs to expand its simulation training capabilities and identified Riverside 1 Medical Office Building, which is adjacent to the school and research center, as a possible location for the new Simulation Center. To assist VTC in obtaining state funding, AECOM programmed and developed a concept design and cost estimate for the new Simulation Center as part of a package submitted to the state to start approval process.

Health Sciences and Technology Expansion Building: AECOM provided architecture and engineering planning and design services for the Health Sciences and Technology Expansion Building at Virginia Tech's growing Roanoke Campus. This initial study was used to secure funding through state to begin the project in 2016.

Feasibility Study for Hospital Expansion: AECOM provided architecture and engineering planning and design services for expansion to the main hospital.

① **Virginia Tech Carilion School of Medicine and Research Institute (VTCRI PHASE I)**
As the gateway building to the academic medical campus, this 154,000 SF facility integrates laboratories, conference and classroom space, mock clinic spaces, offices and informal gathering spaces.

② **Biomedical Research Expansion Building (VTCRI Phase II)**
136,000 SF translational research building integrating thematic research areas with an imaging center, experiential learning and classroom areas and an experimental veterinary oncology treatment center.

③ **Institute for Orthopaedics and Neurosciences**
116,000 SF regional multi-specialty outpatient hub including orthopaedics, physical therapy and sports medicine, where integrated, and highly coordinated care is delivered while advancing translational research and educational initiatives in collaboration with Virginia Tech.

④ **Center for Simulation, Research and Patient Safety**
Transformation of Historic Trolley Barn into an advanced healthcare training environment which bridges the gap between the academic and clinical environment. It includes residential simulation space, operating rooms, trauma rooms, skills lab, classrooms and gathering areas.

⑤ **Carilion Medical Offices Building (Riverside 2)**
100,000 SF office and research building. It provides dedicated office space for Carilion and also tenant space for research and both start-up and established medical technologies companies.

⑥ **Carilion Clinics (Riverside 3)**
210,000 SF Outpatient clinic and Imaging Center; is housed under the largest green roof in the Roanoke Valley at 11,500 SF.

⑦ **Comparative Oncology Research Center for Virginia Maryland College of Veterinary Medicine**
Feasibility study for 16,500 s.f. of new clinical research space connected with adjacent Virginia Tech research building..

⑧ **Roanoke Memorial Hospital Addition Feasability Study**
Development potential study for a 920,000 SF addition comprising a new special imaging, ED, outpatient clinics, inpatient services and multi-level parking for up to 450 vehicles.

⑨ **Carilion Roanoke Community Hospital - Anatomy Teaching Labs**
Virginia Tech School of Medicine, Radford University and Jefferson College of Health Sciences collaborated to develop an interactive anatomy instruction suite including a flexible laboratory and an interactive briefing room.

⑩ **Carilion Clinic Riverside Parking Deck**
461,000 SF multi-level parking deck providing 1,480 vehicle spaces.

Carilion Clinic Center	Curtis Mills	540.981.7001

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

In 2018, Carilion Clinic selected AECOM to conduct a building assessment, followed by a feasibility study of a two-story, 130,000 SF, former J.C. Penney store located within a shopping mall, and the parking lot servicing the building, for potential use as a multi-specialty care clinical space. The study determined that the 50-year-old building's shell is generally in good condition and the structural framing is adequate to support the floor loading for a clinical occupancy. However, the existing systems — including electrical, mechanical, plumbing and fire protection — are aged and require replacement or upgrade to bring the facility up to current code standards. Available on-site parking and access adequately support the new use, and multiple options exist to develop the main entrance and patient drop-off area.

The AECOM project team surveyed the site and studied existing site elements to determine their suitability for reuse. Existing traffic patterns were analyzed and a new traffic pattern was designed for improved traffic flow and pedestrian safety, while also respecting the need for sufficient vehicle access to other retail tenants. Existing building entries were reconfigured with drop-off canopies and pedestrian waiting areas. New accessible parking areas and loading zones were created for enhanced patient access.

Fire, water and sewer services were replaced and reconfigured to improve the building's safety and current supply, with sufficient additional capacity built-in for future upgrades. Electrical and gas services were also upgraded, including the installation of an emergency standby generator.

Relevance to the City:

- ☑ Survey
- ☑ Civil Engineering
- ☑ Architecture and Interiors
- ☑ Mechanical Engineering
- ☑ Electrical Engineering
- ☑ Communications

Key Personnel: John Wissinger, PE, AIA; Mark Garland, PE; Andy Freeland, PE, LEED AP; Michael Lauman, PE; Kyle Dobbins; Mark Lawson, PLS; Daniel DiMarco, AIA, LEED AP BD+C; Mary Silcox

1A lighted translucent panel system illuminates the building's northeast corner, and green walls soften the facade.

Carilion Tanglewood Multi-Specialty Clinic 5

Existing and proposed stormwater systems were also studied to determine any existing points of inadequacy and utilize Nutrient Credit Banking for the most cost-efficient solution for compliance with Virginia Stormwater Management Program regulations. AECOM worked closely with the Western Virginia Water Authority, Roanoke County, VDOT and other project stakeholders throughout the design process to ensure agreement to the project approach.

Following the review of this study, AECOM was contracted as the designer-of-record to repurpose this former retail store into the new Carilion Tanglewood Multi-Specialty Clinic. The clinic will provide pediatric, ENT and plastic surgery services, as well as dental services for both children and adults. Outpatient procedures only will be offered at this clinic. Pediatric services to be provided include General, Adolescent, Physical Therapy/Occupational Therapy, Behavioral Health, Oncology, Endocrinology, Gastroenterology, Cardiology, Pulmonary & Allergy, and pre- and post-surgery clinical visits.

In February 2020, the AECOM project team began collaborating with leadership from pediatrics, dentistry, ENT, Audiology, and Plastic Surgery to develop a design that fits Carilion's goals and vision for the consolidation of all these services under one roof.

The project cost is estimated at $30 million, and the facility is anticipated to open in the summer of 2021.

The patient drop-off zone is designed for two or more vehicles at the entry canopy.

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

AECOM has provided services for Virginia Tech for more than 40 years. In 2018 AECOM was selected again to provide architectural and engineering services to Virginia Tech under a one-year term contract with up to four annual renewals. We have already performed services for six project orders as part of this relationship.

Ambler Johnston Courtyard Renovation: Concept Design through Construction Documents and on-call construction phase services were provided for this transformational exterior project. The design transitions the poorly utilized courtyard across four phases of work into a desirable exterior space that supports a multitude of learning environments for this student residence hall. Drainage, accessibility and spreading capital costs across multiple fiscal years were important drivers.

Cochrane Hall Structural Study: AECOM performed site observation and assessment for structural integrity.

Temporary War Gymnasium: Provided select architecture and engineering services in collaboration with a civil engineering firm and a manufacturer of Fabric Tensile Structures. The gymnasium, large enough to contain four basketball courts was developed over the top of existing tennis courts. This low cost solution allowed the University to continue to provide student activity space while the main gymnasium undergoes a significant renovation

Miles Hall Renovations: Full A/E concept design, construction documentation and construction phase services are being provided for select renovations including the laundry room, accessible restroom and shower, student lounge and two bedrooms of this dormitory. Construction is scheduled to begin in May 2021

Payne Hall Mechanical System Renovations: AECOM has designed a full replacement system of the mechanical systems to this dormitory. Associated works involving architecture, interior design, electrical engineering and plumbing engineering are also being provided. Phase 1 of construction is scheduled for the summer of 2021.

Relevance to the City:

- ☑ Civil Engineering
- ☑ Architecture and Interiors
- ☑ Structural Engineering
- ☑ Mechanical Engineering
- ☑ Electrical Engineering
- ☑ Communications

Key Personnel: John Wissinger, AIA, LEED AP; Daniel DiMarco, LEED AP BD+C; Todd Wheatley, PE; Michael Lauman, PE; Kyle Dobbins; Mark Lawson, PLS; Brian Fisher, PE; Mary Silcox

Whittemore Hall Clean Room Renovation: The design of all support systems to accommodate three new specialized pieces of equipment as well as a new process chiller to cool six additional machines is included within the scope of this project.

These additional projects were also carried out during the term contract held between 2008 and 2012.

Norris Hall Study: AECOM was responsible for the design of the new space configuration for the second floor of Norris Hall through the design development phase.

Surge Space Building Upfit: The flexible design of the Surge Building allowed quick reconfiguration and additional benefits.

Working Drawings Review - Ambler Johnston Hall Renovation: Ambler Johnston Hall is a roughly 270,000 GSF, seven-story residence hall originally constructed in 1949. The building underwent a complete phased renovation. AECOM provided a peer review of the Working Drawings (95% complete) prepared by the Architect/ Engineer of Record.

President's Suite Renovation: AECOM designed renovations to Burruss Hall 210, the President's Suite and Conference Room. This included replacement of reception area, boardroom and corridor ceiling, along with light fixtures and mechanical system diffusers, as needed.

Randolph Hall HVAC Renovations: Randolph Hall was built in the 1950s. AECOM was tasked with designing chilled water air handling units to condition several classrooms and offices in the building.

VET MED Building Emergency Power Upgrades: AECOM designed a new 300kW generator and diesel fuel storage tank for hte exterior of the Virginia-Maryland Regional College of Veterinary Medicine (VET MED).

Additional Tasks include:

- A/E Design Services for Vivarium Feasibility Study
- RB26 MRI Feasibility Study
- VT Research Institute MRI Feasibility Study (a 1,565-square-foot MRI suite within an active veterinary hospital. The MRI is designed to be accessible to farm animals.)
- Virginia-Maryland Regional College of Veterinary
- Medicine Normal Power
- Virginia Tech Carilion Research Institute 3rd Floor Studies
- Lane Stadium Antenna Grounding
- FFE Design Packages for Virginia Tech/Carilion School of Medicine and Research Institute
- Bioinformatics Emergency Power and Redundancy Study
- Virginia Maryland School of Veterinary Medicine Emergency Power Upgrades
- Cassell Coliseum and Jamerson Hall Plumbing Study
- Cassell Coliseum Piping Replacement Design

City of Roanoke	Mr. Luke Pugh, PE	540.853.5208

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

AECOM provided engineering services to the City of Roanoke for the project to replace the fracture critical bridge on Franklin Road over ten tracks of the Norfolk Southern Railway Company. This bridge is located in a constricted urban setting and serves as a gateway to the City's Old Southwest Historic District.

During the preliminary design phase, AECOM developed an evaluation of alternatives for the replacement structure, including various alignments and structure types from conventional curved girders to signature cable stay spans. A corridor study was conducted to ensure compatibility of the new structure with the City's long term planning goals. This evaluation included sampling and testing of selected substructure elements to evaluate their reuse in the new structure.

Final design phase services included bridge and roadway design, geotechnical investigation, sequence of construction plans, traffic management plans, stormwater management, intersection signalization, roadway lighting, and landscaping. AECOM developed renderings for the proposed aesthetic enhancements in support of public relations and served as the City's agent in co-ordination with Norfolk Southern Railway, and supporter approval by regulatory agencies such as Virginia Department of Historic Resources and the City's Comprehensive Land Development Review.

Relevance to the City:

- ☑ Survey
- ☑ Phase I Environmental Services
- ☑ Roadway Design
- ☑ Bridge Design
- ☑ Stormwater Management

Key Personnel: Scott Hodge, PE; Stuart Martin, PE; Ryan Fedak, PE, CFM; John Wissinger, AIA, LEED, AP; Rob Dean, PE

The replacement structure will carry three lanes of traffic with accommodation for pedestrian and bicycle users. The superstructure will consist of haunched steel girders and a concrete deck. Aesthetic enhancements include decorative railing, ornamental lighting, and decorative pylons at each end of the bridge.

Carilion Clinic	Curtis Mills	540.981.7001

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

AECOM was commissioned by Carilion Clinic to prepare a design for the Storm Drain Installation project located at the Riverside Corporate Center. The project involved coordination construction of 950 linear feet of 48" RCP storm drain piping from starting at Riverside Street running to the edge of Roanoke River. The property was owned by the City of Roanoke.

The piping alignment of the 48" pipe was established to take full advantage of clear paths and to preserve magnolia trees and to preserve the newly constructed Roanoke River levee. Great care was taken with align the piping while protecting the roots of the historic magnolia trees. Even greater protection had to be taken while penetrating the Roanoke River levee. This penetration required jacking and boring of approximately 80' of a 48" steel casing pipe.

Water flap valve requirements were very important for the success of the storm drain system. Tidal flap valves with precise adjustments were made to receive approval by City of Roanoke and USACE to release water into river. AECOM provided topographical and utility survey, existing structures elevations and easement preparation documentation for the City of Roanoke. After the project was complete, AECOM had to verify the existing structures elevations to confirm as-built conditions to meet the City's requirements.

There were numerous subsurface challenges that included existing utilities, abandoned utilities and fluctuating river flow elevations. AECOM prepared flow calculations and E&S documentation under the City of Roanoke design requirements.

As a part of the construction development phase, AECOM assisted the Owner with solicitation of bidders, review of the bids, RFI review, show drawing reviews, review and approval of payment request, periodic site observations with substantial and final inspections.

Project Overview

AECOM developed multiple alternatives for evaluation to solve current and future issues at the Exit 150 interchange to I-81 the interface with Route 11, and intersection with Route 220. Our team's alternative development and evaluation included coordination of traffic modeling, preliminary drainage design, and application of access management criteria. The final project included an alternative evaluation report with a recommended preferred alternative for use in an Interchange Modification Report. The project's final design is complete and included development of final construction plans for roadway, drainage, signal design, stormwater management (SWM), and roundabout design. AECOM assisted VDOT during construction.

City of Roanoke	Luke Pugh	540.853.5208

24. BRIEF DESCRIPTION OF PROJECT AND RELEVANCE TO THIS CONTRACT (Include scope, size, and cost)

Project Overview

For more than 20 years AECOM has been providing services instrumental in the redevelopment of the South Jefferson area of Roanoke. AECOM first analyzed a development for 110 acres located south of Roanoke's central business district. AECOM also prepared development design guidelines and an assessment to assist local officials in determining "blight" conditions for other eligible properties. These properties were located on approximately 110 acres, 80% of which are within the 100-year Roanoke River flood plain. AECOM provided master planning and land use planning services, economic assessments and analyses, preliminary assessment of the flood hazard risk, and environmental hazard risk and structural evaluations.

The primary goal of this analysis was to promote private reinvestment and economic growth for the area. The plan has fostered positive economic development through a staged process of public/private redevelopment and/or rehabilitation throughout the entire area and along key corridors connecting to downtown Roanoke including the VT School of Medicine and Research Institute.

The plan also provided an urban development pattern that mitigates environmental risk and was compatible with the surrounding commercial and residential districts.

Riverside Campus Masterplan Update: AECOM performed master planning for the Riverside Medical Center. This vision of a new biomedical research center transformed 40 acres of blighted floodplain along the southern edge of downtown Roanoke and adjacent to Carilion Health Care Center. The plan accommodates over 1 million square feet (msf) of new clinical, education, research and office space around a central landscaped enclave of which more than half has now been built. A 1,400 car parking deck provides convenient parking and access to the campus pedestrian core. Development and architectural guidelines respond to the critical site issues, modulate scale and mass, and prescribe the architectural appearance of the campus to ensure continuity with the downtown fabric, context with the adjacent buildings, and cohesiveness among campus structures.

Relevance to the City:

☑ Master Planning

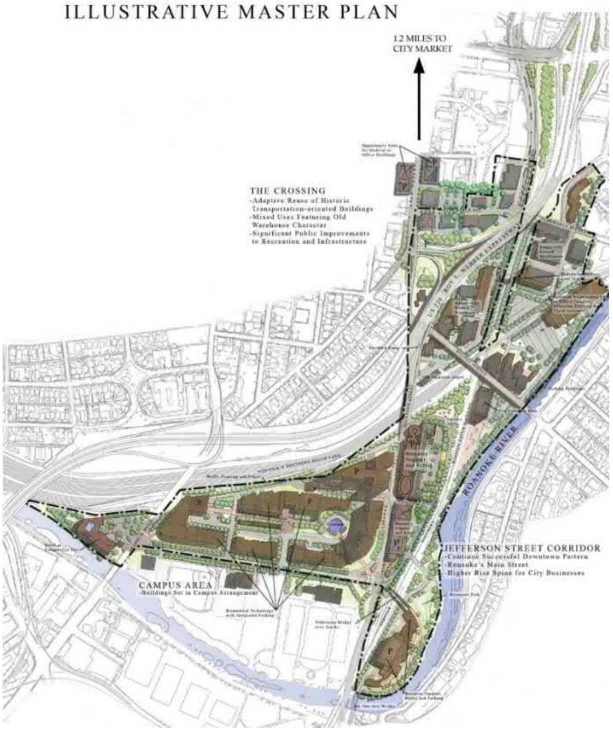
☑ Economic Assessment

☑ Structural Evaluations

Key Personnel: Shane Powers, PLP; Andy Freeland, PE, LEED AP; Mark Lawson, PLS; Scott Hodge, PE; Kyle Dobbins; John Wissinger, AIA; Daniel DiMarco, AIA, LEED AP BD+C

As each new building has been constructed AECOM has continued to update the stormwater masterplan to reflect the actual built condition and the requirement for the remaining developable land.

AECOM has also provided development studies for related parcels to determine the most advantageous sites for growth.



South Jefferson Redevelopment Area Virginia 10

Introduction

We are a local firm with a global footprint; giving us the ability to provide the highest level of customer service and responsiveness coupled with extensive resources and expertise. AECOM has a local office in Roanoke, bringing the experiences of more than 170 professionals to serve the needs of the City of Covington (the City). In addition to our Roanoke offices, we have 9 other Virginia-based offices, which bring to the table over 2,000 professionals across all of our major business lines (water/wastewater, transportation, buildings and places, and environment). AECOM, as a worldwide provider of architectural and engineering services, has the capacity to serve the City with a full spectrum of services.

With AECOM's global reach of resources, we are able to extend our capacity to provide architectural and engineering services beyond our local footprint by accessing our depth of resources through our company-wide Technical Practices Network (TPN), composed of specialty work groups from various engineering and consulting disciplines. Our TPN is an invaluable resource that allows team members to solicit information and/or respond to inquiries on challenges that may have been encountered and addressed on similar projects anywhere in the world. AECOM's TPN is also available to our clients, where they can engage our experts to discuss solutions for their specific challenge.

Our History and Relationship with the City of Covington

AECOM, through its Virginia-based legacy companies, has been providing architectural and engineering services to local governments like the City since 1948. We have built a solid reputation by providing our clients with a wide-range of quality professional services to meet their many varied needs. We understand western Virginia and how to successfully partner with Virginia's local governments.

AECOM has a long standing relationship with the City and Alleghany County, and we look forward to continuing to partner with you by providing our architectural and engineering capabilities on upcoming public works and capital improvement construction projects

Whether boundary/topographic surveys, infrastructure, buildings, environmental, regulatory compliance, economic development services or transportation, AECOM has the experience and expertise to meet the City's needs as outlined in the RFP.

AECOM has prior experience in working directly in and for the City and Alleghany County. Below is a listing of some of the projects where AECOM has served the City and Alleghany County area:

- Renovation to County Courthouse
- VA P25 Radio System Project
- Drone Zone Project
- ADA Compliant Access – Alleghany County Courthouse Front Entrance Ramp
- Industrial Park Utility Analysis
- E911 Site Analysis and Center Development
- Water Storage Tank Recoating

- Lower Jackson River Regional Wastewater Treatment Plant (10 year multi-phase project)
- Fork Farm Road Bridge
- Jackson River Bridge (to BACOVA Guild)
- Bridge over the Jackson River (to elementary/middle school)
- PSAP Consolidation Studies – Virginia Information Technologies Agency (VITA)

Advantages to the City of Covington

Resource Control: By having AECOM staff primarily from our Roanoke operations provides these services, we can make sure that we have the right personnel with the right expertise, experience, and capabilities assigned to your projects. This will reduce the potential for conflicting demands. We are a Virginia firm serving Virginia clients.

Schedule and Cost Control: Having our primary team members based in Roanoke makes routine checks on project schedule and cost more efficient. All of our team members are within close proximity to each other. When project-specific tasks may require AECOM resources from outside the immediate geography, we will strive to engage these resources electronically.

Depth and Breadth of Resources: No one firm can provide the same level of local staff backed by the national resources of AECOM. There is virtually no project that the City might have that AECOM cannot perform.

Responsiveness: The majority of our team members are located in Roanoke, VA which is approximately one hour from the City's offices. Meetings, site visits, and emergency response can be accomplished quickly and economically. Day trips are not a problem.

Dedicated Staff: The project team members assembled for this Term Contract all have previous experience working the City or similar localities in the Commonwealth of Virginia. Some of these team members worked on the Renovation to the County Courthouse, Drone Zone, PSAP Consolidation Studies and Lower Jackson Regional Wastewater Treatment Plant projects.

Project Understanding

The Professional Engineering Services for General Services Term Contract Agreement RFP for the City of Covington will require specialized architectural, engineering, environmental, and surveying experience and expertise, and the ability to handle multiple task orders simultaneously. We have the resources and know-how to work such contracts and offer the following descriptions of our capabilities to provide the services listed in the RFP.

Surveying

AECOM's in-house surveying staff is well experienced in all level of surveying services and property mapping. In addition, we use current, state of the art equipment to produce accurate maps efficiently. Our level of experience covers a wide range of services, both regionally and internationally.

In addition, our survey staff in experience in FEMA mapping standards as related to FEMA elevation certificates. Our Roanoke survey staff has assisted our FEMA flood analysis and mapping staff by providing field measurements and data to determine bridge openings and stream morphology to assist in the development of FIRM maps.

AECOM is also experienced in alternative terrain data gathering methodologies such as LIDAR and drone mapping.

Feasibility Studies and Engineering Economic Analyses

AECOM has developed an extensive background and significant capabilities in the planning and preparation of Engineering Feasibility Studies. We have access, in-house, to virtually all required architectural-engineering discipline capabilities for completing a wide variety of feasibility studies. These studies have included such tasks as:

- Review and documentation of existing facilities
- Interpretations of existing facility construction documentation
- Assessment of condition and capacity of existing facility systems and components
- Assessment of environmental issues and concerns
- Permitting research and development
- Facility planning and programming
- Economic and cost-benefit analyses
- Cultural and natural resource delineations

Transportation Design and Study

AECOM has been a leader in transportation design and study projects for over 60 years, including rural and urban roadway projects. These projects include, but are not limited to, roadways on new locations and widening of existing roads. We also have extensive experience producing construction documents for our transportation projects. AECOM has provided the following tasks and design services for miles of roadway projects for the Virginia Department of Transportation and municipalities throughout Virginia:

- Horizontal and vertical alignment
- Maintenance of traffic and sequence of construction
- Pavement design
- Survey
- Property research
- Plat and easement preparation
- Utility designation and relocation
- Public involvement and public hearings
- Environmental permits

Many of our transportation projects have been completed under open-end contracts.

Building Design and Structural Analysis

Whether it's new construction, renovation or adaptive reuse, AECOM building designers create buildings that balance function and efficiency with aesthetic appeal. Because each project and client is unique, our design teams begin each assignment with a fresh perspective. From office buildings to educational facilities to museums, AECOM architects use a participatory approach to the design process, working closely with clients and stakeholders to develop an optimum design solution within an established budget. Through design workshops and one-on-one interviews, we gain a clear understanding of a client's needs and vision for a project.

As vital contributors to AECOM's building designs, our structural engineers are experienced designers of new stand-alone multi-story structures, building additions, and renovations to existing structures. In selecting structural materials, AECOM engineers strive to use the most economical material suited for the job, whether it is structural steel, cast-in-place reinforced concrete, prestressed concrete, post-tensioned concrete, timber, reinforced masonry, fiberglass-reinforced plastic or composite materials. AECOM structural engineers are skilled in solving all types of structural design problems, particularly in the area of building addition and renovation, including:

- Retrofitting existing buildings to increase load capacities
- New foundations on or adjacent to existing foundations
- Repair of deteriorating concrete and steel structures
- Adding new floors to existing buildings

AECOM has extensive LEED® (Leadership in Energy and Environmental Design) certified professionals who demonstrate the understanding of green building practices and principles, and familiarity with LEED requirements, resources, and processes. The LEED Green Building Rating System is a voluntary, consensus- based national standard for developing high-performance, sustainable buildings. By completing these requirements and attaining LEED accreditation, AECOM employees can provide sustainable site development, water savings, energy efficiency, materials selection, and indoor environmental quality.

Stormwater Management

AECOM has prepared stormwater management plans and designed stormwater management facilities to mitigate the effects of watershed development by improving the quality of stormwater runoff and attenuating peak stormwater runoff rates. In implementing stormwater management criteria on a project, AECOM's experienced staff combines site layout with natural topography to maximize infiltration and reduce the amount of runoff. AECOM has also designed stormwater quantity and quality control devices including underground perforated pipes, infiltration trenches, retention ponds, extended detention ponds, and detention ponds.

Geographical Information Systems (GIS)

At AECOM, we use GIS technology internally to improve the quality and accuracy of the data we collect during our field investigations, to support our decision-making, and to provide consistent, dependable results through data analysis and graphic (map) representation. AECOM uses an integrated team approach to our projects; we assign GIS personnel to work directly with the environmental planners and engineers. Our team works together and with our client to determine what data is needed and how it should be collected, displayed, analyzed, and represented. In this way, each team member contributes from his or her area of expertise. This approach is reflected in our results: we bring accurate data and analysis methodologies to the people who have the practical experience to determine the best possible solution for our clients.

Environmental Design and Management Systems

Unlike many engineering firms, AECOM provides a wealth of experience in environmental site assessment and remediation. For Brownfields sites, AECOM offers these practical services: Phase I and Phase II environmental site assessments, underground and aboveground storage tank assessments and removal, meetings with regulatory authorities, meetings with economic development authorities, surveying, evaluations of asbestos-containing material, renovation of buildings and industrial processes, site planning, permitting, waste management, risk assessment, and corrective actions.

Wastewater Treatment Plants

AECOM provides pilot and treatability services, preliminary and final design, and construction-phase services for wastewater plants. AECOM has designed numerous, enhanced wastewater treatment plants with state-of-the-art advanced processes. Advanced treatment processes designed by the firm include combined and separate stage suspended growth nitrification, suspended-growth biological nutrient removal (BNR) for total nitrogen and phosphorus removal, nitrifying plastic media trickling filters, denitrifying filters, membrane bioreactors, biological aerated filters for denitrification and total nitrogen removal, single media, multimedia, and cloth media filtration, powdered and granular activated carbon adsorption, ultraviolet disinfection, and reverse osmosis. AECOM received an Honor award in 2013 by the American Council of Engineering Companies Virginia for the Lower Jackson River Regional Wastewater Treatment Plant Project.

AECOM has also prepared materials for EPA design seminars on nitrification and denitrification and prepared the EPA process design manual on upgrading existing wastewater treatment plants. AECOM is currently involved with research programs related to contaminants of emerging concern in collaboration with the Water Environment Research Foundation and the U.S. Geological Survey. AECOM is working with these organizations to develop cost-effective treatment technologies to mitigate and control the release of emerging contaminants into the environment and the water cycle. This work won the 2005 Platinum Award for research from the American Council of Engineering Companies. AECOM can also provide Process Safety Management and Risk Management Programs, O&M Manuals, and start-up assistance for water plants. As a full service A-E firm, we can complete all design in-house.

Wastewater Pumping Stations

AECOM provides designs for sewage pumping facilities with consideration of reliability, personnel safety, life-cycle cost- efficiency, expandability, and maintainability. Standardization of owner systems and local serviceability are always important design and pumping system selection considerations.

Sewerage System Master Planning

AECOM has completed dozens of preliminary engineering studies, facility plans, and river basin and municipal master plans, involving waste load allocation, projection of future sewer system demands, collection system sizing and alignment, and investigation of wastewater treatment alternative processes and locations. AECOM has worked closely with municipal planning and public works personnel and with state regulatory agencies to develop the guidance documents to define appropriate long-range sewerage services.

Interceptor and Sewage Collection Systems

AECOM has provided design for entire new sewage collection systems and for parallel and relief sewers. Pipeline sizes have varied from 8 to 66 inches. Projects have been located in urban centers, through developed property, and along environmentally sensitive streams and rivers.

Sewer System Rehabilitation

AECOM provides coordination and supervision of sewer system physical inspections, TV inspections, smoke testing, and flow monitoring services. AECOM rehabilitation designs have employed slip-lining, cured-in-place lining, pipe bursting, total line replacement, and spot repairs.

Water Distribution Systems

AECOM provides water distribution modeling and design of water transmission and distribution mains and water booster stations. AECOM has extensive experience with the design of water mains of all sizes.

Water Storage Tanks

AECOM provides design of ground-level, standpipe and elevated storage tanks, constructed of welded or bolted steel or concrete. We have designed water tanks having a capacity from 100,000 to 4 million gallons. Our related services have included tank rehabilitation, painting, and site plans.

Water Treatment Plants

AECOM provides pilot and treatability services, preliminary and final design, and construction phase services for water plants. AECOM utilizes conventional and state-of-the-art water treatment technologies, including compact treatment configurations, alternative disinfectants, and membrane filtration to define the site-specific, cost-effective solutions for our clients. AECOM can also provide Process Safety Management and Risk Management Programs, O&M Manuals, and start-up assistance for water plants. A full service A-E firm, we can complete all design in-house.

Construction Inspection

Our Roanoke Construction Support staff is ready to assist the City in all levels of effort during the construction process. Our years of experience in managing construction projects have found that the timely and efficient actions to address construction challenges are the pathway to a successful project. These challenges range from shop drawing and pay estimate reviews to dealing with conflict and change orders. We face these challenges head-on while keeping the City in the discussion. We have learned that listening and communicating are the keys to moving projects to completion.

AECOM has the capacity to provide the City with a full complement of architectural and engineering services across major business lines. Below, you will see general qualifications from each of our four key business lines.

Term Contract Experience

AECOM has completed hundreds of open-end term contracts for a variety of clients-including municipalities and authorities with numerous individually negotiated task orders. As a result, we understand the special characteristics of these contracts: short-notice, quick-response requirements, expedited delivery, and continuity of assigned personnel. Our local capabilities and experience allows AECOM to successfully meet these special project needs.

Site/Civil Engineering

AECOM has over 60 civil professionals living and working in Virginia, serving a wide range of clients. We create sustainable and integrated projects appropriate to our clients' goals. We provide comprehensive solutions for our clients and are experts in surveying, site design, grading, water resources, storm water control and treatment, and master planning. We offer integrated services for total project delivery, covering everything from grant/funding applications and initial environmental planning studies to detailed design, and construction management. We understand our responsibility to our clients and their citizens, and work to create, enhance, and sustain the world's built, natural, and social environments. AECOM offers comprehensive engineering to local municipalities. Our civil engineering capabilities incorporate expertise in:

- Surveying
- Master Planning
- Site Grading
- Roadway layout and design
- Utility design and coordination
- Storm water design and treatment
- Permitting/regulatory compliance

- Grants and funding application preparation and administration
- Inspection Services

Transportation

AECOM's transportation expertise falls within multiple sectors – highways and bridges, aviation, freight rail, transit, ports and marine, as well as strategic planning and advisory services. We deliver comprehensive services over the full life cycle of a project to benefit the local government and private industry clients that it serves. We have a genuine appreciation and understanding of the operating structures and business needs of the transportation industry. AECOM's transportation professionals are constantly looking for more efficient, safer, and sustainable ways to move people across cities, countries, and continents. Our Transportation capabilities incorporate expertise in:

- Roadway planning and design
- Preliminary Engineering Reports (PER)
- Greenways and blueways
- Traffic and signalization studies
- Bridge analysis, rehabilitation and design
- Public participation
- Drainage studies and design
- Hydraulic and hydrology studies (Flood Plain Analysis)

Buildings and Places

Creating innovative and practical building engineering designs, our experts ensure that every project meets and exceeds the expectations of clients and building users. Combining local market knowledge with technical expertise, our multidisciplinary approach to building design is based on the client's needs and business case to render cost-effective, functional, inspiring solutions.

We are known internationally for our creative, sustainable, and holistic design approaches which, from the outset, embraces low-carbon and economic operational performance. Our professionals around the world strive to deliver visionary buildings that maximize naturally occurring energy and minimize waste.

Our Buildings and Places professionals have extensive local government experience in:

- Municipal building renovations and expansions
- Emergency services buildings
- Public safety buildings
- Fire and rescue
- Public schools Courthouses
- Correctional facilities/jails
- Recreational facilities
- Construction Administration Services

Environment

AECOM's skilled engineers, scientists, and project specialists provide comprehensive environmental management services that meet client business and operational lifecycle needs for feasibility, impact analysis, and operational compliance as well as remediation, restoration, and reuse of impacted property. Daily we demonstrate global capabilities to manage the world's most complex and important projects. And our clients and their communities truly benefit from our innovative and proven solutions.

We also offer stream restoration services out of our Raleigh office. Our team of professionals have worked throughout the Southeast, and are ready to help the City. Our Environment business line specialized in:

- Stream Restoration
- NEPA documentation and permitting
- Environmental site assessments
- Environmental remediation
- Environmental permitting
- SPCC plan development

H. ADDITIONAL INFORMATION

30. PROVIDE ANY ADDITIONAL INFORMATION REQUESTED BY THE AGENCY. ATTACH ADDITIONAL SHEETS AS NEEDED.

Summary

Resource control: AECOM's staff of 185 engineers and designers in our Roanoke office provides the services requested by the City, we will have the right personnel with the right expertise, experience, and capabilities assigned to your projects. This deep bench will reduce the potential for conflicting demands.

Schedule and cost control: As previously noted, having our primary team members based in Roanoke makes routine checks on project schedule and cost more efficient. All of our team members are within close proximity to each other. When project-specific tasks may require AECOM resources from outside the immediate geography, we will strive to engage these resources electronically to save project dollars.

Depth and breadth of resources: No one firm can provide the same level of local staff backed by the national resources of AECOM. There is virtually no project that the City might have that AECOM cannot perform.

Responsiveness: The majority of our team members are located in Roanoke, VA which is approximately an hour from the City's offices. Meetings, site visits, and emergency response can be accomplished quickly and economically. Again, day trips are not a problem.

Dedicated experienced staff: The project team members assembled for this term contract all have previous experience working with the City or similar localities in the Commonwealth of Virginia.

About AECOM

AECOM is the world's premier infrastructure consulting firm, delivering professional services throughout the project lifecycle – from planning, design and engineering to program and construction management. On projects spanning transportation, buildings, water, energy and the environment, our public- and private-sector clients trust us to solve their most complex challenges. Our teams are driven by a common purpose to deliver a better world through our unrivaled technical expertise and innovation, a culture of equity, diversity and inclusion, and a commitment to environmental, social and governance priorities. AECOM is a Fortune 500 firm and its Professional Services business had revenue of $13.2 billion in fiscal year 2020. See how we deliver what others can only imagine at aecom.com and @AECOM.

Consultant Proposal to Develop Drainage Study

AECOM
10 South Jefferson Street
Roanoke, VA 24011
aecom.com

April 1, 2022

Ms. Krystal M. Onaitis, MPA
City Manager
City of Covington
333 W. Locust Street
Covington, VA 24426
konaitis@covington.va.us

Proposal to Develop City-Wide Drainage Study for City of Covington, VA

Dear Krystal,

AECOM Technical Services, Inc. (AECOM) is pleased to provide you this proposal for select A/E services to support the development of a City-wide Drainage Study (Drainage Study) for the City of Covington (City), to be funded by a Round 3 Community Flood Preparedness Fund (CFPF) Grant administered by the Virginia Department of Conservation and Recreation (DCR). In addition to the Drainage Study, this scope of work includes assistance with updates to the City/s existing floodplain ordinance. This Drainage Study is a critical component to the development of the City's Resilience Plan, as the location, size and condition of the City's stormwater sewer is not fully known, and the City is subject to recurrent flooding due to inadequate and antiquated storm sewer systems. This proposal includes mapping of the stormwater sewer system, condition assessment, hydrologic and hydraulic modeling, and improvement scenario development. The outcomes of this Drainage Study will inform the City's Resilience Plan.

Background

Areas within the City of Covington, Virginia have historically flooded, including over two dozen roadways[1] in the City. This flooding is a health and safety concern for citizens of the City as emergency access routes are impacted by flood waters. In addition, riverine flooding of the Jackson River has occurred at all times of the year, and during all major floods, high velocity flood flows and hazardous conditions exist in the main stream channel and in some parts of the flood plain.

The City does not have their stormwater system mapped in GIS, and the condition of the system is unknown in most areas of the City. City personnel routinely provide reactive maintenance of the stormwater system when complaints are filed due to flooding. Damaged and deteriorated piping is commonplace throughout the City and is likely contributing to recurrent pluvial flooding. In addition, the impact of climate change on rainfall intensity must be factored into H&H modeling efforts to determine if capacity increases are needed.

---

[1] Source: Table 48 from the RVAC Regional Hazard Mitigation Plan

Scope of Services

AECOM will assist the City in development of a City-wide Drainage Study that aligns with the CFPF Study priorities, as listed in the Grant Manual. The following tasks are included and outlined below with a brief summary of services.

Task 1 – Storm Sewer Data Review and Surveying

Task 1.1 – Desktop Data Review and Digitization of Storm Sewer

Task 1.1 includes a review of existing data that is available for the City's storm sewer system. AECOM understands that some of the data available is in hard copy format and needs to be digitized. Sanitary sewer overflows (SSOs) are an ongoing problem, and the City is required to evaluate and correct inflow and infiltration problems within its sanitary sewer collection system and numerous studies and design work has been completed to investigate, inspect and separate the sanitary and storm sewer systems throughout the City. This task includes a review and digitization of available storm sewer data as the first step in the development of a City-wide storm sewer GIS layer.

Task 1.2 – Survey of Storm Sewer

Task 1.2 includes surveying to collect the location, size, inverts and material of major stormwater pipes, ditches, and other structures within the City limits. AECOM will utilize our Roanoke-based surveying crew to collect this information and translate the data for use in ArcGIS and CADD. AECOM has budgeted four weeks (320 hours) of a two-man surveying crew to collect stormwater system information within the study area and 160 hours to post-process survey data.

Task 2 – Storm Sewer Condition Assessment

Task 2 includes condition assessment of critical areas of the City's storm sewer system to identify clogged, broken, cracked, collapsed and otherwise damaged pipe and structures. Understanding the current condition of major pipes will be necessary to develop the H&H model for the City's storm sewer system and will allow the City to develop a prioritized maintenance program for their system. The exact length, size and quantity of stormwater pipes and structures in the City is unknown at this time, so for budgeting purposes, an estimate of $25,000 has been included in this scope for an infrastructure inspection subcontractor to provide CCTV inspections of critical portions of the City's system. At the conclusion of Task 1, AECOM will work with City personnel to identify locations of frequent flooding, maintenance requests and other key areas that will be inspected. The results of these inspections will not only inform the H&H model (Task 4) but will also be provided for the City to help prioritize system maintenance efforts and resource planning.

Task 3 – Evaluation of Regional Rainfall Data

An evaluation of historic regional rainfall data will be conducted to determine if changes in heavy rainfall and intensity are occurring over time in the Covington/Alleghany Highlands region of Virginia. This evaluation will use local and regional level stationarity assessment of historic rainfall data from gauges in Covington (NOAA Site ID 44-2041 and Site ID 44-2044) as well nearby gauges in Clifton Forge, Gathright Dam, Jordan Mines and Hot springs. Historic rainfall trends, along with projections of future changes in the Precipitation-Frequency Curve will be used to determine if modifications should be made to regional rainfall design guidance for key return periods. The deliverable for this task includes a technical memorandum summarizing the findings and recommendations for modifications to the City's rainfall design storm guidance.

Task 4 – Hydrologic and Hydraulic Model of Drainage Areas within City

Using the data collected under Tasks 1 through 3 and available LiDAR for the City, AECOM will prepare PCSWMM models to evaluate the hydraulic performance of the watershed and stormwater management system for the 2-, 10-, 25-, 50- and 100-year storm events using regional rainfall data and Jackson River flood level information. AECOM will use these SWMM models to confirm the locations where recurrent flooding events have been observed and determine if capacity limitations contribute to road flooding in the study area.

Two scenarios will be analyzed to include Scenario A - Existing Conditions (based on current conditions) and Scenario B – Scenario A with new infrastructure improvements (to be identified by AECOM in conjunction with the City). Under Scenario B, alternative improvement combinations will be modeled together; separate models will not be constructed for each possible combination of improvements. AECOM will work with the City to determine the desired level of service for system improvements.

AECOM will present the results of this modeling effort to the City in a workshop (see Task 7) for review and consensus. Modeling files will be provided to the City for future use.

Task 5 – Drainage Study Report Development

This task includes preparation of model documentation and a summary of modeling results and recommended system improvements. The results of the Drainage Study are intended to inform the City's Resilience Plan, and proposed storm sewer system improvement scenarios will be included as resilience projects in the Resilience Plan. AECOM will provide a cost estimate for each improvement project identified. The cost estimate will include costs for surveying, design and construction costs and permit applications preparation, if necessary. Land acquisition costs will not be included. AECOM will document cost estimates and the criteria matrix used in the development of prioritization plan for system improvements. AECOM will submit a draft Drainage Study Report to the City for review and comment. One round of comments is assumed, and a final Drainage Study Report will be provided in electronic and hard copy format.

Task 6 – Floodplain Ordinance Updates

This task includes a review of the current floodplain ordinance and development of recommendations to be considered by the City. The City of Covington is in the Upper James HUC 8 watershed, one of the only watersheds in Virginia that FEMA has not funded to study yet. There are no new FEMA floodplain maps in the works right now, but AECOM suspects that FEMA may fund this watershed in the next couple of years. The City may elect to incorporate recommended ordinance changes once FEMA completes their floodplain study.

Task 7 – Project Management and Meetings

This task includes the following:

- Recurring communication between the City and identified stakeholders including biweekly project status calls, emails and virtual meetings.
- Project management tasks include monthly invoicing and the development of progress reports.
- Quality control reviews of all deliverables and products prepared as part of this project.
- Assistance with the development of CFPF progress reports.
- Attendance at milestone meetings, including the following:
  - Kick-off Meeting (assumed to be virtual, one hour in length)

- Condition Assessment Results Meeting – Present the results of stormwater system inspections.
- Modeling Results and Improvements Identification Meeting – Present the results of the stormwater modeling efforts and preliminary list of identified resilience projects to City personnel and identified stakeholders.
- Public Meetings – present potential project information and solicit input from public on the list of storm sewer improvement projects.

Deliverables for this task include meeting agendas, meeting summaries, invoices, and progress reports.

Assumptions

1. City to provide GIS data available. The City does not currently have GIS data for the stormwater system.
2. The Resilience Plan is a planning level document and will not be stamped and sealed by a Virginia Professional Engineer (PE).
3. AECOM will not be providing site plans, landscaping plans or detailed design for any of the identified storm sewer improvement projects identified in the Drainage Study at this phase of the project.
4. Environmental permitting will not be performed.
5. LiDAR data is available for the study area.
6. Phase I, II, III Archeological Investigations are not included.
7. FEMA CLOMR or LOMR applications are not included.

Schedule

The notice to proceed is dependent on the timing of the CFPF grant awards. AECOM is prepared to commence work within two weeks of NTP from the City, and it is believed that all work include in this scope can be completed within one year from NTP. It is noted that this work will be coordinated with the Resilience Plan, as information collected as part of this Drainage Study will inform the Resilience Plan. The estimated schedule for project milestones is as follows:

- Kick-Off Meeting - within two weeks of NTP
- Public Meeting #1 – within eight weeks of the Kick-Off Meeting
- Publications and Documents Review – approximate 8-week effort, to commence upon receipt of all requested information.
- Condition Assessment Results Meeting – within six weeks of completion of condition assessment inspections of the storm sewer system.
- Proposed Projects Meeting – within 8 weeks of the completion of modeling efforts (combined with Resilience Plan projects meeting).
- Public Meeting #2 – within four weeks of the Modeling Results and Improvements Identification Meeting.

- Draft Drainage Study Submittal to City – within two months of the Public Meeting #2.
- Final Drainage Study Submittal to DCR – within 8 weeks of receipt of comments from City.

<u>Additional Services</u> <u>(available upon request)</u>

1. FEMA CLOMR or LOMR application support
2. Grant Writing and Grant Administration Support

Fee

AECOM will provide the above-described services for the lump sum fee of **$357,380**, as shown in the Task Breakdown table below.

Task	Labor Cost	Subcontractor	Expenses
Task 1.1 -Storm Sewer Digitization	$37,310		
Task 1.2 -Storm Sewer Mapping	$79,660		$1,080
Task 2 - Storm Sewer Condition Assessment	$20,360	$27,500	
Task 3 - Evaluation of Regional Rainfall Data	$22,200		
Task 4 - H&H Modeling of Storm Sewer	$84,160		$1,000
Task 5 - Drainage Study Report Development	$41,960		
Task 6 - Floodplain Ordinance Updates	$12,380		
Task 7 - Project Management and Meetings	$29,770		
Sub-Total	$327,800	$27,500	$2,080
Total Fee	$357,380		

We are eager to begin serving you on this unique project.

Yours sincerely,

N Slater

Final CFPF Applications -City of Covington Va. (EMAIL 1 of 2)

1 message

Patrick Madigan <pmadigan@covington.va.us> Fri, Apr 8, 2022 at 1:00 PM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: Rebecca Nuckols <Rnuckols@covington.va.us>

Sir/Madam,

Attached to this email is one of two applications for the City of Covington.

This application package is for the Drainage Study.

Please don’t hesitate to contact me with any questions.

Respectfully,

Patrick J. Madigan, Sr.

Director of Public Works

City of Covington

333 W Locust St.,

Covington, Va. 24426

Ms. Wendy Howard-Cooper
Director of Dam Safety and Floodplain Management
Virginia Department of Conservation and Recreation
600 East Main Street, 24th Floor
Richmond, VA 23219

RE: Authorization of City of Covington CFPF Capacity Building and Planning Application

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

Please accept this written correspondence as signed documentation authorizing the City of Covington's request for funding from Round 3 of the 2022 Virginia Community Flood Preparedness Fund (CFPF). As the City only recently became aware of this funding and does not have funding established in our currently budget, we respectfully request the Department of Conservation and Recreation waive our match requirement for Capacity Building and Planning.

The CFPF grant would enable to City of Covington to commence Resilience Planning and Capacity Building through the development of a Resilience Plan and funding of Certified Floodplain Manager (CFM) training for one City employee to ensure that the City has a Floodplain Administrator on staff. The Resilience Plan would pull together both local and regional initiatives in a project-based, City-wide effort to address both riverine and pluvial flooding issues. A Community Outreach Plan would be developed to solicit input on flooding concerns and proposed projects from residents and stakeholders. The City is also submitting a separate CFPF grant application to fund a City-wide Drainage Study, as the current undersized and aging storm sewer infrastructure contributes to recurrent flooding issues throughout the City.

Thank you for your consideration of this grant proposal. If you have any questions about this proposal, please contact Patrick Madigan at (540) 965-3911 or pmadigan@covington.va.us.

Sincerely,

K. Onaitis

Krystal M. Onaitis
Covington City Manager

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ☐ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Robens

NFIP Community Identification Number (CID#):(See appendix F

Is Project Located in an NFIP Participating Community? ☐ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes ☐ No

Flood Zone(s) (If Applicable): The project is located on the upper Ware River in Gloucester County. The low bank shoreline faces north-northwest and has an average fetch of 0.7 miles with a long fetch to the northwest of 1.3 miles. The tide range is 2.5 ft. A marsh fringe with an eroding edge exists along the shoreline. To increase the level of shore protection and longer-term coastal resiliency, a living shoreline project was designed with 1 rock sill, sand fill, and Spartina patens and Spartina alterniflora marsh grass plantings. The structure (sill 4A) is part of a system designed for an overall living shoreline project on adjacent properties to provide shore protection with a reach approach. Coastal resiliency is enhanced by the reach approach because adjacent systems work together to provide an enhanced level of shore and habitat protection. Along the Robens properties, approximately 7,600 square feet

Flood Insurance Rate Map Number(s) (If Applicable): ______________________________

Total Cost of Project:
Gloucester-Mathews Gazette-Journal
P.O. Box 2060
Gloucester, Va. 23061

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Covington, VA

Eligibility Information

Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	☐
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	☑
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	540
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	✓
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
N/A	Match not required	✓

Capacity Building and Planning Eligible for Consideration	☑ Yes ☐ No
Applicant Name:	759-4437

Scoring Information

Criterion	Point Value	Points Awarded
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	**55**	55
Development of a new resilience plan.	**55**	55
Resource assessments, planning, strategies and development.	**45**	45
Policy management and/or development.	**40**	40

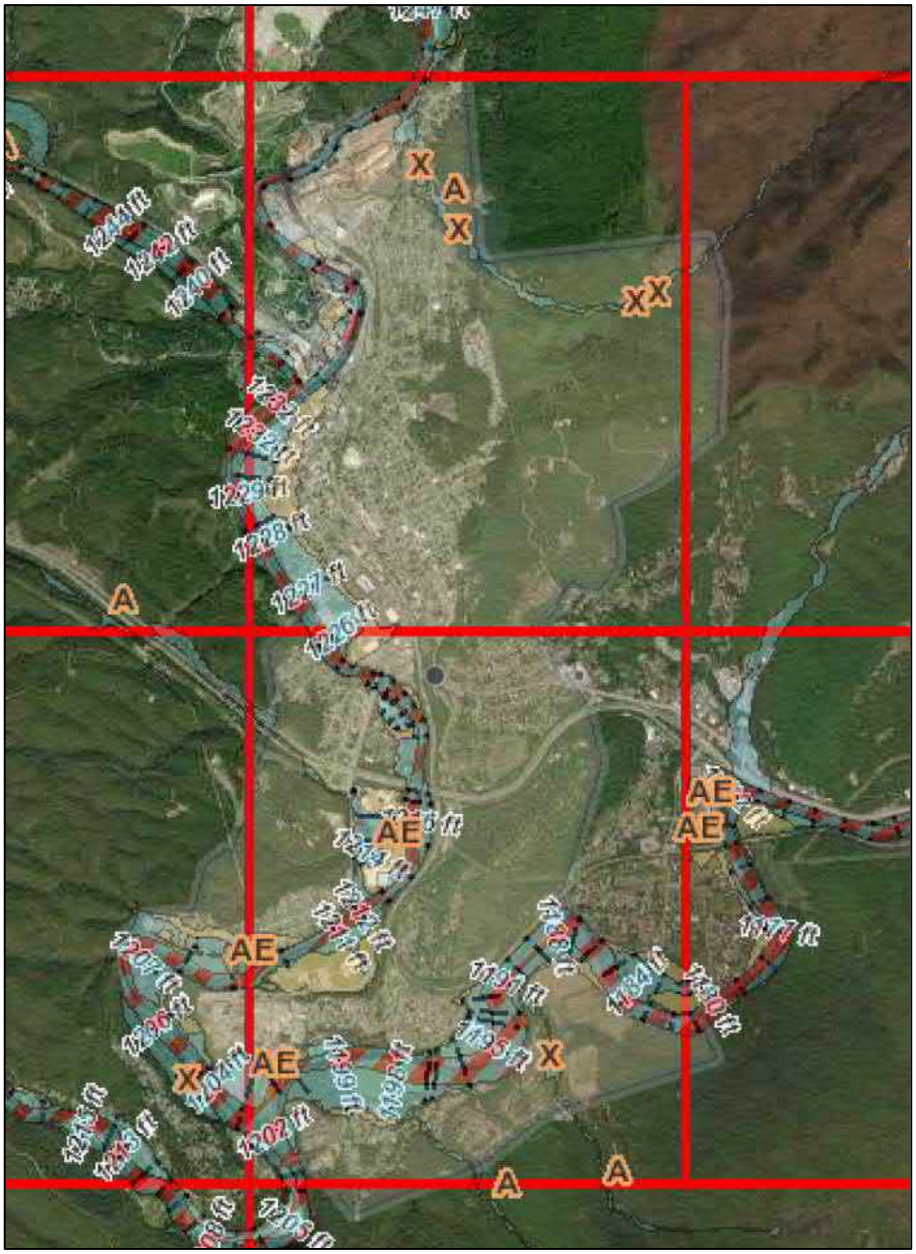
Community Flood Preparedness Fund

Capacity Building and Planning Grant Application



City of Covington, VA
Community Identification Number: 510040
Submitted: April 8, 2022

THE CITY OF COVINGTON

1.0 Scope of Work Narrative

The City of Covington, Virginia is subject to riverine flooding from the Jackson River as well as pluvial flooding due to inadequate and antiquated storm sewer systems. The recurrence of higher intensity storms in recent years has stressed the stormwater conveyance system throughout the City causing local urbanized flooding that is detrimental to the residents and critical infrastructure. **Attachment 1** contains additional links, photos, and other documentation of flooding issues within the City.

The City plans to implement flood prevention and protection projects in areas that are subject to recurrent flooding as confirmed by a local floodplain manager. However, before these projects can be implemented, the City must first develop a Resilience Plan and provide training to a City employee to become a CFM. A Stakeholder Engagement and Community Outreach Plan will be implemented as part of the Resilience Plan development to capture input from the public about flooding concerns. Because of the lack of known information about the City's stormwater system, a City-wide Drainage Study is also needed to identify portions of the storm sewer system that must be upgraded or replaced to alleviate recurrent pluvial flooding from rainfall. The City has submitted a separate CFPF grant application to aid in the development of a Drainage Study, which will inform the Resilience Plan.

Limited resources in the City and a focus on sanitary sewer infiltration and overflow issues have prevented the City from investing in flood mitigation planning and project implementation. The City is a low-income geographic area, as defined in the CFPF Grant Manual, as an area where the median household income ($41,024) is significantly less than 80% of the local median household income ($76,398 in Virginia), according to the US Census Data in 2020[1]. Further, portions of the City are classified as Moderately Socially Vulnerable, according to the ADAPT Virginia's Virginia Vulnerability Viewer (see Figure 1 in **Attachment 2**). Finally, several areas in the City are designated as Qualified Opportunity Zones (see Figure 2 in **Attachment 2**).

The City understands that the CFPF grants must be used in accordance with the following guiding principles:

- Acknowledge climate change and its consequences; and base decision making on the best available science.
- Identify and address socioeconomic inequities and work to enhance equity through adaptation and protection efforts.
- Utilize community and regional scale planning to maximum extent possible, seeking region-specific approaches tailored to the needs of individual communities.
- Understand the fiscal realities and focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The solutions wilt, to the extent possible, prioritize effective natural solutions.

---

[1] https://www.census.gov/quickfacts/fact/table/covingtoncityvirginia,VA,US/PST045221

- Recognize the importance of protecting and enhancing nature based-solutions in all regions, natural coastal barriers, and fish and wildlife habitat by prioritizing nature-based solutions.

1.0 Assess Capacity Needs and Assets

The City of Covington has identified the following resource needs:

- Financial – both a Resilience plan and an in-house Floodplain Administrator/Certified Floodplain Manager are required for any project implementation funding through the CFPF. Although there is a clear and documented need, the City does not have these items specified in the FY2021-2022 budget.
- Human – the City does not currently have a CFM on staff, but the City is planning to hire a new staff member that could be enrolled in CFM training. Therefore, the City is requesting funding to train a new City employee to become a Floodplain Administrator.
- Technical Assistance – The City is seeking a CFPF grant to execute a contract with a Consultant to develop a Resilience Plan. Once adopted, the Resilience Plan will be incorporated into the City's Comprehensive Plan and elements of the Resilience Plan will be included in the next update to the regional Hazard Mitigation Plan.
- Training – The City is requesting funds to provide CFM training for a City employee. In addition, the Community Outreach Plan will include public education on flood risks and mitigation measures.

The City plans to train new staff and utilize the expertise of Consultants to develop, increase and strengthen the floodplain management knowledge and skills in the City. The City plans to build internal resources through continuing partnerships with the Roanoke Valley-Alleghany County Regional Commission and utilizing grants, loans, and other funding sources. Under the separate, Drainage Study CFPF grant application, the City plans to review and revise the City's floodplain ordinance and related policies.

2.0 Goals and Objectives

The goals of this project include:

1. Enable the City to provide training and certification for a new employee to become a Certified Floodplain Manager.
2. Utilize a Consultant to develop a community-wide Resilience Plan to lay the planning framework needed to address riverine and pluvial flooding throughout the City limits.
3. Engage and educate the public that are impacted by flooding in the City.

3.0 Stakeholder Identification, Outreach and Education Strategies

The City plans to work across departments to identify key stakeholders that need to be engaged during the development of the Resilience Plan. While the Department of Public Works will be leading the effort, representatives from other City departments will be engaged throughout the Resilience Plan development effort. The City plans to retain a Consultant to develop an Outreach Plan as part of the overall Resilience Plan development. Outreach strategies include inclusion of a Resilience Plan website, a survey to collect information from the public on flooding concerns and public meetings (in person and virtual) to solicit input from the public on proposed flood mitigation strategies and to provide general flood resilience education.

4.0 Implementation Plan and Timelines

The City will complete all requested grant activities within the 36-month timeline allowable for this cycle of CFPF grant funds. The completion of a City-wide Drainage Study is necessary to complete the Resilience Plan, as the stormwater improvement projects recommended in the Drainage Study will be incorporated into the Resilience Plan. The following timeline outlines the intended activity schedule:

- Round 3 CFPF Grant Applications Due: April 8, 2022
- Announcements anticipated by DCR: June 17, 2022
- Contracts in place for Consultant to Develop Resilience Plan: August 1, 2022
- New City employee to be enrolled in CFM Training within twelve (12) months of grant award announcement.
- Public Meeting #1 to be held by October 3, 2022 to solicit input from the public and key stakeholders
- Public Meeting #2 to be held within four weeks of the completion of the project identification effort (to be coordinated with the Drainage Study), estimated to be complete within one year of the project kickoff (August 2023).
- Final Resilience Plan to be submitted to DCR for review by February 1, 2024.

5.0 Responsible Parties for Capacity Building and Plan Development Process

The City of Covington, Department of Public Works, will be responsible for overseeing and implementing all grant activities.

6.0 Performance Outputs and Measures

Success will be measured by the presence of a new Floodplain Administrator/CFM at the City and the development of a Resilience Plan that will serve as a roadmap for the City to plan future projects and activities with a goal to improve the City's flood resilience.

7.0 Plans for Maintaining Capacity Over the Long Term

The City plans to maintain capacity over the long-term through the establishment of a Floodplain Administrator position. Projects identified in the Resilience Plan will be funded through the City's budget and supplemental grants and loans.

8.0 Supporting Documentation

- City of Covington Current Floodplain Ordinance: https://library.municode.com/va/covington/codes/code_of_ordinances?nodeId=PTIICOOR_APXBZO_ARTXIII-AFLDI
- Current Hazard Mitigation Plan: https://rvarc.org/community/hazard-mitigation/
- Current Comprehensive Plan: https://public.3.basecamp.com/p/UmJw2ghsfpj3enw4RDLGN43f

Budget Narrative

Per the CFPF Grant Manual, the following budget narrative was created for the activities contained in this grant application.

Task	Project Budget	Source of Estimate
CFM Training. Exam and Annual Dues	$165 – ASFPM Yearly Dues (3 years) $185 – ASFPM CFM Exam Fee (Member Rate) $120 – Biennial Renewal Fee (Member Rate) **TOTAL: $800**	ASFPM Certification Fee Schedule[2]
Resilience Plan Development	**$139,790**	Consultant Cost Estimate (see **Attachment 3**)
Total Requested Grant Amount	**$140,590**	

---

[2] https://www.floods.org/certification-program-cfm/getting-certified/#cfm-fee-schedule

The total amount of funds requested is $140,590. Per the instructions in the Grant Manual (page 24), “for local governments designated as low-income geographic areas, 100 percent of the estimated total project costs should be included.” The City does not have cash funds available for a match, and requests full funding of this project, per the authorization letter signed by the City Manager.

Proposal to Develop Resilience Plan for City of Covington, VA

Dear Krystal,

AECOM Technical Services, Inc. (AECOM) is pleased to provide you this proposal for select A/E services to support the development of a Resilience Plan for the City of Covington (City), to be funded by a Round 3 Community Flood Preparedness Fund (CFPF) Grant administered by the Virginia Department of Conservation and Recreation (DCR). The focus of this project is to work closely with the City to evaluate the vulnerability of public assets, utilities, roads and structures within the City to flooding from both the Jackson River and pluvial flooding caused by undersized and damaged drainage systems. The Resilience Plan will focus on the City's floodplains, current and planned gray and green infrastructure, and stormwater management, evaluate flood mitigation options and provide a path forward to allow the City to plan for improvements in the future.

Background

Areas within the City of Covington, Virginia have historically flooded, including over two dozen roadways[1] in the City. This flooding is a health and safety concern for citizens of the City as emergency access routes are impacted by flood waters. In addition, Riverine flooding of the Jackson River has occurred at all times of the year and during all major floods creating high velocity flood flows and hazardous conditions to exist in the main stream channel and in some parts of the flood plain.

Utilizing the proposed Resilience Plan, the City will have a strategy that will focus on upgrading, modifying, and installing new stormwater and flood control practices in strategic locations within the City. The development of the Resilience Plan will be guided by social equity data and principles as it related specifically to this effort. The development of a City-wide Drainage Study is also needed to help inform the Resilience Plan. The City is applying for a separate CFPF grant to fund this Drainage Study. The Resilience Plan will aim to implement nature-based

---

[1] Source: Table 48 from the RVAC Regional Hazard Mitigation Plan

solutions to the maximum extent practicable to mitigate current flooding as well as increase resilience to future flooding situations.

The City, in conjunction with AECOM, will develop the Resilience Plan. The City currently lacks the capacity or in house expertise to undertake this effort singularly and thus outside resources are required for the completion of this task.

Scope of Services

AECOM will assist the City in preparing and adopting a Resilience Plan in accordance with the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund[2]. The Plan will include the five Commonwealth Planning Principles established by the Virginia Coastal Resiliency Master Planning Framework, which was published in October 2020. This proposal has been divided into seven tasks. Each task is outlined below with a brief summary of services.

Task 1 – Publications/Documents Review and Vulnerability Analysis

As part of Task 1, existing documents will be reviewed including the Roanoke Valley-Alleghany Regional Commission (RVARC) Hazard Mitigation Plan (August 2019)[3], existing GIS datasets, the City of Covington Comprehensive Plan (2015-2035)[4], Covington Municipal Code, Covington Floodplain Management Ordinance, existing utility mapping and other relevant documents. This task also includes a discussion with City personnel to identify specific locations where flooding regularly occurs and where projects are planned that should be included in the Plan. Finally, this task will include a review of the current and available revised FEMA Flood Insurance Studies (FIS) and Flood Insurance Rate Maps (FIRMs), repetitive loss data (if available) and information related to social and economic vulnerability.

Task 2 – Stakeholder Engagement and Community Outreach Plan

AECOM will assist the City with stakeholder identification, engagement, and community outreach. This task is broken into two phases:

- Phase 1 will focus on initial engagement, education and soliciting feedback from the public and key stakeholders on flooding concerns throughout the City. A survey will be prepared, and a public meeting will be held to collect information from the public on flooding concerns, potential strategies and general flood resilience education.
- Phase 2 will focus on obtaining input from key stakeholders and the public on proposed resilience strategies through a series of three public meetings and informational brochures/flyers.

These strategies will include the development of a Resilience Plan website as well as public meetings/workshops to present potential flood mitigation projects and solicit input from the public on the Resilience Plan and their personal experiences with flooding within the study area. AECOM will develop display boards, handouts and provide up to two staff members for the two public meetings. In addition, AECOM will develop digital content for inclusion on the Resilience Plan website (to be developed by the City).

Task 3 – Adaptation Alternatives Analysis

AECOM will utilize the information collected and developed in Tasks 1 and 2, as well as the outcome of the City-wide Drainage Study to identify a list of conceptual flood mitigation and stormwater drainage projects that will provide a holistic approach to improving resilience

---

[2] https://www.dcr.virginia.gov/dam-safety-and-floodplains/document/Round-3-2022-CFPF-Manual-final.pdf
[3] https://rvarc.org/community/hazard-mitigation/
[4] https://public.3.basecamp.com/p/UmJw2ghsfpj3enw4RDLGN43f

throughout the City. Projects that provide community-wide benefits while utilizing nature-based solutions will be prioritized and additional focus will be given to areas of social and economic vulnerability as defined in the 2022 Grant Manual for Virginia Community Flood Preparedness Fund. The following project types are anticipated for evaluation as part of this effort:

- Regional ponds
- Stormwater system improvements
- Floodwall implementation
- Residential and commercial building floodproofing
- Urban green infrastructure installation
- Restoration of floodplains
- Site specific nature-based solutions
- Acquisition of flood-prone properties

AECOM will conduct a feasibility analysis for each potential project identified to determine its viability. These evaluations are intended to serve as a planning level exercise and the conceptual projects are not intended to be used as engineering documents. Each conceptual project will include a project summary, potential benefits and constraints, estimated timeline for implementation, and preliminary Engineer's Opinion of Probable Construction Costs (EOPCC). AECOM will develop up to eight potential projects to include as part of the Resilience Plan.

Task 4 – Development of Draft and Final Resilience Plan

AECOM will develop the Resilience Plan in accordance with the guidance provided in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund. The Plan will utilize information collected, identified and developed in Tasks 1-3 as well as the City-wide Drainage Study to provide a flood mitigation approach for the City that is in accordance with the following principles:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and interjurisdictional projects, plans and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science and incorporates climate change and current flood maps.

AECOM will prepare a Draft Resilience Plan in electronic and hard copy format for review and comments by the City. Any necessary revisions from the draft submittal will be included in the Final Resilience Plan, to be submitted to DCR at the conclusion of this task. AECOM will address up to one round of City comments on the Draft Plan as well as one round of comments from DCR on the Final Plan.

Task 5 – Project Management, Coordination and Meetings

This task includes the following:

- Recurring communication between the City and identified stakeholders including biweekly project status calls, emails and virtual meetings.

- Project management tasks include monthly invoicing and the development of progress reports.
- Quality control reviews of all deliverables and products prepared as part of this project.
- Assistance with the development of CFPF progress reports.
- Attendance at milestone meetings, including the following:
  - Kick-off Meeting (assumed to be virtual, one hour in length)
  - Public Meeting #1 – goal of soliciting information from the public on the locations, severity and type of flooding that has been experienced in the study area.
  - Modeling Results & Resilience Projects Identification Meeting – Present the results of the stormwater modeling efforts and preliminary list of identified resilience projects to City personnel and identified stakeholders.
  - Public Meeting #2 – present potential project information and solicit input from public on the list of projects.
  - Resilience Plan Development Meeting – discuss the Draft Resilience Plan submittal and comments and develop strategy for Final Plan development and submittal.

Deliverables for this task include meeting agendas, meeting summaries, invoices, and progress reports.

Assumptions

1. City to provide GIS data available. The City does not currently have GIS data for the stormwater system.
2. The Resilience Plan is a planning level document and will not be stamped and sealed by a Virginia Professional Engineer (PE).
3. AECOM will not be providing site plans, landscaping plans or detailed design for any of the identified flood mitigation measures contained in the study in this phase of the project.
4. Environmental permitting will not be performed.
5. LiDAR data is available for the study area.
6. Phase I, II, III Archeological Investigations are not included.
7. FEMA CLOMR or LOMR applications are not included.

Schedule

The notice to proceed is dependent on the timing of the CFPF grant awards. AECOM is prepared to commence work within two weeks of NTP from the City, and it is believed that all work include in this scope can be completed within one year from NTP. It is noted that this work will be coordinated with the City-wide Drainage Study, as information collected during that effort will inform the Resilience Plan. The estimated schedule for project milestones is as follows:

- Kick-Off Meeting - within two weeks of NTP

- Public Meeting #1 – within eight weeks of the Kick-Off Meeting
- Publications and Documents Review – approximate 5-week effort, to commence upon receipt of all requested information.
- Resilience Projects Identification Meeting – within two weeks of completion of project identification effort (to be coordinated with Drainage Study).
- Public Meeting #2 – within four weeks of the Resilience Projects Identification Meeting.
- Draft Resilience Plan Submittal to City – within two months of the Public Meeting #2.
- Final Resilience Plan Submittal to DCR – within 4 weeks of receipt of comments from City.

Additional Services (available upon request)

1. FEMA CLOMR or LOMR application support
2. Grant Writing and Grant Administration Support

Fee

AECOM will provide the above-described services for the lump sum fee of **$139,790**, as shown in the Task Breakdown table below.

Task	Labor Cost	Expenses
Task 1 - Publications Review and Vulnerability Analysis	$17,410	
Task 2 - Stakeholder Engagement and Community Outreach	$31,620	$1,080
Task 3 - Adaptation Alternatives Analysis	$31,300	
Task 4 - Draft and Final Resilience Plan Development	$31,300	
Task 5 - Project Management and Meetings	$26,080	$1,000
Sub-Total	$137,710	$2,080
Total Fee	$139,790	

We are eager to begin serving you on this unique project.

Yours sincerely,

Ronald B.

Sir/Madam,

Attached to this email is the second of two applications for the City of Covington.

This application package is for the Resilience Plan.

Please don't hesitate to contact me with any questions.

Respectfully,

Patrick J. Madigan, Sr.

Director of Public Works

RE: CITY OF DANVILLE PLEDGE AGREEMENT TO MATCH FUNDING FROM CFPF FOR CAPACITY BUILDING AND PLANNING, IF AWARDED

Dear DCR Review Committee,

The City of Danville enhanced Plan It Danville comprehensive plan update including sustainability and flood prevention, under the Virginia Community Flood Preparedness Fund (CFPF) Grant Program.

The total amount of the project is $1,421,100 of which the proposed CFPF share is 90 percent, a total of $1,278,990. The proposed Danville share is 10 percent, a total of $142,110. It is the intent of City to utilize City funding to fulfill the match requirements. The City will also contribute over $500,000 towards project beyond the match requirements.

As the contributor of the match, The City of Danville will pay the cash contribution during the agreement period. The source of funding for the cash contribution will be City funds. The contact information for the contributor's representative is Doug Plachcinski and he can be contacted at plachhd@danvilleva.gov, 434-799-5260.

Sincerely,

Ken Larking
City Manager

RE: CITY OF DANVILLE AUTHORIZATION TO REQUEST FUNDING FROM CFPF FOR CAPACITY BUILDING AND PLANNING

Dear DCR Review Committee,

This communication confirms the intent of the City of Danville to assume responsibility for implementation of the proposed enhanced Plan It Danville comprehensive plan update including sustainability and flood prevention, under the Virginia Community Flood Preparedness Fund (CFPF) Grant Program.

The total amount of the project is $1,421,100 of which the proposed CFPF share is 90 percent, a total of $1,278,990. The proposed Danville share is 10 percent, a total of $142,110. It is the intent of City to utilize City funding to fulfill the match requirements. The City will also contribute over $500,000 towards project beyond the match requirements.

Thank you for your support of the City of Danville. Your partnership is an investment in our effort to protect residents and critical systems in the City.

Sincerely,

Ken Larking

Ken Larking
City Manager

City of Danville
Community Development
Planning Division

I. Grant Application Information

The City of Danville, Virginia enthusiastically submits this Virginia Community Flood Preparedness Fund (CFPF) grant application. Attachments include completed copies of the CFPF grant application form and Capacity Building/Planning Scoring Sheet. When completed, this planning initiative will significantly advance the sustainability of the City's current comprehensive plan initiative but will also meet the five (5) Resilience Plan criteria outlined in the CFPF Grant Manual.

The timing of this grant request could not be more synergetic because Danville is embarking on a comprehensive planning process to recreate the City's policies and land use regulations with cutting-edge best practices that promote equity and nature-based systems so our community is sustainable for future generations. The City dedicated over $500k the Plan It Danville comprehensive plan initiative.

Danville will integrate the work necessary for a DCR-approved Resilience Plan into the current Plan It Danville comprehensive plan project so there is a seamless framework for implementing innovative, coordinated, cost-effective projects and programs that will reduce potential for flood damages and recovery time. This goal is ambitious but appropriately formulated to manage risk, losses, capital outlays, and future threats alongside a robust outreach program and developing staff capacity. This proposed work program and subsequent plan is based on a keen awareness how stress imposed on aging infrastructure by development pressures and rapidly escalating climate change.

Considerable emphasis will be placed on prioritizing hazard mitigation activities that use nature-based solutions to reduce flood risk, as noted repeatedly in the Scope of Work**.** The project scores 350 points on the CFPF scoring she—the maximum possible for a locality in good standing with the National Flood Insurance Program (NFIP).

Danville was battered with 5 presidentially declared disasters since 2018 with localized effects, including Hurricane Michael that killed citizens and cause millions in property damage in the City. Mitigating potential disaster, responding to inevitable disruption, and managing unprecedented growth and change necessitate the resources available through the CFPF grant program. The City requests $1,278,990, to go along with the $142,110 local match and over $500,000 in additional city funds for a total Comprehensive Plan with enhance sustainability and flood prevention investment of over **$1,921,100.**

This investment will build permanent local capacity for administering and improving floodplain management, energize the community about sustainability and mitigating climate change, and reorient City policies and programs around these concepts for the next generation. The investment will also springboard off recommendations in the recently completed 2021 Multi-Jurisdictional Hazard Mitigation Plan for the West Piedmont Planning District Commission. The existing Floodplan ordinance is on Municode.com and the current 2030 Comprehensive Plan in on the City's website.

Enhanced activities will fold into the existing Plan It Danville comprehensive plan initiative project administration.

II. Scope of Work Narrative

Danville regularly experiences challenging riverine flooding that impacts its community landmarks, its homes and businesses, and its historic downtown. However, the City has rarely had the means to proactively address flooding impacts and plan new approaches for the future. The Community Flood Preparedness Fund offers the City an opportunity to plan toward a more resilient future with sustainable staff capacity.

The City will implement flood prevention and protection projects and studies in areas that are subject to recurrent flooding. However, first the City must update internal floodplain management functions alongside DEQ MS4 permitting tasks and develop a Resilience Plan. All work funded by this application and subsequent projects will be to mitigate future flood damage and to assist the City with floodplain compliance administration while sustainably addressing climate change equally across all demographics.

The City is a low-income geographic area, as defined in the CFPF Grant Manual, as an area where the median household income ($37,147) is significantly less than 80% of the local median household income ($76,398 in VA), according to the US Census 2021 QuickFacts.

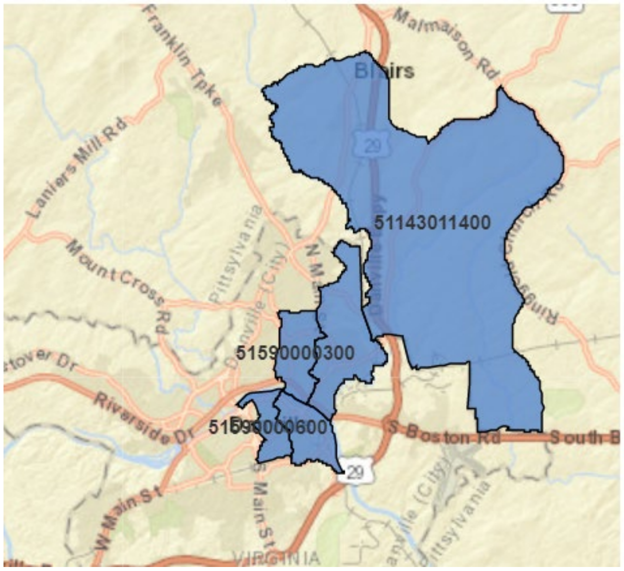

Figure - Danville's Opportunity Zones

Further, the City contains four (4) designated Qualified Opportunity Zones, shown to the right. Once the City's floodplain program is better established, priority will be be on community-scale hazard mitigation and nature-based solutions focused in the Opportunity Zones, when feasible.

Danville has never undertaken such a thorough, comprehensive look at land use planning, stormwater management, floodplain management, and resilience. City staff is fully engaged, and the City does not have additional in-house personnel, technical resources, and technical expertise available to adequately prepare the Resilience Plan elements so City projects will be eligible for future capital project funding.

Fortunately, the City is moving forward with a generational comprehensive planning initiative that has talented and skilled professionals under contract through qualifications-based selection processes. Our professionals experienced in stormwater management, community engagement, watershed planning, riverine flooding, resilience, computer modeling, funding, and engineering to develop additional resiliency components to enhance the comprehensive plan.

City officials will use input from these professionals and community stakeholders to shape the deliverables. The City will direct and manage the effort and provide recommendations for programs and projects. City staff and management will use the results of the utility feasibility analysis, ordinance reviews, system condition assessments, maintenance reviews, community feedback, design requirement recommendations, and capital project recommendations to align the City's implementation efforts with the anticipated needs.

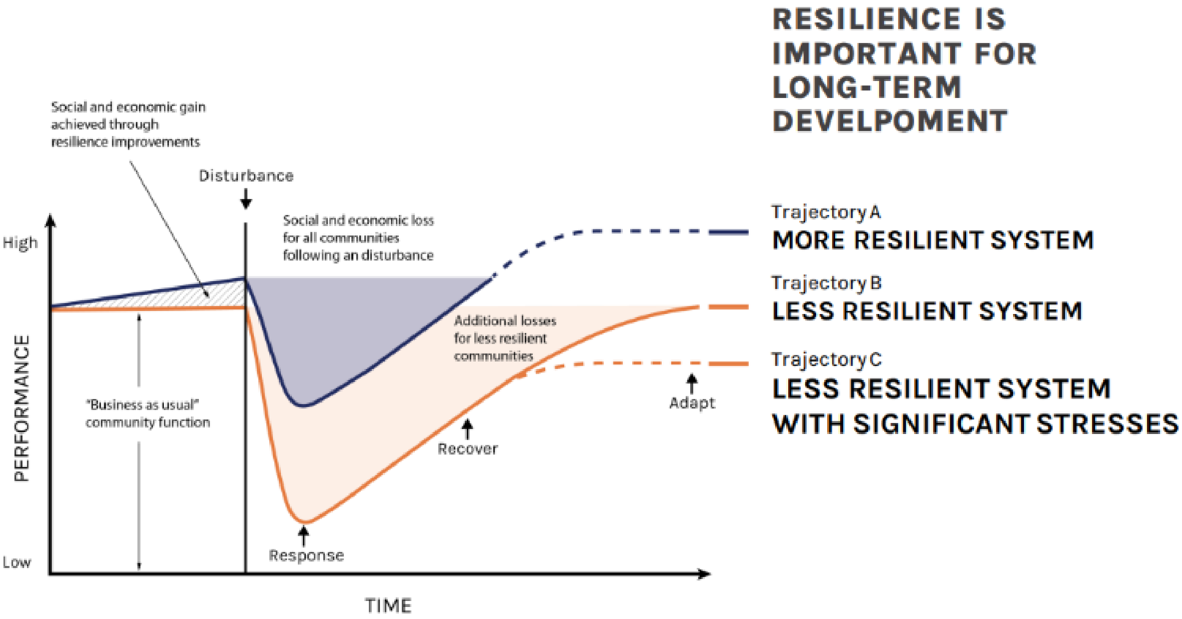
We organized the Plan It Danville initiative into six (6) major topic areas and will enhance all of them with the additional CFPF funding. Within each of these topic areas, this grant application indicates the additional capacity building and planning activities the resiliency planning grant will fund if awarded. Further, the Sustainability Planner funded by this grant will manage stormwater and floodplain management and outreach in concert with other City community-oriented services like healthcare workers, community policing officers, housing inspectors, and parks and recreation planning.

Lastly, and most significantly, the CFPF training will bolster a robust public outreach process that builds community capacity and understanding about the connections between sustainability and equity. This process will enrich out future local boards and commissions members as well as build communications conduits from our residents to Local Government. Key features of the enhanced engagement program include:

- Capacity Building
- Community Boosters
- Community Booster Coordinator
- Community Booster | Social Media Marketer
- Mobile Engagement Vehicle | Ethos Rover
- Project Storefront | Danville Mission Control Center
- Event Catering
- Project Advertising
- Project Communication Platform
- Community Events and Celebration

a. SUSTAINABILTY & RESILIENCE

Today, community resilience is referred to “as the ability to prepare for unanticipated hazards, adapt to changing conditions, and withstand and recover rapidly from disruptions” (NIST, 2021). Resilience is incredibly important to invest in ahead of any sort of unplanned disaster happening. The more a system is prepared, the less impact an unanticipated event will have in terms of disruption. The graphic to the right highlights a path for long-term development in terms of performance. Ideally, uninterrupted growth is the goal of any given area. Considering that unanticipated weather, economic, and public health events will likely occur, then the goal should be to minimize any potential dip in performance to build up additional capacity for preparedness as possible.



RESILIENCE IS IMPORTANT FOR LONG-TERM DEVELPOMENT

Adapted from model developed by M.E. Hynes, B. Ross, and CARRI (2008), presented at the DHS University Summit, Washington, DC

TRENDS

Danville’s current baseline review shows an area with complex, yet exciting, opportunities ahead of it when considering sustainable development. From a social and economic perspective, the area has a lingering legacy of inequity of income and socioeconomic status between specific groups that can disproportionately impact some demographics more than others. From an environmental perspective, the area has fluctuating weather patterns that point to significant changes in trends. The following elements will need to be mitigated Danville:

- **Weather changes including heatwaves, storm surges, severe flooding, and ecosystem loss.**
    - **Heat Hazard**: Average daily temperatures are expected to increase by 9.5 degrees from an average of 69.5 degrees (1961-1990) to around 79 degrees by 2020 exacerbating emission rates. The number of cooling degree days increased 2.4x from 1,330 days (1961-1990) to 3,183 days by 2020. These rates will continue to increase if climate focused interventions are not employed. Source: Climate Explorer NEMAC
    - **Drought**: In 2021, lower precipitation rates were recorded compared to normal year-to-date (YTD) metrics. In October 2020, Danville received a total of 43 inches of precipitation, ~5 inches more than normal YTD. While October 2021, the city received only 25 inches of precipitation. Indicating a dramatic shift in precipitation rates. Source: Climate Explorer NEMAC
    - **Precipitation Patterns**: More sporadic intense rain events, accompanied by less snowfall, increased winter rainfall, more inland flooding, and decreased summer rainfall

reflect more severe seasonal changes, that can impact agriculture and farming cycles. This can place a great deal of strain on existing infrastructure.

  - **Growing Degree Days:** Historically Danville's economy centered around agriculture. Specifically, the growth and production of tobacco products accounting for 4.78% of Danville's domestic production. While tobacco is no longer the leading product of Danville, local agriculture has the potential to continue to be a major economic driver for Danville. This is only possible if Danville can address the climate related issues such as the number of growing degree days. Source: DataUSA.IO
  - **Infrastructure Changes:** Aging or unused infrastructure along the Dan River, in Danville and adjacent cities, can cause public health, ecological, and financial challenges. However, there are political misgivings around the removal of the existing Dan River dams. Many residents want to keep the dams for the views they provide along the Riverwalk Trail. However, the dams are problematic and with their removal, the Dan River flow could increase and help mitigate major flooding and stormwater challenges the city faces. Improvements to the river could also provide much needed resiliency funding if the dams were to be removed. At the same time, trends in recent transportation data also show that investments in more regional systems could go a long way towards uplifting both environmental and socioeconomic goals.

- **Equity Changes:** Systemic resiliency can truly be achieved by carefully connecting the aspects of the comprehensive plan towards intentions across both social and environmental vulnerabilities. We can see how broader socioeconomic resilience can be created by intentionally identifying how local jobs and income-levels can be improved by removing the disproportionate cost-burden from daily activities on historically disadvantaged demographics. Reducing the available portion of income that goes to things like transportation, utility payments, and even food payments can play a huge role in pushing forward the capability of Danville residents to have more disposable income, and therefore, greater money to put towards wealth accumulation that can offset any unexpected expenses caused by unanticipated events.

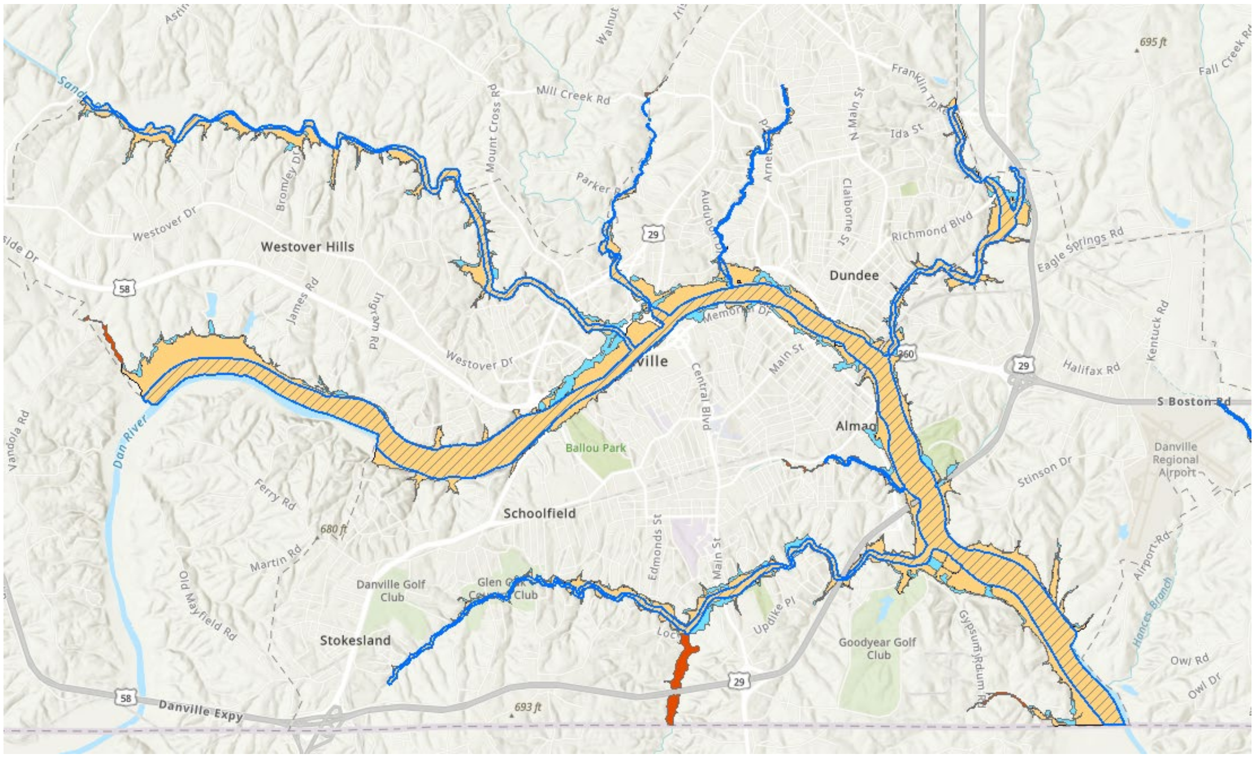


Figure 1- FIRM floodzones in Danville

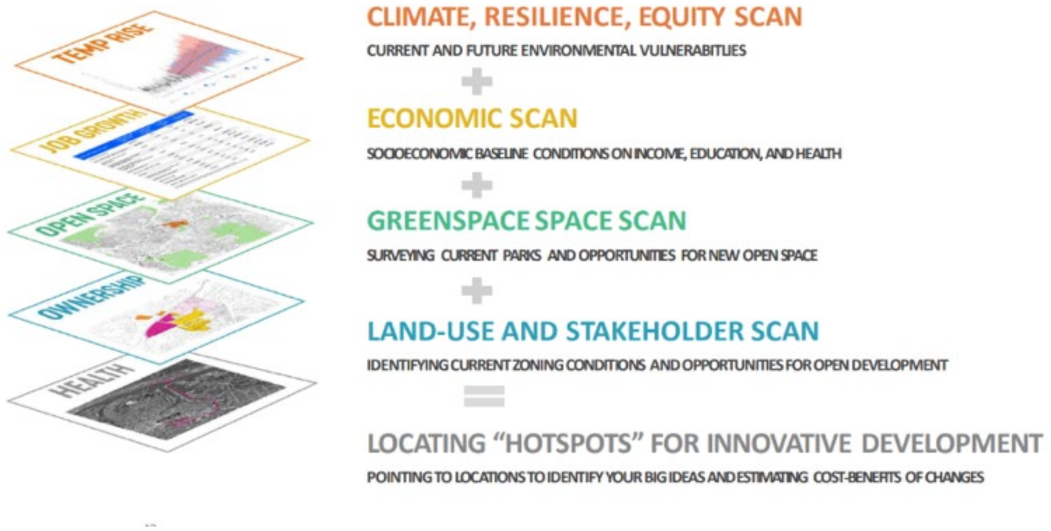
OPPORTUNITIES

Each of the previously mentioned trends are also areas of opportunity. The following areas present the greatest areas of potential intentional opportunity creation that a broader comprehensive planning process can help to push forward in Danville. These include:



- Food- energy- water nexus: taking advantage of the local climate to create a center of environmental excellence in the region. Growing degree days still have a big impact on agriculture and food accessibility. However, due to drought and irregular weather patterns this does not directly equate to increased food production unless these three areas are managed and coordinated intentionally in planning. From the city’s comments on sustainable energy, it seems important to further understand the relationship between local and centralized utilities and identify what incremental changes can happen from an energy perspective.
- Affordable energy: energy is a huge part of the utility-income burden in certain parts of Danville. Evaluating new builds to enhance the use or renewable energy will help reduce the cost of utilities for residents and landowners.
- Connecting to the Commonwealth and federal-level opportunities for local climate leadership: Infrastructure investments and capacity investments are both show huge areas of possible collaboration and overlap. Already, recent solar investments and contracts by the City of Danville have been used as a strategy to build economy, reuse underutilized farmland, and attract companies. Solar energy could also play a role in times of emergency to provide power to critical places and uses, but also provide a way to build jobs.

GAPS

Data is the most important tool to support intentional decision-making. The comprehensive planning process can be supported by intentionally diving deeply into a few key data areas. Otherwise, it can be difficult to judge exactly where in the city these broad macro-level shifts can help to create the most strategic change. These key data areas can include the following the methodology:

NEXT STEPS

Stakeholder coordination through resilience is oftentimes tricky because certain information can be somewhat confidential. In particular, the maps and vulnerabilities that are related to utility-level infrastructure. It is imperative that the city develop strong relationships with utility companies to create comprehensive maps that can highlight areas of vulnerability and strength to develop a comprehensive approach to resiliency.

SUSTAINABILITY AND RESILIENCE ELEMENTS added by the Resiliency Plan application:
• *Providing 3 years of funding for a planning staff Sustainability Planner position to coordinate the planning grant and implementation and transition into a dedicated Floodplain Administrator. Danville needs to build capacity. This staff and outreach program will also satisfy the City's MS4 public involvement and public outreach requirements for the three (3) project years;*
• *Establishing reliable overhead and cost basis rates for future disaster response efforts so the City receives appropriate financial support in recovery;*
• *Developing an ongoing disaster response training program for City employees that are not first responders.*
• *Providing ongoing training, enrichment and peer exchange opportunities for the Sustainability Planner funded by this grant and other City Staff. Sustainability and equity are cross-cutting priorities that impact all City operations and services. These activities include FEMA training and participation at appropriate national and state/regional conferences or other events.*
• *Designating Danville resiliency hubs at community centers that will reduce extreme condition exposure during disasters and improve access to public services and spaces during safe times.*

b. HOUSING

Danville is projecting an influx in its residential and workforce populations, due to new large-scale development taking place at the Berry Hill mega-site and at the site of the future Caesar's Virginia Resort, set to open in 2023. With a rapidly approaching deadline, Danville must develop a clear plan for current and future residents to maximize the benefits of these sweeping changes. These advancements offer Danville an opportunity to take advantage of its historic communities and infrastructure, proximity to the scenic Dan River, and adjacency to other regional economic hubs. Ultimately, this will provide current and future residents the chance to merge lower costs of living with growth opportunities, unique historic elements, and recreational amenities that will enhance overall quality of life and capitalize on the city's small-town charm and potential big city amenities. In preparation for much of this new development, Danville is conducting a more extensive housing study. However, our preliminary findings, gathered prior to the completion of these additional studies or plans, will help to underscore continued housing research and provide high-level policy recommendations.

TRENDS

After meeting with some key community stakeholders and conducting our preliminary analysis, our team identified several housing trends. These trends will guide proposed future development and housing recommendations in the comprehensive plan. These include:

- **Aging housing stock impacting overall housing quality.** Seventeen percent of Danville's housing stock was built before 1940, with 45.9% of homes built between 1960 and 1970. Older homes are gaining some traction in the age of fixer-uppers. However, they can also result in high investment, construction, and maintenance costs. Overall, the aging housing stock contributes to rising infrastructure needs and decreasing home values that can impact general quality of life.

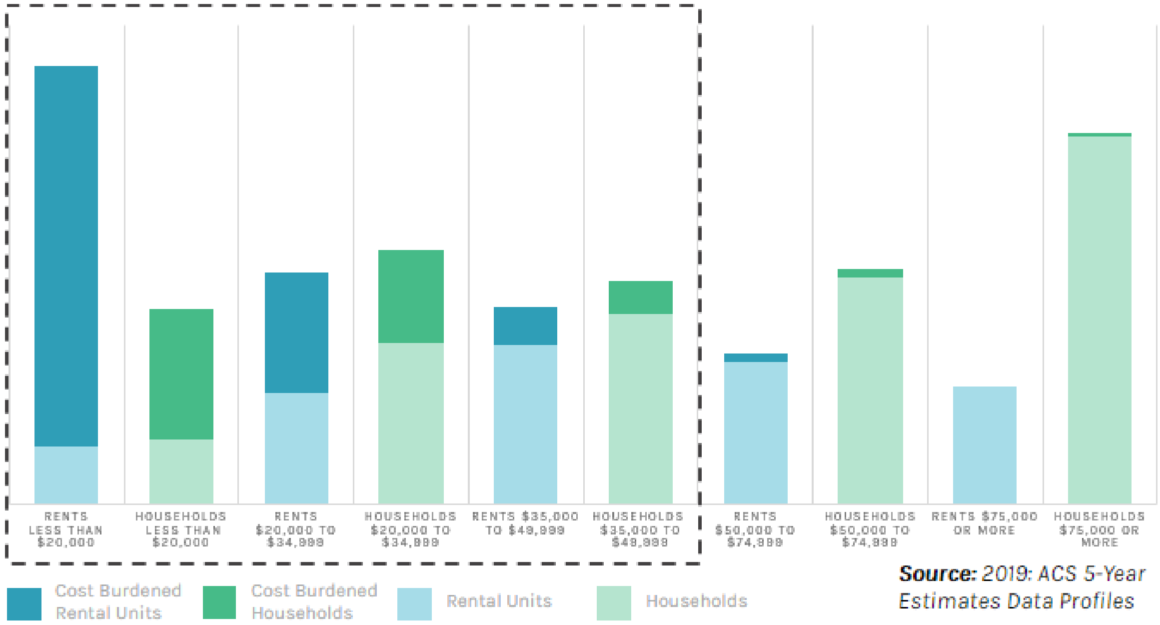
- **Low property values.** The median home value in Danville is $90,500 with 13% of homes valued at $200,000 and above, indicating a small margin of property investment growth. While low property values can be an advantage in terms of affordability, it can also detract from developer interest due to narrower profit margins. **Priorities should include bringing affordable properties up to a certain quality standard and having new construction focus on missing housing typologies.**

- **Predominant housing typology.** Over 70% of households in Danville are single-family units.

- **Large renter population. Forty-eight percent of** residents in Danville are renters. Many renters (85.3%) are spending less than $1000 a month on rent. However, 47% of renters are spending above the recommended 30% of their annual income on rent. This gap indicates that a larger portion of renters in Danville fall into the category of low-income or cost-burdened households.

- **Gap in affordability.** Rental unit and mortgage costs, comparative to income rates, illustrate that approximately 47% of renters and 27% of homeowners are spending above the recommended 30% of their annual income on rent or mortgage payments. Disparities in access to modern amenities further indicate wealth gaps. In Danville, there are currently 570 households without phone service, 3,548 households without access to a computer, and 5,062 households without internet service. Indicating a significant digital divide that exacerbates existing disparities.

COST BURDENED HOUSEHOLDS BY ANNUAL EARNINGS



Source: *2019: ACS 5-Year Estimates Data Profiles*

- **Affordability disproportionately affects residents.** Wage gaps based on gender and race show that housing affordability for women and minority led households are at a disadvantage when it comes to home ownership. The average woman in Pittsylvania County makes approximately $20,000 less than the average male counterpart. The median household income for Black households is about $10,000 less than that of White households.

- **Barriers to development.** Below average property values, higher construction costs, and pandemic related supply chain issues could deter developers. Alternative housing types could also impact development incentives. For example, there are several modular home communities in Danville that could receive HUD (Housing and Urban Development) funding. However, this could decrease surrounding home values, and impede some socio-economic groups from cultivating generational wealth.

- **Resident concerns**. Residents are expressing concerns over the potential for gentrification and displacement, often exacerbated by these types of planning efforts. Specifically, with the onset of a new major amenity like the Caesar’s Palace Casino. This is particularly true in the case of housing. Engagement efforts will focus on creating an inclusive planning process that begins with building community trust to ensure the plan prioritizes existing residents.

OPPORTUNITIES

- Potential strategies to be employed during the Comprehensive Plan process includes but are not limited to: Diversifying housing types. With such a large renter population and cost-burdened households, there is a market for alternate forms of housing including: “missing middle” housing, accessory dwelling units, workforce housing related to economic centers, and retrofits of exiting industrial, commercial, and vacant sites into multi-family mixed use centers. There are also advantages to include ideas such as:

  - A side lot program that allows homeowners living adjacent to vacant properties to purchase and consolidate lots to transform properties through the addition of yard space, driveways, gardens, or home expansions to create smaller affordable housing units and generate alternate income revenues for residents.
  - A scattered-site redevelopment that allows for smaller-scale (15 units or fewer) public housing development, using vacant lots, for greater variety and scale to encourage the development of more affordable units for lower-income residents. This strategy should be underscored by a good management, tenant screening, design, and public relations strategy that would minimize push back for fear of declining property values. While, simultaneously incentivizing multi-scaled development within communities.
  - Amending single family residential zoning to make attached residential and multifamily housing easier to implement and address the missing middle housing sector.
  - Address alternate ways to tackle short-term rentals in the zoning code.
- Expand home ownership literacy to increase wealth building opportunities for Danville residents, with a specific emphasis on historically- disenfranchised populations, to incentivize equitable reinvestment in Danville neighborhoods. This would include, but is not limited to, education on down payment assistance programs, home buyer education, etc.
- Consider opportunities for short term rentals to accommodate workforce and temporary housing during the construction of the casino, while also addressing long-term renter needs.
- Several methods could be used to encourage neighborhood-based reinvestment including capitalizing on regional resources to invest in Danville. There is strong interest from Pittsylvania County to strengthen the capacity of the Danville Land Bank and the Danville Neighborhood Development Corporation (DNDC). Other ideas include establishing a local housing trust fund, which could be managed by existing housing stakeholder groups; ensuring a portion of contracts go to local carpenters and developers to circulate local dollars; and allowing payment in lieu of taxes.

GAPS

The goal is to meet gaps in the market while building on existing community aesthetics and neighborhood character. However, there is often public misconception about placing alternative housing types in existing neighborhoods. This can be addressed through focused engagement that will:

- Identify Danville's housing needs at the neighborhood level through resident conversations, workshops, and surveys.
- Highlight potential barriers to development through developer and city staff focus groups.
- Educate residents about the advantages and disadvantages of a more diversified housing stock.
- Enhanced housing literacy will be paramount to creating lasting change from the resident's level.

NEXT STEPS

The next phase will be multi-pronged. The housing team must clarify what development is most advantageous for Danville's future while simultaneously meeting the current needs of residents.

- Engagement will be resident focused to cultivate a community-lead vision for Danville's neighborhoods. A key aspect of this engagement will be to expand housing literacy among residents of Danville, with a specific focus on marginalized populations and underserved communities
- Data analysis will determine which locations are best for alternative housing development models needed to accommodate new and legacy residents. It will consider current trends related to

economic hubs, amenities, physical access, and housing conditions to determine which housing types are needed in each area. While “missing middle” housing might not be a perfect fit for retrofits near the Danville Mall, existing neighborhoods could be better served through this strategy with additional funding for improvements to existing structures. An analysis of the potential for the Danville Mall to be transformed into a new form of development that emphasizes mixed use or town center development formulas should be investigated.

- An implementation toolkit will include alternative funding sources and a plan for actionable steps to implementation of housing policy.

The goal is to create complete neighborhoods, not isolated pockets of housing.

HOUSING elements added by the Resiliency Plan grant funding application:

- *Understanding accurate potential benefits for dwelling weatherization and energy efficiency improvements including updated building condition data.*

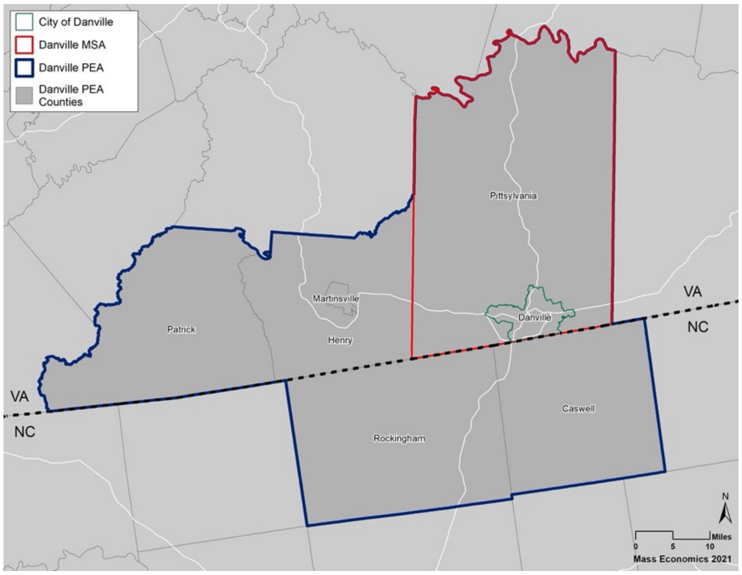
  Specifically, the City will integrate weatherization opportunities into code enforcement, building inspections, and utility programs to better reach residents and property owners through the Virginia Weatherization Program.

  Reducing access barriers to weatherization economic tools provided by Danville Redevelopment Housing Authority, Danville Utilities, and Pittsylvania County Community Action will dramatically assist Danville families to permanently lower crippling utility bills.
- *Updating the City’s flood prevention overlay ordinance and other operations to support Community Rating System membership.*
- *Evaluating and creating a flood insurance rebate $50k seed fund for low- and moderate-income areas.*
- *Developing community outreach promoting permaculture – the design of small agriculturally productive ecosystems suitable to augment household food supplies.*
- *Incorporating floodplain management regulations into the City’s subdivision code and any other appropriate ordinances.*

c. ECONOMIC GROWTH

While Danville’s micropolitan statistical area (mSA), and partial economic area (PEA) were less severely impacted by the pandemic, compared to the rest of the United States between March and April 2020, growth in these areas through June 2021 has notably lagged the national recovery average. This continued an overall decline that began in 2016. Additionally, significant income and resource disparities between various demographic groups and limited financial literacy have created barriers to attaining wealth and economic stability for many residents. However, there is opportunity for growth and development in Danville that can enhance economic opportunities for current and future residents if the right strategies are employed. Below you will note several economic trends contributing to Danville’s current economic state, as well as several opportunities for growth.

TRENDS



- **Job growth in Danville lags the rest of the mSA and PEA – both pre-COVID and during COVID.**
    - **The Danville economy is highly concentrated by a limited set of industries.**
    - The top 3 3-digit industries (Food and Drinking Services, Ambulatory Health Care Services, and Plastics and Rubber Products Manufacturing) (e.g., top 3 3-Digit industries make up 32% of all jobs in 2019 as compared to just 13% in Pittsylvania County and 16% in the U.S.
- **Fourteen of the City's 20 largest industries declined between March 2020 and June 2021, and they all declined more than the U.S average**.
- **There is diversity among work force job holders, meaning there are a higher shares of job holders who are women and BIPOC (Black, Indigenous, People of Color).** However, there are significant wage disparities that exist. For example, women earn approximately 63% of what their male counter parts make, and Black (men and women) workers earn about 70% compared to their white counter parts.
- **There are lower levels of minority-owned business enterprises (MBEs), but relatively high levels of women-owned business enterprises (WBEs).** While MBEs and WBEs have lower average jobs, revenues, and payroll per firm, compared to their male-owned and White-owned counterparts, respectively, MBEs in the city of Danville provide higher average wages than White-owned businesses. This is contrary to the rest of the U.S.
- **Job access challenges persist, specifically for those without access to a private vehicle (physical, commuter flows).**
- **From 2017-2021, retail remained stable in establishment count, employment, and wages, except for:**
    - Food Services (NAICS code 722) and Personal & Laundry Services (NAICS code 812) lost the greatest employment and wages between Q1 and Q2 of 2020 during the initial closure period of COVID.
    - Comparing Q1 2020 to Q1 2021, total quarterly wages in Personal & Laundry Services has not returned to pre-pandemic levels.
- **Year-over-year (2016-2020), annual household expenditures grew in Danville** at a greater rate than the national consumer price index (CPI), as calculated by the Bureau of Labor Statistics. Over the period 2016 to 2020, the CPI increased by 10% while expenditures increased over 21%.

OPPORTUNITIES

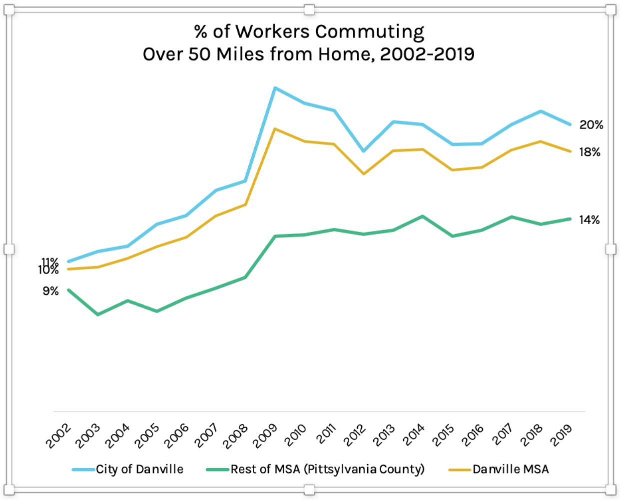
- Leverage publicly owned vacant and underutilized land and buildings. In addition to the mega-site, identify potential adaptive reuse and infill opportunities for both work force housing and commercial uses, along with a site assembly strategy.

- As a border city, assess opportunities to rationalize workforce housing and commercial development strategies. These can be developed in partnership with surrounding counties, including those in North Carolina and the existing rapport that exist with Pittsylvania County.
- Almost two-fifths of the mSA's acreage consists of farms. This is more than Virginia and North Carolina overall. This presents an opportunity to develop and enhance local agriculture and food economies. The food manufacturing industry grew by 24% in Danville between March 2020 to June 2021 and grew in the mSA and PEA overall.
- Like the U.S., retail and consumer-facing industries in Danville and the broader region were severely impacted by the COVID-19 pandemic. The food services, personal services (including laundry), hotels, and other travel/tourism-related industries all declined dramatically through June 2021 – but, as more current data are released, the planning team will evaluate and track the on-going (and uneven) economic recovery in these important industries.
- E-commerce is strong in the PEA overall. Although not a current strength in the city, being only one-fifth of the expected jobs, the sector has grown dramatically nationally during the pandemic.
- Driven by pandemic-accelerated growth of e-commerce and hybrid digital-physical models (e.g., online ordering and supply chain management) there is potential for Danville to lead by helping retailers, restaurants, and business-to-business firms make necessary transitions.
- Conduct retail market analysis to identify submarkets for increased retail/entrepreneurial growth. Beginning by expanding upon the River District's success, as the only branded experiential retail district and home to an opportunity zone, to target for additional development, retail, and entrepreneurial opportunities.
- Employee inflow exceeds outflow. Providing an ability to capture demand for retail goods and services and residential development could be supported by an employee- friendly market.
- Sales tax in Danville and Pittsylvania County is lower than in surrounding municipalities in North Carolina and Virginia. Danville has a competitive advantage for retailers seeking real estate and an opportunity to instate a special tax to bolster the City's municipal budget.
- Leverage Danville's location in a region. Proximity to several academic institutions (i.e., colleges and universities in Chapel Hill, Durham, Greensboro, Blacksburg, and Lynchburg) places Danville in a potentially advantageous position to explore satellite campuses, partnerships, and other educational and economic drivers.

GAPS

- There is a significant small business lending capital gap from traditional banks in Danville. However, there are high levels of lending capital in Pittsylvania County overall. Gaps may be partially addressed by foundation, small business administrations, and state/local government lending, which should be investigated fully in next phase of work.
- There are low levels of MBE entrepreneurship in the City of Danville – but relatively high WBE rates - and both WBEs and MBEs are smaller scale employers compared to their male-owned and white-owned counterparts, respectively.

- Lower levels of educational attainment, disparities by race/ethnicity, and workforce education gaps persist within Danville's and the broader region.
- Available capital to realize real estate development is limited.
- Access to and the presence of major interstate roads create a barrier to economic development.
- Larger retail centers (grocery-anchored strip centers or larger) do not exist within 13-33 miles in each direction from the city's center and the city's southern and western neighborhoods have limited retail development.



- An arts district does not exist in Danville.
- Defining strategies and policies to relocate retail currently located in annexed portions of the city to designated commercial districts.

NEXT STEPS

- Update economic data through end of 2021, as new data is released (6-month lag), to understand ongoing impacts of the COVID-19 pandemic, with a focus on the impacts on BIPOC workers, MBEs, and WBEs.
- Assess land assembly opportunities among vacant and underutilized land and buildings.
- Identify inclusive industry-cluster opportunities through scoring/weighting methodology.
- Develop better understanding of future housing market and demands (inclusive of the potential impact of the casino project) which, in turn, will influence retail and other neighborhood cluster demand (I.e., integrate findings from the ongoing housing study).
- Bolster residential demand with strategies to strengthen and improve commercial corridors over the next 10 years, including exploring the viability of retail and a diversity of non-retail uses.
- Remedy any misaligned municipal codes as it relates to commercial and residential growth opportunities such as outdated parking requirements.
- Understand assistance programs offered to businesses in greater detail and specifically define where opportunities are not meeting the needs of developers, property owners, corporations, and retailers. More at: https://www.discoverdanville.com/business-support/incentives-overview/river-district-businesses-and-developers/
- Continue developing cross-cutting strategies across the project.

ECONOMIC GROWTH elements added by the Resiliency Plan grant funding application:

- *Writing a stormwater design manual explaining low impact site development concepts and best management practices for public and private projects in ESRI storymaps. This program element culminates in a community wide education forum with community partners like the Dan River Basin Association and the Danville Science Center.*
- *Similarly, writing a native plant and tree guide in ESRI storymaps that encourages native landscaping that cools heat islands, replenishes Danville's canopy, provides training to public and private arborists, minimizes stormwater techniques, and beautifies the community with nature-based solutions. This program element culminates in a tree-based outreach event with*

the City's parks and recreation department during our annual Make Danville Shine community pride celebration.

- *Updating the City's Stormwater Management and Flood Prevention internet presence through a redesigned webpage and targeted social media posts to drive increased clicks.*
- *Implementing a GIS based system for managing public and private stormwater control measures and best management practice design/construction plans, maintenance agreements, and inspection records, including private owners' inspection reports to monitor compliance with maintenance agreements. This process will reduce red tape and increase private business efficiencies.*
- *Selecting, acquiring, and implementing software that supports the City's MS4 and VDPES Industrial permit obligations;*
    - *Multi department/user access and integration with other City IT solutions.*
    - *Automate annual and monthly DEQ reporting.*
- *Integrating floodplain management and land disturbance permits into the City's CityWorks permitting system. This process will reduce red tape and increase private business efficiencies.*

d. CONNECTIVITY & MOBILITY

Mobility is an essential part of Danville's future growth and success. Future large-scale development has the potential to rapidly expand Danville's population and therefore its infrastructure needs. However, current transit systems in Danville are considerably disjointed. With the arrival of new development, it will be necessary to assess how the existing transit system could be more integrated. Transportation in Danville is highly dependent on the use of personal vehicles due in large part to large road infrastructure, disconnected pedestrian infrastructure, and local topography. The city of Danville offers several services, including:

- Inner-city busing with 6 fixed routes
- Inter-city busing with 2 fixed routes from Danville to Washington, D.C. and Martinsville to Richmond
- Handy-Van Services
- Reserve-a-Ride services
- Biking services at the Danville Riverwalk Trail and Anglers Ridge Mountain Biking Trail
- Danville Regional Airport

The area also has several projects underway in partnership with the Virginia Department of Transportation and West Piedmont, including:

- Kentuck Road and Piney Forest Road right-of-way improvements
- Ringgold Depot trail connection to the Riverwalk trail
- Bikeable infrastructure improvements on Piedmont Drive

TRENDS

- **Mobility has been drastically impacted as an industry nationwide during the pandemic.** In Danville specifically, COVID-19 has accelerated trends of reduced ridership on fixed transit routes and increased demand for on-demand shared-use mobility. While transit ridership is down over 20%, the demand for rideshare services such as the Reserve-a-Ride service is up 40% in the past year. Senior ridership on public transit has shifted to on-demand rideshare services. However, this service is mostly used for work trips with peak user times covering 4:00 to 7:00 in the morning. This shift in trends is due in part to the pandemic. A rise in rurally located medium-sized businesses over the past decade and the unreliable nature of local taxi services has also played a part in the rise of on-demand services. At approximately $4 a ride, on-demand services are affordable for residents. However, the city does not have a cost-effective way to provide the early morning and late evening on-demand transit services most requested by employees working odd-hour shifts.

- **Bus transit is competing against this increase in on-demand service popularity, safety concerns, and perception issues with mass transit.** The largest of these barriers is high bus driver turnover rates. Drivers have difficult working conditions, safety concerns, and see opportunities for higher pay with the school bus system. The city has waved several licensing requirements to open the hiring pool but have not seen as much interest as anticipated. The city has also seen challenges receiving public and political backing to raise bus fares, which could help increase driver wages.
- **Certain areas are well-served by sidewalks, while others are not.** In general, areas with strong sidewalk networks are insular, lack crosswalks, and tend to be disconnected from the larger transportation framework. A similar trend is seen in bike infrastructure, where strong paths are created in park and economic centers but could benefit from connections to surrounding residential areas. There is a strong incentive for regional investment in multi-modal transportation, but the design could be pushed further to include buffers, materials, and signage which would enhance safety and encourage different mobility behaviors.

OPPORTUNITIES

The primary goal is to create a comprehensive vision for the city, weaving together bicycle planning, riverwalk planning, safety and sidewalk improvements, and complete streets policy. This plan should fill existing connectivity gaps, encourage regular use of non-motorized transit, and align with overall goals of health and resiliency. Initial ideas include:

- **Leverage the Dan River –** Build from the Riverwalk as a recreational anchor or spine
- **Identify funding opportunities** - Position Danville to take advantage of upcoming state and federal funding opportunities. Look ways existing assets can generate more revenue. For example, explore revenue potential of airport as drone hub with ties to manufacturing, shipping, or industrial services.
- **Establish nodes** – Use the land use plan to identify nodes at universities, downtown retail districts, the Riverwalk, and casino, then create actionable steps for development into interconnected non-motorized zones.
- **Connect housing** - Create walkable neighborhoods with basic services available within a 20-minute walk/bike distance, which are connected to downtown and the river, providing attractive missing middle housing to serve a range of income levels and increase growth and density. Expand mobility access in these areas to facilitate access to resources, jobs, exercise. Plan for industrial redevelopment that incorporates workforce housing and connectivity.
- **Explore resiliency opportunities** – Identify methods of fleet conversion to electric or hydrogen.

GAPS

The objective of the engagement process from a transportation perspective will be to understand communities' real and perceived barriers to mobility and access. The comprehensive plan will then look to address gaps in:

- Pedestrian infrastructure – walkable neighborhoods with housing close to amenities and sidewalk or bike infrastructure to accommodate needed connections. Focus on proximity for low-income and missing middle housing.
- Bus infrastructure – address the driver workforce supply and demand imbalance
- Civic infrastructure – align goals and needs of regional transportation planning, city transportation planning, and other city departments to gain local backing and ensure integration of services.

- Physical barriers – understand how the river and topography separate neighborhoods in ways which can be addressed through transportation improvements.

NEXT STEPS

Stakeholder engagement will be key, especially dedicated conversations with non-government task groups, activists, regional players, key employers, and transit users. Coordination with the Schoolfield transportation study will also be an important step to ensure the two plans complement each other and contribute to a unified vision for city staff to build on. Other objectives include:

- Define roadway typologies and assign mode hierarchies
- Map and index current and planned mobility projects
- Create a matrix of upcoming funding sources and timelines
- Develop walkable neighborhood plans
- Investigate zoning code changes for missing middle housing in coordination with housing study
- Assess supportive housing mobility needs
- Explore sustainable fleet options and funding
- Develop a Riverfront connectivity plan
- Research airport opportunities
- Develop a universal fare card strategy

CONNECTIVITY AND MOBILITY elements added by the Resiliency Plan grant funding application:

- *Evaluate relocating or floodproofing all critical facilities that are in Special Flood Hazard Areas or susceptible to disruption from flooding or other weather events.*
- *Considering ordinance performance standards for impervious surfaces and developing a data set with plan review tools to analyze impervious surface changes. Transportation infrastructure is the largest contributor to impervious surface runoff in Danville*
- *Designing templates for green infrastructure retrofits in public and open spaces and integrating them into the City's zoning ordinance standards for landscaping. Danville's publicly owned facilities must demonstrate low impact development outcome to lead the way for private development in our community. Every transportation infrastructure should proactively exceed stormwater quality and quantity management requirements*

e. COMMUNITY HEALTH

While there are challenges to improving the health of the Danville community, there are multiple opportunities to address it within the context of this Comprehensive Plan. Many of the top causes of death in the community can be reduced with shared approaches. Healthy diet, regular exercise, stopping smoking and regular health screenings have been found to reduce acute disease dramatically. Creative strategies to educate the public on the importance of healthy living can be repeated throughout the community and in several of the overall Comprehensive Plan concepts. A comprehensive focus on community education and a shared passion to improve health will go far to raise awareness, which is often the greatest obstacle to improving health.

TRENDS

- **Lower life expectancy rates are prevalent in the city.** Danville's average life expectancy range falls in the lower fiftieth percent of the United States overall. This has contributed to the prevalence of Cancer, Coronary Heart Disease and is compounded by obesity. In addition, the potential for Opioid-related overdoses ranks as the third greatest contributor to poor health in this area. Other chronic diseases associated with respiratory and neurological systems have a great impact on the health of the community.

- **Economic and access barriers to healthcare.** Economic pressures within the community contribute to both a reluctance and even the inability to access healthcare. Access to insurance and Medicaid is limited to less than thirty percent of the population in Danville proper. Many residents are forced to prioritize healthcare lowest on their monthly expenditures following housing and food.

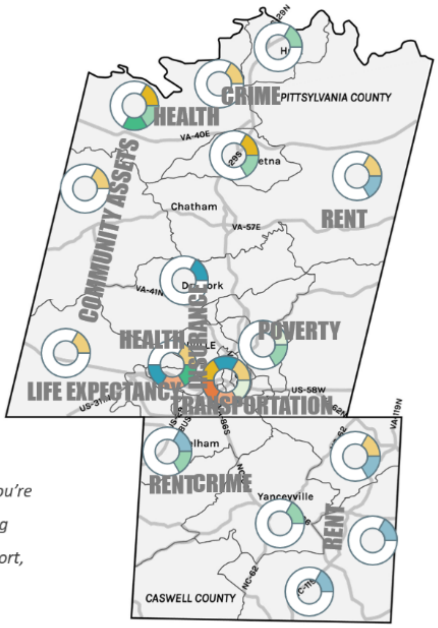
Low Access to Insurance and Medicaid
education for options, tap community institutions for education and support, telehealth for clinical and mental treatment

Prevalence of Cancer
healthy diet, stop smoking, exercise, screening, limit alcohol

Prevalence of Coronary Disease
30-60 minutes of daily activity, brisk walking, running, swimming, cycling, interval/circuit training, healthy diet, health weight, stop smoking

High Poverty
education is the avenue out of poverty, communication strategies for sharing opportunities

"If you don't have ***access to fresh fruits and vegetables*** *and those types of things, then you're just compounding your health problems going forward. If they're not actively engaged in sport, then the kids are* ***overweight****."*



"A person who's living in poverty will think ***'I only need to go when I have to,*** *because if I go now, it's going to cost me money that I don't have.' So as long as you're not hurting and in pain, then we're OK."*

NO VEHICLES
options and collaboration, technology solutions, community forums

Cost Burdened Renters
policy for healthy homes, align housing with populations, culturally driven

High Violent Crime Rate
regional community groups, root cause assessment

Low Community Assets
align investment with regional needs, design to maintain wellness, collaborate with healthcare institutions

Low Life Expectancy
celebrate screening, health education and literacy, educate early

- **Culture does play an increasing role in healthcare access.** This is not just a challenge for Danville, it is a pattern nationally. Some segments of the population access care only when symptoms force action, while others seek alternative forms of treatment outside of an acute care setting. The diversity of cultures in the Danville community creates a diversity in healthcare perception and behavior which is resulting in a less healthy community than seen in other areas of the country.

OPPORTUNITIES

Many of the strategies for improving community health are interlocked with several strategies highlighted in other sections.

- Economic strategies will contribute to a growth in insured citizens
- Housing strategies will ensure citizens are living in safe/mold-free environments
- Mobility strategies will improve access to healthcare institutions and support exercise
- Neighborhood strategies will focus neighbors on health and wellness beyond the individual
- Resilience strategies will focus on personal resilience and personal sustainability
- The key opportunity to share the desire for improved health at a community level, providing individual support with a community approach.

GAPS

Data will inform the opportunities for health and wellness improvement within the Danville community. A deep dive into both the macro and micro level drivers surrounding individual health outcomes will provide a more holistic assessment/measure of which interventions could create the greatest improvements.

NEXT STEPS

Our next steps must be to engage with the authors of the Dan River Health Equity Assessment to share data and community engagement perspective. This information will provide a platform for a deeper dive into key contributors of negative outcomes. Data collection will then focus on the key areas of concern, international strategies for improving health, and an assessment of which strategies have the greatest impact on health outcomes.

COMMUNITY HEALTH elements added by the Resiliency Plan grant funding application:
• *Monitoring and inspecting outfalls and discharge points for illicit discharges with a GIS based system.*
• *Using micro sensors and other cutting edge data collection tools to collect and analyze data so we better understand the localized effects of pollution like increased temperatures and asthma.*
• *Creating a community blueprint for a net zero carbon goal with a feasible horizon.*

f. NEIGHBORHOODS, PARKS, AND LAND USE

The topography and historic development trends of the south have led to the distinct separation of uses throughout the city of Danville. The result is a pattern of corridors and districts separated from each other and pockets of exclusive uses that lack a clear identity.

TRENDS

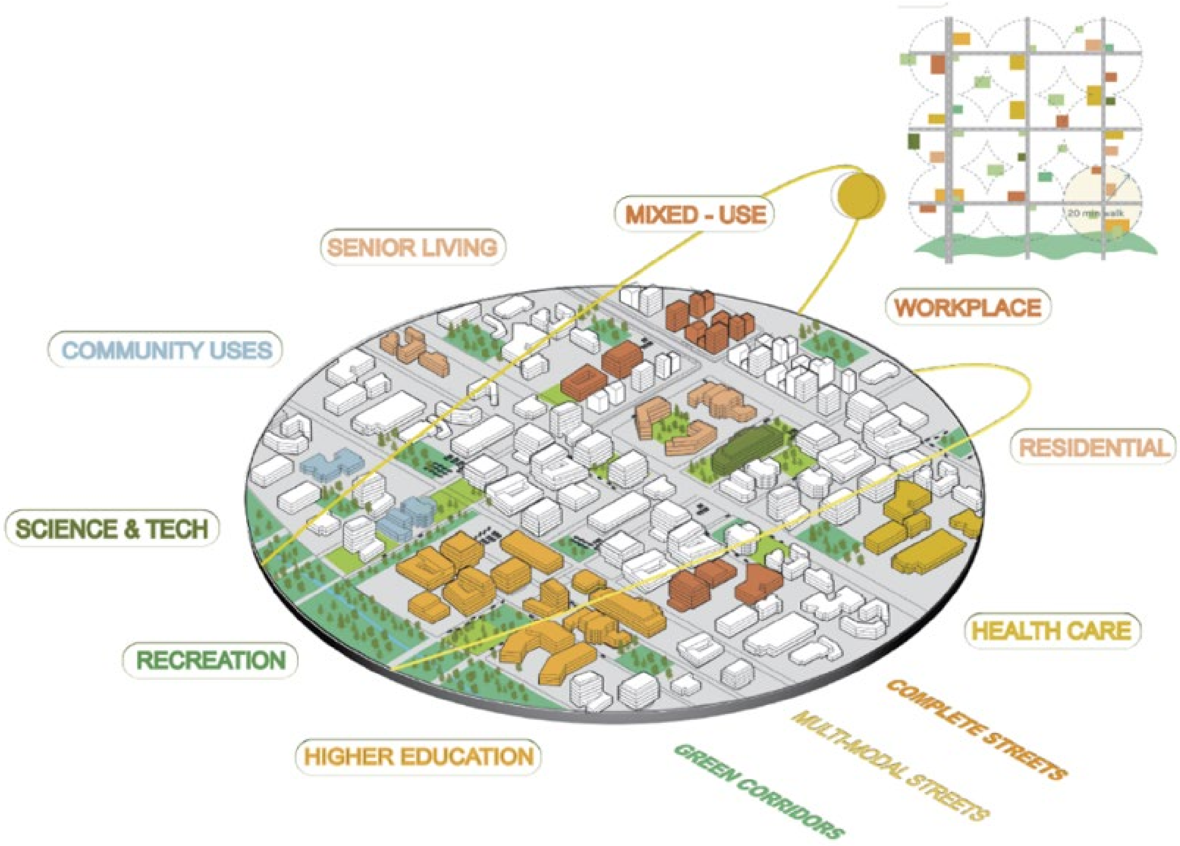
- **Residential Uses**
    - There is a lack of housing supply to meet future potential demand and a lack of diverse housing options to accommodate diverse resident needs.
    - The largest gaps in housing remain in missing middle housing and good quality starter housing. Some of these gaps are offset by an increase in housing development in surrounding Piedmont County, but future trends should identify key residential opportunities in the city itself.
- **Retail and Manufacturing Uses**
    - Retail and manufacturing uses are better thought of as employment opportunities and amenities. Danville is losing retail, which decreases the distribution of employment opportunities and amenities in the city.
    - Commercial uses are mostly along major transit corridors but are not walkable or connected to residential neighborhoods without a car.
- **Natural Features and Open Space**
    - The Dan River is an amenity, but also serves as a divide between North and South Danville.
    - There is a desire to expand the existing 4-acre riverfront park to connect with other parks and open spaces.
    - Danville’s existing parks system is old and primarily located in the heart of the city. There are limited neighborhood parks. North and West Danville are most in need of better-quality parks.
    - Primary concerns around park spaces include connectivity and quality. Most neighborhood parks are primarily unwanted vacant lands that transitioned into informal open space.
    - The few parks that provide quality outdoor space for residents are programmed by the Parks and Recreation Department. These efforts are greatly appreciated and valued within the community.
    - School open spaces are also used as community parks and open spaces but there is no formal agreement between the schools and the parks department.

- **Neighborhoods**
  - Neighborhood identities are more colloquial than political.
  - Neighborhoods are almost entirely residential in use, although there are mixes of residential typologies.
  - Amenities such as parks and retail centers are within a 15-minute walk of residents, but topography generally makes these areas more drivable than walkable.

OPPORTUNITIES

The Danville Comprehensive Plan can use land use as a tool for creating complete neighborhoods in Danville. Complete neighborhoods enable residents to access basic needs within a twenty-minute walking radius. Complete neighborhoods look to combat segregation by race, economic standing, and use to better serve the city. In doing so, complete neighborhoods look to:

- Create accessible, walkable communities with manageable motorized connections
- Combat climate change using sustainable land use patterns
- Incentivize local investment by enhancing neighborhood pride
- Encourage best uses of the land to support a diverse set of residents
- Support healthy living



- Raise local economies
- Schools will soon be receiving additional funding for school improvements which provides an opportunity to couple community spaces with schools. Increase community interaction through a special analysis of neighborhoods using metrics such as access to employment opportunities and open space.

GAPS

Throughout this pre-planning process, several gaps in understanding as it relates to Danville's land uses and neighborhood identity have been identified which will be further explored in the comprehensive planning process.

- Identify how the Schoolfield Plan and other parallel studies will work into the Comprehensive Plan and ensure compatibility.
- Identify how annexed areas of the city have been worked into the community fabric.
- Identify existing deserts (food, physical activity, disconnected from transit) to address the hierarchy of need city-wide and lead to actionable short-term goals as well as a long-term vision.

NEXT STEPS

The engagement strategy for neighborhood analysis will largely focus on understanding how residents currently identify their existing neighborhoods to create a community-based complete neighborhood framework. The housing, mobility, economy, health, and resiliency components will coordinate stakeholder interviews and focus groups which will provide further insights on existing nodes to be enhanced, city interest in specific policies, and equitable resident representation.

NEIGHBORHOODS, PARKS, AND LAND USE added by the Resiliency Plan application:
• *Integrating an overall City watershed plan framework within the Plan It Comprehensive Plan.*
• *Cataloging and producing flood elevation certificates for all buildings in Special Flood Hazard Areas.*
• *Imagining several community scale flood prevention projects*
• *Analyzing stormwater utility feasibility in Danville.*
• *Improving GIS data integrity and feature information for the City's stormwater utility infrastructure.*

SAMPLE GEOGRAPHIC ANALYSIS WORKFLOW

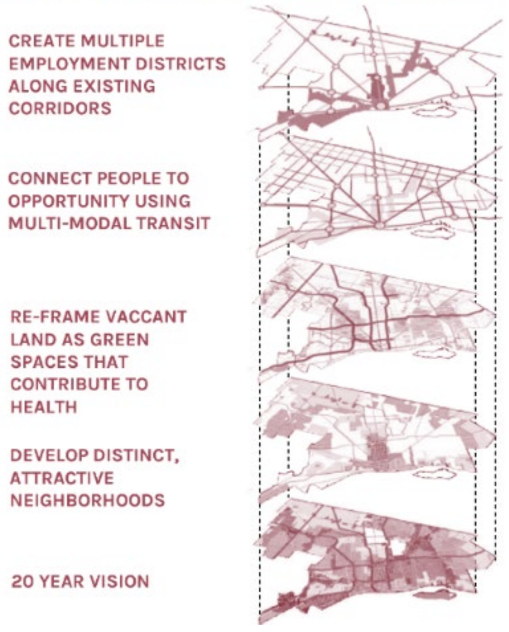


Figure – City of Danville FIRM Maps

g. ENHANCED PUBLIC OUTREACH

OVERVIEW

Plan It Danville is a community-centered engagement process to develop a sustainable comprehensive plan for the City of Danville. The process intentionally realizes Danville's future dreams, ideas, and priorities from a diverse array of viewpoints. An essential premise is that the more people are engaged in shaping the Plan, the more likely they will participate in actively implementing the shared vision. This year-long journey with several phases integrates individuals to add to the conversation about what Danville residents would like to see for their community.

BACKGROUND

A comprehensive plan is considered a 20-year document that public officials should review every five years, and the City of Danville is at the beginning of a new review cycle. The City of Danville decided to aspire to create an award-winning plan based on a process that empowers the community to engage in a holistic view of city government decision-making processes and policymaking – and to think bigger about how Danville could evolve to serve the needs of residents equitably.

The future of planning in Danville is envisioned as a standard interface with community members to guide change to improve the quality of life and access to opportunities. It influences the various factors affecting social determinants of health, such as transportation and housing, which contrasts the current plan, which only serves as a planning resource rather than a guiding document.

APPROACH AND GUIDING PRINCIPLES

From our preliminary investigation, it is evident that stakeholders are excited by Danville's future potential and are ready to see growth that reflects the community's values and needs. Our planning approach will be inclusive and take the necessary steps to **Engage, Inform, and Empower** all stakeholders throughout the process. This approach places Danville's citizens at the center of an 18-month planning process.

- As we **ENGAGE** – we build connections throughout the city by listening, acknowledging local expertise, and working collectively with civic and community leaders to build trust between the community and our project team members. We take the initiative to connect with groups that have been historically overlooked and disenfranchised during past processes.

- As we **INFORM** – we foster authentic connections with the community and stakeholders through a clear and transparent channel of communication that reflects the ideas and opinions of residents by providing a consistent feedback loop between project team members and residents.
- As we **EMPOWER** – we identify opportunities to increase community and civic capacity to help ensure plan implementation.

This approach underscores a project framework that focuses on **three foundational guiding principles – resiliency, equity , and health** - that will serve as the basis for the comprehensive plan. This framework helps to ensure that policy recommendations for the comprehensive plan are crosscutting across the guiding principles. The approach and framework outlined here are supported by **four major planning outcomes** that emerged consistently throughout all our preliminary conversations and research. The themes are as follows:

In early November of 2021, the SmithGroup project consultant team visited Danville to familiarize themselves with Danville's community context and conduct a series of on-site listening sessions with key stakeholders on economic development, engagement, equity, health, housing, mobility, and resiliency. The team's initial findings led them to determine that three (3) foundational principles will transcend through all the Plan's themes: equity, resilience, and health. The Plan's themes will be education, economy, environment, and empowerment.

- **Enhanced Education** – for workforce development, workforce attraction and retention, engagement in lifelong learning, and functioning neighborhood school hubs.
- **Healthy Environment** – for complete neighborhoods, connectivity and mobility, environmental resiliency, land use, community character, and blue/green infrastructure improvements.
- **Thriving Economy** – for local retail, industry, housing, entrepreneurship opportunities, and employment.
- **Community Empowerment** – for long-term civic engagement, capacity building, and elevating Danville's identity and sense of pride.

COMMUNITY ENGAGEMENT GOALS AND OUTCOMES

The premise to this people-based strategy that when people are actively engaged in shaping a Plan they are empowered to own an active role in implementing the shared vision. Collaborative investment in the future community will determine how sustainable and resilient Danville remains. Thus, strength and resiliency are created through intentional activity of storytelling, mapping, and gathering data through surveying. This iterative approach to build the community's confidence in their role to craft their environment in a way that reflects their cultural values of continual growth. Based on the guiding principles, the community engagement goals within this process include:

Establish **equitable access** for the community to share their local knowledge through:

- 120 neighborhood meetings led by Community Boosters
- 20 Tabling Event opportunities at local events hosted by Community Boosters
- Mobile engagement vehicle to meet the people within their communities
- Project storefront located in downtown Danville as a place to gather, learn and inform the planning process
- 5 Danville-wide Community Events that serve as the culmination of each phase in the planning process
- **Ensure communication is multi-directional.** Planners-to-community, community-to-planners, community-to-community, etc.
- **Informed decision-making** providing feedback to inform the decision-making process through:

- Create digital, print, and physical communication channels: Make provisions for direct physical contact with any segments of the community that may experience limited access via other means.
- Manage some channels of communication directly while also enlisting support of pre-existing community channels. Pre-existing channels are likely to include official city channels, established media channels, and formal/informal community channels and nexus points. Actively work to identify and engage the latter on an ongoing basis.

Create a culture of highly responsive community involvement that is **empowers action** to shaping the community.

- Adoption of the comprehensive plan that individuals within the local community and government that spurs strategically, actionable change.
- Build follow-up communications, including simple thank yous, into the communications plan. All individuals who contribute time or share views are entitled to proactive communications informing them of how their contributions are being used. All individuals who contribute time or share views should be personally thanked at the appropriate time(s)

Communication Strategic goals

1. **Make Planning 101 Information Available Anytime:** Build or update the most highly used and visited “front doors” to the Danville brand for community members and other stakeholders.
2. **Provide Anywhere, Anytime Channels for Community Members to Interact:** Incorporate contact, comment, query, feedback mechanisms into #1 or develop purpose-built tools for this goal.
3. **Generate Excitement and Enthusiasm for the Effort:** Concept and develop awareness and engagement campaign for the Plan, including all messages and assets as well as launch and rollout plans: Concept and develop awareness and engagement campaign for the Plan, including all messages and assets as well as launch and rollout plans.
4. **Connect with Key Audiences:** Develop communications templates and tools geared to specific audiences (by type, location, preferred way of receiving/consuming media, etc.)
5. **Foster Engagement:** Coordinate/Integrate campaign effort with community engagement effort.
6. **Create Momentum & Measure Progress:** Identify key performance indicators as well as the means for measuring them. Begin conducting measurements. Develop policy, process for reporting.

PEOPLE-BASED STRATEGY

“Each individual person is very important. Each person has tremendous potential. She or he alone can influence the lives of others within the communities, nations, within and beyond her or his own time.”

-Muhammad Yumus

This engagement process places people at the center for success. Each individual voice contributes knowledge and wisdom that informs how they live, work, and play together.

According to the American Planning Association, a comprehensive plan encompasses "a process that seeks to engage all members of the community to create a more prosperous, convenient, equitable, healthy, and attractive place for present and future generations." This planning effort is forward-facing, with messaging and engagement efforts that reflect and resonate with the City of Danville while also evoking feelings of excitement and optimism for the future.

Key Community Groups and Stakeholders

A vital goal of the engagement effort is to make the Comprehensive Plan process accessible, appealing, and inclusive to everyone in Danville (residents, business owners, property owners, employees, etc.). The method also seeks to build community capacity so that individuals can effect positive change by conversing alongside City government, healthcare and educational institutions, philanthropy, and other stakeholders to understand community systems. This process will shape the future of Danville by:

- Increasing awareness of the planning process
- Assuring that engagement efforts are broad and deep throughout the community using a variety of participation tools and techniques
- Hiring Danville residents who are passionate about engaging their community
- Carrying the voices of the community in a way where people can see how their ideas generate a new vision through the planning process
- It encourages action and implementation in a way that leverages the community's resources most efficiently and effectively

Local Residents

- Born and raised in Danville and those who have relocated
- Many have grown up with the legacy of Schoolfield fresh in their mind, or even more literally connected to the district via family members. These people are the primary audience and primary end-user to keep in mind. The city's locals need to embrace whatever development comes to Schoolfield for it to be a success.

Local Business

- Manufacturing, shipping, logistics, agricultural industry - there are a variety of large-scale manufacturing operations within Danville. The city has been progressive with retaining and supporting their growth.
- Non-manufacturing businesses (e.g., creative industries, healthcare, retail, Caesar's Resort, etc.) have the potential to grow within the revitalized Schoolfield.

Local Educators Note

- Averett University and/or Danville Community College (DCC) could be anchor institution(s) in the mix of the development. With a small local footprint, Averett is primed to expand and highly interested in engaging with innovative new development opportunities.
- High schools and elementary schools could be large users of the space when complete: it should be created with educational and group learning in mind.

International Business

- Japan, Australia, and countries from across the world are already interested in Danville for its approach to supporting manufacturing and innovative business development. This planning and marketing campaign will surely attract the eyes of an international audience if done correctly.

Some other key groups we will engage include, but are not limited to:

- City Departments + Staff
- Former Dan River Mill Workers
- The Danville Museum of Fine Arts and History and other historic / cultural organizations
- Other Government Entities (e.g., School District)
- Developers (local and regional)
- Students (K-12 and College/University)
- Community Leaders
- Churches and Religious Institutions
- Cultural Groups (e.g., Smokestack Theatre Company)

- Hospitals and Health Providers
- Seniors / Active Adults
- Danville Neighborhood Development Corporation
- Southside Outreach Group
- Housing Authority

Community Engagement Process

The Plan It Danville community engagement process will be a 12-month community conversation about our backyards, our neighborhoods, our city, and Danville's place within the region and will be conducted in five phases. These tools can be utilized as a method of expanding engagement during the pandemic. The final set of tools will determine by the community organizers and advisors. Proposed engagement tools include:

- Physical Presence and In-Person Engagement:
    - A fixed storefront location
    - A mobile planning van
    - Hiring community organizers for door-to-door engagement, attendance at pre-planned events, and tailored opportunities for underrepresented groups
    - The creation of a "meeting in a box" game that groups can use for team building and those who might not attend a Plan meeting
    - A giant vinyl billboard to allow for social distancing and engagement activities
    - Promotional pieces, refreshments, and Comprehensive Plan-branded wares
- Digital Communications Platform:
    - Enhanced Project Website
    - Social Media: YouTube Channel, Facebook Page, Instagram, Twitter, WhatsApp
- Advertising:
    - Physical: Posters, Postcards, Social Media Posts, Yard Signs, Feather Flags, Pole Banners, Sidewalk Graphics, Bus Graphics, Bus stops, direct mailers, Billboard
    - Digital: Public service announcements, radio announcements, Television, movie theatre, Showcase magazine, and The Register and Bee newspaper

Engagement Leaders

A futuristic theme will be used for the Comprehensive Plan process. In early listening sessions, there was concern expressed by some community members about a “Mill Mentality” that controlled who made decisions on behalf of the city’s residents. This planning process seeks to empower Danville’s people to determine what the future will hold and encourage localized decision-making. To that end, a series of key functions have been identified:

- Ground Control – A collection of advisors to provide insight into the community and ensure that the consultant team and city staff are set on the right course for success.
- Boosters – Paid organizers from the community that are enthusiastic about spreading the word so that everyone is aware of the planning process and how they can participate.
- Technicians – City staff and key stakeholders that are familiar with resources that can assist in informing comprehensive plan content and recommendations so that implementation is successful.

Ground Control

The Ground Control member position is designed for thought-leaders who work or live in Danville and may seek to take a proactive role in the Danville Comprehensive Plan community engagement process. As a member of the Ground Control team, they will serve with the City of Danville staff and provide guidance to Community Booster's as they do community engagement sessions.

Members of the "Ground Control" team will be primarily asked to advise and make recommendations about the community engagement process to the consultant team (hired by the City). Additional activities may include:

- Reviewing the guiding principles and overall objectives of the Danville Comprehensive Plan.
- Providing wisdom on the best approaches to reach the city's traditionally disenfranchised populations.
- Facilitating partnerships to improve stewardship and accountability.
- Providing insight and advice about where and how to host small conversations and tabling sessions at local events within the community.
- Advising what types of events would be most successful in reaching all segments of Danville's population.
- Collaborating with the City of Danville and the community stakeholders to integrate efforts to increase the staying power of the engagement process and plan recommendations after the Comprehensive Plan is written.
- Identifying potential pitfalls or issues in engagement efforts, use of language, or other areas that might compromise the integrity of the planning process.
- Vetting consultant recommendations.
- Providing support and/or participating at larger community meetings.

An initial orientation meeting will occur to review the proposed community engagement approach for the planning process. Then, it is estimated that there will be one meeting held per month over the next 12 months on a regular schedule. These meetings will consist of consultant presentations, open discussions, and facilitated exercises that assist in guiding the formation of the Comprehensive Plan. Each meeting will be approximately 1.5 hours in length. Full participation in discussions is requested of participants, understanding that emergencies do arise from time to time. Additionally, their participation at some community meetings and events would be beneficial so that they may hear directly from the neighbors, business owners, and other stakeholders.

Community Boosters

The Community Booster position is designed for passionate grassroots organizers who work or live in Danville and desire to take a proactive role in the Danville Comprehensive Plan community engagement process. As a Community Booster, they will act as an extension of the PlanIt Danville project team and assist with community outreach.

"Boosters" will work in a team with others with primary tasks that include increasing awareness of, and participation in, the planning process for Danville's Comprehensive Plan effort. Community Boosters will:

- Attend small gatherings where people already meet and engage, anywhere from church study groups to soccer fields.
- Conduct door-to-door outreach in neighborhoods, business districts, and where people may not feel invited to participate and/or who would not ordinarily participate in a planning process.
- Hold "pop-up" events using a roving planning vehicle to survey residents and community members about their priorities for the future.

- Create unique own events that are relevant to the community, and which can contribute to the planning process.
- Host open houses and meetings in the PlanIt Danville storefront.
- Provide support at larger community meetings alongside the consultant team.

Eight (8) hours of training is required to become a Community Booster. Training will provide each Booster with knowledge regarding the planning process, instruction, and tools to conduct effective meetings and supportive skills such as conflict resolution. This is a paid position. Bilingual facilitators will receive an additional bonus where another language is required to ensure effective communication with participants. The number of hours may vary based on the project timeline but will not generally exceed 12 hours per week. There will be busy points in the process where the need may increase to approximately 24 hours of time. Work hours are flexible: daytime, evenings, or weekend schedule based on each individuals needs and availability. The overall commitment is approximately one year.

PROJECT TIMELINE AND PROCESS

The total project planning period will be 18-months (the additional six (6) months allow for creating the final Plan and developing an implementation program). The community advisors will guide the engagement approach through the community organizers on engagement tools that will best serve the targeted audience Key process design components include:

- The overall approach is iterative– with each step building on the one before it so that the community can see their input will be used and ensure it is correctly understood, which informs how the development of the next phase.
- Large city-wide meetings will be used at critical points in the process so that all city areas can learn from one another.
- In each project phase, pre-programmed community events meet people where they are, in addition to providing for online/virtual input opportunities and special project-related events.
- Engagement methods will accommodate differences in learning and communication styles (verbal, drawing, writing).

GRANT REQUEST TIMELINE: July 2022 – December 2023

Phase	Deliverable	Timeline	Engagement
Phase 1 | Define It!	**Let's build on the best of who and what has come before us.**	Months 1-3	Small Conversations

Goal: The planning team wants to hear from everyone who calls Danville home. As a first step, we'll begin conversations with community members who are often the least engaged—older adults, young people, people who rely on public transit, and unhoused individuals. Early on, we will also connect with community members who want to take an active, ongoing role throughout the process. To begin, community trailblazers and innovators serve as inspirational members of the community. We'll also understand the strengths, weaknesses, threats, and opportunities that community members see. How do individuals define their "home"—the neighborhood they live in and its key features? We also want to learn about that and create maps for people to begin conversations.

Key Areas of emphasis:

- ***Storytelling:*** *Acknowledge History through historical figures like Wendall Scott the Nascar driver.*
- ***Mapping:*** *Have the community draw and define their neighborhood centers.*
- ***Data / Survey:*** *SWOT analysis through strengths, weaknesses, opportunities, and threats.*

Phase 2 | Dream It!	**Let's envision new solutions to existing issues.**	Months 3-6	Community Event #1

Now we're ready for the first-ever event this century that will bring all the neighborhoods of Danville together. You'll be able to see and respond to community members' shared reflections and perspectives on what community means to them. Building on this milestone, together, we'll factor in all the current issues and opportunities to arrive at a shared vision and set of values. During this phase, the planning team will also open a storefront home-base to welcome individuals and groups who want to learn more and connect further, which helps ensure everyone can take who wants to. A mobile engagement vehicle will visit different sites and events where community members come together.

Key Areas of emphasis:

- ***Storytelling:*** *Quality of life today through the lens of current successes, issues, and barriers.*
- ***Mapping:*** *Show neighborhood map and allow for feedback showcased through daily events.*
- ***Data / Survey:*** *Weaknesses and threats define the vision while the strengths and opportunities inform the projects values.*

Phase 3 | Design It!	**Let's set specific goals and outcomes—and look to how they might shape the Danville landscape.**	Months 6-10	Community Event #2

With the beginning of a new school year, let's look at other communities' successes for inspiration we can apply to Danville. In addition to gaining real-world insights, this effort will test the vision and values we have developed. It will allow us to identify the tasks we must accomplish to realize our vision. It will also help us see how we should track progress and measure success. Together we'll review and refine and maps or plans we have drawn up to date.

Key Areas of emphasis:

- ***Storytelling:*** *Aspire through visually identifying existing communities that reflect the values of the project.*
- ***Mapping:*** *Get feedback in opportunities that promote change.*
- ***Data / Survey:*** *Test the vision statements and analyze the tasks needed to accomplish the vision paired with brainstorming key metrics.*

Phase 4 | Detail It!	**Together let's decide who in the community will lead what.**	Months 10-12	Community Event #3

We're ready to think about how everyone in the community is interconnected and how different individuals and groups can help bring the community's values and priorities to life. In doing so, we'll study the local map, prioritize areas for future investment, and brainstorm ways to act. We will identify potential "owners" to assume responsibility for critical aspects of the implementation effort. This phase will include up to four special studies to develop our shared understanding of what policy, program, or practice steps might be needed to get an early start on advancing key ideas and projects.

Key Areas of emphasis:

- ***Storytelling:*** *Empower the community to be the change and ask what is needed to take action.*
- ***Mapping:*** *This analysis will prioritize geographic areas that build criteria for investment with themed breakouts for the community, stakeholders, and city staff*
- ***Data / Survey:*** *Taking the time to list and brainstorm options to implement and prioritize.*

Phase 5 | Do It!	**Let's draw up an action plan to achieve our aspirations.**	*Months 13-18*	Community Event #4

During this final phase of the Plan process, the planning team will bring together all the findings, studies, and analyses from the effort to date to draft the 20-year Comprehensive Plan for Danville. As a companion to the project, we will also develop a five-year strategy to help stakeholders, foundations, champions, and community members to get the implementation off to a great start. Once we're all set, let's share the plan and celebrate our effort together with a lively, final community event!

COMMUNITY EVENT #5

Start Implementation Plan
5 Year Plan for the City of Danville, Stakeholders, Foundations, Champions, etc. (Companion document)

July

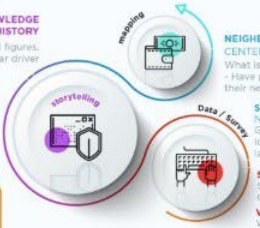
Mission 1
Initiate public involvement

Mission 2
Prepare flight manual

SMALL CONVERSATIONS
Seniors | Students | Homeless Shelter |
Bus Riders | Parks and Recreation Participants
Churches | Block Clubs / Neighborhoods | Disabilities

ACKNOWLEDGE HISTORY
Cutouts of historical figures, e.g. Wendell Scott Nascar driver

QUALITY OF LIFE TODAY
What are the issues and barriers? What's working?



NEIGHBORHOOD CENTER
What is the neighborhood center?
- Have participants draw what defines their neighborhood to them.

SHOW NEIGHBORHOOD MAP
Get feedback: Using the map, draw your week! Identify key places noting the nodes and landmarks that make up your neighborhood

SWOT
Strengths / Weaknesses / Opportunities / Threats

VISION / VALUES
Weaknesses + Threats = Vision
Strengths + Opportunities = Values

Mission 3
Share history and quality of life |

Map neighborhood |

Survey SWOT |

Visioning

Mission 4
Department and organizational functions, challenges, and opportunities.

Strategic plans for organizations and departments (inventory)

Mission 5
Share aspirations |

Map opportunities for change |

Survey vision components

Mission 6
Map idea alignment and draft outcomes

ASPIRATIONS
Identify examples in other places
- Draw pictures of what you would like it to be (informed future)

OPPORTUNITIES FOR CHANGE
Get feedback: draw on the map opportunities in the community that could be different today.

VISION COMPONENTS
- Test Vision Statements
- Brainstorm ways to achieve the future vision
- Key metrics

Mission 7
Execute Special Studies: Area specific plans |

Identify community champions

Mission 8
Implementation Readiness Assessment

Execute Special Studies: Area Specific Plans

Identify Community Champion

Implementation Readiness Assessment

Department & Organizational functions, challenges and opportunities.
Strategic plans for organizations and departments (inventory)
Mapping alignment and resources for desired outcomes
Resource Pairing and Gaps Analysis

Mission 9
Empower |

Show + Tell |

List + Brainstorrm |

Prioritization

Mission 10
Define roles and responsibilities |

Measure for desired outcomes

Empowerment
How can you be the change? What do you need to take action?

SHOW + TELL
Mapping analysis / Priority geographic areas
- Build criteria for investment
- Themed-based breakouts

LIST + BRAINSTORM
List and brainstorm options to implement and prioritize

DANVILLE COMMMUNITY ENGAGEMENT PLAN STRATEGY

PlanIt Danville is a community-centered engagement process to develop a new comprehensive plan for the City of Danville. The process intends to capture Danville's future dreams, ideas, and priorities from a diverse array of viewpoints. An essential premise is that the more people that are engaged in shaping the plan, the more likely they will take an active role in implementing the shared vision. Thus, strength and resiliency will be created through activity. Through this year-long journey, this iterative approach will build the community's confidence in their role in shaping their environment while also creating a culture of growth and learning for a successful trajectory for the next two decades.

H. ENHANCED PLAN ELEMENTS FOR RESILIENCY AND FLOOD P REPAREDNESS BUDGET

SUSTAINABILITY AND RESILIENCE elements added by the Resiliency Plan application:	**Estimated costs basis**	**Estimated cost**
· *Providing 3 years of funding for a planning staff Sustainability Planner position to coordinate the planning grant and implementation and transition into a dedicated Floodplain Administrator. Danville needs to build capacity. This staff and outreach program will also satisfy the City's MS4 public involvement and public outreach requirements for the three (3) project years;*	Staff direct and indirect costs	$ 270,000
· *Establishing reliable overhead and cost basis rates for future disaster response efforts so the City receives appropriate financial support in recovery;*	Consultant Budget	$ 30,000
· *Developing an ongoing disaster response training program for City employees that are not first responders.*	Consulting Planner 4 at 100 hours	$ 19,200
· *Providing ongoing training, enrichment and peer exchange opportunities for the Sustainability Planner funded by this grant and other City Staff. Sustainability and equity are cross-cutting priorities that impact all City operations and services. These activities include FEMA training and participation at appropriate national and state/regional conferences or other events.*	$30k for 3 program years	$ 90,000
· *Designating Danville resiliency hubs at community centers that will reduce extreme condition exposure during disasters and improve access to public services and spaces during safe times.*	Consulting Civil Engineer 5 at 200 hours	$ 43,000
HOUSING elements added by the Resiliency Plan grant funding application:		
· *Understanding accurate potential benefits for dwelling weatherization and energy efficiency improvements including updated building condition data.*	Consulting Planner 3 at 160 hours	$ 23,200
Specifically, the City will integrate weatherization opportunities into code enforcement, building inspections, and utility programs to better reach residents and property owners through the Virginia Weatherization Program.	Consulting Planner 4 at 40 hours	$ 6,400
Reducing access barriers to weatherization economic tools provided by Danville Redevelopment Housing Authority, Danville Utilities, and Pittsylvania County Community Action will dramatically assist Danville families to permanently lower crippling utility bills.	Consulting Planner 4 at 40 hours	$ 6,400
· *Updating the City's flood prevention overlay ordinance and other operations to support Community Rating System membership.*	Consulting Planner 3 at 60 hours	$ 8,700
· *Evaluating and creating a flood insurance rebate $50k seed fund for low- and moderate-income areas.*	Consulting Planner 3 at 40 hours + 50k	$ 55,800
· *Developing community outreach promoting permaculture – the design of small agriculturally productive ecosystems suitable to augment household food supplies.*	Consulting Planner 3 at 40 hours	$ 5,800

· *Incorporating floodplain management regulations into the City's subdivision code and any other appropriate ordinances.*	Consulting Planner 3 at 60 hours	$ 8,700
ECONOMIC GROWTH elements added by the Resiliency Plan grant funding application:		
· *Writing a stormwater design manual explaining low impact site development concepts and best management practices for public and private projects in ESRI storymaps. This program element culminates in a community wide education forum with community partners like the Dan River Basin Association and the Danville Science Center.*	Consulting Engineer 2 at 160 hours	$ 21,600
· *Similarly, writing a native plant and tree guide in ESRI storymaps that encourages native landscaping that cools heat islands, replenishes Danville's canopy, provides training to public and private arborists, minimizes stormwater techniques, and beautifies the community with nature-based solutions. This program element culminates in a tree-based outreach event with the City's parks and recreation department during our annual Make Danville Shine community pride celebration.*	Consulting Engineer 2 at 160 hours	$ 21,600
· *Updating the City's Stormwater Management and Flood Prevention internet presence through a redesigned webpage and targeted social media posts to drive increased clicks.*	Planner 2 at 160 hours	$ 20,000
• Selecting, acquiring, and implementing software that supports the City's MS4 and VDPES Industrial permit obligations	Consultant Budget	$ 20,000
· *Implementing a GIS based system for managing public and private stormwater control measures and best management practice design/construction plans, maintenance agreements, and inspection records, including private owners' inspection reports to monitor compliance with maintenance agreements. This process will reduce red tape and increase private business efficiencies.*	Consultant Budget	$ 20,000
· *Integrating floodplain management and land disturbance permits into the City's CityWorks permitting system. This process will reduce red tape and increase private business efficiencies.*	Consultant Budget	$ 20,000
CONNECTIVITY AND MOBILITY elements added by the Resiliency Plan grant funding application:		
· *Evaluate relocating or floodproofing all critical facilities that are in Special Flood Hazard Areas or susceptible to disruption from flooding or other weather events.*	Consulting Engineer 4 at 160 hours	$ 27,200
· *Considering ordinance performance standards for impervious surfaces and developing a data set with plan review tools to analyze impervious surface changes. Transportation infrastructure is the largest contributor to impervious surface runoff in Danville*	Consulting Planner 2 at 60 hours	$ 7,500
· *Designing templates for green infrastructure retrofits in public and open spaces and integrating them into the City's zoning ordinance standards for landscaping. Danville's publicly owned facilities must demonstrate low impact development outcome to lead the way for private development in our community. Every transportation infrastructure should proactively exceed stormwater quality and quantity management requirements*	Consulting Planner 4 at 200 hours	$ 32,000

COMMUNITY HEALTH elements added by the Resiliency Plan grant funding application:		
· *Monitoring and inspecting outfalls and discharge points for illicit discharges with a GIS based system.*	Consulting Engineer 1 at 200 hours	$ 22,000
· *Using micro sensors and other cutting edge data collection tools to collect and analyze data so we better understand the localized effects of pollution like increased temperatures and asthma.*	Consultant Budget	$ 30,000
· *Creating a community blueprint for a net zero carbon goal with a feasible horizon.*	Consulting Planner 5 at 200 hours	$ 35,000
NEIGHBORHOODS, PARKS, AND LAND USE added by the Resiliency Plan application:		
• *Integrating an overall City watershed plan framework within the Plan It Comprehensive Plan.*	Consulting Engineer 2 at 160 hours	$ 21,600
· *Cataloging and producing flood elevation certificates for all buildings in Special Flood Hazard Areas;*	Consulting Engineer 3 at 240 hours	$ 36,000
· *Imagining several community scale flood prevention projects;*	Consulting Engineer 5 at 120 hours	$ 25,800
· *Analyzing stormwater utility feasibility in Danville;*	Consulting Planner 4 at 160 hours	$ 25,600
· *Improving GIS data integrity and feature information for the City's stormwater utility infrastructure;*	Consulting Survey 1 at 300 hours	$ 33,000
	TOTAL:	$ 986,100

I. COMMUNITY ENGAGEMENT BUDGET

1. Capacity Building: id community organizers, training modules (facilitation training, master plan process, engagement approaches), id community advisors to guide procedures throughout the process, coordination	$280,000
2. Community Boosters: training time, resources for small event coordination for groups and neighborhoods (food, bus tickets, children's activities, etc.), time for door knocking, iPad surveys, and hosting tables at events	$60,480
3. Community Booster | Coordinator	$46,800
4. Community Booster | Social Media Marketer	$12,960
5. Mobile Engagement Vehicle | The Ethos Rover: Contains travel materials and display, vehicle branding	$9,000
6. *Community Events and Celebration: promotional materials that encourage community members to represent Danville and take pride in the process (hats, T-shirts, decals, tote bags, water bottles, etc.)	$88,500
7. Event Catering: Local food trucks, catering, etc.	$40,000
8. Project Storefront | Danville Mission Control Center: information center / meeting space, refreshments, storefront branding (window signage), meeting materials, utilities	$31,200

	9. Project Communication Platform: website, social media, yard signs, billboards, banners, postcard invites, feather flags, pole banners	$25,000
	10. Project Advertising: Public Service Announcements, newspapers, magazines, Digital Marketing including Out-of-Home advertising such as billboards, and In-home advertising such as Hulu ads, etc.	$55,000
	TOTAL	**$346,500**

J. PLAN IT DANVILLE PROMOTIONAL MATERIALS BUDGET

	Quantity	**Cost**	**Total**	**Description**
Community Event #1 | Define It				
Branded T-Shirts	1,200	$7.00	$8,400	Promotional material that builds excitement to **learn and prepare for lift off**.
Promotional Decals | Define It	500	$0.30	$150	
Pin | Define It	1,000	$0.87	$870	
Mini Fan	500	$2.98	$1,490	
			$10,910	
Community Event #2 | Dream It				
Branded T-Shirts	200	$7.00	$1,400	Compel the community to “put on their thinking caps” to **envision** a bright future.
Promotional Decals | Dream It	200	$0.33	$66	
Pin | Dream It	1,000	$0.87	$870

Email Address: plachhd@danvilleva.gov

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

__**Capacity Building and Planning Grants**__

☒ Floodplain Staff Capacity.

☒ Resilience Plan Development

  ☒ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Danville	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☒ Yes ☐ No
Applicant Name:	City of Danville

Scope of Work Narrative – Projects

Project Information

Project Overview

The City of Hopewell, Virginia seeks $1,344,180 in Virginia Community Flood Preparedness Funds matched with $896,120 in local funds to undertake the construction of roadway and drainage improvements to Moultrie Avenue and its surrounding blocks to address recurring inland flooding. These improvements will include installation of pavement, curb and gutter, drainage structures, grass swales, channel improvements, and stream bank stabilization. The drainage conveyance design for this project consists of a series of curb inlets, swales, and storm systems. The strategy places an emphasis on minimizing utility conflicts related to overhead electrical poles and existing sanitary lines, although the relocation of some sanitary lines will be required. The project approach also placed an emphasis on minimizing tree removal, shifting the alignments of the proposed roadway and drainage improvements. Additionally, the roadway design team varied the typical section throughout the corridor to match the existing roadway and minimize the amount of new impervious area.

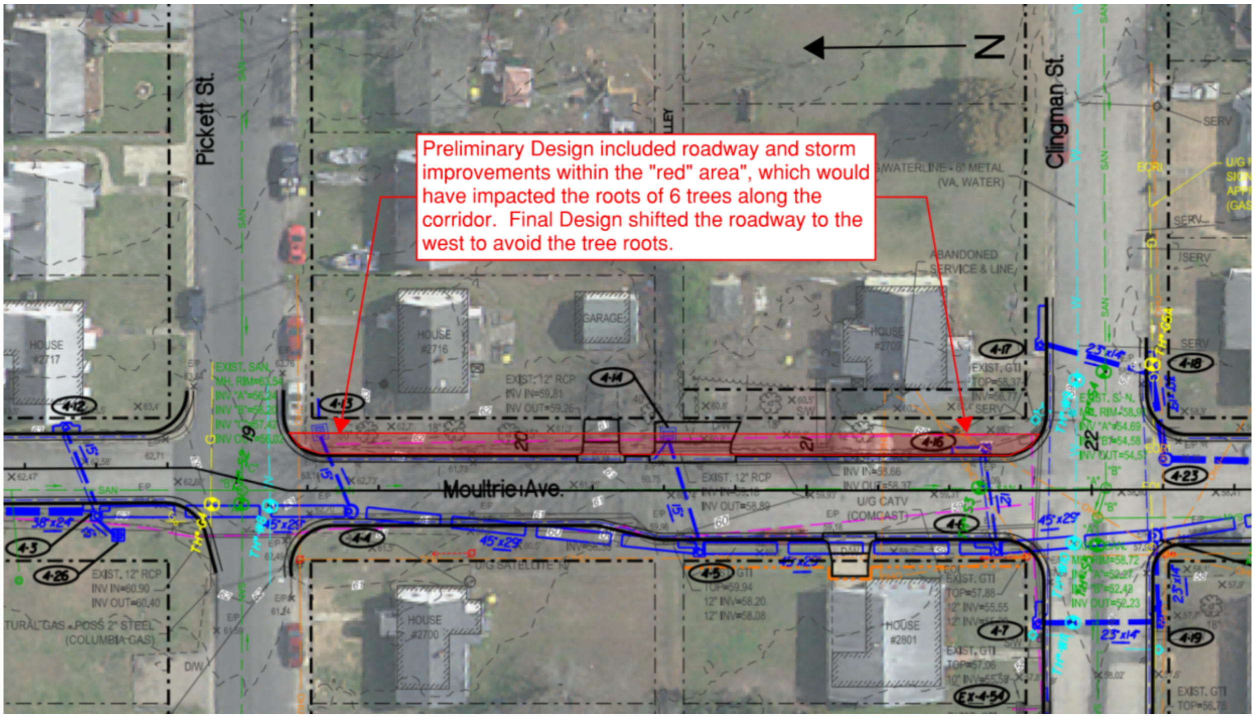
The Moultrie Avenue Roadway and Drainage Improvement project has a total length of approximately 1,700 linear feet, from the intersection of Jackson Street to the intersection of Bluefield Street.

AERIAL SITE MAP (NOT TO SCALE)

The proposed project will undertake a combination of nature-based and gray infrastructure development designed to intercept, contain, and convey water more efficiently and effectively. Project activities will include:

- A closed drainage system along Moultrie Avenue from the intersection of Jackson Street to the existing channel south of Bluefield Street, bypassing the undersized existing culverts at Clingman Street, Hooker Street, and Bluefield Street.
- Concrete driveway aprons and missing links of curb and gutter from the intersection of Johnson Street to Hooker Street.
- New pavement, including surface overlay and sections of full depth reconstruction.

- Channel and stream bank improvements upstream and downstream of the culvert replacements.
- Swale stabilization upstream of inlet 4-27.
- Tree preservation between Pickett Street and Clingman Street; south of Bluefield Street, as highlighted with the below graphics:



Preliminary Design included roadway and storm improvements within the "red" area", which would have impacted the roots of 6 trees along the corridor. Final Design shifted the roadway to the west to avoid the tree roots.

Preliminary Design "red" impacted 6 trees; Final Design avoided these impacts

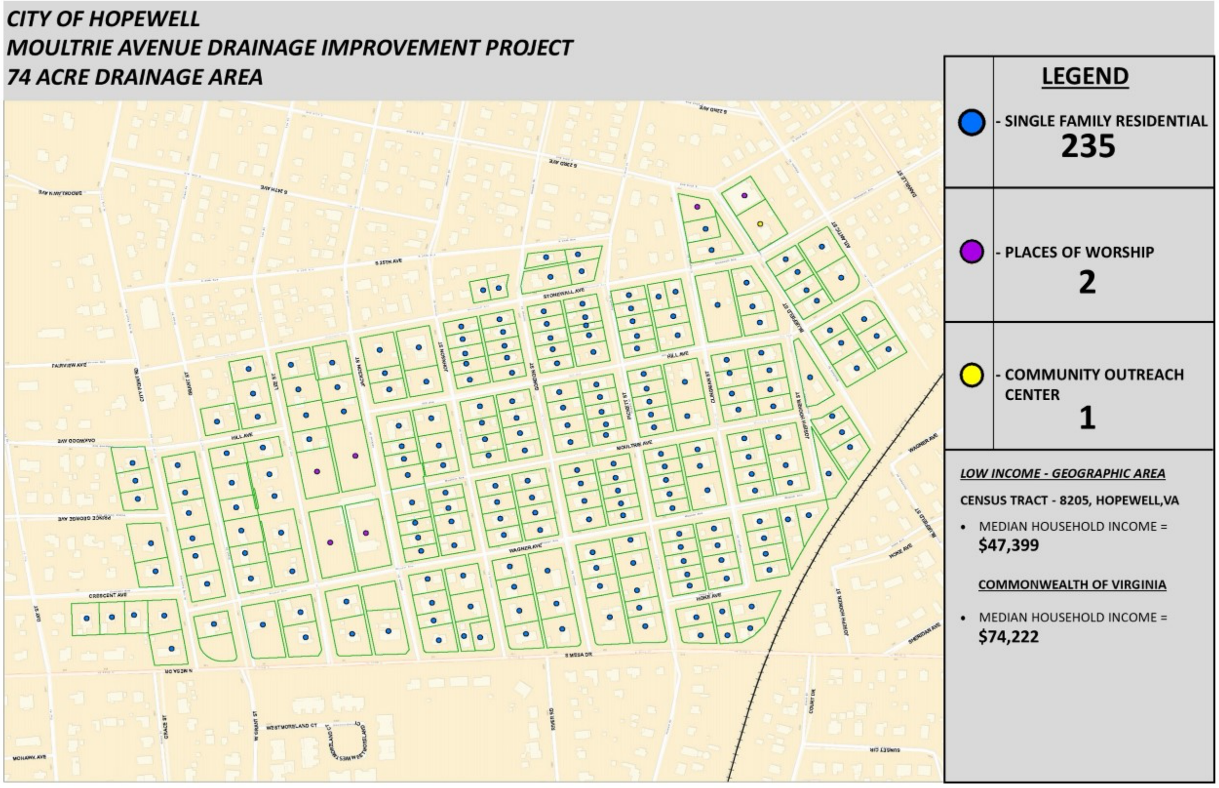
Moultrie Avenue (looking north); Preserved trees shown in the center of the picture

Once completed, the Moultrie Avenue Roadway and Drainage Improvements Project will have numerous and far-reaching benefits including enhanced protection of human health and safety, minimized damage to private property and structures, minimized damage to roads and utilities, reduced expenditures of public money for constructing expensive flood control, and protection of wetlands and waterways.

Population and RL and/or SRL Properties, Residential and/or commercial structures, and Critical Facilities

The Moultrie Avenue Roadway and Drainage Improvements project takes place and directly impacts Census Tract 516708205. According to the U.S. Census Bureau, this tract is home to 4,858 residents and 1,655 households. The median household income in 2020 was $47,399 and the poverty rate was 9.5%. The median age is 38.9. The residents are 60.5% white, 28.8% black or African American, 1.2% Asian, 9.5% other. There are 1,943 housing units in Tract 8205, of which 14.8% are vacant. The housing stock in this tract is also aging with no new housing developments since 2009 and over 68% of housing units built before 1970.

The project team has estimated that the Moultrie Avenue Roadway and Drainage Improvement project will directly benefit 235 single family residential households. This area spans approximately 74 acres and does not include and repetitive loss or severe repetitive loss structures within the project area. In addition to these households, the project area contains two houses of worship and one community outreach center.



Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

The Moultrie Avenue Roadway and Drainage Improvement project was prioritized and selected by the City of Hopewell as a result of repetitive inland flooding during heavy rainfall events. While this project is not located in a FEMA mapped Flood Hazard Area, the existing stormwater system is undersized and ill-equipped to handle even a 1-year flood event.

Since August 2020, the City has recorded 6 significant flood events within the project area, including August 15, 2020, August 23, 2020, November 12, 2020, July 1, 2021, July 26, 2021, and August 20, 2021. These events overtopped the roadways within the project limits, flooded multiple properties and caused flood damage to multiple homes. These flooding events have continued to block access to driveways and roadways as well as causes water damages to structures and long-term issues including mold.

Flooding during July 26th, 2021 storm event

Flooding during August 15th, 2020 storm event

Flooding during November 12th, 2020 storm event

According to Flood Factor, there are 717 properties in Hopewell that have greater than 26% chance of being severely affected by flooding over the next 30 years. This represents 7% of all properties in the city. From 2021 to 2051, the City is likely to experience a 0.5% increase in the percent of properties at risk in the 500-return period (0.2% annual risk) from 7.50% in 2021 to 8.00% in 2051.

Cost Share

The City of Hopewell is fully prepared to cover the cost share of the proposed project, as highlighted in the attached budget narrative and match commitment letter. The funding for the grant match is contained in the Hopewell 2022 – 2026 Capital Improvement Plan.

Administration of local floodplain management regulations

The City of Hopewell's Floodplain Ordinance can be found at https://library.municode.com/va/hopewell/codes/code_of_ordinances?nodeId=COCI_APXAZOOR_ARTXVFLDI_LJUBOCH

The Regional Hazard Mitigation Plan is located at the Crater Planning District Commission website at https://craterpdc.org/environment/documents/hazmit2017/Hopewell_%20JurSumMaps_2017.pdf

The current Hopewell Comprehensive Plan can be found at https://hopewellva.gov/wp-content/uploads/2018/03/City-of-Hopewell-2018-Comprehensive-Plan-Final-Draft.pdf

Need for Assistance

Hopewell is an economically distressed community that has recently been experiencing a population decline, reducing its tax base and highlighting the challenges of being a small-town, manufacturing community in the 21st Century. Despite being only miles from Richmond, the state capital of Virginia, Hopewell's economy is struggling compared to the rest of the Commonwealth of Virginia and the United States. On key indicators of income, Hopewell is drastically worse off than Virginia and the country overall. Hopewell has a median household income of only $39,030, compared to $76,456 at the state level, and its per capita income is only $21,927, compared to $40,635 at the state level. Furthermore, Hopewell suffers from unemployment woes, with 6.9% of Hopewell residents unemployed, compared to 4.6% across Virginia. Economic opportunity is also a challenge as only 14.8% of residents have a four-year college degree or graduate degree, which is significantly less than Virginia's 38.8% of residents with four-year degrees or higher and the national average of 32.1%.

According to the Virginia ADAPT screening tool, the project area census tract is classified as having moderate social vulnerability with a vulnerability index score of 0.4; however, the CDC ATSDR's Social Vulnerability Index for 2018 identified an overall SVI Score of .6595, indicated a moderate to high level of vulnerability. While the project area is moderately well-off compared to other census tracts in Hopewell, it still lags the State on key economic indicators including median income, unemployment rate, and poverty rate.

Hopewell has the staff resources to support flood mitigation and adaptation measures and at present, the City employs approximately 6 relevant staffers including a floodplain administrator who also serves as the director of planning, two engineers, an emergency manager, and a building official. Despite having staff capacity, the city is facing ongoing pressures to address aging infrastructure and stricter stormwater management regulation under tight budget constraints. Recognizing the need to take a long-term approach to stormwater management, the City utilized GIS floodplain mapping and stormwater drainage and storm sewer asset inventories to create a Stormwater Resilience Plan adopted by City Council in September 2021. The City is now ready to implement this plan, but lacks the financial resources needed to undertake larger, long range projects with community scale benefits such as the proposed Moultrie Avenue Roadway and Drainage Improvement project.

Goals and Objectives

Investing in upgrades to aging and overloaded stormwater systems can allow water to be conveyed more efficiently and effectively, improving flood resilience and protection in areas prone to recurring flood events. Effective stormwater conveyance such as that proposed in this Moultrie Avenue Roadway and Drainage Improvement project also provides environmental, social, and economic benefits to the local community. Expected benefits from the project include the reduction of flooding to protect people and property in the 74-acre project area, reduced demand on existing stormwater drainage systems, reduced erosion, and increased protection of the local environment by decreasing the headwater elevations at various culverts.

By investing in enhanced stormwater systems in the project area, the project team intends to meet the following goals and measurable objectives.

Goal 1. Improve stormwater conveyance to relieve the burden on existing infrastructure systems

1. Objective: Upgrade the storm system to improve conveyance from the 1-year event to the 10-year event.

Goal 2: Control flooding in the project area to protect life and property

1. Objective: Reduce backwater flood elevations at the properties upstream of the culverts at Clingman Street, Joseph Hooker Street, and Bluefield Street.

Goal 3: Protect waterways to support healthy streams and rivers

1. Objective: Stabilize 170 lf of existing banks and channels
2. Objective: Restore 0.72 acres of native grasses and plants
3. Objective: Maximize Tree Preservation. Design development reduced the removal of trees from 7 (preliminary) to 1 (final) by shifting the alignment of Moultrie Avenue between Pickett Street and Clingman Street.

Approach, Milestones, and Deliverables

The project team has completed all preliminary design, engineering, and permitting activities for the Moultrie Avenue Roadway and Drainage Improvement project and the project is ready to be bid out to eligible construction firms through a competitive RFP process. As such, the project team has identified the following approach, milestones, and deliverable to implement the construction of the project. The project team anticipates a 2-year project period.

Milestone 1: Project Kick-off

Deliverables

- Agreement signed with DRC
- Confirm project team, roles, and responsibilities
- Hold initial kick-off meeting

Milestone 2: Competitive Procurement Process

Deliverables

- Finalize RFP for construction services
- Issue a public bid
- Review qualified applicants
- Select contractor

Milestone 3: Mobilization

Deliverables

- Deliver equipment and operating supplies to site
- Establish offices, building, and other necessary general facilities for the contractor’s operations at the site
- Complete insurance agreements
- Establish traffic controls

Milestone 4: Construction

Deliverables

- Construction Survey
- Complete excavation and demolition activities
- Closed drainage system along Moultrie Avenue from the intersection of Jackson Street to the existing channel south of Bluefield Street, bypassing the undersized existing culverts at Clingman Street, Hooker Street, and Bluefield Street.
- Concrete driveway aprons and missing links of curb and gutter from the intersection of Johnson Street to Hooker Street.
- New pavement, including surface overlay and sections of full depth reconstruction.
- Channel improvements, stream bank stabilization, and tree preservation.

Milestone 5: Demobilization

Deliverables

- Disassembly, removal, and site cleanup

Milestone 6: Project Closeout

Deliverables

- Final report delivered to DCR

Project Partners

Partner	**Role**
Virginia Department of Transportation	Key funding partner; assisted in the development of project design and engineering
HDR	Completed preliminary design and engineering
Virginia American Water	Contributing to relocation effort of water lines
Columbia Gas	Contributing to relocation of gas lines

Relationship to Other Projects

Hopewell has received $330,000 in cost share from the Virginia Department of Transportation through their Revenue Sharing Program matched with $330,000 in local funds to undertake the design and engineering of this project, which is now completed. In addition, this project builds off the recently completed Hopewell Stormwater Resiliency Plan, adopted by City Council in September 2021. The Moultrie Avenue Roadway and Drainage Improvement project was identified as a Category 4 – Long Range project and was included in the City’s 2022-2026 Capital Improvement Plan. This project is one of the largest proposed projects in terms of cost and scale in the Stormwater Resilience Plan.

Maintenance Plan

The Moultrie Avenue Roadway and Drainage Improvement Project, once implemented and in place, will adhere the maintenance standards outlined in the City of Hopewell Post-Construction Stormwater Management Program and Process. This Post-Construction Stormwater Management Manual includes a series of written procedures that ensure adequate long-term inspection and maintenance of Stormwater Best Management Practices (BMPs) and has been developed as part of Minimum Control Measure 6 as described in the City’s municipal separate storm sewer system (MS4) Permit. Hopewell’s Post-Construction Stormwater Management Program includes three distinct components: program documentation, inspections, and maintenance. These components will remain the responsibility of the City’s Public Works Department.

The City’s Post Construction Stormwater Management Manual can be found at https://hopewellva.gov/wp-content/uploads/2019/09/Hopewell-Post-Construction-SWM-Manual-w-Apps-Rev-Sep2019.pdf.

Criteria

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

    a. Yes

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**
    a. Yes, see attached.
3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**
    a. N/A
4. **Has the applicant provided evidence of an ability to provide the required match funds?**
    a. Yes, see attached letter of match commitment.
5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**
    a. Yes

Budget Narrative

Moultrie Avenue Roadway & Drainage Improvement Estimated Project Budget

Item	Cost
Mobilization	$125,016
Construction Surveying	$18,815
Construction	$2,096,469
Estimated Total Project Cost	**$2,240,300**
Virginia DCR RTP Request	**$1,344,180**
Local Match – City of Hopewell	**$896,120**

The proposed items and estimated total project cost were developed by HDR as part of the design and engineering process. For a complete list of quantities and unite prices for the proposed scope of work, please see the attached detailed cost estimates.

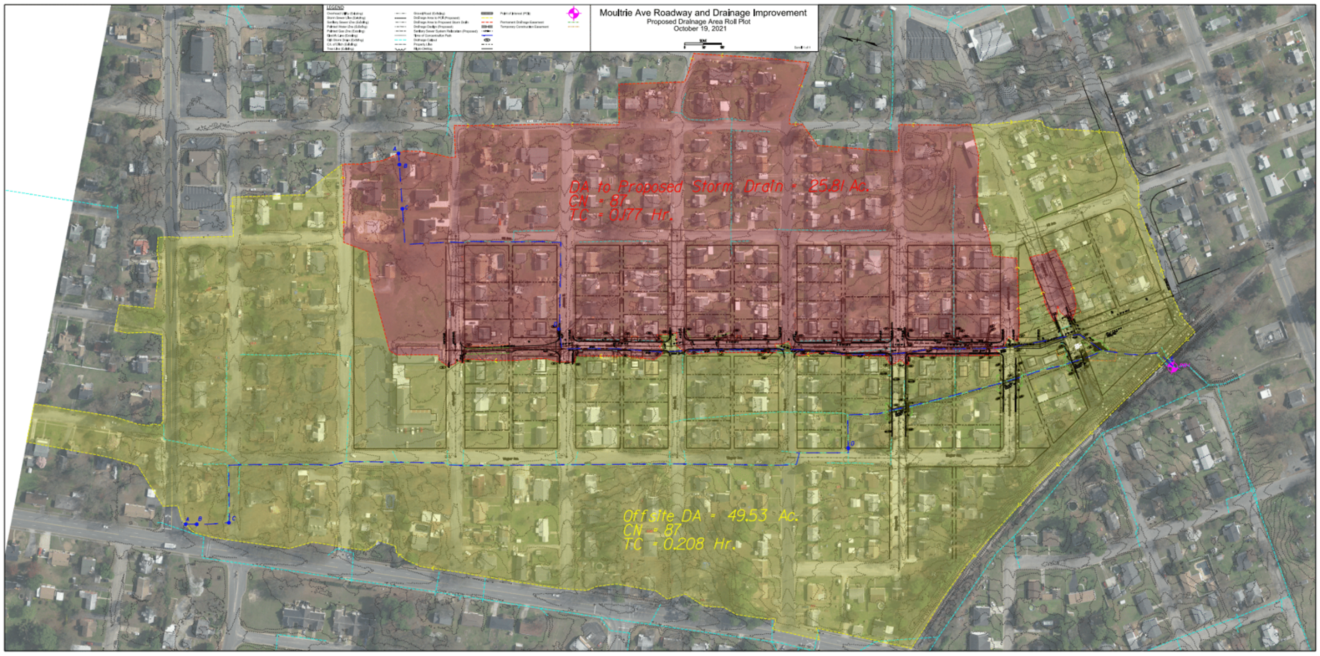
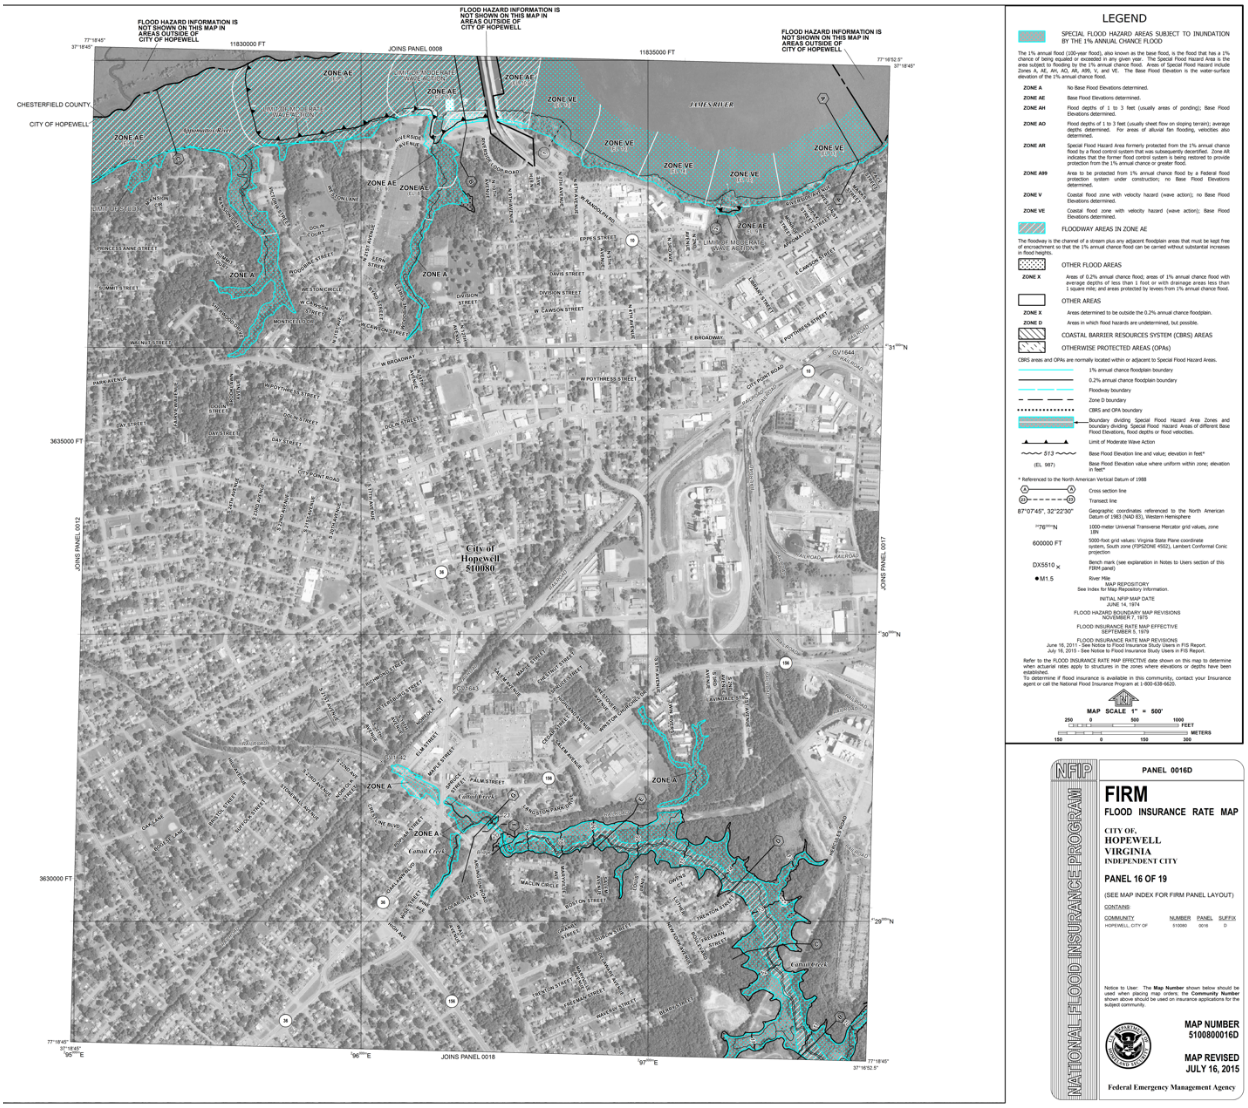
Project Area Map



Flood Insurance Rate Map



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

───	1% annual chance floodplain boundary
───	0.2% annual chance floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
········	CBRS and OPA boundary
▨	Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.

RE: City of Hopewell Community Flood Preparedness Fund Match Commitment

To Whom It May Concern:

On behalf of the City of Hopewell, I authorize the request for funding for the City's grant proposal submission to the Virginia Community Flood Preparedness Fund to support the Moultrie Avenue Roadway and Drainage Improvements Project. The improvements include installation of pavement, curb and gutter, and drainage structures. The drainage conveyance design for this project consists of a series of curb inlets, ditches, and storm systems.

If awarded, and subject to execution of a grant agreement, the City of Hopewell pledges its commitment to providing $896,120 in funding to meet the match requirements established by the 2022 Virginia Community Flood Preparedness Fund Grant Manual Round 3. This match is equivalent to 40% of the overall project cost of $2,240,300. The City has budgeted funds for the Moultrie Avenue Roadway and Drainage Improvement Project under the 2022 – 2026 Capital Improvement Plan.

Hopewell greatly appreciates the opportunity to seek funding to improve flood protection and prevention measures in order to boost our community's resilience.

Sincerely,

John M. Altman

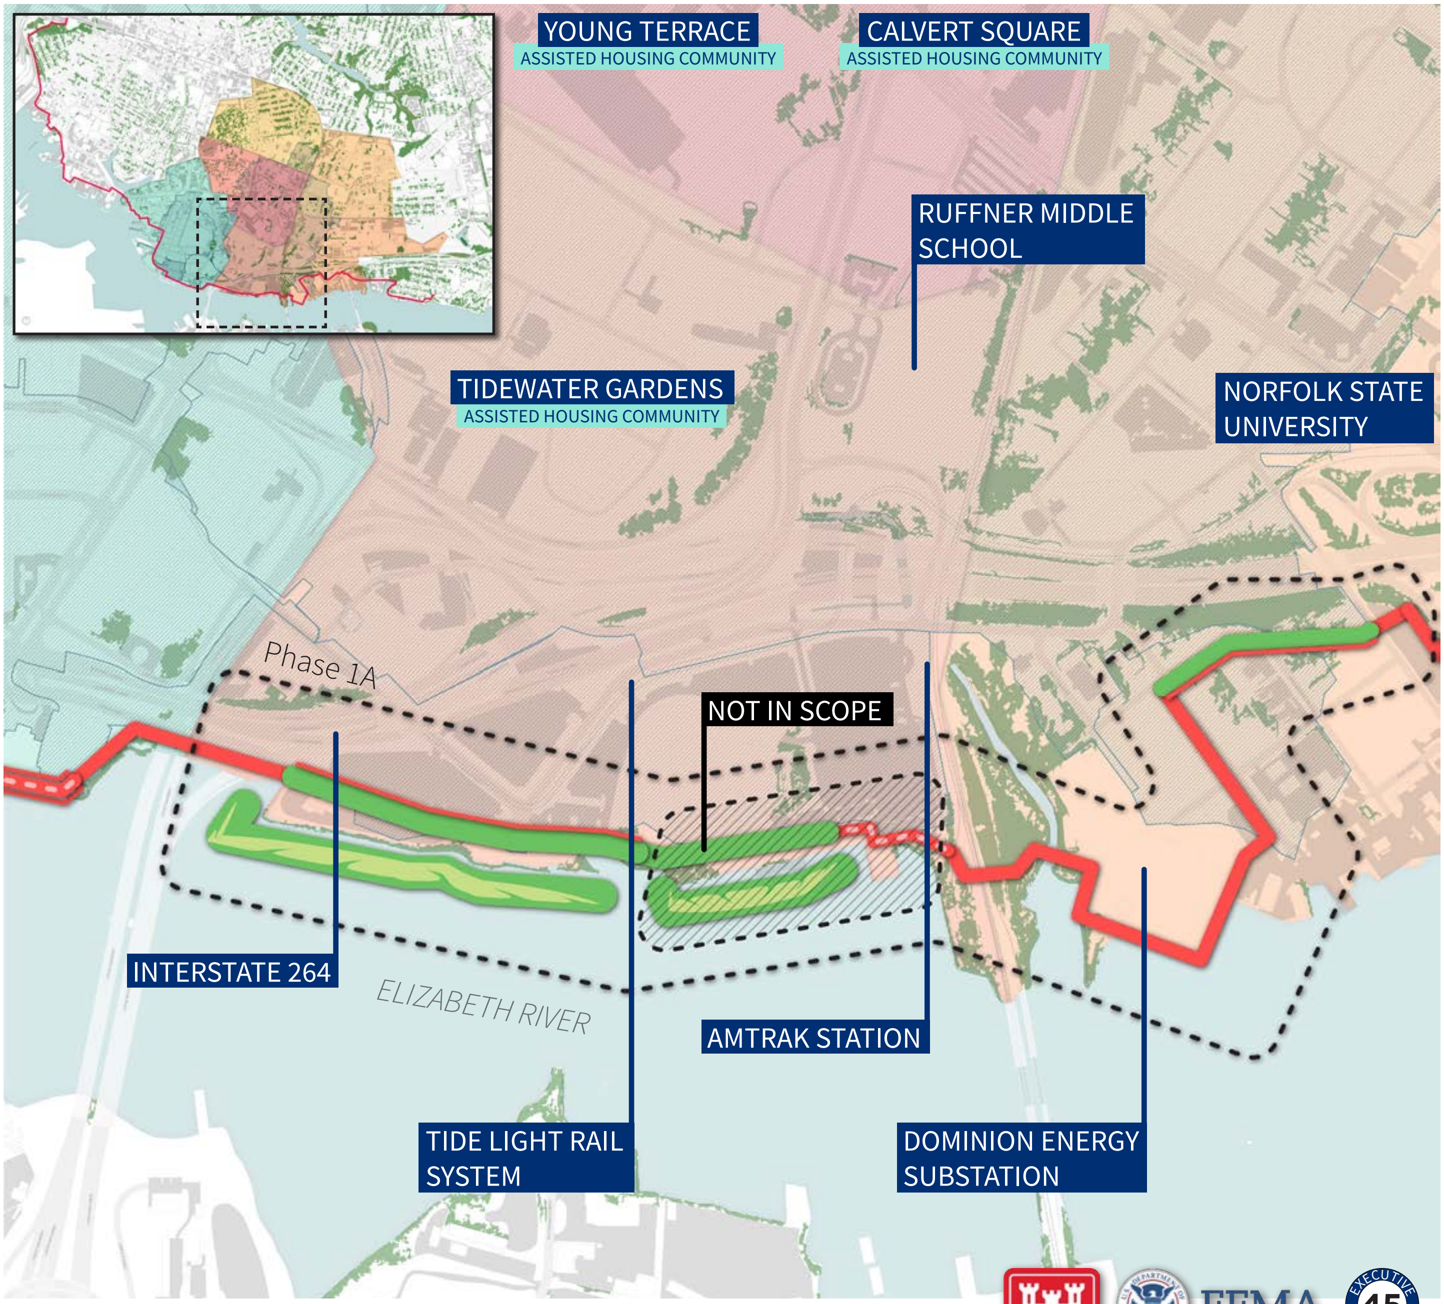
Norfolk, VA 23510

THE CITY OF NORFOLK

Contents

GRANT-FUNDED PROTECTION FOR VULNERABLE CITIZENS AND CRITICAL INFRASTRUCTURE

Phase 1A Protection Alignment and Protected Assets



PROTECTION FOR VULNERABLE RESIDENTS

- Communities with Social Vulnerability Rating Indexes from 2.2 to 4.5
- Six census tracts containing three assisted housing communities

PROTECTION FOR CRITICAL INFRASTRUCTURE

- Dominion Energy substation
- Amtrak station connecting Norfolk to the Northeast Regional rail line
- Interstate 264
- The Tide Light Rail System

FEMA EXECUTIVE ORDER 45

Phase 1A utilizes natural and nature-based protection measures to construct a hybrid flood barrier system that ensures Norfolk will meet protection requirements set forth by the US Army Corps of Engineers, FEMA, and the State of Virginia.

Example Hybrid Project:

Ghent Harbor Park Barrier System

This project was identified as a potential flood mitigation strategy as part of Norfolk's Coastal Storm Risk Management Study, which provided a comprehensive investigation of flood-risk management problems and solutions in the city. The proposed project involves creation of a structural barrier that would span from Historic Ghent along the Downtown Norfolk waterfront properties, as well as complementing reef structures.

Location
Ghent Downtown, Norfolk,
Hampton Roads PDC

Owner
City of Norfolk

Cost
$442,733,000

Status
Proposed

Resilience Strategies Employed

Natural and Nature-Based: Habitat Creation
Structural: Floodwall

Coastal Hazards Addressed

This hybrid approach, combining natural and built features, will enhance coastal resilience to extreme events and reduce the risk of coastal flooding for the city. The natural and nature-based design elements will serve as the primary protection during small to medium storm events, which due to their greater frequency, can be costlier over time than more rare larger storms, while "hard" structures provide protection during major storm events. Also, reef structures will be used as a supplement to floodwalls and surge barriers. These nature-based features act as secondary support to "hard" engineered structures, protecting them from additional hazard exposure thereby reducing operational, maintenance, and repair costs.

Anticipated Project Benefits

Behind the flood protection system lies important infrastructure such as the region's only Tier 1 trauma hospital, the region's children's hospital, emergency services, the region's only medical school, critical transportation corridors used for evacuation, city hall, the city institutional network, cultural assets, and adjacent historic districts as well as public housing.

Notable Characteristics

The Commonwealth seeks to focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The City of Norfolk's Coastal Risk Management Study provides a good example of how to use benefit-cost analysis to evaluate and prioritize resilience projec account for the co-benefits of natural and nature-based design elements.

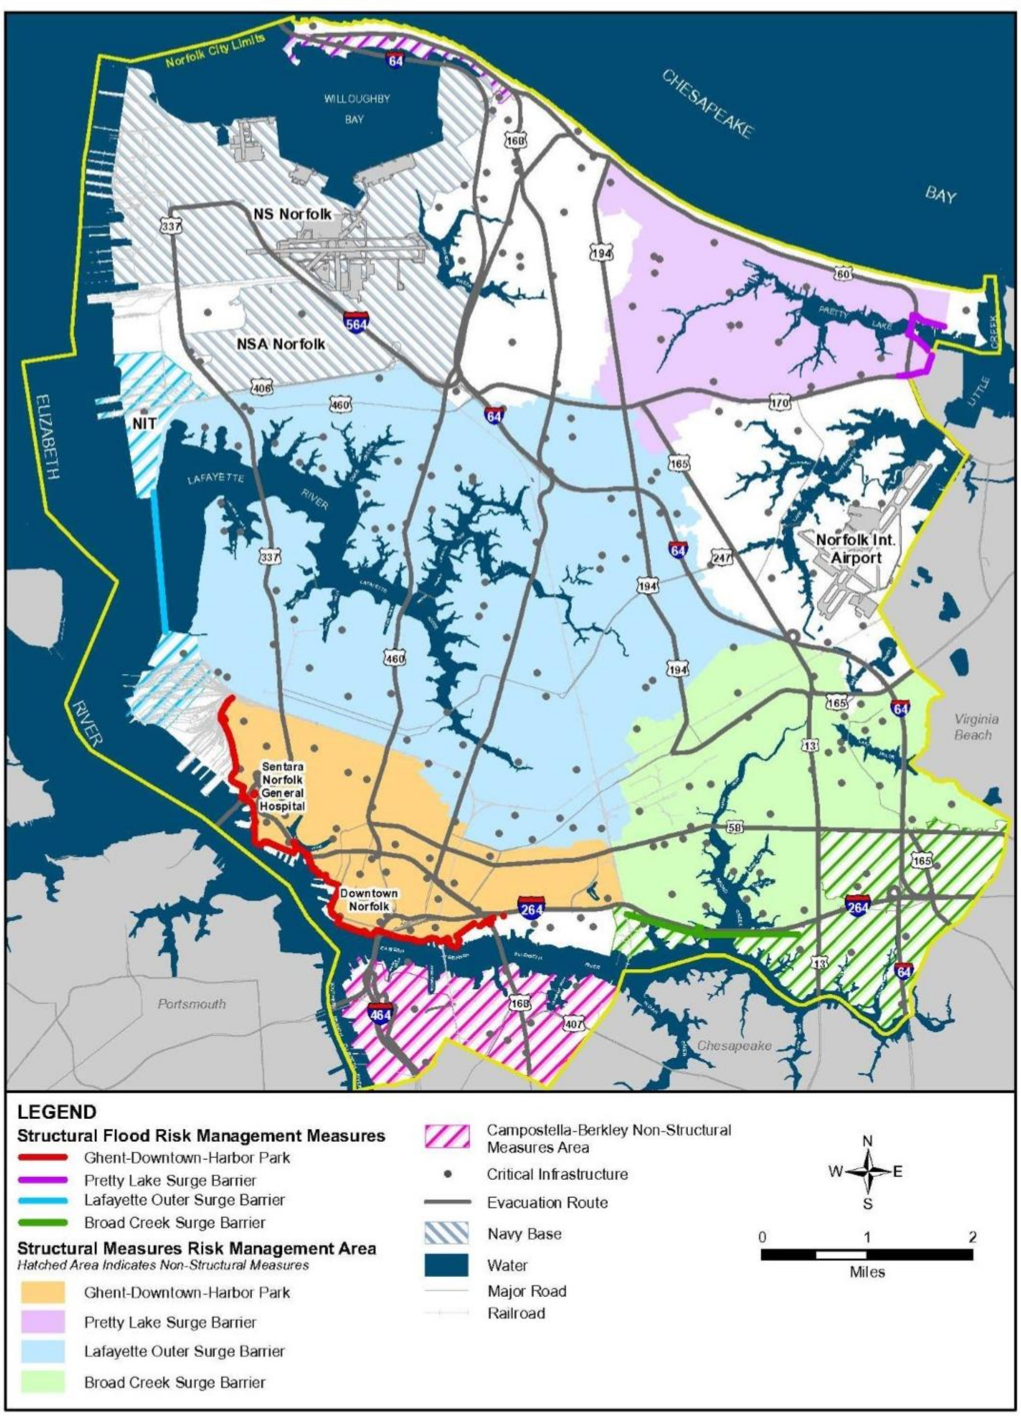
Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X_ No ____

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
☑ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☑ Living shorelines and vegetated buffers.
☑ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☑ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Location of Project (Include Maps): Entire project encompasses various locations surrounding Norfolk (see map below).



Area of Focus for Grant Application: Project Area – Ghent-Downtown-Harbor Park Area (in red) to the east of the Berkley Bridge

Figure 1 - First Feature Overview Map

NFIP Community Identification Number (CID#): 510104

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): VE, AE, Shaded X (500 year), X (low to moderate)

Flood Insurance Rate Map Number(s) (If Applicable): 51010400056H, 51010400057H, 51010400058H, 51010400059H

Total Cost of Project – Ghent-Downtown-Harbor Park Phase 1 (FY23 – FY32): $627,668,000

Total Cost of Phase 1A – Berkley Bridge to Campostella Road (FY23 – FY25): **$160,731,286**

Total Amount Requested (Phase 1A): $28,127,975

Appendix B: Scoring Criteria for Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**The City of Norfolk**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	☑
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	☑
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration		☑ **Yes** ☐ **No**
Applicant Name: The City of Norfolk		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	**0**
☐ Wetland restoration, floodplain restoration ☑ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	**0**
1.b. any other nature-based approach	**40**	**0**
All hybrid approaches whose end result is a nature-based solution	**35**	**35**
All other projects	**25**	**0**
7. Is the project area socially vulnerable? (**Based on ADAPT VA's Social Vulnerability Index Score.)**		
Very High Social Vulnerability (More than 1.5)	**15**	**15**
High Social Vulnerability (1.0 to 1.5)	**12**	**0**

Moderate Social Vulnerability (0.0 to 1.0)	**8**	**0**
Low Social Vulnerability (-1.0 to 0.0)	**0**	**0**
Very Low Social Vulnerability (Less than -1.0)	**0**	**0**
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	**0**
No	**0**	**0**
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	**10**
No	**0**	**0**
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	**5**
No	**0**	**0**
11. Does this project provide "community scale" benefits?		
Yes	**20**	**20**
No	**0**	**0**
Total Points		**85**

Executive Summary:

The City of Norfolk requests **$28,127,975** from the Virginia Community Flood Preparedness Fund (CFPF) to support 17.5% of the total costs to construct the first phase (Phase 1A) of the **Ghent-Downtown-Harbor Park Flood Protection Barrier System**. Phase 1A of the project will protect the most vulnerable populations within the Norfolk, assisted housing residents of the St. Paul's Transformation Area, which includes thousands of residents living in the Tidewater Gardens, Young Terrace, and Calvert Square low-income housing communities.

The project will construct a hybrid flood barrier system, consisting of a green levee extending eastward from the I-264 Berkley Bridge, beyond Harbor Park with hybrid I-/T-walls terminating at the soon to be completed Ohio Creek Watershed flood protection project - $112M HUD-funding resilience project to protect the historic African American community of Chesterfield Heights and assisted housing residents of Grandy Village.

Norfolk is identified globally as a pioneer for pushing the bounds of coastal and social resilience with bold action-oriented initiatives and incorporating the City's strategy of resilience-equity. As Norfolk continues to "Design the Coastal Community of the Future," Phase 1A is Norfolk's biggest step to-date towards merging these Resilience and Equity missions.

Phase 1A of the Ghent-Downtown-Harbor Park Flood Protection Barrier System is a new-start project in a $1.7B Coastal Storm Risk Management (CSRM) flood protection system being constructed in partnership with the Norfolk District of the U.S. Army Corps of Engineers (USACE). The Norfolk CSRM project was Authorized by Congress in the Water Resources Development Act, signed into law by the President in 2020.

With the passage of President Biden's Infrastructure Investment and Jobs Act (IIJA), USACE announced $399M of IIJA funding to support construction of the Norfolk CSRM, beginning with Phase 1A of the Ghent-Downtown-Harbor Park Flood Protection Barrier System. The City of Norfolk, as the nonfederal sponsor, is required to assemble a 35% nonfederal match prior to the commencement of each project phase.

Phase 1A will require $56M of nonfederal funds prior to the start of FY23. The City of Norfolk intends to meet its nonfederal obligation to USACE through a 50/50 split with the Commonwealth. A full award of this grant request would satisfy this requirement and allow Norfolk to complete the 3-year $160.7M project. There is a 10-year plan outlined in this application to fund the other phases of the Ghent-Downtown-Harbor Park Flood Protection Barrier System, and to fund the other major flood protection projects of the City-wide CSRM system. Phase 1A will provide protection from coastal storm surge flooding through construction of structural and non-structural flood protection. This phase provides the most natural and nature-based features (NNBFs) of any coastal flood protection project within the system and within any single project within the City's history.

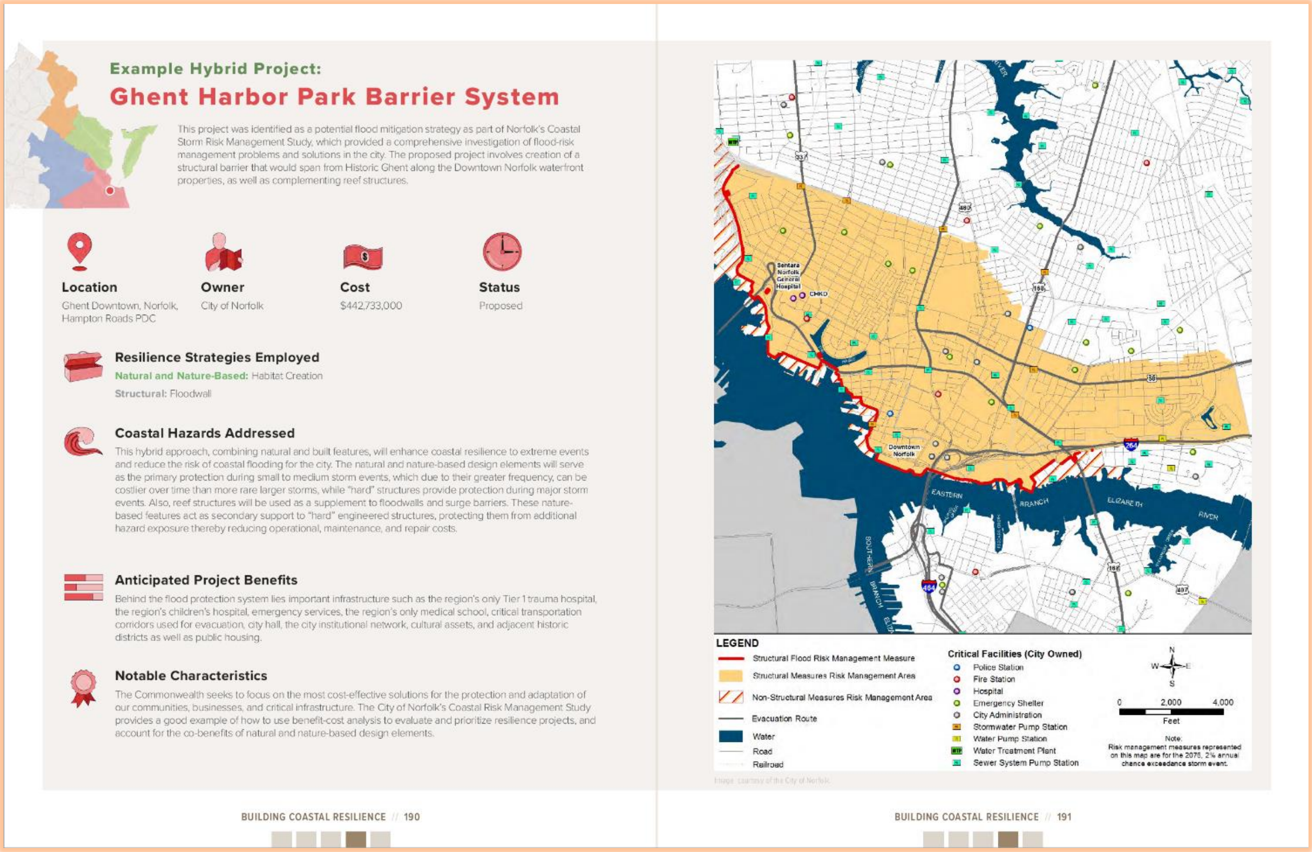
The project is designed to meet the guidance of the Commonwealth's Executive Orders 24 & 45, with the flood protection provided beyond the minimum sea level rise guidance to year with 2100, with more than 8 feet of freeboard above the FEMA Base Flood Elevation included in the system design. The project has a Benefit-Cost Ratio of 3.3 with annual net benefits of protection calculated at more than $46M per year over the course of the project’s lifespan.

The principal benefit of this project is lives saved.

As the nation witnessed in 2021 when Hurricane Ida tracked over New Orleans on the 16th Anniversary of a hurricane Katrina, the post-Katrina USACE flood protection resulted in approximately 1,500 fewer lives being lost in Louisiana. Similarly, the City of Norfolk is committed to making Norfolk the most resilient urban coastal community in the world through these bold actions; before the big one strikes.

> *The Commonwealth seeks to focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The City of Norfolk’s Coastal Risk Management Study provides a good example of how to use benefit-cost analysis to evaluate and prioritize resilience projects, and account for the co-benefits of natural and nature-based design elements.*

- Virginia Coastal Resilience Master Plan, Ghent Harbor Park Barrier System (pg. 190).



Example Hybrid Project:

Ghent Harbor Park Barrier System

This project was identified as a potential flood mitigation strategy as part of Norfolk’s Coastal Storm Risk Management Study, which provided a comprehensive investigation of flood-risk management problems and solutions in the city. The proposed project involves creation of a structural barrier that would span from Historic Ghent along the Downtown Norfolk waterfront properties, as well as complementing reef structures.

Location	Owner	Cost	Status

BUILDING COASTAL RESILIENCE // 191

1. Project Information:

a. Overview of Norfolk’s social condition and flood risk background

The City of Norfolk is increasingly at risk from flooding and damage from coastal storms. Located in Southeastern Virginia, Norfolk is an urbanized, relatively flat, community with nearly all areas below elevation 15 feet (NAVD88). Established in 1682, Norfolk has a long and proud history as a national maritime trading, shipbuilding and military center. Today, a city of approximately 247,421, Norfolk is the commercial center of Hampton Roads which is a region of 1.7 million residents.

With a median household income of $53,253, Norfolk is defined as a low-income community compared to the rest of Virginia, which has a median household income of $76,448. Within the City’s population, 13% have a household income of less than $15,000. 8.9% of the City’s population has a household income of between $15,000 - $24,999. As a result, more than 20% of the City’s population is living beneath the Federal Poverty Standard of $26,500. The City is classified as moderately socially vulnerable, with an overall score of 0.59, as identified by ADAPT VA’s Social Vulnerability Index. The entire City is routinely impacted by flooding which is precipitated by various occurrences to include coastal flooding, stormwater impacts, and rainfall.

According to ADAPT VA’s Social Vulnerability Index, the project area is classified very high social vulnerability with scores ranging from 2.8 to 4.5 (Attachment A). It is paramount the City prioritize flood mitigation for Norfolk’s most vulnerable populations.

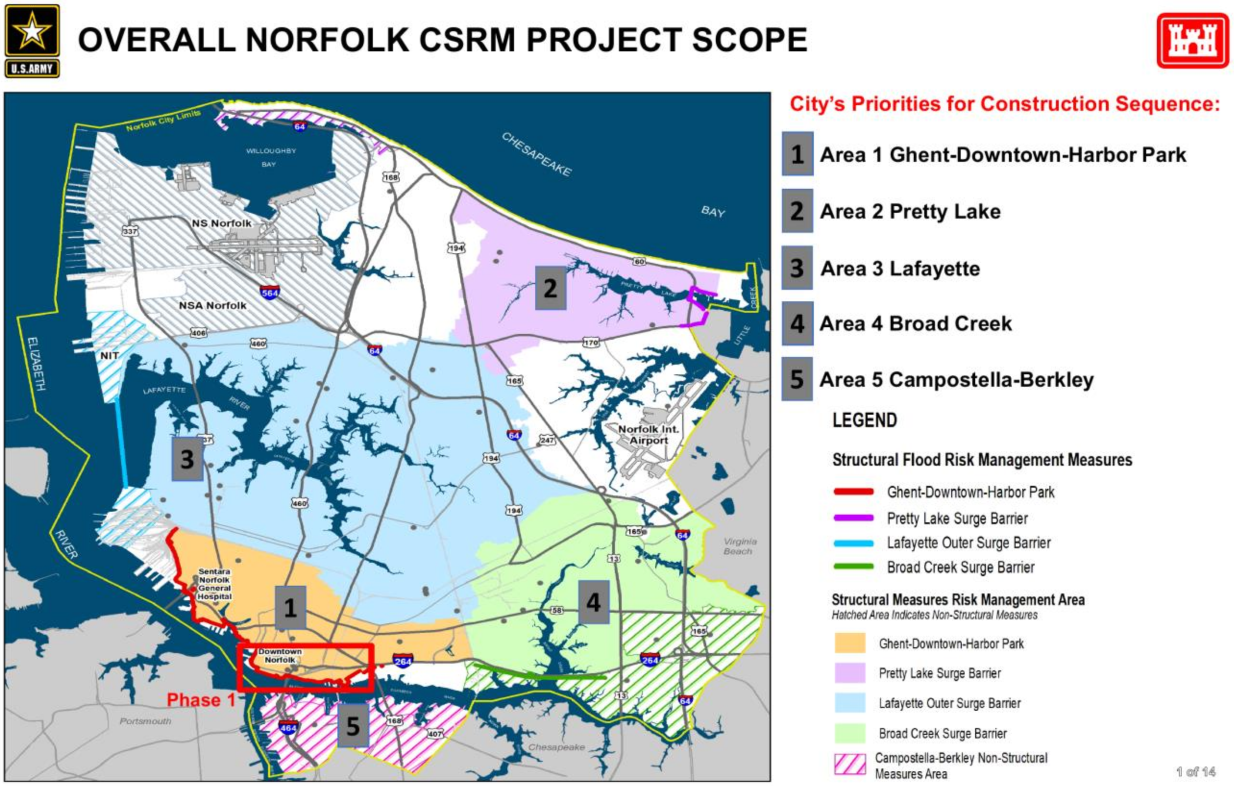
The low elevations and tidal connections to the Elizabeth River and Chesapeake Bay place a significant percentage of the city at risk of flooding from high tides, nor’easters, hurricanes and other storms. Exacerbating the flooding is the phenomenon of relative sea level rise (RSLR), which is the combination of water level rise and land subsidence. Norfolk is documented as having one of the highest rates of RSLR among Atlantic coastal communities.

b. *U.S. Army Corps of Engineers (USACE) and NACCS*

The U.S. Army Corps of Engineers’ (USACE) North Atlantic Comprehensive Coastal Study (NACCS), as well as studies by others, highlights the frequency of intense coastal storms and their associated water surface elevations. Add to this the predicted rate of RSLR, and it is clear that risks to the city are not static and will increasingly affect the city into the future. Economics are only a part of the picture. The USACE, along with the City of Norfolk, and engaged stakeholders, have also considered impacts to cultural resources, vulnerable populations, the environment, and national security, along with the more traditional economic evaluations.

In 2016, in response to increased flood risks, the USACE Norfolk District entered into an agreement with the City of Norfolk, the non-Federal Sponsor, to develop a Coastal Storm Risk Management integrated feasibility report and environmental impact statement (Norfolk CSRM IFR/EIS, or “Norfolk CSRM report”). The long-term strategy for resilience in Norfolk is a layered solution that includes elements executed by the non-Federal sponsor, other Federal agencies, the Commonwealth of Virginia or one of its agencies, and/or non-governmental organizations in addition to the recommendations for implementation by the USACE study. The Recommended Plan from the Norfolk CSRM report is the National Economic Development (NED) Plan and incorporates structural, nonstructural, and natural and nature-based features (NNBF) measures that will reduce future flood risk for the City of Norfolk.

Figure 2 below shows an overview of the project alignment throughout the City of Norfolk.



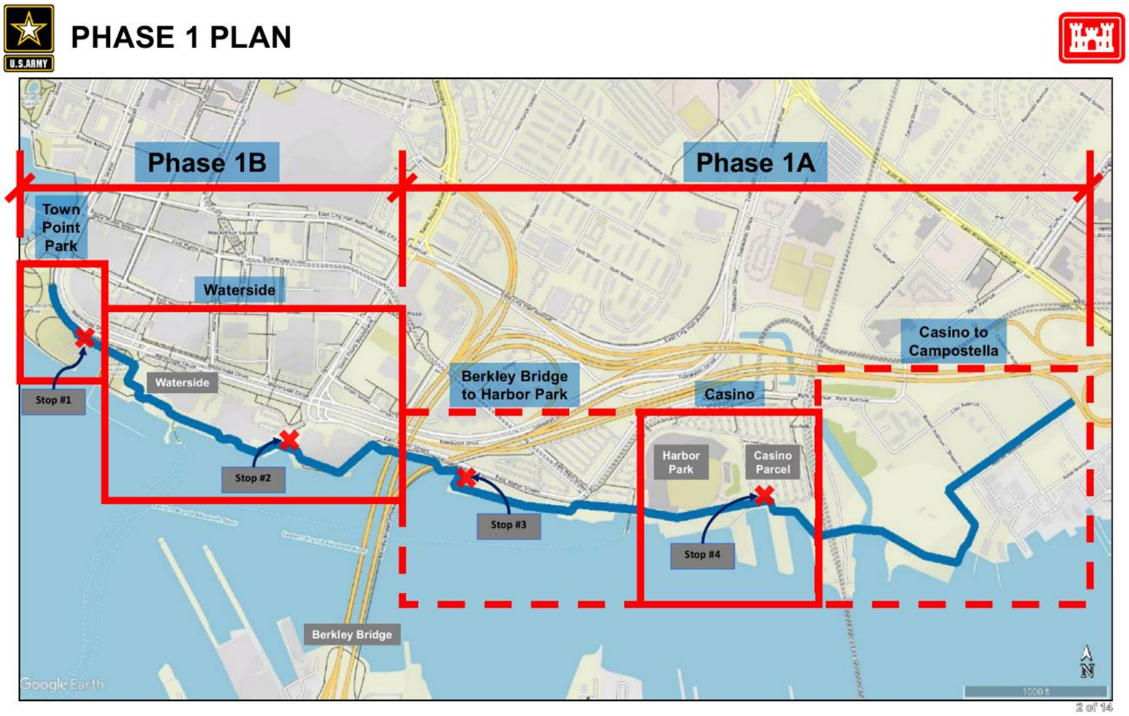
The Norfolk Coastal Storm Risk Management Study identified construction sequence areas as follows:

1. Area 1: Ghent-Downtown-Harbor Park
2. Area 2: Pretty Lake
3. Area 3: Lafayette River
4. Area 4: Broad Creek
5. Area 5: All Nonstructural areas; Campostella-Berkley, Willoughby Spit, and others.

In 2020, the project was authorized by Congress in the bipartisan Water Resources Development Act. On January 19, 2022, the United States Army Corps of Engineers (USACE) announced its plan for investing the $14 billion from President Biden's Bipartisan Infrastructure Law to strengthen port and waterway supply chains and bolster climate resilience. In this plan, the City of Norfolk will receive $249,331,000 to increase community resilience to flooding. On March 30, 2022, the United States Army Corps of Engineers (USACE) announced an additional $150,000,000 from President Biden's Infrastructure Investment & Jobs Act to support the Coastal Storm Risk Management (CSRM) project in the City of Norfolk. The project funding now totals $399,331,000 with an additional $215,000,000 required match of non-federal funds. The city will use the funding for the design and construction of storm surge barriers, levees, and pump stations to reduce storm risk as part of a large-scale extension of the Downtown Norfolk Floodwall. The federal funding allocation for developing complete plans and specifications for extension northwards to the Midtown Tunnel and west towards the Campostella Bridge as well as a surge barrier at the Hague.

As a non-federal sponsor of the project, the City of Norfolk is responsible for providing a 35% cost-share match. The City is prioritizing this project due to the tremendous impact the project will have on flood mitigation in the City. Accordingly, the project was identified in the 2021 Virginia Coastal Resilience Master Plan as an example hybrid project.

With the authorized federal funding, the City of Norfolk and USACE are focusing on the Phase 1A of the Ghent-Downtown-Harbor Park flood barrier system. The project will provide flood risk reduction in the economic core of the city by providing a continuous project alignment from West Ghent through the Harbor Park area. The project is selected as the priority of major construction based on the economic value of the area as well as important infrastructure such as the region's only Tier 1 trauma hospital, the region's children's hospital, emergency services, the region's only medical school, critical transportation corridors used for evacuation, city hall, city institutional network, cultural assets, and adjacent historic districts as well as well as assisted housing.



Protecting this economic, social and cultural center of Norfolk is called for in the citizen-led *Vision2100* plan for Norfolk. The CSRM IFR/EIS report and the DCR-approved Resilience Plan for Norfolk includes *Vision2100* as a key document that reinforced the overarching vision for how Norfolk will adapt to rising seas over the remainder of this century. This project area is identified for "Enhancing Economic Engines" as its adaptation strategy. The highest priority action for such areas calls for Norfolk to "Expand the flood protection system."

In coordination with the USACE Norfolk District, the City has selected the first feature to be fully designed in the PED phase, and the first feature bid for construction, to be a portion of the recommended structural protection for the Ghent-Downtown-Harbor Park measure. The floodwall segment to be developed into full designs includes the eastern end of the floodwall alignment. This segment runs to the west behind the Harbor Park Baseball Stadium, underneath the Berkley Bridge, and continues to the existing downtown Norfolk floodwall, as shown in Figure 2. This includes approximately 2,600 linear feet of berm, 4,000 linear feet of floodwall and one pump station based on the conceptual alignment from the IFR/EIS. Future references to this area will be called the Harbor Park to Downtown Berm and Floodwall.

This rendering is conceptual in nature and is provided for informational purposes only. It is a depiction of a design in progress and does not necessarily represent the final version of the project.

This alignment is a practical first element of construction for the following reasons:

- Real Estate considerations.
- The project will benefit the most vulnerable populations within Norfolk, meeting the City's goals of Resilience-Equity.

- Significant Natural and Nature-Based Features (NNBFs) are included in this initial phase, providing opportunities to incorporate innovative NNBF hybrid technologies being developed in concert with the GO Virginia-funded resilience accelerator, RISE Resilience Innovations.

BERKLEY BRIDGE – HARBOR PARK LEVEE

This rendering is conceptual in nature and is provided for informational purposes only. It is a depiction of a design in progress and does not necessarily represent the final version of the project.

The Scope of Work and Proposed Budget reflects the planned efforts to complete remaining feasibility level analyses required prior to the start of construction, collect required data, progress the development of Plans and Specifications for the Harbor Park to Downtown Berm and Floodwall, coordinate with project stakeholders, and complete project environmental compliance items.

Major PED efforts to be completed before construction can occur include (Harbor Park to Downtown Berm and Floodwall footprint only):

- Topographic and utility surveys;
- Wetland, Mean High Water (MHW) line, and Mean Low Water (MLW) line delineations;
- Environmental permits;
- Refining the project alignment;
- Conducting geotechnical investigations;
- Conducting Phase I Hazardous Toxic and Radioactive Waste (HTRW) environmental site assessments on each affected parcel
- Surveying project areas for potential cultural resources;
- Completing interior drainage analysis and pump station sizing;
- Designing project elements and performing appropriate reviews, validations, and certifications;

- Finalizing Real Estate acquisition and/or Right-of-Entry agreements;
- Developing the Current Working Estimates (CWEs) and Independent Government Estimates (IGEs) for survey, design, and future construction contracts and
- Preparing bid packages for proposals.

This area has low lying elevation and is one of the most flooded areas of the city (see 100 Year Flood Plain and Existing Drainage System map below). Unfortunately, many of the flood events are underreported. This is an underreported area due to the high number of rentals in the area. The site is in Zone AE of the special flood hazard area as indicated on the FEMA flood insurance rate map for the City of Norfolk (CID 510104, FIRM/FIS eff. 2-17-17). The City of Norfolk has experienced flooding from all three types of storms (tropical storms, hurricanes, and nor'easters).

The storms that impact the City of Norfolk (and the greater Hampton Roads area) are occurring more frequently and are more intense based on the historical record data. The Sewells Point tide gauge shows that in the last 20 years storms are producing higher water surface elevations. This could also be result of sea level rise. The table displays the date of historical storm events where the water surface elevations reached over 4.0 feet NAVD 88, the type of storm, the peak water surfaces elevations, and cost. The peak water surface elevations were measured by the NOAA – Sewells Point tide gauge and reference to NAVD 88.

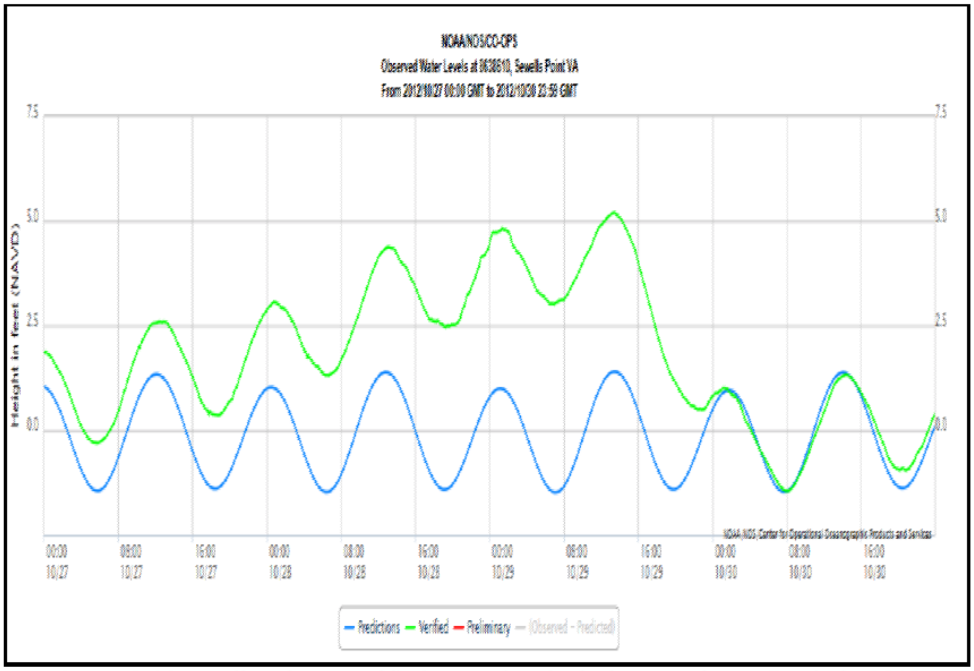

Figure 3.11. Predicted vs. Verified water levels during Hurricane Sandy in 2012.

2. Need for Assistance

The implementation of the floodwall will reduce impacts to critical infrastructure such as the industries mentioned above and ensure flood impacts are minimized.

Norfolk is home to the Port of Virginia's Norfolk International Terminals (NIT), one of Virginia's most significant economic assets with an impact of $60 billion in economic activity annually and port-related industries generating 374,000 jobs. The city is also home to multiple universities and key medical services supporting the region including Old Dominion University, Norfolk State University, Eastern Virginia Medical School, Sentara Norfolk General Hospital, and The Children's Hospital of the King's Daughters. Although the city has a formidable commercial, educational, militaristic, and healthcare focused industries, a significant amount of the city's population experiences severe economic hardship.

In comparison to other areas of Virginia, Norfolk is a low-income community, with median household income less than 80% of the statewide metric. The city has an average Social Vulnerability Index score of 0.59, ranking it as having Moderate Social Vulnerability as a whole. However, many of the densest population areas are concentrated in 25 census tracts listed as having High or Very High Social Vulnerability. An attached spreadsheet provides a summary of Social Vulnerability Index scores for each census tract in the city (Attachment B).

The entire project will provide city-wide impacts and the first proposed phase is focused on an area in which the annual median household income is $15,834 and categorized as Very High Social Vulnerability. In this area, 54% of households are identified as below the poverty level and there are 694 households without a vehicle (Attachment C).

In the project area, there are a myriad of residential and commercial structures that will be benefited by this project to include the St. Paul's Area. This Area is home to the region's highest concentration of assisted housing with 1,674 aging units that do not meet modern building standards in three adjacent family assisted housing communities. This area floods regularly, a problem worsened by increased frequency and duration of significant storm events. The City of Norfolk and Norfolk Redevelopment and Housing Authority are actively working to address these challenges through the St. Paul's Transformation project which is leveraging U.S. Department of Housing and Urban Development Choice Neighborhood Initiative (CNI) Implementation Grant for $30 million. The program will include a reimagined Newton's Creek that is daylighted to provide enhanced stormwater infiltration and storage as part of Phase 1A's interior drainage needs to support the St. Paul's Blue/Greenway, another highlighted example hybrid project from the Coastal Resilience Master Plan.

Walke Street at Charlotte Street, Mid 20th Century and 2019 (NRHA, Google)

Recent flooding in Newton’s Creek Historic Footprint within the Tidewater Gardens assisted housing community.

Alternatives

The City and USACE Norfolk District analyzed, developed, and recommended a myriad of alternative measures to the recommended plan. The measures were combined into alternative plans that would provide coastal storm risk management for large portions of Norfolk. To meet the objectives of the study all areas of the city were investigated for coastal storm risk management solutions. The formulation strategy sought a comprehensive project that would allow Norfolk to maintain critical infrastructure, evacuation routes, and cohesive neighborhoods. Also, by formulating a comprehensive, citywide alternative, socially vulnerable neighborhoods will receive the same, or similar, levels of risk reduction as wealthy or more valuable property areas.

Four types of alternatives were formulated: the No Action, the Structural Only, the Nonstructural Only, and the Structural / Nonstructural Combination Alternatives.

In all, ten alternative plans were developed; plus the No Action Alternative.

Each alternative plan has its own economic valuations based on its component measures. These alternative plans include some measures that were later found to be not cost-justified, at which point re-formulation of the focused array was necessary; plans are shown in the table below.

Focused Array of Alternatives					
Alternative Plan	**Total Avg. Annual Costs ($1000's)**	**Annual Benefits ($1000's)**	**Annual Net Benefits ($1000's)**	**BCR**	**Total Project Cost ($1000's)**
Alternative 1 (No Action)	$0	$0	$0	$0	$0
Alternative 2a - Structural Only (LR-1a)	$52,000	$123,000	$71,000	2.4	$ 1,369,000
Alternative 2b - Structural Only (LR-1b)	$49,000	$ 123,000	$75,000	2.5	$ 1,278,000
Alternative 2c - Structural Only (LR-2 S)	$37,000	$ 83,000	$46,000	2.3	$978,000
Alternative 3- Nonstructural Only (All reaches)	$88,000	$ 152,000	$64,000	1.7	$ 2,319,000
Alternative 4a - Combination Structural and Nonstructural (LR-1a)	$72,000	$ 162,000	$90,000	2.2	$ 1,903,000
Alternative 4b - Combination Structural and Nonstructural (LR-1b)	$69,000	$ 162,000	$93,000	2.7	$ 1,811,000
Alternative 4c - Combination Structural and Nonstructural (LR-2 S)	$64,000	$ 163,000	$99,000	2.6	$1,688,000
Alternative 4d - Combination Structural and Nonstructural (LR-1a), Berkley and Campostella Nonstructural	$72,000	$ 162,000	$90,000	2.3	$1,891,000
Alternative 4e - Combination Structural and Nonstructural (LR-1b), Berkley and Campostella Nonstructural	$68,000	$ 162,000	$94,000	2.4	$ 1,799,000
Alternative 4f - Combination Structural and Nonstructural (LR-2 S), Berkley and Campostella Nonstructural	$64,000	$ 163,000	$100,000	2.6	$ 1,676,000

Final Array of Alternatives

Alternative Plan	Description	Total Avg. Annual Costs ($1000's)	Annual Benefits ($1000's)	Annual Net Benefits ($1000's)	BCR	Total Project Cost ($1000's)
Alternative 1	No Action	0	0	0	0	0
Alternative 2a	Structural Only in All Reaches with the Outer Lafayette SSB, NNBF	$46,000	$136,000	$91,000	3.0	$1,231,000
Alternative 3	Nonstructural and Ringwalls Only in All Reaches	$108,000	$143,000	$35,000	1.3	$2,933,000
Alternative 4d	Structural and Nonstructural Combination, Outer Lafayette SSB, Campostella/Berkley Nonstructural, NNBF	$66,000	$168,000	$102,000	2.5	$1,787,000

Measures in Each Alternative Plan

Alternative Plan	Description
Alternative 1	No Action
Alternative 2a	PL-2S, LR-1aS, EBS, BC-1S
Alternative 3	BC-1N, EB-1N, EB-1aN, EB-2N, EB-3N, EB-3aN, EB-4N, EB-4aN, EB-4bN, EB-5N, EB-5aN, EB-7N, EB-8N, H-1N, LR-1N, LR-2N, MS-2N, PL-1N, PL-1aN, PL-2N, WB-1N
Alternative 4d	PL-2S, LR-1aS, EBS, BC-1S, EB-1N, EB-4N, EB-4aN, EB-4bN, EB-5aN, EB-7N, EB-8N, MS-2N, PL-1N, WB-1N

The following environmental consequences were each analyzed individually against the Final Array of Alternatives (No Action, Structural Only Alternative, Nonstructural Alternative, 4d Recommended Plan): land use, geology and soils, coastal hydraulics, water quality, floodplains, wetlands and mudflats, submerged aquatic vegetation, terrestrial wildlife and upland vegetation, benthic resources, plankton, fish and fishery resources, special status species, passage/trapping effects, turbidity, vessel interactions, cumulative effects, cultural resources, recreational resources, visual resources, socioeconomics, hazardous materials and wastes, safety, transportation and navigation, utilities, noise, and climate change (see Chapter 11 of the Norfolk CSRM study).

▨ *Area not included in study

This study considered a range of nonstructural and structural measures to reduce the risk of storm damage in the study area. Through an iterative planning process, potential coastal storm risk management measures were identified, evaluated, and screened. Those remaining were developed into defined coastal storm risk management alternatives that composed a focused array of alternatives. The alternatives and measures of the focused array then underwent further screening and comparison to reduce the list of alternatives to final array of alternatives. Based on an evaluation of the costs and benefits of the final array of alternatives, including potential environmental impacts, Alternative 4d was identified as the **Tentatively Selected Plan (TSP)**. The TSP is the identified plan at the 3% ACE water level. After identification of the TSP, the plan was evaluated at the 10% and the 1.4% ACE water levels to better optimize the plan for costs and benefits.

3. Goals and Objectives:

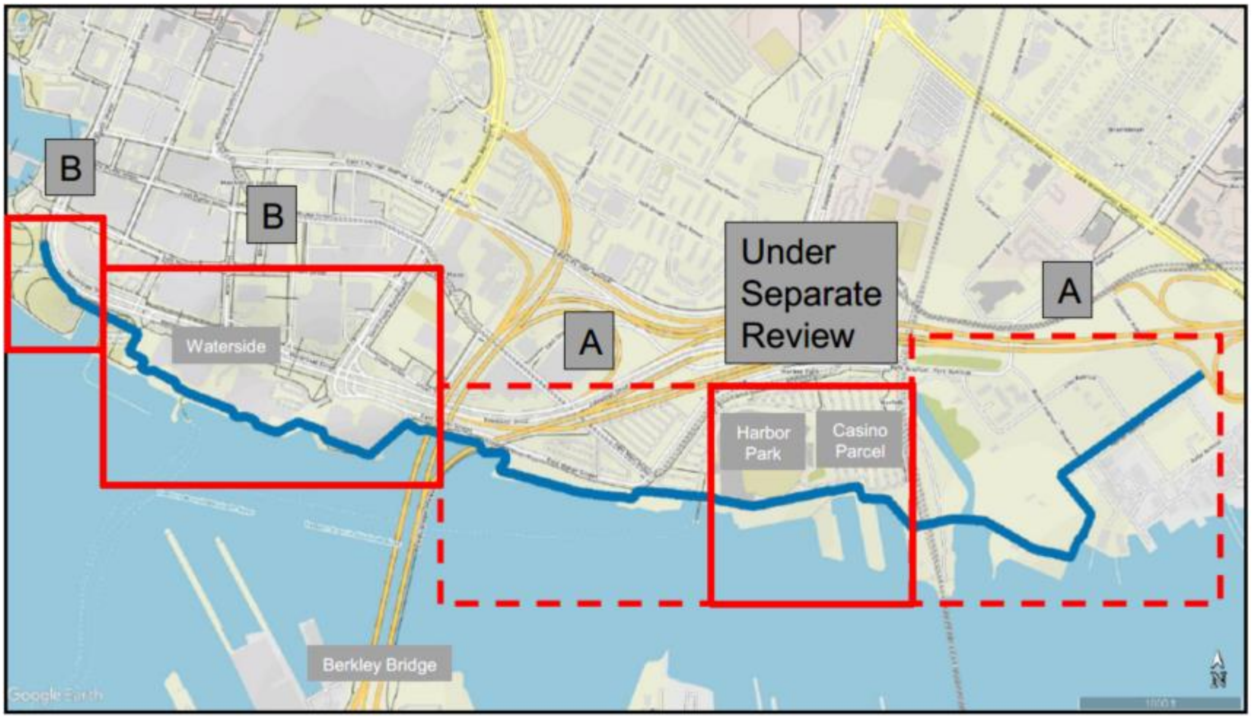
Within the Recommended NED Plan, Alternative 4d of the Norfolk CSRM IFR/EIS recommends multiple floodwalls, surge barriers, tide gates, levees, pump stations and nonstructural measures such as home elevations, buyouts, and basement fills.

> *Phase 1A of the Ghent-Downtown-Harbor Park Barrier System Addresses the first project segment with a hybrid green levee living shoreline focus, providing projection for the most socially vulnerable population within Norfolk.*

This project covers the majority of Harbor Park in Downtown Norfolk along with areas of the City to the east of Harbor Park. Surrounding areas are characterized by a protective floodwall measure that runs from the West Ghent neighborhood to just past the Harbor Park area. Within the Harbor Park area, a levee will be constructed that ties in the eastern extent of the Harbor Park and future development area for a casino to and a levee with living shorelines within the western extent of Phase 1A; interior drainage analyses were developed. There is sufficient right-of-way to allow the construction of this feature where in other parts walls are used because of limited space.

The proposed project offers numerous unparalleled benefits for the residents, existing infrastructure, and transportation. Through the mitigation of ongoing flooding impacts, these elements will be protected through the creation of the protective flood measures.

Map overview of Phase 1:



4. Approach, Milestones, and Deliverables:

The City of Norfolk and USACE have determined a strategic schedule for the project. Focusing on the first phase of the comprehensive project will yield definitive deliverables in alignment with the scope of work. The City and USACE will execute the project in 3 years. The draft Project Partnership Agreement (PPA) is prepared. The PPA will identify all sources of nonfederal match, including this grant once awarded, and then the PPA will be signed with project commencement by the start of FY23 (October 1). The PPA is unable to be signed until all funding sources are confirmed.

The first 15 months will include finalizing 100% design for the entire project phase. This effort also includes the process of securing contractor, value engineering process, independent cost estimate, independent external peer review, and a constructability review all prior to the request for proposal (RFP) process and bids being received. Construction is scheduled to begin in January 2024 and all work completed by September 30, 2025. Milestones will be tracked through quarterly reports and ongoing project status updates which define the funding expended, project accomplishments and activities, and anticipated next steps to meet the project implementation deadline.

Each design milestone will incur a deliverable at 35%, 65%, 100% from USACE Norfolk District and the City. Quality control assessment reports will be provided for each milestone. The anticipated schedule is defined below:

Deliverable	Description	Date
35% Submittal & Value Engineering	Plans, outline specifications, design analysis, cost estimate	10/5/22 - 12/27/22
65% Submittal	Plans, redline specifications, design analysis, cost estimate, draft 1354, bid schedule	10/5/22 - 5/4/23
100% Submittal	Plans, typed specifications, design analysis, cost estimate, draft 1354, bid schedule	5/5/23 - 11/5/23
Backcheck Submittal	Includes revisions to all design documents until comments are closed	
Virginia DEQ Submittal Documents	Prepare and submit the required documents for DEQ review after the 65% resolution meeting	8/3/23 - 10/31/23
Biddability, Constructability, Operability, Environmental and Sustainability (BCOES) Design Submittal	The value of BCOES reviews is based on minimizing problems during the construction phase through effective checks performed by knowledgeable, experienced personnel prior to advertising for a contract. Biddability, constructability, operability, environmental, and sustainability requirements must be emphasized throughout the planning and design processes for all programs and projects, including during planning and design charrettes. This will help to ensure that the government's contract requirements are clear, executable, and readily understandable by private sector bidders or	11/6/23- 12/26/23

	proposers. It will also help ensure that the construction may be done efficiently and in an environmentally sound manner, and that the construction activities and projects are sufficiently sustainable. Finally, effective BCOES reviews of design and contract documents will reduce risks of cost and time growth, unnecessary changes and claims, as well as support safe, efficient, sustainable operations and maintenance by the facility users and maintenance organization after construction is complete.	
Ready To Advertise (RTA) Submittal	At RTA, the design analysis is not a contract document, but rather a final documentation of the basis of design for the Resident Engineer, and digital archival document for Engineering Division. The design analysis should be developed from Concept Design to include a discussion of any new or unfamiliar products, critical product features, critical milestones that may require designer consultation, items of particular customer interest revealed in design meetings, shop drawings of particular interest or criticality, anticipated difficult construction features.	12/27/23-12/30/23
Geotechnical report	Outlines the content of subsurface investigations, geotechnical design reports, geotechnical design analyses, and geotechnical data for inclusion in design and contract documents.	12/27/23-12/30/23
Construction	Site work begins until completion.	1/1/24- 8/31/25

The City of Norfolk is partnering with the USACE to complete the project and has developed a strategy for implementation. Supporting funds for the project include federal funding and local state/government funding. The federal funding is provided through the appropriated funding from the Infrastructure Investment and Jobs Act (IIJA). To continue to move the project forward, the Commanding U.S. Army Colonel of the USACE Norfolk District provided the City with a letter of funding confirmation (Attachment D).

The City of Norfolk's Office of Resilience has an extensive history of successfully managing state and federal grant funds for resilience projects. As a major city, the City of Norfolk manages a large operating budget, including a fee to address and support resilience projects, and demonstrates excellent in fiscal responsibility. The City of Norfolk has exemplary and committed staff members to support, implement, and execute grants on schedule and within budget. This project will be managed through the City of Norfolk's Office of Resilience and the USACE Norfolk District.

In addition to Resilience's staff and consultants, the team members will include Norfolk staff from the Department of Public Works. Proposed team members are noted below:

Table 1 – City of Norfolk and USACE Project Team

Name	Title	Department
Kyle Spencer, GISP, CFM	Acting Chief Resilience Officer	Resilience
Matthew Simons, AICP CFM	Coastal Resiliency Manager	Resilience
Stephanie Daniel	Management Analyst	Resilience
John White	City Stormwater Engineer	Stormwater
Tammy Halstead, PE	Civil Engineer IV	Public Works
Richard Klein, PE	Chief, Programs and Civil Works Branch	USACE Norfolk District
Walt Trinkala	Project Manager/Engineer	USACE Norfolk District
Jack Wall	Project Manager	USACE Norfolk District
Matthew McKeehan, PE	Levee Safety Program Mgr.	USACE Norfolk District
Dan Hughes	Planning Resource Section Chief	USACE Norfolk District
Kathy Purdue	Environmental	USACE Norfolk District
John Haynes	Cultural Resources	USACE Norfolk District
Doug Hessler	GIS	USACE Norfolk District
Robin Williams	H&H Chief	USACE Norfolk District
Wayne Miller	Structural, Chief	USACE Norfolk District
Todd Waldman	District Counsel	USACE Norfolk District
Mark Haviland	PAO, Chief	USACE Norfolk District

5. Relationship to Other Projects:

The project is directly tied to the City of Norfolk and USACE's Coastal Storm Risk Management Study (CSRM) that was finalized in 2019. The recommendations for this project are derived from the extensive feasibility study conducted by the USACE. Furthermore, this project is the beginning of a comprehensive City-wide effort to implement the CSRM recommendations to reduce the ongoing challenges of flooding. In September 2021, the City of Norfolk was awarded funding from the first round of the Community Flood Preparedness Grant Fund to support additional coastal process calculations and value engineering efforts for the continued design of infrastructure features identified in the Norfolk Coastal Storm Risk Mitigation (CSRM) Feasibility Study and Integrated EIS (FS/EIS).

6. Nonfederal Sponsor Responsibilities and Operations & Maintenance:

As the non-Federal project partner, the City of Norfolk must comply with all applicable Federal laws and policies and other requirements, including but not limited to:

A. In a cost sharing coordination with the Federal Government, who shall provide 65% of the initial project cost, provide 35% of the costs of project construction:
   1. Provide all lands, easements, rights of way and relocations (LERR), including suitable borrow areas, uncontaminated with hazardous and toxic wastes, and perform or ensure performance of any relocations determined by the Federal Government to be necessary for the initial construction, operation, and maintenance of this project.

   2. Perform, or cause to be performed, any investigations for hazardous substances as are determined necessary to identify the existence and extent of any hazardous substances regulated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Public Law (PL) 96-510, as amended, 42 U.S.C. 9601-9675, that may exist in, on, or under lands, easements, or rights-of-way that the Federal Government determines to be required for the construction, operation, and maintenance of the Project. However, for lands that the Federal Government determines to be subject to the navigational servitude, only the Federal Government shall perform such investigations unless the Federal Government provides the non-Federal project partner with prior specific written direction, in which case the non-Federal project partner shall perform such investigations in accordance with such written direction.
   3. Coordinate all necessary cleanup and response costs of any CERCLA-regulated materials located in, on, or under lands, easements, or rights-of-way that the Federal Government determines to be necessary for the construction, operation, or maintenance of the project.
   4. Cost-share of the cost of mitigation and data recovery activities associated with historic preservation, that are in excess of 1 percent of the total amount authorized to be appropriated for the project.

B. For fifty years, operate, maintain, repair, replace, and rehabilitate the completed project, or functional portion of the project, at no cost to the Government, in a manner compatible with the project’s authorized purposes and in accordance with applicable Federal and State laws and any specific directions prescribed by the Government in the Operations, Maintenance, Replacement, Repair and Rehabilitation (OMRR&R) manual and any subsequent amendments thereto.

C. Provide the Federal Government a right to enter, at reasonable times and in a reasonable manner, upon property that the non-Federal project partner, now or hereafter, owns or controls for access to the project for the purpose of inspection, and, if necessary after failure to perform by the non- Federal project partner, for the purpose of completing, operating, maintaining, repairing, replacing, or rehabilitating the project. No completion, operation, maintenance, repair, replacement, or rehabilitation by the Federal Government shall operate to relieve the non-Federal project partner of responsibility to meet the non-Federal project partner's obligations, or to preclude the Federal Government from pursuing any other remedy at law or equity to ensure faithful performance.

D. Hold and save the United States free from all damages arising from the construction, operation, maintenance, repair, replacement, and rehabilitation of the project and any project-related betterments, except for damages due to the fault or negligence of the United States or its contractors.

E. Keep, and maintain books, records, documents, and other evidence pertaining to costs and expenses incurred pursuant to the Project in accordance with the standards for financial management systems set forth in the Uniform Administrative Requirements for Grants and Cooperative Agreements to State and Local Governments at 32 Code of Federal regulations (CFR) Section 33.20.

F. As between the Federal Government and the non-Federal project partner, the non-Federal project partner shall be considered the operator of the project for the purpose of CERCLA liability. To the maximum extent practicable, operate, maintain, repair, replace and rehabilitate the project in a manner that will not cause liability to arise under CERCLA.

G. Comply with the applicable provisions of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1790, Public Law 91-646, as amended by Title IV of the Surface Transportation and Unifom1 Relocation Assistance Act of 1987 (Public Law 100-17),and the Unifom1 Regulations contained in 49 CFR Part 24, in acquiring lands, easements, and rights-of-way, required for the construction, operation, and maintenance of the project, including those necessary for relocations, borrow materials, and dredged or excavated material disposal, and inform all affected persons of applicable benefits, policies, and procedures in connection with said Act.

H. Comply with all applicable Federal and State laws and regulations, including, but not limited to, Section 601 of the Civil Rights Act of 1964, Public Law 88-352 (42 U.S.C. 2000d), and Department of Defense directive 5500.11 issued pursuant thereto, as well as Army regulation 600- 7, entitled "Nondiscrimination on the Basis of Handicap in Programs and Activities Assisted or Conducted by the Department of the Army."

I. Participate in and comply with applicable Federal flood plain management and flood insurance programs and comply with the requirements in Section 402 of the Water Resources Development Act of 1986, as amended.

J. Not less than once each year inform affected interests of the extent of storm risk management afforded by the project.

K. Publicize flood plain information in the area concerned and provide this information to zoning and other regulatory agencies for their use in preventing unwise future development in the flood plain and in adopting such regulations as may be necessary to prevent unwise future development and to ensure compatibility with the degree of storm risk management provided by the project.

L. Prevent obstructions of or encroachments on the project (including prescribing and enforcing regulations to prevent such obstructions or encroachments) which might hinder its operation and maintenance, or interfere with its proper function, such as any new development on project lands or the addition of facilities which would degrade the benefits of the project.

M. Provide and maintain necessary access roads, parking areas, and other public use facilities, open and available to all on equal terms.

N. Comply with Section 221 of Public Law 91-611, Flood Control Act of 1970, as amended, and Section 103 of the Water Resources Development Act of 1986, Public Law 99-662, as amended, which provides that the Secretary of the Army shall not commence the construction of any water resources project or separable element thereof, until the non-Federal project partner has entered into a written agreement to furnish its required cooperation for the project or separable element.

O. Quarterly and after storm events, perform surveillance of the project to determine project maintenance or repair needs and provide the results of such surveillance to the Federal Government.

The City of Norfolk is actively preparing for ongoing and lifetime maintenance costs of the project. Annual Operations and Maintenance (O&M) costs for the entire Ghent-Downtown-Harbor Park Barrier System are anticipated to cost $585,000 annually (2019 estimate). The O&M costs of the project will be financed by the City of Norfolk through increased allocations to the City's general fund beginning in fiscal year 2026.

> *Accordingly, portions of the proposed project will experience reduced annual O&M costs over the lifespan of the project due to the construction of NNBF's such as oyster reefs, which will reduce the impacts of wind generated wave hazards by approximately 20%-50% according to the CSRM feasibility study completed by the USACE.*

A Project Partnership Agreement between the City of Norfolk and USACE will be in place to establish the requirement for annual and ongoing O&M appropriations. O&M costs for determining were based on parametric costs developed in the North Atlantic Coast Comprehensive Study (NACCS). Parametric costs were then adjusted based on the length and type of measure. The following assumptions were applied to operation and maintenance estimates:

- $2 per linear foot plus $10,000 per drain for floodwalls and levees.
- 0.5% of total costs for wetlands and living shorelines.
- 1% of total costs for groins, breakwaters, and revetments.
- 0.5% of total costs for storm surge barriers.
- 1% of total costs for beach restoration with renourishment interval of 4 years.

After computation of the total costs, costs were annualized using the FY2017 (October 2016) discount rate of 2.875% for a 50-year life cycle of the project. Repair, replacement, and rehabilitation cost will be completed during optimization phase and are not expected to impact plan selection.

Once the project has been constructed and turned over, USACE will provide an operations, maintenance, repair, replacement, and rehabilitation (OMRR&R) manual which will be written specifically for the City of Norfolk. The City will have the primary responsibility for operating and maintaining the project. The intent of the manual is to provide the City with some clear and comprehensive guidance on the operation and maintenance of levees, floodwalls, and other flood control structures. It will describe how to plan and prepare for high water and storm events, and lays out steps to take during emergencies that will help reduce the threat of flooding. The manual will also explain the types of assistance that the U.S. Army Corps of Engineers can provide to a community before, during, and after a flood. Monitoring and inspections will occur to ensure that the project functions as designed and that the local sponsor confirms to all OMRR&R recommendations and requirements that will assist in functionality of the project.

USACE will inspect the project each year with the City of Norfolk. USACE conducts two types of levee and floodwall inspections: Routine Inspection and Periodic Inspection. Routine Inspection is a visual inspection to verify and rate levee/floodwall system operation and maintenance. It is typically conducted each year for all levees/floodwalls in the USACE Levee Safety Program. Periodic Inspection is a comprehensive inspection conducted by a USACE multidisciplinary team that includes the local sponsor and is led by a professional engineer. USACE typically conducts this inspection every five years on the federally authorized levees in the USACE Levee Safety Program.

Periodic Inspections include three key steps: (1) Data collection - A review of existing data on operation and maintenance, previous inspections, emergency action plans and flood fighting records; (2) Field inspection - Similar to the visual inspection for a Routine Inspection, but with additional features; (3) Final report development - A report including the data collected, field inspection findings, an evaluation of any changes in design criteria from the time the levee was constructed, and additional recommendations as warranted, such as areas that need further evaluation. Both Routine and Periodic Inspections result in a final inspection rating for operation and maintenance. The rating is based on the levee/floodwall inspection checklist, which includes 125 specific items dealing with the operation and maintenance of levee embankments, floodwalls, interior drainage, pump stations, and channels. Each levee/floodwall segment receives an overall segment inspection rating of Acceptable, Minimally Acceptable, or Unacceptable. USACE also shares the results with FEMA, to help inform decisions about levee accreditation for flood insurance purposes. The inspection ratings are available in the National Levee Database.

7. Criteria*:*

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

   The City of Norfolk is an independent city in the Commonwealth of Virginia.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**

   The City of Norfolk submitted a Resilience Plan package in July 2021 and received approval of the plan from Virginia Department of Conservation and Recreation on August 11, 2021 (Attachment E).

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

   The City of Norfolk is an independent city in the Commonwealth of Virginia.

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

   Yes, the required match is provided by federal and local funding with details included as an attachment.

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

   The project benefit for the entire city is unparalleled. With the first phase of implementation funding that is requested in this application, it will establish Norfolk's commitment to foster and encourage resilience. The expected impacts of implementing this effort will create 27,236 feet of floodwall protection, 7,200 lf. of NNBF living shoreline, 5,250 lf. of NNBF Oyster Reef, and 3,800 lf. of mitigation linear shoreline in addition to t-walls, pump stations, surge barriers, miter gates, and tide (sluice) gates. This will provide the City with essential flood protection as flooding events continue to increase in frequency and intensity.

8. Budget Narrative

Based upon multiple metrics, the project area is defined as a low-income area. As a result, the City of Norfolk seeks 17.5% grant funding to support the construction of Phase 1A of the Ghent-Downtown-Harbor Park flood barrier system. The City proposes to fund 82.5% match through a combination of local funds (17.5%) and federal funds (65%) recently awarded to the City of Norfolk for this project. In January 2022, the U.S. Army Corps of Engineers (USACE) announced that $249,331,000 of federal funding has been appropriated from Infrastructure Investments and Jobs Act (IIJA) for Phase 1A of this CSRM project. On March 30, 2022, USACE announced that the remaining $150,000,000 of federal support needed to complete all of the Ghent-Downtown-Harbor Park Barrier System (CSRM Phase 1 – ph. 1A through 1D) has been appropriated in the USACE FY23 work plan (Attachment F).

The City of Norfolk and its State partners must provide the necessary 35% match ($215,024,385) to unlock the $399,331,000 appropriated from USACE for this project ($614,335,385 total).

Phase 1A is the discrete 3-year first start project which is the subject of this CFPF grant application. The costs to finish design and construction for Phase 1A is $160,731,286. The City of Norfolk is requesting $28,127,975 (17.5%) to be matched with the same amount from the City of Norfolk to meet the City’s 35% nonfederal match obligation by the start of Fiscal Year 2023. All match funding will go towards developing final USACE-approved designs, and construction. The tables below summarize project costs. Funds proposed as match are authorized through existing approved budgets and verified on the attached, signed City Manager Transmittal Form outlining grant and match funds for the current Community Flood Preparedness Fund grant cycle. Upon award of grant funds, the City sets up a special revenue account that includes approved match funds and cash funds to cover awarded grant funding until reimbursement is received. This allows Norfolk to move through projects without delays for reimbursement requests.

Cost Breakdown

Project Tasks	Grant Funds (17.5%)	Match Funds (82.5%)	Total
Task I Final Design	$667,500	$3,146,786	$3,814,286
Task II Construction	$27,460,475	$129,456,525	$156,917,000
Total Project Costs:	$28,127,975	$132,603,311	$160,731,286

	Budget Categories:	**Project Tasks**		
		Task 1: Final Design	**Task 2:** Construction	**TOTAL:**
Direct Costs	Personnel	$0	$0	$0
	Fringe Benefits	$0	$0	$0
	Travel	$0	$0	$0
	Equipment	$0	$0	$0
	Supplies	$0	$0	$0
	Contractual	$3,814,286	$156,917,000	$160,731,286
	Other:	$0	$0	$0
Total Direct Costs:		$3,814,286	$156,917,000	$160,731,286
Indirect Costs:		$0	$0	$0
Total Grant Funding:		$667,500	$27,460,475	$28,127,975
Matching Funds:		$3,146,786	$129,456,525	$132,603,311
Total Budget:		$3,814,286	$156,917,000	$160,731,286

Budget Breakdown:

100% of estimated total project costs provided (low-income geographic area designation)

Task I: Final Design ($3,814,286): The City will work with USACE to complete the project design along with the selected consultant(s). The City is requesting $667,500 from the fund to support this effort. USACE will adhere to required procurement processes and regulations to procure a qualified consultant to assist the City with this effort. USACE tracks all expenses in a near identical way as a typical contractor. All services from USACE and their contractors will be reported to DCR as contractual expenses. Given that the City of Norfolk and federal match for this grant is well above the minimum required by the CFPF grant manual, the City of Norfolk will not be submitting any request for CFPF match credit from work-in-kind expenditures. However, the City of Norfolk will track all work-in-kind expenses (personnel, etc.) for submission to the federal government, and will agree to provide this information to DCR upon request.

Task II: Construction ($156,917,000): The City of Norfolk and USACE will fund project construction in six project reaches as delineated below (listed from West to East). The City is requesting $27,460,475 from the fund to support this effort. These construction reaches are not constructed sequentially; construction may begin simultaneously, and construction activities will likely overlay.

1. **Phase 1a | Berkley Bridge Levee:** Construction will commence with the creation of a levee, T-wall, closures, and living shorelines. A levee will be a standard berm/levee geometry of a 10-foot wide crest covered with 6 inches of aggregate base, 3H: 1V side slopes, and 2 feet of riprap on the waterside. An inspection or key trench is excavated into existing ground along the berm/levee alignment. The inspection trench is 10 feet wide at the bottom with 1H: 1V sides slopes. For a berm/levee height less than 6 feet, the depth of the inspection trench is equal to the height of the levee. For a berm/levee height of 6 feet or greater, the depth of the inspection trench is 6 feet. The inspection trench is backfilled with compacted embankment fill material, which is also used to construct the levee. T-Walls will be traditional concrete stem walls with pile supported bases. Gate closures are designed into a floodwall system where passage through the floodwall is needed during non-flooding periods. Typically gate closures are designed to accommodate automobile traffic where a floodwall is designed across a roadway. Gate closures can also be designed for pedestrian traffic. The gates are closed during flooding periods and so disruptions to traffic should be considered. The existing Norfolk floodwall utilizes gate closures and the closures envisioned for this study are likely to be similar in design and function. Living Shorelines will provide erosion protection for coastal flood defense structures while creating new habitat and improving ecological functions of the Elizabeth River. The levee will transition to a T-wall/L-wall at the Berkley Bridge Pump Station, directly beside the southwest corner of Harbor Park ballfield.

2. **Phase 1a | Berkley Bridge Pump Station**: A pump station will be constructed in the project area. Upgrades to the subsurface drainage system as well as construction of coastal flood protection will necessitate the installation of pump stations to discharge stormwater into the Elizabeth River.

Drainage system upgrades and additional water storage areas aim to reduce the need for pumping and the number of pump stations needed.

3. **Phase 1a | Harbor Park and Railroad Gate:** As the levee transitions to a T-wall/L-wall structure at the Berkley Bridge Pump Station, the T-wall/L-wall extends eastward along the backside of the Harbor Park ballfield. This portion of Phase 1A will be located on private property currently under development. As part of the current development, the developer has sought to construct this portion of the flood protection system ahead of the USACE. As such, the developer is working directly with USACE and the City of Norfolk to construct this portion of the flood protection system on their site. This portion of the project is not part of this grant application and is shown in the attached exhibits as “Not in Scope.” No portion of the CFPF grant would be utilized for this portion of the Phase 1A system. The eastern edge of this private development terminates at the Norfolk Amtrak station. This is where the Phase 1A system would tie into the developer’s private flood protection system. At this location the flood protection system will cross the Amtrak rail line, and rail lines owned/operated by Norfolk Southern with a large at-rail flood gate crossing. This gate crossing will be a significant structure that leads to eastward to Newton’s Creek.

4. **Phase 1a | Newton’s Creek Closure:** Construction will continue with the creation of a tide gate and T-wall. A tide gate structure will be integrated into the coastal flood protection. It will restore ecological function to the wetlands and protect the site from tidal events.

5. **Phase 1a | Newton’s Creek Pump Station**: A pump station will be constructed in the project area. Upgrades to the subsurface drainage system as well as construction of coastal flood protection will necessitate the installation of pump stations to discharge stormwater into the Elizabeth River. Drainage system upgrades and additional water storage areas aim to reduce the need for pumping and the number of pump stations needed.

6. **Phase 1a | Newton’s Creek to Campostella:** This effort will include the construction of T-Walls and closures. T-Walls will be traditional concrete stem walls with pile supported bases. Gate closures are designed into a floodwall system where passage through the floodwall is needed during non-flooding periods. Typically gate closures are designed to accommodate automobile traffic where a floodwall is designed across a roadway. Gate closures can also be designed for pedestrian traffic. The gates are closed during flooding periods and so disruptions to traffic should be considered. The existing Norfolk floodwall utilizes gate closures and the closures envisioned for this study are likely to be similar in design and function.

Subject: City of Norfolk Coastal Storm Risk Management (CSRM) Project

Dear Dr. Filer,

The purpose of this letter is to provide you and your staff an update on the Corps of Engineers funding plan for the City of Norfolk CSRM Project. The project has a total estimate of approximately $1.78 billion and would be cost shared between the Corps and the City at percentages of 65% Federal, 35% Non-Federal.

We are in the third year of the Preconstruction Engineering and Design (PED) phase, with a budget of $8.3 million. The Federal share of 65% is fully funded by allocations we have received to date of $5.4 million. The non-Federal (City) share of the PED phase is approximately $2.9 million.

As you know for the Construction phase, the project received approval for $399.3 million of Infrastructure Investment and Jobs Act (IIJA) funding, in the FY 2022, IIJA Construction Work Plan, copy attached. Last month the project received an initial allocation of $100,000 from the IIJA funding to support the transition to the construction phase. Receipt of the initial funding amount is a prerequisite for entering into the Project Partnership Agreement (PPA) between the Corps and the City. One of the important next steps is to develop the PPA.

While we continue to await IIJA program guidance that would address procedures for additional funding allocations, we do expect the IIJA program will be treated as a supplemental program, with funds managed by our Headquarters and issued to the Norfolk District on an as-needed basis. In this regard my staff will continue to work with the City staff to develop an appropriate Federal – Non-Federal multi-year funding schedule that will match the City's financial capabilities. The Federal – Non-Federal funding schedule will be a supporting document to the PPA package.

Please refer questions regarding the Norfolk CSRM project to Mr. Walter Trinkala, Project Manager, at (757) 201-7715 or email Walter.a.Trinkala@usace.army.mil.

Sincerely,

Brian P. Hallberg

RE: City of Norfolk Resilience Plan Second Submission - CFPF

Dear Mr. Simons:

Thank you for providing an overview of your Resilience Plan, and informing DCR of the various plans that the City of Norfolk will be utilizing to fulfill the Resilience Plan submission requirements. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on August 8, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

   a. Project-based: Nine watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy divided into 15 project areas, each with discrete projects identified.

   b. Projects focused on flood control and resilience included city-wide and various coastal projects and a specific project in Chesterfield Heights.

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   a. Natural and nature-based flood management measures are identified for use in projects throughout the city in the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*, the *Combined Coastal and Precipitation Flooding Master Plan*, the *Hampton Roads Mitigation Plan* and *A Green Infrastructure Plan for Norfolk: Building Resilient Communities*.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**

    a. All parts of a locality: Locality divided into 9 watersheds, with 90 planning districts covering the entirety of the jurisdictional boundary.

    b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented in the USACE *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*, the *Combined Coastal and Precipitation Flooding Master Plan* and in *PlaNorfolk 2030*.

    c. Demographic Analysis: Demographic Analysis conducted by USACE, utilizing U.S. Census Bureau, Bureau of Labor and Statistics, Virginia Employment Commision, and other information from local planning agencies, and incorporated into the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**

    a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.

    b. Clearly articulated timeline or phasing for plan implementation: 5 year timeline presented in the *Combined Coastal and Precipitation Flooding Master Plan*. Phased time-line for completion found within *PlaNorfolk 2030, Vision2100*, and *A Green Infrastructure Plan for Norfolk: Building Resilient Communities*. Phased approach for project implementation contained within the Fugro Atlantic *Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*. Program phases clearly articulated and an impact statement completed in USACE *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**

    a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into the strategic approach presented in the *Hampton Roads Hazard Mitigation Plan,* the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

VA DCR looks forward to working with you as you work to make the City of Norfolk a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

Resilience Planning Overview for the City of Norfolk

In response to the resilience planning requirements of the **Community Flood Preparedness Fund** ("the CFPF" or "Fund") outlined within the 2021 CFPF Grant Manual (Appendix G: Elements of Resilience Plans), the City of Norfolk ("the City") has prepared the following Resilience Planning Overview of formal and relevant plans utilized for resilience planning efforts by the City to prioritize potential projects and to assist the City is its efforts to secure funding for such critical resilience plans, studies and projects.

The **Elements of Resilience Plans** taken from Appendix G of the 2021 CFPF Grant Manual, from which communities are expected to highlight the stated resilience planning contents as they related to CFPF grant applications, are as follows:

1. *It is project-based with projects focused on flood control and resilience.*
2. *It incorporates nature-based infrastructure to the maximum extent possible.*
3. *It includes considerations of all parts of a locality regardless of socioeconomics or race.*
4. *It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.*
5. *Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.*

Norfolk's resilience planning elements are not contained within an adopted "stand alone" plan. However, Norfolk's utilizes various plans within a resilience repertoire, which altogether serve multiple needs for various audiences; from technical to public-facing to operational. This Resilience Planning Overview will expressly identify to the grant reviewer, and to the public, how various resilience planning documents of the City of Norfolk satisfy all the CFPF Resilience Plan elements.

The following plans for the City of Norfolk will contribute to this Resilience Planning Overview:

- ***plaNorfolk2030*** (2013, as amended)
- ***Vision2100*** (2016)
- ***Hampton Roads Hazard Mitigation Plan*** (2017)
- ***Combined Coastal and Precipitation Flooding Master Plan*** (2017)
  - Appendix A: ***Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*** **(Fugro Atlantic)**
  - Appendix B: ***City-wide Drainage and Watershed Master Plan*** **(Timmons Group)**
- ***A Green Infrastructure Plan for Norfolk*** (2018, as amended)
- ***USACE Coastal Storm Risk Management (CSRM) Feasibility Study and Environmental Impact Statement*** (2019)
- ***Zoning Ordinance of the City of Norfolk*** (2018, as amended)
- ***Development of an Urban Resilience Analysis Framework with Application to Norfolk, VA*** (2016)

Responses are provided below in red based on the various Norfolk plans for the following example resilience elements outlined in Appendix G of the 2021 CFPF Grant Manual:

- ***Equity based strategic polices for local government-wide flood protection and prevention.***
  The ***Hampton Roads Hazard Mitigation Plan*** recommends the highest priority of protection to be reserved towards protection projects for severe repetitive loss areas (Mitigation Actions 8 &

11) in Norfolk. Research in Norfolk has shown that these areas are often places where the most vulnerable residents are housed.

Additionally, Mitigation Action 12 recommends Norfolk begin risk/hazard mitigation efforts equitably by first implementing a major flood control project within the historically black community of Chesterfield Heights; implementation of a $112M HUD project awarded through the National Disaster Resilience Competition (construction currently underway).

- **Proposed projects that enables communities to adapt to and thrive through natural or human hazards.**
  The ***Combined Coastal and Precipitation Flooding Master Plan*** (Norfolk's "Flooding Master Plan") is based on a major multi-year study effort supported by technical analyses and recommendations from Fugro Atlantic within the ***Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*** (the "Fugro report"). The Flooding Master Plan is also supporting by a thorough analysis and priority ranking technical guide of the City's drainage conveyance system, ***City-wide Drainage and Watershed Master Plan*** by Timmons Group.

  Together, with this technical supporting documentation, the Flooding Master Plan provides the framework for Norfolk to intelligently review and prioritize flood protections project to enable Norfolk to adapt and thrive to current and future flood threats.

- **Documentation of existing social, economic, natural, and other conditions present in the local government.**
  Sandia National Laboratories provided an analysis framework (***Development of an Urban Resilience Analysis Framework with Application to Norfolk, VA)*** for conceptualizing the resilience needs for Norfolk, including vulnerability assessments for critical infrastructure with the context of local economic and logistical impacts. The findings of which have been incorporated into other resiliency plans such as the USACE Coastal Storm Risk Management Study.

  The ***USACE Coastal Storm Risk Management*** (CSRM) ***Feasibility Study and Environmental Impact Statement*** presents a robust analysis of the best recommendations for City-wide flood protection measures for the City of Norfolk. This report includes 10% engineered designs for the various flood protection measures recommended throughout the entire community, and a preliminary Environmental Impact Statement is included outlining the existing social, economic, natural conditions, vulnerabilities and stressors within the natural and social environment, as well as proposed impacts. See the various CSRM appendices for these detailed conditions and impact reports.

- **Review of the vulnerabilities and stressors, both natural and social in the local government.**
  See CSRM comment above. Additional overview of the vulnerabilities and stressors can be found in the ***Hampton Roads Hazard Mitigation Plan***.

- **Forward-looking goals, actionable strategies, and priorities through as seen through an equity-based lens.**
  Norfolk remains committed to presenting all action plans through an equity-based lens, as found within the actionable strategies of ***A Green Infrastructure Plan for Norfolk*** and the ***Hampton Roads Hazard Mitigation Plan***. Both plans are tactical, and recommendation are based on a 5-year forward-looking outlay. Recommendations of the Fugro report are based on a 50-year outlay, and recommendations of ***Vision2100*** geared towards the year 2100.

- **Strategies that guides growth and development away from high-risk locations that may include strategies in comprehensive plans or other land use plans or ordinances or other studies, plans or strategies adopted by a local government.**
  Vision2100 is serves a land use guide for the City. The plan divides Norfolk up into four main areas by which the City will focus new investments and make necessary steps to prepare for a changing environment:
  - ✓ Purple: Low Flood Risk / Low Degree of Civic Assets: Establishing Neighborhoods of the Future
  - ✓ Green: Low Flood Risk / High Degree of Civic Assets: Designing New Urban Centers
  - ✓ Yellow: High Flood Risk / Low Degree of Civic Assets: Adapting to Rising Waters
  - ✓ Red: High Flood Risk / High Degree of Civic Assets: Enhancing Economic Engines (protect!)

- **Proposed acquisition of land or conservation easements or identification of areas suitable for conservation particularly areas identified as having high flood attenuation benefit by *ConserveVirginia* or similar data driven tools.**
  Vision2100 provides the framework for selecting the areas suitable for conservation easements. The ***Norfolk Zoning Ordinance*** provides the mechanism for purchasing land conservation easement credits from the Coastal Resilience Overlay through transferring Resilient Quotient points to the Upland Resilience Overlay (requires extinguishment of a density unit – developable dwelling unit). The conservation easement, while recorded on the deed and kept on file with the Planning Department, can be held by the property owner, the Zoning Ordinance also permits it to be placed in a land trust.

- **Identification of areas suitable for property buyouts in frequently flooded areas.**
  See ***Vision2100*** "Yellow" areas (High Flood Risk / Low Degree of Civic Assets: Adapting to Rising Waters) and Coastal Resilient Overlay areas on the Norfolk Zoning Map.

- **Identification of critical facilities and their vulnerability throughout the local government such as water and sewer or other types identified as "lifelines" by FEMA.**
  A list of all critical facilities is contained within the *Norfolk Emergency Operations Manual* (2020). See Mitigation Action 5 from ***Hampton Roads Hazard Mitigation Plan***: "Purchase and install generators or other continuous power sources for critical facilities and infrastructure. This action may include, but is not limited to pump stations, EOC (Emergency Operations Center), shelters, underpasses and important traffic signals." The critical facilities list is available upon request.

- **Identified ecosystems/wetlands/floodplains suitable for permanent protection.**
  See ***A Green Infrastructure Plan for Norfolk***, this includes an *Action Plan Appendix for Threatened and Endangered Species* within critical floodplain habitats, as well as a detailed ecological inventory with recommendations for floodplain protection measures within an connected open space corridor network.

- **Identified incentives for restoring riparian and wetland vegetation.**
  - The City's Public Works Division of Stormwater Management offers the **Stormwater Fee Reduction Program** for homeowners and businesses who opt to implement water quality improvements on their private property including riparian buffer and shoreline management improvement.
  - **Environmental Conservation Consulting** – Norfolk annually funds a contract to coordinate with residential property owners for implementation of water quality improvements on their private property including riparian buffer and shoreline management improvement through a cost-share program. Property owners get a percentage of the project paid through the contractor via the Environmental Conservation Consulting services contract.
  - Norfolk regularly applies for grants to partner with community organizations for implementation of green infrastructure of public lands – projects are reviewed by the **Watershed Management Task Force** to ensure that projects are furthering the goals and objectives of the adopted ***Green Infrastructure Plan for Norfolk***.

- **A framework for implementation, capacity building and community engagement.**
  The **Watershed Management Task Force** and the recently created Program for Public Information committee are two groups made up of joint staff/citizen/technical expert members, which collectively drive the City's ongoing programing for green infrastructure projects and flood mitigation messaging. Capital Improvement Project funding recommendations from the ***Green Infrastructure Plan for Norfolk*** are also reviewed monthly by the Watershed Management Task Force.

- **Strategies for creating knowledgeable, inclusive community leaders and networks.**
  The 12-member Norfolk Coastal Management Review Board (CMRB) provides recommendations to the 7-member Erosion Advisory Commission, which is partially comprised of members of the CMRB. The CMRB is made up of elected leaders, civic league presidents/community leaders and technical experts from the Virginia Institute of Marine Science, Virginia Marine Resources Commission, Army Corp of Engineers, Old Dominion University Department of Ocean, Earth and Atmospheric Sciences, and city technical staff, providing workshops, seminars and project assessments of coastal mitigation and erosion projects; specifically intended to build grassroots technical capabilities and citizen champions within the community. The Norfolk CMRB and Erosion Advisory Commission is established by City Code and guided by the City's adopted Sand Management Plan.

- **A community dam safety inventory and risk assessment posed by the location and condition of dams.**
  Not applicable in Norfolk – not at dam risk.

- **A characterization of the community including population, economics, cultural and historic resources, dependence on the built environment and infrastructure and the risks posed to such infrastructure and characteristics by flooding from climate change, sea level rise, tidal events or storm surges or other weather.**

  This general characterization is well documented within the general/comprehensive plan for the City of Norfolk – ***plaNorfolk2030***. This includes dozens of resiliency recommendations for flood risk reduction and communication.

- **Strategies to address other natural hazards that would cause, affect or result from flooding events including:**
  - **Earthquakes.**
  - **Storage of hazardous materials**
  - **Landslides/mud/debris flow/rock falls.**
  - **Prevention of wildfires that would result in denuded lands making flooding, mudslides or similar events more likely.**
  - **Preparations for severe weather events including tropical storms or other severe storms, including winter storms.**

  The ***Hampton Roads Hazard Mitigation Plan*** is a FEMA-accredited all-hazards plan.

To whom it may concern,

Attached is a Community Flood Preparedness Fund Round 3 grant request for **$28,127,975** to support the first phase of a $1.8B Coastal Storm Risk Management flood protection project in partnership with the City of Norfolk and U.S. Army Corps of Engineers.

Let me know if you have any questions about the application.

Thank you.

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☑ Wetland restoration.

☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☑ Living shorelines and vegetated buffers.

☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☑ Stream bank restoration or stabilization.

☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.
☐

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**City of Norfolk**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	
Project Eligible for Consideration		**☑ Yes** **☐ No**

Applicant Name:	**City of Norfolk**		
Scoring Information			
Criterion		**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)			
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.			
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.		**50**	
☑ Wetland restoration, floodplain restoration ☑ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☑ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.		**45**	**45**
1.b. any other nature-based approach		**40**	
All hybrid approaches whose end result is a nature-based solution		**35**	
All other projects		**25**	
7. Is the project area socially vulnerable? (**Based on [ADAPT VA's Social Vulnerability Index Score.)](#)**			
Very High Social Vulnerability (More than 1.5)		**15**	**15**
High Social Vulnerability (1.0 to 1.5)		**12**	
Moderate Social Vulnerability (0.0 to 1.0)		**8**	
Low Social Vulnerability (-1.0 to 0.0)		**0**	
Very Low Social Vulnerability (Less than -1.0)		**0**	

8. Is the proposed project part of an effort to join or remedy the community’s probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide “community scale” benefits?		
Yes	**20**	
No	**0**	0
Total Points		**75**

Riverside Memorial Cemetery Shoreline Stabilization

Scope of Work and Budget Narratives

Project Information

The City of Norfolk seeks support for stabilization and restoration of a highly eroded bank and shoreline along the Riverside Memorial Cemetery in the Campostella-Berkley area of Norfolk, Virginia (Figure 1). The cemetery was established by a private company in 1910 and purchased by the City of Norfolk in 1971. It has a long history of use by residents of the surrounding community. Early in its history, a monument company was also operated at the cemetery and many ornate statues and monuments can be seen around the cemetery, including the Langley Angel. With elevations up to 15 foot NAVD, Riverside Memorial Cemetery has some of the highest ground elevations in Hampton Roads and during World War II a lookout tower was established at the site to monitor activity along the Elizabeth River. The unnamed creek on the eastern side of the cemetery, hereafter identified as Campostella Creek, was historically a large wetland complex with small creeks draining areas deeper in Campostella-Berkley. The angle of the creek's mouth creates a naturally protected harbor and the adjacent Eastern Branch of the Elizabeth River grew into a major industrial/commercial hub or the region, so over time the wetlands were dredged to create deeper water for industrial activity such as boat building and repair. 1937 aerial imagery (Figure 2) shows approximately half of the current creek having been dredged, with areas closer to the cemetery and further south into the headwaters still retaining wide swaths of wetlands. Further dredging, marine industrial activity, and wind-driven waves from the expanded creek mouth resulted in further loss of wetlands and eventually of the bank up to the cemetery over the following decades. In recent years detailed review of the site in hopes of restoring the shoreline revealed how badly many areas along the bank had eroded, with some vertical or even undercut, threatening numerous graves in the cemetery above.

The 44 acre cemetery is an important community asset to Norfolk and particularly to the surrounding neighborhoods of Campostella-Berkley. Campostella Creek drains south through Campostella and drains a 78 acre watershed that includes residential neighborhoods, an elementary school, several recreation centers, numerous industrial sites, and upcoming mixed used developments aimed at revitalizing the area, such as Sycamore Plaza near the headwater of the creek. The community within the watershed, completely within US Census Tract 51, is an at-risk community with very high social vulnerability (SVI Score = 2.4). Norfolk overall is a low-income community compared to the rest of the state, with a city-wide median household income of $53,253 versus a state-wide median household income of $76,448, and median household income in the project area is far lower at $28,671. The community is also noted to be at high risk for exposure to potential hazardous or toxic materials (Exposure Score = 1.3) and restoration of wetlands in the creek may help to filter pollutants for both community and environmental health.

To address the severe erosion of the cemetery bank and restore the wetland shoreline lost over time, Norfolk proposes to utilize primarily nature-based solutions such as living shoreline techniques, bank fill and grading, green block technology, and planted armored matting. Very limited grey techniques such as rock revetment may be required on several stretches of bank, but the project is projected to be over 95% nature-based solutions. Over 1500 linear feet of shoreline will be stabilized and nearly an acre of historical wetland restored, with front edge protection and sloped design to help protect it from adjacent

Figure 1- Project Area Map

Figure 2- 1937 Aerial Photo of Project Area

impacts. The combined effort will protect and enhance a valuable community asset, provide coastal erosion protection into the future, enhance both aesthetics and wildlife habitat, and improve water quality of a creek through the Campostella neighborhood and the Elizabeth River as a whole with an estimated reduction of hundreds of pounds per year of nitrogen and sediment, as well as thousands of pounds of fine sediments. Restored marshes will also help to slow and absorb tidal flood water forced into the narrow creek during major storm events.

Need for Assistance:

While Norfolk is one of the most populated cities in Virginia and a major hub for commerce, military facilities, and other services, much of its population faces severe economic hardship. Compared to Virginia as a whole, Norfolk is a low-income community, with median household income less than 80% of the statewide metric. The city has an average Social Vulnerability Index score of 0.59, ranking it as having Moderate Social Vulnerability as a whole, however many of the densest population areas are concentrated in 25 census tracts listed as having High or Very High Social Vulnerability, including Census Tract 51 in which the proposed project is located. Attached documents provide additional community demographic, economic, and vulnerability information for Census Tract 51 (Appendix D).

While the City of Norfolk manages a robust budget, including a fee to address operation and maintenance of its stormwater system, the combined impacts of climate change and aging infrastructure are placing stress on the City’s ability to address all high priority needs in a timely manner. City departments regularly seek grant and loan support to increase the amount of work accomplished at any given time, leveraging Capital Improvement Funds as matching funds and professional engineers, project managers, scientists, and other staff to manage projects and outside funding sources. As a major city within Virginia, Norfolk’s staff have all necessary resources to move projects to completion, with a heightened focus for any awarded grants and loans to stay on budget and schedule.

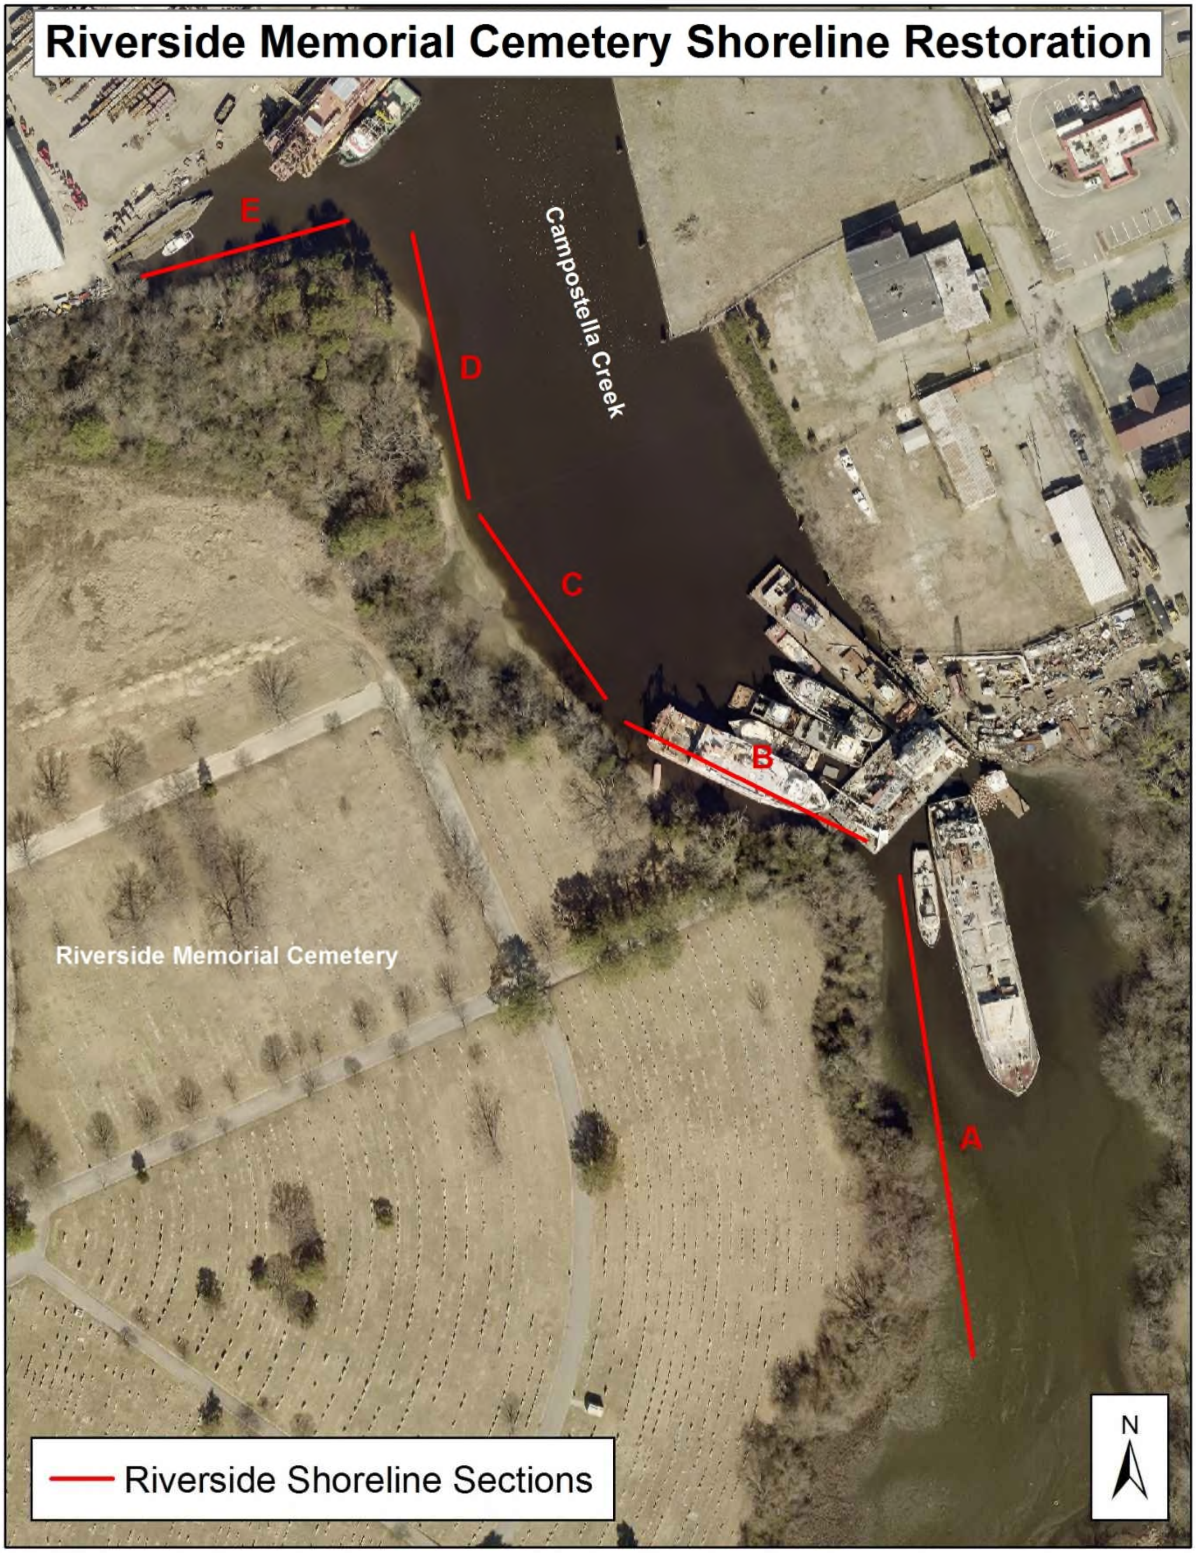
Goals and Objectives:

Norfolk proposes to stabilize the eroding bank at Riverside Memorial Cemetery with various approaches depending on severity of slope and to restore the tidal marsh with a hybrid living shoreline to reduce tidal impacts. These actions will mitigate the immediate risk to the cemetery and provide resilience into the future, while also absorbing flood waters as they move into the creek during large storm events. The project would also provide valuable water quality and wildlife habit improvements in the Campostella Creek and the Eastern Branch of the Elizabeth River. Based off a 30% design, survey, and environmental assessment of the site (see attachments in Appendix D) and follow-up discussions including changes to the 30% design, the project can be broken into seven sections (Figure 3) based off bank height and slope, which averages 10’ in height and ranges from 16% to 400% in slope. Table 1 provides shoreline length and average height for each section.

Table 1 – Project Shoreline Section

Shoreline Section	Section Length (ft)	Average Bank Height (ft)
A	500	10
B	400	10
C	275	9
D	180	9
E	170	8

Figure 3- Project Sections



Section A faces southeast, is exposed to little fetch, and is the furthest from major industrial activities. 1937 aerial photos (Figure 2 above) indicate this area had a stable vegetated slope and wide salt marsh at the time. A low riprap or oyster block sill will be constructed between 25 to 40 feet from the toe of slope as a channelward sill, followed by sand fill to raise elevation above the mudflat allowing replanting of low and high marsh species. Sand fill will raise elevation at the toe of slope and the bank will be further stabilized using green wall technologies such as Envirolok vegetated geobags. Inclusion of vegetated geobags rather than planted pavers was a modification from the 30% design to incorporate greater green alternatives. As the shoreline turns north towards Section B, the offshore sill will become larger and bank stabilization will transition to a more hardened structural approach, such as Flexmat vegetated pavers.

Section B faces east to northeast. This portion of the cemetery bank sit closest to the channel of Campostella Creek and is exposed to a moderate fetch from the north. Heavy marine industrial activity is common in the channel from facilities on the opposite side of the creek. Very little vegetated wetlands or mudflats remain across much of this section and historical aerials indicate it had been heavily dredged close to shore by the late 1930s. Two of the most critical slopes along the entire site are found here, nearly vertical with ongoing undercutting and top of bank erosion. Improvements to this section will include a high nearshore riprap sill or revetment, with limited marsh restoration behind the portion closest to the channel to minimize narrowing of the creek at this point. To reduce future impacts on the bank, a more solid structural protection such as Flexamat will be used. Soil fill at top of bank will be required in several areas to provide further protection for threatened gravesites. Where tree removal is necessary to accomplish this, additional plantings will be called for to restore the vegetated buffering and ensure continued tranquility at the cemetery. As the shoreline turns to face north as it meets Section C, the marsh will be widened and bank stabilization will be softened.

Section C faces northeast to east. Despite some dredging of the creek by the late 1930s, historical aerial photos show a 200’ wide salt marsh. Although a significant mudflat remains, erosion from a fetch to the north, heavy marine industrial activity, and a stormwater flume outfall have caused loss of most vegetated wetlands. A large marsh, over 100 feet deep at its widest point from toe of slope, will be re-established through this section of shoreline. The width will allow a large high marsh to be restored closer to the slope, ensuring a long life for the system in the face of sea level rise. A low riprap or oyster block sill will be used to secure the channelward edge. A concrete flume in the center of this section currently serves as an outfall for precipitation runoff for a large portion of the cemetery. Over time the bank surrounding and at the end of this flume has eroded back. Fill will be used to extend the bank and re-establish the slope in this area, then a manhole and pipe will be used to direct water from the road above. A riprap channel will protect the marsh below from runoff. To either side of the outfall, existing slopes are relatively stable and no improvements are expected once sand fill for the marsh raises the toe elevation. As Section C transitions to Sections B and D to either side, requirements for both sill height and slope stabilization will increase.

Section D face east and is subject to wind driven waves from the mouth of the creek and to marine industrial impacts from adjacent properties. Historical aerials show an extensive marsh, similar to Section C; however, the creek has been widened significantly in this section over time and less mudflat or vegetated wetlands remain. The bank is generally more stable through this section, with a forested slope above a lower eroding toe. To protect from wind and boat driven waves, a larger riprap sill will be utilized through this section, with a 20 to 30 foot wide marsh restored behind. Sand fill will tie into a structural slope stabilization such as Flexamat or Envirolok. As the shoreline turns to face north towards Section E, the restored shoreline will narrow and slope protection will transition to heavier Flexamat or riprap revetment.

Section E faces north into a narrow, 100 foot wide side channel, where heavy marine industrial activity is common. Like Section D, this portion of the creek has been heavily modified since the 1930s. A forested slope sits above a heavily eroding and undercut toe. Small pockets of wetlands and mudflat remain. Due to the narrow, heavily used channel riprap revetment or heavy Flexamat will be used to stabilize the toe of slope. A small area of wetland restoration may be possible in the western corner at the end of the creek, but otherwise marsh planting will be limited along this section.

Across the entire site, tree and understory planting will be utilized wherever possible on restored slopes to provide long-term stabilization and greening of the site. Along the offshore sill, piles will be driven as needed or required by permit to mark the location of these hard structures for marine industrial operators and recreational boaters. Where possible or required by permit, any existing marsh or shellfish habitat will be protected or incorporated into the project design.

Approach, Milestones, and Deliverables:

The design for the proposed improvements is underway and expected to be complete by end of 2022, with permit approval potentially extending into early 2023 depending on interagency coordination. The City hopes to issue requests for bids in spring 2023, allowing for the project to begin construction by fall of 2023. No major obstacles are expected for construction, but work may be required from both land and water, so construction could extend over several years across the various sections of the project. Although material and supplies continue to have longer-than-usual lead times under current economic conditions, the City anticipates the project could be fully completed within the required 36 months from signing of agreement, regardless of any delays. Table 2 below provides a summary of the proposed schedule and milestones.

Table 2 - Project Schedule and Milestones

Date	Milestone Activity
March 2023	Project Fully Designed, Approved, and Permitted
May 2023	Request for Bids Initiated
August 2023	Bids Reviewed and Contract Process Initiated
November 2023	Notice to Proceed Issued
September 2025	Construction Complete

The project is being managed through the Department of Public Works- Division of Environmental Storm Water Management. Hazen and Sawyer, an on-call engineering consultant for the City is designing the project and will be retained for construction management assistance. In addition to Norfolk Storm Water staff and consultants, study team members would include Norfolk staff from the Department of Recreation, Parks, and Open Space, the Department of Planning, and the Office of Resilience. Coordination will be conducted with adjacent property owners regarding any necessary modifications to ensure industrial activities can continue in a reasonable manner. Proposed internal team members are noted in Table 3 below and additional consultants, outside team members or interviewees would be sought as needed.

Seamus McCarthy, CFM	Environmental Services Manager	Planning
Kyle Spencer	Chief Resilience Officer (Acting)	Resilience

Relationship to Other Projects:

Stabilization and restoration of shorelines are major components of both water quality and resilience efforts in Norfolk. Norfolk has seen significant fill, dredging, and armoring of coastal areas through time, with many of these efforts resulting in eroding shoreline. Reconnection of floodplains, restoration of wetlands and other aquatic habitats, and modifications to address current and future tidal impacts are often possible in these deteriorated areas, allowing for nature-based solutions rather than repeat of past mistakes. The multiple benefits of these solutions reduce flooding and erosion, improve water quality, enhance wildlife habitat, and provide recreation and aesthetic amenities.

Norfolk has been successful in offsetting City funds with grants, loans, and partnerships to support shoreline restoration efforts. Funders and partners for past and ongoing projects include Virginia Department of Environmental Quality, National Fish and Wildlife Foundation, US Army Corps of Engineers, Chesapeake Bay Foundation, Elizabeth River Project, and many others. Norfolk has a strong history of completing large grant and loan supported projects within both budget and schedule. While material, labor, or weather delays do occur, by initiating design and permitting ahead and applications for this support, Norfolk provides more time for potential construction delays within the timeframe of a given grant or loan.

Maintenance Plan:

The City of Norfolk – Division of Environmental Storm Water Management maintains three full time crews dedicated to maintenance of best management practices, ditches, and shorelines. Crew members are trained in use of equipment and techniques to manage vegetation, grading, and hard structures. City engineers and inspectors monitor all shoreline projects annually and a PM program requires routine or identified maintenance quarterly. Additional monitoring will be provided at this location by Department of Parks and Recreation- Division of Cemeteries staff, to ensure the long-term protection of grave sites. Storm Water fees that fund the Division’s operating budget and Capital Improvement Program will be used as necessary to ensure successful operation and maintenance of the facility well into the future.

Criteria:

1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?

The City of Norfolk is an independent city in the Commonwealth of Virginia.

2. Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?

The City of Norfolk submitted a Resilience Plan package in July 2021 and received approval of the plan from Virginia Department of Conservation and Recreation on August 11, 2021. An overview with relevant links is attached.

3. For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?

The City of Norfolk is an independent city in the Commonwealth of Virginia.

4. Has the applicant provided evidence of an ability to provide the required match funds?

Match funds for the proposed project are in a currently approved Capital Improvement Plan. An attached Transmittal Form signed by Norfolk's City Manager identifies specific budget accounts and approval to apply funds towards grant match.

5. Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?

The project will help to stabilize a high bank and wetland complex eroded over time through coastal and anthropogenic causes. Restored wetlands will also act as a buffer by absorbing tidal waters moving further into the community during major storm events. Resilience of both the Riverside Memorial Cemetery and Campostella community overall will be enhanced.

Budget Narrative:

The City of Norfolk seeks 80% grant funding to support the proposed shoreline restoration and bank stabilization at Riverside Memorial Cemetery. A recently updated opinion of probable cost of construction (OPCC), completed by design consultants Hazen & Sawyer after review of the 30% design phase, estimates the construction to cost $1,900,000. This includes a 30% contingency to address unexpected changes during the remainder of design and increasing costs of construction due to nationwide economic conditions. This cost will fund all necessary materials, supplies, and labor for a qualified contractor to construct the project after a competitive bid process. The City proposes to fund their 20% match of $380,000 through Storm Water Capital Improvement Program funds for water quality improvements. Design costs are encumbered through existing budget, so all match funding will go towards contracted work, along with the requested $1,900,000 in grant funds. Table 3 shows the consultant supplied OPCC. In addition to the direct funding as included match, Norfolk also commits to managing all remaining or necessary aspects of design, permitting, project management, and public outreach using existing qualified staff. No grant funds are sought for this nor match applied, leaving funds fully available for contracted construction work. Funds proposed as match are authorized through existing approved or upcoming proposed budgets and verified on the attached, signed City Manager Transmittal Form outlining grant and match funds for all Norfolk applications to the current Community Flood Preparedness Fund grant cycle. Upon award of grant funds, the City sets up a special revenue account that includes approved match funds and cash funds to cover awarded grant funding until reimbursement is received, allowing Norfolk to move projects forward without delays for reimbursement requests.

RESPONSIBLE LAND DISTURBER (RLD) DESIGNATION

THE FOLLOWING PERSON KERRY BRAY (PRINT), ______ (SIGN), IS IDENTIFIED AS THE RESPONSIBLE LAND DISTURBER WHO WILL BE IN CHARGE OF AND RESPONSIBLE FOR CARRYING OUT THE LAND DISTURBING ACTIVITY. THIS PERSON MEETS THE APPLICABLE REQUIREMENTS OF VIRGINIA CODE SECTION 10.1–563 AND 10.1–566 BY VIRTUE OF THE FOLLOWING (CHECK THE CATEGORY THAT APPLIES):

______ RESPONSIBLE LAND DISTURBER CERTIFICATE

______ DCR CERTIFICATION FOR COMBINED ADMINISTRATOR, ADMINISTRATOR, PLAN REVIEWER, INSPECTOR, OR CONTRACTOR

__X__ VA PROFESSIONAL ENGINEER, LAND SURVEYOR, LANDSCAPE ARCHITECT, OR ARCHITECT

RLD CONTACT INFORMATION

NAME: KERRY BRAY

CERTIFICATION/REGISTRATION NUMBER: 53228

COMPANY: HAZEN AND SAWYER

MAILING ADDRESS: 4500 MAIN STREET, SUITE 500, VIRGINIA BEACH, VA 23462

TELEPHONE: (919) 863-9267 FAX: ______

EMAIL: KBRAY@HAZENANDSAWYER.COM

THIS DESIGNATION MAY ONLY BE CHANGED BY A PLAN COVER SHEET REVISION THAT MUST BE SUBMITTED TO THE CITY FOR VERIFICATION AND APPROVAL.

UPON AWARD OF THE CONTRACT AND BEFORE ANY LAND DISTURBING ACTIVITY CAN BEGIN, THE CONTRACTOR SHALL EXECUTE AND SUBMIT A RESPONSIBLE LAND DISTURBER NOTIFICATION FORM TO THE DEPARTMENT OF PLANNING, ENVIRONMENTAL SERVICES, ROOM 508, CITY HALL BUILDING, 810 UNION STREET, NORFOLK, VA 23510 TEL: (757) 664–4368. AWARD OF THE CONTRACT WILL RELIEVE THE ABOVE SIGNER OF ALL RESPONSIBILITY.

SITE DATA:

THIS PROJECT IS LOCATED ON CITY PROPERTY ALONG WATERS OF A TRIBUTARY TO THE ELIZABETH RIVER.

PROPERTY ADDRESSES:
1000 E INDIAN RIVER ROAD
NORFOLK, VA 23523
CITY OF NORFOLK: GPIN# 1437608648 & 1437613201

EXISTING LAND USE:
ZONING: OSP: OPEN SPACE AND PRESERVATION
DISTRICT: OPEN SPACE AND PRESERVATION
RIVER BASIN: ELIZABETH RIVER
FLOOD ZONE: AE

PROTECTED SHORELINE	TBD LINEAR FEET
RESTORED SHORELINE	TBD LINEAR FEET
CREATED TIDAL WETLANDS	TBD ACRES

THIS PROPERTY IS LOCATED WITHIN A CITY OF NORFOLK CBPA DESIGNATED INTENSELY DEVELOPED AREA (IDA).

THIS PROJECT LIES WITHIN THE COASTAL RESILIENCE OVERLAY.

LAND DISTURBANCE:

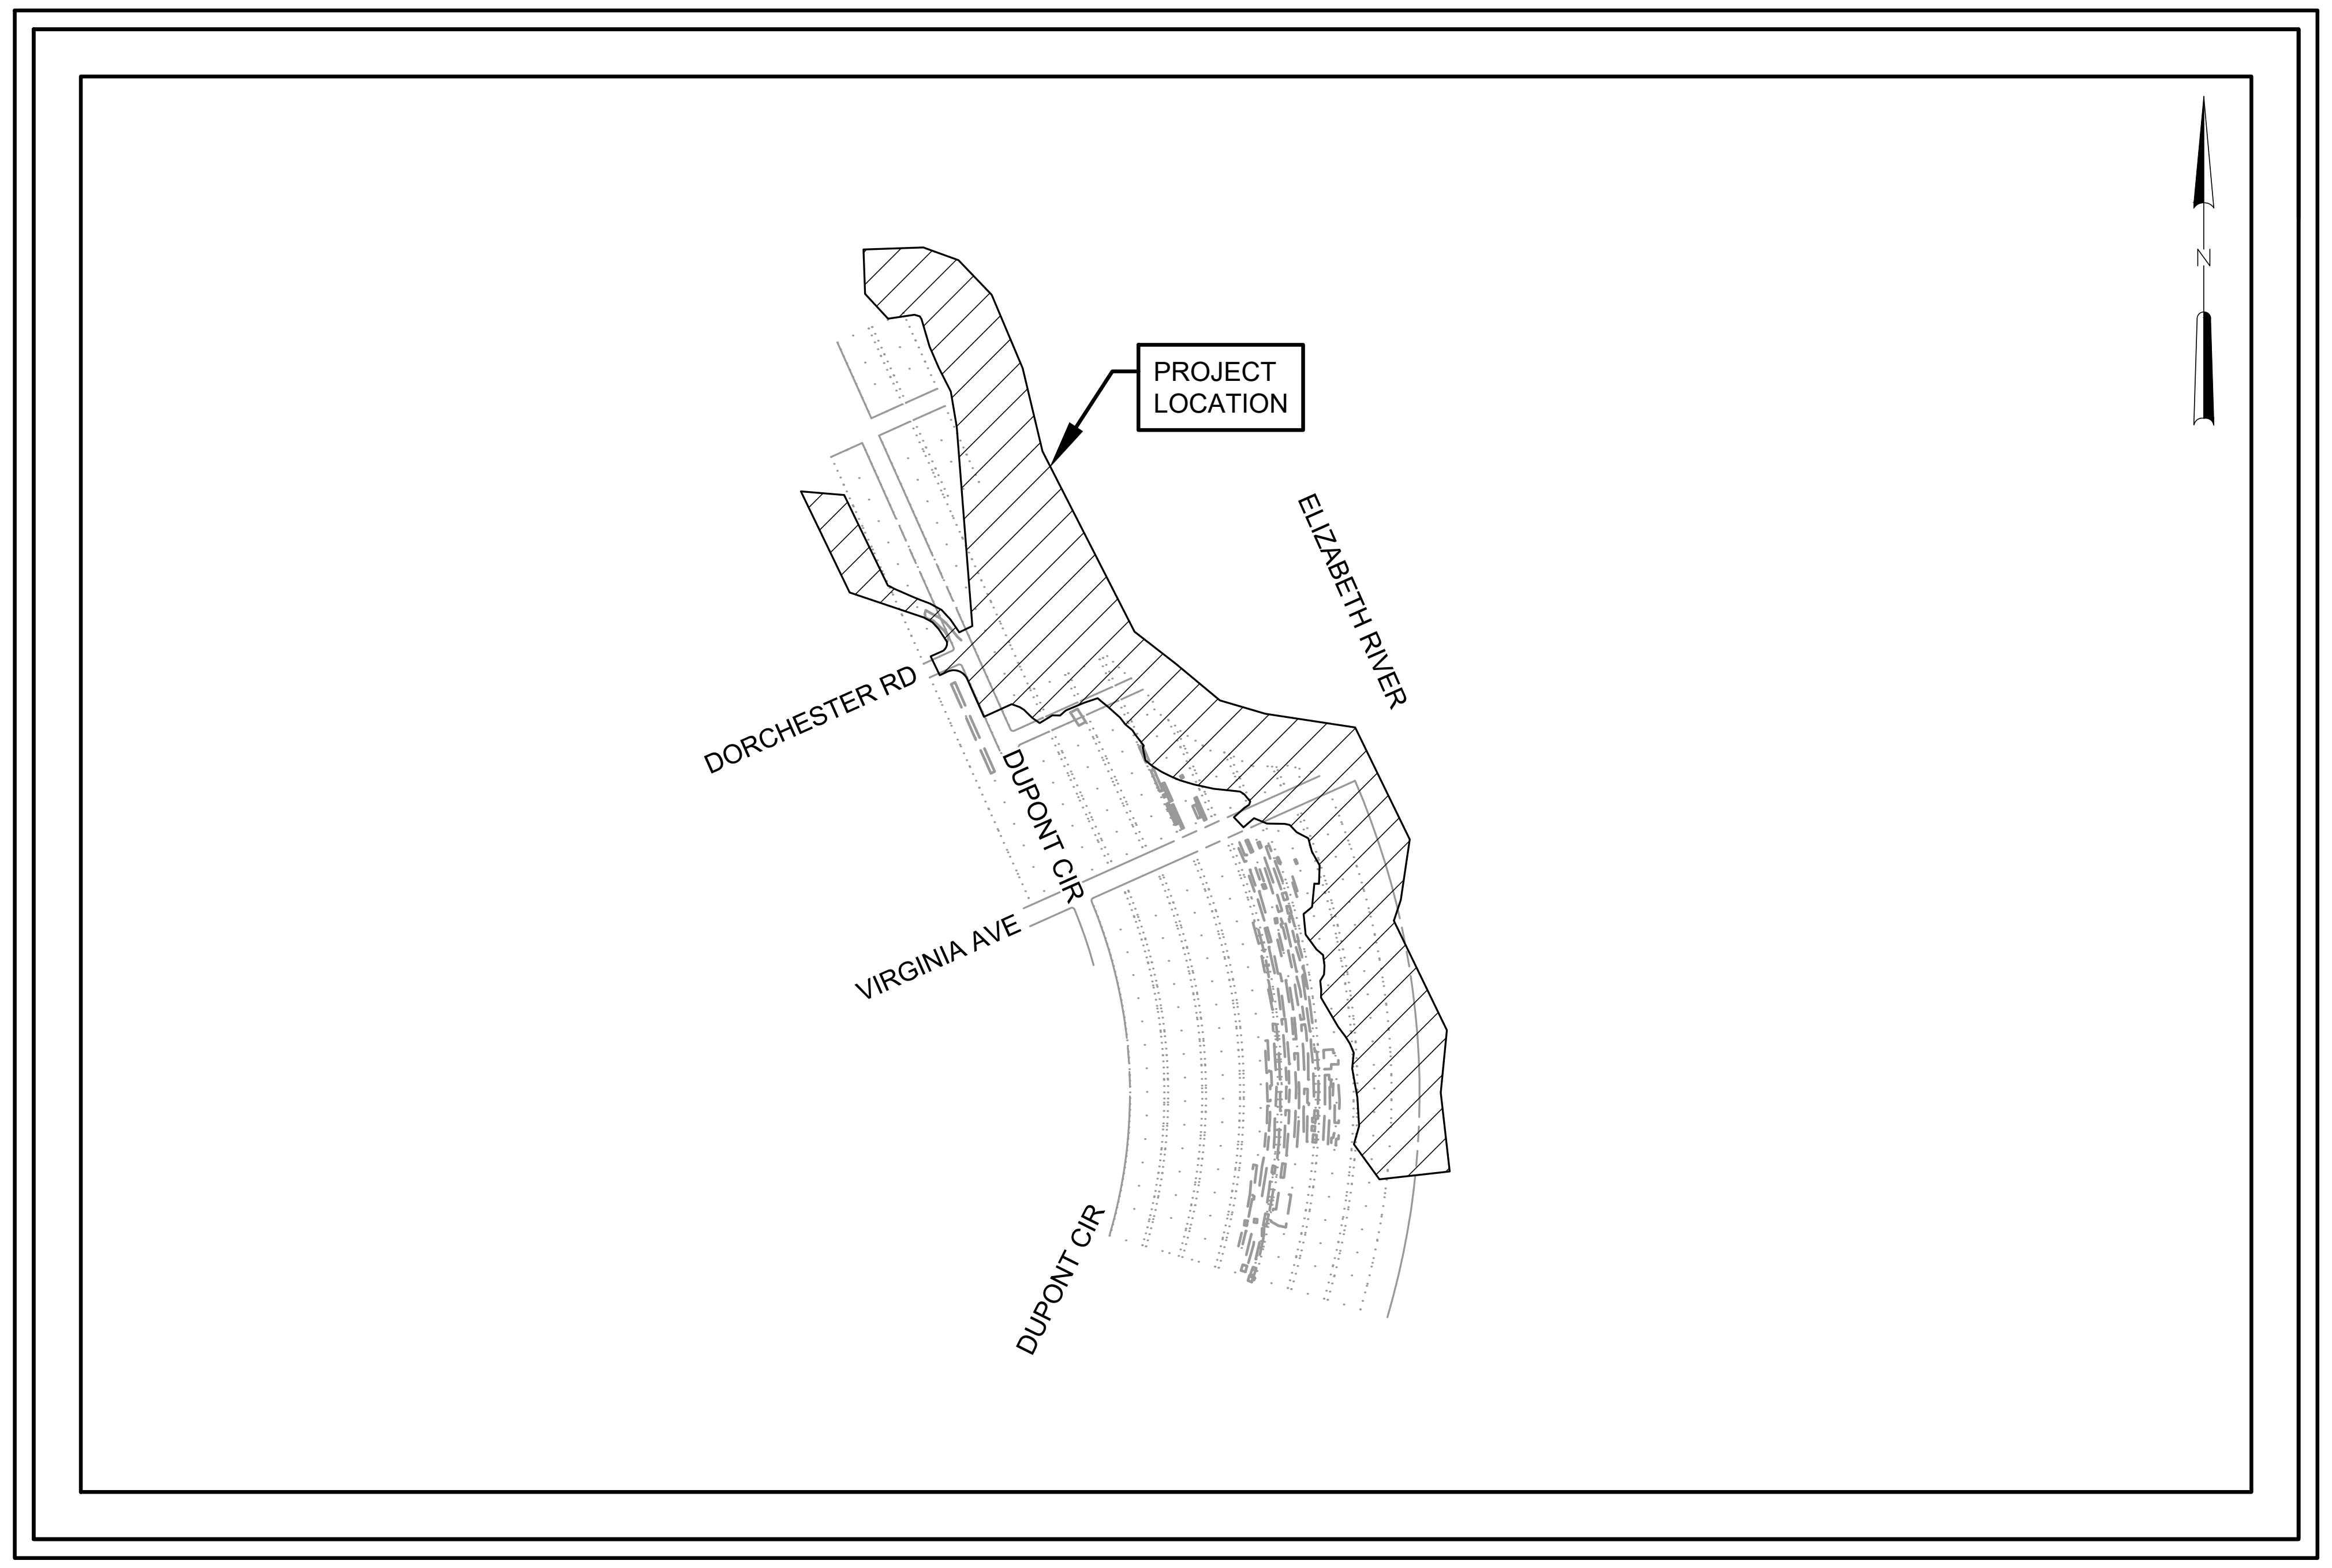
OWNERSHIP OF IMPROVEMENT	CITY OF NORFOLK
TYPE OF IMPROVEMENT	SHORELINE RESTORATION
EXISTING IMPERVIOUS COVER	0.06 ACRES
PROPOSED IMPERVIOUS COVER	0.06 ACRES
LIMITS OF DISTURBANCE	3.05 ACRES

GENERAL NOTE:

1. THE CONTRACTOR SHALL CONTACT THE CITY OF NORFOLK, BUREAU OF ENVIRONMENTAL SERVICES. 664-4368, AT LEAST 48 HOURS PRIOR TO ANY LAND DISTURBING ACTIVITY SO THAT LAND DISTURBING PERMIT CAN BE ISSUED AND A PRE-CONSTRUCTION CONFERENCE SCHEDULED.

RECORD DRAWING AND CERTIFICATION NOTE:

1. THE STORMWATER MANAGEMENT/BMP FACILITY AND ASSOCIATED STORMWATER CONVEYANCE SYSTEM(S) AS PROPOSED FOR THIS PROJECT WILL REQUIRE THE SUBMISSION, REVIEW AND APPROVAL OF A RECORD DRAWING (AS-BUILT) AND CONSTRUCTION CERTIFICATION PRIOR TO RELEASE OF THE CO. RECORD DRAWING AND CONSTRUCTION CERTIFICATION IS REQUIRED TO BE RECORDED AND CHECKED BY A LICENSED SURVEYOR.



PROJECT AREA
SCALE 1" = 200'

STORMWATER NOTE:

1. CONTRACTOR TO CONTACT ENVIRONMENTAL STORM WATER MANAGEMENT AT 823-4089 (48-HOUR NOTICE) FOR PRE-CONSTRUCTION CONFERENCE AND INSPECTION REQUIREMENT WHEN A BMP IS PROPOSED AND/OR TIE-IN TO CITY STORM DRAIN SYSTEM.

TOLERANCE NOTES:

1. ALL STORM DRAINAGE SHALL BE INSTALLED WITHIN 0.10' (ONE TENTH OF ONE FOOT) OF THE ELEVATION SHOWN ON THE PLAN, OR AS SPECIFIED IN WRITING BY THE CITY.
2. MINIMUM STORM SEWER SLOPE SPECIFIED ON THE PLAN ARE ABSOLUTE MINIMUM. LESSER SLOPE WILL NOT BE ACCEPTED UNLESS IN WRITING BY THE CITY.
3. CONTRACTOR TO BE RESPONSIBLE FOR ALL CORRECTION COST (I.E. PLAN REVISION, PHYSICAL CORRECTION, ETC.) REQUIRED AS A RESULT OF INSTALLATION NOT MEETING THE TOLERANCE REQUIREMENT.
4. LAND DISTURBANCE: CONFIRM POST-DEVELOPMENT REDUCTION IN IMPERVIOUS COVER WITH THE ADDITION OF CLASS II RIPRAP AND STONE SILL.

CHESAPEAKE BAY PRESERVATION AREA NOTE:

1. THIS PROPERTY IS LOCATED IN THE CHESAPEAKE BAY PRESERVATION AREA (CBPA) AND IS SUBJECT TO CERTAIN DEVELOPMENT REQUIREMENTS AND LIMITATIONS. NO TREE REMOVAL, LAND DISTURBING ACTIVITY OR CONSTRUCTION ACTIVITY CAN BE COMMENCED WITHOUT PRIOR APPROVAL FROM THE CITY OF NORFOLK. PLEASE CONTACT THE BUREAU OF ENVIRONMENTAL SERVICES AT (757) 664-4368 FOR FURTHER INFORMATION.

LANDSCAPING NOTE:

1. CONTACT JACK ERWIN AT (757) 664-4751 OR JACK.ERWIN@NORFOLK.GOV PRIOR TO INSTALLATION OF CBPA TREE MITIGATION.

TOPOGRAPHIC SURVEY OF RIVERSIDE MEMORIAL PARK
NORFOLK, VIRGINIA
SCALE: 1"=25'
PMI PROJECT #21-416

SURVEY NOTES:

1. THE MERIDIAN SOURCE OF THIS TOPOGRAPHIC SURVEY IS BASED ON THE CITY OF NORFOLK GEODETIC CONTROL NETWORK, VIRGINIA STATE PLANE COORDINATE SYSTEM, SOUTH ZONE, NORTH AMERICAN DATUM 1983/1993HARN (US SURVEY FEET).
2. ELEVATIONS REFER TO NAVD88(GEOID12a) ESTABLISHED FROM CITY OF NORFOLK CONTROL DISK BR014 (ELEVATION=13.73).
3. THIS SURVEY WAS PREPARED TO SHOW EXISTING FEATURES AS OF 11/17/2021 AND DOES NOT CERTIFY TO CHANGES TO SITE CONDITIONS WHICH OCCUR SUBSEQUENT TO THIS DATE AND OR TO PROPOSED IMPROVEMENTS.
4. THIS SURVEY DOES NOT CONSTITUTE A BOUNDARY SURVEY NOR A SUBDIVISION OF LAND.
5. PROPERTY AND RIGHT-OF-WAY LINES WERE ESTABLISHED USING A COMPILATION OF DEEDS OF RECORD, PLATS OF RECORD AND EXISTING FIELD MEASUREMENTS.
6. THIS SURVEY DOES NOT INTEND TO DEPICT ANY WETLANDS, HAZARDOUS WASTE AND ENVIRONMENTAL FEATURES THAT MAY AFFECT SAID PROPERTY EXCEPT AS SHOWN.
7. AN ELECTRONIC SWEEP OF THE AREAS USING QL-B DESIGNATION TECHNIQUES WAS PERFROMED WITH THIS SURVEY AND NO UNDERGROUND UTILITY DATA WAS FOUND.
8. THIS TOPOGRAPHY SURVEY WAS COMPLETED UNDER THE DIRECT AND RESPONSIBLE CHARGE OF IVAN LINEBERRY FROM AN ACTUAL GROUND SURVEY MADE UNDER MY SUPERVISION; THAT THE PLAT, MAP, OR DIGITAL GEOSPATIAL DATA INCLUDING METADATA MEETS MINIMUM ACCURACY STANDARDS UNLESS OTHERWISE NOTED.

NOTES:

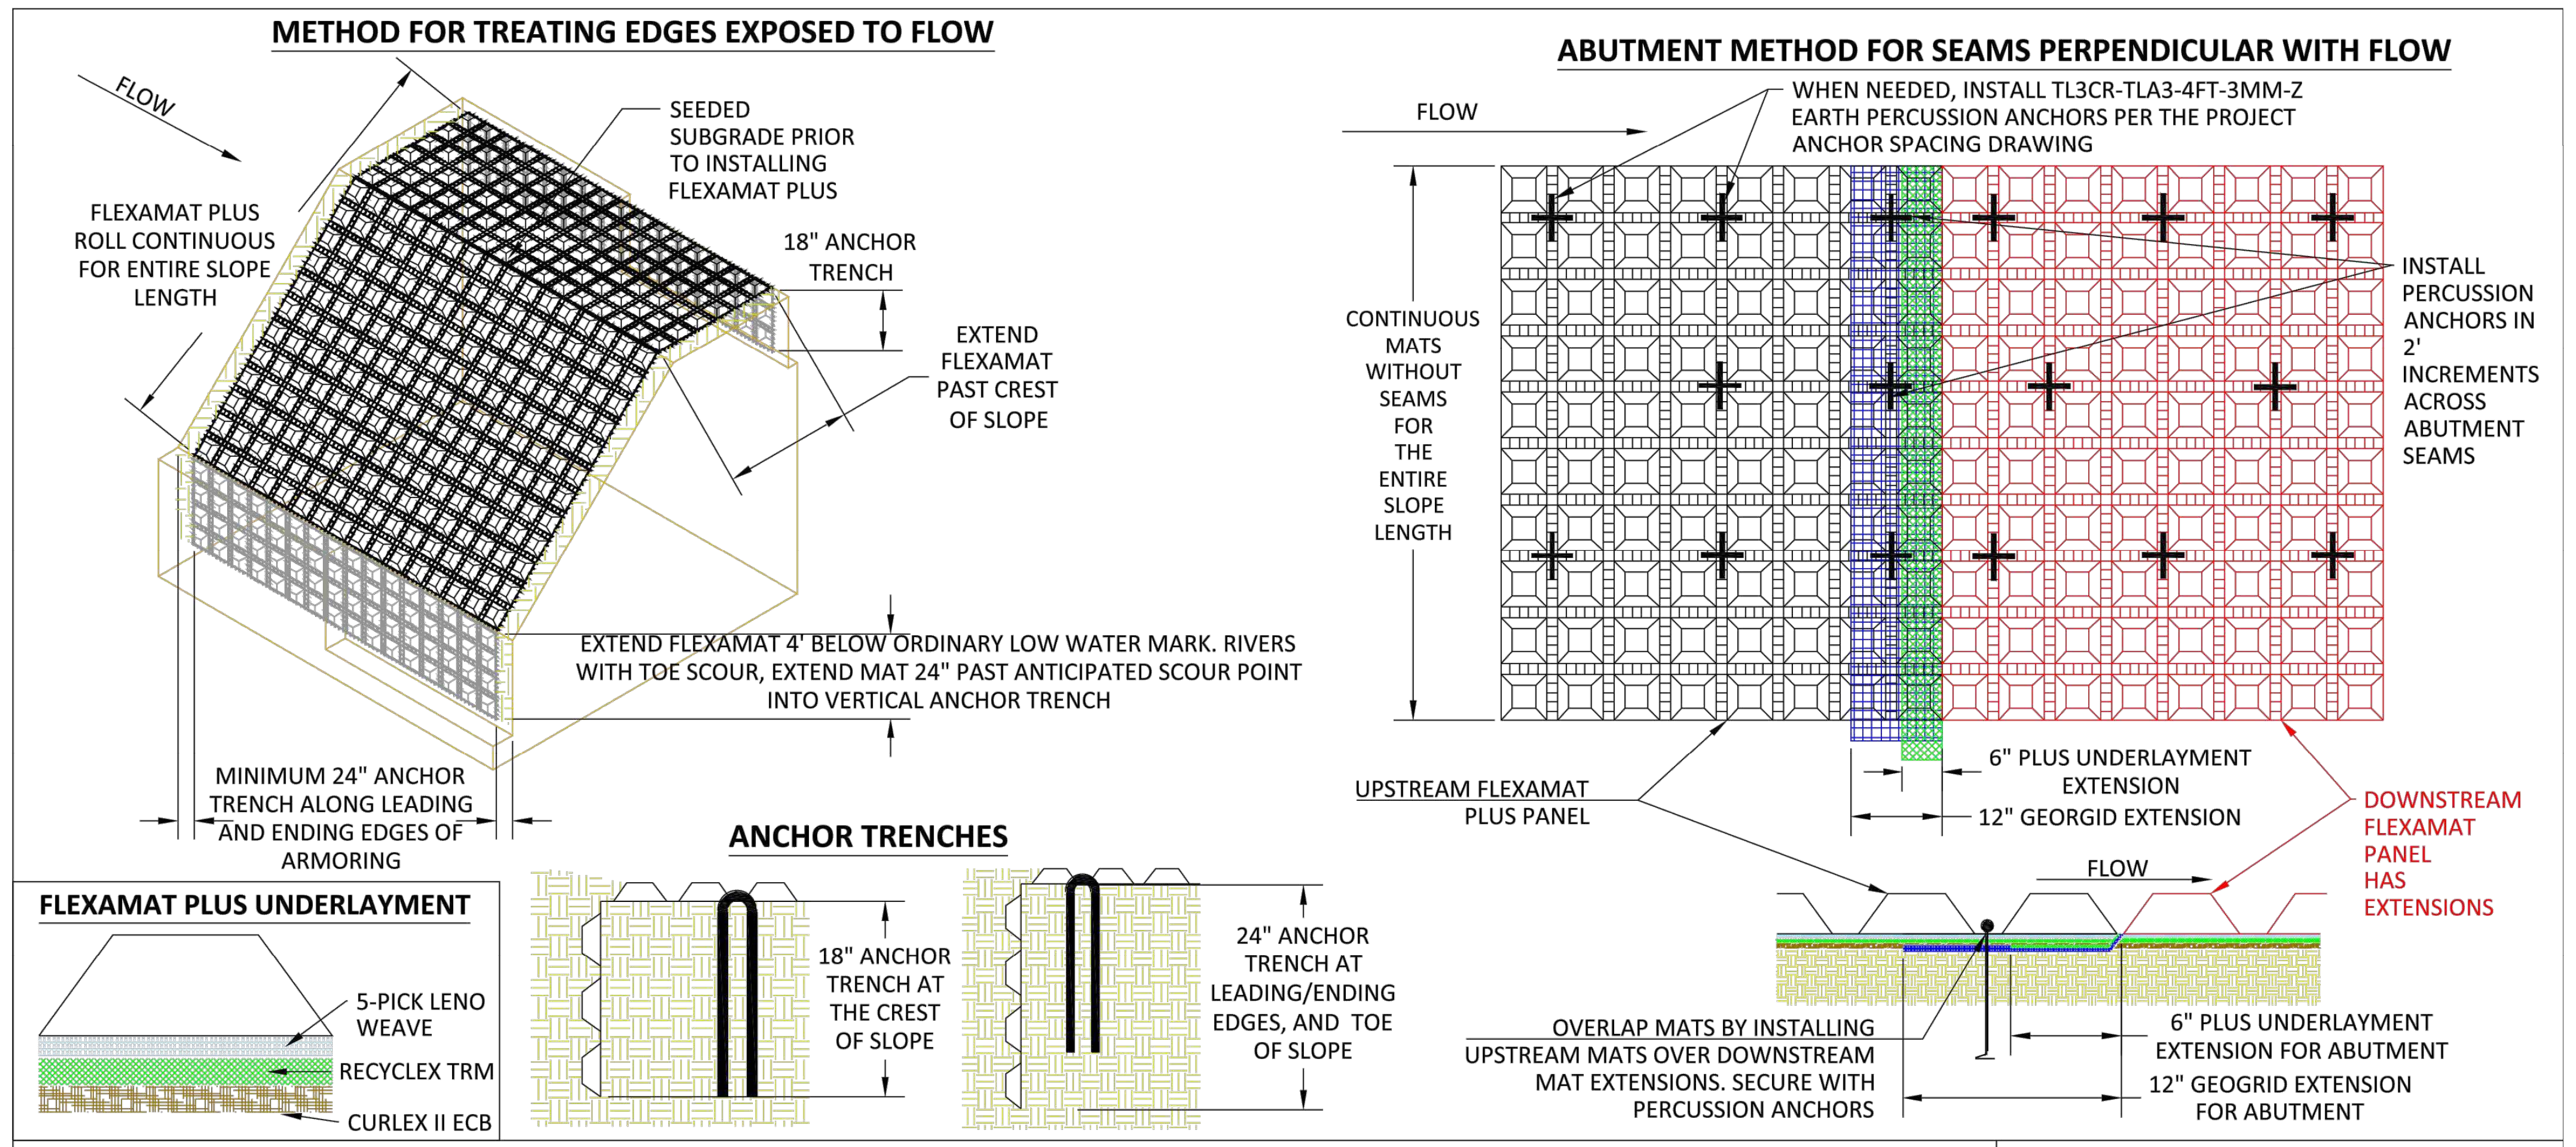
1. TOP LAYER OF RIPRAP ON SILL (MIN 12-IN) SHALL BE VDOT CLASS 1 RIPRAP.
2. EXTEND GEOGRID A MINIMUM OF 6-INCHES UP SLOPE OF SILL OVER GEOTEXTILE FABRIC.
3. THE INTENT OF THIS DETAIL IS TO SHOW THE GENERAL REQUIREMENTS FOR CONSTRUCTING THE SILL. THE OVERALL MATERIAL DEPTH OF SILL MAY VARY DEPENDING ON THE UNDERLYING CONDITIONS. CONTRACTOR SHALL REFER TO THE GEOTECHNICAL REPORT FOR BORING INFORMATION.
4. CONTRACTOR TO OVEREXCAVATE TO REMOVE 12 INCHES OF EXISTING MUCK PRIOR TO PLACEMENT OF GEOGRID AND SAND FILL.
5. GEOGRID TO BE TENSAR TRIAX TX7 OR APPROVED EQUAL.
6. SEE PLANTING PLAN FOR EXACT PLANTING ZONE EXTENTS.

STONE SILL

NTS



FLEXAMAT PLUS - RIVERBANK STEEP SLOPE ARMORING DETAIL

CONSTRUCTION NOTES:

1. AN ENGINEER OR MANUFACTURER'S REPRESENTATIVE SHALL BE ONSITE FOR THE START OF THE INSTALLATION.
2. ALL SUBGRADE SURFACES PREPARED FOR PLACEMENT OF MATS SHALL BE SMOOTH AND FREE OF ROCKS, STICKS, ROOTS, OTHER PROTRUSIONS, OR DEBRIS OF ANY KIND.
3. PRIOR TO INSTALLING MATS, SEED AND FERTILIZE OVER PREPARED SUBGRADE WITH SITE SPECIFIC MIX.
4. INSTALL FLEXAMAT ROLLS THAT ARE 15.5' WIDE WITH A 12" GEOGRID EXTENSION AND A 6" PLUS UNDERLAYMENT EXTENSION. INSTALLATION WILL START ON THE DOWNSTREAM END OF THE CHANNEL AND WORK TOWARDS THE UPSTREAM END OF THE INSTALLATION.
   - 4.1. THE TOP EDGE OF MAT SHALL EXTEND 3' PAST THE CREST OF SLOPE AND BE EMBEDDED 18".
   - 4.2. PRIOR TO INSTALLING UPSTREAM MATS ENSURE THE GEOGRID AND TRM EXTENSIONS ARE LAYING FLAT ON SUBGRADE. INSTALL UPSTREAM MATS OVER THE GEOGRID-PLUS EXTENSIONS OF DOWNSTREAM MATS.
   - 4.3. WHEN NEEDED, SECURE OVERLAPS USING TL3CR-TLA3-4FT-3MM-Z EARTH PERCUSSION ANCHORS PER THE ANCHOR SPACING DETAIL.
   - 4.4. WHEN NEEDED, INSTALL TL3CR-TLA3-4FT-3MM-Z EARTH PERCUSSION ANCHORS THROUGHOUT THE SLOPE PER THE ANCHOR SPACING DETAIL.
5. EXTEND FLEXAMAT 4' BELOW ORDINARY LOW WATER MARK. RIVERS WITH TOE SCOUR SHALL EMBED THE MAT 24" PAST THE ANTICIPATED SCOUR POINT. FILL AND COMPACT TERMINATION TRENCH WITH SUITABLE FILL.
6. LEADING AND ENDING EDGES OF THE ENTIRE FLEXAMAT SLOPE PROTECTION SHALL HAVE A MINIMUM 24" ANCHOR TRENCH. ANCHOR TRENCH SHALL EXTEND MINIMUM 24" BEYOND THE ANTICIPATED SCOUR POINT.

MAP PANELS	☐	Digital Data Available
	☐	No Digital Data Available
	☒	Unmapped

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 4/4/2022 at 9:33 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

THE CITY OF NORFOLK

Maintenance and Management Plan

Shoreline restoration projects often provide water quality benefits and are managed as best management practices (BMP) by the City of Norfolk. Department of Public Works- Division of Environmental Storm Water Management is responsible for most public BMPs, including living shorelines. Per Part I, Section B.2.(h) of the City's Municipal Separate Storm Sewer (MS4) permit and section 2.8 of Division of Environmental Storm Water Management's Program Plan, public BMPs are inspected and maintained annually or more often if needed based on inspections or resident concerns. Both documents are linked below. A Division SOP provides additional information and is provided below.

Three dedicated operations crews maintain vegetated features such as shorelines, ponds, and ditches and additional crews are available to assist with structural repairs. On-call contractors are also available for larger maintenance tasks. These crews and contractors are funded through a dedicated storm water fee. The project will be monitored monthly for the first year to ensure no erosion has started and will be inspected at least once per year afterwards. Any necessary repairs to the bank or shoreline vegetation, grading, or structures will be conducted by Division of Environmental Storm Water Management operations staff or on-call contractors.

Norfolk MS4 Permit

Norfolk Division of Environmental Storm Water Management Program Plan

SOP 654

DEPARTMENT OF PUBLIC WORKS
DIVISION OF ENVIRONMENTAL
STORM WATER MANAGEMENT
STORM WATER BMP INSPECTIONS

DATE WRITTEN: March 8, 2005
DATE REVISED: June 28, 2017; September 18, 2018; November 25, 2019; February 10, 2020
PREPARED BY: Kyle Quick, Environmental Specialist; June Whitehurst, Environmental Programs Manager
REVIEWED BY: John M. White, Storm Water Engineer
FILE PATH: Enter Link Here

DISTRIBUTION: Operations Personnel

PURPOSE / OBJECTIVE:

To define guidelines for the inspection and enforcement for the installation and maintenance of all private and city-owned storm water structural best management practices (BMPs). BMPs reduce unwanted contaminants and/or the volume of storm water entering the City MS4 system and local waterways. BMPs are regularly inspected to ensure they are working as designed and maintained in such a manner to not cause flooding, become a nuisance, or impose a threat to health and safety.

RESPONSIBILITIES:

Division – The Department of Public Works, Division of Environmental Storm Water Management is the administrator of the MS4 VPDES Permit, VA0088650. Environmental staff ensures compliance with the VPDES permit associated with BMP inspections to the storm water system. State law requires BMPs to be inspected once every 5-years. The City's MS4 permit requires city-owned BMPs be inspected and maintained once per year.

Environmental Staff develop and maintain a list of BMPs within the geographic boundary of the City of Norfolk. This list is routinely updated following site plan review. Environmental staff conduct routine inspections of both private and public storm water BMPs.

OTHER:

BMPs are used to reduce pollution in and/or volume of storm water runoff, thereby protecting area waterways. Some examples of structural storm water BMPs include infiltration trenches, grass swales, detention basins, retention ponds, oil/grit separators, bioretention basins, manufactured BMPs, etc.

REQUIREMENTS:

1. BMPs are approved for installation after an extensive site plan review by a designated storm water engineer. All pertinent information pertaining to the BMPs are entered into the current BMP tracking database.

2. As part of the site plan approval process, a Declaration of Covenants for Storm and Surface Water Facility and System Maintenance (BMP Maintenance Agreement) should be signed and notarized by the owner or responsible party of the private property being developed to maintain the BMP after construction. That party will remain responsible for all maintenance until the property is sold; at which time the new owner is responsible for maintaining the BMP. A copy of the agreement is filed with the clerk of the court by the owner or responsible party. A copy of the agreement is also maintained in the site plan file at the Division.

3. Storm water management (SWM) facilities or BMPs are required to be installed in accordance with the approved plans, and manufacturers' specifications where applicable. The City of Norfolk Planning Department, Building Safety Bureau will inspect the installation of onsite stormwater piping and structures. The Department of Public Works, Environmental Storm Water Management

staff will inspect the installation of BMPs. Additionally, they also inspect stormwater piping and structures within the City Right-of-Way and piping that ties into the City's MS4 system. During construction, environmental staff will have completed the following procedures:

a. A pre-construction meeting will be scheduled to go over expectations. Pre-construction meetings will be documented.

b. Follow up inspections with the contractor will occur throughout the construction process to verify that the BMPs are installed in accordance with the approved plans. These inspections should take place before any backfilling occurs and should include pictures for documentation. If there is a tie-in to the city system, a storm water inspector will inspect the tie-in.

c. A construction record drawing ("As-built" submission) signed and sealed by a professional registered in Virginia will be reviewed by a storm water engineer or their designee to verify the SWM facilities have been installed per the approved plan.

d. A final inspection will be performed by the environmental staff to ensure that the BMP and contributing drainage areas are stabilized. The inspector will also ensure that the site is free of excessive litter or debris, sediment build up, or erosion, and no deviations from the approved construction record drawing.

e. Upon approval of the construction record drawing and the final inspection, the environmental staff will approve the release of the Certificate of Occupancy (if required) and approval to terminate bonds for stormwater improvements.

4. All privately-owned and city-owned BMP inspections are tracked in the current BMP tracking database. The database enables the Division to maintain inspection data and to ensure inspections are completed on a routine schedule.

5. When an inspection is conducted, the following items are checked to ensure that the BMP will consistently perform its water quality improvement and/or runoff reduction functions.

a. *Sediment Buildup*: Sediment buildup can reduce the effectiveness of the BMP by blocking inlets and outlets, reducing infiltration rates, and reducing effectiveness of pretreatment practices.

b. *Erosion*: Erosion can lead to reduced volume of the BMP and/or structural failure. Erosion is a common problem around inlets and outlets of BMPs, and may also be caused by roots of woody vegetation and animal burrows.

c. *Debris and Litter Removal*: Regular removal of litter and debris is essential to ensure the BMP is working properly. The BMP must be free from debris and litter in or around the BMP structure.

d. *Vegetation*: Vegetation must be established and maintained to guard against erosion and sediment buildup, and to maintain designed pollutant removal rates where applicable. Excessive vegetation clippings must be removed from the BMP and disposed of properly.

e. *Deviation from the Construction Record Drawing*: Verify a property owner, tenant, or other responsible party has not modified a post-construction BMP without written approval from the City of Norfolk Department of Public Works storm water engineer, or their designee.

   f. *Manufactured BMPs*: The owner or responsible party are required to maintain manufactured BMPs in accordance with the manufacturer's specifications, and to provide evidence of continued maintenance by copies of maintenance records and/or photographic proof.

   g. *Other Maintenance Concerns*: Refer to the Virginia Department of Environmental Quality Stormwater Design Specifications for other BMP maintenance concerns.

6. The environmental staff will complete an inspection report and track inspections in the current BMP tracking database. The responsible party will either be sent an email or a letter that lists the BMP maintenance discrepancies and includes a copy of the inspection report, if necessary. The responsible party will have a specified time-period to complete the maintenance after the report has been sent. A re-inspection will occur after the allotted time-period to ensure all corrections have been made. If the inspector has had no contact from the property owner, if letters have been returned, or if the discrepancies have not been addressed a Notice of Violation (NOV) may be sent or issued. If no progress occurs after the NOV has been issued, further legal actions should be taken. The City also holds the right to conduct the corrections after proper warning, and then charge the responsible party for any financial obligations. If the BMP is working properly and does not appear to have any maintenance discrepancies, a note will be made in the file and no report will be sent to the responsible party.

7. Routine maintenance for any City-owned BMP is conducted by the Division which is submitted in a service request and put into the work management tracking system. The City-owned BMPs must also follow all the guidelines established above.

8. The Norfolk Public Schools BMPs are inspected by the environmental staff, however, the school board facilities manager is the main point of contact for any discrepancies regarding BMP maintenance at school facilities. The school board is responsible for maintaining the BMPs and if major work is required beyond the capabilities of facilities personnel, then they will hire a contractor.

RE: City of Norfolk Resilience Plan Second Submission - CFPF

Dear Mr. Simons:

Thank you for providing an overview of your Resilience Plan, and informing DCR of the various plans that the City of Norfolk will be utilizing to fulfill the Resilience Plan submission requirements. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on August 8, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

    a. Project-based: Nine watersheds—each with a defined geographic area, analysis of community social and environmental characteristics, types of flooding, and a tailored flood resilience strategy divided into 15 project areas, each with discrete projects identified.

    b. Projects focused on flood control and resilience included city-wide and various coastal projects and a specific project in Chesterfield Heights.

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

    a. Natural and nature-based flood management measures are identified for use in projects throughout the city in the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*, the *Combined Coastal and Precipitation Flooding Master Plan*, the *Hampton Roads Mitigation Plan* and *A Green Infrastructure Plan for Norfolk: Building Resilient Communities*.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**

    a. All parts of a locality: Locality divided into 9 watersheds, with 90 planning districts covering the entirety of the jurisdictional boundary.

    b. Social vulnerability: Social implications of flood hazards and analysis of populations at-risk documented in the USACE *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*, the *Combined Coastal and Precipitation Flooding Master Plan* and in *PlaNorfolk 2030*.

    c. Demographic Analysis: Demographic Analysis conducted by USACE, utilizing U.S. Census Bureau, Bureau of Labor and Statistics, Virginia Employment Commision, and other information from local planning agencies, and incorporated into the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**

    a. Coordination with other projects, plans, and activities: Contains the planning processes and frameworks which outline local and regional plans used by the City and address resilience; and how they have been integrated for flood adaptation planning.

    b. Clearly articulated timeline or phasing for plan implementation: 5 year timeline presented in the *Combined Coastal and Precipitation Flooding Master Plan*. Phased time-line for completion found within *PlaNorfolk 2030, Vision2100*, and *A Green Infrastructure Plan for Norfolk: Building Resilient Communities*. Phased approach for project implementation contained within the Fugro Atlantic *Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*. Program phases clearly articulated and an impact statement completed in USACE *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**

    a. Technically backed water-resources analysis, sea level rise projections, storm surge, and climate change incorporated into the strategic approach presented in the *Hampton Roads Hazard Mitigation Plan,* the *Final Integrated City of Norfolk Coastal Storm Risk Management Feasibility Study / Environmental Impact Statement*.

VA DCR looks forward to working with you as you work to make the City of Norfolk a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

Resilience Planning Overview for the City of Norfolk

In response to the resilience planning requirements of the **Community Flood Preparedness Fund** ("the CFPF" or "Fund") outlined within the 2021 CFPF Grant Manual (Appendix G: Elements of Resilience Plans), the City of Norfolk ("the City") has prepared the following Resilience Planning Overview of formal and relevant plans utilized for resilience planning efforts by the City to prioritize potential projects and to assist the City is its efforts to secure funding for such critical resilience plans, studies and projects.

The **Elements of Resilience Plans** taken from Appendix G of the 2021 CFPF Grant Manual, from which communities are expected to highlight the stated resilience planning contents as they related to CFPF grant applications, are as follows:

1. *It is project-based with projects focused on flood control and resilience.*
2. *It incorporates nature-based infrastructure to the maximum extent possible.*
3. *It includes considerations of all parts of a locality regardless of socioeconomics or race.*
4. *It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.*
5. *Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.*

Norfolk's resilience planning elements are not contained within an adopted "stand alone" plan. However, Norfolk's utilizes various plans within a resilience repertoire, which altogether serve multiple needs for various audiences; from technical to public-facing to operational. This Resilience Planning Overview will expressly identify to the grant reviewer, and to the public, how various resilience planning documents of the City of Norfolk satisfy all the CFPF Resilience Plan elements.

The following plans for the City of Norfolk will contribute to this Resilience Planning Overview:

- ***plaNorfolk2030*** (2013, as amended)
- ***Vision2100*** (2016)
- ***Hampton Roads Hazard Mitigation Plan*** (2017)
- ***Combined Coastal and Precipitation Flooding Master Plan*** (2017)
    - Appendix A: ***Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*** **(Fugro Atlantic)**
    - Appendix B: ***City-wide Drainage and Watershed Master Plan*** **(Timmons Group)**
- ***A Green Infrastructure Plan for Norfolk*** (2018, as amended)
- ***USACE Coastal Storm Risk Management (CSRM) Feasibility Study and Environmental Impact Statement*** (2019)
- ***Zoning Ordinance of the City of Norfolk*** (2018, as amended)
- ***Development of an Urban Resilience Analysis Framework with Application to Norfolk, VA*** (2016)

Responses are provided below in red based on the various Norfolk plans for the following example resilience elements outlined in Appendix G of the 2021 CFPF Grant Manual:

- ***Equity based strategic polices for local government-wide flood protection and prevention.***
  The ***Hampton Roads Hazard Mitigation Plan*** recommends the highest priority of protection to be reserved towards protection projects for severe repetitive loss areas (Mitigation Actions 8 &

11) in Norfolk. Research in Norfolk has shown that these areas are often places where the most vulnerable residents are housed.

Additionally, Mitigation Action 12 recommends Norfolk begin risk/hazard mitigation efforts equitably by first implementing a major flood control project within the historically black community of Chesterfield Heights; implementation of a $112M HUD project awarded through the National Disaster Resilience Competition (construction currently underway).

- **Proposed projects that enables communities to adapt to and thrive through natural or human hazards.**
  The ***Combined Coastal and Precipitation Flooding Master Plan*** (Norfolk's "Flooding Master Plan") is based on a major multi-year study effort supported by technical analyses and recommendations from Fugro Atlantic within the ***Norfolk Preliminary City-wide Coastal Flooding Mitigation Concept Evaluation and Master Plan Development*** (the "Fugro report"). The Flooding Master Plan is also supporting by a thorough analysis and priority ranking technical guide of the City's drainage conveyance system, ***City-wide Drainage and Watershed Master Plan*** by Timmons Group.

  Together, with this technical supporting documentation, the Flooding Master Plan provides the framework for Norfolk to intelligently review and prioritize flood protections project to enable Norfolk to adapt and thrive to current and future flood threats.

- **Documentation of existing social, economic, natural, and other conditions present in the local government.**
  Sandia National Laboratories provided an analysis framework (***Development of an Urban Resilience Analysis Framework with Application to Norfolk, VA)*** for conceptualizing the resilience needs for Norfolk, including vulnerability assessments for critical infrastructure with the context of local economic and logistical impacts. The findings of which have been incorporated into other resiliency plans such as the USACE Coastal Storm Risk Management Study.

  The ***USACE Coastal Storm Risk Management*** **(CSRM)** ***Feasibility Study and Environmental Impact Statement*** presents a robust analysis of the best recommendations for City-wide flood protection measures for the City of Norfolk. This report includes 10% engineered designs for the various flood protection measures recommended throughout the entire community, and a preliminary Environmental Impact Statement is included outlining the existing social, economic, natural conditions, vulnerabilities and stressors within the natural and social environment, as well as proposed impacts. See the various CSRM appendices for these detailed conditions and impact reports.

- **Review of the vulnerabilities and stressors, both natural and social in the local government.**
  See CSRM comment above. Additional overview of the vulnerabilities and stressors can be found in the ***Hampton Roads Hazard Mitigation Plan***.

- **Forward-looking goals, actionable strategies, and priorities through as seen through an equity-based lens.**
  Norfolk remains committed to presenting all action plans through an equity-based lens, as found within the actionable strategies of ***A Green Infrastructure Plan for Norfolk*** and the ***Hampton Roads Hazard Mitigation Plan***. Both plans are tactical, and recommendation are based on a 5-year forward-looking outlay. Recommendations of the Fugro report are based on a 50-year outlay, and recommendations of ***Vision2100*** geared towards the year 2100.

- **Strategies that guides growth and development away from high-risk locations that may include strategies in comprehensive plans or other land use plans or ordinances or other studies, plans or strategies adopted by a local government.**
  Vision2100 is serves a land use guide for the City. The plan divides Norfolk up into four main areas by which the City will focus new investments and make necessary steps to prepare for a changing environment:
  - ✓ Purple: Low Flood Risk / Low Degree of Civic Assets: Establishing Neighborhoods of the Future
  - ✓ Green: Low Flood Risk / High Degree of Civic Assets: Designing New Urban Centers
  - ✓ Yellow: High Flood Risk / Low Degree of Civic Assets: Adapting to Rising Waters
  - ✓ Red: High Flood Risk / High Degree of Civic Assets: Enhancing Economic Engines (protect!)

- **Proposed acquisition of land or conservation easements or identification of areas suitable for conservation particularly areas identified as having high flood attenuation benefit by *ConserveVirginia* or similar data driven tools.**
  Vision2100 provides the framework for selecting the areas suitable for conservation easements. The ***Norfolk Zoning Ordinance*** provides the mechanism for purchasing land conservation easement credits from the Coastal Resilience Overlay through transferring Resilient Quotient points to the Upland Resilience Overlay (requires extinguishment of a density unit – developable dwelling unit). The conservation easement, while recorded on the deed and kept on file with the Planning Department, can be held by the property owner, the Zoning Ordinance also permits it to be placed in a land trust.

- **Identification of areas suitable for property buyouts in frequently flooded areas.**
  See ***Vision2100*** "Yellow" areas (High Flood Risk / Low Degree of Civic Assets: Adapting to Rising Waters) and Coastal Resilient Overlay areas on the Norfolk Zoning Map.

- **Identification of critical facilities and their vulnerability throughout the local government such as water and sewer or other types identified as "lifelines" by FEMA.**
  A list of all critical facilities is contained within the *Norfolk Emergency Operations Manual* (2020). See Mitigation Action 5 from ***Hampton Roads Hazard Mitigation Plan***: "Purchase and install generators or other continuous power sources for critical facilities and infrastructure. This action may include, but is not limited to pump stations, EOC (Emergency Operations Center), shelters, underpasses and important traffic signals." The critical facilities list is available upon request.

- **Identified ecosystems/wetlands/floodplains suitable for permanent protection.**
  See ***A Green Infrastructure Plan for Norfolk***, this includes an *Action Plan Appendix for Threatened and Endangered Species* within critical floodplain habitats, as well as a detailed ecological inventory with recommendations for floodplain protection measures within an connected open space corridor network.

- **Identified incentives for restoring riparian and wetland vegetation.**
  - The City's Public Works Division of Stormwater Management offers the **Stormwater Fee Reduction Program** for homeowners and businesses who opt to implement water quality improvements on their private property including riparian buffer and shoreline management improvement.
  - **Environmental Conservation Consulting** – Norfolk annually funds a contract to coordinate with residential property owners for implementation of water quality improvements on their private property including riparian buffer and shoreline management improvement through a cost-share program. Property owners get a percentage of the project paid through the contractor via the Environmental Conservation Consulting services contract.
  - Norfolk regularly applies for grants to partner with community organizations for implementation of green infrastructure of public lands – projects are reviewed by the **Watershed Management Task Force** to ensure that projects are furthering the goals and objectives of the adopted ***Green Infrastructure Plan for Norfolk***.

- **A framework for implementation, capacity building and community engagement.**
  The **Watershed Management Task Force** and the recently created Program for Public Information committee are two groups made up of joint staff/citizen/technical expert members, which collectively drive the City's ongoing programing for green infrastructure projects and flood mitigation messaging. Capital Improvement Project funding recommendations from the ***Green Infrastructure Plan for Norfolk*** are also reviewed monthly by the Watershed Management Task Force.

- **Strategies for creating knowledgeable, inclusive community leaders and networks.**
  The 12-member Norfolk Coastal Management Review Board (CMRB) provides recommendations to the 7-member Erosion Advisory Commission, which is partially comprised of members of the CMRB. The CMRB is made up of elected leaders, civic league presidents/community leaders and technical experts from the Virginia Institute of Marine Science, Virginia Marine Resources Commission, Army Corp of Engineers, Old Dominion University Department of Ocean, Earth and Atmospheric Sciences, and city technical staff, providing workshops, seminars and project assessments of coastal mitigation and erosion projects; specifically intended to build grassroots technical capabilities and citizen champions within the community. The Norfolk CMRB and Erosion Advisory Commission is established by City Code and guided by the City's adopted Sand Management Plan.

- **A community dam safety inventory and risk assessment posed by the location and condition of dams.**
  Not applicable in Norfolk – not at dam risk.

- **A characterization of the community including population, economics, cultural and historic resources, dependence on the built environment and infrastructure and the risks posed to such infrastructure and characteristics by flooding from climate change, sea level rise, tidal events or storm surges or other weather.**

  This general characterization is well documented within the general/comprehensive plan for the City of Norfolk – ***plaNorfolk2030***. This includes dozens of resiliency recommendations for flood risk reduction and communication.

- **Strategies to address other natural hazards that would cause, affect or result from flooding events including:**
  - **Earthquakes.**
  - **Storage of hazardous materials**
  - **Landslides/mud/debris flow/rock falls.**
  - **Prevention of wildfires that would result in denuded lands making flooding, mudslides or similar events more likely.**
  - **Preparations for severe weather events including tropical storms or other severe storms, including winter storms.**

  The ***Hampton Roads Hazard Mitigation Plan*** is a FEMA-accredited all-hazards plan.

City of Norfolk- Virginia Community Flood Preparedness Fund Grant Application

1 message

Shafer, Justin <Justin.Shafer@norfolk.gov> Fri, Apr 8, 2022 at 1:39 PM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: "Spencer, Kyle" <Kyle.Spencer@norfolk.gov>, "Simons, Matthew" <Matthew.Simons@norfolk.gov>, "Daniel, Stephanie F" <Stephanie.Daniel@norfolk.gov>

Good Afternoon,

On behalf of the City of Norfolk, please find attached a grant application submission for the Virginia Community Flood Preparedness Fund for review and consideration. Due to email size limits, a second application package will be submitted separately.

Please let us know if you have any questions. Thank you for your time and consideration.

Thank you,

Justin Shafer

Project Manager- Water Quality & Green Infrastructure

Building Coastal and Flooding Resilience Capacity in Northampton County

Contents

Scope of Work Narrative

Northampton County, located on the Eastern Shore of Virginia, is a rural area that is highly vulnerable to rising seas and recurrent flooding- inland and coastal. This rural county has a population of just under 12,000 and has a small town feel where the residents take pride in their communities and the surrounding nature on which the local economy depends. The area is bounded by Accomack County to the north, the Chesapeake Bay to the west and coastal bays and barrier islands to the east with the highest elevation of 30-35 feet above sea level found along the spine of the peninsula. Numerous areas along the bayside and seaside as well as the many creeks that feed into these larger waterways experience sunny day flooding that is increasing with sea level rise. Additionally, with so much low-lying land and a highwater table, many inland regions also flood with increasingly heavy rain events. The region is expected to face accelerated sea level rise and an increase in storm intensity, including hurricanes and annual precipitation. Northampton County recognizes the need to increase resilience by mitigating and minimizing flooding vulnerability and is requesting funding to increase capacity to accomplish that.

Specifically in this proposal, we are seeking funds to

1. Increase staff resilience capacity by hiring a full-time Environmental Outreach and Certified Floodplain Manager (CFM) who will manage the day-to-day activities of such work, including serving as lead for public engagement support and leading the efforts to proactively seek funding from public sources- state and federal; and
2. Conduct an assessment of stormwater/drainage at identified location(s) within Northampton County to better understand the issues and next steps that are needed to allow solutions to be implemented.

Northampton County's seaside and bayside communities and villages, such as Cape Charles, Oyster and Willis Wharf, share many common characteristics and face similar challenges with sea level rise and storm surge flooding, while inland communities experience flooding during increasingly heavy storm and rain events. These frequent events impact road access, school schedules, increased farmland flooding, boat ramp access for working watermen and other essential functions.

Working waterfronts and agricultural villages are a legacy of the past that are still important to Northampton County's economy, and tourism, especially eco-tourism, is the fastest growing portion of our economy. Accessibility to nature for aquaculture and recreation through trails and water activities is important to the local community and attracts tourism. The County contains some of the last remaining stretches of undeveloped coastline on the East Coast and large portions of the County are protected through conservation – including two large public parks, the Eastern Shore of Virginia National Wildlife Refuge, and Kiptopeke State Park. Northampton County remains a rural gem, with the major industries of the area reliant on the abundant natural and cultural resources of the County – agriculture, aquaculture, and tourism.

The lands and waters of the County not only include important resources and habitat but also support the vibrant agriculture and seafood industry of the region as well as support the growing ecotourism industry. As a vital player in the local economy, agriculture, aquaculture and habitat resources must be responsibly managed and protected such that they continue to contribute to the economic resiliency of the region. The following demonstrate that importance:

- Of the 212 square miles, the most common land cover is wetlands making up 37.4% of the land surface. These wetlands provide important habitats for the region's various rare species as well as supporting a vibrant seafood industry in the region. Most of the wetlands are in the eastern portion of the county and are protected as conservation areas.

- Cropland is also an important use of land making up 28.9% of the land area.
- Collectively, wetlands and croplands, which make up two-thirds of the county's total land area, provide significant environmental value to the county.
- Agriculture, Forestry, Fishing and Hunting are some of the largest industry sectors in the County, making up 18.9% of all jobs and surpassing national averages.
- In 2017, aquaculture commodity sales in Northampton County topped $28 million. This makes Northampton County not only the leader in aquaculture sales in Virginia, but also along the entire East Coast.

In June 2021, the County adopted a Comprehensive Plan with an outlook to 2040, called *Your Northampton County* (https://www.co.northampton.va.us/government/departments_elected_offices/planning_permiting_enforcement/planning/comp_plan). The Comprehensive Plan recognizes the impact global forces such as climate change and sea level rise can have on its assets and defines the following goals:

- Build a more resilient community protected against the hazards of climate change
- Participate in regional energy and climate change planning
- All activities will plan for climate change resiliency
- Encourage the use of design techniques to slow water's rise and help absorb water into the landscape, such as living shorelines, rain gardens, and green roofs.
- Participate in the development and implementation of the Statewide Resiliency Master Plan.
- Under categories of Adapt to Climate Change and Minimize and Mitigate Environmental Hazards, the Implementation Matrix in the plan lists numerous needs for the County concerning sea level rise, flooding and stormwater management. Included in these projects are infrastructure assessments, environmental considerations such as marsh migration, and engagement with the communities.
- Inundation of roads is expected to be a growing problem as sea level is projected to rise and weather events become more severe. Northampton County must work with VDOT and A-NPDC to accomplish the recommendations found in the 2015 Infrastructure Inundation Vulnerability Assessment.
- Stormwater management is identified as a high priority.
- Flooding caused by hurricanes, northeasters, and tropical storms has proven to be the greatest natural hazard to people and property on the Eastern Shore of Virginia. A FEMA Flood Risk Report estimates that 212 square miles of the county's land area is within some Flood Hazard Area. Much of this land which is undeveloped consists of Coastal High Hazard Areas where a 1% annual chance of flooding exists as the result of storm induced wave action. Other portions of the county are in areas that require flood insurance because a 1% chance of annual flooding is possible. As of January 2016, there were 572 National Flood Insurance Program policies in the County, with 334 of those being in the unincorporated portions of the County.

Specific actions outlined in the Comprehensive Plan include:

- Review and update local floodplain regulations in accordance with the National Flood Insurance Program requirements.
- Proactively implement the Northampton County-specific strategies and projects in the Eastern Shore Hazard Mitigation Plan, as amended.
- Recommend the provision of independent back-up sources of power (e.g. gas generators) for commercial and institutional uses when primary power source is interrupted for an extended period.

- Participate in the “Advancing Ecosystem and Community Resilience” project through the Virginia Coastal Zone Management Program to identify the County’s resiliency needs, establish resilience priorities, and conceptualize potential projects.
- Provide education and outreach materials on hazard preparedness, food management, sea level rise, and recommended mitigation steps to homeowners and private businesses that have been identified as located in vulnerable areas.
- Preserve available open spaces adjacent to marsh lands to support marsh migration and inland retreat of the marshes under rising sea level.
- Review non-conforming lot and structure standards to encourage safe building and rebuilding in areas subject to sea level rise.
- Consider establishing a transfer of development rights (TDR) program to encourage density reductions in vulnerable areas
- Guide new development and locate critical facilities and infrastructure outside areas at a high risk for flooding, areas subject to inundation within 100 years (as identified by the National Oceanic and Atmospheric Administration), and other hazards.
- Utilize TNC’s Coastal Resilience Mapping portal to visualize food and sea-level rise risks, identify sustainable natural solutions for resiliency, and demonstrate historic coastline changes when considering land-use applications.

On Virginia’s Eastern Shore, assessment of the effects of global climate change on local natural resources and development of adaptation and resilience strategies began back in 2009 and culminated in formation of the (first of its kind in the region) Climate Adaptation Working Group (CAWG) that continues to work as an effective partnership. The CAWG consists of the following sectors and representatives:

- State and federal agencies – U. S. Fish and Wildlife Service, Virginia Department of Conservation and Recreation, Virginia Department of Wildlife Resources, NASA-Wallops Flight Facility, Virginia Department of Forestry, and Virginia Department of Environmental Quality’s Coastal Zone Management Program
- Local Government – County Board of Supervisors members, mayors, town and county planners, and A-NPDC planners
- Academic research partners (including the University of Virginia and the Virginia Institute of Marine Science)
- Virginia Eastern Shore Land Trust
- Special Assistant to the Governor on Coastal Adaptation and Protection (previous administration)
- The Nature Conservancy’s Virginia Coast Reserve

The CAWG has been meeting quarterly since 2011 and has worked on resilience projects collaboratively including creation of a living shoreline demonstration project on Occohannock Creek in Accomack County and creation of TNC’s online Virginia Eastern Shore Coastal Resilience (CR) Tool (maps.coastalresilience.org/virginia). Working with the CAWG, the County was recently focused on creating a list of resilience projects for inclusion in the Virginia Coastal Resilience Master Plan. This list will also be utilized by the CAWG, County, and localities to prioritize projects and prepare for upcoming funding opportunities in the Commonwealth and beyond.

The Comprehensive Plan outlines numerous steps the County wishes to take to increase resilience to flooding, both coastal and inland, but to begin acting on these steps, increased capacity in County staff is required. This position would work proactively with local landowners on flooding issues (wetland management, living shorelines, etc.) and would work on implementing the items prioritized in the Comprehensive Plan. An important part of this process taken on by this position will be to pursue additional public funding opportunities that will increase resilience and benefit the County. We anticipate future funding through the Infrastructure Investment and Jobs Act through agencies such as NOAA and NFWF as well as continued funding through the CFPF.

As a step forward in addressing inland flooding due to rainfall, the County is also requesting funds to complete a Stormwater Drainage Assessment for 1-2 localities. This(s) plan will serve as a blueprint for other localities within the County and inform the creation of a county-wide effort to address inland flooding. The Environmental Outreach and Certified Floodplain Manager position will oversee these projects once hired.

Vulnerability Assessment

Northampton County is expected to experience continued sea level rise, an environment in which tropical storms and hurricanes are more intense, and increased precipitation, all of which increases the vulnerability of the region to flooding. In the following, we assess the vulnerability to flooding from these environmental changes as well as the social vulnerability of the population using various online assessment tools.

- All of the fringing land areas on the peninsula will be inundated with 4-6 feet of water by the year 2100 under the high sea level rise scenario (TNC's Coastal Resilience (CR) Tool, maps.coastalresilience.org/virginia, Figure 2). Parts of the seaside and bayside communities, such as Oyster, Willis Wharf, Cape Charles and others, will become flooded.
- More pressing, by the year 2075, much of this area is predicted to be under 1-2 feet of water, including towns such as Cape Charles and areas just to its north surrounding Cherrystone Inlet and the Village of Oyster, among others. (TNC's CR Tool)
- Hotspots for inundation exist in extremely low-lying areas in the southern part of the county on the bayside and the northern portion, from Machipongo to the county line, on the seaside (TNC's CR Tool). An example of commonly occurring coastal flooding already threatening these communities is shown in the attached images (Photos 1-6).
- The estimated economic annual loss from coastal flooding in the year 2065 predicted under the high sea level rise scenario for the majority of the region is $1,000-$500,000 with many areas in the $500,000-$1M range and the $1M-$5M range (TNC's CR Tool, Figure 2).
- Using a threat index within the CR Tool, which incorporates "storm surge scenarios and landscape characteristics that exacerbate flood potential," the entirety of Northampton County is in the medium to high range.
- The majority Northampton County, except for the barrier and marsh islands, is made up of soil that is easily eroded by water, characterized as medium-high (along the spine and to the seaside) to high (from the spine to the bayside) erodibility. This information is found using the Coastal Resilience Evaluation and Siting Tool (CREST, resilientcoasts.org) from the National Fish and Wildlife Foundation (NFWF).
- The total amount of annual precipitation in the contiguous U.S. has increased over the past century. Figure 3, taken from the EPA website (https://www.epa.gov/climate-indicators/climate-change-indicators-us-and-global-precipitation) which is based on data from NOAA (NOAA, 2021), shows the difference in annual precipitation from 1901-2020 compared to the century average. Note that in the early century, more years fell below that average while in the last half of the century, annual precipitation is exceeding that average.
- Annual rainfall on the Eastern Shore of Virginia is expected to increase from 5-10% within the next 15-20 years. (FloodFactor.com, First Street Foundation).
- The amount of rain within a single storm event has increased in recent decades, due to warming of the atmosphere and oceans. Figure 4 shows the land area (y-axis) for which single storm events have contributed a large portion of the annual rainfall. As time has progressed into the late 20th and early 21st centuries, the amount of land where this is

> happening has been increasing. In fact, for the contiguous U.S., 9 of the top 10 years for extreme 1-day precipitation events have occurred in the last 26 years (NOAA, 2016).

To assess social vulnerability, we examined the ADAPTVA Vulnerability Viewer, which uses Census Tract data. Northampton County is classified as having moderate social vulnerability with a vulnerability index score of 0.9. The table below includes the characteristics as listed in this tool.

Classification	**Characteristics**
Socio-economic	Rural, high dependency on social security, moderate elderly population, moderately low income, moderately high nursing home population, moderately high minority population
Housing	high density, mobile homes, vacant homes, second homes, low rent and long-term renters
Hazardous/Toxic	Very high potential for hazardous/toxic exposure

The Centers for Disease Control (CDC) also produce a Social Vulnerability Index (https://svi.cdc.gov/map.html) for each county based on Census Tract data. This tool indicates that Northampton County has a moderate to high level of vulnerability. The main contributor to this high vulnerability is minority status and language; however, all categories ranked above the 55th percentile including socioeconomic, household composition and disability, and housing type and transportation. The table below outlines vulnerable population demographics from other online vulnerability mapping tools which use Census as well as other data sources.

Descriptor	**Characteristics**
Population	15% under the age of 5* 21% over the age of 64* 73% people of color* 11-14% with a disability+
Income	59% low income* 9% unemployed+
Resources	14-16% food insecure+ 18% without computer access+
Education	42% with less than a high school education*

* Source: Environmental Protection Agency, Environmental Justice, https://ejscreen.epa.gov/mapper/index.html?wherestr=Oyster%2C+VA

+ Source: PolicyMap.com

Northampton County is identified as low income based on the definition given in the Grant Manual that “any locality, or community within a locality, that has a median household income that is not greater than 80 percent of the local median household income.” The U.S. Census Bureau (https://www.census.gov/quickfacts/fact/map/northamptoncountyvirginia,VA/INC110220) lists the median household income for Virginia as $76,398 and for Northampton County as $50,819; therefore the County is in the 66.5th percentile compared to all of Virginia.

Outcome(s)

The goal for the proposed funding is to increase the capacity of Northampton County to address flooding. The purpose of the funding is twofold:

1. Increase capacity within the existing and new county staff for an Environmental Outreach and Certified Floodplain Manager (CFM).

   Job description: Provides environmental technical support and administers the Northampton County Floodplain Ordinance for the Planning, Permitting and Enforcement Department.

   Duties:
   - Responsible for administering the floodplain ordinance
   - Reviews and analyzes stormwater issues countywide both tidal and in-land flooding
   - Prepares grant applications
   - Provides public outreach and community engagement for flooding and environmental issues including but not limited to coastal resiliency, wetlands, beaches and coastal primary sand dunes and additional resource protection areas.
   - Represents the County at stakeholder meetings.

2. Create an assessment of stormwater drainage needs for 1-2 defined localities to inform needed projects to increase the resilience of these localities to flooding hazards.
   - The County will hire a consulting firm to conduct stormwater drainage assessments and provide project design plans.
   - The assessments will lead to projects that will address flooding issues, increasing resilience to storm and rain events. Project designs outlined will provide details for funding applications.
   - Stormwater drainage assessments are needed county-wide, and the goal for the County is to implement assessments and projects throughout all areas. The assessments conducted for the first 1-2 localities will serve as a model for county-wide implementation.

Activities

The below timeline assumes funding will be dispersed in Fall 2022. Due to the difficulty in hiring professionals with specific qualifications (i.e. required certification and knowledge) in rural communities, we have allotted 9 months between advertising and having the position filled. If awarded, the county will repurpose current staff to move this project forward until the duties are sufficiently assigned. Once this position is filled, the staff member will begin engaging with the community, partners, and stakeholders to develop and fund projects to enhance the resilience of Northampton County to flooding.

Target Timeframe	Activity
Summer 2022 (pre-award)	Develop position description/duties for Environmental Outreach and Certified Floodplain Manager
Fall 2022	Recruit for the Environmental Outreach and Certified Floodplain Manager position
Winter 2022	Determine 1-2 localities for stormwater assessment
Summer 2023	Train new and existing staff to perform duties of Environmental Outreach and Certified Floodplain Manager position
Spring 2023	Release request for proposals for consulting firm to conduct the defined stormwater assessment(s)
Fall 2023	Hire and orient consulting firm
Winter 2023	Consulting firm begins stormwater assessment
Summer 2024	Stormwater assessment complete
Fall 2024	Plan next steps for implementation of stormwater recommendations

Required Application Components (Part IV from the Round 3 Grant Manual)

1. *Assess capacity needs and assets*
    - County assets, in the form of businesses, agriculture, industry, communities and infrastructure, are at risk due to flooding, and that risk is predicted to worsen in the future with climate change.
    - The County anticipates additional opportunities to fund projects that will address flooding and needs the capacity to respond to these opportunities. Awareness of coastal flooding issues is the focus of Virginia's Coastal Resilience Master Plan, and there are plans to expand it into a statewide flooding resilience master plan. Currently, Virginia has appropriated funds through the CFPF, and federal government funds will address climate resilience through the nationwide Infrastructure Investment and Jobs Act initiative.
    - As in many rural counties, the staff within the Northampton County Planning Division is not large, and each person takes on numerous duties to fulfill all County needs. The County currently does not have a Certified Floodplain Manager (CFM) on staff. Using the funds proposed here, the County will hire an Environmental Outreach and Certified Floodplain Manager. As part of the outreach, this position will work proactively with landowners on resilience issues, thus preventing loss of wetlands and using more nature-based resilience planning and implementation.
    - The County is aware that stormwater management plans and projects are needed throughout the County, but they lack the staff to conduct the assessments and implement projects. The County will prioritize localities in need of improvements and will use funds from this proposal to hire a consultant to conduct the assessments and plan designs for improvements for 1-2 localities. We anticipate this to be the first of many such projects, but realizing that we cannot tackle all localities at one time, will prioritize, fund, and implement them as resources allow. Using project and design plans outlined in the resulting assessment, the County will apply for additional funding to implement the needed improvements to stormwater drainage to ameliorate the impacts of rainwater flooding.

2. *Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.*
    - The overarching goal for this proposal is to increase capacity within Northampton County to address flooding issues. First, to enable the County to manage flooding projects, including funding, implementation, and community outreach, we propose to hire an Environmental Outreach and Certified Floodplain Manager. Secondly, the need currently exists for stormwater drainage improvements in communities throughout the County. We also intend to use funds from this proposal to create a stormwater management plan for 1-2 localities, anticipating that this will be an ongoing process to encompass all stormwater management needs in the County. The CFM will enable the County to take a whole community approach to flooding resilience and create an ongoing plan for tackling those issues.

3. *Stakeholder identification, outreach and education strategies.*

    Community outreach and education is a large part of the duties of the County Planning office for every type of planning need. Stakeholders (homeowners, business owners, contractors, etc.) all need information regarding the specific problem and activity affecting them.
4. *Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc*.

    - Please see the Activities section on page 7 for these details.

5. *Parties responsible for capacity building and/or plan development process.*
    - Northampton County staff is responsible for hiring and assigning the duties of the Environmental Outreach and Certified Floodplain Manager and hiring a consulting firm to conduct a stormwater assessment for 1-2 localities identified by the County.
6. *Performance outputs and measures. Describe the expected results and benefits and how success will be measured.*
    - For this specific funding period, the outcomes will be the hiring of an Environmental Outreach and Certified Floodplain Manager and the creation of a stormwater management plan for 1-2 localities complete with needs and engineering plans.
    - Benefits from the funds requested go beyond the term of this funding, however. The intent is for the CFM position to be permanent, enabling the County to conduct future planning concerning flooding. This could include a Flooding Resilience Countywide Plan which will define projects that can be implemented using future funding opportunities, all of which the CFM can manage and execute.
    - The stormwater management plan created with this funding will define specific improvements needed such that funds can be sought and projects implemented.
    - The floodplain manager position will help the County acquire additional funding, such as through the CFPF or the Infrastructure Investment and Jobs Act, to implement proactive projects to increase flood resilience and prevent flooding.
7. *Plans for maintaining capacity, as necessary, over the long term.*
    - The Environmental Outreach and Certified Floodplain Manager duties and position are intended to be permanent and will be funded through public sources.

- Our goal is that the CFM will apply for future funding to assess and implement specific projects that increase flooding resilience.
- The Stormwater Drainage Assessment will identify projects for which funding will be sought for implementation. It will also inform the County in creating a county-wide stormwater plan.

Required Checklist Items (Appendix D from CFPF Manual)

- Link to current floodplain ordinance: https://codelibrary.amlegal.com/codes/northamptoncounty/latest/northampton_va/0-0-0-16924

- Current Hazard Mitigation plan: http://www.a-npdc.org/wp-content/uploads/2016/04/FullHMP2016.pdf

  Please note that the 2022 Eastern Shore Hazard Mitigation Plan rewrite is underway with the status at the following link https://a-npdc.org/accomack-northampton-planning-district-commission/coastal-resources/hazard-mitigation-planning/

- Current comprehensive plan: https://www.co.northampton.va.us/government/departments_elected_offices/planning_permiting_enforcement/planning/comp_plan

Figures and Photos

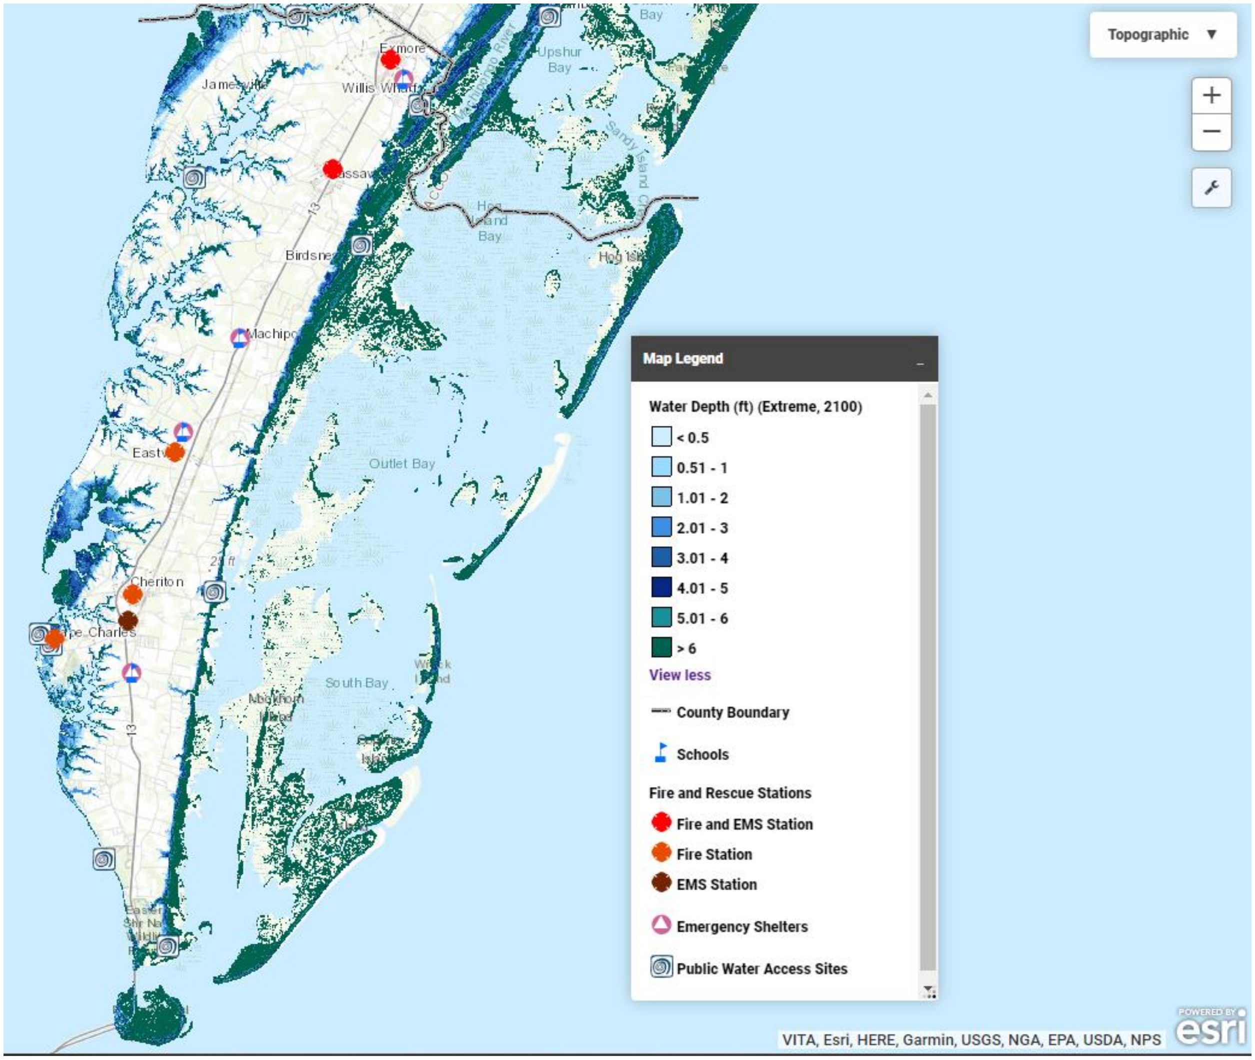

Figure 1: A plot of water depth on land areas due to sea level rise under an extreme sea level rise future scenario shown for the year 2100 as plotted by TNC's CR Too (maps.coastalresilience.org/virginia). Important community resources (fire and rescue stations and public boat ramps) are shown with icons.

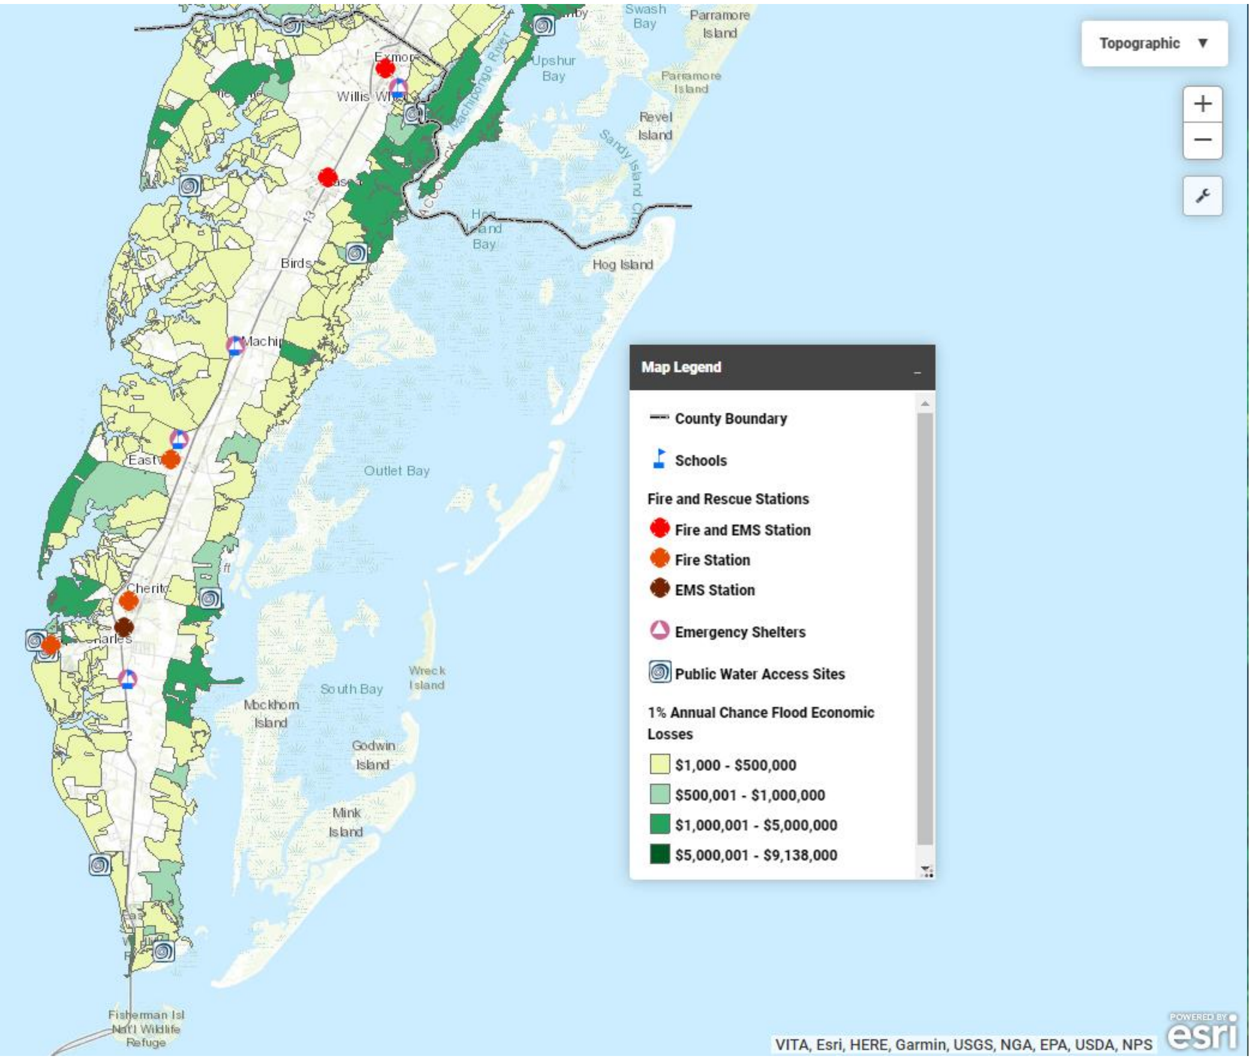

Figure 2: Shaded areas indicate areas with 1% annual chance of economic loss due to flooding (TNC's CR Tool; maps.coastalreseilience.org/virginia). The color of the shading indicates the amount of loss estimated. The data used in this analysis were generated using FEMA's HAZUS-MH risk analysis software and are derived from the maximum extent of modeled flooding at all locations across the Eastern Shore and are therefore not representative of any single flood event.

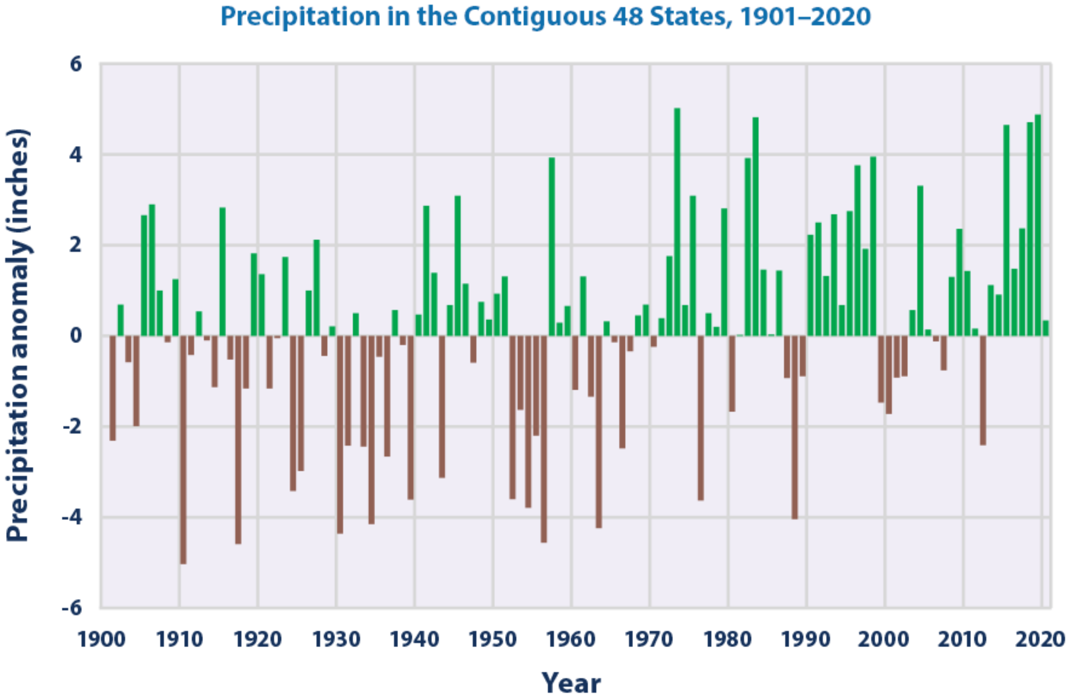

Figure 3: The total annual amount of precipitation in the contiguous 48 states has changed since 1901. This graph uses the 1901–2000 average as a baseline for depicting change. Choosing a different baseline period would not change the shape of the data over time. Image taken from the EPA website, https://www.epa.gov/climate-indicators/climate-change-indicators-us-and-global-precipitation (NOAA, 2021).

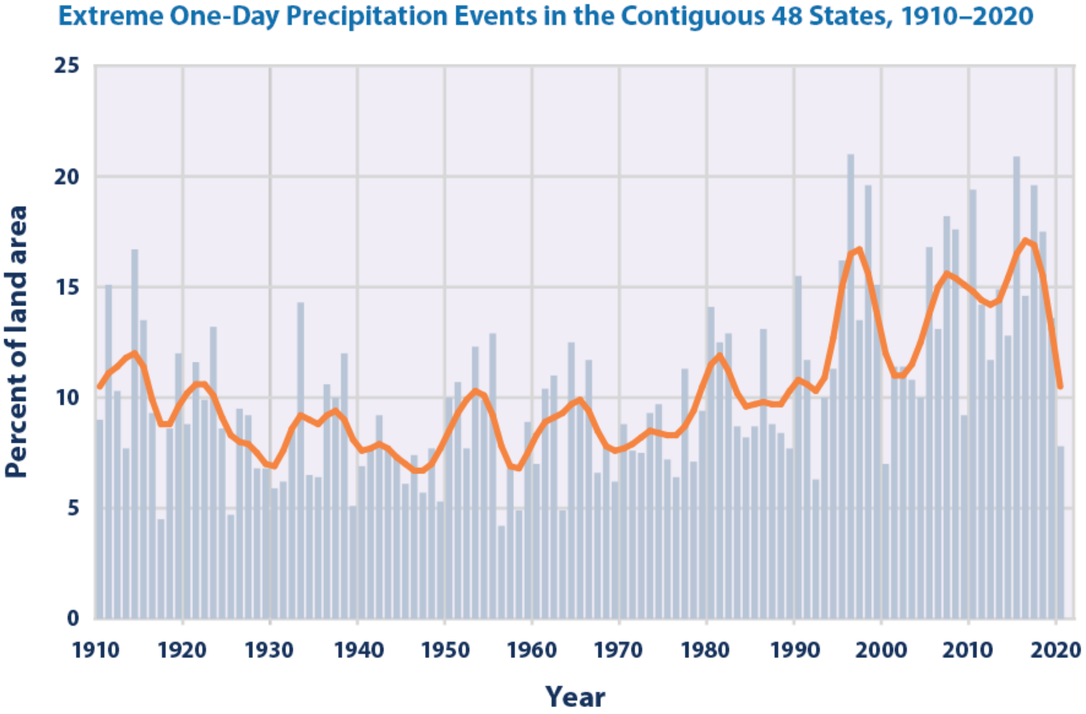

Figure 4: The percentage of the land area of the contiguous 48 states where a much greater than normal portion of total annual precipitation has come from extreme single-day precipitation events. The bars represent individual years, while the line is a nine-year weighted average. Image taken from the EPA website, https://www.epa.gov/climate-indicators/climate-change-indicators-heavy-precipitation (NOAA, 2021).

Photo 1: Flooding of Sunnyside Road and Broadwater Circle in the seaside community of Oyster due to storm surge.

Photo 2: Flooding of ditches and road on Church Neck Road, the only access to communities extending down Church Neck, due to rainfall and inadequate drainage.

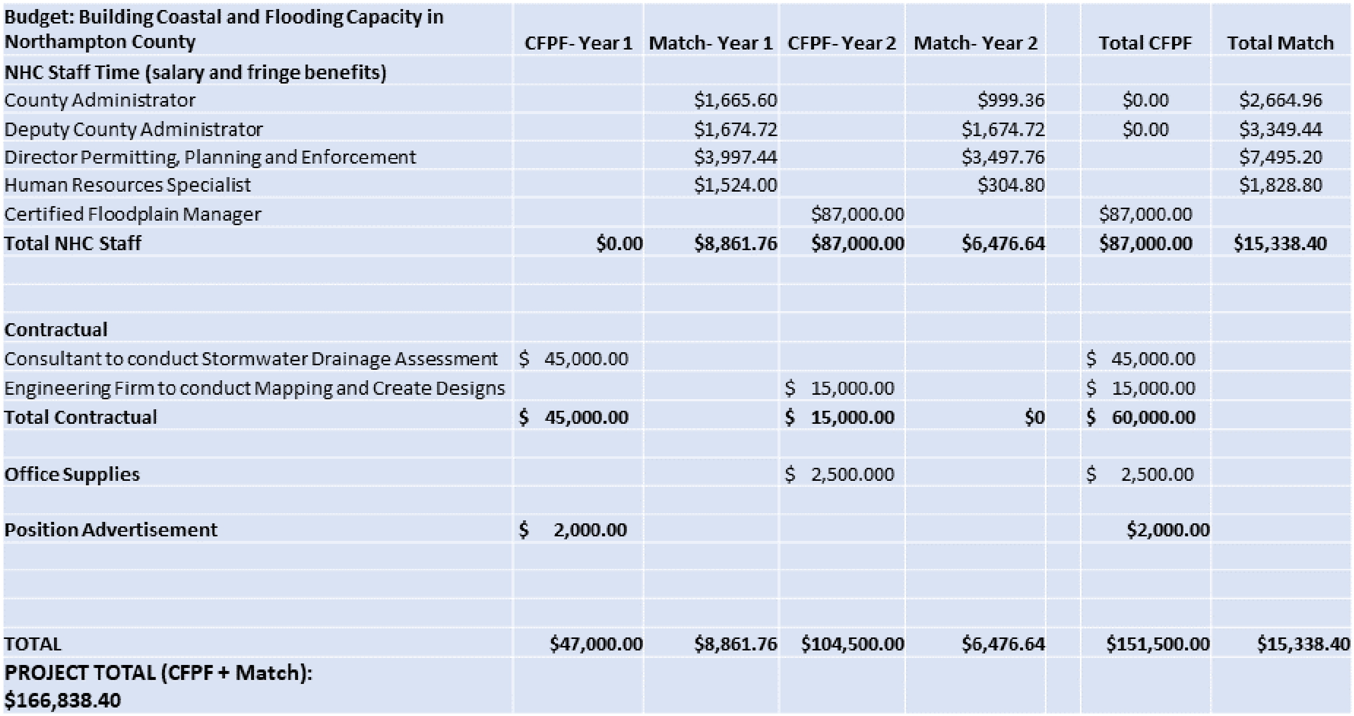
Photo 3: Flooding on Church Neck Road and adjacent farm fields from rainfall and inadequate drainage.

Photo 4: Flooding in the town of Nassawadox from rainfall and inadequate drainage.

Photo 5: Flooding of a farm field in the town of Nassawadox due to rainfall and inadequate drainage.

Photo 6: Flooding of a parking lot in the town of Nassawadox due to rainfall and inadequate drainage.

Budget Narrative



Budget: Building Coastal and Flooding Capacity in Northampton County	CFPF- Year 1	Match- Year 1	CFPF- Year 2	Match- Year 2		Total CFPF	Total Match
NHC Staff Time (salary and fringe benefits)							
County Administrator		$1,665.60		$999.36		$0.00	$2,664.96
Deputy County Administrator		$1,674.72		$1,674.72		$0.00	$3,349.44
Director Permitting, Planning and Enforcement		$3,997.44		$3,497.76			$7,495.20
Human Resources Specialist		$1,524.00		$304.80			$1,828.80
Certified Floodplain Manager			$87,000.00			$87,000.00	
Total NHC Staff	**$0.00**	**$8,861.76**	**$87,000.00**	**$6,476.64**		**$87,000.00**	**$15,338.40**
Contractual							
Consultant to conduct Stormwater Drainage Assessment	$ 45,000.00					$ 45,000.00	
Engineering Firm to conduct Mapping and Create Designs			$ 15,000.00			$ 15,000.00	
Total Contractual	**$ 45,000.00**		**$ 15,000.00**	**$0**		**$ 60,000.00**	
Office Supplies			$ 2,500.000			$ 2,500.00	
Position Advertisement	**$ 2,000.00**					**$2,000.00**	
TOTAL	**$47,000.00**	**$8,861.76**	**$104,500.00**	**$6,476.64**		**$151,500.00**	**$15,338.40**
PROJECT TOTAL (CFPF + Match): $166,838.40							

The total cost for this two-year project is $166,838.40 with $151,500.00 requested from the CFPF and $15,338.40 provided as match.

Staff time

Northampton County Staff (direct expenses):

- *Environmental Outreach and Certified Floodplain Manager* – Salary ($65,000) and employer cost (taxes, benefits and workers compensation, $22,000) for a total of $87,000. We anticipate that persons in this position would start working in Year 2 of the proposal.

Northampton County (match):

- *County Administrator* - Salary for time spent recruiting for the position, interviewing and hiring, management for the position as well as creating a Request for Proposal and hiring a consultant to conduct the stormwater assessment.
- *Deputy County Administrator* - Salary for time spent recruiting for the position, interviewing and hiring, management for the position as well as creating a Request for Proposal and hiring a consultant to conduct the stormwater assessment.
- *Director Permitting, Planning and Enforcement*- Salary for time spent recruiting for the position, interviewing and hiring, management for the position as well as creating a Request for Proposal and hiring a consultant to conduct the stormwater assessment.
- *Human Resources Specialist* – Salary for staff time spent hiring the new position.

Contractual

Funds to contract an engineering/consulting firm for mapping and civil engineering services for stormwater/drainage study at identified location(s) within Northampton County ($45,000) to take place in Year 1. We estimate an additional $15,000 for design services taking place in Year 2.

Supplies (match)
Office and other supplies to allow Northampton County Staff to perform duties associated with this award.

Position Advertisement
Cost to advertise the Certified Floodplain Manager position.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☒ Floodplain Staff Capacity.

☒ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies and development.
  - ○ Policy management and/or development.
  - ○ Stakeholder engagement and strategies.

Location of Project (Include Maps): Northampton County, Virginia

Community Flood Preparedness Fund Review Committee:

I am writing this letter to provide support for the North Hampton County's proposed project, *Building Coastal and Flooding Resilience Capacity in Northampton County*. The Nature Conservancy recognizes that the County needs additional capacity to deal with increasing threats from coastal and inland flooding, sea level rise and more intense and frequent storm events.

The proposal's scope of work represents a real effort by a local community and the Commonwealth of Virginia to address coastal and inland flooding as well as adaptation and resilience in a highly vulnerable, rural landscape by providing capacity to hire additional County staff to be proactive both with landowners dealing with these issues as well as to take advantage of new potential funding sources that will be provided by the state and federal governments in the next few years. Understanding the County's inland flooding is also critical and we support hiring a consultant to help develop a plan to deal with overflowing ditches, other drainage issues and access to important community assets.

Thank you for support of this project and feel free to contact me at jbieri@tnc.org or 757-442-5416 if you should any specific questions about this proposal.

Sincerely,

Jill Bieri
Director, Virginia Coast Reserve

Ms. Wendy Howard-Cooper
Director of Dam Safety and Floodplain Management
Virginia Department of Conservation and Recreation
600 East Main Street, 24th Floor
Richmond, VA 23219

RE: Authorization of City of Petersburg CFPF Project Application

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

The City of Petersburg has assembled the attached Project grant application to request Community Flood Preparedness Fund assistance to include recovery, demolition, and revitalization of the Old Ramada Inn site in the heart of the City. Petersburg is the gateway to Virginia from the South via I-95 and I-85. The recovery, demolition, and revitalization of this site will meet many of the Department's criteria for a successful project including acquisition of property consistent with an overall comprehensive or regional plan, floodplain restoration, and a nature-based approach of removal of a commercial structure from the floodway and floodplain. The resulting land conversion from impervious area to conserved open space will provide a multitude of floodplain related benefits. Ancillary benefits to the City of Petersburg & the Petersburg Region are the economic benefits associated with removal of this "eyesore" that sits along the I-95 corridor at the gateway to the City.

The City has been struggling to address this property since its abandonment in 2012, exploring many avenues; however, one of the biggest barriers may be the proximity of the floodway and floodplain of Lieutenants Run. This source of funding perfectly aligns many symbiotic objectives. As the City is a documented low-income geographic area, and the project site is within a designated Qualified Opportunity Zone, with a high social vulnerability index score, the City respectfully requests full funding of this project and a waiver of match funds. Please accept this letter as my authorization of the request for CFPF assistant to enable the City to make significant progress toward Resilience and equitable management of our floodplains.

Sincerely,

Kenneth L Miller

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

We were not quite able to full complete the application for demolition of the Roper Building…we just got the attached demo estimate from staff this morning (per the attached email). Nonetheless, I wanted to send you **everything we have right now** – including a cover letter signed by our Interim City Manager – in hopes that we will be able to proceed as demolition of the Roper Building has been deemed **very important** to DCR.

Please review the attached…and if feasible let me know if/how we can proceed. Thank you!!

Respectfully submitted,

Hey Aislinn,

I took a look at the "Lakemont" application documents, and the only comment I have at this point is that the "Appendix C" PDF seems to be the one for the Old Ramada Inn instead of the Lakemont Projects. If this was just an oversight and you have the Lakemont Historic Flood Data/Images file done and ready to review, please provide.

Thanks again for your help,

Darryl E. Walker

Darryl/Joanne,

I am aware of some comments to the cover letter and that I need to update the signatory for the application for CFPF-1 Old Ramada Inn, so I've attached those two documents for your review.

Here is the link for the CFPF-2 Lakemont package: CFPF-2

Could you please kindly review and provide comment for both by COB Wednesday, April 6, so that I can make the revisions and consolidate the package for submittal before Friday? This should include obtaining Mr. Miller's signature on the Cover Letter and the application.

Thanks,

Aislinn

Darryl,

Please follow this link to download CFPF Round 3 draft application components for the Old Ramada Inn site (380 E. Washington Street et al.): CFPF-1 Old Ramada Inn

The package includes as complete an application as I am able to assemble, given the information I have been provided to-date. Please note, the word document of the application which includes the cover and the scope and budget narratives has a few comments and one complete highlighted portion where input from the City would be beneficial.

Other items to note:

1. The application and the cover letter need to be signed by Mr. Turille
2. Please provide comments for the word document
3. Please review the Maintenance and Management Plan. We could consider using N/A in place of this document, but I will leave that up to the City's discretion and can revise accordingly.

Please provide comment/additional information as soon as possible.

Thanks,

Aislinn

Subject: FW: CID 510112 - Resilience Plan

Darryl,

I sent the initial Resilience Plan to Ms. Howard-Cooper since it will take her about a week to review, but if you have any comments or revisions please let me know, and I will make them at once! She wrote this, via email, in response to my question about whether it needed to go before Council: *"The plan can be a compilation of already adopted plans provided per instructions in Attachment G of the grant manual. If you are creating a new plan, it will need to be adopted by the community."* I will leave that decision up to the City.

Tomorrow, I will begin in earnest on the applications. Please provide any and all information in addition to what Joanne sent last week, specifically in regards to cost, about the old Ramada Inn building and the Roper Building. I also plan to reiterate the information from the BRIC grant for Lakemont, so if you can forward me any information you have from December that I might not have already, please do. Any information will help me to strengthen the City's applications.

Thanks,

Aislinn

April 8, 2022

Ms. Wendy Howard-Cooper
Director of Dam Safety and Floodplain Management
Virginia Department of Conservation and Recreation
600 East Main Street, 24th Floor
Richmond, VA 23219

RE: Authorization of City of Petersburg CFPF Project Application

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

The City of Petersburg has assembled the attached Project grant application to request Community Flood Preparedness Fund assistance to implement a flood prevention and protection project in the Lakemont Neighborhood. The project will result in the improvement of structural stormwater conveyance systems that will provide community scale benefits in an underserved section of the City.

The City has been relying on key partnerships and funding assistance to make progress in addressing historic and repetitive localized flooding in this neighborhood because of antiquated and insufficient storm sewer systems, and the Community Flood Preparedness Fund is an ideal opportunity to expand on previous partnerships that focused more on water quality and less on the management of the quantity of stormwater runoff. As the City is a documented low-income geographic area, and the project site is within a designated Qualified Opportunity Zone, with a very high social vulnerability index score, the City respectfully requests a waiver of the full match requirement. Please accept this letter as my authorization of the request for CFPF assistant to enable the City to make significant progress toward Resilience and equitable management of our floodplains.

Sincerely,

Kenneth L Miller

Kenneth Miller
Interim City Manager

Appendix A: Application Form for Grant Requests for All Categories

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Telephone Number: (804) 733-2357 **Cell Phone Number:** (____) ____

Email Address: dwalker@petersburg-va.org

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☒ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Lakemont Neigbhorhood, Petersburg, VA 23803
refer to Appendix A for Detailed Maps of the Project Area

NFIP Community Identification Number (CID#):(See appendix F 510112

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes ☒ No

Flood Zone(s) (If Applicable): N/A

Flood Insurance Rate Map Number(s) (If Applicable): 5101120007C eff. 2/4/2011

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

We were not quite able to full complete the application for demolition of the Roper Building…we just got the attached demo estimate from staff this morning (per the attached email). Nonetheless, I wanted to send you **everything we have right now** – including a cover letter signed by our Interim City Manager – in hopes that we will be able to proceed as demolition of the Roper Building has been deemed **very important** to DCR.

Please review the attached…and if feasible let me know if/how we can proceed. Thank you!!

Respectfully submitted,

Darryl E. Walker

Subject: Re: CID 510112 - Resilience Plan

Good morning,

I have attached the demolition estimate for the Roper Brother building. During our walk through of the property and building it was found that the structure is currently being used by the police department. If you have any questions about this, please let me know.

Thank you,

Bradley Shupp

Hey Aislinn,

I took a look at the "Lakemont" application documents, and the only comment I have at this point is that the "Appendix C" PDF seems to be the one for the Old Ramada Inn instead of the Lakemont Projects. If this was just an oversight and you have the Lakemont Historic Flood Data/Images file done and ready to review, please provide.

Thanks again for your help,

Darryl E. Walker

Good Afternoon Everyone,

Attached is a revised cover letter for the Old Ramada Inn Project…changed the signature section at the bottom (Joanne, did not see an amount in this letter, so nothing to change there).

I have copied Armesha Moody so that we may work to get this letter put on letterhead and signed by the Interim City Manager…hopefully by COB. If additional assistance is needed, please let me know.

Thanks much,

Darryl E. Walker

Darryl/Joanne,

I am aware of some comments to the cover letter and that I need to update the signatory for the application for CFPF-1 Old Ramada Inn, so I've attached those two documents for your review.

Here is the link for the CFPF-2 Lakemont package: CFPF-2

Could you please kindly review and provide comment for both by COB Wednesday, April 6, so that I can make the revisions and consolidate the package for submittal before Friday? This should include obtaining Mr. Miller's signature on the Cover Letter and the application.

Thanks,

Aislinn

Subject: RE: CID 510112 - Resilience Plan

Darryl,

Please follow this link to download CFPF Round 3 draft application components for the Old Ramada Inn site (380 E. Washington Street et al.): CFPF-1 Old Ramada Inn

The package includes as complete an application as I am able to assemble, given the information I have been provided to-date. Please note, the word document of the application which includes the cover and the scope and budget narratives has a few comments and one complete highlighted portion where input from the City would be beneficial.

Other items to note:

1. The application and the cover letter need to be signed by Mr. Turille
2. Please provide comments for the word document
3. Please review the Maintenance and Management Plan. We could consider using N/A in place of this document, but I will leave that up to the City's discretion and can revise accordingly.

Please provide comment/additional information as soon as possible.

Thanks,

Aislinn

Subject: FW: CID 510112 - Resilience Plan

Darryl,

I sent the initial Resilience Plan to Ms. Howard-Cooper since it will take her about a week to review, but if you have any comments or revisions please let me know, and I will make them at once! She wrote this, via email, in response to my question about whether it needed to go before Council: *"The plan can be a compilation of already adopted plans provided per instructions in Attachment G of the grant manual. If you are creating a new plan, it will need to be adopted by the community."* I will leave that decision up to the City.

Tomorrow, I will begin in earnest on the applications. Please provide any and all information in addition to what Joanne sent last week, specifically in regards to cost, about the old Ramada Inn building and the Roper Building. I also plan to reiterate the information from the BRIC grant for Lakemont, so if you can forward me any information you have from December that I might not have already, please do. Any information will help me to strengthen the City's applications.

Thanks,

Aislinn

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

- ☒ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☒ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☒ Studies and Data Collection of Statewide and Regional Significance.

☒ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☒ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): WITHIN MUNICIPAL BOUNDARY OF TOWN OF OCCOQUAN, VA

NFIP Community Identification Number (CID#):(See appendix F)___510124_________________

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): ____

Flood Insurance Rate Map Number(s) (If Applicable): ______51153C0217D________________________

Total Cost of Project: ______$175,000_____________________________________

Total Amount Requested ____$131,250________________

Town of Occoquan Resilient Stormwater and Flood Management Study and Implementation Plan

The Town of Occoquan (Town) is applying for this grant assistance under the Virginia Department of Conservation and Recreation (DCR) Community Flood Preparedness Fund (CFPF) Round 3 'Study' category for a new study that evaluates the town's stormwater and flood resilience and ultimately results in an actionable plan that when implemented, increases the town's overall resilience and responds to the impacts of climate change within the community and region.

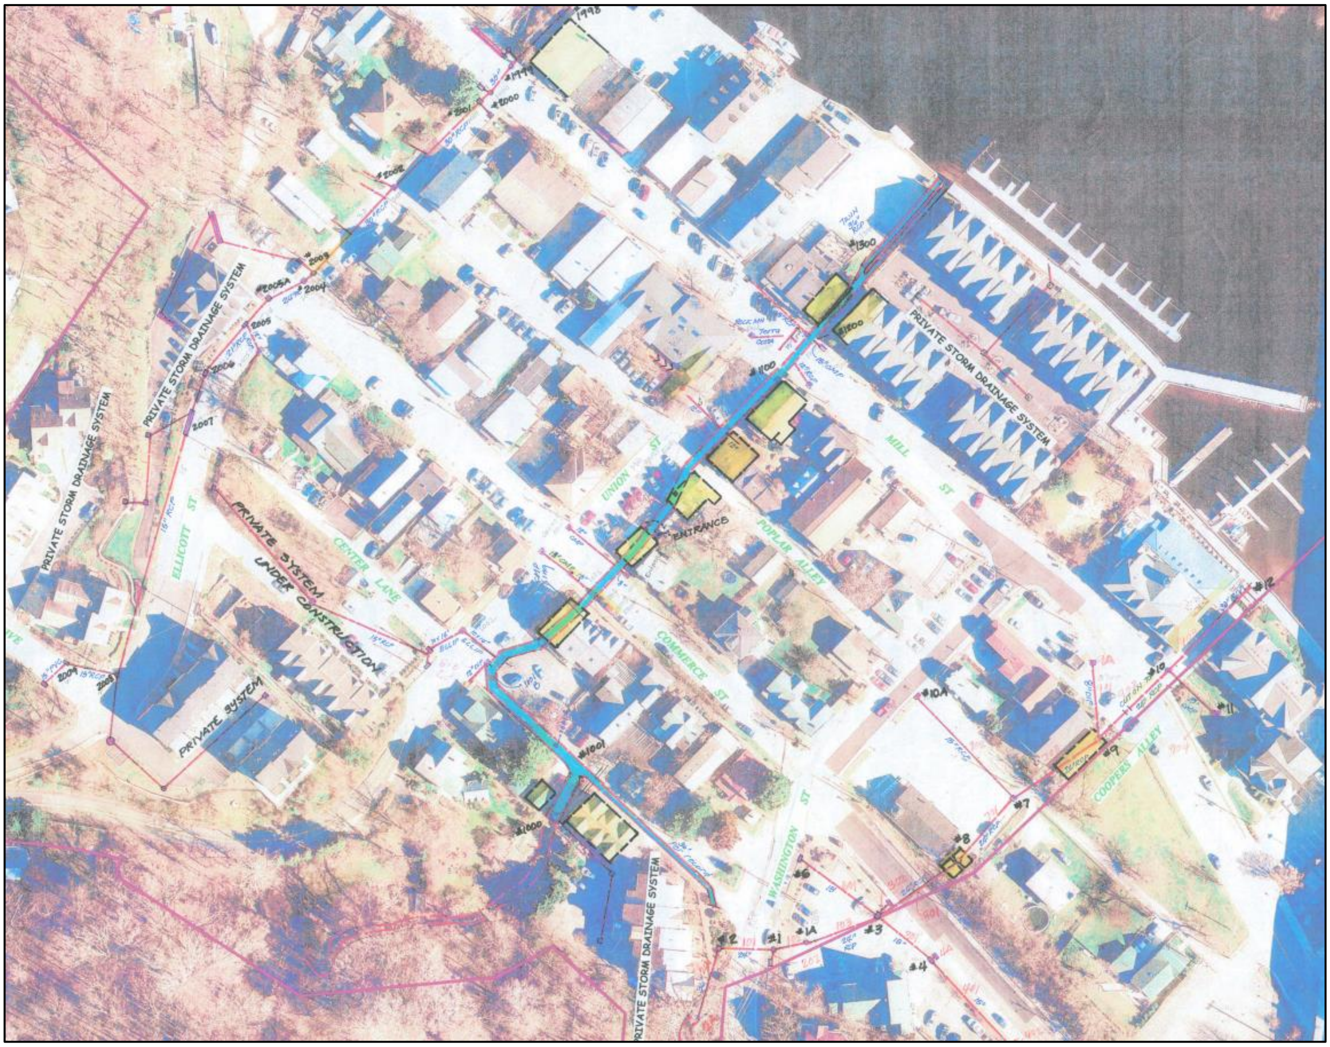
The project, *Town of Occoquan Resilient Stormwater and Flood Management Study and Implementation Plan*, is focused on evaluating the town's existing conditions, future conditions, and provides an actionable plan that incorporates flood resilience goals, considers capacity, and identifies opportunities for green infrastructure throughout the community. This Plan will aid the Town in implementing a comprehensive stormwater and flood management program and guide investment into projects aimed at enhancing and supporting the town's resilience goals today and into the future.

While a community Resilience Plan is not required for submission under the 'study' category according to the 2022 Grant Manual for the Virginia CFPF, the Town will be submitting a Resilience Plan for consideration by DCR in April 2022. The Town has integrated flood mitigation and resilience goals across areas of the local government, with flood resistance and stormwater management a priority addressed through our comprehensive planning and town ordinances and policies. This project will advance the town's priorities identified in these plans and policies, especially as it relates to building a resilient stormwater and flood management program for the community.

I. Background Information

The Town of Occoquan experiences periodic flooding, particularly in the spring and fall, from two primary sources. First among these is the Occoquan River. Flooding associated with spring thaws and rains to the west, and fall hurricanes or tropical storms that create a tidal bore, are fairly common, occurring roughly every other year.

The second primary source of flooding in Occoquan is flash-flooding from two major streams that flow through town to the Occoquan River – Ballywhack Creek and Boundary Branch. This flooding is much less predictable, affects inland properties in town, endangers traffic on major streets in town, and threatens damage to the town's stormwater system. Each of these tributaries originates outside of town, thus drawing from watersheds well beyond town boundaries, and is significantly affected by development and stormwater practices beyond the town's control. Sitting at the bottom of hillsides along the banks of the Occoquan River, the Town of Occoquan and its stormwater management system is a recipient of runoff, some uncontrolled, from developments and roadways outside of Occoquan.



[Map 1] Town of Occoquan Downtown along the Occoquan River, 2018. Existing locations of the three main stormwater systems that run through Occoquan and exit into the Occoquan River: Ellicott Street system, Union Street System and Coopers Alley System. The Town of Occoquan has responsibility for management of its Stormwater Program.

The Town is responsible for managing and administering its stormwater program, including maintenance of existing stormwater structures, and planning for capital improvements to the system in response to existing needs and anticipated future needs caused by increased development in the region and impacts from climate change.

In 2018, the Town partnered with Prince William County to conduct a preliminary investigation and evaluation of the town's three main stormwater systems that run through the historic district and discharge directly into the Occoquan River. Since then, the Town has been working closely with Prince William County to assist the Town in performing a comprehensive review of the town's stormwater program, including mapping and evaluating existing public underground and surface infrastructure, locating and evaluating private facilities that feed into the town's system, as well as identifying opportunities for stream restoration and projects to combat impacts from climate change. The Town's intent is to incorporate natural elements to aid in stormwater management and to combat climate change. Part of this assessment includes evaluating the stormwater management program within the town and establishing a Stormwater Utility Fee to aid in maintaining and upgrading the town's infrastructure now and into the future.

II. Project Information

The Town of Occoquan is seeking this grant request to fund development of *Town of Occoquan Resilient Stormwater and Flood Management Study and Implementation Plan*. The Town has been subject to various flooding events over the years and has limited historical or existing conditions information and data to evaluate and plan for the future of the town's stormwater program, including the community's flood resilience. This study, once completed, will provide the Town with invaluable data on existing conditions, future conditions, and provide an actionable plan that incorporates flood resilience goals, considers capacity, and identifies opportunities for green infrastructure throughout the community. This Plan will be the launching pad for the Town to invest in and modernize our stormwater program to reduce flood risk, incorporate green infrastructure that addresses stormwater quality and quantity, respond to climate change, as well as increase quality of life and natural beauty within our community.

a. Scope of Work

The following Scope of Work outlines the intended process and deliverables associated with the development of the *Occoquan Resilient Stormwater and Flood Management Study and Implementation Plan*. The funding requested through this grant program will fund the development of this Plan.

Task 1. Project Kickoff

1.1 <u>Project Kickoff Meeting</u>
At the onset of the project, the Project Team will review and commit to a detailed proposed schedule, which outlines key milestones, including projected meeting dates. An agreed-upon schedule will ensure that the project keeps moving forward and is completed within the grant timeframe required by the funder, the Virginia Department of Conservation and Recreation. All of the FY23 activities will be completed by June 30, 2023, so that Occoquan can receive all Community Flood Preparedness funds allocated to them for FY23.

1.2 <u>Collect Background Information</u>
As much historical information as possible will be gathered and reviewed regarding the condition of the town's drainage system, where available.

Task 2. Flood Resilience Assessment

An assessment of flood vulnerability will be performed using a Hydraulic and Hydrologic model and a field survey of the current condition of the town's stormwater system.

2.1 <u>Field Data Collection Survey</u>
The purpose of the data collection efforts, identified in the following sub-tasks, is to minimize data gaps by collecting an appropriate level of data to cost-effectively estimate future project costs. Where insufficient data is available to develop a reasonable cost estimate for a particular project, the tasks and associated cost to obtain will be estimated. A data gap analysis will be used to identify projects that may not be ready to proceed during the early stages of the plan. It will also be utilized to identify data gathering tasks that could be added to early phases of the plan to facilitate future projects.

Two to three weeks of field effort will be conducted by two stormwater trained professionals to verify connectivity, as well as to establish an accurate and complete the town stormwater GIS layer. Collected data may include topography, drain manholes, catch basins, outfalls, and numerous other physical features such as roadways, parcels, and water ways. The Town will update their stormwater GIS data based on information obtained through this project's data gathering efforts.

The consultant will conduct surveys, geotechnical, and groundwater investigations to inform the design process and project feasibility. The following items are associated with this investigation task:

a. GPS all encountered drainage structures, and locations where historical structures reportedly existed;
b. Main channel and stream embankment debris, channel cross-section, slope, sinuosity, and existing erosion/deposition features, identify reference reaches along the channel for periodic flow and velocity measurements;
c. Locations of embankment erosion;
d. Type and condition of culverts and headwalls;
e. Types and location of aquatic and surrounding upland vegetation;
f. Photos documenting the condition of outlets to the Occoquan River and contributing drainage system;
g. Ground elevations and physical structures at numerous points of interest in the watershed in the project areas of interest (e.g., known areas of flooding, existing culverts, etc.); and
h. Geotechnical and groundwater surveys to further the understanding of given pilot project site constraints, concerns, and requirements.

Flood prone areas, as identified by municipal staff and residents, will also be evaluated to gain a better understanding of potential improvements required to mitigate flooding issues. It is estimated that the town has areas of localized flooding that will be evaluated as part of the project. A site visit will be conducted at each location to document existing conditions and identify potential solutions. This may also include meeting with impacted residents to gain a better understanding of flooding issues that directly impact them. At some locations, the solution may require a phased approach that includes evaluation, design, and construction phases. The goal at each location will be to eliminate localized flooding while incorporating green infrastructure/low impact development (GI/LID) practices, where feasible.

The purpose of the investigation of flood prone areas is to minimize data gaps by collecting an appropriate level of data to cost-effectively estimate future project costs. Where insufficient data is available to develop a reasonable cost estimate for a particular project, the tasks and associated cost to obtain will be estimated. A data gap analysis will be used to identify projects that may not be ready to proceed during the early stages of the plan. It will also be utilized to identify data gathering tasks that could be added to early phases of the plan to facilitate future projects.

All field collected data will provide condition assessment information that will be utilized to better predict future project costs. Condition information collected regarding the condition of the town's stormwater drainage system will be compiled in a format compatible with the town's existing GIS database and displayed on a series of maps. A visual representation of the wide-ranging data will be used to understand the "big picture"; create a list of potential projects; develop rating criteria to prioritize the projects; identify gaps in the available data; and ultimately, present the *Town's Resilient Stormwater and Flood Management and Implementation Plan*. The maps and data will also provide a visual tool to help the public to better understand the nature and scope of the town's stormwater issues. Each site identified will have a project summary that will include the potential GI approach, brief narrative, benefits anticipated, and estimated cost for design and construction.

Deliverables:

- *Existing Conditions Memo*
- *GIS Layers*
- *List of actions to address data gaps*

2.2 Hydraulic & Hydrologic Study

The project consultant will develop a detailed Hydraulic and Hydrologic (H&H) model to assess the capacity of the town's stormwater system. The H&H model will assess the stormwater and riverine conditions.

The H&H model will evaluate flooding extents, depths, and durations throughout the study area. The model will include upstream drainage areas that are expected to contribute runoff in the study neighborhood. The anticipated drainage area is approximately 390 acres. That area will be broken up into several subcatchments based on watershed hydrology, topography, land use patterns, and the locations of outfalls, catch basins, and other stormwater infrastructure. Input parameters representative of those subcatchments will be derived from Occoquan's existing records.

The runoff hydrographs generated by these subcatchments will be routed into a 1D framework consisting of a series of nodes and conduits. Nodes define the rim and invert elevations of various manholes and catch basins or the channel bottom and bank elevations of open channels. These elevation data will be obtained from available town records, the latest available LiDAR, or during consultant field investigations. Nodes are connected by conduits, which may represent closed storm drain systems or open channel flow. The dimensions of these conveyances will be derived from existing town records, potentially from existing FEMA models, or from consultant field investigations.

The hydrologic and hydraulic (H&H) is expected to be conducted using the PCSWMM modeling platform. Based on the EPA's Storm Water Management Model (SWMM) model, PCSWMM can evaluate the land's runoff response to various rainfall events and the movement of runoff through open channel, closed pipe systems, and surface flooding in streets. Also, it is anticipated that the traditional 1D model framework of nodes and conduits will be overlayed with a 2D mesh to better understand the extents, depths, and durations of flooding and to better understand present and future flood impacts in the community. To ensure the model's accuracy and usefulness, it will be calibrated against historical observations of flooding within the project area.

If needed, the Project Team will collect additional information for input into the model through field investigations.

The model will be used to evaluate the magnitude and associated impacts of inland flooding during a range of design events (e.g. 2-, 10-, 25-, 100-year), under both baseline and future climate scenarios. Baseline design rainfall depths and temporal distributions for the neighborhood will be derived from NOAA Atlas 14 data. The specific rainfall events and scenarios, including planning horizons and storm recurrence intervals used to drive the inland flooding analyses will be selected in collaboration with the Town.

2.3 Green Infrastructure Assessment

The *Occoquan Resilient Stormwater and Flood Management and Implementation Plan* will include an assessment of the opportunities to implement green infrastructure. Green infrastructure (GI) and low impact development (LID) are considered climate resilience best management practices and will be considered as part of the action development. Green infrastructure experts will look for opportunities to capture runoff from large impervious areas and convert as much of that volume into infiltration loss or detention storage for slow release. By increasing infiltration through green infrastructure designs, up to the 95th percentile (2 inches of runoff) of all rainfall events that occur in a year can be captured and stored. On an annual basis, this can be a significant volume capture and removal of pollutant loads.

The addition of GI and more vegetative planting will also be assessed for reduction of the Heat Island Effect. The I-Tree tool may be used to quantify the Greenhouse Gas (GHG) emission reductions and stormwater runoff reduction due to adding plantings. The application of this tool will help Occoquan respond to higher temperatures by increasing the urban forest and tree plantings. This will also provide direction for future planning for tree plantings and expected benefits.

Deliverables:

- *Green Infrastructure Opportunities Analysis*
- *List of opportunities to implement green infrastructure*
- *I-Tree Tool Assessment*

Task 3. Public and Stakeholder Engagement

3.1 Public Engagement

The consultant, working closely with the Project Team, will develop an internal and external outreach program for presenting the *Occoquan Resilient Stormwater and Flood Management and Implementation Plan* to the elected body and relevant town department, Prince William County and other surrounding localities, and external stakeholders. Target stakeholders are identified as property owners, businesses, residents, non-profit organizations, and other entities that have a direct interest in the outcome of the plan.

The Project Team will leverage existing platforms to disseminate new materials relating to the relationship between stormwater management and climate resilience, such as volunteer outings, the Town's website, mailings, and tabletop displays. The project team will also share public engagement material linking stormwater and climate resilience with the Northern Virginia Regional Hazard Mitigation Plan Committee and the Chesapeake Watershed campaign to reach the regional stakeholders. The Project Team will attend or host two to three public events or create tabling materials for existing events. The workshops will ground truth flooding and urban heat challenges, gather input for the plan, and inform participants about the link between stormwater flooding and climate change. Proposed updates to the town's stormwater guidance and rules and regulations will be shared through public meetings and or an online portal with feedback which will be available for residents, developers, businesses and surrounding communities. The consultant will also work with the Town to present the final report to the public.

Deliverables

- *Event materials for two to three dual purpose tabling events or workshops to educate the public and collect input*
- *Informational and web content will showcase the climate resiliency components of the project and areas where the public can participate and will include:*
- ▪ *Up to two fact sheets or promotional flyers*
- ▪ *Website content*
- *Up to five promotional and educational social media posts on the:*
- ▪ *Town of Occoquan, Facebook*
- ▪ *Town of Occoquan, Instagram*
- *List of actions identified by the community*

Task 4. Action Identification

The consultant will generate a list of actions to review and discuss with the Town. The Town will further develop plan scope and add any additional projects that should be considered.

General project types will include:

- Inspection and/or rehabilitation of critical stormwater infrastructure (culverts, pipes, stream channels);
- Design of improvements to eliminate localized flooding issues, including retrofit of the existing drainage system, to incorporate BMPs that encourage green infrastructure practices and help improve water quality, reduce flooding, and reduce urban heat island effect; and
- Drainage system operation & maintenance needs so that the Town may ultimately move from a reactive to a proactive approach

Culverts identified for future repair will be included as separate projects within the Plan and will be assigned planning level repair costs. It is anticipated that many culverts will require a complete structural evaluation to fully understand the extent of repairs that will be required, and costs for additional evaluation will be incorporated into the Plan. An allowance will also be factored into repair deficiencies that may be identified during the evaluation.

Deliverables:

- *Plan scope*
- *List of culverts and planning level repair costs*
- *List of compiled project ideas*

Task 5. Action Prioritization

An equitable climate resilience-based approach will be utilized to analyze and prioritize the town’s stormwater capital needs. The prioritization will be based on the probability of failure, climate change resilience potential, social impact, and the magnitude of the consequence of failure. The probability of failure will be based upon the age and the overall condition of the asset. Rating criteria will vary based on the asset type, but could include costs and operational feasibility. Consequence of failure categories to be considered may include, but are not limited to, impacts to health and safety, potential for property damage, cost of deferred maintenance, the number of people impacted, impacts to traffic, and the impact on town development priorities. The consultant and the Town will discuss and finalize the selection of evaluation criteria under which each identified action will be ranked with the Project Team input.

Some of the factors may be weighted more heavily to arrive at a final project score and ranking. Action prioritization may not always be consistent with the rating system. In some respects, projects may be grouped together. If a project is critical to the success of another highly rated project, the two projects will be grouped and completed together. Other adjustments will be made, as needed, to decrease total project cost through economy of scale. The action priority ranking will be reviewed with the Project Team to arrive at a final consensus regarding the weighting and ranking of projects. A final combined ranked table will be presented. In addition, for priority actions with opportunities for natural drainage enhancement that are readily apparent, a separate field in the prioritization matrix will be added to highlight these projects. If two projects are closely ranked, the project that has known potential for natural drainage enhancement will be given priority in the implementation of the overall plan.

The recommended actions will be displayed on a series of maps and the following implementation chapter will focus on the recommended actions.

Deliverables:

- *List of recommended or prioritized actions*
- *Map showing locations of recommended actions identified under the Plan*

Task 6. Implementation Chapter

In developing a multi-year implementation chapter of the Plan, several factors will be evaluated to determine the appropriate length, for example, a fixed annual expenditure, a fixed plan length, or limitations on the amount of work that can reasonably be completed per year. The implementation chapter will guide the town's efforts to modernize its stormwater collection system, while ensuring that adequate funding is available. Development of an implementation chapter for prioritized actions will help ensure the protection of flood prone areas and improve overall water quality. By completing actual field reconnaissance during the plan's development to collect condition assessment data, as proposed, a more accurate assessment of future program costs can be generated. The implementation chapter will also include information about operation and maintenance.

The *Occoquan Resilient Stormwater and Flood Management and Implementation Plan* will include an operational assessment of the staffing, resources, equipment, and department organizational approach to implement stormwater services. The operational assessment will be based on a review of existing budgets, services conducted, and the organizational structure of the town departments that are involved in stormwater management. Recommendations for possible reorganization to improve stormwater management and services and a comparison of this reorganization against current conditions will be a part of the final deliverable. Recommendations will be presented based on improved integration, collaboration, performance, costs, and training needs. A cash flow diagram will be developed to assess the plan's compatibility with available funding sources. Recommended adjustments will be proposed as needed to help the Town balance the level of funding need with the capital and operation & maintenance recommendations outlined in the plan.

Deliverables:

- *Implementation chapter*
- *Operational assessment*
- *Cash flow diagram*

Task 7. Reporting and Grant Management

The Project Team will prepare regular reports to monitor the budget and schedule for submittal to DCR. The project team will draft the *Occoquan Resilient Stormwater and Flood Management and Implementation Plan* report based on the work and findings of the previous Tasks. The *Resilient Stormwater and Flood Management and Implementation Plan* components will include the following:

- Summary of Existing Stormwater System Conditions and Projected Climate Impacts
- Green Infrastructure Opportunities Map and Recommendations
- Culvert Evaluation and Rehabilitation Project List
- Project Prioritization Methodology and Prioritization Matrix
- List of Prioritized Projects and Implementation
- Operational Assessment

Project Timeline

b. Budget Narrative

The *Occoquan Resilient Stormwater and Flood Management and Implementation Plan* will be conducted as one study within FY2023. The total project is estimated to cost $175,000. The Town respectfully requests 75% of the estimated total project cost to be funded by this grant: $131,250. The Town has included the funding request, including a 25% Town match, in its FY2023 Capital Improvement Program Proposed Budget. The Town Council also passed a Resolution of Support committing to submit this grant request and identify and allocate the necessary funding depending on the success of this grant request.

Appendix C: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	TOWN OF OCCOQUAN, VA	
Eligibility Information		
Criterion	Description	Check One
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application? N/A		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration		☐ Yes ☐ No
Applicant Name:	TOWN OF OCCOQUAN, VA	
Scoring Information		
Criterion	Point Value	Points Awarded
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	30
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	15
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	45
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	
☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include	**45**	45

projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.		
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	50	50
☐ Regional hydrologic and hydraulic studies of floodplains.	45	45
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	40	40
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	35	35
7. Is the study area socially vulnerable? (**Based on** [ADAPT VA's Social Vulnerability Index Score.)])		
Very High Social Vulnerability (More than 1.5)	15	
High Social Vulnerability (1.0 to 1.5)	12	
Moderate Social Vulnerability (0.0 to 1.0)	8	8
Low Social Vulnerability (-1.0 to 0.0)	0	0
Very Low Social Vulnerability (Less than -1.0)	0	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	10	
No	0	X
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	10	
No	0	X
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	5	5
No	0	
Total Points		318

TOWN OF OCCOQUAN, VIRGINIA
RESOLUTION

RESOLUTION ENDORSING SUBMISSION OF AN APPLICATION TO THE VIRGINIA COMMMUNITY FLOOD PREPAREDNESS FUND GRANT

WHEREAS, one of the highest natural risks to affect the Town of Occoquan according to the 2018 Northern Virginia Hazard Mitigation Plan is flooding and flash flooding; and

WHEREAS, since its inception, the Town of Occoquan has managed its stormwater program and participates regionally on planning efforts to increase community resiliency; and

WHEREAS, the Virginia Department of Conservation and Recreation (DCR) manages the Virginia Community Flood Preparedness Fund (CFPF) to provide support for regions and localities across Virginia to reduce the impacts of flooding by empowering communities to develop and implement action-oriented approaches to bolster flood preparedness and resilience; and

WHEREAS, DCR has solicited applications for competitive awards through three (3) eligible categories: planning and capacity building, flood prevention and protection studies, and projects; and

WHEREAS, the fund prioritizes the availability of funding for localities to develop and implement a comprehensive, whole community approach to flood preparedness and resilience to ensure coordinated mitigation efforts are maintained and enhanced by all stakeholders; and

WHEREAS, town staff has recommended that this funding be used to retain a firm to develop a Town of Occoquan Resilient Stormwater and Flood Management Study and Implementation Plan that focuses comprehensively on the town's stormwater program and integrates historical data, analyzes existing and future conditions, capacity, and mitigation concepts to enhance the Town's resilience to floods; and

WHEREAS, if awarded, the grant budget will be established on a reimbursement basis; and

WHEREAS, the CFPF grant requires a 25% funding match, totaling $37,500 for this application and has been incorporated into the Town of Occoquan FY2023 Capital Improvement Program.

NOW, THEREFORE, BE IT RESOLVED, the Occoquan Town Council, meeting in regular session this 5th day of April, 2022 endorses submission of an application for such purpose to the Virginia Department of Conservation and Recreation's Virginia Community Flood Preparedness Fund Grant.

Adopted by the Town Council of the Town of Occoquan, Virginia this 5th Day of April 2022.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project): Acquisition of land; restoration of natural features

Project Grants (Check All that Apply)

☒ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☒ Floodplain restoration.
☐ Construction of swales and settling ponds.
☒ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☒ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☒ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply) N/A

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants N/A

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Mayo Island (37.529252, -77.433230)

NFIP Community Identification Number (CID#):(See appendix F 510129

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Regulatory Floodway within Special Flood Hazard Area (Zone AE)

Flood Insurance Rate Map Number(s) (If Applicable): Panel 0043E

Total Cost of Project: $11,500,000.00

Total Amount Requested $9,200,000.00

Scope of Work

1. Project Information:

The City of Richmond seeks $9.2 million in funding from the Community Flood Preparedness Fund to support its acquisition of the 14.5-acre privately owned Mayo Island located in the James River. The property is located entirely within the Federal Emergency Management Agency's Regulatory Floodway Zone AE of the Special Flood Hazard Areas. It is also located in an Intensely Developed Area that overlays the Resource Protection Area of the Chesapeake Bay Preservation Area while the remainder of the island is Resource Management Area.

Mayo Island has a long history dating to the 18th century when the first bridge was erected to connect the north and south side of the James River in Richmond, Virginia. Various bridges to the island would be washed out by flooding over the centuries and the island itself would become inundated on numerous occasions. The most memorable occasions occurred in 1969, 1972, and 1985 and subsequently lead to the construction of the Richmond Floodwall that was completed in 1995. Mayo Island is one of just two privately owned islands that make up the archipelago of islands between the floodwalls. It is the largest island and also the only developed one due to the bridge that connects into Richmond to Manchester at grade.

Population:
As of April 1, 2020, the U.S. Census Bureau reports the population of the City of Richmond to be 226,610. Racially, the demographics of the City are 46.1% Black or African America and 45.2% White. 20.9% of the population live in poverty. Mayo Island is located in Census Tract 610.02, which is also identified as Opportunity Zone Census Tract ID 517600610000 by the Internal Revenue Services. Demographics specific to this geographic area are 47.1% White and 35.8% Black or African American. This particular project is located in a low-income geographic area as defined in the DCR 2022 Grant Manual.

According to the Trust for Public Land ParkServe model, 1,447 people live within the 10-minute walk model. However, within 1-mile of the property that population is growing at the fastest pace in the Richmond region. Mayo Island is also served by Mayo's Bridge for U.S. Route 360 that carries over 20,000 cars daily and is served by public transportation.

Historic Flooding Data:
Please reference the more exhaustive narrative below outlining 18th, 19th, and 20th Century flooding history.

Local Government Ability to Provide Cost Share:
See Budget Narrative.

Local Floodplain Management Regulations:
The City of Richmond's local floodplain management regulations is accessible online at https://library.municode.com/va/richmond/codes/code_of_ordinances?nodeId=PTIICICO_CH14FLMAERSECODR

2. Need for Assistance:

The Richmond Department of Public Utilities / Storm Water leadership and project managers, in coordination with the Richmond Department of Parks & Recreation and other departments and agencies, are experienced in executing capital projects from the time of inception and scoping to construction and final close-out. DPU/SW has sufficient capacity including staff, external consultants and contractors, and financial resources to adequately manage and facilitate all that is required to bring this project to completion. DPU/SW has three Capital Projects Managers and 4 Engineers. Any and all reporting requirements, either those of the City of those specific to DCR Community Flood Preparedness Grant Fund will be adequately addresses as may be required.

Mayo Island is located in Census Tract 610.02, which is also identified as Opportunity Zone Census Tract ID 517600610000 by the Internal Revenue Services. The project thus meets the definition for "low-income geographic area" in the 2022 Grant Manual. According to ADAPT Virginia's Virginia Vulnerability Viewer, Mayo Island is classified as High Social Vulnerability and scores 1.2 on the Social Vulnerability Index.

3. Goals and Objectives:

The goal of the project is simple – acquire Mayo Island from private landowners to turn it into public open-space and implement Natural and Nature Based Features (NNBF) such as converting riparian buffer turf & impervious areas to forest and protecting natural wetlands with surrounding upland buffer. This has been part of the City of Richmond's comprehensive plan for 30 years.

4. Approach, Milestones, and Deliverables:

The island was listed for sale in February 2022 for an asking price of $19 million. The City of Richmond in coordination with Capital Region Land Conservancy (CRLC) have completed a fair market value appraisal of the property, which is $11.4 million, that meets Yellow Book and Uniform Standards of Professional Appraisal Practice (USPAP). Per the local comprehensive plan, the City shall acquire the property for fair market value. The owners are in negotiation with CRLC to enter a purchase agreement. CRLC will then work to transfer the property to the City of Richmond as it has done with similar projects at Dock Street and the James River Park System.

A purchase agreement is anticipated to be finalized in Summer 2022 after which due diligence of the property will be conducted. This is to include title research and a Phase I Environmental Survey Assessment. An existing ALTA survey of the property was prepared in April 2008 by Timmons Group.

Closing on the acquisition of Mayo Island could occur in 2022 but is dependent on factors discovered during the due diligence period. Work to remove impervious surface and to restore riparian area, plant trees, and implement other BMPs as well as provide public access will occur after the Community Flood Preparedness Grant performance period.

5. Relationship to Other Projects:

After the 1985 flooding of Downtown Richmond, the Richmond Floodwall was built at a cost of $143 million to the city and federal agencies. Mayo Island and Mayo's Bridge remained in the floodway. Since 1994, the acquisition of Mayo Island has been in the City's master plan though the purchase price has remained out of reach for the City's Capital Improvement Plan budget. In partnership with other non-profits such as Capital Region Land Conservancy, the City is beginning to acquire parcels that have been identified as strategic acquisitions along the riverfront. This includes 5.2 acres at Dock Street next to Great Shiplock Park that is in the floodplain as well as 6 acres along the James River at Brander Street and adjacent to Ancarrow's Landing. This work to acquire private lands is helping to build out the eastern portions of the James River Park System that welcomes more than 2 million visitors annually. Mayo Island will become a key feature of the park.

Additionally, renovation and/or replacement of the 110-year-old Mayo's Bridge has been deemed a critical priority for the City of Richmond. The Virginia Department of Transportation has determined that the bridge is structurally deficient. The cost to replace the bridge is estimated at $80 million of which $14 million has been secured. This includes $5 million that was recently provided through the federal Infrastructure Investment and Jobs Act. Additional funding for Mayo's Bridge is being sought from the Commonwealth Transportation Board.

6. Maintenance Plan:
A benefit to nature-based projects is that there can be low ongoing maintenance costs. Once Mayo Island is acquired, restoration work can commence to remove concrete and asphalt surfaces and restore vegetation. Mayo Island will then be placed under the supervision of the James River Park System with a conservation easement. Stewardship of the conservation values will become a community responsibility with support from non-profit organizations including Capital Region Land Conservancy and Friends of James River Park.

7. Criteria:
Appendix B is attached to this application. All criteria for eligibility have been met for Flood Prevention and Protection Projects. Reponses to scoring information also make the Mayo Island acquisition project very competitive with a total score of 97 out of 110 available points. This includes acquisition of property in the local comprehensive plan that includes restoration of floodplain to natural and beneficial function, living shorelines and vegetated buffers, permanent conservation of land in the Floodplain and Flooding Resilience layer of ConserveVirginia v3.0. As noted previously, the project area has a Social Vulnerability Index Score of 1.2. and is within a low-income geographic area as defined in the 2022 Grant Manual. The project will also help the City of Richmond meet Chesapeake Bay TMDLs through best management practices to reduce nitrogen, phosphorus, and sediment as established in the Commonwealth of Virginia Chesapeake Bay TMDL Phase III Watershed Implementation Plan. Land Use Change BMPs that are anticipated for post-acquisition implementation include Impervious Urban Surface Reduction, Forest Buffers, Urban Forest Planting, and Urban Tree Canopy Expansion. Additional BMPs specific to the James River Basin that may be implemented include Conservation Landscaping Practices, Erosion and Sediment Control, Shoreline Management (Urban), Urban Nutrient Management, Wet Ponds and Wetlands. Removing approximately 8 acres of surface parking and restoring it to a more natural area will have many co-benefits.

Additionally, the City of Richmond is a local government and thus an eligible applicant. The City of Richmond fulfills the Resilience Plan submission requirement as confirmed by correspondence letter between Wendy Howard Cooper, Director Dam Safety and Floodplain Management, and Allen Shue, Greeley and Hansen, dated August 19, 2021.

Budget Narrative

The total estimated cost for the acquisition of Mayo Island is expected to be $11.5 million. $11.4 million is the fair market appraised purchase price. Other due diligence costs are expected to be approximately $100,000 to include appraisal, survey, legal, title, and Phase I ESA. A budget pro forma is provided below showing estimated income and expenses per quarter.

The City of Richmond is requesting $9.2 million (80% of the nature-based project cost) from the Community Flood Preparedness Fund.

The City of Richmond currently has the remaining $2.3 million needed to complete this project. $1.5 million is currently budgeted for future park acquisition from American Rescue Plan Act funding and the balance of $800,000 will be provided from general operating funds. However, through efforts of the Capital Region Land Conservancy and other partners, the City anticipates that its matching share could be privately raised. These funds are not pledged by the organizations referenced but are instead sources that will be asked for financial assistance with the project.

Funding to complete the transformation of Mayo Island post acquisition will be provided in future years. This will include replanting riparian tree buffers and removing impervious surfaces and providing nature-based, flood resilience projects.

Historical Background

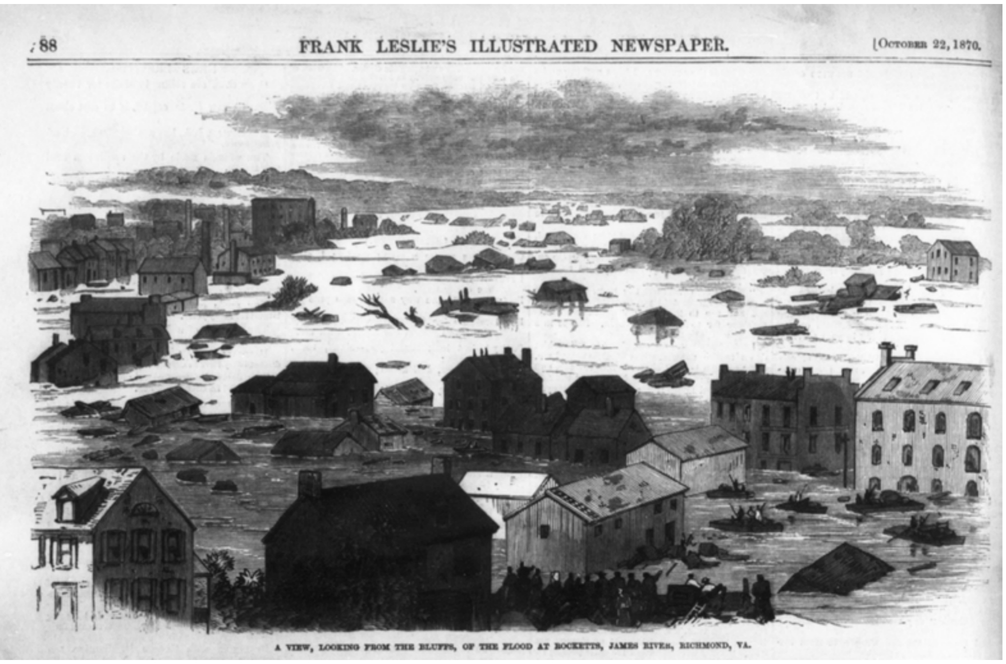
Mayo Island is named for William Mayo (1685-1744) who laid out Richmond's street grid in 1737. He conceived a bridge that would be the first to cross the James River when only ferry operations connected the north and south shores during the colonial period. It was to be constructed at the end of the fall line where rapids cease and the tidal flatwater begins. His son John Mayo (1737-1786) was granted a charter in 1785 by the General Assembly to build a toll bridge. He died before it was built. His son John Mayo Jr. (1760-1818) completed the first bridge crossing, floating pontoon bridge – "large logs, raft-like, spiked to the rocks, with rough floor laid on the logs" across the river in 1788.

Mayo's Island began as two islands: Tollhouse Island to the west and Confluence Island to the east. The two islands were merged and expanded by fill and alluvial deposits to create Mayo's Island's present form. The Tollhouse Island section contained the tollhouse and a wooded grove used for picnics, barbeques, fishing, and quoits

After the Great Fresh of 1771 with its "wall of water" killing about 150 people and reaching flood stage of forty-five feet above normal, it's hard to imagine the desire to have invested in a bridge that seemed likely to washout. The Virginia Gazette reported the 1771 flood being twenty feet higher than that in May 1766. It is estimated to have crested at 40 feet. Mayo's Bridge was frequently destroyed by floods and rebuilt. It was a profitable venture afterall with six-and-a-quarter cents per person, per horse, and per wheel being charged at the toll house located on Mayo Island. Historical documents reveal that the bridge was destroyed by floods in 1790, 1802, 1814, 1816, 1823, 1835, 1847, 1870, 1877, 1882, and 1899. It was also burned during the War of 1812 and in 1865 during the evacuation of Richmond by the Confederacy during the American Civil War. The current filled concrete bridge was built in 1913 and has withstood numerous flood events.

View of Richmond by John William Hill, artist & F. Palmer, lithographer (1852)

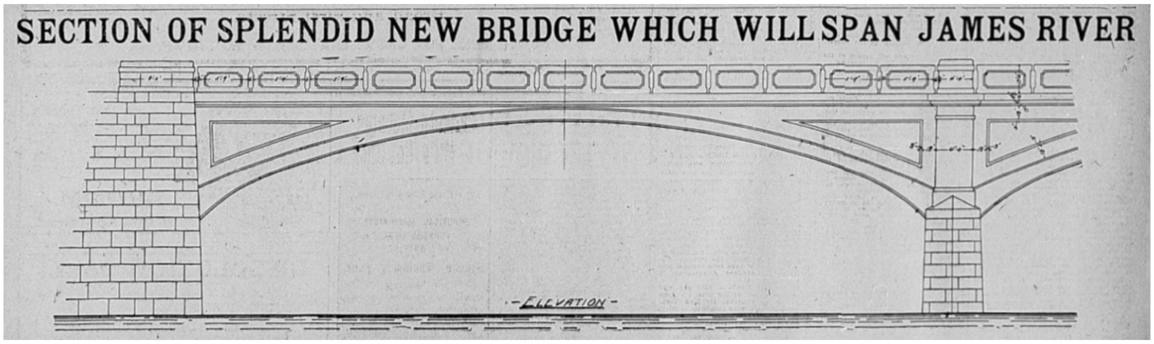
In addition to the Great Fresh of 1771, the Great Flood of 1870 was a devastating event in Richmond. Frank Leslie's Illustrated Newspaper October 22, 1870 reported "At a later hour in the day the entire portion of Mayo's Bridge, extending from Manchester to Mayo's Island, was swept away by the foaming torrent, and the huge mass floated slowly down the river. Further down, toward Rocketts, all the docks were completely submerged, and seriously damaged." An accompanying illustration shows a view from Libby Hill of houses and debris floating down the James River past Rockett's Landing.



A View, Looking from the Bluffs, of the Flood at Rocketts, James River, Richmond, Va. by Frank Leslie Illustrated Newspaper (1870)

The repaired Mayo Bridge (1889)

Plans to build a new bridge in 1904 and were designed with previous flood threats in mind. According to a *Times-Dispatch* article, the new bridge was to be “five feet higher than the flood of 1877, which was the highest flood known here.” Engineers at the time claimed the class of construction minimized danger from extreme floods. “These bridges have been known to be completely submerged by water, and remain perfectly intact.” As a free bridge, the project was funded jointly by Manchester and Richmond at a proposed cost of $250,000 and was laid out by the Concrete Steel Engineering Company of New York.



SECTION OF SPLENDID NEW BRIDGE WHICH WILL SPAN JAMES RIVER

Times-Dispatch July 3, 1904

In March 2022, U.S. Senator Mark Warner announced $5 million in federal funding to help pay for replacement of the 110-year-old bridge. The total cost is expected to be around $80 million with $14 million secured and requests pending with the Commonwealth Transportation Board.

In the 1950s a motor freight company, the Overnight Transportation Co., operated from this Mayo Island. Its offices and terminal were located in the two-story brick building that faces Mayo's Bridge at 501 South 14th Street. The existing T-shaped brick building on the east side was used as a truck maintenance and storage facility by the company. Later, other transportation companies used the east side of the island for activities ranging from refurbishing container trailers to truck maintenance to truck and trailer parking and storage.

During the 1950s, two gas stations, which were almost across the street from each other, were operated on the island. An ESSO station, which no longer exists, was located on the east side of Mayo's Bridge and a Gulf station, which operated until the early 1970s, was located on the island's west side. The building that housed the Gulf station is now used as part of the Reynolds Recycling operation.'

Another major user of the island was the paper and wood related industry. In the 1870s a lumber mill operated on the east side of the island.' The western side of the island was used by several paper companies. In the 1950s, the Manchester Paper Company operated a paper storage warehouse on the western portion of the island, followed by the Standard Paper Manufacturing Company and finally a paper recycling company until its warehouse was destroyed in 1987 by fire.

Early Public Recreation

In 1875, the Virginia Boat Club was founded and boathouses were built on the south side of Mayo Island. Boathouses with rowboats, canoes, rowing sculls were a regular feature until 1969 when the facilities of the Club were destroyed by flooding. Mayo Island also served as the home of Richmond's minor league baseball team, the Richmond Colts. The stadium known as Mayo Island Park, later named Tate Field, operated on the island from 1894 until 1941 when it was destroyed by a fire. During a game in 1922, legendary slugger Babe Ruth hit a home run over the right-field fence. College football games were also played at the Park between 1921 and 1928 when City Stadium opened. During this era of great public access to the island for recreation, the island continued to regularly flood. Events in 1936 and 1937 brough some of the highest floodwaters to Richmond.

Virginia Boat Club, Tate Field, and Mayo Island by Dementi Studio (1931)

Tate Field by Dementi Studio (1937)

Modern Flooding

The history of flooding in Richmond is well documented. However, events in the past 50 years are among the top with regard to height of flood waters and financial impacts. Many people recall the devastation that Hurricanes Camille (1969), Agnes (1972), and Juan (1985) wrought on Downtown Richmond. According to the National Oceanic and Atmospheric Administration, these hurricanes represent the highest recorded crests of the James River with data from the 1771 and 1870 events being reported anecdotally.

Hurricane Agnes made landfall in Florida on June 19, 1972. The tropical system drenched the eastern United States and flooded Shockoe Bottom and Manchester in Richmond, Virginia. Richmond's Mayo Island and Mayo Bridge were inundated. On June 23 the James River crested at 28.62 feet at the Richmond Westham gauge and 36.5 feet at the Richmond City Locks gauge. Thirteen fatalities and over $125 million in losses were reported in Virginia.

Richmond Times Dispatch (1972)

Hurricane Camille, a Category 5 hurricane, made landfall near the mouth of the Mississippi River on August 17, 1969. The remnants of the storm crossed the Appalachian Mountains and devastated Nelson County, Virginia. Rainfall in excess of 27 inches, mostly falling in a five-hour period, overwhelmed the James River and its tributaries. On August 21, the James River crested at 41.3 feet at Columbia gauge, 24.95 feet at Richmond Westham gauge, and 28.6 feet at Richmond City Locks gauge. 153 people died and numerous roads, bridges, and structures were damaged or destroyed. Damage totaled more than $140 million and Virginia was declared a disaster area.

Richmond Times Dispatch (1969)

Rounding out the Top 3 floods is Hurricane Juan that combined with another low-pressure system and dropped significant rainfall across the Appalachian Mountains and Mid-Atlantic in late October 1985. The James River crested at 24.77 feet at the Richmond Westham gauge and 30.76 feet at Richmond City Locks gauge. Several blocks of Downtown Richmond were flooded on November 7. President Ronald Reagan signed legislation authorizing the construction of Richmond’s floodwall the following year.

Richmond Times Dispatch (1985)

A joint city and federal project, the Richmond Floodwall was completed in 1995 at a cost of $143 million. It earned its accreditation from the Army Corps of Engineers on March 19, 2010. The floodwall is located on both the north and south side of the James River. The north side measures 4,277 feet and protects 150 acres. The south side measurers 13,046 feet long and protects 600 acres. There are 30 sluice gates and 19 road closures that are inspected every 90 days. The road closures are operated once a year. The area between the floodwall is uninhabited and largely undeveloped with the exhibition of Mayo Island. On November 12, 2020 the flood gates at Dock Street and Brander Street were closed due to precautionary measure. It was the first time since 1999 that the gates were closed due to flood risk.

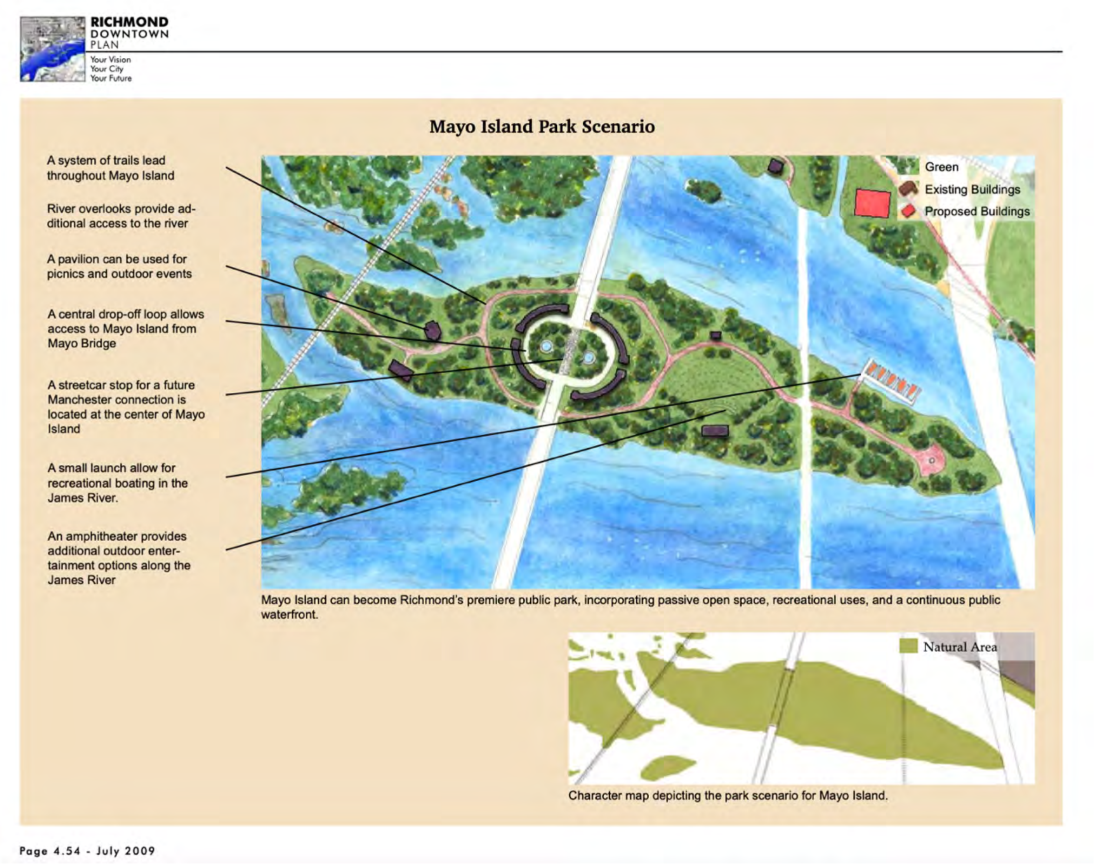
Local Comprehensive Plan

Acquisition of Mayo Island has been in the City's comprehensive plan almost four decades. The 1983 Master Plan noted "the conversion of Mayo Island into public open space is recommended due to its accessibility by City residents, including the handicapped, the availability of excellent fishing opportunities, and the potential for boating access." In 1994, the City of Richmond received a grant of $15,000 from the Virginia Coastal Resources Management Program through the Department of Environmental Quality to conduct a study of Mayo's Island. The explicit interest was to provide fishing access, boating access, and reestablish wildlife habitat by removing some of the impervious surface and revegetating part of the island. Amendments to the 1984 Downtown Plan were then adopted by Ordinance 1994-052-58.

The acquisition of Mayo Island has been more particularly detailed in the Richmond Downtown Plan (adopted in 2009), Richmond Riverfront Plan (adopted in 2012), and James River Park Master Plan (adopted in 2019).

On page 4.47 of the Richmond Downtown Plan, one of the goals identified is "Establish Mayo Island as a premiere public park." Acquisition is specifically noted: "Mayo Island in the center of the river should be purchased. The City should purchase the properties at fair market value and negotiations with these various property owners should begin as soon as possible." The plan further notes "Mayo Island, half of Brown's Island, Vauxhall Island, and most of the Canal and James River waterfront is privately held by individuals, corporations and industrial owners. While it is impractical to consider buying back all of these properties for public use in the present generation, the City should plan strategic purchases of some of these properties, and should secure waterfront access and trail right-of-way rights from the others, regardless of whether there is future development by the private and/or public sectors."

"The transformation of Mayo Island into a central public park cannot occur without the restoration of Mayo Bridge. The establishment of a comfortable pedestrian linkage between Downtown and Manchester also depends upon the restoration of the Mayo Bridge." "A historic bridge restoration project of this scale will require a staging area. As a part of the restoration project, Mayo Island could be purchased for staging, to later become a celebrated riverfront park."



RICHMOND DOWNTOWN PLAN

Mayo Island also received a dedicated chapter in the 2012 Richmond Riverfront Plan.

26 NOVEMBER 2012

RICHMOND *RIVERFRONT* PLAN

MAYO'S ISLAND: LONG-TERM PLAN

Mayo's Island would be transformed from a predominantly paved parking lot with decaying buildings to an island landscape inviting exploration. Pedestrian and bike trails would traverse the island, maximizing access along the river and across the island, intersecting with a diversity of programmatic activities. From open lawns for informal play to integrated play environments, the transformed Mayo's Island would offer opportunities for play, bike and skate rental, as well as passive gardens, within an iconic 21st-century landscape capitalizing on its position in the middle of the river. The intersection of Mayo Bridge with Mayo's Island can be detailed as a speed table, or benched travel way, effectively calming speeding bridge traffic most days, while on rare occasions allowing the bridge to be closed for civic events. At 16-acres, Mayo's Island is more than twice as large as Brown's Island, and positioned squarely in the middle of the James River. A publicly-owned Mayo's Island would allow ample space for a new Richmond landscape type: an exploratory, green landscape capable of hosting events and festivals, a dynamic hybrid landscape that does not exist along the Richmond Riverfront.

SECTION 2: RIVERFRONT PLAN

PAGE 69

“Mayo’s Island is strategically located to serve communities on both the north and south sides of the River as a premier regional public open space. Mayo’s Island is both the largest and most vehicular-accessible of all the islands; additionally, it is adjacent to the habitat-rich archipelago of smaller islands immediately upriver. The island should be acquired for public use as open space, consistent with recommendations in the 2009 Downtown Master Plan, that envisioned Mayo’s Island as the centerpiece of the Riverfront. The island could provide a distinct open space that provides walking and biking trails, multiple watercraft launches, an exploratory green landscape, play areas, an event lawn, and restored riparian overlooks upriver and downriver. Existing parking lots could be reused adjacent to the road, and a plaza with concessions and recreational equipment rentals could offer support for a variety of programs. The rehabilitation of Mayo Bridge should integrate with this anticipated revitalization of Mayo’s Island, in support of this anticipated active, pedestrian landscape. The Plan recommends that 14th Street as it crosses the island be reconfigured to calm traffic speed and accommodate the anticipated foot and bike traffic crossing the street from one side of the island to the other. The acquisition and transformation of Mayo’s Island into public open space is a priority for protecting the integrity of the James River as an accessible landscape, reflective of Richmond’s rich natural and cultural legacy: Mayo’s Island becomes the ‘green jewel’ of the Richmond Riverfront.”

“Mayo’s Island would be transformed from a predominantly paved parking lot with decaying buildings to an island landscape inviting exploration. Pedestrian and bike trails would traverse the island, maximizing access along the river and across the island, intersecting with a diversity of programmatic activities. From open lawns for informal play to integrated play environments, the transformed Mayo’s Island would offer opportunities for play, bike and skate rental, as well as passive gardens, within an iconic 21st-century landscape capitalizing on its position in the middle of the river. The intersection of Mayo Bridge with Mayo’s Island can be detailed as a speed table, or benched travel way, effectively calming speeding bridge traffic most days, while on rare occasions allowing the bridge to be closed for civic events. At 16-acres, Mayo’s Island is more than twice as large as Brown’s Island, and positioned squarely in the middle of the James River. A publicly owned Mayo’s Island would allow ample space for a new Richmond landscape type: an exploratory, green landscape capable of hosting events and festivals, a dynamic hybrid landscape that does not exist along the Richmond Riverfront.”

The James River Park Master Plan that City Council adopted in 2020 reiterates the need to acquire Mayo Island. A citation from page 61 reads: “Mayo Island was the single largest island identified in the 2012 Riverfront Plan, and remains the primary, privately held island for future Park acquisition. Since then, the property has been repaved with approximately 625 striped parking spaces.”

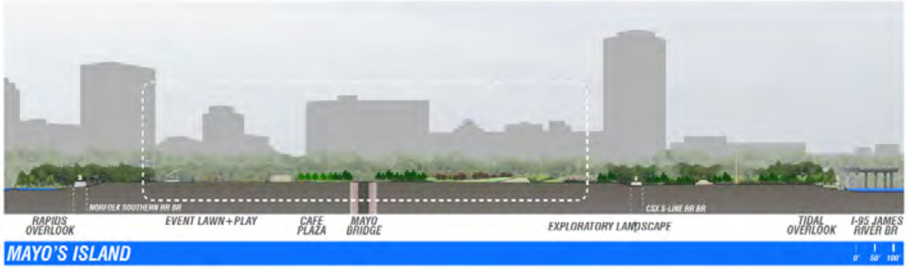
The acquisition of Mayo Island would support the City’s RVA Clean Water Plan by allowing it to implement the following strategies.

1) Replace or restore 10 acres of riparian buffers in MS4 and/or Combined Sewer System area. Evaluate opportunities for inclusion of access points to waterbody for recreational activities.
2) Place an additional 10 acres under conservation easement, prioritizing conservation of land that creates connected green corridors. Evaluate opportunities for inclusion of access points to waterbody for recreational activities.

Finally, the current Richmond 300 Master Plan lists as one of its goals: “develop and implement the plan for rehabilitating/replacing the Mayo Bridge that incorporates pedestrian and bicycle infrastructure.”

Physical conditions

Mayo Island is the largest and most accessible of the archipelago fall line islands in the James River. It is approximately 2,140 feet long and about 500 feet wide at its widest point. Mayo Island is 29 feet in elevation above sea level at its highest point and is located in the James River's 100-year floodplain. Because the James River drains 25% of the state, moderate floods are estimated to occur every 3 1⁄2 years. In the middle of the island, the 100-year floodplain is 36 feet in elevation while at the upper end of the island it is 36.9 feet. Essentially flat, the island has relatively steep banks approximately 25 feet to 28 feet high around most of its perimeter, making access to the water somewhat difficult. Exceptions to the steep bank conditions occur at the island's upstream and downstream tips, where more gentle and sloping terrain is found. Access to the water is easiest at these locations.



About one-third, or 4.75 acres, of the island's total of approximately 13.62 acres are located west of Mayo's Bridge (14th Street) while 8.87 acres, are located east of the bridge. When reference is made to the western portion of Mayo Island, it refers to that portion of the island west of Mayo's Bridge (14th Street) while reference to the eastern section of the island refers to the section of the island east of Mayo's Bridge (14th Street). The majority, approximately 7 acres of the island is paved with impervious concrete and asphalt. This includes 2.5 acres of paved parking on the western section and 4.5 acres of paved parking and impervious surfaces including structures on the eastern section of Mayo Island.

Current uses on Mayo Island include surface parking lots, recycling transfer, and artist loft rental. Future development of this privately-owned island is constrained by three significant factors: flooding, infrastructure, and utilities. Mayo's Island lies in the Regulatory Floodway and 100-year floodplain and has been flooded a number of times in the past twenty-five years. The island also lies in a Chesapeake Bay Preservation Area with part of the island classified as an Intensely Developed Area (IDA) designated as an overlay to the Resource Protection Area, this category includes “areas of existing development and infill sites where little of the natural environment remains.”

Other portions of the island are classified as a Resource Management Area. The Virginia Department of Conservation & Recreation’s Development Vulnerability Model shows Mayo Island as fully developed.

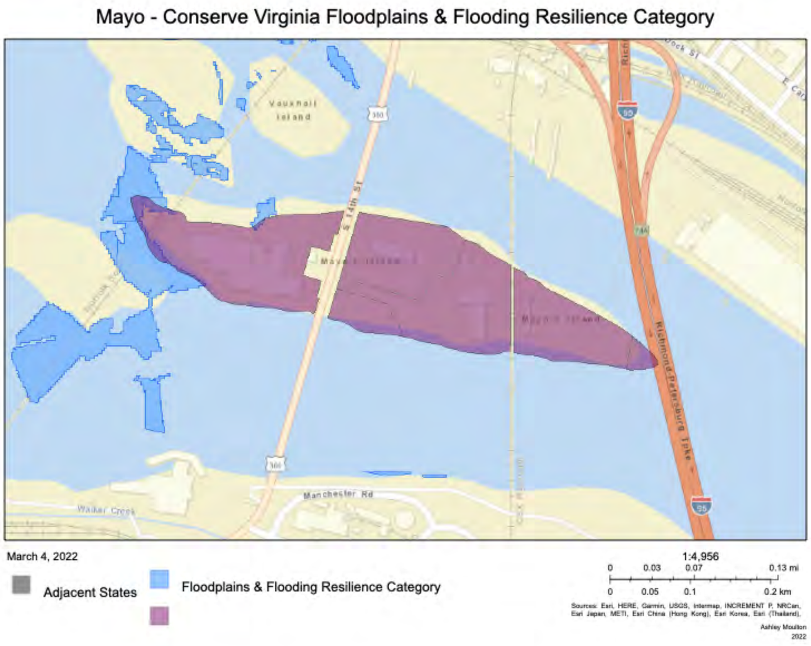
Ashley Moulton
2022

The general topographic elevation of the island is lower than the base flood elevation, making redevelopment extremely difficult from a construction design standpoint. Historically, the island has endured multiple catastrophic floods resulting in immersion and the total loss of various structures. Additionally, the 1995 floodwall on either bank of the James is likely to amplify the flooding impact at Mayo’s Island; the former wide breadth of the river at this location is now constrained between two floodwalls, concentrating floodwaters. The entire island is located in the Regulatory Floodway. The regulations governing development in floodways (44 CFR § 60.3.(d)3) stipulate that no new development, substantial improvements on existing development, or fill is permitted without an engineered certificate proving the development will not contribute to an increase in flood levels. If such development is approved, the City of Richmond's floodplain ordinance requires that residential and commercial structures must be elevated one foot above the base flood elevation, which ranges from 35-37 feet. In addition to the Regulatory Floodway building limitations, any redevelopment of commercially-viable structures requires a secondary emergency vehicle egress route to either bank of the river. While any new egress bridge would be a significant cost, it would also have to surmount the height of the floodwalls that protect the City from a 280-year flood event. The absence of any detectable link to the City sanitary sewer system is the third constraint. Written records and site investigations have shown no evidence of a functioning sanitary sewer system; therefore island structures do not currently conform to regulatory health and building codes. The cost of addressing all three constraints, particularly the implied public funding of significant infrastructure improvements to solve the constraints, leads the City to focus on acquisition rather than private development.

Conservation Values

Mayo Island ranks in the Top 10 Percent of land within Virginia to be protected as scored by ConserveVirginia 3.0, the scientific model developed by the Department of Conservation & Recreation. The property is included in several categories – Floodplains & Flooding Resilience, Cultural and Historic Preservation, and Scenic.



Mayo - Conserve Virginia Floodplains & Flooding Resilience Category

2022

Mayo's Island is located in a stretch of the James River designated as a State Scenic River. Known as the Falls of the James Scenic River, this section is administered by the Falls of the James Scenic River Advisory Board.

Nature-Based Infrastructure and Restoration Opportunity

As concluded in the 1994 report *An Evaluation of Mayo's Island for Potential Public Access for Recreation and Open Space Use*, "restoring most of the surface of Mayo's Island to a natural condition will be beneficial to wildlife, reduce runoff, and present a more pleasing environment for public use." This sentiment has been reiterated in subsequent comprehensive plans and more particularly detailed in the Richmond Downtown Plan (2009) and Richmond Riverfront Plan (2012).

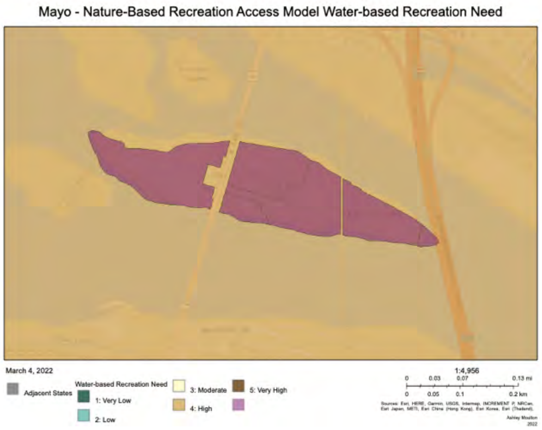
Current restoration planning models, such as the James River Water Quality Improvement Program Restoration Planner (JRWQIP) that was developed by the Chesapeake Conservancy with funding from the Virginia Environmental Endowment and the ADAPTVA Interactive Map created by the Center for Coastal Resources Management and Virginia Institute of Marine Science, show the restoration priority of for Mayo Island as well as particular initiatives that can be incorporated into future plans for the property after acquisition.

The JRWQIP Restoration Planner notes that the Mayo Island is of the highest priority for restoration opportunities in the Middle James River. Likewise, the Adapt VA Interactive Map shows the western side of Mayo Island as having many benefits as Lands for Protection in using Natural and Nature-Based Features for coastal resilience. Such benefits include 1) interception and reduction of flooding as floodwaters are stored and slowly released by trees and wetlands; 2) protecting and restoring natural features can earn credits for reduced insurance premiums through the National Flood Insurance Program's Community Rating System (in which the City already participates and could directly benefit); 3) forests, trees, and wetlands effectively filter air pollution and remove excess nitrogen and phosphorus and also capture sediment in stormwater runoff; 4) floodplain restoration reestablishes a more natural hydrologic regime that connects wetlands, waterways, and adjacent land.

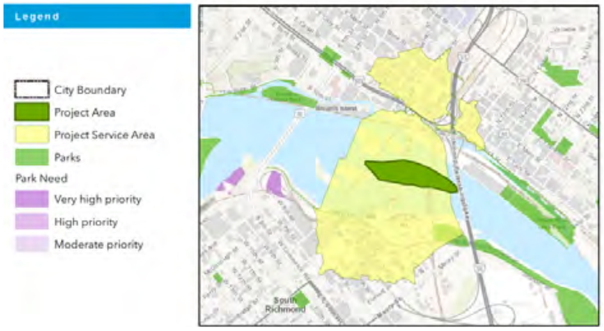
Future Public Access and Recreation:

"Mayo Island could provide recreational benefits by increasing the opportunities for the public to experience and enjoy the James River at a unique area, the fall line. Trails; landscaping; fishing access sites, including for handicapped fishing; a boat launching site; food service; tackle shop; and other amenities and services would enable Mayo's Island to provide a range of outdoor recreational benefits. Private development could provide some of these recreational opportunities on and from the island." That was the conclusion of the 1994 report prepared for the City of Richmond. As has been articulated through the Richmond Downtown Plan (2009) and Richmond Riverfront Plan (2012) the acquisition of Mayo Island for outdoor recreation remains a high priority. It could also serve as a visitor hub in support of the adventure tourist looking to book excursions such as whitewater rafting, cycling the Virginia Capital Trail, mountain biking at the Richmond Ride Center, rappelling the Manchester Climbing Wall, etc.

According to the Nature-Based Recreation Access Model for Water-Based Recreation Need, Mayo Island ranks as a high need. Mayo Island ranks as a moderate need for the Land-Based Recreation Need.

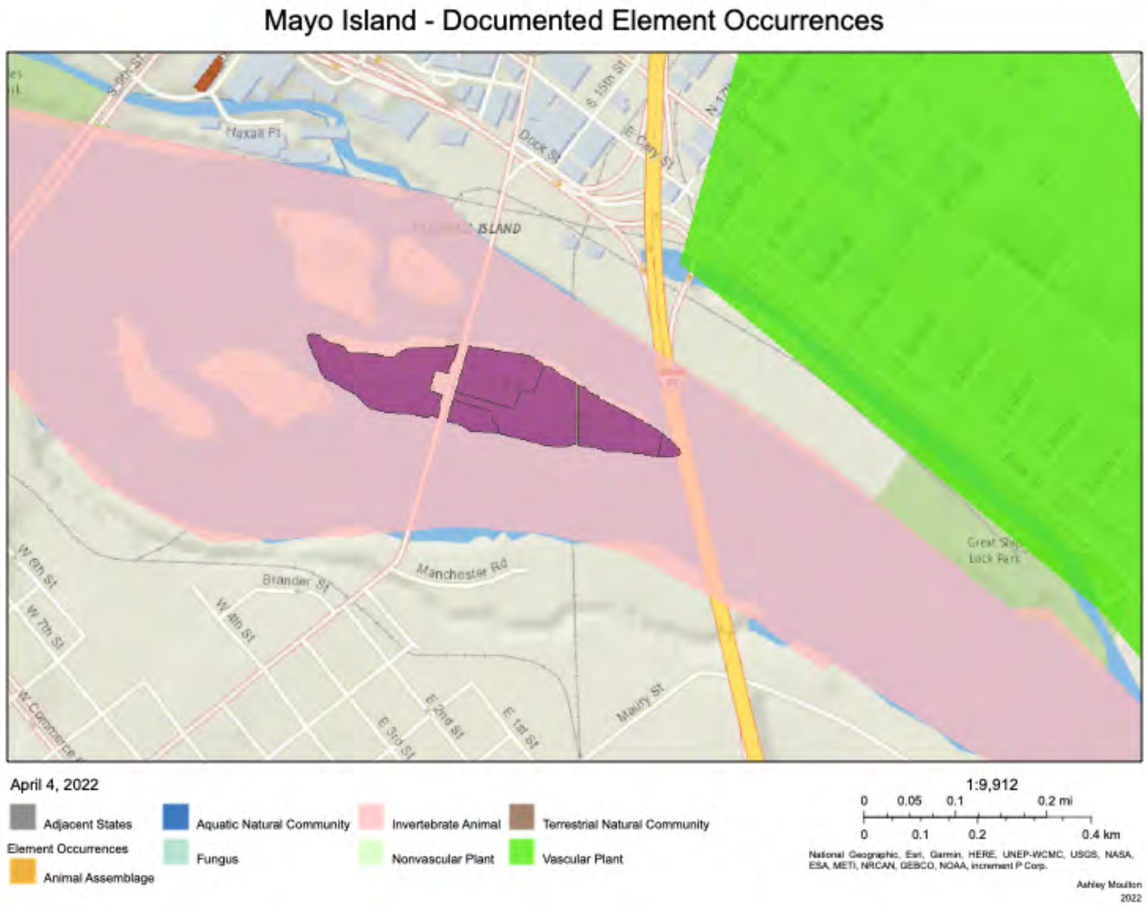


Trust for Public Land – ParkServe 10-minute Walk Model

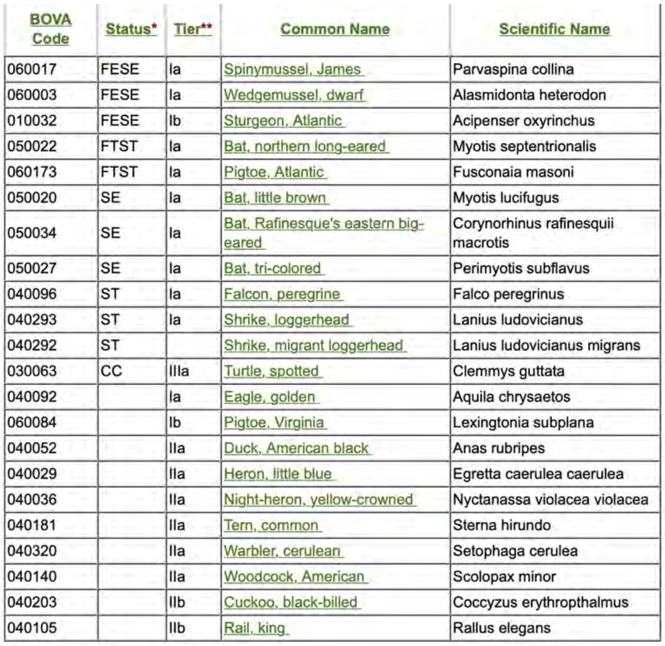


Improved Wildlife Habitat

Mayo Island is situated at an important confluence of the James River where the freshwater rapids meet brackish tidal waters. This is why residents have come to the banks of the James River and Mayo Island and atop Mayo's Bridge to fish. The Department of Conservation and Recreation Natural Heritage Division reports Documented Element Occurrences for invertebrate animal in the river surrounding Mayo Island. This is due to the Atlantic Sturgeon that is Federally Endangered and State Endangered with a status of 1b. The James River is a major fishway for anadromous fish, including American and hickory shad, alewife and blueback herring, and striped bass, and yellow perch. While none of these anadromous fish species are threatened or endangered the herring and shad have a Moderate Conservation Need according to the Virginia Department of Game and Inland Fisheries. Probably the heaviest fishing traffic is during the spring spawning run of perch.



In addition to the above referenced fish, Mayo Island is also suitable habitat for the following known or likely species:



BOVA Code	Status*	Tier**	Common Name	Scientific Name
060017	FESE	Ia	Spinymussel, James	Parvaspina collina
060003	FESE	Ia	Wedgemussel, dwarf	Alasmidonta heterodon

SURVEYORS CERTIFICATE:

TO: REPUBLIC MAYO ISLAND, LLC AND LAWYERS TITLE INSURANCE CORPORATION

THIS IS TO CERTIFY THAT THIS PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS," JOINTLY ESTABLISHED AND ADOPTED BY ALTA, ACSM AND NSPS IN 2005, AND INCLUDES ITEMS 1,2,3,4,7(a),8,9,10,11(a),13, AND 14 OF TABLE A THEREOF. PURSUANT TO THE ACCURACY STANDARDS AS ADOPTED BY ALTA AND NSPS AND IN EFFECT ON THE DATE OF THIS CERTIFICATION, UNDERSIGNED FURTHER CERTIFIES THAT IN MY PROFESSIONAL OPINION, AS A LAND SURVEYOR REGISTERED IN THE COMMONWEALTH OF VIRGINIA, THE RELATIVE POSITIONAL ACCURACY OF THIS SURVEY DOES NOT EXCEED THAT WHICH IS SPECIFIED THEREIN.

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/31/2022 at 8:58 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

FIRMette of the project Area

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) Report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study Report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study Report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

Accredited Levee Notes to Users: Check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at http://www.fema.gov/business/nfip/index.shtm.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** was NAD 83, GRS 1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

Base map data was obtained from the City of Richmond including transportation, hydrography, and political lines. Basemapping was originally interpreted from orthophotography flown in March of 1999. Additional information has been drived from other sources.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables for multiple streams in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map showing the layout of map panels for this jurisdiction.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products, or the National Flood Insurance Program in general, please call the **FEMA Map Information eXchange (FMIX)** at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	1% Annual Chance Floodplain Boundary
———	0.2% Annual Chance Floodplain Boundary
— —	Floodway boundary
— — —	Zone D boundary
•••••••	CBRS and OPA boundary
▨	Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities.
~~ 513 ~~~	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

Ⓐ——Ⓐ	Cross section line

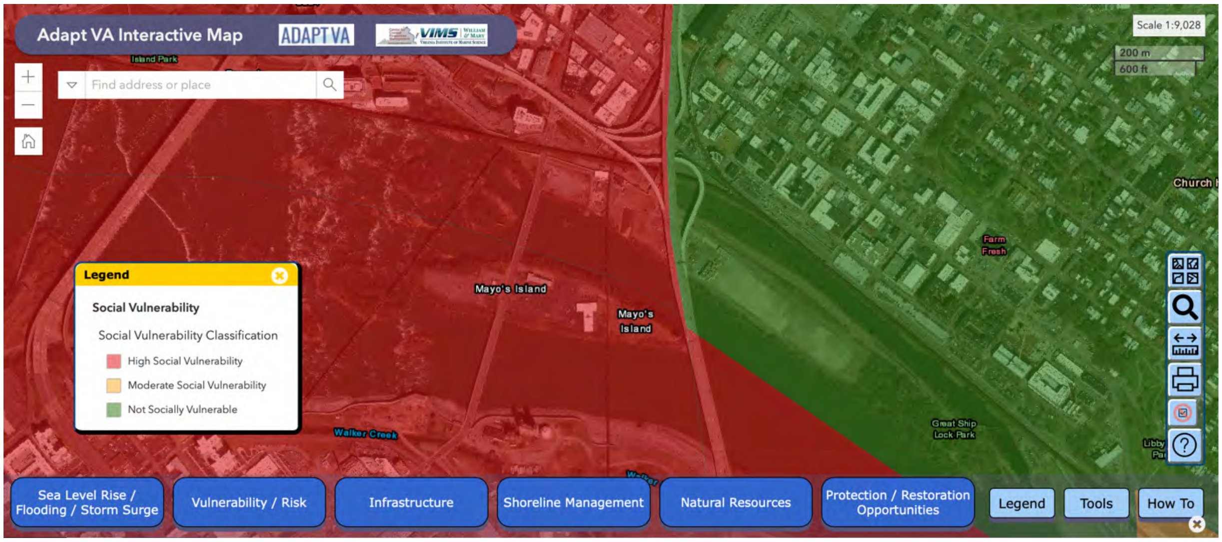
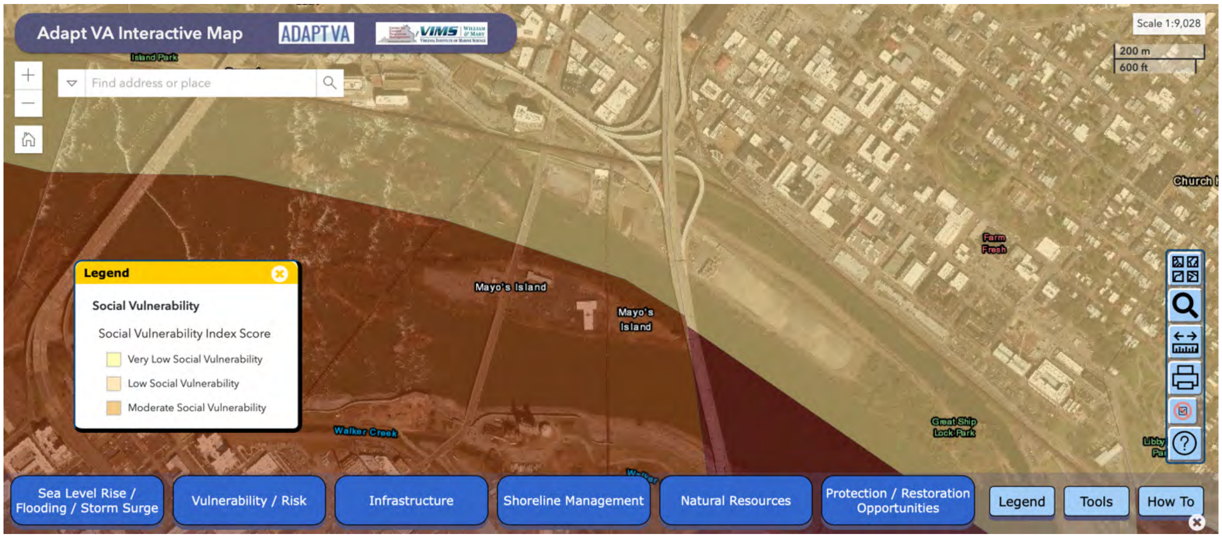
Social Vulnerability Index Scores – Adapt VA Virginia Vulnerability Viewer





Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**City of Richmond**	
	Eligibility Information	
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	X
No	Eligible for consideration	
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Scoring Criteria Projects 1-B

Project Eligible for Consideration		☒ **Yes** ☐ **No**
Applicant Name:		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	**50**
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (**Based on ADAPT VA's Social Vulnerability Index Score.)**)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	12
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Scoring Criteria Projects 2-B

Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide “community scale” benefits?		
Yes	**20**	20
No	**0**	
Total Points		97

Appendix D: Checklist All Categories

Virginia Department of Conservation and Recreation

Community Flood Preparedness Fund Grant Program

Scope of Work Narrative	
Supporting Documentation	**Included**
Detailed map of the project area(s) (Projects/Studies)	☒ Yes ☐ No ☐ N/A
FIRMette of the project area(s) (Projects/Studies)	☒ Yes ☐ No ☐ N/A
Historic flood damage data and/or images (Projects/Studies)	☒ Yes ☐ No ☐ N/A
A link to or a copy of the current floodplain ordinance	☒ Yes ☐ No ☐ N/A
Non-Fund financed maintenance and management plan for project extending a minimum of 5 years from project close	☐ Yes ☐ No ☒ N/A
A link to or a copy of the current hazard mitigation plan	☒ Yes ☐ No ☐ N/A
A link to or a copy of the current comprehensive plan	☒ Yes ☐ No ☐ N/A
Social vulnerability index score(s) for the project area from [ADAPT VA's Virginia Vulnerability Viewer]()	☒ Yes ☐ No ☐ N/A
If applicant is not a town, city, or county, letters of support from affected communities	☐ Yes ☐ No ☒ N/A
Completed Scoring Criteria Sheet in Appendix B, C, or D	☒ Yes ☐ No ☐ N/A
Budget Narrative	
Supporting Documentation	**Included**
Authorization to request funding from the Fund from governing body or chief executive of the local government	☒ Yes ☐ No ☐ N/A
Signed pledge agreement from each contributing organization	☐ Yes ☐ No ☒ N/A

CITY OF RICHMOND
Chief Administrative Office

April 8, 2022

This project is funded through the City’s American Rescue Plan Act (ARPA) funding. No other state, federal, or private funds are anticipated to be allocated for use in this project. The City’s ARPA spend plan was approved by Ordinance No. 2021-291 (attached) and provides $1,500,000 for the acquisition of new south side parks. Any remaining funding needs will be found in the FY 2023 Park, Recreation, and Community Facilities operating budget. The City of Richmond has in place the capacity to execute the funding of the City of Richmond’s required match.

Sincerely,

Lincoln Saunders

J.E. Lincoln Saunders

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☒ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Application Form CFPF| 2-A

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Richmond Wastewater Treatment Plant
1400 Brander Street, Richmond, VA 23224

NFIP Community Identification Number (CID#):(See appendix F 510129

Application Form CFPF| 3-A

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Zone AE

Flood Insurance Rate Map Number(s) (If Applicable): Effective: 5101290043E, effective 7/16/2014
Preliminary: 5101290043F, issued 2/22/2022

Total Cost of Project: $585,000

Total Amount Requested $292,500

Scope of Work Narrative

1. Project Information

Background

The City of Richmond's Wastewater Treatment Plant (WWTP) is located on a flood prone site adjacent to the James River. The Federal Emergency Management Agency's (FEMA) recent flood risk review for the City revealed a preliminary 3-foot increase in the base flood elevation for the facility and surrounding area (see attached FIRMette and Preliminary FIRM Map). In preparation for this increase, Flood Vulnerability and Mitigation Planning Studies were performed to evaluate the impact and determine the facility's current flood hazard susceptibilities. The resulting reports documented several of the building's flood pathways, low lying open tanks, and exposed equipment that assume risk detrimental to the continued function of the facility. Further analysis prioritized the mitigation efforts by determining what operations would be critical to the rapid recovery of baseline processes after a flood event. The critical process operations were identified as seven of the structures or buildings associated with preliminary and primary treatment of wastewater as well as UV disinfection. A severe flood event rendering one or more of the functions of these structures incapable would jeopardize the environmental, infrastructure, and public health protections the facility provides.

The proposed design and construction project will consist of flood mitigation improvements for the seven critical structures identified as vital to the rapid recovery of facility operations after a flood event. The seven critical structures are:

1. Main Plant Switchgear Building
2. Main Pumping Station
3. Primary Sludge Pumping Station
4. Preliminary Sedimentation Tanks (4)
5. Gravity Sludge Thickener Tanks
6. Digester Tanks (2) and Sludge Control Building No. 1
7. UV Building

A target design flood protection level was set at +39.0 ft (City Datum) to include freeboard and surcharge above the new 100-year base flood elevation. The project design will raise the flood protection to the new level and primarily focus on a combination of three flood mitigation strategies identified during the planning phase: raising equipment, replacing susceptible exterior elements with flood proof alternatives, and/or sealing the buildings or structures. Existing exterior walls and foundations will be structurally reinforced to accommodate the increased flood loading, and sump pumps will be added as a redundancy measure. The proposed flood resistant construction and structural components will be designed in accordance with the 2018 Virginia Construction Code, ASCE 7, and ASCE 24. Implementation of these mitigation strategies will allow for a base level of treatment to occur while the remainder of the facility recovers from the flood event and adds resilience to a vital service that the community depends on.

WWTP Structures Included in the Project: (North to South) Main Pumping Station, Main Plant Switchgear Building, Digester Tanks (2) and Sludge Control Building No. 1, Primary Sludge Pumping Station, Preliminary Sedimentation Tanks (4), Gravity Sludge Thickener Tanks, and UV Building

The following mitigation strategies were identified for each of the seven critical structures. The recommended strategy accounts for the criticality and value of vulnerable assets, site-specific constraints, type of flood pathways, feasibility, and cost of implementation. All Elevations are in reference to the City Datum which is 0.8 ft above NAVD 88 Datum.

Main Plant Switchgear Building: The building's first floor elevation of +35.2 feet is 3.8 feet below the DFE level. The first floor contains critical equipment used to control, protect, and isolate the facility's electrical equipment. The recommended mitigation strategy is Sealing the Building. The flood pathways on the exterior of the building will be sealed, protected with temporary barriers, raised, or replaced with watertight assemblies to prevent water inundation up to the higher elevation.

Main Pumping Station: The first floor is 3.0' feet below the DFE at an elevation of +36.0 feet and contains a majority of the critical electrical equipment necessary to operate the station. The lower levels of the station contain pumps and equipment necessary to transport wastewater to the facility. The recommended mitigation strategies are to Raise Equipment and Seal the Building. The perimeter of the building and flood pathways can be protected or sealed using flood barriers and new floodproof fenestrations. The extensive below grade space creates a potential risk to flood water inundation through cracks and penetrations, therefore critical equipment will be raised as a secondary measure. The below grade cracks and penetrations would also be sealed. Structural reinforcement of the exterior walls is also necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

Primary Sludge Pumping Station: The building's first floor elevation is 9.0 feet below the anticipated +39.0 foot DFE level. The first floor contains the critical electrical equipment necessary to operate the station and the majority of the pumps and associated equipment are located on the lowest level. The recommended mitigation strategy is to Seal the Building. The flood pathways on the exterior of the building need to be sealed, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation. Structural reinforcement of the exterior walls is necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

Preliminary Sedimentation Tanks (4): The preliminary sedimentation tanks consists of four trains of clarifiers with a top slab elevation of +22.0 feet which is 17 feet below the DFE. At grade motor operated gear units and control panels power the sludge collection flights. The recommended mitigation strategies are to Flood Proof Equipment and Seal the Structure. The strategy includes installing a 9 foot high removeable flood barrier wall around the entire structure to protect it to a height of a 50 year flood event. Utilizing a perimeter barrier to protect to the 100 year storm elevation was determined to be exponentially more expensive to the point of not being cost effective. Therefore, to include the mitigation of a 100 year storm event, the recommended strategy includes the replacement of critical equipment with equivalent flood proof versions or purchasing replacement equipment to have available during the rarest events. Watertight electrical enclosures are also planned.

Gravity Sludge Thickener Tanks: The top slab of the four gravity sludge thickeners is 10 feet below the DFE at Elevation +29.0 feet. Thickener rake drive motors are located at that level and are at risk. Sludge pumps are located in the lower level of the building and are also vulnerable. The recommended mitigation strategy is to Flood Proof Equipment. The strategy is to replace the critical equipment with equivalent flood proof versions or place them in submersible enclosures in order to maintain their function after a flood.

Digester Tanks (2) and Sludge Control Building No. 1: The base of the tanks and first floor of the control building are 7.4 and 5.0 feet below the anticipated DFE level, respectively. The recommended mitigation strategy is to Seal the Building and Tanks. The flood pathways identified on the exterior of both structures need to be sealed, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation. Structural reinforcement of the exterior walls of the Sludge Control Building is also necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

UV Building: The Facility was built ten years ago to be dry-flood proof to an Elevation of +36.0 feet which is now 3 feet below the DFE. The recommended mitigation strategy is to Seal the Building. The flood pathways identified on the exterior of the building, particularly those between Elevations 36.0 and 39.0 feet, need to be raised, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation.

DFE= 39.0 ft (City Datum)

Structure Name	Type	ELEV (City Datum)	Flood Depth (ft)	Recommended Flood Mitigation Strategy
Main Plant Switchgear Building	Structure	35.2	3.8	Seal Building
Main Pumping Station	Structure	18.0/36.0	21.0/3.0	Raise Equipment, Seal Building
Primary Sludge Pumping Station	Structure	30.0	9.0	Seal Building
Preliminary Sedimentation Tanks (4)	Tanks	22.0	17.0	Seal Structure, Flood Proof Equipment
Gravity Sludge Thickener Tanks	Tanks	29.0	10.0	Flood Proof Equipment
Sludge Control Building No. 1	Structure	34.0	5.0	Seal Building
Digester Tanks (2)	Tanks	31.6	7.4	Seal Building
UV Building	Structure	20.5	18.5	Seal Building

Flood Mitigation Strategy Recommendations

Design Phase Scope of Services

The scope of services for the Design Phase of the Project is divided into the following eight Tasks. This information is also part of the attached Task Order draft for the WWTP Flood Mitigation Design Project.

TASK 1 – PROJECT MANAGEMENT
This task includes management of activities, meetings, and workshops for the design phase of the project as follows:

Kickoff Meeting
A kickoff meeting will be held with the City project team to review the scope of work and discuss the overall project goals. Greeley and Hansen PM will prepare the agenda and minutes of these meetings for review and approval by the City PM.

Design Review Meetings
As part of Task 1, review meetings will be held with the City at 30, 60, 90, and 100%.milestones. These meetings will review work progress and identify efforts and expectations for the remainder of the work. Greeley and Hansen PM will prepare the agenda and minutes of these meetings for review and approval by the City PM.

Coordination, Quality Control, and Progress Reports

This will include project coordination with key City of Richmond staff, project team and subconsultants. It is anticipated that this will be an ongoing Quality Control process. A Greeley and Hansen Principal will review all project design deliverables for quality assurance. Project progress will be reported and included in the invoices on a monthly basis.

TASK 2 – SURVEY AND GEOTECHNICAL

Survey

Mobilize surveyor to document site conditions at the four corners of each of the seven structures of focus. Survey to provide topographic information including natural features and elevations, ground conditions, vegetation, man-made surface features and structures, and utilities. Underground utilities will be marked by Miss Utilities and documented on survey. No ground penetrating radar is planned. The North American Vertical Datum of 1988 (NAVD 88) will be used as the vertical control datum.

Geotechnical Investigation

Mobilize geotechnical engineer to perform up to five soil borings at the site and provide recommendations for necessary below grade design. Based on the anticipated locations, five borings 50 feet deep will be provided. Investigation will include field soil borings, rock cores, laboratory testing, and engineering analysis and report.

TASK 3 – 30% DESIGN

A basis of design memorandum will be developed to solidify the strategies recommended in the Flood Vulnerability and Mitigation Planning Studies, and allow for updates relative to new survey information. The memorandum with summarize the architectural and engineering design criteria and will include 30% drawings and a specification list. Drawings will be created using 3D REVIT and AutoCAD Civil 3d. Greeley and Hansen's BIM and CAD standards will be used. Draft memo will be sent to City for review. It is anticipated that the City will review and provide comments within two weeks. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied in a tabular comment register.

The following information will be included in the basis of design memorandum:

- INTRODUCTION AND PROJECT OVERVIEW
- CODE SUMMARY
- PERFORMANCE CRITERIA:
- 30% DRAWINGS
- LIST OF SPECIFICATIONS
- OPINION OF PROBABLE CONSTRUCTION COST

A site visit will take place at the onset of the 30% Design phase to investigate site conditions. One engineer will lead site visit.

TASK 4 – 60% DESIGN

The City review comments from the basis of design memorandum will be incorporated in the drawings, and the design will be further detailed. An AACE Class 3 Opinion of Probable Construction Cost (OPCC) will be prepared. 60% design documents will be provided for client review. Two weeks will be provided in the schedule for this review. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied to in a tabular comment register.

TASK 5 – 90% DESIGN

The 60% City review comments will be incorporated, and the design will be further detailed and include a document set covering all disciplines. This 90% phase will include final draft specifications and an updated Class 2 OPCC. The front end of the project book will be coordinated with City's procurement department. 90% design documents will be provided for client review, including third-party constructability review. Two weeks will be provided in the schedule for this review. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied in a tabular comment register.

TASK 6 – PERMITTING

This task will provide 100% complete signed and sealed contract documents for electronic submission to receive a certificate from the City's Permit and Planning department for permit review. Permit review comments and corrections will be incorporated into documents.

TASK 7 – 100% DESIGN

This task will deliver the 100% complete signed and sealed contract documents for bid purposes incorporating all previous City comments, third-party constructability review comments, and front-end documents coordinated with the City. Fully documented review comment adjudication will be completed before the documents are sealed. These represent the finished construction documents (100% bid documents) less any potentially needed Addenda that might follow.

TASK 8 – BID ASSISTANCE

This task will include bidding services such as attending a pre-bid meeting, providing addenda, and evaluation of bids. It is anticipated that a mandatory pre-bid meeting will be required. Greeley and Hansen will prepare materials for this meeting and attend the meeting to present materials as needed on City's behalf. It is anticipated that this task will include a site walk through for contractors.

Total Project Cost and Statement of Funding

This application pertains to funding for the design phase of the project. The total cost of design services for the project is estimated at $585,000. At a CFPF Fund/City match split of 50% / 50%, the City is applying for $292,500 towards the design fee. The attached statement of funding describes the City's ability to pay the remaining $292,500 for their match portion.

Population Served

The Richmond WWTP is the primary treatment facility for 225,000 people including all of the residents of the City and a number of residents of surrounding communities.

In addition, the immediate area around the facility is identified as a low-income geographic area and a location of very high social vulnerability (see attached Social Vulnerability and Qualified Opportunity Zone Maps). The protection of wastewater services reduces the community's risks in a number of ways including: reducing the contamination of water resources, safeguarding public health, and preventing environmental pollutants.

Historic Flood Information

The WWTP is located in Special Flood Hazard Zone AE. The effective FIRM map was last created in July of 2014 and identified a BFE through the middle of the site of approximately 33.5 feet in NAVD 88 (34.3 feet City Datum). FEMA's flood risk review over the course of the last two years culminated in the production of preliminary FIRM maps in February of 2022 which depicted a 3-foot rise in the BFE to 36.5 feet in NAVD 88 (37.3 feet City Datum) for the facility.

On November 14, 2020, the James River crested at 16.95 feet in NAVD 88 at the City Locks gauge, flooding portions of Richmond's Wastewater Treatment Plant (see attached Historic Flood Images). The flooding of the James River in Richmond is driven by rainfall in the upper portions of the watershed beginning in the Appalachian Mountains. The City is required to treat wastewater flows to best of their ability, and in large scale events this mandate is continually balanced against ensuring the safety of staff and facility. During this event the plant was shut down for three days due to the inundation and the facility incurred $3000 in damages. In terms of scale, the flood event did not reach the level of a ten year flood elevation (at 19.9 feet in NAVD 88), but nevertheless caused a substantial void in service to the community. The indirect cost due to loss of service was calculated for the 225,000 users at the FEMA provided rate of $41 per person per day of lost wastewater service, the total service loss came to $27,675,000.

At least four additional storm events of greater magnitude than the most recent event have occurred over the last 25 years but records regarding the amount of loss or loss of service were unavailable.

Jan 27, 2010	Flooding of the Facility. The river crested at 18.1 ft (NAVD 88) at the nearest gauge to the WWTP.
Feb 25, 2003	Flooding of the Facility. The river crested at 18.73 ft (NAVD 88) at the nearest gauge to the WWTP.
Sep 8, 1996	Flooding of the Facility. The river crested at 21.23 ft (NAVD 88) at the nearest gauge to the WWTP.
Jan 21, 1996	Flooding of the Facility. The river crested at 20.61 ft (NAVD 88) at the nearest gauge to the WWTP.

Past WWTP Flood Events

Floodplain Management Regulations

The current floodplain regulations for the City of Richmond can be found at the following site:

Chapter 14 - FLOODPLAIN MANAGEMENT, EROSION AND SEDIMENT CONTROL, AND DRAINAGE | Code of Ordinances | Richmond, VA | Municode Library

2. Need for Assistance

Currently many of the critical operations at the facility are at risk to equipment damage and induced loss of service from flood events below a 10 year level event. A recent event below a 10-year level storm halted operations at the facility for 3 days. It is reasonable to assume that a much larger event will have drastic and potentially long term effects on the wastewater service to the community.

The expected annual damages (equipment and service loss) for carrying this risk are estimated at almost $3.4 million (see Budget Narrative analysis). The project decreases this risk by dramatically increasing the protection level of critical operations to allow for a rapid recovery after events up to the 100 year level.

As previously mentioned, the immediate area surrounding the facility is identified as a low-income geographic area and a location of very high social vulnerability (see attached Social Vulnerability and Qualified Opportunity Zone Maps). The protection of wastewater services reduces the risk of untreated sewage being introduced into the waterways and environment of the surrounding community

Alternatives

The recommended project was compared to two alternatives: no action and a perimeter flood wall constructed around the facility.

No Action
A 100-year flood event could decimate many of the critical structures, tanks, and housed equipment at the facility knocking out water treatment services to the City and surrounding communities for many months.

A Perimeter Flood Wall Option around the Facility
The Richmond WWTP is located in the 100-year floodway adjacent to the James River. A costly alternative includes designing and constructing a flood wall around the entire facility to prevent the site wide inundation of flood water. The flood wall would be approximately 7800 ft in length and vary in height from 5'-20' depending on the grade elevation on the site. At an estimated cost of $225/sf the wall would have an estimated construction cost of 22 million dollars. A permanent wall at the site would have a large impact on the hydrology and flooding potential of the surrounding area that would require extensive study to limit determinantal effects.

In previous years the City and US Army Corps of Engineers have evaluated the installation of a floodwall around the facility and thus far it has been determined by the Corps to not be cost effective (low benefit to cost ratio).

3. Goals and Objectives

The flood mitigation effort at the WWTP will benefit the 225,000-person service area in the City of Richmond (and surrounding communities) by protecting the reliability of an essential resource. The long-term stabilization of wastewater service reduces community risks for a multitude of lifelines including: the protection of water resources, safeguarding public health, reducing contamination of food sources, functioning community infrastructure, and preventing environmental pollutants.

The WWTP’s flood mitigation project will be cost effective. The total project benefit (risk avoided) is calculated at $42,773,800 and opinion of probable cost of mitigation is $ 5,586,110, producing a benefit to cost ratio of 7.6. Further explanation and documentation for this analysis is provided in the Budget Narrative section.

4. Approach, Milestones, and Deliverables

The flood mitigation efforts will be implemented in a traditional design-bid-build project. The start of design for the project is planned for the middle of 2022. The anticipated schedule includes 9 months of design, 3 months of procurement, and 2 years of construction (see table below). Milestones for design will include 30%, 60%, and 100% deliverables at the three, six, and nine-month points, respectively. Milestones for construction will be at 25% Construction Complete, 50% Construction Complete, 75% Construction Complete, and 100% Construction Complete. The City of Richmond's Department of Public Utilities will manage and complete the project with outside consultant Architects and Engineers.

Project Schedule

5. Relationship to Other Projects

The project focuses on the protection of seven structures at the facility that have been deemed critical for the rapid recovery of baseline treatment operations. Additional secondary structures and operations at the facility will continue to be susceptible to flood hazards. The protection of these additional less critical areas is planned to be integrated into general capital improvement work for each structure.

6. Maintenance and Management Plan

All equipment and flood mitigation elements installed through this project will be maintained in perpetuity by the DPU's in-house maintenance staff at the WWTP through maintenance work orders. Maintenance work orders are used by the facility in concert with the Operation and Maintenance Manual to track, operate, and maintain all assets. All Maintenance Work Orders are funded through the Facility's Operation and Maintenance Fund. All manufacturer instruction, documentation, and recommendations for maintenance and repair of installed elements will become part of the Facility's Operation and Maintenance Manual.

7. Additional Criteria

- The City has an approved resilience plan through DCR. See attached Resilience Plan Approval letter.
- No portion of the project has been included in any application or program previously funded by the DCR.
- Evidence of an ability to provide the required match funds: see attached Statement of Funding letter.
- A link the current hazard mitigation plan: RCMR-HMP-07182017-1.pdf (planrva.org)
- A link to the current comprehensive plan: Master Plan | Richmond (rva.gov)

Budget Narrative

1. Estimated Total Project Cost

The total cost of services for the Design phase of the project is **$585,000**. A tabular breakdown of this cost organized by the anticipated amount of hours per employee rate is located below (and also contained in the attached draft Task Order for WWTP Flood Mitigation Design Project).

WWTP Flood Mitigation Design Project

Estimated Cost of Services

Estimated Labor Costs:

Tasks	**Program Coor.**	**Project Manager**	**Architect / Engineer IV**	**Architect / Engineer III**	**Architect / Engineer II**	**Architect / Engineer I**	**Sen. CADD Tech.**	**Jr. CADD Tech.**	**Typist/ Clerical**	**Total Hours**	**Estimated Labor Costs**
Task 1 - PROJECT MANAGEMENT	8	80	8							96	$20,920
Task 2 - SURVEY AND GEOTECHNICAL	1	8	12	16						37	$7,207
Task 3 - 30% DESIGN	1	24	30	220	220	240	20	120	6	881	$118,331
Task 4 - 60% DESIGN	1	24	30	200	200	240	20	120	6	841	$112,311

										0	
Subtotal Labor Hours	14	180	152	720	715	770	70	384	30	0	**$421,200**
Hourly Rate	$ 295	$ 211	$ 210	$ 169	$ 132	$ 110	$ 111	$ 95	$ 72		
Estimated Total Labor Cost	$ 4,130	$ 37,980	$ 31,920	$ 121,680	$ 94,380	$ 84,700	$ 7,770	$ 36,480	$ 2,160	$421,200	

Estimated Other Direct Costs:

Item	**Cost**	**Multiplier**	**Total Estimate**
1. Survey AND Geotechnical (MBE)	$20,000	1.05	$21,000
2. Structural Subcontractor (MBE)	$130,000	1.05	$136,500
3. Reproduction	$1,000	1.05	$1,050
4. Travel	$5,000	1.05	$5,250
Subtotal Estimated Other Direct Costs			**$ 163,800**

Total Estimated Costs:

Total Estimated Cost of Labor and Other Direct Costs			**$585,000**

Estimated Cost of Design Services

2. Amount of Funds Requested from the Fund

The total amount of grant assistance requested by the fund for the Design phase of the project is **$292,500.** This amount constitutes a 50% / 50% split between the Fund and the City of Richmond's match amount. The grant funds will be allocated to cover half of the estimated Cost of Design Services in the table above.

3. Amount of cash funds available

The City of Richmond Department of Public utilities has a match amount of **$292,500**, which when combined with the amount of funds requested reflects the total estimated cost of the Design phase of the project. The City's funds will be sourced from DPU's CIP Fund. A Statement of Funding letter from the City has been included with the supporting documentation with the application**.**

A letter authorizing the request for funding from the City has also been included with the supporting documentation with the application**.**

4. Opinion of Probable Flood Mitigation Costs

This section provides a conceptual opinion of the probable construction cost for the identified mitigation strategy for each structure. The conceptual opinion of probable construction has been updated to reflect the initial structural analysis completed and the additional assessment of optimal resiliency design strategies. The conceptual opinions of construction cost provided in this report are considered AACE Class 5. The conceptual cost of sealing a building comprised of a conservative estimate for the protection of each flood pathway. The conceptual cost of raising equipment included an estimate of the platform of structure needed to raise and access the equipment and the effort to reinstall. The conceptual cost of installing flood proof equipment was considered equivalent to the replacement cost of the original piece of equipment. These construction cost opinions include materials and equipment, labor and installation, contingency, and general contractor overhead; and are based on the engineer's experience with prior projects and cost sources such as RS Means. All benefits and costs are provided in 2022-dollar values.

Opinion of Probable Cost of Mitigation per Structure

Item No.	Item Description	Quantity	Unit	Unit Price	Amount
Main Plant Switchgear Building					
Northside					
1	New Flood windows (5)	170	SF	$ 500	$ 85,000

				Subtotal	**$ 197,300**
				Total All Items	**$ 5,586,110**

5. Opinion of Probable Mitigated Risk

This section quantifies the present risk to the WWTP and critical assets given the probability of a future flood event. According to FEMA the replacement cost value is defined as the "cost to replace property with the same kind of material and construction without deduction for depreciation."[1] A conceptual opinion of probable asset replacement costs are listed below.

Opinion of Probable Asset Replacement Costs

Item No.	Item Description	Quantity	Unit	Unit Price	Amount
Main Plant Switchgear Building					
1	Main Switchgear	1	EA	$ 500,000	$ 500,000
2	Transformers: T-29, T-30	2	EA	$ 150,000	$ 300,000
3	Distribution Panels, Control-Panel, Automatic Transfer Switch, DCU-EB	1	LS	$ 400,000	$ 400,000
				Subtotal	**$ 1,200,000**
Main Pump Station					
1	Gate operators	1	EA	$ 100,000	$ 100,000
2	AFDs	4	EA	$ 500,000	$ 2,000,000
3	Venturi meter sensor	1	EA	$ 75,000	$ 75,000
4	AFD control panels	1	EA	$ 250,000	$ 250,000
5	4 pump Motors	4	EA	$ 250,000	$ 1,000,000
6	MCC, Transformer, switchgear	1	EA	$ 500,000	$ 500,000
7	DCS, Pump Control, DCU, Lighting trans, lighting panel	1	LS	$ 1,000,000	$ 1,000,000
				Subtotal	**$ 4,925,000**
Primary Sludge Pump Station					
1	5 primary sludge pumps	5	EA	$ 150,000	$ 750,000
2	2 scum pumps	2	EA	$ 75,000	$ 150,000
3	2 ferric chloride pumps	2	EA	$ 75,000	$ 150,000
4	pump control panel	1	EA	$ 100,000	$ 100,000
5	DCU, MCC, MCS, Lighting	1	LS	$ 400,000	$ 400,000
				Subtotal	**$ 1,550,000**
Preliminary Sedimentation Tanks					
1	Flight drives, collector motors	8	EA	$ 12,500	$ 100,000
2	Cross and longitudinal drives	16	EA	$ 5,000	$ 80,000
3	Control panels	8	EA	$ 15,000	$ 120,000
				Subtotal	**$ 300,000**
Gravity Sludge Thickener Tanks					
1	Thickener drives	4	EA	$ 40,000	$ 160,000
2	sludge pumps	4	EA	$ 100,000	$ 400,000
				Subtotal	**$ 560,000**
Digester Tanks and Sludge Control Building No.1					
1	Controllers, MCC	1	EA	$ 300,000	$ 300,000

---

[1] https://www.fema.gov/national-flood-insurance-program/definitions#R

Item No.	Item Description	Quantity	Unit	Unit Price	Amount
2	Valves	12	EA	$ 40,000	$ 480,000
3	Circulating pumps	9	EA	$ 150,000	$ 1,350,000
4	Sludge heating water pumps	12	EA	$ 10,000	$ 120,000
5	CC, Steam system, lighting	1	LS	$ 500,000	$ 500,000
				Subtotal	**$ 2,750,000**
UV Building					
1	UV Reactors	1	LS	$ 1,000,000	$ 1,000,000
2	MCC UV1	1	EA	$ 300,000	$ 300,000
3	UV System Control Centers SCC-1, SCC-2	2	EA	$ 200,000	$ 400,000
4	480V Switchgear UV1, UV2	2	EA	$ 500,000	$ 1,000,000
5	VFDs	4	EA	$ 75,000	$ 300,000
				Subtotal	**$ 3,000,000**
				Total All Items	**$ 14,285,000**

Expected annual damages (EAD) for each structure were calculated based the conservative probability of flooding given the current protection level and the replacement cost value of assets at risk. A conceptual opinion of probable expected annual damages to critical assets are summarized below.

Expected Annual Damages per Structure

Structure Name	Estimated Total Asset Replacement Cost	Probability	Expected Annual Damages (EAD)
Main Plant Switchgear Building	$1,200,000	1%	$12,000
Main Pumping Station	$4,925,000	10%	$492,500
Primary Sludge Pumping Station	$1,500,000	2%	$30,000
Preliminary Sedimentation Tanks	$300,000	10%	$30,000
Gravity Sludge Thickener Tanks	$600,000	2%	$12,000
Digester Tanks/ Sludge Control Building #1	$2,750,000	1%	$27,500
UV Building	$3,000,000	1%	$30,000
	Total		**$634,000**

In addition to the asset replacement cost, the facility's mitigated risk includes a conceptual value for the loss of service to the community. FEMA estimates the economic impact of the loss of wastewater service to be $41 per person per day lost of service. The Richmond Wastewater Treatment Plant serves approximately 225,000 people. Using the data from the most recent storm event in 2020, the facility incurred 3 days of lost service for an event that did not reach the level of a 10-year storm, so a 10% probability was conservatively used. The economic impact of service loss is estimated at $27,675,000. The expected annual value is the following:

Expected Annual Value of Service Loss to a Flood Event

Name	Estimated Total Economic Impact of Service Loss	Probability	Expected Annual Value of Service Loss
WWTP	$27,675,000	10%	**$2,767,500**

In order to compare future, recurring EAD to the 2022 cost of proposed mitigation strategies, a discount rate was applied over the life of a project to establish flood risk. The useful lifetime of flood mitigation for this study was estimated at 30 years. A discount rate of 7% was used in accordance with FEMA benefit-cost analysis and as required by the Federal Government's Office of Management and Budget for 2022. The present value formula used is as follows:

$$\text{Risk} = EAD\left[\frac{1-(1+r)^{-T}}{r}\right]$$

Where EAD = expected annual damages

r = discount rate = 7%

T = useful life, years = 30

The table below provides a summary of the present value of the risk to critical assets at each structure.

Present Value at Risk for Each Structure

Structure Name	EAD	Mitigated Risk (Present Value)
Main Plant Switchgear Building	$12,000	$148,800
Main Pumping Station	$492,500	$6,107,000
Primary Sludge Pumping Station	$30,000	$372,000
Preliminary Sedimentation Tanks	$30,000	$372,000
Gravity Sludge Thickener Tanks	$12,000	$148,800
Digester Tanks/ Sludge Control Building #1	$27,500	$341,000
UV Building	$30,000	$372,000
Total		**$7,861,600**

The table below provides the present value of the risk to the WWTP for service loss.

Present Value at Risk for Loss of Service

Name	Expected Annual Value of Service Loss	Mitigated Risk (Present Value)
WWTP	$2,767,500	**$34,317,000**

In adding the two mitigated risk categories, the total present value of mitigated risk comes to **$42,178,600**.

The following benefit to cost ratio for the WWTP Flood Mitigation effort was determined.

Benefit to Cost Summary of Mitigated Risk

Total Benefit, Present Value Mitigated Risk	Estimated Cost of Flood Mitigation	Benefit-to-Cost Ratio
$42,178,600	**$5,586,110**	**7.6**

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Richmond	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration		☒ **Yes** ☐ **No**
Applicant Name:	City of Richmond DPU	
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	25
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	15
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		**70**

* A **Base Flood Elevation** is the expected elevation of flood water during the 1% annual chance storm event. Structures below the estimated water surface elevation may experience flooding during a base flood event.

Hazard Level	Flood Hazard Zone
High Flood Hazard	**AE, A, AH, AO, VE and V Zones.** Properties in these flood zones have a 1% chance of flooding each year. This represents a 26% chance of flooding over the life of a 30-year mortgage.
Moderate Flood Hazard	**Shaded Zone X.** Properties in the moderate flood risk areas also have a chance of flooding from storm events that have a less than 1% chance of occuring each year. Moderate flood risk indicates an area that may be provided flood risk reduction due to a flood control system or an area that is prone to flooding during a 0.2% annual chance storm event. These areas may have been indicated as areas of shallow flooding by your community. **Unshaded Zone X.** Properties on higher ground and away from local flooding sources have a reduced flood risk when compared to the Moderate and High Flood Risk categories. Structures in these areas may be affected by larger storm events, in excess of the 0.2% annual chance storm event.
Low Flood Hazard	**Insurance Note:** High Risk Areas are called 'Special Flood Hazard Areas' and flood insurance is mandatory for federally backed mortgage holders. Properties in Moderate and Low Flood Risk areas may purchase flood insurance at a lower-cost rate, known as Preferred Risk Policies. See your local insurance agent or visit https://www.fema.gov/national-flood-insurance-program for more information.

Disclaimer: This report is for informational purposes only and is not authorized for official use. The positional accuracy may be compromised in some areas. Please contact your local floodplain administrator for more information or go to msc.fema.gov to view an official copy of the Flood Insurance Rate Maps.

RE: City of Richmond Resilience Plan Submission - CFPF

Dear Mr. Shue:

Thank you for providing an overview of your Resilience Plan, and informing DCR of the various plans that the City of Richmond will be utilizing to fulfill the Resilience Plan submission requirements. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on August 20, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

   Meets criteria as written.

   a. Project-based: The city of Richmond lies within the James River Watershed with 24 miles of the James River flowing through the city. This has been subdivided into 4 watershed groupings, each with uniquely defined characteristics. Several projects have been completed or are phased for completion as notated in the *Richmond-Crater Hazard Mitigation Plan*. Additionally, watershed based projects have been outlined in the *RVA Clean Water Plan* and flood control and resilience projects are also identified within the *RVA Emergency Operations Plan*.

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   Meets criteria as written.

a. Natural and nature-based flood management measures are identified for use in projects throughout the city in the *RVA Clean Water Plan*.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**

   Meets criteria as written.

   a. All parts of a locality: Entirety of the City of Richmond's stormwater system was evaluated as part of the watershed characterization in the *RVA Clean Water Plan;* and city-wide land use patterns described in the *2017 Richmond-Crater Hazard Mitigation Plan*.

   b. Social vulnerability: FEMA TEIF 2.0 analysis used to evaluate flood risk in the *2017 Richmond-Crater Hazard Mitigation Plan*.

   c. Demographic Analysis: Community profiles of the city and region-wide demographics captured in the *2017 Richmond-Crater Hazard Mitigation Plan*.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**

   Meets criteria as written.

   a. Coordination with other local and inter-jurisdictional projects, plans and activities:
   The development of the *Richmond-Regional–Crater PDC Multi-Regional Hazard Mitigation Plan* included coordination with public servants and planning officials from all but three of the 24 localities included in the Crater and Plan RVA PDC's. It also draws from several regional plans and activities as outlined on section 3.3 on page 3-12.

   The Technical Workgroup which contributed to the development of *the RVA Clean Water Plan* drew on experience from 30 different entities including state agencies, community associations, conservation and planning organizations, educational and scientific institutions, and other collectives as outlined in Section 2 on pages 6-7.

   b. Clearly articulated timeline or phasing plan for implementation:
   Section 5 of the *RVA Clean Water Program* identifies strategies for green infrastructure, stream restoration and land & water conservation in the City. Sections 4, 7 and 8 Identify a planning framework for the prioritization projects as well as a means by which success will be measured.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**

   Meets criteria as written.

a. The *Richmond-Regional–Crater PDC Multi-Regional Hazard Mitigation Plan* references best-available data regarding flood risk from FEMA and the NCDC in sections 5.6.6 and 5.6.9. The RVA *Clean Water Plan* is established on data from the City’s 2015 *Watershed Characterization Report* as well as the City’s *2017 Clean Water Modeling Report*, found in Appendix A.

VA DCR looks forward to working with you as you work to make the City of Richmond a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

CONTRACT NO. 17000006735
Wastewater Utility Work Order

WWTP Flood Hazard Mitigation Strategic Planning

BACKGROUND

The Federal Emergency Management Agency's (FEMA) recent flood risk review revealed an anticipated 3-foot increase in the base flood elevation for the Richmond Wastewater Treatment Plant (WWTP) and surrounding area. In preparation for this increase a Flood Vulnerability Study and Mitigation Planning Studies were performed for the City of Richmond (the City) to evaluate the impact and realize the current flood hazard susceptibilities. The resulting reports documented several of the building's flood pathways, low lying open tanks, and exposed equipment that assume risk detrimental to the continued function of the facility. Further analysis prioritized the mitigation efforts by determining what operations would be critical to the rapid recovery of baseline processes after a flood event. The critical process operations were identified as those associated with preliminary and primary treatment of wastewater as well as UV disinfection. The following buildings or structures were identified:

1. Main Plant Switchgear Building
2. Main Pumping Station
3. UV Building
4. Primary Sludge Pumping Station
5. Preliminary Sedimentation Tanks (4)
6. Gravity Sludge Thickener Tanks
7. Digester Tanks (2) and Sludge Control Building No. 1

The following scope of services are for the design of flood mitigation improvements for the seven critical structures identified as vital to the rapid recovery of facility operations after a flood event. A target design flood protection level was set at +39.0 ft to include freeboard and surcharge above the new 100-year base flood elevation. The project design will raise the flood protection to the new level and primarily focus on a combination of three flood mitigation strategies identified during the planning phase: raising equipment, replacing susceptible exterior elements with flood proof alternatives, and/or sealing the buildings or structures. Existing exterior walls will be structurally reinforced to accommodate the increased flood loading, and sump pumps will be added as a redundancy measure. The proposed flood resistant construction and structural components will be designed in accordance with the 2018 Virginia Construction Code, ASCE 7, and ASCE 24. Implementation of these mitigation strategies will allow for a base level of treatment to occur while the remainder of the facility recovers from the flood event and adds resilience to a vital service that the community depends on.

This Richmond WWTP Flood Mitigation design includes architectural and engineering drawings and specifications, opinions of probable construction cost, permitting, and bid assistance. The Design will incorporate a quality assurance and quality control program resulting in high quality deliverables.

SCOPE OF SERVICES

Unless noted otherwise, all deliverables will be transmitted electronically in portable document format (pdf).

TASK 1 – PROJECT MANAGEMENT

This task includes management of activities, meetings, and workshops for the design phase of the project as follows:

Kickoff Meeting

A kickoff meeting will be held with the City project team to review the scope of work and discuss the overall project goals. Greeley and Hansen PM will prepare the agenda and minutes of these meetings for review and approval by the City PM.

Design Review Meetings

As part of Task 1, review meetings will be held with the City at 30, 60, 90, and 100%.milestones. These meetings will review work progress and identify efforts and expectations for the remainder of the work. Greeley and Hansen PM will prepare the agenda and minutes of these meetings for review and approval by the City PM.

Coordination, Quality Control, and Progress Reports

This will include project coordination with key City of Richmond staff, project team and subconsultants. It is anticipated that this will be an ongoing Quality Control process. A Greeley and Hansen Principal will review all project design deliverables for quality assurance. Project progress will be reported and included in the invoices on a monthly basis.

Deliverables:

- Agenda, draft and final minutes from the meetings and workshops for distribution to the attendees. Agenda will be distributed no later than two (2) working days before meetings. Draft minutes will be distributed within five (5) working days of the meeting. Final minutes will be distributed within (2) days after draft minutes distributed (if revisions requested by attendees).
- Monthly Progress Reports.

TASK 2 – SURVEY AND GEOTECHNICAL

Survey

Mobilize surveyor to document site conditions at the four corners of each of the seven structures of focus. Survey to provide topographic information including natural features and elevations, ground conditions, vegetation, man-made surface features and structures, and utilities. Underground utilities will be marked by Miss Utilities and documented on survey. No ground penetrating radar is planned. The North American Vertical Datum of 1988 (NAVD 88) will be used as the vertical control datum.

Geotechnical Investigation

Mobilize geotechnical engineer to perform up to five soil borings at the site and provide recommendations for necessary below grade design. Based on the anticipated locations, five borings 50 feet deep will be provided. Investigation will include field soil borings, rock cores, laboratory testing, and engineering analysis and report.

Deliverables:

- Site Survey sealed and signed in PDF 60% Design Drawings and Specifications.
- Geotechnical Report
- Soil Borings

TASK 3 – 30% DESIGN

A basis of design memorandum will be developed to solidify the strategies recommended in the Flood Vulnerability and Mitigation Planning Studies, and allow for updates relative to new survey information. The memorandum with summarize the architectural and engineering design criteria and will include 30% drawings and a specification list. Drawings will be created using 3D REVIT and AutoCAD Civil 3d. Greeley and Hansen's BIM and CAD standards will be used. Draft memo will be sent to City for review. It is anticipated that the City will review and provide comments within two weeks. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied in a tabular comment register.

The following information will be included in the basis of design memorandum:

- INTRODUCTION AND PROJECT OVERVIEW
- CODE SUMMARY
- PERFORMANCE CRITERIA:
- 30% DRAWINGS
- LIST OF SPECIFICATIONS
- OPINION OF PROBABLE CONSTRUCTION COST
    - This OPCC will be AACE Class 3

A site visit will take place at the onset of the 30% Design phase to investigate site conditions. One engineer will lead site visit.

Deliverables:

- Basis of Design Memorandum
- Class 3 OPCC
- Comment register
- Site Visit Notes

TASK 4 – 60% DESIGN

The City review comments from the basis of design memorandum will be incorporated in the drawings, and the design will be further detailed. An AACE Class 3 Opinion of Probable Construction Cost (OPCC) will be prepared. 60% design documents will be provided for client review. Two weeks will be provided in the schedule for this review. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied to in a tabular comment register.

Deliverables:

- 60% Design Drawings and Specifications.
- Class 3 OPCC
- Comment register

TASK 5 – 90% DESIGN

The 60% City review comments will be incorporated, and the design will be further detailed and include a document set covering all disciplines. This 90% phase will include final draft specifications and an updated Class 2 OPCC. The front end of the project book will be coordinated with City's procurement department. 90% design documents will be provided for client review, including third-party constructability review. Two weeks will be provided in the schedule for this review. Client comments will be collected in a written tabular comment register. Comments will be adjudicated with City's project manager and replied in a tabular comment register.

Deliverables:

- 90% Design Drawings and Specifications.
- Class 2 OPCC
- Comment register

TASK 6 – PERMITTING

This task will provide 100% complete signed and sealed contract documents for electronic submission to receive a certificate from the City's Permit and Planning department for permit review. Permit review comments and corrections will be incorporated into documents.

Permitting fees will be paid by the City and are not included in this task order.

Deliverables:

- Final signed and sealed drawings and specifications issued for permit
- Permit application forms

TASK 7 – 100% DESIGN

This task will deliver the 100% complete signed and sealed contract documents for bid purposes incorporating all previous City comments, third-party constructability review comments, and front-end documents coordinated with the City. Fully documented review comment adjudication will be completed before the documents are sealed. These represent the finished construction documents (100% bid documents) less any potentially needed Addenda that might follow.

Deliverables:

- 100% Design Drawings and Specifications.
    - The City will be provided with both electronic and hard copy documents for 100% submittal. Electronic documents will be provided in PDF format. Four (4) hard copy full size and four (4) half-size drawing sets with specifications will also be provided.
- Class 2 OPCC

TASK 8 – BID ASSISTANCE

This task will include bidding services such as attending a pre-bid meeting, providing addenda, and evaluation of bids. It is anticipated that a mandatory pre-bid meeting will be required. Greeley and Hansen will prepare materials for this meeting and attend the meeting to present materials as needed on City's behalf. It is anticipated that this task will include a site walk through for contractors.

Deliverables:

- Pre-bid meeting agenda and notes.
- Written responses as needed to Contractor Bid questions as requested through the City's Procurement.
- Bid addenda as requested through the City's Procurement.

Statement of Funding Letter

April 6, 2022

Virginia Department of Conservation and Recreation
600 East Main Street
24th Floor
Richmond, VA 23219-2094

Re: WWTP Flood Mitigation Project

To whom it may concern:

The total estimated value of design services for the WWTP Flood Mitigation Project is $585,000. The City of Richmond, Department of Public utilities will utilize their CIP fund to cover their 50% match share of the cost ($292,500). DPU is committed to contributing the match amount from this fund to cover the cost of the project.

Sincerely,

John W Vaughan Jr.

John W. Vaughan, Jr.
City of Richmond, Department of Public Utilities
Deputy Department Director, Senior
(804) 646-5232

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☒ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Application Form CFPF| 2-A

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Richmond Wastewater Treatment Plant
1400 Brander Street, Richmond, VA 23224

NFIP Community Identification Number (CID#):(See appendix F 510129

Application Form CFPF| 3-A

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Zone AE

Flood Insurance Rate Map Number(s) (If Applicable): Effective: 5101290043E, effective 7/16/2014
Preliminary: 5101290043F, issued 2/22/2022

Total Cost of Project: $5,586,110

Total Amount Requested $2,793,055

Scope of Work Narrative

1. Project Information

Background

The City of Richmond's Wastewater Treatment Plant (WWTP) is located on a flood prone site adjacent to the James River. The Federal Emergency Management Agency's (FEMA) recent flood risk review for the City revealed a preliminary 3-foot increase in the base flood elevation for the facility and surrounding area (see attached FIRMette and Preliminary FIRM Map). In preparation for this increase, Flood Vulnerability and Mitigation Planning Studies were performed to evaluate the impact and determine the facility's current flood hazard susceptibilities. The resulting reports documented several of the building's flood pathways, low lying open tanks, and exposed equipment that assume risk detrimental to the continued function of the facility. Further analysis prioritized the mitigation efforts by determining what operations would be critical to the rapid recovery of baseline processes after a flood event. The critical process operations were identified as seven of the structures or buildings associated with preliminary and primary treatment of wastewater as well as UV disinfection. A severe flood event rendering one or more of the functions of these structures incapable would jeopardize the environmental, infrastructure, and public health protections the facility provides.

The proposed design and construction project will consist of flood mitigation improvements for the seven critical structures identified as vital to the rapid recovery of facility operations after a flood event. The seven critical structures are:

1. Main Plant Switchgear Building
2. Main Pumping Station
3. Primary Sludge Pumping Station
4. Preliminary Sedimentation Tanks (4)
5. Gravity Sludge Thickener Tanks
6. Digester Tanks (2) and Sludge Control Building No. 1
7. UV Building

A target design flood protection level was set at +39.0 ft (City Datum) to include freeboard and surcharge above the new 100-year base flood elevation. The project design will raise the flood protection to the new level and primarily focus on a combination of three flood mitigation strategies identified during the planning phase: raising equipment, replacing susceptible exterior elements with flood proof alternatives, and/or sealing the buildings or structures. Existing exterior walls and foundations will be structurally reinforced to accommodate the increased flood loading, and sump pumps will be added as a redundancy measure. The proposed flood resistant construction and structural components will be designed in accordance with the 2018 Virginia Construction Code, ASCE 7, and ASCE 24. Implementation of these mitigation strategies will allow for a base level of treatment to occur while the remainder of the facility recovers from the flood event and adds resilience to a vital service that the community depends on.

WWTP Structures Included in the Project: (North to South) Main Pumping Station, Main Plant Switchgear Building, Digester Tanks (2) and Sludge Control Building No. 1, Primary Sludge Pumping Station, Preliminary Sedimentation Tanks (4), Gravity Sludge Thickener Tanks, and UV Building

The following mitigation strategies were identified for each of the seven critical structures. The recommended strategy accounts for the criticality and value of vulnerable assets, site-specific constraints, type of flood pathways, feasibility, and cost of implementation. All Elevations are in reference to the City Datum which is 0.8 ft above NAVD 88 Datum.

Main Plant Switchgear Building: The building's first floor elevation of +35.2 feet is 3.8 feet below the DFE level. The first floor contains critical equipment used to control, protect, and isolate the facility's electrical equipment. The recommended mitigation strategy is Sealing the Building. The flood pathways on the exterior of the building will be sealed, protected with temporary barriers, raised, or replaced with watertight assemblies to prevent water inundation up to the higher elevation.

Main Pumping Station: The first floor is 3.0' feet below the DFE at an elevation of +36.0 feet and contains a majority of the critical electrical equipment necessary to operate the station. The lower levels of the station contain pumps and equipment necessary to transport wastewater to the facility. The recommended mitigation strategies are to Raise Equipment and Seal the Building. The perimeter of the building and flood pathways can be protected or sealed using flood barriers and new floodproof fenestrations. The extensive below grade space creates a potential risk to flood water inundation through cracks and penetrations, therefore critical equipment will be raised as a secondary measure. The below grade cracks and penetrations would also be sealed. Structural reinforcement of the exterior walls is also necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

Primary Sludge Pumping Station: The building's first floor elevation is 9.0 feet below the anticipated +39.0 foot DFE level. The first floor contains the critical electrical equipment necessary to operate the station and the majority of the pumps and associated equipment are located on the lowest level. The recommended mitigation strategy is to Seal the Building. The flood pathways on the exterior of the building need to be sealed, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation. Structural reinforcement of the exterior walls is necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

Preliminary Sedimentation Tanks (4): The preliminary sedimentation tanks consists of four trains of clarifiers with a top slab elevation of +22.0 feet which is 17 feet below the DFE. At grade motor operated gear units and control panels power the sludge collection flights. The recommended mitigation strategies are to Flood Proof Equipment and Seal the Structure. The strategy includes installing a 9 foot high removeable flood barrier wall around the entire structure to protect it to a height of a 50 year flood event. Utilizing a perimeter barrier to protect to the 100 year storm elevation was determined to be exponentially more expensive to the point of not being cost effective. Therefore, to include the mitigation of a 100 year storm event, the recommended strategy includes the replacement of critical equipment with equivalent flood proof versions or purchasing replacement equipment to have available during the rarest events. Watertight electrical enclosures are also planned.

Gravity Sludge Thickener Tanks: The top slab of the four gravity sludge thickeners is 10 feet below the DFE at Elevation +29.0 feet. Thickener rake drive motors are located at that level and are at risk. Sludge pumps are located in the lower level of the building and are also vulnerable. The recommended mitigation strategy is to Flood Proof Equipment. The strategy is to replace the critical equipment with equivalent flood proof versions or place them in submersible enclosures in order to maintain their function after a flood.

Digester Tanks (2) and Sludge Control Building No. 1: The base of the tanks and first floor of the control building are 7.4 and 5.0 feet below the anticipated DFE level, respectively. The recommended mitigation strategy is to Seal the Building and Tanks. The flood pathways identified on the exterior of both structures need to be sealed, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation. Structural reinforcement of the exterior walls of the Sludge Control Building is also necessary to resist the flood loading. A carbon fiber reinforced polymer product that can be applied to the interior walls is recommended to provide the additional strength needed.

UV Building: The Facility was built ten years ago to be dry-flood proof to an Elevation of +36.0 feet which is now 3 feet below the DFE. The recommended mitigation strategy is to Seal the Building. The flood pathways identified on the exterior of the building, particularly those between Elevations 36.0 and 39.0 feet, need to be raised, protected with temporary barriers, or replaced with watertight assemblies to prevent inundation to the higher elevation.

DFE= 39.0 ft (City Datum)

Structure Name	Type	ELEV (City Datum)	Flood Depth (ft)	Recommended Flood Mitigation Strategy
Main Plant Switchgear Building	Structure	35.2	3.8	Seal Building
Main Pumping Station	Structure	18.0/36.0	21.0/3.0	Raise Equipment, Seal Building
Primary Sludge Pumping Station	Structure	30.0	9.0	Seal Building
Preliminary Sedimentation Tanks (4)	Tanks	22.0	17.0	Seal Structure, Flood Proof Equipment
Gravity Sludge Thickener Tanks	Tanks	29.0	10.0	Flood Proof Equipment
Sludge Control Building No. 1	Structure	34.0	5.0	Seal Building
Digester Tanks (2)	Tanks	31.6	7.4	Seal Building
UV Building	Structure	20.5	18.5	Seal Building

Flood Mitigation Strategy Recommendations

Total Project Cost and Statement of Funding

This application pertains to funding for the construction phase of the project. The total opinion of probable construction cost for the project is $5,586,110. At a CFPF Fund/City match split of 50% / 50%, the City is applying for $2,793,055 towards construction. The attached statement of funding describes the City's ability to pay the remaining $2,793,055 for their match portion.

Population Served

The Richmond WWTP is the primary treatment facility for 225,000 people including all of the residents of the City and a number of residents of surrounding communities.

In addition, the immediate area around the facility is identified as a low-income geographic area and a location of very high social vulnerability (see attached Social Vulnerability and Qualified Opportunity Zone Maps). The protection of wastewater services reduces the community's risks in a number of ways including: reducing the contamination of water resources, safeguarding public health, and preventing environmental pollutants.

Historic Flood Information

The WWTP is located in Special Flood Hazard Zone AE. The effective FIRM map was last created in July of 2014 and identified a BFE through the middle of the site of approximately 33.5 feet. FEMA's flood risk review over the course of the last two years culminated in the production of preliminary FIRM maps in February of 2022 which depicted a 3-foot rise in the BFE to 36.5 feet for the facility.

On November 14, 2020, the James River crested at 16.95 feet in NAVD 88 at the City Locks gauge, flooding portions of Richmond's Wastewater Treatment Plant (see attached Historic Flood Images). The flooding of the James River in Richmond is driven by rainfall in the upper portions of the watershed beginning in the Appalachian Mountains. The City is required to treat wastewater flows to best of their ability, and in large scale events this mandate is continually balanced against ensuring the safety of staff and facility. During this event the plant was shut down for three days due to the inundation and the facility incurred $3000 in damages. In terms of scale, the flood event did not reach the level of a ten year flood elevation (at 19.9 ft in NAVD 88), but nevertheless caused a substantial void in service to the community. The indirect cost due to loss of service was calculated for the 225,000 users at the FEMA provided rate of $41 per person per day of lost wastewater service, the total service loss came to $27,675,000.

At least four additional storm events of greater magnitude than the most recent event have occurred over the last 25 years but records regarding the amount of loss or loss of service were unavailable.

Jan 27, 2010	Flooding of the Facility. The river crested at 18.1 ft (NAVD 88) at the nearest gauge to the WWTP.
Feb 25, 2003	Flooding of the Facility. The river crested at 18.73 ft (NAVD 88) at the nearest gauge to the WWTP.
Sep 8, 1996	Flooding of the Facility. The river crested at 21.23 ft (NAVD 88) at the nearest gauge to the WWTP.
Jan 21, 1996	Flooding of the Facility. The river crested at 20.61 ft (NAVD 88) at the nearest gauge to the WWTP.

Past WWTP Flood Events

Floodplain Management Regulations

The current floodplain regulations for the City of Richmond can be found at the following site:

Chapter 14 - FLOODPLAIN MANAGEMENT, EROSION AND SEDIMENT CONTROL, AND DRAINAGE | Code of Ordinances | Richmond, VA | Municode Library

2. Need for Assistance

Currently many of the critical operations at the facility are at risk to equipment damage and induced loss of service from flood events below a 10-year level event. A recent event below a 10-year level storm halted operations at the facility for 3 days. It is reasonable to assume that a much larger event will have drastic and potentially long term effects on the wastewater service to the community.

The expected annual damages (equipment and service loss) for carrying this risk are estimated at almost $3.4 million (see Budget Narrative analysis). The project decreases this risk by dramatically increasing the protection level of critical operations to allow for a rapid recovery after events up to the 100-year level.

As previously mentioned, the immediate area surrounding the facility is identified as a low-income geographic area and a location of very high social vulnerability (see attached Social Vulnerability and Qualified Opportunity Zone Maps). The protection of wastewater services reduces the risk of untreated sewage being introduced into the waterways and environment of the surrounding community

Alternatives

The recommended project was compared to two alternatives: no action and a perimeter flood wall constructed around the facility.

No Action
A 100 year flood event could decimate many of the critical structures, tanks, and housed equipment at the facility knocking out water treatment services to the City and surrounding communities for many months.

A Perimeter Flood Wall Option around the Facility
The Richmond WWTP is located in the 100-year floodway adjacent to the James River. A costly alternative includes designing and constructing a flood wall around the entire facility to prevent the site wide inundation of flood water. The flood wall would be approximately 7800 ft in length and vary in height from 5'-20' depending on the grade elevation on the site. At an estimated cost of $225/sf the wall would have an estimated construction cost of 22 million dollars. A permanent wall at the site would have a large impact on the hydrology and flooding potential of the surrounding area that would require extensive study to limit determinantal effects.

In previous years the City and US Army Corps of Engineers have evaluated the installation of a floodwall around the facility and thus far it has been determined by the Corps to not be cost effective (low benefit to cost ratio).

3. Goals and Objectives

The flood mitigation effort at the WWTP will benefit the 225,000-person service area in the City of Richmond (and surrounding communities) by protecting the reliability of an essential resource. The long-term stabilization of wastewater service reduces community risks for a multitude of lifelines including: the protection of water resources, safeguarding public health, reducing contamination of food sources, functioning community infrastructure, and preventing environmental pollutants.

The WWTP's flood mitigation project will be cost effective. The total project benefit (risk avoided) is calculated at $42,773,800 and opinion of probable cost of mitigation is $ 5,586,110, producing a benefit to cost ratio of 7.6. Further explanation and documentation for this analysis is provided in the Budget Narrative section.

4. Approach, Milestones, and Deliverables

The flood mitigation efforts will be implemented in a traditional design-bid-build project. The start of design for the project is planned for the middle of 2022. The anticipated schedule includes 9 months of design, 3 months of procurement, and 2 years of construction (see table below). Milestones for design will include 30%, 60%, and 100% deliverables at the three, six, and nine-month points, respectively. Milestones for construction will be at 25% Construction Complete, 50% Construction Complete, 75% Construction Complete, and 100% Construction Complete. The City of Richmond's Department of Public Utilities will manage and complete the project with outside consultant Architects and Engineers.

ACTIVITY	DURATION IN MONTHS											
	3	6	9	12	15	18	21	24	27	30	33	36
Flood Mitigation Project Design	🟩	🟩	🟩

Flood Mitigation Project Construction					🟩	🟩	🟩	🟩	🟩	🟩	🟩	🟩
Milestones	30%	60%	100%			25%		50%		75%		100%

Project Schedule

5. Relationship to Other Projects

The project focuses on the protection of seven structures at the facility that have been deemed critical for the rapid recovery of baseline treatment operations. Additional secondary structures and operations at the facility will continue to be susceptible to flood hazards. The protection of these additional less critical areas is planned to be integrated into general capital improvement work for each structure.

6. Maintenance and Management Plan

All equipment and flood mitigation elements installed through this project will be maintained in perpetuity by the DPU's in-house maintenance staff at the WWTP through maintenance work orders. Maintenance work orders are used by the facility in concert with the Operation and Maintenance Manual to track, operate, and maintain all assets. All Maintenance Work Orders are funded through the Facility's Operation and Maintenance Fund. All manufacturer instruction, documentation, and recommendations for maintenance and repair of installed elements will become part of the Facility's Operation and Maintenance Manual.

7. Additional Criteria

- The City has an approved resilience plan through DCR. See attached Resilience Plan Approval letter.
- No portion of the project has been included in any application or program previously funded by the DCR.
- Evidence of an ability to provide the required match funds: see attached Statement of Funding letter.
- A link the current hazard mitigation plan: RCMR-HMP-07182017-1.pdf (planrva.org)
- A link to the current comprehensive plan: Master Plan | Richmond (rva.gov)

Budget Narrative

1. Estimated Total Project Cost

The total opinion of probable construction cost for the project is **$5,586,110**. A tabular breakdown of this cost organized in section 4 below - Opinion of Probable Flood Mitigation Costs.

2. Amount of Funds Requested from the Fund

The total amount of grant assistance requested by the fund for the Construction phase of the project is **$2,793,055.** This amount constitutes a 50% / 50% split between the Fund and the City of Richmond's match amount. The grant funds will be allocated to cover half of the estimated cost of construction.

3. Amount of cash funds available

The City of Richmond Department of Public utilities has a match amount of **$2,793,055**, which when combined with the amount of funds requested reflects the total estimated cost of the construction for the project. The City's funds will be sourced from DPU's CIP Fund. A Statement of Funding letter from the City has been included with the supporting documentation with the application**.**

A letter authorizing the request for funding from the City has also been included with the supporting documentation with the application**.**

4. Opinion of Probable Flood Mitigation Costs

This section provides a conceptual opinion of the probable construction cost for the identified mitigation strategy for each structure. The conceptual opinion of probable construction has been updated to reflect the initial structural analysis completed and the additional assessment of optimal resiliency design strategies. The conceptual opinions of construction cost provided in this report are considered AACE Class 5. The conceptual cost of sealing a building comprised of a conservative estimate for the protection of each flood pathway. The conceptual cost of raising equipment included an estimate of the platform of structure needed to raise and access the equipment and the effort to reinstall. The conceptual cost of installing flood proof equipment was considered equivalent to the replacement cost of the original piece of equipment. These construction cost opinions include materials and equipment, labor and installation, contingency, and general contractor overhead; and are based on the engineer's experience with prior projects and cost sources such as RS Means. All benefits and costs are provided in 2022-dollar values.

Opinion of Probable Construction Cost of Mitigation

Item No.	Item Description	Quantity	Unit	Unit Price	Amount
Main Plant Switchgear Building					
Northside					
1	New Flood windows (5)	170	SF	$ 500	$ 85,000
2	Single Door w/ sidelite - Flexible Flood Cover	32	SF	$ 210	$ 6,720
Southside

6	Seal exterior conduit penetrations (3)	3	EA	$ 500	$ 1,500
				Subtotal	**$ 197,300**
				Total All Items	**$ 5,586,110**

5. Opinion of Probable Mitigated Risk

This section quantifies the present risk to the WWTP and critical assets given the probability of a future flood event. According to FEMA the replacement cost value is defined as the “cost to replace property with the same kind of material and construction without deduction for depreciation.”[1] A conceptual opinion of probable asset replacement costs are listed below.

---

Opinion of Probable Asset Replacement Costs

Item No.	Item Description	Quantity	Unit	Unit Price	Amount
Main Plant Switchgear Building					
1	Main Switchgear	1	EA	$ 500,000	$ 500,000
2	Transformers: T-29, T-30	2	EA	$ 150,000	$ 300,000
3	Distribution Panels, Control-Panel, Automatic Transfer Switch, DCU-EB	1	LS	$ 400,000	$ 400,000
				Subtotal	**$ 1,200,000**
Main Pump Station					
1	Gate operators	1	EA	$ 100,000	$ 100,000
2	AFDs	4	EA	$ 500,000	$ 2,000,000
3	Venturi meter sensor	1	EA	$ 75,000	$ 75,000
4	AFD control panels	1	EA	$ 250,000	$ 250,000
5	4 pump Motors	4	EA	$ 250,000	$ 1,000,000
6	MCC, Transformer, switchgear	1	EA	$ 500,000	$ 500,000
7	DCS, Pump Control, DCU, Lighting trans, lighting panel	1	LS	$ 1,000,000	$ 1,000,000
				Subtotal	**$ 4,925,000**
Primary Sludge Pump Station					
1	5 primary sludge pumps	5	EA	$ 150,000	$ 750,000
2	2 scum pumps	2	EA	$ 75,000	$ 150,000
3	2 ferric chloride pumps	2	EA	$ 75,000	$ 150,000
4	pump control panel	1	EA	$ 100,000	$ 100,000
5	DCU, MCC, MCS, Lighting	1	LS	$ 400,000	$ 400,000
				Subtotal	**$ 1,550,000**
Preliminary Sedimentation Tanks					
1	Flight drives, collector motors	8	EA	$ 12,500	$ 100,000
2	Cross and longitudinal drives	16	EA	$ 5,000	$ 80,000
3	Control panels	8	EA	$ 15,000	$ 120,000
				Subtotal	**$ 300,000**
Gravity Sludge Thickener Tanks					
1	Thickener drives	4	EA	$ 40,000	$ 160,000
2	sludge pumps	4	EA	$ 100,000	$ 400,000
				Subtotal	**$ 560,000**
Digester Tanks and Sludge Control Building No.1					
1	Controllers, MCC	1	EA	$ 300,000	$ 300,000
2	Valves	12	EA	$ 40,000	$ 480,000
3	Circulating pumps	9	EA	$ 150,000	$ 1,350,000
4	Sludge heating water pumps	12	EA	$ 10,000	$ 120,000
5	CC, Steam system, lighting	1	LS	$ 500,000	$ 500,000
				Subtotal	**$ 2,750,000**
UV Building					
1	UV Reactors	1	LS	$ 1,000,000	$ 1,000,000
2	MCC UV1	1	EA	$ 300,000	$ 300,000
3	UV System Control Centers SCC-1, SCC-2	2	EA	$ 200,000	$ 400,000
4	480V Switchgear UV1, UV2	2	EA	$ 500,000	$ 1,000,000
5	VFDs	4	EA	$ 75,000	$ 300,000
				Subtotal	**$ 3,000,000**
				Total All Items	**$ 14,285,000**

Expected annual damages (EAD) for each structure were calculated based the conservative probability of flooding given the current protection level and the replacement cost value of assets at risk. A conceptual opinion of probable expected annual damages to critical assets are summarized below.

Expected Annual Damages per Structure

Structure Name	Estimated Total Asset Replacement Cost	Probability	Expected Annual Damages (EAD)
Main Plant Switchgear Building	$1,200,000	1%	$12,000
Main Pumping Station	$4,925,000	10%	$492,500
Primary Sludge Pumping Station	$1,500,000	2%	$30,000
Preliminary Sedimentation Tanks	$300,000	10%	$30,000
Gravity Sludge Thickener Tanks	$600,000	2%	$12,000
Digester Tanks/ Sludge Control Building #1	$2,750,000	1%	$27,500
UV Building	$3,000,000	1%	$30,000
	Total		**$634,000**

In addition to the asset replacement cost, the facility's mitigated risk includes a conceptual value for the loss of service to the community. FEMA estimates the economic impact of the loss of wastewater service to be $41 per person per day lost of service. The Richmond Wastewater Treatment Plant serves approximately 225,000 people. Using the data from the most recent storm event in 2020, the facility incurred 3 days of lost service for an event that did not reach the level of a 10-year storm, so a 10% probability was conservatively used. The economic impact of service loss is estimated at $27,675,000. The expected annual value is the following:

Expected Annual Value of Service Loss to a Flood Event

Name	Estimated Total Economic Impact of Service Loss	Probability	Expected Annual Value of Service Loss
WWTP	$27,675,000	10%	**$2,767,500**

In order to compare future, recurring EAD to the 2022 cost of proposed mitigation strategies, a discount rate was applied over the life of a project to establish flood risk. The useful lifetime of flood mitigation for this study was estimated at 30 years. A discount rate of 7% was used in accordance with FEMA benefit-cost analysis and as required by the Federal Government's Office of Management and Budget for 2022. The present value formula used is as follows:

Risk = $EAD\left[\frac{1-(1+r)^{-T}}{r}\right]$

Where EAD = expected annual damages

r = discount rate = 7%

T = useful life, years = 30

The table below provides a summary of the present value of the risk to critical assets at each structure.

Present Value at Risk for Each Structure

Structure Name	EAD	Mitigated Risk (Present Value)
Main Plant Switchgear Building	$12,000	$148,800
Main Pumping Station	$492,500	$6,107,000
Primary Sludge Pumping Station	$30,000	$372,000
Preliminary Sedimentation Tanks	$30,000	$372,000
Gravity Sludge Thickener Tanks	$12,000	$148,800
Digester Tanks/ Sludge Control Building #1	$27,500	$341,000
UV Building	$30,000	$372,000
Total		**$7,861,600**

The table below provides the present value of the risk to the WWTP for service loss.

Present Value at Risk for Loss of Service

Name	Expected Annual Value of Service Loss	Mitigated Risk (Present Value)
WWTP	$2,767,500	**$34,317,000**

In adding the two mitigated risk categories, the total present value of mitigated risk comes to **$42,178,600**.

The following benefit to cost ratio for the WWTP Flood Mitigation effort was determined.

Benefit to Cost Summary of Mitigated Risk

Total Benefit, Present Value Mitigated Risk	Estimated Cost of Flood Mitigation	Benefit-to-Cost Ratio
$42,178,600	**$5,586,110**	**7.6**

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Richmond

Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☒ **Yes** ☐ **No**
Applicant Name:	City of Richmond DPU

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	25
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	15
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		**70**

* A **Base Flood Elevation** is the expected elevation of flood water during the 1% annual chance storm event. Structures below the estimated water surface elevation may experience flooding during a base flood event.

Hazard Level	Flood Hazard Zone
High Flood Hazard	**AE, A, AH, AO, VE and V Zones.** Properties in these flood zones have a 1% chance of flooding each year. This represents a 26% chance of flooding over the life of a 30-year mortgage.
Moderate Flood Hazard	**Shaded Zone X.** Properties in the moderate flood risk areas also have a chance of flooding from storm events that have a less than 1% chance of occuring each year. Moderate flood risk indicates an area that may be provided flood risk reduction due to a flood control system or an area that is prone to flooding during a 0.2% annual chance storm event. These areas may have been indicated as areas of shallow flooding by your community. **Unshaded Zone X.** Properties on higher ground and away from local flooding sources have a reduced flood risk when compared to the Moderate and High Flood Risk categories. Structures in these areas may be affected by larger storm events, in excess of the 0.2% annual chance storm event.
Low Flood Hazard	**Insurance Note:** High Risk Areas are called 'Special Flood Hazard Areas' and flood insurance is mandatory for federally backed mortgage holders. Properties in Moderate and Low Flood Risk areas may purchase flood insurance at a lower-cost rate, known as Preferred Risk Policies. See your local insurance agent or visit https://www.fema.gov/national-flood-insurance-program for more information.

Disclaimer: This report is for informational purposes only and is not authorized for official use. The positional accuracy may be compromised in some areas. Please contact your local floodplain administrator for more information or go to msc.fema.gov to view an official copy of the Flood Insurance Rate Maps.

RE: City of Richmond Resilience Plan Submission - CFPF

Dear Mr. Shue:

Thank you for providing an overview of your Resilience Plan, and informing DCR of the various plans that the City of Richmond will be utilizing to fulfill the Resilience Plan submission requirements. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the June 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on August 20, 2024.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

   Meets criteria as written.

   a. Project-based: The city of Richmond lies within the James River Watershed with 24 miles of the James River flowing through the city. This has been subdivided into 4 watershed groupings, each with uniquely defined characteristics. Several projects have been completed or are phased for completion as notated in the *Richmond-Crater Hazard Mitigation Plan*. Additionally, watershed based projects have been outlined in the *RVA Clean Water Plan* and flood control and resilience projects are also identified within the *RVA Emergency Operations Plan*.

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   Meets criteria as written.

a. Natural and nature-based flood management measures are identified for use in projects throughout the city in the *RVA Clean Water Plan*.

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**

Meets criteria as written.

a. All parts of a locality: Entirety of the City of Richmond's stormwater system was evaluated as part of the watershed characterization in the *RVA Clean Water Plan;* and city-wide land use patterns described in the *2017 Richmond-Crater Hazard Mitigation Plan*.

b. Social vulnerability: FEMA TEIF 2.0 analysis used to evaluate flood risk in the *2017 Richmond-Crater Hazard Mitigation Plan*.

c. Demographic Analysis: Community profiles of the city and region-wide demographics captured in the *2017 Richmond-Crater Hazard Mitigation Plan*.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**

Meets criteria as written.

a. Coordination with other local and inter-jurisdictional projects, plans and activities:
The development of the *Richmond-Regional–Crater PDC Multi-Regional Hazard Mitigation Plan* included coordination with public servants and planning officials from all but three of the 24 localities included in the Crater and Plan RVA PDC's. It also draws from several regional plans and activities as outlined on section 3.3 on page 3-12.

The Technical Workgroup which contributed to the development of *the RVA Clean Water Plan* drew on experience from 30 different entities including state agencies, community associations, conservation and planning organizations, educational and scientific institutions, and other collectives as outlined in Section 2 on pages 6-7.

b. Clearly articulated timeline or phasing plan for implementation:
Section 5 of the *RVA Clean Water Program* identifies strategies for green infrastructure, stream restoration and land & water conservation in the City. Sections 4, 7 and 8 Identify a planning framework for the prioritization projects as well as a means by which success will be measured.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**

Meets criteria as written.

a. The *Richmond-Regional–Crater PDC Multi-Regional Hazard Mitigation Plan* references best-available data regarding flood risk from FEMA and the NCDC in sections 5.6.6 and 5.6.9. The RVA *Clean Water Plan* is established on data from the City's 2015 *Watershed Characterization Report* as well as the City's *2017 Clean Water Modeling Report*, found in Appendix A.

VA DCR looks forward to working with you as you work to make the City of Richmond a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

Statement of Funding Letter

CITY OF RICHMOND

Department of Public Utilities

April 6, 2022

Virginia Department of Conservation and Recreation
600 East Main Street
24th Floor
Richmond, VA 23219-2094

Re: WWTP Flood Mitigation Project

To whom it may concern:

The total estimated cost of construction for the WWTP Flood Mitigation Project is $5,586,110. The City of Richmond, Department of Public utilities will utilize their CIP fund to cover their 50% match share of the cost ($2,793,055). DPU is committed to contributing the match amount from this fund to cover the cost of the project.

Sincerely,

John W. Vaughan, Jr.
City of Richmond, Department of Public Utilities
Deputy Department Director, Senior

Re: Authorization of Tazewell County CFPF Application

Dear Ms. Howard-Cooper and Members of the Review Team:

Tazewell County is proud to submit the enclosed application to the third grant round of the Community Flood Preparedness Fund. We firmly believe that the capacity-building and planning that will result from this project, should you choose to support it, will help the people of Tazewell County to work toward a more resilient community.

Tazewell County and our neighbors in Southwest Virginia have experienced devastating recurrent flooding that has increased in recent years. We are pleased to see that DCR has been willing to direct some of this new fund to mountainous and disadvantaged communities and we hope to join our neighbors in working with your program.

Please accept this letter as my authorization of the request for CFPF funding.

Also, please reach out to me, Emergency Management Coordinator David White, or any of our proposed team of consultants with questions. We look forward to working with you.

Sincerely,

C. Eric Young, Esq.
Tazewell County Administrator

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☒ Floodplain Staff Capacity.

☒ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☒ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Tazewell County, VA (see maps in attachments)

NFIP Community Identification Number (CID#):(See appendix F 510160

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): ____________________

Flood Insurance Rate Map Number(s) (If Applicable): ____________________

Total Cost of Project: $369,500

Total Amount Requested $332,550

Scope of Work Narrative

Tazewell County has long experienced challenging riverine flooding that impacts its homes, churches, community infrastructure, and businesses, as well as the coal mines that have served as the economic backbone of the region. However, as a low-income community, Tazewell County has rarely had the resources to properly address impacts of flooding and plan new approaches for the future. The Community Flood Preparedness Fund offers Tazewell County an opportunity to build toward a more resilient future, and thus the County is applying to the third CFPF round in the Capacity Building and Planning Category.

Proposal

The proposed project includes a professional engineering analysis and planning effort engaging stakeholders throughout Tazewell County, along with training for a key member of the County staff to become a Certified Floodplain Manager. By working with consultants that can help build this effort toward greater community-based natural resource management, Tazewell will lay strong groundwork for future resilience projects.

Today's Flooding Hotspots

In today's weather patterns, Tazewell's transportation network and its adjacent homes, community infrastructure, and businesses have proven to be key vulnerabilities. These are anticipated to be among the priorities revealed by the engineering analysis and plan development. The maps and FIRMettes in the supporting documentation (Attachment 1, overview maps, Attachment 2, aerial maps, and Attachments 3.1-3.8, FIRMettes) illustrate these known hotspots, but do not predetermine the projects to be identified by the plan. Brief overviews of each hotspot are:

1. Clinch River at Bottom Rd. and Kirby Rd. in Raven: This area floods to and over the road, impacting houses and churches in the vicinity.
2. Clinch River at Plant Rd.: When this area floods, access to the sewage treatment plant is cut off.
3. Clinch River at Fourth St. in Richlands: Floods in this area at times reach residential buildings on the banks of the creek.
4. Big Creek at Kentucky Avenue: Another known flooding point at a key transportation nexus.
5. Indian Creek at Banes Bottom near Indian Creek Rd.: Floods affect houses and trailers near the banks. Also, along Indian Creek Rd. leaving Cedar Bluff going toward Baptist Valley, a bridge is sometimes flooded and made impassable.
6. Bluestone River at Big. Branch Rd., Falls Mills area: The curve before Big Branch Rd. is impacted by floodwaters that cover the west side of the road heading toward Pocahontas. This is especially dangerous at night as this is an area not served by streetlights.

For additional recent history of flash flooding due to rain events, see news coverage of floods in 2020 and 2021, such as these articles (also provided as Attachment 4):

- https://www.bdtonline.com/news/state-of-emergency-declared-in-tazewell-county-due-to-flooding/article_732adc66-48fe-11ea-ab01-67b21dc9e50c.html
- https://woay.com/town-of-richlands-sees-blocked-roads-as-river-banks-flood-monday-morning/

Local elected officials and concerned citizens have begun seeking more proactive solutions. Neighboring Buchanan County's success in securing a CFPF grant to boost its resilience planning provides a model for Tazewell to apply. This effort has the active support of Delegate Will Morefield, Third District, as demonstrated in his letter of support (Attachment 5).

Existing Policies

Tazewell County has a floodplain ordinance, Attachment 6 in the supporting documentation. In developing this ordinance, the County's stated goals were "to prevent the loss of property and life, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base[.]" Those goals continue to underlie the County's flood resilience efforts today, including with this grant application.

The floodplain ordinance complements the Tazewell County Comprehensive Plan and the hazard mitigation plan for the entire Cumberland Plateau Planning District Commission, linked here:

- http://tazewellcountyva.org/wp-content/uploads/2015/11/Compplanfinal.pdf
- http://cppdc.org/Reports/Mitigation%20Plan%20Edit.pdf

Case for Support

Tazewell County meets the definition of a low-income community that the CFPF was especially designed to support. The median household income in the County is only 55% that of the Virginia median -- $42,207 per year, versus $76,398 per year, in 2020 dollars according to the US Census Bureau (Attachment 7). With this household income level, Tazewell County meets the CFPF definition of a low-income community.

Two of Tazewell County's census tracts, 202 or Bluefield and 206 or Claypool Hill, are federally designated Opportunity Zones (Attachment 8). One of the County's preliminary identified flooding hotspots, the Falls Mills area, overlaps the Census Tract 202/Bluefield Opportunity Zone. More priority resilience projects may be identified within the Opportunity Zones during the analysis and planning process. Thus the plan is expected to benefit not only the exceptionally vulnerable areas of the County, but also provide community-scale benefits as the capacity and resources of the entire County are lifted.

Tazewell County's case for support is also demonstrated in the VIMS Social Vulnerability Index. Two of the County's 11 census tracts fall into the High category of the index, while the remaining 9 of 11 census tracts fall into the Moderate category. Some of the County's preliminary identified flooding hotspots in the Doran and Richlands areas overlap zones of High social vulnerability. The Index categories are illustrated in the map in the supporting documentation (Attachment 9). Characteristics cited in the Index's assessment of housing the county typically include fragile stock, high percentage of mobile homes, low values and rents, and long term renters. These residents will benefit from the state's assistance with plans to reduce their flooding vulnerability and improve their communities' resilience.

This Scope of Work Narrative will now present further details of the proposed activities to be undertaken by Tazewell County and its project partners.

Proposed Activities

Tazewell County, working with contractors First Earth|2030 and Stantec, will undertake a process to build capacity and develop an actionable resilience plan. This process is expected to take approximately 12 months following a CFPF grant award and contractual notice to proceed.

Task 1: Initiate the Project

Task 1A: Orientation Meeting

The project partners will facilitate a project orientation meeting to review scope, schedule, and resources with a small core team, led by Shanna Plaster, Administrator for Northwestern District; Eric Young, County Administrator; Dave White, Emergency Management Coordinator; Barry Brooks, Director of Fire and Rescue and Deputy Emergency Management Coordinator; Ken Dunford, Director of Engineering; and AJ Robinson, Director of Tourism and Public Relations. The goals of the project will also be reviewed. At a minimum, goals for the plan are to:

- Understand flood risk and identification of projects for flood preparedness, control, and resilience
- Incorporate green, grey, and blue projects with an emphasis on nature-based solutions
- Integrate the whole community, regardless of socioeconomics or race
- Coordinate with existing and planned relevant projects, plans, activities
- Leverage best available science and incorporation of current and future flood data
- Develop a plan that provides a pathway to uninterrupted primary public roadway access, increased public safety, and less flooding

Key outcomes of this meeting will be to determine the Flood Resilience Planning Team members and to determine the kickoff meeting date for developing the Resilience Plan.

The project lead, Eric Young, with the assistance of the consultants, will also provide monthly reporting to DCR on progress and financial status.

Task 1B: Form the Planning Team

A Tazewell County Flood Resilience Planning Team will be formed to participate throughout the process. The Planning Team is intended to include a broad range of stakeholders vested in flood control, preparedness and resilience, including County staff, staff from the Towns of Bluefield, Cedar Bluff, Pocahontas, Richlands, and Tazewell, and other communities within the County, community leaders, emergency response and floodplain management officials, regional planners from the Cumberland Plateau Planning District Commission and state (e.g., Virginia Department of Conservation and Recreation (DCR) and Virginia Department of Emergency Management), technical experts, representatives of residents and real property owners, and the business community. Planning Team members will meet regularly (approximately monthly) and will be responsible for providing input throughout the planning process such as understanding of existing and planned projects, plans, and data, review of draft materials, and project weighting criteria (See Task 3 for more on stakeholder and community engagement).

Task 2: Data Collection and Review

In Task 2, the County will collect data and information and conduct a review of plans, data, and projects, capacities, and capabilities at the County and incorporated Town (as applicable) levels. Outcomes of this task include a draft existing conditions assessment and a capability and capacity needs assessment.

Task 2A: Data Collection and Review

Plans, Projects, Policies, Activities

A review of the County's existing plans, projects, and activities, as well as any of the same available from the five incorporated Towns, will be conducted to integrate information from these plans and inform community flood vulnerability, capabilities, and deficiencies. Plans to be reviewed and incorporated include but are not limited to the Cumberland Plateau Planning District Commission Hazard Mitigation Plan, local floodplain ordinance, Capital Improvement Plan, comprehensive plan, stormwater plan, and other documents with potential flood relevance. Further, County participation in programs that reduce flood impacts, such as the National Flood Insurance Program Community Rating System, will be reviewed.

Financial, Human, Technical Assistance, Training Resources

The team will conduct a review of available resources in this category to develop and manage flood mitigation projects. The County will likely need ongoing dedicated funding to support ongoing work. In addition, this proposed capacity-building project will enable Tazewell County to have a Certified Floodplain Manager on staff by providing funds for Tazewell County's Director of Engineering, who has volunteered for the role, to train for and take the CFM exam concurrently within this planning process. The scheduling of the next feasible training course and exam are to be determined. At the time of this application, the Towns of Bluefield and Tazewell have CFMs on staff, but there are none to serve the other three Towns or the County as a whole.

Built and Living Infrastructure and System Data

Next, GIS information will be gathered for green and gray infrastructure, systems, and assets. This includes data such as residential and non-residential structures, green space and wetlands (including identified ecosystems/wetlands/floodplains suitable for permanent protection), community dam safety inventory and risk assessment posed by the location and condition of dams, and transportation data. An understanding of criticality (those assets that provide essential services and functions) will be collected. Data will be collected in collaboration with the community stakeholder leaders, county and municipal staff, and project leadership. Once critical facilities and assets are determined, asset data (e.g., condition, location, age, material) will be collected from respective departments or utilities.

Current and Future Flood Hazard Data

Flood and climate data will be collected and reviewed to support the proposed vulnerability, risk, and resilience assessments and project identification. Flood data will be collected from local (including County engineering and/or planning staff), regional, state, and Federal agency sources, including any FEMA Flood Hazard Products, streamflow and gage data, flood studies, flood models, drainage analyses and H&H studies, as available. Data may also be available from the Virginia Department of Energy.

Best available climate data for the areas will be used to understand future flood-risk hazards. The data collected will be influenced by planning period, availability, and security sensitivity. Default data will be any community GIS data supplemented by federal data typically available to support community hazard planning, local and state climatological records of extreme events, historical records of severe weather, newspapers articles, online reports, severe event databases, and academic studies.

Existing data will be reviewed for completeness (i.e., coverage of impacted and potential project areas) and the ability to support resilience planning.

Planning Team members and stakeholders will be consulted throughout the Data Collection and Review task to understand available information and project status.

Task 2B Summarizing Data Review

Existing Conditions Summary

The data review and collection task will be summarized into an Existing Conditions assessment. The assessment will include:

- Existing community characteristics, including demographic, social, and economic factors
- Natural and social community stressors that contribute to vulnerability
- Geographic conditions and natural resources, such as those that provide natural flood-risk reduction services like wetlands, natural areas, and preservation areas
- Understanding of current flood "hot spots" throughout the county, including hot spots known through experience such as the Richlands/Doran/Raven area and areas around primary and secondary roads, as noted in the introduction to this scope of work.
- Documentation of any flood data limitations (best available data will be leverage but no new data will be developed as part of the plan)
- Existing capabilities and deficiencies in flood resilience

Capability and Capacity Needs Assessment

Building on the information above, the County, First Earth|2030, and Stantec will also prepare a Capability and Capacity Needs Assessment. This assessment will document any deficiencies or limitations in flood resilience (e.g., staff, training, data, policy, funding, technical assistance, etc.), and recommend strategies to increase overall capacity and capability. This includes reviewing flood-related policies and providing recommendations for revisions or new policy to enhance the County's capability in floodplain management. Of note, the assessment will also include a policy review, including identified incentives for restoring riparian and wetland vegetation. A lead will be identified to track capacity building and each strategy will be assigned to a responsible party and a timeline for completion will be included.

A long-term strategy to maintain capacity and capabilities will be determined, such as regular staff training and cross-training as well as potential budget strategies to support staff in that work and to maintain the newly achieved CFM certification noted above.

Task 3: Engage the Stakeholders

Stakeholders include the Planning Team, members of the public and those with an interest or need for flood protection and prevention. Stakeholders will be engaged concurrently throughout the resilience planning process via workshops, meetings, online presence, and targeted interviews, for example. This includes stakeholder education on how flood mitigation can be leveraged to achieve their vision for their community results through publicly supported, implementable flood mitigation projects. The project partners intend to provide a dedicated webpage for the project to keep the public and stakeholders apprised on draft plan and meeting information.

Of note, standard outreach methods such as public meetings, informational interviews, and surveys will need to be tailored to COVID-19 precautions, local internet capacity, and county residents' preferred methods of input to achieve whole community participation. These methods will be defined at the onset of the planning process and with input from the planning team.

Planning Team Kick-off Meeting

Once the Planning Team has been formed (Task 1B), the County project leads will facilitate a kick-off meeting to develop a project framework that establishes a successful process for community engagement and capacity building, as well as data collection and technical analysis regarding assets, climate data, and vulnerability assessments. The purpose of the meeting is to provide a detailed introduction to the project, introduce participants, identify targeted (and measurable) outcomes, define Planning Team member roles, and review project milestones and schedule. A key outcome of the meeting will be to review and refine the project's goals and objectives for whole community protection and prevention.

Public Kick-off Meeting

The County will facilitate a kick-off meeting to introduce the project, key milestones, and public participation input mechanisms.

Public Risk Assessment Results and Priority Area Identification Workshop

A joint workshop of the Planning Team and stakeholders will be held once a draft of the existing conditions and risk assessment (Task 4 below) is completed. Outcomes of the meeting include identifying high priority locations in which to focus project development.

Public Project Alternatives Review (Priority Area-Specific) Workshops

These joint workshops for the Planning Team and stakeholders will be held once project alternatives have been identified for each priority area. Workshops will then be held for priority areas (grouping areas where it's feasible) to review and refine projects. Outcomes of the workshop include gaining project buy-in from the stakeholders while informing project prioritization. Up to three workshops will be held.

Public Project Prioritization (Priority Area-Specific)

These joint workshops for the Planning Team and stakeholders will be held once project alternatives have been prioritized for each priority area. Workshops will then be held for priority areas (grouping areas where it's feasible). Outcomes of the workshop include gaining final stakeholder/public buy-in on projects. Up to three workshops will be held.

Draft Plan Review

This review is anticipated to be virtual, with posting and comment collection through the project website and social media.

Task 4: Assess Problems and Risk

Assessing risk and vulnerability is essential for identifying and prioritizing locations and projects for risk reduction. Collected and/or developed data will be used to assess risk and vulnerability, including from the concurrent public/stakeholder engagement noted in the previous section. Risk posed by flooding from riverine, pluvial (urban), and precipitation-induced mudflows will be included. Assessment of these flood hazards will include consideration of:

- A description of possible flood hazards within the community
- Descriptions of previous impacts, including property and infrastructure damages, life safety impacts, and disruptions to businesses and services, as available
- Current and projected flood risks trends including frequency and intensity
- Mapping of areas impacted by flood hazards and a description of areas impacted
- Potential impacts from cascading hazard events, such as wildfires and hurricane or tropical storm remnants
- Existing flood control measures and structures including dams/levees

Vulnerability of identified critical facilities and assets will be assessed by mapping flood hazards with critical facilities/assets to determine exposure, along with assessment of potential impacts such as physical and social vulnerability with respect to existing mitigation measures. Community stressors that contribute to vulnerability will also be considered.

Task 4.A: Identify Priority Areas

Once risk and vulnerability have been assessed, priority areas will be identified using a developed scoring methodology. At a minimum, this methodology will include factors such as flood exposure (e.g., high-risk areas), vulnerability, adaptive capacity, and social vulnerability. The federally recognized Opportunity Zones (202 or Bluefield and 206 or Claypool Hill), areas identified in the Floodplains and Flooding Resilience Category of ConserveVirginia, and vulnerable population areas will also be factors in project identification and prioritization.

Task 4.B: Identify Priority Projects

Using risk assessment results, stakeholder feedback, and priority areas, flood mitigation projects will be identified and prioritized. A wide range of project types will be considered, including but not limited to:

- Planning (e.g., land use and floodplain management ordinances, conservation overlays and easements, riparian buffers);
- Future studies - identification of future studies and analysis needed (e.g., H&H for future conditions);
- Policies and programs (buyouts/land acquisition, Community Rating System, elevation);
- Natural stream and wetland restoration or preservation;
- Structural (hardening, culvert upgrades and replacements, slope stabilization);
- Strategies to address other natural hazards that would cause, affect, or result from flooding events including:
    - Mine blow-outs,
    - Earthquakes,
    - Storage of hazardous materials,
    - Landslides/mud/debris flow/rock falls,

    - Prevention of wildfires that would result in denuded lands making flooding, mudslides or similar events more likely,
    - Preparations for severe weather events including tropical storms, winter storms, or other severe storms,
- Emergency Response; and,
- Community Outreach and Education (e.g., education for community leaders, outreach materials for the public), including strategies for creating and supporting knowledgeable, inclusive community leaders and networks.

Once projects have been identified, they will be prioritized using various metrics. Different weights may be applied to metrics as appropriate. Prioritization metrics to be considered in the plan include:

- Risk reduction (e.g., losses avoided)
- Nature-based solution
- Equity-based
- Within priority area
- Within Census Tract 202/Bluefield and 206/Claypool Hill Opportunity Zones
- Cost-effectiveness (determined via planning level costs analysis and/or benefit-cost analysis)
- Political feasibility
- Time needed for implementation
- Other special consideration as necessary (e.g., historic or cultural)
- Co-benefits (e.g., water quality, habitat preservation or restoration, community amenities)

These projects will be presented to the planning team and the public via stakeholder workshops.

Task 5: Draft the Plan

The County will draft an actionable flood resilience plan to meet the goals of the project. The resilience plan will include the elements DCR defines for a successful resilience plan:

- Be project-based with projects focused on flood control and resilience
- Incorporate nature-based infrastructure to the maximum extent possible
- Consider all parts of Tazewell County and its communities regardless of socioeconomics or race
- Coordinate with other local and inter-jurisdictional projects, plans, and activities
- Clearly articulate a timeline and/or phasing for implementation, and
- Be based on the best available science, incorporating climate change, changes in precipitation events, and current and/or revised flood maps.

The following sections are envisioned:

- Introduction
- Background and Goals
- Planning Process (including stakeholder engagement)
- Existing Conditions (demographics, capabilities, issue understanding)
- Capacity and Capability Needs Assessment
- Risk and Vulnerability Assessment

- Priority Area Identification
- Prioritized Flood Risk-Reduction Actions
- Plan Implementation and Maintenance

Measuring Success

Performance Output	**Measurement**
An actionable plan	DCR-approved plan
Identified capability/capacity needs with strategies to remedy	Increase in staff, financial, and/or technical capacity to manage flood risk such as presence of CFM on staff, presence of risk communication program
Prioritized projects	Wide range of project types (e.g., planning, policy, structure, NBS, etc.); linkable to a funding source
Plan maintenance procedures	Procedures agreed upon by the project partners for regular meeting of the Planning Team, project status reviews, and plan updates.

A completed Scoring Criteria Sheet for this proposed project (using Appendix D for Capacity Building and Planning) is in the supporting documentation, Attachment 10.

Budget Narrative

The estimated total cost to bring the project to completion is $369,500.

Because of Tazewell County's household median income level, it meets the CFPF definition of a low-income community, and therefore this application requests 90% support from the Fund and offers a 10% match.

- The amount of grant assistance requested from the Fund is $332,550.
- The amount of cash funds available and pledged as match is $36,950. The source of these funds is First Earth|2030's operational funds, held at Virginia National Bank.

The budget table on the following page provides detailed additional information about the intended expenditures to implement this planning and capacity-building project.

The rate cards from First Earth|2030 and Stantec, the two third-party contractors, further illustrate the breakdown of expenditures (see following pages).

Please see the cover letter to this application package as the required authorization to request funding from the Fund from C. Eric Young, Esq., Tazewell County Administrator (the chief executive of the local government).

Please also see Attachment 11 for a signed pledge agreement with First Earth|2030 as the contributing organization.

TAZEWELL COUNTY FLOOD PREPAREDNESS PLAN

Budget Summary

March 30, 2022

DRAFT ESTIMATE

			Direct Expenses	Prime Contract	Sub Contract			Tazewell County Applicant
TASK #	**TASK / TASK NAME**	**PROJECT TOTAL**	**TAZEWELL COUNTY**	**FIRST EARTH|2030**	**STANTEC**	**SUBTOTAL**	MATCH	**REQUESTED CFPF FUNDS**
TASK 1:	**INITIATE THE PROJECT**							
	Task 1A: Orientation Meeting	$15,000	$0	$9,000	$6,000			
	Task 1B: Form the Planning Team	$4,500	$0	$3,000	$1,500			
						$19,500	$2,550	$16,950
TASK 2:	**DATA COLLECTION AND REVIEW**							
	Task 2A: Data Collection and Review	$42,500	$0	$3,500	$39,000			
	Task 2B: Summarizing the Data	$20,000	$0	$2,000	$18,000			
						$62,500	$0	$62,500
TASK 3:	**ENGAGE THE STAKEHOLDERS**							
	Planning Team Kickoff	$16,500	$0	$7,500	$9,000			
	Public Kickoff Meeting	$18,000	$0	$9,000	$9,000			
	Public Risk Assessment and Priority Area ID Workshop	$11,500	$0	$2,500	$9,000

Hiring FE 2030:
We provide unique and high-quality services for our clients. Our fees are based on transactional work or service fees. Rates are dependent on scope of work and opportunity.

Scope of Work Considerations:

- Length of contract
- Geographic focus
- Augmentation of project with grant writing/management and submission
- Federal, State, and Local obstacles/permitting
- Specialized resources, expertise, and/or use of intermediaries

FE 2030 rates are determined by the type of client engagement:

- *One-time fee* - fee based transactional work for the client
- *Monthly/Yearly retainer* - sources all investment opportunities in the time contracted, advises on projects, and provides continual service support
- *Specific project-based fee* - could involve property advice, grant writing, tax credit planning, property management, providing best use options
- *Percentage fee* – percentage of investment dependent on scope of work
- *Other* - fee specifically designed for client or project that may be based on blended and/or geographically diverse work and focus

FE general consulting rates which may vary depending on the project:

Program Manager	$250.00/ hr
Senior Project Manager	$200.00/ hr.
Project Manager	$175.00/ hr.
GIS/ Data Analyst	$120.00/ hr.
Grant Specialist	$85.00/ hr.
Technician	$75.00/ hr.
Travel Time	Quarter rate
Expenses	Bill at cost

Solutions & Offerings

First Earth | 2030 has originated and transacted over $100,000,000 of market activity for our clients by analyzing opportunities with experienced guidance and skilled management. Our goal has been to deliver financial value on important properties while simultaneously conserving, enhancing, and protecting the land's significant ecosystems.

First Earth | 2030 is a results-based environmental asset management firm delivering customized outcomes for public and private clients. Our team provides innovative conservation techniques and solutions that result in environmental and economic project lift.

FE delivers ecosystem service solutions that enhance and protect the value of open space lands, working farms, timberlands, shorelines and wetlands. We optimize our clients' eco-asset potentials of their land, water and air to generate:

- Strong risk adjusted returns
- Improved conservation values
- Increased real property values

Project costs managed by FE can often be reduced by delivering return mechanisms that include incentives such as federal and state tax deductions/ credits, carbon finance, mitigation finance, grants and project completion investment contracts.

Land Asset Management Solution Sets

- Open space, mine land and timber land solutions
- Flood preparedness & living shoreline solutions
- Outdoor recreation as economic development solutions
- Renewable energy generation solutions

Service Offerings

- Program Requirement Scoping Services
- Initial Project Design
- Project Management & Delivery
- Grant Writing
- Post Construction Monitoring & Stewardship Services

BREAKING FEATURED

State of emergency declared in Tazewell County due to flooding

By CHARLES OWENS Bluefield Daily Telegraph
Feb 6, 2020

Photo by Larry Hypes

The Bluestone River at Falls Mills was a roaring torrent Thursday evening with small creeks pouring water into yards and fields in the soggy weather pattern.

TAZEWELL, Va. — A state of emergency has been declared in Tazewell County due to flooding.

All county offices, the courthouse and the sheriffs office are closed for the remainder of the day, according to a statement by the Tazewell County Sheriff's Office.

The statement said currently there is one shelter open at the Richlands Police Department for anyone displaced by flooding.

A flash flood warning remains in effect for Tazewell County. According to the National Weather Service in Blacksburg, Va., significant flooding is occurring in parts of the region. The forecast warns that the Clinch River in Tazewell County may reach flood heights not seen in over 40 years.

The warning states the Clinch River is already above flood stage, and is expected to crest around 15 feet.

If this were to occur, this would be the highest readings since November of 2003 or earlier, the flash flood warning said. A local emergency has been declared and evacuations in the vicinity of the Clinch River may be needed shortly, the warning states.

Robert Beasley, a meteorologist with the National Weather Service in Blacksburg, Va. said that he and his colleagues have been monitoring this storm system for about a week.

"We have been looking at this for several days and it has been concerning us for almost a week," Beasely said. "It is a little unprecedented because we usually do not have air that is this moist at this time of the year."

According to Beasely, the situation in Tazewell,Va. remains serious. "It has been really bad more in the Richlands and Tazewell areas," he said.

As of 2:30 p.m., Tazewell County emergency dispatch stated that no water rescues have been reported there and no major problems, just a lot of minor flooding.

This story will be updated as more details become available.

Town of Richlands sees blocked roads as river banks flood Monday morning

By **Jacob Comer** - March 1, 2021 5:37 pm

RICHLANDS, VA (WOAY) – Early Monday morning, the Town of Richlands saw river banks begin to flood.

Police began to block off flooded roads and along with fire and rescue, they began knocking on doors, letting residents know about the potential danger.

"Most of the roads we've concentrated on are residential streets," Richlands Police Chief Jerry Gilbert said. "Letting people know the water was rising and they may want to consider evacuating their homes and moving to higher ground."

This isn't the first time the Town of Richlands has seen flooding of this caliber. There were two significant floods last year, one of which saw water nearly reach the main downtown roadway.

One of those previous floods happened in February of 2020, and saw more than 200 people evacuated from their homes due to rising waters. This flooding is not as serious as the previous year's, but water has begun to cross some streets and some roads are blocked off.

According to Tazewell County Public Schools, the county took precautions and even let some students go home early.

"We had some high water in the Richlands area and we wanted to make sure the students could get home safely and that our bus drivers could carry them safely on the buses," Tazewell Schools PR Director Lindsey Mullins said.

Gilbert added that while this flooding is not as bad as last year's, people should still be vigilant and never drive through flooded roadways.

"Do not drive through the water. We don't know what's underneath. We don't want anybody getting off in a ditch or anything, flooding out in the middle of the water."

Jacob Comer

Re: CFPF application from Tazewell County

Dear Ms. Howard-Cooper and Members of the Review Team,

I write to you in enthusiastic support of the application from Tazewell County for a grant in the Capacity Building and Planning category of the Community Flood Preparedness Fund.

I am a longtime advocate of bringing resources to bear on the recurrent flooding in my district. As we have seen ever more often in recent years, Southwest Virginia's coalfields, abandoned mines, historic towns, and critical roadways are at risk from riverine flooding. Your past support for capacity-building and problem-solving in Southwest Virginia and the Coalfields has been gladly welcomed – and it continues to be badly needed.

By creating a resilience plan with Community Flood Preparedness Fund support in the coming months, then seeking future grant support for projects to implement the plan, Tazewell County will be able to prevent flooding and stabilize its losses. As a low-income county with two federally designated Opportunity Zones, it will then be able to use its revenues for other community needs and aspirations.

Thank you for your considerations and please do not hesitate to contact me if you have any questions.

Sincerely,

Will

Chapter 8 - FLOOD DAMAGE PREVENTION

TITLE

TAZEWELL COUNTY FLOOD DAMAGE PREVENTION ORDINANCE, IN ACCORDANCE WITH SECTION 15.1-431 OF THE CODE OF VIRGINIA, (1950), AS AMENDED. ;FL;

Footnotes:

--- (1) ---

Editor's note— *Ord. adopted Jan. 11, 2011, repealed the former Ch. 8, Arts. I—IV, §§ 8-1—8-9, 8-36, 8-37, 8-61—8-64, 8-86—8-90, and enacted a new Ch. 8 as set out herein. The former Ch. 8 pertained to similar subject matter and derived from an ordinance adopted Sept. 10, 1990.*

Cross reference— *Erosion and sediment control, Ch. 6; fire prevention and protection, Ch. 7; housing, Ch. 9; mobile homes, Ch. 11; planning and development, Ch. 15; sewers and drains, Ch. 16; subdivisions, App. A; flood provisions under subdivision ordinance, App. A, § 4-3.*

State Law reference— *Flood Damage Reduction Act, Code of Virginia, § 10.1-600 et seq.; comprehensive flood control program, Code of Virginia, §§ 10.1-658, 10.1-659.*

ARTICLE I. - GENERAL PROVISIONS

Sec. 8-1. - Statutory authorization and purpose.

This chapter is adopted pursuant to the authority granted by Code of Virginia § 15.2-2280. The purpose of these provisions is to prevent: The loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

(1) Regulating uses, activities, and development which, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

(2) Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;

(3) Requiring all those uses, activities, and developments that do occur in floodprone districts to be protected and/or floodproofed against flooding and flood damage; and,

(4) Protecting individuals from buying land and structures which are unsuited for intended purposes because of flood hazards.

(Ord. of 1-11-11(1), § 1.1)

Sec. 8-2. - Applicability.

These provisions shall apply to all privately and publicly-owned lands within jurisdiction of the unincorporated portions of Tazewell County, Virginia, and identified as being floodprone.

(Ord. of 1-11-11(1), § 1.2)

Sec. 8-3. - Compliance and liability.

(a) No land shall hereafter be developed and no structure shall be located, relocated, constructed, reconstructed, enlarged, or structurally altered except in full compliance with the terms and provisions of this chapter and any other applicable ordinances and regulations which apply to uses within the jurisdiction of this chapter.

(b) The degree of flood protection sought by the provisions of this chapter is considered reasonable for regulatory purposes and is based on acceptable engineering methods of study, but does not imply total flood protection. Larger floods may occur on rare occasions. Flood heights may be increased by man-made or natural causes, such as ice jams and bridge openings restricted by debris. This chapter does not imply that districts outside the floodplain district or land uses permitted within such district will be free from flooding or flood damages.

(c) Records of actions associated with administering this chapter shall be kept on file and maintained by the Department of Building Safety or such other custodian as may from time to time be selected by the Board of Supervisors by resolution.

(d) This chapter shall not create liability on the part of Tazewell County or any officer or employee thereof for any flood damages that result from reliance on this chapter or any administrative decision lawfully made there under.

(Ord. of 1-11-11(1), § 1.3)

Sec. 8-4. - Abrogation and greater restrictions.

This chapter supersedes any ordinance currently in effect in floodprone areas. Any ordinance, however, shall remain in full force and effect to the extent that its provisions are more restrictive.

(Ord. of 1-11-11(1), § 1.4)

Sec. 8-5. - Severability.

If any section, subsection, paragraph, sentence, clause, or phrase of this chapter shall be declared invalid for any reason whatever, such decision shall not affect the remaining portions of this chapter. The remaining portions shall remain in full force and effect; and for this purpose, the provisions of this chapter are hereby declared to be severable.

(Ord. of 1-11-11(1), § 1.5)

Sec. 8-6. - Penalty for violations.

Any person who fails to comply with any of the requirements or provisions of this article or directions of the director of planning or any authorized employee of Tazewell County shall be guilty of a misdemeanor and subject to the penalties there for.

In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of this article. The imposition of a fine or penalty for any violation of, or noncompliance with, this article shall not excuse the violation or noncompliance or permit it to continue; and all such persons shall be required to correct or remedy such violations or noncompliance within a reasonable time. Any structure constructed, reconstructed, enlarged, altered or relocated in noncompliance with this article may be condemned, declared to be a public nuisance, and be abatable as such. Flood insurance may be withheld from structures constructed in violation of this article.

(Ord. of 1-11-11(1), § 1.6)

Secs. 8-7—8-15. - Reserved.

ARTICLE II. - DEFINITIONS

Sec. 8-16. - Definitions.

[The following words, terms and phrases, when used in this chapter, shall have the meanings ascribed to them in this section, except where the context clearly indicates a different meaning:]

Base flood. The flood having a one-percent chance of being equaled or exceeded in any given year.

Base flood elevation. The Federal Emergency Management Agency designated 100-year water surface elevation. The water surface elevation of the base flood in relation to the datum specified on the community's flood insurance rate map. For the purposes of this chapter, the 100-year flood or one-percent annual chance flood.

Basement. Any area of the building having its floor sub-grade (below ground level) on all sides.

Board of appeals. The board designated by separate ordinance to review appeals made by individuals with regard to decisions of the ordinance administrator in the interpretation of this chapter until such time as an appeals board is so designated, all appeals shall be presented to the board of supervisors.

Development. Any manmade change to improved or unimproved real estate, including, but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.

Elevated building. A nonbasement building built to have the lowest floor elevated above the ground level by means of fill, solid foundation perimeter walls, pilings, or columns (posts and piers).

Encroachment. The advance or infringement of uses, plant growth, fill, excavation, buildings, permanent structures or development into a floodplain, which may impede or alter the flow capacity of a floodplain.

Flood or *flooding:*

(1) A general or temporary condition of partial or complete inundation of normally dry land areas from:
   a. The overflow of inland or tidal waters; or
   b. The unusual and rapid accumulation or runoff of surface waters from any source.
   c. Mudflows which are proximately caused by flooding as defined in paragraph (1)b. of this definition and are akin to a river of liquid and flowing mud on the surfaces of normally dry land areas, as when earth is carried by a current of water and deposited along the path of the current.

(2) The collapse or subsistence of land along the shore of a lake or other body of water as a result of erosion or und caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusually hi level in a natural body of water, accompanied by a severe storm, or by an unanticipated force of nature such as f or an abnormal tidal surge, or by some similarly unusual and unforeseeable event which results in flooding as de paragraph (1)a. of this definition.

Flood insurance rate map (FIRM). An official map of a community, on which the administrator has delineated both the special hazard areas and the risk premium zones applicable to the community. A FIRM that has made available digitally is called a digital flood insurance rate map (DFIRM).

Flood insurance study (FIS). An examination, evaluation and determination of flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation and determination of mudflow and/or flood-related erosion hazards.

Floodplain or *floodprone area.* Any land area susceptible to being inundated by water from any source.

Floodproofing. Any combination of structural and nonstructural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

Floodway. The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one (1) foot.

Freeboard. A factor of safety usually expressed in feet above a flood level for purposes of floodplain management. "Freeboard" tends to compensate for the many unknown factors that could contribute to flood heights greater than the height calculated for a selected size flood and floodway conditions, such as wave action, bridge openings, and the hydrological effect of urbanization in the watershed. When a freeboard is included in the height of a structure, the flood insurance premiums may be cheaper.

Highest adjacent grade. The highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

Historic structure. Any structure that is:

(1) Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;

(2) Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district;

(3) Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of the Interior; or

(4) Individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either:

a. By an approved state program as determined by the Secretary of the Interior; or

b. Directly by the Secretary of the Interior in states without approved programs.

Lowest floor. The lowest floor of the lowest enclosed area (including basement). An unfinished or flood-resistant enclosure, usable solely for parking of vehicles, building access or storage in an area other than a basement area is not considered a building's lowest floor; provided, that such enclosure is not built so as to render the structure in violation of the applicable nonelevation design requirements of Federal Code 44CFR § 60.3.

Manufactured home. A structure, transportable in one (1) or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when connected to the required utilities. For floodplain management purposes the term "manufactured home" also includes park trailers, travel trailers, and other similar vehicles placed on a site for greater than one hundred eighty (180) consecutive days, but does not include a recreational vehicle.

Manufactured home park or subdivision. A parcel (or contiguous parcels) of land divided into two (2) or more manufactured home lots for rent or sale.

New construction. For the purposes of determining insurance rates, structures for which the "start of construction" commenced on or after the enactment of this chapter, or after December 31, 1974, whichever is later, and includes any subsequent improvements to such structures. For floodplain management purposes, new construction means structures for which the start of construction commenced on or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures.

Recreational vehicle. A vehicle which is:

(1) Built on a single chassis;

(2) Four hundred (400) square feet or less when measured at the largest horizontal projection;

(3) Designed to be self-propelled or permanently towable by a light duty truck; and

(4) Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

Special flood hazard area. The land in the floodplain subject to a one-percent or greater chance of being flooded in any given year as determined in section 8-32 of this chapter.

Start of construction. For other than new construction and substantial improvement, under the Coastal Barriers Resource Act (P.L. - 97-348), means the date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, substantial improvement or other improvement was within one hundred eighty (180) days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation; or the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers, or foundations or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of the construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

Structure. For floodplain management purposes, a walled and roofed building, including a gas or liquid storage tank, that is principally above ground, as well as a manufactured home.

Substantial damage. Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed fifty (50) percent of the market value of the structure before the damage occurred.

Substantial improvement. Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds fifty (50) percent of the market value of the structure before the start of construction of the improvement. This term includes structures which have incurred substantial damage regardless of the actual repair work performed. The term does not, however, include either:

(1) Any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions; or

(2) Any alteration of a historic structure, provided that the alteration will not preclude the structure's continued designation as a historic structure.

Violation. The failure of a structure or other development to be fully compliant with the county's floodplain management regulations. A structure or other development without the elevation certificate, other certifications, or other evidence of compliance required in sections 60.3(b)(5), (c)(4), (c)(10), (d)(3), (e)(2), (e)(4), or (e)(5) is presumed to be in violation until such time as that documentation is provided.

Watercourse. A lake, river, creek, stream, wash, channel or other topographic feature on or over which waters flow at least periodically. Watercourse includes specifically designated areas in which substantial flood damage may occur.

Zoning administrator or *ordinance administrator* or *administrator.* The public official designated by the Tazewell County Board of Supervisors, by separate ordinance or resolution, to administer, interpret and enforce the ordinance for the county.

(Ord. of 1-11-11(1))

Secs. 8-17—8-30. - Reserved.

ARTICLE III.ESTABLISHMENT - OF DISTRICTS

Sec. 8-31. - Description of districts.

(a) *Basis of districts.* The various floodplain districts shall include special flood hazard areas. The basis for the delineation of these districts shall be the flood insurance study (FIS) and the flood insurance rate maps (FIRM) for Tazewell County prepared by the Federal Emergency Management Agency, Federal Insurance Administration, and Tazewell County, dated February 18, 2011, and any subsequent revisions or amendments thereto.

The boundaries of the special flood hazard area and floodplain districts are established as shown on the flood insurance rate map which is declared to be a part of this chapter and which shall be kept on file at the Tazewell

County Building Safety office.

(1) The floodway district is delineated, for purposes of this chapter, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the 100-year flood without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this District are specifically defined in the above-referenced flood insurance study and shown on the accompanying flood insurance rate map.

(2) The special floodplain district shall be those areas identified as an AE zone on the maps accompanying the flood Insurance Study for which 100-year flood elevations have been provided.

(3) The approximated floodplain district shall be those areas identified as an A or A99 zone on the maps accompanying the flood insurance study. In these zones, no detailed flood profiles or elevations are provided, but the 100-year floodplain boundary has been approximated. For these areas, the 100-year flood elevations and floodway information from federal, state, and other acceptable sources shall be used, when available. Where the specific 100-year flood elevation cannot be determined for this area using other sources of data, such as the U.S. Army Corps of Engineers Flood Plain Information Reports, U.S. Geological Survey Flood-Prone Quadrangles, etc., then the applicant for the proposed use, development and/or activity shall determine this elevation in accordance with hydrologic and hydraulic engineering techniques. Hydrologic and hydraulic analyses shall be undertaken only by professional engineers or others of demonstrated qualifications, who shall certify that the technical methods used correctly reflect currently-accepted technical concepts. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the governing body.

(b) *Overlay concept.*

(1) The floodplain districts described above shall be overlays to districts as shown on any future official zoning ordinance map, and as such, the provisions for the floodplain districts shall serve as a supplement to the underlying district provisions.

(2) If there is any conflict between the provisions or requirements of the floodplain districts and those of any underlying district, the more restrictive provisions and/or those pertaining to the floodplain districts shall apply.

(3) In the event any provision concerning a floodplain district is declared inapplicable as a result of any legislative or administrative actions or judicial decision, the basic underlying provisions shall remain applicable.

(Ord. of 1-11-11(1), § 3.1)

Sec. 8-32. - District boundary changes.

The delineation of any of the floodplain districts may be revised by the Tazewell County Board of Supervisors where natural or manmade changes have occurred and/or where more detailed studies have been conducted or undertaken by the U. S. Army Corps of Engineers or other qualified agency, or an individual documents the need for such change. However, prior to any such change, approval must be obtained from the Federal Insurance Administration.

(Ord. of 1-11-11(1), § 3.3)

Sec. 8-33. - Interpretation of district boundaries.

Initial interpretations of the boundaries of the floodplain districts shall be made by the floodplain ordinance administrator (hereinafter referred to as the ordinance administrator or administrator). Should a dispute arise concerning the boundaries of any of the districts, the board of zoning appeals, or if there being none, the board of supervisors shall make the necessary determination. The person questioning or contesting the location of the district boundary shall be given a reasonable opportunity to present his case to the board and to submit his own technical evidence if he so desires.

(Ord. of 1-11-11(1), § 3.4)

Sec. 8-34. - Submitting technical data.

A community's base flood elevations may increase or decrease resulting from physical changes affecting flooding conditions. As soon as practicable, but not later than six (6) months after the date such information becomes available, a community shall notify the Federal Insurance Administrator of the changes by submitting technical or scientific data. Such a submission is necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and floodplain management requirements will be based upon current data.

(Ord. of 1-11-11(1), § 3.5)

Secs. 8-35—8-50. - Reserved.

ARTICLE IV. - DISTRICT PROVISIONS

Sec. 8-51. - Permit and application requirements.

(a) *Permit requirement.* All uses, activities, and development occurring within any floodplain district, including placement of manufactured homes, shall be undertaken only upon the issuance of a floodplain building permit. Such development shall be undertaken only in strict compliance with the provisions of this chapter and with all other applicable codes and ordinances, as amended, such as the Virginia Uniform Statewide Building Code (VA USBC) and the Tazewell County Subdivision Ordinance. Prior to the issuance of any such permit, the administrator shall require all applications to include compliance with all applicable state and federal laws and shall review all sites to assure they are reasonably safe from flooding. Under no circumstances shall any use, activity, and/or development adversely affect the capacity of the channels or floodways of any watercourse, drainage ditch, or any other drainage facility or system.

(b) *Site plans and permit applications.* All applications for development within any floodplain district and all building permits issued for the floodplain shall incorporate the following information:

(1) The elevation of the base flood at the site.

(2) The elevation of the lowest floor (including basement).

(3) For structures to be floodproofed (nonresidential only), the elevation to which the structure will be floodproofed.

(4) Topographic information showing existing and proposed ground elevations.

(Ord. of 1-11-11(1), § 4.1)

Sec. 8-52. - General standards.

The following provisions shall apply to all permits:

(1) New construction and substantial improvements shall be according to the VA USBC, and anchored to prevent flotation, collapse or lateral movement of the structure.

(2) Manufactured homes shall be anchored to prevent flotation, collapse, or lateral movement. Methods of anchoring may include, but are not limited to, use of over-the-top or frame ties to ground anchors. This standard shall be in addition to and consistent with applicable state anchoring requirements for resisting wind forces.

(3) New construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.

(4) New construction or substantial improvements shall be constructed by methods and practices that minimize flood damage.

(5) Electrical, heating, ventilation, plumbing, air conditioning equipment and other service facilities, including duct work, shall be designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

(6) New and replacement water supply systems shall be designed to minimize or eliminate infiltration of floodwaters into the system.

(7) New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

(8) On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

In addition to provisions (1)—(8) above, in all special flood hazard areas, the additional provisions shall apply:

(9) Prior to any proposed alteration or relocation of any channels or of any watercourse, stream, etc., within this jurisdiction a permit shall be obtained from the U. S. Corps of Engineers, the Virginia Department of Environmental Quality, and the Virginia Marine Resources Commission (a joint permit application is available from any of these organizations). Furthermore, in riverine areas, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the Department of Conservation and Recreation (Division of Dam Safety and Floodplain Management) and the Federal Insurance Administrator.

(10) The flood-carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

(Ord. of 1-11-11(1), § 4.2)

Sec. 8-53. - Specific standards.

In all special flood hazard areas where base flood elevations have been provided in the flood insurance study or generated according section 8-56, the following provisions shall apply:

(1) *Residential construction.* New construction or substantial improvement of any residential structure, including manufactured homes, shall have the lowest floor, including basement, elevated to or above the base flood level of at least one (1) foot above the base flood level.

(2) *Nonresidential construction.* New construction or substantial improvement of any commercial, industrial, or nonresidential building or manufactured home shall have the lowest floor, including basement, elevated to or above the base flood level of at least one (1) foot above the base flood level. Buildings located in all A1—30, AE, and AH zones may be floodproofed in lieu of being elevated provided that all areas of the building components below the elevation corresponding to the BFE plus one (1) foot are water tight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A registered professional engineer or architect shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation to which such structures are floodproofed, shall be maintained by the ordinance administrator.

(3) *Elevated buildings.* Fully enclosed areas, of new construction or substantially improved structures, which are below the regulatory flood protection elevation shall:

a. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door) or limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

b. Be constructed entirely of flood-resistant materials below the regulatory flood protection elevation;

c. Include, in zones A, AO, AE, and A1—30, measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings must either be certified by a professional engineer or architect or meet the following minimum design criteria:

1. Provide a minimum of two (2) openings on different sides of each enclosed area subject to flooding.
2. The total net area of all openings must be at least one (1) square inch for each square foot of enclosed area subject to flooding.
3. If a building has more than one (1) enclosed area, each area must have openings to allow floodwaters to automatically enter and exit.
4. The bottom of all required openings shall be no higher than one (1) foot above the adjacent grade.
5. Openings may be equipped with screens, louvers, or other opening coverings or devices, provided they permit the automatic flow of floodwaters in both directions.
6. Foundation enclosures made of flexible skirting are not considered enclosures for regulatory purposes, and, therefore, do not require openings. Masonry or wood underpinning, regardless of structural status, is considered an enclosure and requires openings as outlined above.

(4) *Standards for manufactured homes and recreational vehicles.*

a. All manufactured homes placed, or substantially improved, on individual lots or parcels, in expansions to existing manufactured home parks or subdivisions, in a new manufactured home park or subdivision or in an existing manufactured home park or subdivision on which a manufactured home has incurred substantial damage as the result of a flood, must meet all the requirements for new construction, including the elevation and anchoring requirements in subsection 8-52(1) and (2), and subsection 8-53(1).

b. All recreational vehicles placed on sites must either:

1. Be on the site for fewer than one hundred eighty (180) consecutive days;
2. Be fully licensed and ready for highway use: A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utilities and security devices and has no permanently attached additions; or
3. Meet all the requirements for manufactured homes in sections 8-52 and 8-53(4).

(Ord. of 1-11-11(1), § 4.3)

Sec. 8-54. - Standards for the floodway district.

The following provisions shall apply within the floodway district:

(1) Encroachments, including fill, new construction, substantial improvements and other developments are prohibited unless certification such as hydrologic and hydraulic analyses (with supporting technical data) is provided demonstrating that encroachments shall not result in any increase in flood levels during occurrence of the base flood. Hydrologic and hydraulic analyses shall be undertaken only by professional engineers or others of demonstrated qualifications, who shall certify that the technical methods used correctly reflect currently-accepted technical concepts. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the ordinance administrator.

Development activities which increase the water surface elevation of the base flood may be allowed, provided that the applicant first applies, with the ordinance administrator's endorsement, for a conditional flood insurance rate map and floodway revision, and receives the approval of the Federal Emergency Management Agency.

(2) If section 8-56 is satisfied, all new construction and substantial improvements shall comply with all applicable flood hazard reduction provisions of article IV.

(3) The placement of manufactured homes (mobile homes) is prohibited, except in an existing manufactured homes (mobile homes) park or subdivision. A replacement manufactured home may be placed on a lot in an existing manufactured home park or subdivision provided the anchoring, elevation, and encroachment standards are met.

(Ord. of 1-11-11(1), § 4.4)

Sec. 8-55. - Standards for the special floodplain district.

The following provisions shall apply within the special floodplain district:

Until a regulatory floodway is designated, no new construction, substantial improvements, or other development, including fill, shall be permitted within the areas of special flood hazard, designated as zones A1—30 and AE on the flood insurance rate map, unless it is demonstrated that the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood more than one (1) foot at any point on property not owned by the applicant.

Development activities in zones Al—30, AE, and AH, on the county's flood insurance rate map which increase the water surface elevation of the base flood by more than one (1) foot may be allowed, provided that the applicant first applies, with the ordinance administrator's endorsement, for a conditional flood insurance rate map revision, and receives the approval of the Federal Emergency Management Agency.

(Ord. of 1-11-11(1), § 4.5)

Sec. 8-56. - Standards for approximated floodplain.

The following provisions shall apply with the approximate floodplain district:

The approximated floodplain district shall be that floodplain area for which no detailed flood profiles or elevations are provided, but where a 100-year floodplain boundary has been approximated. Such areas are shown as zone A on the maps accompanying the flood insurance study. For these areas, the 100-year flood elevations and floodway information from federal, state, and other acceptable sources shall be used, when available. Where the specific 100-year flood elevation cannot be determined for this area using other sources of data, such as the U. S. Army Corps of Engineers Floodplain Information Reports, U. S. Geological Survey Flood-Prone Quadrangles, etc., then the applicant for the proposed use, development and/or activity shall determine this elevation. For development proposed in the approximate floodplain the applicant must use technical methods that correctly reflect currently accepted technical concepts, such as point on boundary, high water marks, or hydrologic and hydraulic analyses. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the ordinance administrator.

The ordinance administrator reserves the right to require hydrologic and hydraulic analyses for any development.

When such base flood elevation data is utilized, the lowest floor shall be elevated to or above the base flood level. During the permitting process, the Ordinance Administrator shall obtain:

(1) The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and

(2) If the structure has been floodproofed in accordance with the requirements of this article, the elevation (in relation to mean sea level) to which the structure has been floodproofed.

(Ord. of 1-11-11(1), § 4.6)

Sec. 8-57. - Standards for subdivision proposals.

(a) All subdivision proposals shall be consistent with the need to minimize flood damage;

(b) All subdivision proposals shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage;

(c) All subdivision proposals shall have adequate drainage provided to reduce exposure to flood hazards; and

(d) Base flood elevation data shall be provided for subdivision proposals and other proposed development proposals (including manufactured home parks and subdivisions) that exceed fifty (50) lots or five (5) acres, whichever is the lesser.

(Ord. of 1-11-11(1), § 4.7)

Secs. 8-58—8-70. - Reserved.

ARTICLE V. - PERMIT PROCESS

Sec. 8-71. - Ordinance administrator review required.

No development or construction may be built in a flood district without a permit issued by the ordinance administrator or a certificate from the ordinance administrator that such development or construction does not come within the jurisdiction of this chapter. persons proposing development or construction in flood districts shall apply for a determination of applicability or a permit from the ordinance administrator.

(Ord. of 1-11-11(1), § 5.1)

Sec. 8-72. - Development or construction permitting.

Applications for permits shall be submitted to the building official's office who shall forward the same to the ordinance administrator. The ordinance administrator shall establish a form for applications. The board of supervisors may by resolution establish a reasonable fee for processing applications.

(1) Permit approval. The ordinance administrator shall, within ten (10) days of submission of an application, (1) determine whether the proposed Development or Construction is within the jurisdiction of this chapter and (2) whether the proposed development or construction would be permitted by this chapter. The ten-day time limit for approval shall be tolled for any application that is incomplete, while such application is incomplete, or for any application where any particular request for additional information is outstanding, until such information is supplied by the applicant.

   a. If development or construction as proposed is not within the jurisdiction of this chapter the ordinance administrator shall provide a certificate to the applicant advising that the structure is not within the jurisdiction of this chapter and advising the building inspector that such construction is not regulated by the ordinance.

   b. If the proposed development or construction is within the jurisdiction of this chapter, the ordinance administrator shall, notify the applicant in writing and advise him that the application is either approved or that it is not approved. If the application is denied the notice shall state the reasons for the denial.

(2) Any notice given pursuant to this section shall advise the applicant of their right to request a variance from ordinance requirements or to appeal any decision of the ordinance administrator to the board of supervisors or zoning board and shall include the date, location and approximate time by which the application for variance or for an appeal must be submitted to the county administrator. Such notice to the applicant shall be in writing sent by certified mail to the address shown on the application. Failure to provide the applicant notice or any defect in notice shall be remedied by tolling the time in which the applicant may request a variance or an appeal until proper notice is given. If no notice is sent to the applicant within thirty (30) days of the date of the application, the applicant may consider the application denied and proceed with an appeal, should the applicant chose to do so.

(3) The applicant shall have thirty (30) days from the date of the notice of denial to file a written request for an appeal or a variance with the county administrator. Failure to note the appeal within thirty (30) days shall forever bar the request for appeal or variance.

(Ord. of 1-11-11(1), § 5.2)

Sec. 8-73. - Appeal and variance process.

(a) Upon receipt of a notice of appeal or variance from a decision of the ordinance administrator, the county administrator shall schedule a hearing before the board of supervisors or zoning board. Where the applicant requests a variance the administrator shall cause a notice of the application for variance to be mailed to all owners of property adjoining the property upon which applicant proposes development or construction not in conformity with the ordinance. Such notice shall be sufficient if mailed by first class U.S. mail to the address of the owner as shown in the commissioner of revenue or treasurer's office. The board of supervisors by resolution may establish a fee for the costs of issuing such notice to be paid by applicants for variances. Such fee shall be established annually.

(b) The board of supervisors or zoning board shall hear the appeal or request for variance within a reasonable time. Should the Board not hear the appeal within six (6) months, the applicant may consider the appeal denied. A conditional variance granted to the applicant may be deemed a denial by the applicant. Notice of the board's decision shall be given to the applicant in the same manner as notice of denial was given to the applicant by the ordinance administrator.

(c) The applicant may appeal the board's decision to the Circuit Court for the County of Tazewell, Virginia by filing a petition with said court within ninety (90) days of the date of the notice of the board's decision.

(Ord. of 1-11-11(1), § 5.3)

Secs. 8-74—8-90. - Reserved.

ARTICLE VI. - APPEALS AND VARIANCES

Sec. 8-91. - Appeals.

Appeals are a claim that the decision of the ordinance administrator was in error. If an appeal is granted by the zoning board the ordinance administrator may appeal the decision of the zoning board to the Circuit Court of Tazewell County, Virginia, by filing a petition with said court within sixty (60) days of the notice of the board's decision.

(Ord. of 1-11-11(1), § 6.1)

Sec. 8-92. - Variances.

Variances are a request that the regulations contained in the ordinance not be applied to the applicant's proposed Development or Construction.

(Ord. of 1-11-11(1), § 6.2)

Secs. 8-93—8-100. - Reserved.

ARTICLE VII. - FACTORS TO BE CONSIDERED

Sec. 8-101. - Factors to be considered.

Variances shall be issued only upon (i) a showing of good and sufficient cause, (ii) after the board of zoning appeals or board of supervisors has determined that failure to grant the variance would result in exceptional hardship to the applicant, and (iii) after the board of zoning appeals or board of supervisors has determined that the granting of such variance will not result in (a) unacceptable or prohibited increases in flood heights, (b) additional threats to public safety, (c) extraordinary public expense; and will not (d) create nuisances, (e) cause fraud or victimization of the public, or (f) conflict with local laws or ordinances.

While the granting of variances generally is limited to a lot size less than one-half (½) acre, deviations from that limitation may occur. However, as the lot size increases beyond one-half (½) acre, the technical justification required for issuing a variance increases. Variances may be issued by the board of zoning appeals or board of supervisors for new construction and substantial improvements to be erected on a lot of one-half acre or less in size contiguous to and surrounded by lots with existing structures constructed below the base flood level, in conformance with the provisions of this section.

Variances may be issued for new construction and substantial improvements and for other development necessary for the conduct of a functionally dependent use provided that the criteria of this section are met, and the structure or other development is protected by methods that minimize flood damages during the base flood and create no additional threats to public safety.

In passing upon applications for variances, the board of zoning appeals or board of supervisors shall satisfy all relevant factors and procedures specified in other sections of the County's ordinances and consider the following additional factors:

(1) The danger to life and property due to increased flood heights or velocities caused by encroachments. No variance shall be granted for any proposed use, development, or activity within any floodway district that will cause any increase in the 100-year flood elevation.

(2) The danger that materials may be swept on to other lands or downstream to the injury of others.

(3) The proposed water supply and sanitation systems and the ability of these systems to prevent disease, contamination, and unsanitary conditions.

(4) The susceptibility of the proposed facility and its contents to flood damage and the effect of such damage on the individual owners.

(5) The importance of the services provided by the proposed facility to the community.

(6) The requirements of the facility for a waterfront location.

(7) The availability of alternative locations not subject to flooding for the proposed use.

(8) The compatibility of the proposed use with existing development and development anticipated in the foreseeable future.

(9) The relationship of the proposed use to the comprehensive plan and floodplain management program for the area.

(10) The safety of access by ordinary and emergency vehicles to the property in time of flood.

(11) The expected heights, velocity, duration, rate of rise, and sediment transport of the floodwaters expected at the site.

(12) The historic nature of a structure. Variances for repair or rehabilitation of historic structures may be granted upon a determination that the proposed repair or rehabilitation will not preclude the structure's continued designation as a historic structure and the variance is the minimum necessary to preserve the historic character and design of the structure.

(13) Such other factors which are relevant to the purposes of this chapter.

The board of zoning appeals or board of supervisors may refer any application and accompanying documentation pertaining to any request for a variance to any engineer or other qualified person or agency for technical assistance in evaluating the proposed project in relation to flood heights and velocities, and the adequacy of the plans for flood protection and other related matters.

Variances shall be issued only after the board of zoning appeals or board of supervisors has determined that the granting of such will not result in (a) unacceptable or prohibited increases in flood heights, (b) additional threats to public safety, (c) extraordinary public expense; and will not (d) create nuisances, (e) cause fraud or victimization of the public, or (f) conflict with local laws or ordinances.

Variances shall be issued only after the board of zoning appeals or board of supervisors has determined that the variance will be the minimum required to provide relief.

The board of zoning appeals or board of supervisors shall notify the applicant for a variance, in writing and signed by title of appropriate public official, that the issuance of a variance to construct a structure below the 100-year flood elevation (a) increases the risks to life and property and (b) will result in increased premium rates for flood insurance.

A record shall be maintained of the above notification as well as all variance actions, including justification for the issuance of the variances. Any variances that are issued shall be noted in the annual or biennial report submitted to the Federal Insurance Administrator.

(Ord. of 1-11-11(1))

Secs. 8-102—8-110. - Reserved.

ARTICLE VIII. - EXISTING STRUCTURES IN FLOODPLAIN AREAS

Sec. 8-111. - Existing structures in floodplain areas.

A structure or use of a structure or premises which lawfully existed before the enactment of these provisions, but which is not in conformity with these provisions, may be continued subject to the following conditions:

(1) Existing structures in the floodway area shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion would not result in an increase in the base flood elevation of more than one (1) foot.

(2) Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain areas to an extent or amount of less than fifty (50) percent of its market value shall conform to the VA USBC.

(3) The modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, regardless of its location in a floodplain area to an extent or amount of fifty (50) percent or more of its market value shall be undertaken only in full compliance with this chapter and shall require the entire structure to conform to the VA USBC.

(Ord. of 1-11-11(1))

Secs. 8-112—8-120. - Reserved.

ARTICLE IX. - OTHER PERMITS NOT TO BE ISSUED

Sec. 8-121. - Other permits not to be issued.

The office of building safety, or such other agency as may be delegated responsibility for enforcement of the building code, shall not issue a permit for development or construction on property located in flood districts without a letter of authorization from the ordinance administrator. The county engineer's office or such other agency as may be delegated responsibility for enforcement of the county's erosion and sediment control laws, shall not issue a permit for development or construction on property located in flood districts without a letter of authorization from the ordinance administrator.

Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	Tazewell County

Eligibility Information

Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X (n/a)
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☒ Yes ☐ No

Applicant Name:	Tazewell County

Scoring Information

Criterion	Point Value	Points Awarded
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	55	
Development of a new resilience plan.	55	X 55
Resource assessments, planning, strategies and development.	45	X 45

Wendy Howard-Cooper
Director for Dam Safety and Floodplain Management
Department of Recreation and Conservation
600 East Main Street, 24th Floor
Richmond VA 23219

Re: Pledge agreement for match of Tazewell County CFPF application

Dear Ms. Howard-Cooper and Members of the Review Team:

Please accept this joint letter as a pledge agreement providing evidence of the matching contribution for Tazewell County's application to the Capacity Building and Planning (Low Income) category of the third grant round of the Community Flood Preparedness Fund.

The contributor:
First Earth|2030, 3705 Saunders Ave, Richmond VA 23227, 703-447-9505
The applicant organization:
Tazewell County
The title of the project for which the cash contribution is made:
Capacity Building and Planning for Flood Resilience in Tazewell County
The source of funding for the cash contribution:
First Earth|2030's operational funds, held at Virginia National Bank
The dollar amount of the cash contribution:
$36,950

With this letter, First Earth|2030 agrees that if the CFPF grant is awarded, First Earth|2030 will pay the cash contribution during the agreement period.

Thank you, and please contact either of us with questions. We look forward to working with DCR on this project.

Sincerely,

Charles Westbrook
Principal, First Earth|2030

C. Eric Young, Esq.
Tazewell County Administrator

Commonwealth of
Virginia

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X__ No _____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

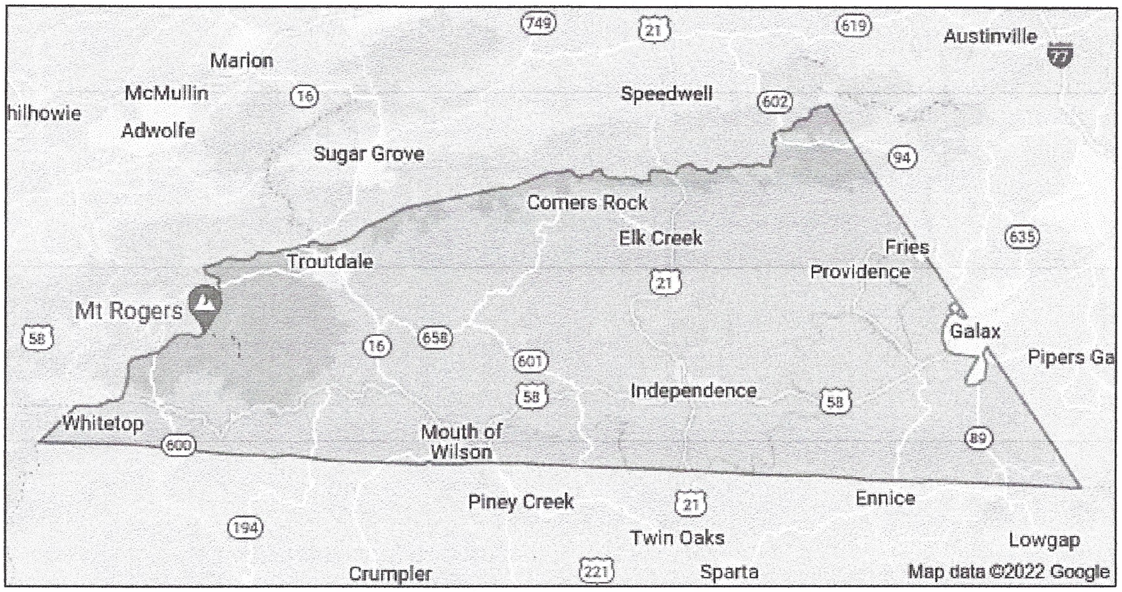
☐ Floodplain Staff Capacity.

X Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Grayson County



NFIP Community Identification Number (CID#): 510243

Is Project Located in an NFIP Participating Community? X Yes ☐ No

Is Project Located in a Special Flood Hazard Area? X Yes ☐ No

Flood Zone(s) (If Applicable): **As shown on applicable FIRM Panels covering Grayson County**

Specific maps and data of Grayson Co. and incorporated areas may be found in the FEMA FLOOD INSURANCE STUDY NUMBER 51077CV000A, found at:
https://drive.google.com/file/d/1iH9cMkPCf31OlGoPOCFBYkJPEXVBxKOr/view?usp=sharing

Flood Insurance Rate Map Number(s) (If Applicable): **Multiple FIRM Panels cover Grayson County**

Total Cost of Project: **$75,565**

Total Amount Requested **$75,565**

Scope of Work Narrative – Capacity Building and Planning

1. The key resource needed by Grayson County at this time is technical assistance in developing a Resilience Plan as outlined by DCR, and certification of the County's Floodplain Manager. The Plan will help determine knowledge, skills and abilities of existing staff and identify any additional staff and/or resources needed. Grayson will collaborate with regional resources and/or seek external funding in order to meet specific needs that may not be available at the county level. The County Emergency Services Coordinator/Director, Public Service Authority will oversee any policy changes and capacity needs as outlined through the Plan. These two key elements will strengthen Grayson's prevention and response to flooding issues working in tandem with the County's integrated system of tracking and documenting disasters and the ability for FEMA to load relevant parcel zone data for quick reporting.

A link to the County Floodplain Ordinance can be found at this link: https://www.graysoncountyva.gov/state-of-virginia-tourism/flood_plain_ordinance/ [click the box for the document to open]

The 2018 County Comprehensive Plan, https://www.graysoncountyva.gov/comprehensive-plan1/ , references flooding as a major concern:

- Strategy 8.2: Conduct education and outreach to floodplain property owners.
- The plan discusses flash flooding as an expected hazard of the mountainous topography and abundance of streams, and discusses that, "Flooding has been identified as the number one hazard for Grayson County and is listed as such in the 2018 update." (p. 11-8, County Comprehensive Plan).
- Floodplain development is guided by the Grayson County Floodplain Ordinance as mandated by Federal Emergency Management Agency (FEMA). (p.11-8)

The 2018 Mount Rogers Hazard Mitigation Plan can be found at this link, https://mrpdc.org/docs/2018%20Hazard%20Mitigation%20Final%20Plan,%2002-06-19.pdf

2. The overarching goal of the proposed project is for Grayson County to respond appropriately to existing repetitive flooding issues as well as identify and prevent potential flooding issues. The objectives are 1) to engage qualified technical assistance to develop a Resilience Plan encompassing required components as stated by DCR and 2) to provide certification of the County's Floodplain Manager. With these items in place, Grayson intends to implement the Plan and further increase capacity to respond and prevent flooding, and specifically, to apply for future DCR funding for construction of an improved stormwater drainage system in the vicinity of Fries Middle School.

3. The requested funding would be utilized to prepare a Flooding Resilience Plan and certify the County Floodplain Manager, benefitting the County and the incorporated municipalities within. Grayson County has been working with the Town of Fries, in particular, as recurrent flooding over several years has been identified at Fries Middle School. Flash flood damage

incidents have been recorded over several years including a period of four years in which the school was closed due to mold damage, with students transferred to other County schools.

4. Once funding is secured, Grayson will procure professional engineering services for a private firm to prepare the Flooding Resilience Plan and register the Floodplain Manager for certification training. The contract with the consultant would stipulate the timeframe for Plan development. It is anticipated that the required timeframe for plan development would be approximately 6-8 months. Grayson County desires to have the Plan and certification completed in sufficient time to identify and request construction funds for the highest priority need during DCR's 2023 construction funding application cycle.

5. Grayson County will engage the expertise of The Lane Group in developing the Resilience Plan. They have worked with Grayson on related projects and are familiar with the County and the region in addition to providing specific expertise for developing the Plan. The County will rely upon guidance from the Lane Group regarding the best pathway for CFM training and certification as well. We have done preliminary research through the VA and National Floodplain Manager Associations.

6. The expected result of the proposed project is a Resilience Plan as outlined by DCR and may include additional components as deemed necessary and/or relevant, and certification of the Floodplain Manager. Success will be measured by the development of said Plan and the certification process. Additional benefits will be capacity building of the County moving forward, and greater potential for funding to address identified flooding issues.

7. The County Emergency Services Coordinator/Director, Public Service Authority in conjunction with relevant partners, collaborators and consultants, will utilize the Plan as a guide in maintaining capacity going forward.

Budget Narrative - Required for All Grant Categories

- ***Estimated total project cost*:**

  The total project cost of $75,565 is composed of:

  - The estimated cost of service for a private consultant to prepare the Grayson County Flooding Resilience Plan is $75,000.
  - The estimated cost of Floodplain Manager training and certification is $565. The County will cover any travel related costs for certification.

- ***Amount of funds requested from the Fund***: This is the total amount of any grant assistance sought from the Fund. Include a detailed breakdown of how this funding is proposed to be allocated. At a minimum this should include a breakdown of salaries, fringe benefits, travel, equipment, supplies, construction, contracts and other direct costs. Please refer to the match requirements in Part II of this manual. For local governments designated as low-income geographic areas, 100 percent of the estimated total project costs should be included.

Grayson County is requesting a waiver of the 10% match, thereby requesting a total of $75,565 from DCR for this project.

As Grayson requests a waiver of the full or partial match (as deemed appropriate by DCR), we provide the following context of the County, which includes the towns of Fries (population of 444) , Troutdale (163), and Independence (877). The population of Grayson County is 15,333. About 50% are ages 50 and older, with 24% being 65 and older, many of whom live alone in remote areas. The county's unemployment rate is 5.5% compared to the state average of 4%. Median family income for Grayson County is $47,900, which is 58% of the median for Virginia, of $81,947.

According to the 2018 Mt. Rogers Planning District Commission Comprehensive Economic Development Strategy, Grayson has the lowest median income in the service area. In a comparison with state data, Kids Count (2018) indicates 27.5% of children live in poverty in Grayson County compared to 13.8% for Virginia, and 23% of children in Grayson experience child food insecurity compared to 12.5% for Virginia.

A 2020 DHCD Report on Local Vulnerability Analysis ranks Grayson County as third from the bottom in dependence on local tax revenue. Grayson joins Bland County and Galax City in highest percentage of residents working outside of the county/city, with each above 35 percent, which also contributes to decreased spending/revenue in the county of residence.

Within a larger context, the Economic Innovation Group provides a Distressed Communities Index (DCI) which examines economic well-being at the zip code level. With a Distressed Communities Index of 96.1, Grayson County ranks as a highly distressed area. The index looks at indicators such as percent obtaining a high school diploma, the poverty rate, median household income, employment, and housing vacancy. In a comparison with state data, Kids Count (2018) indicates 27.5% of children live in poverty in Grayson County compared to 13.8% for Virginia, and 23% of children in Grayson experience child food insecurity compared to 12.5% for Virginia.

As Va. Tech Economist, Dr. Sheryl Bailey shared, the pandemic delivered "deep blows to minorities, low-wage workers, women, and workers with less than college degree." Workers do not have skills for needed jobs, and workers with lower education are experiencing more impact of COVID. 21% of Grayson residents age 25+ have less than HS graduation compared to 13% in US, and 10.7% age 25+ have a bachelor's degree or more education compared to 30.3%

in US. Small and minority owned businesses are always more vulnerable: about 40% of Grayson's small businesses are owned by women.

Additionally, the Centers for Disease Control and Prevention Social Vulnerability Index (SVI) refers to a community's capacity to prepare for and respond to the stress of hazardous events ranging from natural disasters, such as tornadoes or disease outbreaks, to human caused threats, such as toxic chemical spills. The Index examines indicators of 1) socioeconomic status, 2) household composition & disability, 3) minority status and language, and 4) housing type and transportation. Index scores range from 0 (lowest vulnerability) to 1 (highest vulnerability). The Grayson County SVI score of .64 indicates a moderate to high level of vulnerability. Further breakdown of the score indicates that Grayson lies within the second highest tier of overall vulnerability, within the highest tier for socioeconomic status, the second highest tier for household composition/disability, the lowest tier for race/ethnicity/language, and the highest tier for housing/transportation.

Within the context of the recent county budget and particularly with the infusion of American Rescue Plan Act (ARPA) funding, County administration and the Board of Supervisors ranked their top priorities as 1) water and stormwater infrastructure, 2) emergency services, and 3) childcare.

Although the County has experienced repetitive flooding, attempts at addressing the issue have fallen short with lack of required foundational items to secure funding and meeting required match. Having a Resilience Plan in place and a Certified Floodplain Manager will provide the County with a good foundation to move forward. While we are requesting a waiver, Grayson understands and is willing to provide a reasonable match as deemed appropriate by DCR.

- ***Amount of cash funds available***: This amount, when combined with the amount of funding requested from the Fund, must reflect the <u>total estimated project cost</u> to demonstrate that all necessary funding has been secured to complete the project. Include a description of the source of these funds and evidence of the applicant's ability to obtain these funds to complete the project.

  While the County requests a full or partial waiver of the 10% match for Capacity Building and Planning Grants, Grayson County commits to paying the full 10% of the total estimated project cost, which would equate to $7,556.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Grayson County**	
Eligibility Information		
Criterion	**Description**	**Check One**

Re: Support Letter – DCR Community Flood Preparedness Fund Proposal

To Whom It May Concern:

In accordance with DCR's requirement of a 10% match for Planning and Capacity Building Grants, the sum of $7,556 is hereby authorized in covering the full match of the total estimated cost of $75,565 for the purposes of 1) a private consultant to prepare the Grayson County Flooding Resilience Plan and, 2) fees to certify the County's Floodplain Manager. The intent for this capacity building is for Grayson County to utilize these components to identify and request construction funds for the highest priority needs during DCR's 2023 construction funding application cycle, and other appropriate venues. While Grayson requests a waiver of the full or partial match, the County acknowledges that it is one among many applications and requests and is willing to provide a reasonable match as deemed appropriate by DCR.

Sincerely,

William L. Shepley

COMMONWEALTH OF VIRGINIA

2022 Grant Manual for the Virginia Community Flood Preparedness Fund

2022 Grant Funding

Applications Due: 4 p.m., 04/08/2022

Developed by the Department of Conservation and Recreation
in cooperation with the Virginia Resources Authority

DCR
Virginia Department of Conservation & Recreation

VRA
VIRGINIA
RESOURCES
AUTHORITY

Contents

Part I: Introduction and Overview

Purpose of this Manual

The purpose of this manual is to provide guidance regarding the policies, criteria, conditions, and procedures for determining project eligibility and awarding grants from the Virginia Community Flood Preparedness Fund to local governments per §10.1-603.25 et seq. of the *Code of Virginia* and as required by the Clean Energy and Community Flood Preparedness Act (the Act). While the statute authorizes loans in addition to grants, this grant round will be for **grants only**. The manual describes three categories that are eligible to receive grant funds. The three grant categories are: Capacity Building and Planning, Projects, and Studies.

The Department expects to initiate one more grant and/or loan round prior to August 2022 to ensure those that need additional time to develop proposals will have an opportunity to apply in an additional grant round.

Virginia Community Flood Preparedness Fund (Fund) Overview and Authority

The Fund was established to provide support for regions and localities across Virginia to reduce the impacts of flooding, including flooding driven by climate change. The Fund will prioritize projects that are in concert with local, state, and federal floodplain management standards, local resilience plans, and the Virginia Coastal Resilience Master Plan. The Fund will empower communities to complete vulnerability assessments, and develop and implement action-oriented approaches to bolster flood preparedness and resilience. The following conditions shall apply to the use of moneys allocated from the Fund:

1. Localities shall use moneys in the Fund primarily for the purpose of implementing flood prevention and protection projects and studies in areas that are subject to recurrent flooding as confirmed by a locality-certified floodplain manager.
2. Moneys in the Fund may be used to mitigate future flood damage and to assist inland and coastal communities across the Commonwealth that are subject to recurrent or repetitive flooding.
3. No less than 25 percent of the moneys disbursed from the Fund each year shall be used for projects in low-income geographic areas (defined in the definitions section below).
4. Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk.

The Fund consists of all sums that are designated for deposit in the Fund from revenue generated by the sale of emissions allowances pursuant to subdivision C 1 of §10.1-1330 of the Code of Virginia, all sums that may be appropriated to the Fund by the General Assembly, all receipts by the Fund from the repayment of loans made by it to local governments, all income from the investment of moneys held in the Fund, and any other sums designated for deposit to the Fund from any source, public or private, including any federal grants and awards or other forms of assistance received by the Commonwealth that are eligible for deposit in the Fund under federal law.

Interest earned on moneys in the Fund shall remain in the Fund and be credited to it. Any moneys remaining in the Fund, including any appropriated funds and all principal, interest accrued, and payments, at the end of each fiscal year shall not revert to the general fund but shall remain in the Fund. All loans and grants provided under this article shall be deemed to promote the public purposes of enhancing flood prevention or protection and coastal resilience.

The Department, in consultation with the Secretary of Natural Resources and the Special Assistant to the Governor for Coastal Adaptation and Protection, have established this grant manual to establish policy and procedures regarding the distribution and prioritization of loans and grants, including loans and grants that support flood prevention or protection studies of statewide or regional significance.

The Department shall administer and direct distribution of loans and grants from the Fund. ***While grants and loan instruments are available to the Department for use under the Fund, only applications for grant funds are being solicited during this application period. In the future, the Fund may also provide loans. Details will follow in future grant manuals.***

A. Commonwealth Resilience Planning Principles

Regardless of region, the CFPF will be guided by the following principles:

1. Acknowledge climate change and its consequences, and base decision making on the best available science.
2. Identify and address socioeconomic inequities and work to enhance equity through adaptation and protection efforts.
3. Utilize community and regional scale planning to the maximum extent possible, seeking region-specific approaches tailored to the needs of individual communities.
4. Understand fiscal realities and focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The solutions will, to the extent possible, prioritize effective natural solutions.
5. Recognize the importance of protecting and enhancing nature-based solutions in all regions, natural coastal barriers, and fish and wildlife habitat by prioritizing nature-based solutions.

B. Definitions

Some of the terms used in this grant manual and in § 10.1-603.24 of the *Code of Virginia* have specific meanings that may vary from other contexts. For the purposes of this manual and the Fund:

“Capacity Building” means improving the ability of a local government through training of existing staff, hiring personnel, contracting with expert consultants or advisors, and other related actions that allow a local government to identify and mitigate risk and flood impacts.

“Community Scale project” means a project that provides demonstrable flood reduction benefits at the US census block level or greater.

"Cost," as applied to any project financed under the provisions of this article, means the total of all costs incurred by the local government in carrying out all works and undertakings necessary or incidental to the accomplishment of any proposed project.

"Department" means the Virginia Department of Conservation and Recreation.

"Flood prevention or protection" means the construction of hazard mitigation projects, acquisition of land, or implementation of land use controls that reduce or mitigate damage from coastal or riverine flooding.

“Eligible Applicants” are local governments, as defined below, and federally or state recognized Indian tribes. The program allows eligible applicants to join together to submit joint proposals.

"Flood prevention or protection study" means the conduct of a hydraulic or hydrologic study of a floodplain with historic and predicted floods, the assessment of flood risk, and the development of strategies to prevent or mitigate damage from coastal or riverine flooding.

"Fund or fund" means the Virginia Community Flood Preparedness Fund created pursuant to § 10.1-603.25 of the Code of Virginia.

“Hybrid Solution” means a project that incorporates nature-based and hardened solutions to achieve an outcome that is primarily nature-based.

“Locality-certified floodplain manager” means a Certified Floodplain Manager according to the Association of State Floodplain Managers (https://www.floods.org/certification-program-cfm/) who is in the employ of a local government.

"Local government" means any county, city, town, municipal corporation, authority, district, commission, or political subdivision created by the General Assembly or pursuant to the Constitution of Virginia or laws of the Commonwealth, or any state or federally recognized Virginia Indian Tribe.

"Low-income geographic area means any locality, or community within a locality, that has a median household income that is not greater than 80 percent of the local median household income, or any area in the Commonwealth designated as a qualified opportunity zone by the U.S. Secretary of the Treasury via his delegation of authority to the Internal Revenue Service. A project of any size within a low-income geographic area will be considered.

“Nature-based solution” means an approach that reduces the impacts of flood and storm events through the use of environmental processes and natural systems. A nature-based solution may provide additional benefits beyond flood control, including recreational opportunities and improved water quality. This includes a project that reduces these impacts by protecting, restoring or emulating natural features.

“National Flood Insurance Program (NFIP)” means the Program as established by the United States Congress through the passage of the National Flood Insurance Act of 1968, as amended.

“Project” means activities that include the development of flood protection facilities, acquisition of land, restoration of natural features or other activities that involve design, construction or installation of facilities. Activities such as design necessary to ensure projects meet their intended purpose will be considered part of the project.

“Recurrent or Repetitive Flooding” means the flooding effects of rain events, storm surges, and tidal flooding that occur on a regular or frequent basis including areas with repetitive loss properties as defined by the Federal Emergency Management Agency under the National Flood Insurance Program.

“Resilience Plan” means a locally adopted plan that describes the entire local government’s approach to flooding and meets the following criteria:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science, and incorporates climate change, sea level rise, and storm surge (where appropriate), and current flood maps.

“VRA” means the Virginia Resources Authority

“Virginia Coastal Resilience Master Plan” means the document released by Governor Northam on December 7, 2021 (https://www.dcr.virginia.gov/crmp/plan)

Part II: General Department Grant Eligibility Criteria and Application Procedures

---

A. Department Conditions and Limitations for Making Grants and Loans

1. Grant assistance and loans will be awarded by category on a competitive scoring basis for eligible projects that meet the general conditions of this section and the specific criteria set out in the project category descriptions. Scoring criteria to be utilized for each project category are contained in Appendix B.

   The total amount of funds granted in any grant round, the amount of funds allocated to each of the three grant categories, and final determinations of grant awards will be set by the Department in consultation with the Chief Resilience Officer and the Special Assistant to the Governor for Coastal Adaptation and Protection. The Department anticipates that the allocations across grant categories will change with each grant round depending on demonstrated interested need.

2. Grant matching requirements are as follows*. The nature-based solution percentage will be based on the degree to which a completed project is comprised of a nature-based solution. Removal of existing infrastructure or structures may be necessary to achieve the nature-based solution.
   a. Planning and Capacity Building– Fund 75%/Match 25%.
   b. Flood Prevention and Protection Studies – Fund 50%/Match 50%.
   c. Projects that will result in nature-based solutions - Fund 70%/Match 30%.
   d. Projects that will result in hybrid solutions - Fund 60%/Match 40%.
   e. All other Projects - Fund 50%/Match 50%.
3. For projects that are located in and serve low-income geographic areas, the following match requirements shall apply:
   a. Planning and Capacity Building– Fund 90%/Match 10%*.
   b. Flood Prevention and Protection Studies – Fund 90%/Match 10%.
   c. Projects that will result in nature-based solutions - Fund 80%/Match 20%.
   d. Projects that will result in hybrid solutions - Fund 65%/Match 35%.
   e. All other Projects Fund 55%/Match 45%.

   ***Match requirements for Planning and Capacity Building in low-income geographic areas will not require match for applications requesting less than $3,000. Where a** local government is unable to secure required match funds for larger planning and study grants-contact the Department at cfpf@dcr.virginia.gov

A completed resilience plan will be required before a local government can apply for and receive funding from the Project category only. Capacity-building and planning and study grants will be available to any local government prior to having met the requirements of the Resilience Plan as defined in this manual.

4. Grant funds will be disbursed on a reimbursement basis and may be drawn down quarterly or after the completion of the approved project.

5. A total of **<u>$40 million</u>** is available for grants during this grant cycle. Of this amount, a minimum of 25% will be reserved for proposals that address low-income geographic areas. The grant amount per project will be determined based on scoring, amounts requested from eligible projects, and available funds. Based on the amount of funds available, it is possible not all projects or applications received will receive funding.

6. Minimum grant awards by category will be as follows: Project grants $50,000; Capacity Building and Planning grantavailas, and study grants: $1,000. Project grants will not be capped and final awards will be determined based on available funds following review by the Department.

7. Each application submitted must be for a discrete project to be completed after the beginning of the application period and not later than 3 years from the date of an executed agreement or by an extension date approved by the Department. These specified dates constitute the required "project completion date". Reimbursement requests must be submitted within 90 days following passage of the authorized project completion date. Projects that are proposed to extend longer than 3 years may be submitted in phases. Phases of the project that extend beyond 36 months should be submitted in future applications. Studies and capacity building proposals may also be presented in phases.

8. No project or portion thereof identified in a previously awarded grant that was reimbursed by the Department is eligible for funding.

9. The Department, the Chief Resilience Officer, the Special Assistant to the Governor for Coastal Adaptation and Protection, and the Virginia Resources Authority reserve the right to provide funding at a level less than requested by the applicant, or to refuse to fund an applicant's request. Reasons for such determinations include, but are not limited to, incomplete applications or resilience plans, low project ranking, the feasibility of the proposal, total funding determined to be necessary to complete the project, an anticipated inability to complete the project by the specified completion date, and total available funding.

10. Local governments may contract with public, private and non-profit organizations or entities to implement approved projects.

11. **<u>Applications will be accepted beginning (*01/03/2022*) and ending at 4:00 p.m. on (04/08/2022) at cfpf@dcr.virginia.gov.</u>**

12. For a grant to be authorized, an eligible capacity building activity, project or study shall satisfy the following general conditions:
    a. A complete application meeting the requirements set forth in this manual has been submitted to the Department within the specified application period.
    b. The local government has authorized requesting assistance from the Fund and has also authorized the availability of identified matching funds or a statement indicating that authorization is pending, and once approved, will be forwarded to the Department **prior to the close of the application period**. Authorizations not received prior to the close of the application period will cause the application to be disqualified for the current grant round.
    c. Where project completion is dependent on a variety of funding sources, including from the Fund, the local government has provided satisfactory assurances of all necessary funds to fully finance the project. This must include signed, written verification as outlined in requirements for the Budget Narrative on page 20.
    d. For projects that will require future maintenance, a maintenance and management plan for the projects must be provided demonstrating how the project will be maintained with funds secured by the grant recipient independent of the Fund over the lifespan of the projects
    e. If a grant is sought for capacity building and planning activity, a project, or a study that will be carried out in concert with a federal agency, the applicant must have authorization to enter into any necessary written agreement with the federal agency endorsing the application, including any provisions for cost-sharing. A copy of the agreement must be submitted with the application.
    f. **Grant funds may be used as match for other sources of funding; however, grant funds awarded from the Fund may NOT be utilized as match funds for other monies from the Fund. Monies used to match grants from the Fund may not be used as match for other grants.**

B. Application and Selection Process

1. General Submittal Information and Deadline

A complete electronic file with all required attachments **is the preferred method of submission**. **All electronic applications** should be submitted in a PDF format to cfpf@dcr.virginia.gov.

Files should be saved as follows:

- CID51XXXX_LocalgovernmentName_CFPF.pdf
    - (example: CID510090_LoudounCounty_CFPF.pdf).
- If multiple applications for the local government then please use
    - CID510090_LoudounCounty_CFPF-1.pdf; LoudounCountyCFPF-2.pdf. etc.

“Community Identification Number (CID#)” is a 6-digit designation identifying each National Flood Insurance Program (NFIP) community. The first 2 numbers are the state code. Virginia’s state code is “51”. The next 4 digits are the Federal Emergency Management Agency (FEMA)-assigned community number and can be found in Appendix F of this manual. The CID# applies to the local government where the work is being done, not necessarily where the applicant is based. Where no CID# has been assigned, CID# will be 510 plus the three digit FIPS code and Department designation (example for City of Richmond – 510760-DCR1). The list of communities without a FEMA assigned CID# is also found in Appendix F.

If electronic submittal is not possible, please submit 4 complete copies of each application (including one originally-signed copy), together with all attachments and supporting documentation, to the Virginia Department of Conservation and Recreation at the address below:

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

Please ensure signature pages are completed prior to submitting electronically or mailing. Applications without signatures will be considered incomplete and will be removed from funding consideration for the current round. Applications will be accepted beginning on January 3, 2022. **All applications must be RECEIVED by 4:00 p.m. eastern daylight savings time on April 8, 2022**. Applications received after this deadline **will not be considered** during the current round.

For proposals that can only be submitted in paper format, it is important that applications be printed on one-sided pages. All pages must be sized to 8.5 x 11 inches. Photographs are acceptable. All photos and images and their captions must be on 8.5 x 11-inch paper and be of a quality suitable for reproduction by a photocopier. It is not necessary to submit 4 sets of original images, but all reproduced images must be clear and discernable. Images and photos will not be returned.

Applications will be scored, ranked, and funded based on scoring criteria in Appendix B and the availability of funds.

General Application Inquiries: For any questions regarding the application process, please contact the Department of Conservation and Recreation, Division of Dam Safety and Floodplain Management at (804) 371-6095 or via email at cfpf@dcr.virginia.gov.

2. Project, Study, Capacity Building and Planning Application Contents

Organizational Information

The Application Form (Appendix A) contains general organizational information, including the title, category, and location of the project, the amount of grant funds requested, and contact information for the applicant or the applicant’s designated contact person.

Scope of Work Narrative (as an attachment to the Application Form)
The requirements for the project's Scope of Work Narrative are outlined in Part III of this manual. A completed scoring criteria sheet must also be included to support the Scope of Work Narrative.

Budget Narrative (as an attachment to the Application Form)
The Budget Narrative establishes the proposed budget for the project. It should include evidence of the source of funds available to fully fund the project, including the required cash matching funds. A description of the Budget Narrative is outlined in Part III of this manual.

3. Application Review and Approval

Qualifying projects in each category are selected for funding on a competitive scoring basis. The Department will use the following procedure in determining the qualification of an application.

Department of Conservation and Recreation (Department) Review
The Department will review the applications for completeness in accordance with the eligible grant categories and application requirements. Department staff, in consultation with the Secretary of Natural Resources and the Special Assistant to the Governor for Coastal Adaptation and Protection, will review and rank each complete application to determine its merits in accordance with the criteria set out in this manual pursuant to the scoring criteria contained in the applicable Appendix for each of the three grant categories (Capacity Building and Planning, Projects and studies).

Virginia Resources Authority Review
Following the project acceptance and approval, and pending further necessary submittals, the application will be forwarded to VRA for the execution of a grant agreement and funding.

4. Grant Funded Activity Commencement and Schedule for Completion

Projects, capacity building and planning and studies will be required to be completed after the beginning of the application period and not later than 36 months following the issuance of a signed agreement between the applicant and VRA on behalf of the Department. Projects, capacity building and planning, and studies with a longer time horizon should be submitted in phases.

If a project, study, capacity building or planning activity does not commence in a timely fashion to allow completion within the agreement period, funding will be withdrawn and the applicant may reapply during the next grant round, should funds be available. Such funds may be redistributed to other qualifying projects at the discretion of the Department in consultation with the Chief Resilience Office and the Special Assistant to the Governor for Coastal Adaptation and Protection.

An extension may be granted at the discretion of the Department; however, all extension requests (Appendix D) must be received no later than 90 days prior to the expiration of the original agreement, and the approved activity must have commenced within the first nine months of the original agreement period.

5. Reporting and Close-Out Guidelines for Grant Recipients

Where applicable, the Department will conduct project inspections as necessary to ensure conformance to grant terms. **Final project deliverables defined in the approved Scope of Work are due to the Department within 30 days following the project end date, unless another date is approved by the Department.**

a. ***All materials shall be provided digitally to the Department at cfpf@dcr.virginia.gov.***
b. All documents must be provided in PDF and/or a Microsoft Word compatible format, including any embedded maps or other figures/illustrations.
c. All engineering files (including hydrologic and hydraulic studies) and assumptions necessary to replicate various analyses or other calculations need to be provided in a format compatible with the software used to perform those calculations; likewise, all output files are also required.
d. All tabular information not included in the engineering files above, whether contained within any report or appendix, which was used as the basis for any calculation, shall be provided in a Microsoft Excel compatible format or Microsoft Access compatible format.
e. All map data shall be delivered as a geodatabase or individual shapefiles. Additionally, maps shall be provided in a PDF format if not already included embedded within the report(s).
    - If derived from CAD or another non-GIS workflow, data must be converted into a GIS format.
    - See the Virginia Soil and Water Conservation Board's Guidance Document for specific requirements and direction for mapping - Dam Break Inundation Zone Modeling and Mapping Procedures (PDF) (09/16).
f. If digital submittal is not possible, printed materials, together with all attachments and supporting documentation, may be submitted to the Virginia Department of Conservation and Recreation at the address below:

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

6. Grant Award and Administration

After application approval, a letter will be sent from the Department to the applicants, and notice of awards will be posted on the Department Dam Safety and Floodplain Management Community Flood Preparedness Fund web page at https://www.dcr.virginia.gov/dam-safety-and-floodplains/dsfpm-cfpf.

VRA will email grant agreements to recipients using the email address provided in the original application. If no email address was provided, the Grant Agreements will be sent via U.S. mail. Recipients shall return the signed grant agreement within 90 days of receipt to:

Virginia Resources Authority
1111 E. Main Street, Suite 1920
Richmond, VA 23219

Grant agreements not signed and returned to VRA within 90 days as required will have grant funds rescinded.

Within 30 days after the project, study, capacity building or planning activity is completed the applicant shall submit digital copies of the completed work to cfpf@dcr.virginia.gov along with the completed Certificate of Approval Floodplain Management form (which will be provided along with the grant award documents from VRA for review and approval by Department staff).

Final reimbursement requests must be submitted within 90 days following passage of the authorized project completion date; this request must include completed and signed Exhibit E Reimbursement Request Form, signed Exhibit D Form of Requisition along with the signed Certificate of Approval Floodplain Management, proof of payment (canceled checks, bank statements, accounting system reports, etc.) and invoices to cfpf@dcr.virginia.gov or:

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

All forms are located in the VRA grant agreement.

Invoices must be detailed and specific to the project awarded and must provide sufficient detail to determine the work and hours actually completed related to the approved project.

7. Virginia Resources Authority Disbursement of Grant Funds

Grant funds may be disbursed on a quarterly basis. For low-income geographic areas, one-quarter of the grant award may be advanced upfront to the grant recipient to be offset against actual expenditures at the end of the grant award.

All requests for disbursement shall be provided to the Department for approval according to the reimbursement terms of the grant manual and grant agreement. The Department shall forward the approved request to VRA for payment to the applicant. VRA will not disburse funds prior to receipt of a fully executed grant agreement signed by the grant recipient and subsequently signed by VRA's Executive Director. Where applicable, the Department will conduct site visits and inspections to monitor project compliance. A checklist for reimbursement will be included in the VRA grant agreement.

Part III: Eligible Activities Descriptions: Projects, Studies, Capacity Building and Planning

A. Capacity Building and Planning

While certain local governments and regions have taken significant steps in developing and implementing comprehensive approaches to flood preparedness and resilience, many areas have yet to establish the necessary foundation for such activities, often because of a lack of resources. It is imperative that such planning activities take place.

To encourage sound planning, the Fund will provide local governments grants for capacity building efforts, prioritizing those that create or update resilience plans, as defined in this manual.

To further encourage planning, applicants applying for project grants must have an approved resilience plan, and projects must be approved by a Certified Floodplain Manager (CFM) pursuant to section one of this manual.

Capacity building and planning grants are designed to help local governments meet both of those future requirements.

Applicants may seek funds to secure services or personnel necessary to develop plans, programs, and projects within the defined project period and scope of eligible activities. More details on plan requirements are included in this section so applicants may assess whether or not they will need capacity building and planning assistance.

The Fund will strive to provide capacity building and planning grants to help any local government that does not yet have such a plan or capacity to create and implement a resilience plan to develop one to address its flood resilience needs in a comprehensive manner.

The number of grants awarded for this purpose will be dependent on available funds.

Details on Required Resilience Plans for Project Grant Applicants

A plan can be either one document or a combination of documents that meet the elements described in the definitions section of this manual. Once the Department certifies a local government has met the minimum requirements that determination will stand for a period of three years.

For this grant round, the resilience plan may be submitted before or concurrently with the submission of a project plan. Applicants may submit their resilience plans at any time. Resilience plans should be clearly identified with the name of the local government in the file name (example: CID#.Essex.resilienceplan) and submitted to cfpf@dcr.virginia.gov. The CID# is unique to each county, city or town in Virginia.

A plan for purposes of the CFPF during this grant round will meet the following criteria:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science and incorporates climate change, sea level rise, and storm surge (where appropriate), and current flood maps.

Additional information on plan submittal and approval is available in Appendix G.

The Department expects to complete or begin an additional grant round prior to August 2022, so applicants should understand that even if they are unable to meet this requirement during this round, they will have additional time to complete their plan submissions and apply for project grants in the future grant round.

B. Flood Prevention and Protection Projects

The purpose of this category is to assist local governments with flood prevention or protection activities to prevent loss of life and reduce property damage caused by flooding. Flood prevention or protection project means any project to reduce coastal, riverine or inland flooding.

During this grant round, a local government may not apply for or receive funding from the Project category unless it has a completed a resilience plan certified by the Department. Planning, studies, and capacity building grants will be available to any local government prior to the adoption of a resilience plan. Further information on expected content are contained in Appendix G.

If multiple eligible entities are included in one application, applicants should list all localities with their CID#s, for example: CID510XXX-KellerTown_CID510XXX-MelfaTown_CID510XXX-PainterCFPF-1

While the grant recipient, and therefore responsible party, is defined in the Code of Virginia, projects may serve a smaller geographic area within the local government, particularly low-income geographic areas. Projects undertaken by municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these, must be consistent with resilience plans and efforts in the local government where the project takes place. Letters of support from affected localities must be included with the application.

All projects that demonstrate a primary purpose of prevention or protection to reduce coastal, riverine or inland flooding will be considered.

Examples of applicable projects include:

Nature-based solutions including but not limited to: wetland restoration, floodplain restoration, swales and settling ponds, living shorelines and vegetated buffers.

Additional flood control solutions including, but not limited to: floodwalls, levees, berms, flood gates, structural conveyances and storm water systems, and medium to large scale Low Impact Development (LID) in urban areas

Preservation and creation of open space including: property acquisition and relocation and the permanent conservation of lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.

C. Studies

To assist the Commonwealth and its local governments, the Fund will provide grants for various studies designed to improve long term planning and effectiveness of resilience plans and projects.

Examples of applicable projects include:

a. Studies to revise floodplain ordinances in order to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This shall include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variance procedures. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.
b. Hydraulic or hydrologic studies of a floodplain with historic and predicted floods, the assessment of flood risk, and the development of strategies to prevent or mitigate damage from coastal or riverine flooding.
c. Hydrologic and hydraulic studies of floodplains to clarify or update by FEMA Flood Insurance Rate maps (FIRMS).
d. Studies and Data Collection of Statewide and Regional Significance: Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:

1. Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.
2. Regional relative sea level rise projections for use in determining future impacts.
3. Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.
4. Flash flood studies and modeling in riverine regions of the state.
5. Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.
6. New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.
7. Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.
8. Regional hydrologic and hydraulic studies of floodplains.
9. Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.
10. Other proposals that will significantly improve protection from flooding on a statewide or regional basis.

Part IV: Required Application Components

A. Scope of Work Narrative – Capacity Building and Planning

All applications must include a Scope of Work Narrative that clearly describes the proposed activities, including supporting documentation as necessary and, at a minimum, includes the following.

1. Assess capacity needs and assets to include:
    a. Resource needs identification – financial, human, technical assistance, training.
    b. Plan for developing, increasing, or strengthening knowledge, skills and abilities of existing or new staff. This may include training of existing staff, hiring personnel, contracting with of expert consultants or advisors.
    c. Resource development strategies. Where capacity is limited by funding, what strategies will be developed to increase resources in the local government? This may include work with non-governmental organizations, or applying for grants, loans, or other funding sources.
    d. Policy management and/or development.
2. Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.
3. Stakeholder identification, outreach and education strategies.
4. Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.
5. Parties responsible for capacity building and/or plan development process.
6. Performance outputs and measures. Describe the expected results and benefits and how success will be measured.
7. Plans for maintaining capacity, as necessary, over the long term.

B. Scope of Work Narrative – Projects

All applications must include a Scope of Work Narrative that clearly describes the proposed project or study, including supporting documentation as necessary. It may be helpful to review the checklist in Appendix C to ensure that the application includes all the required elements. The Scope of Work narrative for all applications should address the following elements.

1. ***Project Information***: Describe in detail the area to be studied or protected including the following. *Note that information should be provided on the local government(s) in which the project is taking place, even if that local government it is not the grant applicant*. Projects undertaken by municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these, must be consistent with resilience plans and efforts in the local government where the project takes place. Letters of support from affected local governments must be included with the application.

- Population
    - Provide population data for the local government in which the project is taking place, including identification of any low-income geographic area and the estimated number of residents that will be impacted by this project.
- Historic flooding data and hydrologic studies projecting flood frequency
    - Provide information on the flood risk of the project area, including whether the project is in a mapped floodplain, what flood zone it is in, and when it was last mapped. If the property or area around it has been flooded before, share information on the dates of past flood events and the amount of damage sustained.
- The ability of the local government to provide its share of the cost
    - This must include an estimate of the total project cost, a description of the source of the funds being used, evidence of the local government's ability to pay for the project in full or quarterly prior to reimbursement, and a signed pledge agreement from each contributing organization.
- The administration of local floodplain management regulations
    - The Department will determine if the community is in good standing with the NFIP. If applicable, provide the Department with a link to the current floodplain ordinance, or attach a PDF or Word document of the ordinance.
- Other necessary information to establish project or study priority
    - Repetitive Loss and/or Severe Repetitive Loss Properties
        - Do not provide the addresses for these properties, but include an exact number of repetitive loss and/or severe repetitive loss structures within the project area. Work with the local floodplain administrator or emergency manager to find this information. If they do not have a list of repetitive loss/severe repetitive loss structures, the Department can assist them in accessing these lists.
    - Residential and/or Commercial Structures
        - Describe the residential and commercial structures impacted by this project, including how they contribute to the community such as historic, economic, or social value. Provide an exact number of residential structures and commercial structures in the project area.
    - Critical Facilities
        - If there are critical facilities within the project area, describe each facility. Critical facilities are those that provide services and functions essential to the community, including hospitals, fire stations, police stations, storage facilities for critical records, power plants, and wastewater treatment plants, among others.

2. ***Need for Assistance*****:** Identify and describe any relevant issues or problems that will be addressed by the project.
   - Explain the local government's financial and staff resources. How many relevant staff members (floodplain administrators, planners, emergency managers, building officials, engineers) does the local government have? To what relevant software does the local government have access? What are the local government's capabilities?
   - The Department will prioritize low-income geographic areas for funding. Low-income geographic area means any locality or geographic area within a locality that may cross municipal or county boundaries, that has a median household income that is not greater than 80 percent of the local median household income, or any area in the Commonwealth designated as a qualified opportunity zone by the U.S. Secretary of the Treasury via his delegation of authority to the Internal Revenue Service.
   - The Department will consider the project area's social vulnerability index score when reviewing grant applications. The Social Vulnerability Index, available through ADAPT Virginia's Virginia Vulnerability Viewer, will be used for this review.
   - This index is based on census tract data; the index score for the census tract that contains the project area should be used. If the project area falls within multiple census tracts, please provide the scores for all census tracts. The average score for the project area will be used for scoring the application.
     - For more information on social vulnerability, please see ADAPT Virginia's fact sheet.

Alternatives**:** If the project proposed does not employ a nature-based or hybrid solution and the total project cost is greater than $3 million, describe at least one alternative that could reasonably address the issue identified. Please also consider the No Action Option as a third alternative as part of the analysis. Explain these alternatives and the reason the proposed project was selected.

3. ***Goals and Objectives:*** Identify and describe the goals and objectives of the project. Include a description of the expected results of the completed project and explain the expected benefits of the project. This may include financial benefits, increased awareness, decreased risk, etc.

4. ***Approach, Milestones, and Deliverables*****:** Outline a plan of action laying out the scope and detail of how the proposed work will be accomplished with a timeline identifying expected completion dates. Determine milestones for the project that will be used to track progress. Explain what deliverables can be expected at each milestone, and what the final project deliverables will be. Identify other potential project partners.
   - If assistance is sought for a project that will be carried out in concert with a federal agency, provide evidence of an agreement with the federal agency endorsing the project.

5. ***Relationship to Other Projects*****:** Where applicable, briefly describe the relationship between this project and other past, current, or future resilience projects. If the applicant has received or applied for any other grants or loans, please identify those projects, and, if applicable, describe any problems that arose with meeting the obligations of the grant and how the obligations of this project will be met.

6. ***Maintenance Plan:*** For ongoing projects or projects that will require future maintenance, such as infrastructure, flood warning and response systems, signs, websites, or flood risk applications, a maintenance and management plan for the projects must be provided demonstrating how they will be maintained after the lifespan of this grant for a minimum of five years. Ongoing operation and maintenance will be the financial responsibility of the grantee and will not be eligible for monies from the Fund.

7. ***Criteria:*** Describe how the project meets each of the applicable scoring criteria contained in Appendix B, and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application. <u>Appendix B must be completed and submitted with the application.</u>

   For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

   1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?
   2. Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?
   3. For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?
   4. Has the applicant provided evidence of an ability to provide the required match funds?
   5. Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?

      Documentation: As outlined in the Budget Narrative section below, the applicant must include an estimate of the project cost, a description of the source of the funds being used, evidence of the applicant's ability to pay for its share of the project, and signed authorization or a pledge agreement from each contributing organization.

C. Scope of Work Narrative – Studies

All applications for proposed studies the applicant should include the following:

1. The specific type of study proposed including whether the study is new or updates a prior study.
2. The relationship of the study to the local government's needs for flood prevention and protection, equity, community improvement, identification of nature-based solutions or other priorities contained in this manual.
3. The qualifications of the individuals or organizations charged with conducting the study or the elements of any request for proposal that define those qualifications
4. The expected use of the study results in the context of the local resilience plan or, in the case of regional plans, how the study improves any regional approach.
5. If applicable, how the study may improve Virginia's flood protection and prevention abilities in a statewide context.

D. Budget Narrative- Required for All Grant Categories

Each application must include a detailed Budget Narrative explaining all proposed expenditures. A budget narrative is applicable to requests from any category of grants in this manual. The following items must be included in the Budget Narrative:

- ***Estimated total project cost*:** This amount must reflect the total cost of bringing the project to completion. Estimates for all work to be completed by third parties (engineers, contractors, etc.) on the specified project should be included. If multiple project types are selected, a detailed breakdown of how the funding is proposed to be allocated must be included for each selected project type.

- ***Amount of funds requested from the Fund*:** This is the total amount of any grant assistance sought from the Fund. Include a detailed breakdown of how this funding is proposed to be allocated. At a minimum this should include a breakdown of salaries, fringe benefits, travel, equipment, supplies, construction, contracts and other direct costs. Please refer to the match requirements in Part II of this manual. For local governments designated as low-income geographic areas, 100 percent of the estimated total project costs should be included.

- ***Amount of cash funds available*:** This amount, when combined with the amount of funding requested from the Fund, must reflect the total estimated project cost to demonstrate that all necessary funding has been secured to complete the project. Include a description of the source of these funds and evidence of the applicant's ability to obtain these funds to complete the project.

- Authorization to request for funding: Local governments seeking funding shall also attach signed documentation authorizing the request for funding.

Where a local authorization is not applicable, a pledge agreement is required for each contribution, signed by the authorized representative of the contributing organization and the applicant organization, which must include:

- The name, address, and telephone number of the contributor;
- The name of the applicant organization;
- The title of the project for which the cash contribution is made;
- The source of funding for the cash contribution;
- The dollar amount of the cash contribution; and
- A statement that the contributor will pay the cash contribution during the agreement period.

Note: Grant funds may be used as match for other sources of funding; however, grant funds awarded from the Fund may NOT be utilized as match funds for other monies from the Fund. Monies used to match grants from the Fund may not be used as match for other grants.

Appendix A: Application Form for Grant Requests for All Categories

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Name of Local Government:
Shenandoah County

Category of Grant Being Applied for (check one):

X **Capacity Building/Planning**

_____**Project**

_____**Study**

NFIP/DCR Community Identification Number (CID) 510147

If a state or federally recognized Indian tribe, Name of tribe_____________________________

Name of Authorized Official: ____

Signature of Authorized Official: ____

Mailing Address (1): 600 North Main St. Suite 107

Mailing Address (2): ____

City: Woodstock **State:** VA **Zip:** 22664

Telephone Number: (____) _______________ Cell Phone Number: (____) ________________

Email Address: ____

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes _X__ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☒ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Shenandoah County, Virginia

NFIP Community Identification Number (CID#):(See appendix F 510147

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): A, AE, and 0.2 PCT Annual Chance Flood Hazard

Flood Insurance Rate Map Number(s) (If Applicable): All within Shenandoah County, Va

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☐ **Yes** ☐ **No**

Applicant Name:	Shenandoah County

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	
No	**0**	
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	
No	**0**	
Total Points		

Appendix C: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration		☐ **Yes** ☐ **No**
Applicant Name:		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**

Appendix G: Elements of Resilience Plans

As previously stated in this manual, the contents of a resilience plan for the purpose of this grant round are meant to include the following elements.

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a locality regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.

As described earlier, such plans may refer to a previously adopted “stand alone” plan that meets the definition or references the elements of other plans or documents when compiled address the elements of the definition. Sources of elements of compiled plans may include sections from a local comprehensive plan or other land use plans or ordinances, a local hazard mitigation plan, a plan developed that addresses flooding and resilience but may include other elements, and plans developed for the local government by a third party that addresses any of the elements described in 1 – 5 above. These may also include regional strategies or plans in which a local government is a party. In either case, a stand-alone plan, or a document that includes the compiled elements of multiple plans or documents should be submitted and include identification of the sources of the plans or elements submitted.

The following are examples of elements of plans that local governments may possess that would be appropriate for inclusion in a submission.

- Equity based strategic polices for local government-wide flood protection and prevention.
- Proposed projects that enables communities to adapt to and thrive through natural or human hazards.
- Documentation of existing social, economic, natural, and other conditions present in the local government.
- Review of the vulnerabilities and stressors, both natural and social in the local government.
- Forward-looking goals, actionable strategies, and priorities through as seen through an equity-based lens.
- Strategies that guides growth and development away from high-risk locations that may include strategies in comprehensive plans or other land use plans or ordinances or other studies, plans or strategies adopted by a local government.
- Proposed acquisition of land or conservation easements or identification of areas suitable for conservation particularly areas identified as having high flood attenuation benefit by *ConserveVirginia* or similar data driven tools.

- ☐ Identification of areas suitable for property buyouts in frequently flooded areas.
- ☐ Identification of critical facilities and their vulnerability throughout the local government such as water and sewer or other types identified as “lifelines” by FEMA.
- ☐ Identified ecosystems/wetlands/floodplains suitable for permanent protection.
- ☐ Identified incentives for restoring riparian and wetland vegetation.
- ☐ A framework for implementation, capacity building and community engagement.
- ☐ Strategies for creating knowledgeable, inclusive community leaders and networks.
- ☐ A community dam safety inventory and risk assessment posed by the location and condition of dams.
- ☐ A characterization of the community including population, economics, cultural and historic resources, dependence on the built environment and infrastructure and the risks posed to such infrastructure and characteristics by flooding from climate change, sea level rise, tidal events or storm surges or other weather.
- ☐ Strategies to address other natural hazards that would cause, affect or result from flooding events including:
    - Earthquakes.
    - Storage of hazardous materials
    - Landslides/mud/debris flow/rock falls.
    - Prevention of wildfires that would result in denuded lands making flooding, mudslides or similar events more likely.
    - Preparations for severe weather events including tropical storms or other severe storms, including winter storms.

Scope of Work Narrative – Capacity Building and Planning In Shenandoah County

1. Assess capacity needs and assets to include:

    a. Resource needs identification – financial, human, technical assistance, training.
    Currently Shenandoah County does not have any staff trained or certified for Floodplain Administration and the County has not allocated funding to provide training for its team of staff.

    b. Plan for developing, increasing, or strengthening knowledge, skills and abilities of existing or new staff. This may include training of existing staff, hiring personnel, contracting with of expert consultants or advisors.
    The County intends to have its designated Zoning/Subdivision/Floodplain Administrator, Erosion And Sediment Control Administrator, and one additional staff member or community partner trained and certified. The training would be achieved through their attendance of the FEMA administered training at the Emergency Management Institute in Emmitsburg, Maryland. In addition, the staff will obtain membership in ASFPM and take the Certified Floodplain Manager exam. Their training, membership, and certification will increase the capacity and scope of work that can be performed by Shenandoah County for floodplain administration, enforcement, and related project management.

    c. Resource development strategies. Where capacity is limited by funding, what strategies will be developed to increase resources in the local government? This may include work with non-governmental organizations, or applying for grants, loans, or other funding sources.
    The County is partnering with the Northern Shenandoah Valley Regional Commission to apply for funding for a regional resilience plan. In addition, the County intends to seek grant funding in the future for studies and assessments of the current floodplain ordinance as well as projects related to the resilience plan, which will require the County to have a Certified Floodplain Manager.

    d. Policy management and/or development.
    With the training and certification of Shenandoah County staff, the County will increase its scope, capacity, and institutional knowledge to better enforce, administer, and manage floodplain related issues and its floodplain ordinance to ensure the protection of the health, safety, and welfare of the community.

2. Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.
The County's goal is to have professionally trained and certified staff available to address non-compliance to the floodplain ordinance, future revisions to the ordinance per the direction of FEMA and the Virginia Department of Conservation and Recreation, and to manage projects that relate to the floodplain.

3. Stakeholder identification, outreach and education strategies.
With trained and certified staff available, the County will be better prepared to engage the community on floodplain resiliency and community preparedness for flooding. The County is also working on a Master Plan for the North Fork of the Shenandoah River and its watershed in the County with over 30 other groups including Federal, State, and Local agencies and various non-profits and community organizations. With trained and certified staff, the efforts for the Master Plan will have better guidance as it relates to the floodplain.

4. Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.
The plan would include having all three individuals certified within 2 years. This would include attending the training in Emmitsburg, Maryland and successfully passing the CFM exam.

5. Parties responsible for capacity building and/or plan development process.
Shenandoah County's Office of Community Development will be responsible for overseeing capacity building through staff training and certification.

6. Performance outputs and measures. Describe the expected results and benefits and how success will be measured.
Success will be measured by the ability for trained CFM's to adequately address floodplain issues, ordinance changes, complaints, and questions. The expected results is for staff to be trained on how to successfully handle and understand floodplain topics which will benefit the County greatly by ensuring the Floodplain Ordinance is implemented correctly and the Shenandoah River and its tributaries are protected to the best of staff's ability.

7. Plans for maintaining capacity, as necessary, over the long term.

Once certified, the CFM's will attend continuing education opportunities through FEMA to maintain certification.

Shenandoah County Budget: Planning And Capacity Building

Shenandoah County's median household income is $57,252 compared to Virginia's $74,222. Shenandoah County meets the low-income geographic area requirement as $57,252 / $74,222 = ~77%

Item	Notes	Cost	Total For Three Individuals
Travel to Emmitsburg, MD for FEMA E0273 Course at NETC	58.5 cents/mile (2022 IRS Rate) x 103 miles*	$60.26	**$180.77**
Return Travel from Emmitsburg, MD for FEMA E0273 Course at NETC	58.5 cents/mile (2022 IRS Rate) x 103 miles*	$60.26	**$180.77**
NETC Meal Ticket	Purchase of a meal ticket is required to stay on NETC Campus	$234.28	**$702.84**
ASFPM Annual Membership (2 years)	It is more cost-effective to take the CFM exam as a ASFPM member, in order to receive the discounted rate. Cost is for 2 years of ASFPM Membership.	$330	**$990**
CFM Exam Fee	CFM Exam Fee Rate with ASFPM Membership	$185	**$555**
ASFPM CFM Biennial Renewal Fee	CFM Biennial Renewal Fee Rate with ASFPM Membership	$120	**$360**
Total		**$989.79**	**$2,969.37**
*103 miles = approximate distance from Shenandoah County, VA to Emmitsburg, MD			

Shenandoah County Budget Narrative Justification

Shenandoah County's median household income is $57,252 compared to Virginia's $74,222. Shenandoah County meets the low-income geographic area requirement as $57,252 / $74,222 = ~77%

A. Travel Costs – Total: $361.53

- Travel to Emmitsburg, MD for FEMA E0273 Course at NETC.
    - Travel to Emmitsburg, Maryland from Woodstock, Virginia is approximately 103 miles.
    - One individual's cost per the above rate is $60.255, the total derives from the individual cost being multiplied three times.
    - This was derived using the 2022 IRS Rate of 58.5¢ per mile: https://www.irs.gov/newsroom/irs-issues-standard-mileage-rates-for-2022.
- Return travel from Emmitsburg, MD for FEMA E0273 Course at NETC.
    - Travel to Woodstock, Virginia from Emmitsburg, Maryland is approximately 103 miles.
    - One individual's cost per the above rate is $60.255, the total derives from the individual cost being multiplied three times.
    - This was derived using the 2022 IRS Rate of 58.5¢ per mile: https://www.irs.gov/newsroom/irs-issues-standard-mileage-rates-for-2022.

B. Food – Total: $702.84

- Purchase of a meal ticket is required to stay on NETC Campus: https://netcmealtickets.com/
- One meal ticket costs $234.28, the total derives from the individual cost being multiplied three times.

C. Membership - Total: $990

- It is more cost-effective to take the CFM exam as a ASFPM member, in order to receive the discounted rate. Cost is for 2 years of ASFPM Membership: https://www.floods.org/membership-communities/start/join-renew/
- One ASFPM Membership costs $330, the total derives from the individual cost being multiplied three times.
- This is required in order to ensure ASFPM Membership is provided to the three staff members to be trained and certified.

D. Exam - Total: $555

- CFM Exam Fee Rate with ASFPM Membership: https://www.floods.org/certification-program-cfm/getting-certified/#cfm-fee-schedule
- One CFM Exam costs $185, the total derives from the individual cost being multiplied three times.
- This is vital to our grant application and project as without the exam we will not have the ability to have certified staff in our County.

E. ASFPM CFM Biennial Renewal Fee - Total: $360

- CFM Biennial Renewal Fee Rate with ASFPM Membership: https://www.floods.org/certification-program-cfm/getting-certified/#cfm-fee-schedule
- One CFM Biennial Renewal Fee Rate with ASFPM Membership costs $120, the total derives from the individual cost being multiplied three times.
- This is required to maintain ASFPM Membership for the three staff members to be trained and certified.

Total: $2,969.37

Virginia Community Flood Preparedness Fun 2022 Grant

2 messages

Brenna Menefee <BMenefee@shenandoahcountyva.us> Fri, Apr 8, 2022 at 3:50 PM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>

Please see the attached grant application for Shenandoah County. This grant is for the 2022 Virginia Community Flood Preparedness Fund. Shenandoah County is applying for funds under the Planning and Capacity Building section. Please advice if there is anything else we can provide.

Thank you,

Brenna Menefee

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☒ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Four Mile Run Watershed (Arlington and Fairfax Counties, Cities of Falls Church and Alexandria)

NFIP Community Identification Number (CID#):(See appendix F 515520, 515519, 510054, 515525

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Zone AE, X

Flood Insurance Rate Map Number(s) (If Applicable): 5100540018D, 5155190033F, 5155190029F, 51013C0077D, 51013C0076D

Total Cost of Project: $137,947

Total Amount Requested $68,500

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration	☐ **Yes** ☐ **No**
Applicant Name:	

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	35
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☒ Flash flood studies and modeling in riverine regions of the state.	**45**	45
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☒ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	50
☒ Regional hydrologic and hydraulic studies of floodplains.	**45**	45
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on [ADAPT VA's Social Vulnerability Index Score.)](#)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	0
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	0
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
Total Points		175

Proposal for Analysis of Hydrologic Conditions in Four Mile Run

Scope of Work Narrative

Study Area and Background

The Northern Virginia Regional Commission (NVRC) proposes a new study to assess changes in watershed hydrology using existing streamflow and precipitation monitoring data from Four Mile Run. By analyzing historical streamflow and precipitation data, the study aims to provide locally-specific information to inform effective watershed resource management and stormwater mitigation efforts.

Rapid population growth in Northern Virginia following World War II (>500% between 1930 and 1960) resulted in extensive land development and the construction of impervious surfaces such as roads, rooftops, and other hardscapes. By the time stormwater regulations and requirements were introduced in the 1970s, much of the Four Mile Run watershed was already developed. Since then, watershed jurisdictions have been working to retroactively improve stormwater infrastructure while also managing continued urbanization and accompanying expansion of impervious surfaces.

Sub-hourly measurements of streamflow and precipitation are available at the Four Mile Run stream gage since the beginning of water years (Oct.1 – Sept. 30) 1998 and 2005, respectively. Additionally, peak annual and mean daily streamflow records date back to 1951, though multiple gaps exist in the daily streamflow record during periods when the gage was not operational. The long duration of this dataset, facilitated by an ongoing long-term partnership between USGS and the NVRC, presents a unique opportunity to evaluate multi-decadal change in a suite of hydrologic metrics in an urban watershed. Since 1998, when the current period of monitoring began, and 1951 when data were first collected, the watershed has been subjected to multiple pressures such as changing climate and urbanization. Understanding how these forces have, and continue to, collectively alter watershed hydrology, is critical for addressing issues such as flooding, water-quality degradation, channel instability, and reductions in stream health.

Frequent flash flooding occurred in the Arlandria section of the watershed prior to the completion of a multi-million dollar channel modification project in 1977. This frequent flash flooding was attributed to the cumulative impacts of development from all four jurisdictions that share the watershed. Residential and commercial areas located between the Potomac River and I-395 sustained over $40 million worth of property damages from seven major floods that ravaged the watershed throughout the 1960s and early 1970s.

More recent flooding events and their economic impacts on the region are noted in the 2017 Northern Virginia Hazard Mitigation Plan. However, the region continues to experience intense rain events and frequent localized flooding outside of mapped FEMA floodplains, often overwhelming stormwater systems and leading to infrastructure damages. See Figures 1-3 for photos of damages from a 2019 rain event.

During the Fall of 2020, the Federal Emergency Management Agency (FEMA) held a series of Community Coordination and Outreach (CCO) Meetings for the jurisdictions of Arlington County, City of Alexandria and the City of Falls Church to update their Flood Insurance Rate Maps (FIRM). The following preliminary FIRM maps have been released within the Four Mile Run watershed and are included in this application: 5100540018D, 5155190033F, 5155190029F, 51013C0077D, 51013C0076D.

The watershed encompasses a large and diverse area that ranges from Very Low to High Social vulnerability, less than -1 to 1.4 on Adapt VA's Social Vulnerability Index. When compared to other watersheds in the Northern Virginia region, Four Mile Run has a greater concentration of vulnerable neighborhoods. The census tracts with high social vulnerability scores all shared the same housing characteristic of dense housing/older stock/lacking plumbing. See the table below for a sample list of scores:

Census Tract	**Social Vulnerability Index Classification**	**Social Vulnerability Index Score**
4514	High Social Vulnerability	1.4
1020.03	High Social Vulnerability	1.4
2012.03	High Social Vulnerability	1.1
1020.03	High Social Vulnerability	1.4
1024	Low Social Vulnerability	-0.9
4527	Moderate Social Vulnerability	0.5
1029.1	Very Low Social Vulnerability	-1.9
1028.01	Low Social Vulnerability	-0.4
2008.01	Low Social Vulnerability	-1.0
1010	Very Low Social Vulnerability	-1.3
1027.01	Moderate Social Vulnerability	0.2
1011	Very Low Social Vulnerability	-1.7

Scope of Work

Utilizing data from the existing USGS streamgage and precipitation gage (USGS Station ID 01652500), located on Four Mile Run at Shirlington Road on the border of Arlington County and Alexandria, the objectives of this proposed effort are to:

1. Compute a suite of hydrologic metrics to characterize the flow regime,
2. Investigate multi-decadal trends in those metrics,
3. Compare metrics at Four Mile Run to other monitored streams in the region where similar analyses have been conducted.

To investigate changes in the flow regime, multiple methods will be explored to compute trends in mean daily streamflow. Trends will also be analyzed on a record of peak annual streamflows, which are available continuously from 1951 to present. These data quantify the magnitude of the largest streamflow event each year and may have increased over this period due to urban activities that promote rapid runoff such as the development of impervious surfaces, stream channelization, and construction of storm sewers; as well as climate factors such as changes in rainfall volume and intensity.

Evaluations of the flow regime will also include hydrograph separations to quantify the portions of streamflow that occur as baseflow (discharging groundwater) or stormflow (runoff), runoff ratios to investigate relations between precipitation and stormflows, and stream flashiness to characterize the frequency and rapidity of short-term changes in streamflow. Although changes may occur throughout the entire flow regime, particular focus will be placed on changes in stormflow hydrology. A common feature of urbanization is an increase in impervious cover, leading to an increase in storm runoff. The four jurisdictions draining Four Mile Run, the cities of Falls Church and Alexandria, and the counties of Arlington and Fairfax have approximately 60, 43, 42, and 22 percent of their lands covered by impervious surfaces, respectively. Likewise, changes in climate have been linked to an increase in the volume, intensity, and recurrence of storm events in both recent and future decades. Individual storm events will be extracted from the long-term record and used to describe the duration, volume, rate of change, magnitude, and timing of storm hydrographs. Collectively, these event-based analyses will be used to characterize the transport of precipitation from land to stream and determine if and how those processes have changed over time.

Duration metrics that reflect the volume and intensity of precipitation, as well as the volume and timing of water inputs to the stream, which are functions of watershed storage and transport, will be computed. Event duration will be characterized with three metrics: 1) total duration, 2) duration of the rising limb, and 3) duration of the falling limb. Increased stormflow volume and runoff rates result in increased peak streamflow. In addition to exacerbating flooding issues, the increased energy exerted on the stream channel leads to bank and bed instability that can damage infrastructure and cause ecological harm. Change in magnitude of stormflows will be assessed by computing a trend on the peak streamflow from each storm event that occurred throughout the study period.

This effort will culminate in a published peer-reviewed scientific journal article characterizing patterns and trends in the long-term hydrologic and precipitation data at the existing Four Mile Run streamgage. A summary of the findings will be presented to all stakeholders in the region.

Target criteria for the chosen consultant includes:

1) extensive hydraulic and hydrologic analysis experience,
2) streamflow trend calculations
3) peer-reviewed scientific journal publication development

The selected vendor will work with NVRC and local government staff to complete the analysis and share the results with the appropriate audience.

Expected Future Use and Applicability Across the Region and State

A sustainable and resilient watershed incorporates water management solutions that are specific to the characteristics of its landscape, therefore understanding how the flow regime has changed and computing trends is critical to implement successful management and mitigation practices. The results of this study will inform regional coordination and planning efforts and provide a comprehensive understanding of multi-decadal changes in an urban watershed.

Advancing resilience in the face of climate change is a statewide need and priority. Since changes in climate have been linked to an increase in the volume and intensity rain events in both recent and future decades, the Commonwealth expressed the need for predictive floodplain mapping to assist localities with understanding future risk in Phase 1 of VA's Coastal Resilience Master Plan (CRMP). In order to more accurately model changes in the watershed, we need to understand how land development has altered stream hydrology, especially with respect to the extreme rain events the region has already experienced. The increase in stormflow volume and runoff rates can not only harm water quality but also damage critical infrastructure, causing injuries and even loss of life.

Phase 1 of the CRMP outlined the need for a full riverine and coastal gauge indication and warning system. Virginia has relatively few coastal gauges and even fewer that have data over a usable timespan showing accurate trends. The proposed study would support efforts in Phase 2 of the CRMP to build a statewide gauge system and provide crucial information to local planners and emergency managers.

If funded, this study would complete the initial step in a comprehensive evaluation of the Four Mile Run watershed and address iterative work needs outlined in the CRMP. Building on this effort, additional studies could analyze of the relative influence of the potential drivers of change such as climate and urbanization. More and better-integrated data is critical to anticipate the severity of flood events and better prepare Virginians for the hazards posed by floods.

Budget Narrative

Estimated total project cost: $137,947.00
Amount of funds requested from the Fund: $68,500
Amount of cash funds available: $ $69,447.00

The Commission estimates the cost of this study at $137,947. The requested funds will cover the cost of a contractor analysis and journal publication, and NVRC will provide 50% match to manage the project through existing Stormwater Resiliency and Four Mile Run Watershed Management budget programs.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Base map information shown on this FIRM was provided in digital format by the United States Department of Agriculture - Aerial Photography Field Office (USDA - APFO), National Agriculture Imagery Program (NAIP). This information was derived from digital orthophotography at a 2-foot resolution from photography dated 2019.

RESOLUTION

Resolution No. 22-25

PATRON: Robert W. Lazaro, Jr.
Executive Director
DATE: March 24, 2022

AUTHORIZATION TO SUBMIT A HYDROLOGIC STUDY PROPOSAL TO THE VIRGINIA DEPARTMENT OF CONSERVATION AND RECREATION

WHEREAS, the Four Mile Run watershed is one of the most heavily urbanized drainage basins in the Northern Virginia region; and

WHEREAS, the United States Geological Survey owns and operates a rainfall-runoff gage for the watershed; and

WHEREAS, hydrologic data for the watershed is available starting in 1947 and throughout the urbanized development of watershed; and

WHEREAS, these records are strongly representative of the cumulative, downstream impacts of land use changes and stormwater management actions during a period of rapid development; and

WHEREAS, floods are one of the most common natural hazards in our region and can result in significant damage as an increasing number of localized heavy downpour events overwhelm stormwater conveyance systems; and

WHEREAS, inland flooding due to extreme rainfall is increasing with warming temperatures; and

WHEREAS, evaluating long-term rainfall-runoff dynamics in the watershed would provide insight into the effectiveness of past management actions and help inform future management actions; and

WHEREAS, the Northern Virginia Regional Commission has over a 20-year history coordinating the Four Mile Run Watershed Program; and

WHEREAS, the Virginia Department of Conservation And Recreation has grant funding available for conducting flood protection and prevention studies; and

THEREFORE BE IT RESOLVED, that the Northern Virginia Regional Commission authorizes the Executive Director to apply for a grant not to exceed $95,000 from the Department of Conservation And Recreation in support of furthering a hydrologic study in Four Mile Run watershed;

BE IT FURTHER RESOLVED that the Northern Virginia Regional Commission authorizes the Executive Director to enter into a contract with the Virginia Resources Authority, should the proposal be accepted for funding.

RESOLUTION

Resolution No. P21-34

PATRON: Robert W. Lazaro, Jr.
Executive Director
DATE: June 24, 2021

ADOPTON OF THE FY 2022 ANNUAL BUDGET AND PROGRAMS

WHEREAS, the Commission considers a *Preliminary Budget* each fall for the upcoming fiscal year; and

WHEREAS, the sources and amounts of expected funds have altered since the Commission adopted the *FY 2022 Preliminary Budget* on October 22, 2020; and

WHEREAS, in accordance with the Commission's budget policy, the Executive Director has prepared a draft *Annual Budget and Programs* for FY 2022;

THEREFORE BE IT RESOLVED, that the Northern Virginia regional Commission adopts the draft proposed *FY 2022 Annual Budget and Programs* dated June 24, 2021, including member government general dues contributions at a rate of $0.60 per capita and total projected revenue and expenditures as follows:

Revenue:	$7,942,690
Expenditures:	$7,806,578
Contingency/reserves:	$ 136,112

BE IT FURTHER RESOLVED, that in approving the *FY 2022 Annual Budget and Programs*, the Commission acknowledges and authorizes the staff positions as detailed in the Personnel Schedule (pp.8-9), subject to modification in accordance with the Commission's *Personnel and Administrative Policies and Practices.*

June 24, 2021

Dear Chairman Tarter and Honorable Members of the Northern Virginia Regional Commission:

I am pleased to submit for your consideration the *Budget and Programs for Fiscal Year 2022*. The budget in my opinion supports the work of the Commission and helps us to continue to provide value to our local government partners.

The proposal contains no per capita dues increase to our local government members nor does it rely on speculative revenue to balance it. The proposal is conservative in nature and allows the Commission full flexibility in making future changes.

I am proud that working together we have had more than four years of positive financial performance. As you know, as of the end of FY2019 we have eliminated the structural deficit and made our first contribution to the Commission's Reserve Fund consistent with Commission policy. The Budget before the Commission projects to make a contribution to the Reserve Fund as well. While we must be mindful of events outside of our control, I am pleased to report our staff continues to provide excellent results for our region and partner local governments.

Highlights of the Budget include:

- No increase in per capita dues
- Reflects an increase of funding from the Commonwealth of Virginia in the amount of $14,000
- Budget remains in balance
- Anticipates the award of a $3 Million grant from Virginia Housing for affordable housing
- Provides $250,000 in funding from the District of Columbia for the Commuter Fast Ferry
- Adds one new position dedicated to the issue of resiliency planning and flooding
- Adds funding for the required Regional Water Supply Plan which is mandated by State regulation. This is the first major update in more than ten years. All jurisdictions regardless of NVRC membership are required to participate in the plan.

I am thankful for this opportunity to present the budget to the Commission for approval.

Sincerely,

Robert W. Lazaro, Jr.
Executive Director

• Subject to audit

Indirect costs, which support all projects, are allocated based on the ratio of the individual project's direct salaries, leave and fringe benefits to total direct salaries, leave and fringe benefits.

The audited indirect cost rate for FY 2020 was 47.40% calculated as follows:

FY 2020 Indirect cost pool	795,624
Total direct salaries, leave, fringe	1,678,720

The budgeted indirect cost rate for 2021 is 53.98% calculated as follows:

FY 2021 Indirect cost pool	988,237
Total direct salaries, leave, fringe	1,830,883

The proposed budgeted indirect cost rate for 2022 is 45.52% calculated as follows:

FY 2022 Indirect cost pool	953,605
Total direct salaries, leave, fringe	2,095,055

Regional Council Services

a. Hold monthly Commission meetings including presentations / learning opportunities for Commissioners, focusing on topics directed by the Commission.

b. Review and restate the Commission's mission and role in addressing important, current or emerging regional issues.

c. Provide a daily weekday e-newsletter, *"News from the Region and State,"* summarizing news related to local and statewide issues.

d. Convene, host and participate in (where appropriate) meetings of regional peer groups composed of local government counterparts – including chief elected officers, chief administrative officers, and others – to share information, and strategies on issues that are likely to benefit from a regional perspective.

e. Work toward strengthening the capacity of Virginia's network of 21 planning district commissions to serve as a reliable statewide resource for information and technical services, by continuing active involvement in the Virginia Association of Planning District Commissions.

f. Continue to work with international partners – especially from Germany, France, United Kingdom, Sweden, Canada, Japan, Switzerland, South Korea, Italy, Belgium and Ireland – that have economic connections (i.e., in trade and foreign direct investment) with Northern Virginia, to achieve transfer of policy and technical innovations from overseas that will benefit the economies, environment and communities of the Northern Virginia region.

g. Establish and maintain strategic alignments with Northern Virginia's commercial, civil society, academic, scientific and research communities engaged in parallel international work (e.g., George Mason University, Northern Virginia Community College, Northern Virginia Technology Council).

h. Work with the Community Foundation for Northern Virginia to diversify opportunities for funding and carrying out projects and programs benefiting the Northern Virginia region.

i. Continue to serve as program administrator of the Commonwealth's "GO Virginia" initiative for regional economic projects.

FTE *1 = 2080 hr*	0.96	Expenses		Revenue	
		Personnel	$204,015	Grants/contracts	$ 249,994
		Contract	214,000	Fees	-
		Subgrants	-	Local designated funds	1,200
		Other	234,626	Other	193,176
		Share of indirect costs	92,862	General Funds	301,133
		TOTAL	$745,503	TOTAL	$745,503

Community - Military Partnership

a. Direct the Partnership program to protect, preserve and enhance Northern Virginia military installations and community partnerships by supporting bi-monthly meetings. Encourage regular communication on military facility viability; exploration of privatization opportunities such as autonomous vehicles and cybersecurity; and on issues affecting readiness, public safety and security. Facilitate cooperative and constructive relationships among the military installations in the region, and collaboration among military installations and the civilian sector, on critical topics such as land use, critical infrastructure, cybersecurity, veterans' needs, GIS, first- and last-mile transportation needs, environmental and energy issues, and other common areas where partnerships will lead to the "base of the future." Specifically, direct focus on:

- Engaging with regional bases (Joint Base Myer-Henderson Hall, Fort Belvoir and Marine Corps Base Quantico, as well as regional Army Reserves, Virginia National Guard Units, and Reserve Marine Corps.
- Tracking legislation, Executive Orders and appropriations, in order to inform local governments of compliance and funding matters that could have a bearing on their responses to any future Base Realignment and Closure decisions.
- Working with state officials in advocating for the defense industry in the Commonwealth of Virginia.
- Participating with the Secretary of Veterans and Defense Affairs on the Virginia Military Advisory Council.
- Continuing work with military, public and private institutions with respect to coordination of efforts related to a cyber-ready workforce.
- Promoting the military value of the installations within the region, providing awareness of the state of current and future mission readiness, and providing demographic and economic data to support the missions.

b. Continue to support the concept of transportation alternatives with outreach and education through Commuter Centers at Fort Belvoir, Quantico and Joint Base Myer-Henderson Hall by assisting military and defense workers find viable commuter options that relieve Northern Virginia's congestion from single-occupancy vehicles on the roads and at the gates, by working with the Transportation Demand Management County representatives.

c. Continue to partner with non-profits and other private-sector resources to support the military and their families with services from the community.

d. Conduct research, analysis, and assessment of models and practices that will place the Northern Virginia region in a strategically advantageous position for upcoming Base Realignment and Closure and cyber threats.

e. Work toward reaching the "Base of the Future" with partnership opportunities.

f. Assist bases in Northern Virginia with strategic public-public and public-private partnerships.

FTE *1 = 2080 hr*	1.29	Expenses		Revenue			
		Personnel	$225,675	Grants/contracts	$	159,895	
		Contract	23,350	Fees		13,500	
		Subgrants	-	Local designated funds		126,027	(5¢ per capita)
		Other	8,267	Other		-	
		Share of indirect costs	102,721	General Funds		60,591	
		TOTAL	$360,013	TOTAL		$360,013	

Workforce

a. Continue the Commission's initiative engaging academic, business, government, and non-profit sectors in preparing a regional workforce for the labor requirements of the Northern Virginia region. Such efforts include coordination with the US Military, public school divisions and the private sector.

b. Continue to partner with the region's public school districts, institutions of higher learning, and private sector, to help foster improved coordination of cyber workforce initiatives.

c. Leverage funding with the Commission's investment, to help plan and carry out actions that help meet the program's objectives.

FTE *1 = 2080 hr*	0.14	Expenses		Revenue		
		Personnel	$ 37,543	Grants/contracts	$ -	
		Contract	-	Fees	-	
		Subgrants	-	Local designated funds	50,411	(2¢ per capita)
		Other	300	Other	-	
		Share of indirect costs	17,089	General Funds	4,521	
		TOTAL	$ 54,932	TOTAL	$ 54,932	

Demographics/Geographical Information System (GIS)

a. Provide information and analysis related to trends, issues and other matters that impact the region to Commissioners, local government partners and the public. Demographer will coordinate efforts with Environmental, Human Services and Community/Military in-house staff and work with local government partners.

b. Provide meeting space and participate in regional workgroups of local governments, Virginia Geographical Information Network (VGIN), demographers, data analysts and GIS Managers

c. Respond to requests for demographic and GIS information

d. Provide internet presence of updated demographic and GIS information that accurately reflects the region.

e. Undertake special studies at the direction of the Commission and / or Executive Director.

FTE *1 = 2080 hr*	0.88	Expenses		Revenue	
		Personnel	$152,848	Grants/contracts	$ -
		Contract	5,000	Fees	-
		Subgrants	-	Local designated funds	-
		Other	15,025	Other	-
		Share of indirect costs	69,571	General Funds	242,444
		TOTAL	$242,444	TOTAL	$242,444

Four Mile Run Watershed Management

a. Continue to implement the Four Mile Run Watershed Management Program, which was established to ensure that drainage modification projects in the Four Mile Run Watershed do not increase runoff peaks in a manner that could impair the effectiveness of the U.S. Army Corps of Engineer's Flood Control Project, and which now includes activities designed to improve the quality of the surface and ground waters in the Four Mile Run watershed.

- Operate the Four Mile Run computer model as a tool for planning around and preparing for channel impacts.
- Update the model incorporating new data from participating jurisdictions on watershed changes to maintain the accuracy and validity of assumptions; incorporate more recent and standard versions of the software; coordinate with the Technical Review Committee in implementing the best option; and work with the jurisdictions to update the model with the best available GIS data.
- Continue to gather precipitation and discharge data in the watershed to assist with model calibration.
- Continue to co-fund the U.S. Geological Survey stream gauge at Shirlington and the tidal gage near Rt. 1, to provide continuous stage, flow and precipitation data.
- Continue to provide participating jurisdictions with information on the effectiveness of local programs for controlling storm water runoff to prevent flooding in the US Army Corps of Engineers flood control channel in lower Four Mile Run. Provide assessments of the impact of proposed individual land surface, storm drain network, or stream channel changes.
- Continue to provide liaison with non-local agencies (e.g., VDOT, US Army Corps of Engineers, Virginia Department of Environmental Quality, USGS and others) to ensure their awareness of and cooperation with the Four Mile Run Watershed Management Program.
- Maintain a library of historic information related to the Four Mile Run watershed and management program and manage an Internet webpage of relevant Four Mile Run documents, announcements, etc.

b. Continue to assist with modeling and coordination to meet the requirements of FEMA's National Floodplain Insurance Program (NFIP) along Four Mile Run, which contains a FEMA-designated Special Flood Hazard Area regulated by the NFIP.

c. Continue to run the Four Mile Run model on an as-needed basis to evaluate the effect of developmental projects on the flood control channel volume. When those projects are not sponsored by a Four Mile Run partner, the Commission will seek reimbursement for time and expenses from the developmental entity.

d. Oversee contractor for a Chesapeake Bay Trust grant for the development of a regional Intensity, Duration, Frequency (IDF) Curves to assist localities in the development of stormwater planning in the context of climate change. Joint project with Occoquan Watershed Management Program.

FTE *1 = 2080 hr*	0.16	Expenses		Revenue	
		Personnel	$ 19,548	Grants/contracts	$ -
		Contract	120,000	Fees	10,000
		Subgrants	-	Local designated funds	135,639
		Other	325	Other	-
		Share of indirect costs	8,898	General Funds	3,132
		TOTAL	$148,771	TOTAL	$148,771

Occoquan Watershed Management

a. Provide ongoing program management for the Occoquan Reservoir water supply protection program, including:

- Managing the modeling contract between NVRC and the Occoquan Watershed Monitoring Lab.
- Developing water quality projections for the Occoquan Reservoir based upon the Occoquan Model and projected population and development growth within the watershed or other scenarios based upon input from the Occoquan Watershed Modeling Subcommittee.
- Continuing to develop education and outreach tools for the Occoquan watershed management plan and as a way of promoting watershed stewardship, including control of pollution from runoff.

b. Participate in Chesapeake Bay Program activities affecting the Occoquan Program, including the Water Quality Goal Implementation Team, the Watershed Technical Workgroup, the Modeling Workgroup, and the Urban Stormwater Workgroup. Continue to serve as the Chairman of the Urban Stormwater Program.

c. Participate in Metropolitan Washington Council of Governments' activities affecting the Occoquan Program, including the Chesapeake Bay Policy Committee and the Water Resources Technical Committee.

d. Continue to serve on Commonwealth Technical Advisory Committees and Policy Advisory Committees in development of water resource regulations and policies.

e. Continue to research alternate stormwater BMPs and participate in the Chesapeake Bay Urban Stormwater BMP Expert Panels.

f. Oversee contractor for a Chesapeake Bay Trust grant for the development of a regional Intensity, Duration, Frequency (IDF) Curves to assist localities in the development of stormwater planning in the context of climate change – a joint project with the Four Mile Run Program.

g. Continue to develop coordination, education and outreach tools for the SaMS salt reduction effort to reduce the impact to the Occoquan Reservoir.

FTE *1 = 2080 hr*	0.50	Expenses		Revenue	
		Personnel	$ 82,748	Grants/contracts	$ 3,333
		Contract	116,000	Fees	-
		Subgrants	-	Local designated funds	204,520
		Other	5,716	Other	-
		Share of indirect costs	37,664	General Funds	34,275
		TOTAL	$242,128	TOTAL	$242,128

Northern Virginia Waste Management Board

a. Continue to provide ongoing program management for the Northern Virginia Waste Management Board and serve as a liaison between state and local and federal agencies and associations.

b. Conduct the biannual residential solid waste services and management practices survey for Washington metropolitan area jurisdictions, working with the Board to improve data quality and collection.

c. Track proposed changes to federal and state solid waste regulations and report to the Board. Convene ad-hoc "review and comment" committees as necessary, coordinating input from the Board on legislative issues to the Commission.

d. Continue to maintain the Know Toxics education campaign to identify audiences and most effective messages for campaigns on proper management of hazardous waste.

e. Pursue special projects related to solid waste as directed by the waste board.

FTE *1 = 2080 hr*	0.41	Expenses		Revenue	
		Personnel	$ 67,844	Grants/contracts	$ -
		Contract	1,600	Fees	-
		Subgrants	-	Local designated funds	88,860
		Other	3,818	Other	-
		Share of indirect costs	30,880	General Funds	15,282
		TOTAL	$104,142	TOTAL	$104,142

Coastal Resources Management

a. Provide coordination and technical support to eligible member governments in Northern Virginia on coastal resources management issues. Continue to serve as a point of information exchange and as a liaison between local governments and state agencies including the Governor's Special Assistant for Coastal Resiliency, Virginia Department of Conservation and Recreation Chesapeake Bay Local Assistance, the Virginia Department of Environmental Quality Coastal Resources Management Program, and the Department of Conservation and Recreation.

  - Work with stakeholders in the region on issues related to litter and marine debris..

b. Continue to provide expertise and information to local governments and Northern Virginia residents in order to promote sustainable development along the Potomac River, taking into consideration changes to sea level rise, storm surge, and other coastal hazards.

c. Manage the Northern Virginia Climate Resiliency Project, which seeks to increase the resilience of critical built infrastructure in Northern Virginia. Continue to coordinate and work with a stakeholder group to identify tools and information that can help determine priorities and actions that can be taken to decrease the severity of future consequences emanating from climate and extreme weather.

d. Continue to implement the Northern Virginia Clean Water Partners – Regional Stormwater Education Campaign, in coordination with local government partners and other interested parties. The campaign is a region-wide education and outreach strategy aimed at reducing nonpoint source pollution through individual behavioral changes and supports Northern Virginia local jurisdictions in meeting their stormwater permit requirements.

e. Serve as representative of NVRC on the Virginia Coastal Policy Team.

f. Coordinate on a quarterly basis with the Virginia Coastal Zone Management Program and Virginia's eight other Coastal planning district commissions.

g. Speak and give presentations about NVRC projects at applicable meetings or conferences when required.

h. Write proposals for new projects that include scope of work, budgets, deliverables and schedule for implementation.

FTE *1 = 2080 hr*	0.67	Expenses		Revenue	
		Personnel	$ 91,751	Grants/contracts	$ 64,500

Municipal Separate Storm Sewer (MS4) Workgroup

a. Continue to implement a regional program for managing storm water in Northern Virginia, convening an MS4 Workgroup composed of local staff, and assisting member governments in addressing the following goals:

- Effectively address state and federal regulations;
- Foster regional cooperation and share professional knowledge and experience;
- Lessen the expenditures of each local government by conducting cooperative activities wherever possible;
- Facilitate the efficient collection and distribution of information to agencies;
- Cost effectively facilitate training to governmental staff and the development community;
- As possible and where feasible negotiate as one collective entity with the EPA and state agencies;

b. Continue to serve as a vital source of information and analysis on the Chesapeake Bay TMDL, the associated Watershed Implementation Plan (WIP) development process, stormwater and municipal separate storm sewer systems (MS4) regulatory development for local governments, and as a vehicle for EPA and the Commonwealth to reach local stakeholders

c. Participate in the upcoming Department of Environmental Quality (DEQ) Advisory Committee to discuss revising the phosphorus water quality standard to meet water quality requirements of the Virginia Stormwater Management Program.

d. Continue to participate as a stormwater expert in the Secretary of Natural Resource's Chesapeake Bay Stakeholder Advisory Group which has been tasked with overseeing the development of Virginia's Chesapeake Bay Watershed Implementation Plan.

FTE *1 = 2080 hr*	0.55	Expenses		Revenue		
		Personnel	$ 93,173	Grants/contracts	$ 29,000	
		Contract	-	Fees	-	
		Subgrants	-	Local designated funds	75,616	3¢ per capita
		Other	4,930	Other	-	
		Share of indirect costs	42,410	General Funds	35,897	
		TOTAL	$140,513	TOTAL	$140,513	

Other Environmental Services

a. Coordinate 2023 Northern Virginia Water Supply Plan update with participating jurisdictions and the regions Water Authorities

b. Coordinate with the Interstate Commission on the Potomac River Basin to incorporate its demand, supply and needs assessments through 2050 for the Virginia participants in the CO-OP Water Supply Program into the Northern Virginia Plan.

c. Continue to develop demand, supply and needs assessments through 2050 for all jurisdictions and utilities outside of the CO-OP Program.

d. Aid in the development of alternative scenarios for water supply and work with local governments to find consensus on the alternatives.

e. Continue to coordinate with other environmental agencies, particularly the Metropolitan Washington Council of Governments, the Potomac Watershed Roundtable, and the local Soil and Water Conservation Districts.

f. Assist the Department of Conservation and Recreation (DCR) and the Department of Environmental Quality (DEQ to meet the requirements of Virginia's commitments to the Chesapeake Bay Agreement by serving as a catalyst for intergovernmental communication.

g. Develop partnerships and grant opportunities to educate and coordinate water infrastructure efforts and initiatives.

FTE *1 = 2080 hr*	0.57	Expenses		Revenue	
		Personnel	$ 95,558	Grants/contracts	$ -
		Contract	-	Fees	-
		Subgrants	-	Local designated funds	116,750
		Other	6,325	Other	-
		Share of indirect costs	43,494	General Funds	28,627
		TOTAL	$145,377	TOTAL	$145,377

Stormwater Resiliency

a. Assist in responding to the 2016 Northern Virginia Hazard Mitigation Plan update, which determined that most of the Northern Virginia jurisdictions have a 'Highly Likely' probability of continued flood risk due to a 'High' vulnerability to flood hazards.

b. Coordinate a regional approach to addressing a critical part of the flood response strategy: communicate with the public about flood risk and provide education about overland relief encroachments, flood insurance and ways to prepare for floods, by

- Assembling stakeholders to determine education and outreach needs and opportunities.
- Identifying existing public information efforts.
- Identifying hazardous areas and properties and hazard types.
- Assembling flood insurance information.
- Determining coordinated messages.
- Creating a website with all relevant information.
- Delivering messages on various platforms at coordinated times.
- Developing "Soak it Up" workshop guides/materials.
- Conducting a series of "Soak it Up" Workshops.

FTE *1 = 2080 hr*	0.66	Expenses		Revenue	
		Personnel	$ 76,781	Grants/contracts	$ -
		Contract	-	Fees	-
		Subgrants	-	Local designated funds	
		Other	-	Other	-
		Share of indirect costs	34,949	General Funds	111,730
		TOTAL	$111,730	TOTAL	$111,730

Energy Management

a. Expand regional energy management activities to enhance local energy programs through common actions or shared service delivery.

- Expand residential and commercial building energy efficiency programs to additional communities across the NVRC region.
- Identify policy roadblocks to implementing local energy policies and develop alternatives to remove the roadblocks.
- Sustain integration of energy and sustainability policy programs

b. Strengthen regional and local energy planning and projects.

- Coordinate NVRC energy program actions with regional groups and localities.
- Support public utility and other energy company energy initiatives.
- Facilitate involvement of universities, research, commercial, NGO and other education institutions in regional sustainability and local energy efforts.
- Work with partners on the implementation of programs supported in the Virginia Clean Economy Act and Solar Freedom Act that are beneficial to the region.
- Continue to operate programs that promote renewable energy, sustainability and energy efficient efforts (Solarize NoVA).

c. Identify, track, and analyze energy-based state legislative actions related to Northern Virginia jurisdictions' legislative priorities.

d. Enhance energy best practices through international exchanges, policy transfer and lesson learning opportunities to help the region replicate successful practices for energy management, sustainability and security.

FTE *1 = 2080 hr*	0.41	Expenses		Revenue	
		Personnel	$ 75,822	Grants/contracts	-
		Contract	-	Fees	10,000
		Subgrants	-	Local designated funds	87,500
		Other	2,400	Other	-
		Share of indirect costs	34,513	General Funds	15,235
		TOTAL	$112,735	TOTAL	$112,735

Regional Planning Services

a. Assist member governments and other parties in sharing industry best practices related to sustainability, through a region-wide sustainability network.

FTE	0.11	Expenses		Revenue	
1 = 2080 hr		Personnel	$ 19,065	Grants/contracts	$ -
		Contract	-	Fees	-
		Subgrants	-	Local designated funds	-

Trails, Open Space and Heritage Resources

a. Promote bicycle and pedestrian safety by working with Virginia Department of Motor Vehicles and others, by providing outreach and training on "sharing the road," especially areas where there is a high incidence of bicyclist and pedestrian crashes.

a. Continue partnership with the National Park Service in developing the Potomac Heritage National Scenic Trail in Northern Virginia, through activities such as:

- Organizing and promoting outdoor recreation, heritage tourism and conservation interests to demonstrate the value of increased outdoor recreation opportunities for residents and visitors.
- Maintaining an inventory of gaps in the trail network and working to support gap closures and more equitable access to trails from communities.
- Implementing projects, in support of public water access plans, in consultation with a regional advisory group, for increasing water access from trail segments while conserving viewsheds and integrating access to public transit.
- Conducting scenic resource inventories.
- Promoting and supporting recognition of the PHNST in Northern Virginia.

FTE *1 = 2080 hr*	0.55	Expenses		Revenue	
		Personnel	$ 89,362	Grants/contracts	$175,295
		Contract	90,550	Fees	-
		Subgrants	-	Local designated funds	-

		Share of indirect costs	40,675	General Funds	84,348
		TOTAL	$259,643	TOTAL	$259,643

Other Human Services Programs

a. Accept and award funds received from the Virginia Housing PDC Grant Program to local affordable/workforce housing development projects that will result in new habitable units within three years of the grant award. From the $3M funding anticipated monies will be used to underwrite partial NVRC staff time, limited direct costs, public opinion polling re: proposed projects, and an $83,000 (each) contribution toward the production of at least 30 new affordable housing units.

b. Continue to host the Northern Virginia Aging Network (local Agency on Aging staff and related agencies) web presence at www.novaregion.org/nvan. Offer the meeting venue, with conference call support to this group. Provide fiduciary services receiving payments for NVAN's annual Legislative Breakfast.

c. Continue to support the *Quick Guide Online;* seek external resources (e.g., foundation support) to further modernize this resource.

d. Update and maintain the regional lists of local homeless shelters, winter overflow shelters, and homeless day programs.

e. Convene and provide program and administrative support to the Northern Virginia Human Service Officials (HSOs) Committee, which may include joint planning, creation of new methods to advance human services, visioning and implementation of service regionalization activities developed by HSO consensus.

FTE *1 = 2080 hr*	1.12	Expenses		Revenue	
		Personnel	$176,722	Grants/contracts	$199,375
		Contract	50,000	Fees	-
		Subgrants	-	Local designated funds	-
		Other	9,140	Other	6,100
		Share of indirect costs	80,437	General Funds	110,824
		TOTAL	$316,299	TOTAL	$316,299

HIV / AIDS Programs

a. Provide critical medical care, housing, and supportive services via subcontract service providers to low-income, uninsured people with HIV/AIDS. This includes:

- $2.0 million in Ryan White Part B funds split between subcontracts to serve people living with HIV in Northern Virginia (and statewide) and technical consulting on various HIV issues from NVRC staff to Virginia Department of Health.
- $2.4 million in Housing Opportunities for Persons with AIDS (HOPWA) funds to support long-term housing subsidies, homelessness prevention, and essential support services for persons with HIV and their families in 16 Virginia localities, including all NVRC member localities.

b. Advocate for the appropriate allocation of Ryan White and HOPWA resources to Northern Virginia from the DC Department of Health, HIV/AIDS, Hepatitis, STD & TB Administration (HAHSTA), and from the Virginia Department of Health.

c. Continue to add key referral information to the HIV Resources Project website, focusing on information useful to the greater Northern Virginia community, e.g., affordable housing programs. Make minor expansions to the website to improve how-to information on various housing topics among persons living with HIV. (This material will be appropriate for a statewide audience.) About $50,000 is set aside within the HOPWA allocation to support this activity as well as limited telephone counseling for persons with HIV in need of housing assistance.

FTE *1 = 2080 hr*	4.90	Expenses		Revenue	
		Personnel	$ 559,632	Grants/contracts	$4,152,785
		Contract	23,400	Fees	-
		Subgrants	3,450,000	Local designated funds	-
		Other	10,475	Other	-
		Share of indirect costs	254,728	General Funds	145,451
		TOTAL	$4,298,236	TOTAL	$4,298,236

Commuter Ferry

a. Procure expert consultant services to begin development of a business case for a commuter fast ferry service on the M-495 Marine Highway designated by the US Department of Maritime Administration, to serve as a foundation for public and private investment in this mode of commuter service along the waterfront communities on the Anacostia, Potomac, and Anacostia rivers that border eastern Prince William and southern Fairfax Counties, suburban Maryland, several military bases including Joint Base Anacostia-Bolling/Department of Homeland Security, and other locations into the District of Columbia.

b. Address in this initial work the following types of questions:

- What service models, governance options and financial models should be considered?
- What feedback can be obtained from the industry on potential delivery/service options?
- What information can be gleaned about private investment funding by conducting private sector sounding exercises?
- What freight options are available?

c. Coordinate meetings of, and input from, the M495 Stakeholders as an advisory group on the project.

Good afternoon,

Attached please find the Northern Virginia Regional Commission's official application to DCR to conduct an Analysis of Hydrologic Conditions in Four Mile Run. Let me know if there is anything else I can provide.

Best,

Nora

Virginia Department of Conservation and Recreation
cfpf@dcr.virginia.gov

RE: Eastern Shore of Virginia Regional Resilience Community Plan Development CFPF Application

Dear Ms. Howard-Cooper and Members of the Review Team:

The Eastern Shore, being a land between two waters, is extremely vulnerable to flooding as a result of storm events, sea level rise, climate change, and increased rainfall. In addition to these vulnerabilities, both Accomack and Northampton Counties are considered low-income geographic areas with median household incomes falling below the $59,377.60 threshold. According to the US Census Bureau QuickFacts table, Accomack County median household income equals $46,178 and Northampton County median household income equals $50, 819. The development of a regional resilience plan, guided by a steering committee made up of community leaders and region-wide stakeholders, is a critical need of the counties and localities in the Eastern Shore Region for both sustainability of the region and for prioritization of mitigation projects. A plan is also a critical prerequisite when seeking potential funding to aid in flood preparedness and mitigation.

In an effort to increase the number of community flood mitigation projects that meet criteria for the Community Flood Preparedness Fund (CFPF), staff at the Accomack-Northampton Planning District Commission (A-NPDC) are applying for funds from CFPF Round 3. This will increase the A-NPDC's capacity to address the critical needs across the Shore for a region-wide resilience plan. A regional resilience plan is instrumental in increasing coastal resilience and protection for the community and its culture, preserving natural habitats, and using nature-based solutions (NBS) where possible. The A-NPDC currently leads the Climate Adaptation Working Group (CAWG), focused on identifying resilience needs in the region, and working with members of the community and local government to connect these region-wide resilience needs (projects, studies, plans, etc.) with appropriate funding sources. The CAWG has developed a living database of Eastern Shore Regional Resiliency Projects, 85 of which were submitted for the Virginia Coastal Resilience Master Plan, Phase 1. The next step in these efforts is the development of a comprehensive regional resilience plan that describes the entire local government's approach to flooding. The completion of this Regional Resilience Plan will build capacity across Eastern Shore communities by qualifying flood protection and mitigation projects for various funding, including the Community Flood Preparedness Fund.

This Eastern Shore Regional Resilience Plan will be project-based with a focus on flood control and resilience; it will simultaneously incorporate nature-based infrastructure to the greatest extent possible, and be based on the best available science, incorporating climate change, sea level rise, storm surge (as appropriate), and current flood maps. This plan will consider all parts of local government and include the coordination with other local and inter-jurisdictional projects, plans, and activities, and lastly will have clearly articulated phasing for plan implementation. Regardless of socioeconomics and race, public outreach will be conducted and community input will be requested to ensure the development of a truly comprehensive Regional Resilience Plan.

Sincerely,

Jessica Steelman

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? **Yes** ___X_____ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

- ☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

__Capacity Building and Planning Grants__

- ☑ **Floodplain Staff Capacity.**
- ☑ **Resilience Plan Development.**
- ☑ **Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.**
- ☑ **Resource assessments, planning, strategies and development.**
  - **Policy management and/or development.**
  - **Stakeholder engagement and strategies.**

Is Project Located in an NFIP Participating Community? ☑ **Yes**, the project covers both communities currently participating in a NFIP and those not yet participating in a NFIP. ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ **Yes** ☐ No

Flood Zone(s) (If Applicable): The Eastern Shore, VA region falls within Flood Zone X.

Flood Insurance Rate Map Number(s) (If Applicable): Refer to FIRMette Product ID tables above.

Total Cost of Project: $375,000

Total Amount Requested $375,000

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	A-NPDC	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	**Eligible for consideration**	✓
No	**Not eligible for consideration**	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	**Eligible for consideration under all categories**	
No	**Eligible for consideration for studies, capacity building, and planning only**	✓
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	**Eligible for consideration**	✓
No	**Not eligible for consideration**	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	**Not eligible for consideration**	
No	**Eligible for consideration**	✓
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	**Eligible for consideration**	✓
No	**Not eligible for consideration**	
N/A	**Match not required**	
Capacity Building and Planning Eligible for Consideration		✓ **Yes** ☐ **No**

Applicant Name:	A-NPDC		
Scoring Information			
Criterion		**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)			
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.		**55**	
Development of a new resilience plan.		**55**	
Resource assessments, planning, strategies and development.		**45**	
Policy management and/or development.		**40**	
Stakeholder engagement and strategies.		**25**	
Goal planning, implementation and evaluation.		**25**	
Long term maintenance strategy.		**25**	
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.		**15**	
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)			
Very High Social Vulnerability (More than 1.5)		**15**	
High Social Vulnerability (1.0 to 1.5)		**12**	
Moderate Social Vulnerability (0.0 to 1.0)		**8**	
Low Social Vulnerability (-1.0 to 0.0)		**0**	
Very Low Social Vulnerability (Less than -1.0)		**0**	
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?			
Yes		**10**	
No		**0**	
9. Is the proposed project in a low-income geographic area as defined in this manual?			
Yes		**10**	
No		**0**	
10. Does this project provide "community scale" benefits?			
Yes		**20**	
No			
Total Points			

Scope of Work Narrative

Assessment of Capacity Needs and Assets

The Eastern Shore is considered a part of *Rural Coastal Virginia* and features the Nation's longest stretch of undeveloped barrier islands – key land formations in protecting the mainland from storm events that cause flooding. According to the Virginia Coastal Resilience Master Plan (CRMP), the Eastern Shore is at risk of losing up to 171,830 total acres of Tidal Wetlands, Beaches and Dunes, Upland Habitat, and Conserved Lands, respectively, by 2080 due to flooding. This loss significantly impacts the economy of the region, driven by commercial/recreational fishing, aquaculture, and ecotourism where the region's "natural landscapes are fundamental to its identity, attracting visitors and new residents alike" (CRMP, 2021). Critical Sectors across the Eastern Shore are also at risk of being impacted negatively by flooding; where the CRMP shows a +1029% change in Energy Assets exposed and a +13,185% change in Water, Wastewater, and Waste assets impacted by 2080. Community resources on the Eastern Shore are also highly susceptible to hazards from flood events. By the year 2080, the region will see an increase of +3,816% in Residential Population exposed – from 200 residents in 2020 to 7,800 residents in 2080. Annualized Structure Losses are predicted to hit $289M by 2080, a +1,299% change, and Agricultural Land Acres exposed will increase +236% from 5,300 acres in 2020 to nearly 18,000 acres in 2080 (CRMP, 2021). As referenced in the CRMP, current and future flood events can "result in increased soil salinity, potentially harming crop health and viability to harvest for years after a flood. These effects may lead to reduced profits, interruptions to the supply chain, and damage agricultural ways of life, leading to economic and social impacts locally and regionally" (CRMP, 2021).The Eastern Shore has a social vulnerability index average rating of 0.9 (high moderate vulnerability), not including Wallops or Assateague Island, according to ADAPT VA's Virginia Vulnerability Viewer (2016). According to the Center for Disease Control (CDC) Social Vulnerability Index (2018), where possible scores range from 0 (lowest vulnerability) to 1 (highest vulnerability), Accomack County rates a 0.8025 and Northampton County rates a 0.6764.

Localities across the Eastern Shore have town governments made up of volunteers; some are teachers, some are business owners, etc. While this demonstrates a passion and love for the place they live, it also highlights a lack of capacity in the number of full-time local government and non-profit staff to develop individual plans in the area of environmental and coastal resilience. The Accomack-Northampton Planning District Commission (A-NPDC) seeks to provide coastal management technical assistance to localities across the region to address the lack of capacity at the local level. One way the A-NPDC can do this is through the development of a region-wide resilience plan that all localities and counties can utilize to prioritize mitigation projects and reference when seeking future flood preparedness and hazard funds. Currently, the Eastern Shore also lacks financial resources to plan and implement flood preparedness and mitigation projects. The development of a regional resilience plan will act as a bridge for localities to qualify for available and future flood and coastal resilience funds.

A regional resilience plan is instrumental in increasing coastal resilience and protection for the community and its culture, preserving natural habitats, and using nature-based solutions (NBS) where possible. The A-NPDC currently leads the Climate Adaptation Working Group (CAWG), focused on identifying resilience needs in the region, and working with members of the community and local government to connect these region-wide resilience needs (projects, studies, plans, etc.) with appropriate funding sources. The CAWG has developed a living database of Eastern Shore Regional Resiliency Projects, 85 of which were submitted for the Virginia Coastal Resilience Master Plan, Phase 1. The A-NPDC was awarded CFPF Round 1 funds to develop an agriculture study, examining crop impacts from flood events; this information is intended to be incorporated into the regional resilience plan. The next step in this effort is the development of a comprehensive regional resilience plan that includes every local government's approach to flooding. The completion of this regional resilience plan will build capacity across Eastern Shore communities by prioritizing and qualifying flood protection and mitigation projects for various funding avenues, including the Community Flood Preparedness Fund.

This Eastern Shore Regional Community Resilience Plan will be project-based with a focus on flood control and resilience; it will simultaneously incorporate nature-based infrastructure to the greatest extent possible, and be based on the best available science, incorporating climate change, sea level rise, storm surge (as appropriate), and current flood maps. This plan will consider all local governments and include coordination with other local and inter-jurisdictional plans, programs, and activities, and lastly will have clearly articulated phasing for plan implementation. The Planning District Commission will conduct broad, inclusive public outreach and community response will be recorded and quantified to ensure the development of a truly comprehensive regional resilience plan. Through public engagement, including public listening sessions, surveys, and educational materials, this effort will raise awareness across the region about flood hazard areas, the social vulnerability of coastal communities, and steps to manage these risks. Planning District Commission staff will further build capacity within the region by utilizing these funds to become trained and certified in stormwater management, using coursework offered by the Department of Environmental Quality (DEQ). If funded, the Planning District Commission will establish an internship program to increase capacity for resource assessment, data collection, plan compilation, and public engagement.

Goals & Objectives

1. Develop a Regional Resilience Plan

A. Guided by a Steering Committee consisting of local officials, experts in coastal resilience, and Eastern Shore leaders.

B. Basis in community-wide approach to flood resilience, identifying economic impacts, critical assets at risk, and communities facing forced migration.

C. Incorporate relevant data and plan segments from other published regional, local, and county plans (i.e., Hazard Mitigation Plan, Comprehensive Plans, Coastal Resilience Master Plan maps, etc.).

D. Make available to localities updated data/resources for incorporation into local plans.

E. Develop general template of policy language relevant to the regional resilience plan, as determined by the Steering Committee, for use by counties and localities in the revision or modification of existing plans.

F. Adoption of the Regional Community Resilience Plan by counties/localities.

2. Seek Department of Conservation and Recreation (DCR) certification that the plan meets minimum requirements

A. Build rapport with DCR representative who can provide guidance in the development of a regional resilience plan that will meet minimum requirements for future funding.

B. Develop a plan with these minimum requirements in mind.

3. Publish and Distribute the Regional Resilience Plan

A. Make available, copies of the DCR certified regional resilience plan in the A-NPDC library and online.

B. Distribute electronic file of the regional resilience plan to localities, academia and nonprofits (i.e., VIMS, Eastern Shore Community College, TNC, etc.), and public libraries.

C. Provide one (1) print copy of the regional resilience plan to each County.

4. Capacity Building, Training, and Education

A. Certify A-NPDC staff member(s) in stormwater management and/or erosion and sediment control, as course is available from DEQ and feasible to attend (location or virtual) to increase floodplain staff capacity.

B. Engage and educate community members impacted by the region's floodplains through public meetings and providing information about available trainings and workshops facilitated by state entities.

C. Hire a student intern to assist in research development and assessment, plan compilation, and public outreach.

Stakeholders, Outreach, and Education

Stakeholders

The following table lists potential stakeholders.

	Stakeholder	Entity
1	Residents	Community
2	Property Owners	Community
3	Students	Community
4	Business Owners (Agriculture, Aquaculture, Restaurants, Shops, Attractions, etc.)	Community
5	Accomack County	Local Government
6	Accomack County Public Works	Local Government
7	Northampton County	Local Government
8	Northampton County Public Works	Local Government
9	Towns/Communities	Local Government
10	Virginia Tech Eastern Shore AREC	Higher Education
11	College of William and Mary Virginia Institute Marine Science	Higher Education
12	UVA Coastal Research Center	Higher Education
13	The Nature Conservancy	Non-Profit 501 (c)(3)
14	Virginia's Eastern Shore Land Trust	Non-Profit 501 (c)(3)
15	Eastern Shore Regional Navigable Waterways Committee	Professional/State Government
16	DCR Region Steward	State Government
17	US Army Corps of Engineers	Federal Government
18	Accomack-Northampton PDC	Professional/State Government
19	Chesapeake Bay Foundation	Non-Profit 501 (c)(3)
20	Wetlands Watch	Non-Profit 501 (c)(3)
21	Citizens for a Better Eastern Shore (CBES)	Non-Profit 501 (c)(3)

Steering Committee Members

The following table lists who will be invited to participate on the Steering Committee.

	Steering Committee Invitee	Entity
1	Accomack County Official/Staff	County Government
2	Accomack County Public Works Representative	County Government

3	Northampton County Official/Staff	County Government
4	Northampton County Public Works Representative	County Government
5	Town or County Official/Staff/Leader	County Government
6	Virginia Tech Eastern Shore AREC	Higher Education
7	College of William and Mary Virginia Institute Marine Science	Higher Education
8	UVA Coastal Research Center	Higher Education
9	The Nature Conservancy	Non-Profit 501 (c)(3)
10	Virginia's Eastern Shore Land Trust	Non-Profit 501 (c)(3)
11	Eastern Shore Regional Navigable Waterways Committee Member	Professional/State Government
12	DCR Region Steward	State Government
13	US Army Corps of Engineers Representative	Federal Government
14	Accomack-Northampton PDC *(Lead)*	Professional/State Government
15	Chesapeake Bay Foundation	Non-Profit 501 (c)(3)
16	Wetlands Watch	Non-Profit 501 (c)(3)
17	Citizens for a Better Eastern Shore (CBES)	Non-Profit 501 (c)(3)

Outreach & Education Strategies

Community members, including, but not limited to: community leaders, students, influencers, and business owners will be engaged through public meetings held during the planning process and other means of gathering public input (i.e., surveys, email campaigns, etc.). Trainings and workshops offered by state entities will be shared through social media channels to provide education opportunities for community members.

Implementation Plan & Timeline

The Planning District Commission will complete all grant activities within twenty-four (24) months following a CFPF award, allowable for this round of CFPF grant funds. During this time, the following activities will be conducted: resource assessment, data collection, report compilation, community engagement, and plan development. Within the first three (3) months, a steering committee will be established to begin the guidance of the regional resilience plan development. The steering committee will create a timeline for meeting each objective and set a public input meeting for stakeholders across the region's communities. Staff training for stormwater management and/or erosion and sediment control through DEQ will occur within the project's development period. The intern will be hired in the first half of the grant period to build capacity for data/report compilation, resource assessment, and public outreach.

Parties Responsible

The Resilience Plan Steering Committee, led by Planning District Commission staff, will be charged with guiding the development of the resilience plan. Planning District Commission staff will be responsible for overseeing and implementing all grant activities.

Performance Outputs and Measures

The key short-term result of this project will be the development of the Eastern Shore's Regional Community Resilience Plan. Achieving the publication of this plan within eighteen (18) months, while remaining on budget, would be considered a success. Another short-term result with long-term benefits would be the training of an A-NPDC staff member to become certified in stormwater management and/or erosion and sediment control. This has the potential to enable the A-NPDC to conduct regulatory inspections for a Virginia stormwater management program, review erosion and sediment control (ESC) plans and stormwater management (SWM) plans, and build knowledge in the following areas: Virginia stormwater management law and regulations, basic stormwater principles, construction general permit requirements, stormwater BMPs, Virginia erosion and sediment control law and regulations, fundamentals of erosion and stormwater runoff, and erosion and sediment control measures. The output of this request will be a comprehensive approach to flood mitigation, preparedness, and coastal resilience in the form of a regional resilience plan.

Plans for Maintaining Capacity

Once the resilience plan has been finalized, there is no anticipated need for continuing support in its immediate development. The Eastern Shore region will utilize the plan for subsequent grant requests and project proposals for a period of three (3) years in accordance with the 2021 CFPF manual and as a resource for managing flood mitigation, preparedness, and coastal resilience. It is intended to align this regional resilience plan with the region's Hazard Mitigation Plan (HMP) and, if funding is available, update the regional resilience plan every five (5) years.

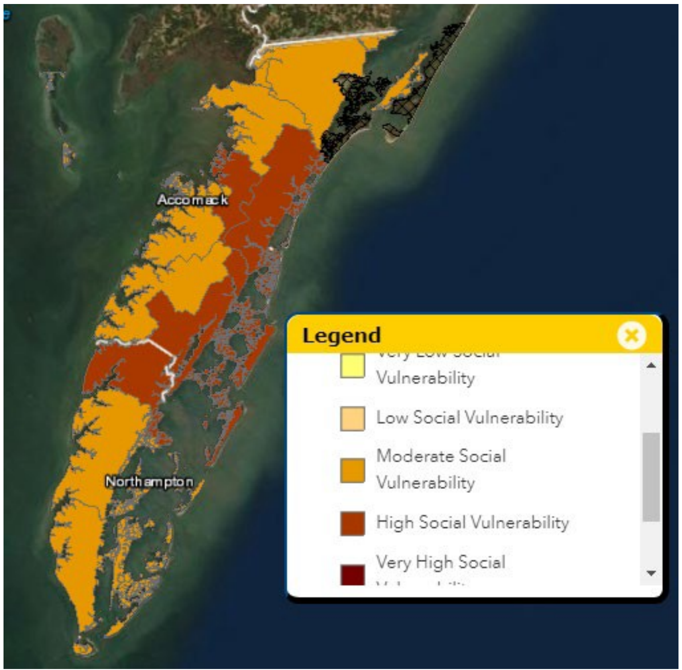
Social Vulnerability Scores

The Eastern Shore has a social vulnerability index average rating of 0.9 (high moderate vulnerability), not including Wallops or Assateague Island, according to ADAPT VA's Virginia Vulnerability Viewer (2016).



According to the Center for Disease Control (CDC) Social Vulnerability Index (2018), where possible scores range from 0 (lowest vulnerability) to 1 (highest vulnerability), Accomack County rates a 0.8025 and Northampton County rates a 0.6764.

Non-Fund financed Maintenance and Management Plan

While the development of this plan will take only one to two years for full completion, the intention is to update it every five years, in alignment with other regional plans, such as the Hazard Mitigation Plan. A-NPDC staff will aim to do this with non-fund finances, seeking alternative coastal management and resilience funds to support staff time necessary to facilitate and publish update(s) of the Regional Resilience Plan.

FEMA Flood Data

Accomack County

Accomack County FEMA Flood Data

According to the County, the area is *"… a relatively flat area between two major bodies of water. Large portions of the County consist of hydric soils or have a high-water table that are poorly drained and subject to ponding. Tides play a role in possible flooding. Accomack is also subject to severe impacts from nor'easters, tropical storms and hurricanes. During these events and other periods of strong winds rainfall entering ditches and creeks can flood an area if a rising tide is pushing the water back up into creeks. This combination of flat terrain, climate, coastal location, and tides creates large areas subject to flood risk."*

County Administrator

March 30, 2022

Virginia Department of Conservation and Recreation (VDCR)
RE: Community Flood Preparedness Fund, Round 3
cfpf@dcr.virginia.gov

To Whom It May Concern:

On behalf Accomack County, I fully support the efforts of the Accomack-Northampton Planning District Commission (A-NPDC) in seeking funding from the Community Flood Preparedness Fund (CFPF) for Capacity Building & Planning through the development of a regional resilience plan.

The Eastern Shore, being a land between two waters, is extremely vulnerable to flooding as a result of storm events, sea-level rise, climate change, and increased rainfall. In addition to these vulnerabilities, Accomack County is considered a low-income geographic area with median household incomes falling below the $59,377.60 threshold. According to the US Census Bureau QuickFacts table, Accomack County's median household income equals $46,178. The development of a regional resilience plan, guided by a steering committee made up of community leaders and region-wide stakeholders is a critical need of Accomack County and its localities in the Eastern Shore region for both sustainability of the region and for prioritization of mitigation projects. A plan is also a critical prerequisite when seeking potential funding to aid in flood preparedness and mitigation.

The anticipated regional resilience plan will directly impact Accomack County, increasing assets the localities of Accomack County have when seeking funding for flood preparedness and mitigation projects. With this resilience plan, Accomack County is hopeful that more localities will seek flood funding to address critical projects and identified needs within their community.

Sincerely,

Michael T. Mason,
County Administrator

Re: Support for *Capacity Building: Development of the Eastern Shore Regional Community Resilience Plan*

Dear Mrs. Steelman:

On behalf of Northampton County, I fully support the efforts of the Accomack-Northampton Planning District Commission (A-NPDC) in seeking funding for a Community Flood Preparedness Fund (CFPF) grant through the Virginia Department of Conservation & Recreation to develop a Regional Resilience Plan.

A Regional Resilience Plan is instrumental in increasing coastal resilience and protection for the community and its culture, preserving natural habitats, and using nature-based solutions (NBS) where possible. The A-NPDC currently leads the Climate Adaptation Working Group (CAWG), focused on identifying resilience needs in the region, and working with members of the community and local government to connect these region-wide resilience needs (projects, studies, plans, etc.) with appropriate funding sources. The CAWG has developed a living database of Eastern Shore Regional Resiliency Projects, 85 of which were submitted for the Virginia Coastal Resilience Master Plan, Phase 1. The next step in these efforts is the development of a comprehensive regional resilience plan that describes the entire local government's approach to flooding. The completion of this Regional Resilience Plan will build capacity across Eastern Shore communities by qualifying flood protection and mitigation projects for various funding, including the Community Flood Preparedness Fund.

This Eastern Shore Regional Resilience Plan will be project-based with a focus on flood control and resilience; it will simultaneously incorporate nature-based infrastructure to the extent possible, and be based on the best available science, incorporating climate change, sea level rise, storm surge (as appropriate), and current flood maps. This plan will consider all parts of local government and include the coordination with other local and inter-jurisdictional projects, plans, and activities, and lastly will have clearly articulated phasing for plan implementation. Regardless of socioeconomics and race, public outreach will be conducted and community input will be requested to ensure the development of a truly comprehensive Regional Resilience Plan.

If you have any questions, please advise.

Sincerely yours,

CHARLES KOLAKOWSKI
County Administrator

CHESAPEAKE BAY FOUNDATION
Saving a National Treasure

April 8, 2022

Virginia Department of Conservation and Recreation
Attention: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, Virginia 23219

To Whom It May Concern:

On behalf of the Chesapeake Bay Foundation (CBF), I submit this letter of support for the Accomack-Northampton Planning District Commission (ANPDC) Eastern Shore Regional Community Resilience Plan.

CBF is a nonprofit organization dedicated to saving the Chesapeake Bay with more than 91,000 members in Virginia. CBF carries out its mission through restoration, advocacy, education, and litigation from offices in Richmond, Virginia Beach, and other locations in the Bay watershed, including Virginia's Eastern Shore.

ANPDC's application to the Virginia Community Flood Preparedness Fund (CFPF) is aligned with the Commonwealth's objectives for resilience laid out in the Coastal Resilience Master Plan (CRMP) and the preferences included in the CFPF. ANPDC's proposal to develop a plan that is protective of communities in Accomack and Northampton Counties as well as their natural resources makes it an ideal candidate for CFPF support.

Sea level rise and increased flooding threaten communities around the Commonwealth. However, many smaller localities do not have the personnel or resources to begin assessing those impacts, or the funds necessary to implement solutions. The proposal from ANPDC would help Eastern Shore communities with the essential first step of developing a resilience plan. Their projects-based approach builds upon the work of the CRMP by opening the door for Eastern Shore localities to receive CFPF awards, as well as federal dollars dedicated to resilience efforts.

Rising waters carry potential impacts to habitat and water quality throughout the Chesapeake Bay watershed which is why the CFPF included a strong preference for nature-based designs. The proposal acknowledges the risks to the tidal wetlands, beaches, and dunes, as well as uplands, and as such, will focus on those projects that maximize nature-based designs. Additionally, given the region-wide focus of the proposal, it also meets CFPF objectives for community scale.

ANPDC has a demonstrated track record of coordinating regional resilience efforts through the Climate Adaptation Working Group (CAWG) and their numerous partnerships with localities. It is the ideal organization to help coordinate the creation of this regional plan. We hope the agency will look favorably upon this application.

Sincerely,

Margaret L. (Peggy) Sanner
Virginia Executive Director

Re: Eastern Shore of VA Regional Resilience Community Plan Development CFPF Application

Dear Ms. Howard-Cooper,

I am writing as Wetlands Watch's Executive Director to communicate our organization's support of Accomack-Northampton Planning District Commission's (A-NPDC) application to the Virginia Community Flood Preparedness Fund (CFPF) for the development of the "Eastern Shore of VA Regional Community Resilience Plan."

Understanding the risks facing a region and planning to address the impacts of those risks is critical to build community-wide resilience. Virginia's Eastern Shore is experiencing a number of flood risks related to current and projected future conditions. Recurrent tidal flooding and increased rainfall makes many roads impassable, farmlands not farmable, tree buffers die, and septic systems fail. Planning for these impacts will help educate local government staff, community decision makers, residents, businesses, and many other stakeholders about their specific risks so they can take action during and after flood events. The creation of the Resilience Community Plan will also allow those Eastern Shore local governments participating in the plan to apply for future CFPF project funding that is essential to implement strategies identified in the resultant plan.

We strongly support ANPDC's application to the Community Flood Preparedness Fund. We believe the state resources invested in the development of the Eastern Shore Regional Community Resilience Plan will enhance flood safety and community resilience in communities where staff capacity is low and resources are scarce. We look forward to work with the A-NPDC and Eastern Shore communities on this endeavor.

Sincerely,

William A. Stiles, jr

RE: Eastern Shore of Virginia Regional Resilience Community Plan Development CFPF Application

Ms. Howard-Cooper and Members of the Review Team:

I am writing to you in support of the application by the Accomack-Northampton Planning District Commission (A-NPDC) for funding from the Community Flood Preparedness Fund (CFPF) to support development of a regional resilience plan.

As I'm sure you are aware, the topography of the Eastern Shore of Virginia (ESVA) is, well, there is little to no topography here. Storm water infiltrates and pools in flooded woodlands as much or more than it runs off, and we are in an area with one of the highest relative level rise rates. Farm land and houses are being lost to rising salt water on both Seaside and Bayside, where small increases in sea level impact significant horizonal area due to the flat terrain. It is an economically depressed area, dominated by agriculture and use of marine resources (wild harvest fisheries and aquaculture). Many of our residents lack the education, resources, and scope of attention beyond survival to address future needs, reacting rather than planning.

The development of a regional resilience plan under the leadership of A-NPDC would be a great service to the residents of the ESVA and the local governments struggling to meet basic services for their citizens.

I started my current position with VIMS here in Wachapreague in 2015. I quickly realized that the A-NPDC was a leader in addressing economic and environmental issues for the ESVA, providing critical planning resources for individuals, communities, and local government, and securing and managing grants and contracts to improve conditions here on the ESVA. I have always found them to be highly professional and practically oriented. They are well qualified for the proposed task.

Please contact me if any further information is needed.

Sincerely,

Richard A Snyder

RE: Eastern Shore of Virginia Regional Resilience Community Plan Development CFPF Application

To Whom It May Concern:

I am writing to you on behalf of CBES Board and membership in support of the Accomack-Northampton Planning District Commission's [A-NPDC] grant application to develop a regional resilience plan for the Eastern Shore.

As a 34-year nonprofit with a focus on conservation, natural resource protection and community action, we have long recognized and advocated for the need to comprehensively address rising sea levels and the ramifications of increased and more intense storm events on our vulnerable peninsula.

Our monthly *ShoreLine News Journal* has covered this issue extensively including our latest edition which addressed maintaining or abandoning flooded roads.

CBES knows the solid track record of the A-NPDC and firmly believes they are the agency our community can depend on to facilitate the development of a Shore wide regional plan. Such a planning, project-based strategy is not a luxury but a necessity for the protection of our community's future.

Godspeed,

Donna Bozza, CBES Executive Director

Cc: Jessica Steelman, Coastal Planner
Accomack-Northampton Planning District Commission

Flooded Roads: Maintain or Abandon?

By Sue Mastyl

A spring 2020 paper from the Virginia Coastal Policy Center (VCPC) of William & Mary Law School outlines the potential liability issues of closing roads due to increased flooding.[1]

As policymakers continue to update plans for flooding due to sea-level rise (SLR), increased precipitation, and more frequent storm events, one area of concern is road flooding. Some roads on the Eastern Shore and throughout coastal Virginia already flood on a regular basis with king tides and storms; this will only increase in severity and frequency.

Failure to maintain a flooded road could leave a locality open to liability. Abandoning a section of road due to flooding may also create liability.

Flooded Roads on the Eastern Shore

The Virginia Department of Transportation (VDOT) oversees 57,867 miles of roads in Virginia – 1,516 miles on the Shore. The 2021 VTrans (Virginia's Transportation Plan) cited 32,100 miles of roads at risk of flooding due to SLR, storm surge, and inland/riverine flooding.[2]

A 2015 study by Accomack-Northampton Planning District (A-NPDC) and VDOT assessed the vulnerability of Eastern Shore roads to flooding.[3] They determined that with 1 foot of SLR (currently projected by 2040[4]), 33 miles of roads would be vulnerable to inundation; the number rises to 371 miles (24.5% of all roads) with 6 feet of SLR, which could occur as early as 2090 under the NOAA intermediate-high scenario.[5] Over 80% of the vulnerable roads were in Accomack County. The study noted that the SLR predictions "represent stillwater conditions," without considering wind, storm events, or astronomical tides, so that "a larger number of roads may be subject to flooding than what is indicated by this study."

The A-NPDC study showed that:

- 100% of roads on Tangier will be inundated with 1 foot of SLR; this will occur for Chincoteague and Saxis with 4 feet of SLR, and for Wachapreague with 6 feet of SLR.
- Major access roads will be inundated with 2 feet of SLR, including:
  - Bell's Neck Road, Chincoteague Causeway, Crystal Beach Road, East Point Road, Greenbackville/State Line Road, Hopkins Road, North Chesconessex/Northside Road, Saxis Causeway, and Schooner Bay Road in Accomac County
  - Bayford Landing, Church Neck/Bayside Road, Johnsons Cove/Old Neck Road, Webbs Island, and Wise Point Landing in Northampton County

The study noted that estimating costs to maintain or elevate roads vulnerable to flooding is difficult. A 2003 study for 3 Chesapeake Bay communities in Maryland estimated costs from $385,000 to $1.5 million per lane mile; a 2009 study for 6.75 miles of roads on the Middle Peninsula of Virginia estimated $5.3 million for short-term solutions and $26.5 million for long-term plans. All of these estimates would have to be adjusted for inflation.

Potential Liabilities

The VCPC paper notes that local governments will play a key role in deciding whether to 1) replace roads vulnerable to flooding (including the option to elevate the roads), 2) continue to maintain them in place, or 3) abandon them altogether. Some policymakers are taking steps to address the threat of SLR on roads, including plans by the U.S. Fish & Wildlife Service and National Park Service to move the road and parking lot for the beach on Assateague Island to a more stable location.[6,7] However, communities are already seeing pushback on some plans, including homeowners in Gloucester County who threatened to sue after the county and VDOT posted "Road May Flood" signs, because it might decrease property values; and homeowners in Florida who successfully sued the county when it stopped repairing a low-lying, flood-prone road due to increasing costs.

The primary source of funding for roads in Virginia is the SMART SCALE program; importantly, only historical flooding, and not future SLR, is factored in, and only with respect to disruption to traffic. Environmental quality is only 1 of 6 factors considered in evaluations.

In deciding to abandon a road, the governing body must determine that either there is "no public necessity" (which could include scenic value alone) for continuing its use, or "the safety and welfare of the public" are best served by the abandonment. Once abandoned, it may not be possible to add the road back into the system.

Of the options outlined above, replacing or elevating sections of road will be the most expensive in many cases. Maintaining roads in place also has significant costs, while failure to maintain a flooded road could leave a locality open to liability under the takings clause, either by preventing access to property or by causing damage to property. Abandoning a section of road due to flooding may also create liability if a property owner feels they have been denied access to their property.

To avoid these liabilities, the VCPC authors recommend including the community in the process, with early

Virginia Institute of Marine Science

Calling All Anglers

You Too Can Be a Fisheries Scientist

By George Mapp

Birdwatchers have excellent phone apps to help identify birds in the field. Simply take a picture, submit it, and if the picture is detailed enough, the app will identify the bird. Or submit a sound recording. If it's a new species for you, click and it's added to your life list. More importantly, your observation is added to a database, catalogued, and made available to researchers and the public. For users, it's convenient – there's no need for field guides or notebooks. For the rest of us, the data reveal what both sexes look like and sound like at all ages, when and where species normally occur, and enables estimates of abundance and migration patterns.

Now the Virginia Institute of Marine Science (VIMS) has developed a similar app for anglers. RecFish (https://www.recfish.org/) is now available on mobile devices and as a website. The initial version is not fully functional, as it can only recognize a few species. It takes several thousand pictures of each species to "train" the machine learning software – software also used for facial recognition and optical character readers. So, the goal of this first version is to gather pictures. As more and more are added, identification "skill" will improve.

The goal is to identify the fish, estimate size and weight, and determine if it is legal to keep. Future enhancements may include whether it is edible, legal regulations, and the citation size and weight. One possible enhancement – virtual fishing tournaments. Like the birder databases, this one will add to our knowledge of the appearance of both sexes at all ages, migration patterns, abundance, and size and weight statistics.

VIMS has been doing trawl surveys for 67 years, but only in waters deeper than 9 feet. While the data are invaluable for managing fisheries, it misses shallow waters – important fish habitats of grass beds and oyster reefs.

There are approximately 300 fish species reported in the Bay, but only about 30 year-round resident species. The rarer the species, the more important the pictures are. Anglers are not inclined to pose with throw-back fish, but by photographing them, they will be doing a good deed. Those who prefer not to divulge the location of their favorite fishing spot can opt to provide an approximate location or no location at all.

More and more anglers, like birders, are content to observe without harming the animals. For anglers, this is catch-and-release. Injuries to fish can be minimized in several ways, for example, by using barbless hooks, leaving the fish in the water while carefully removing the hook, and releasing promptly.

Flooded Roads, *cont'd from p. 4*

discussions and negotiations with affected property owners; ongoing education of citizens about current and predicted flooding risks in the community; and developing alternative plans to provide access to affected properties.

As SLR increases and storm events increase in frequency and intensity, localities "will need to consider whether it is worth the expense to continuously maintain roads that are repeatedly damaged by flooding," the authors note. "Localities will ... have to consider the option of abandoning certain roads that become problem areas for repeated flooding," which may remove the legal risk and costs associated with ongoing maintenance, "but does come with its own potential legal risks, ... from landowners who lose sole access to their properties."

The National Oceanic and Atmospheric Administration (NOAA) recently released a first of its kind database that helps communities understand the potential economic disruptions due to flooding.

The database provides employment in coastal inundation zones statistics, and is one of the newest products available from NOAA’s Digital Coast.

Information about the number of businesses and employees that could be impacted by flood events can be hard to find and can leave a big gap in a risk analysis. To help fill this data gap, NOAA’s Office for Coastal Management partnered with the Bureau of Labor Statistics to create employment statistics for different coastal inundation zones. These highly anticipated data include the number of establishments—and the number of people employed by those business establishments—that fall within various coastal inundation footprints. These data are reported as aggregated statistics at state and county levels.

https://coast.noaa.gov/digitalcoast/data/coastal-inundation-zones.html

Budget Narrative

The total cost for capacity building and planning is $350,000. The A-NPDC respectfully requests full funding of this project and a waiver of match funds. Both counties within the region – Accomack and Northampton – are significantly vulnerable to flood hazards and climate change being surrounded by the Chesapeake Bay to the west and the Atlantic Ocean to the east. According to the grant manual for CFPF Round 3, on p. 24, "For local governments designated as low-income geographic areas, 100 percent of the estimated total project costs should be included". It is crucial that the Eastern Shore possess a Regional Community Resilience Plan and the CFPF would allow this process to be initiated and implemented far sooner than possible than seeking local funds. Additionally, this regional plan is a key criterion for localities to apply for future CFPF for projects, 85 of which have already been identified as needed during the past year's efforts to provide projects for the Virginia Coastal Resilience Master Plan and an additional 43 which are still in pre-planning stages.

Task	Project Budget
Resilience Plan	$340,000
Community Engagement (Four county-wide sessions, 14 town and site-specific sessions, and 2 regional sessions, to include all advertisement and marketing materials)	$20,000
Steering Committee meetings and materials	$5,000
Staff Training	$2,000
Internship Program (12-16 weeks) conducted over two years	$8,000
Total	**$375,000**

cvpdc.org

April 5, 2022

Virginia Department of Conservation and Recreation
Attn: Virginia Community Flood Preparedness Fund
Division of Dam Safety and Floodplain Management
600 East Main Street, 24th Floor
Richmond, VA 23219

To Whom it May Concern:

It is my pleasure to, on behalf of our member localities, to submit a Community Flood Preparedness Fund (CFPF) Planning and Capacity Building application to develop a Central Virginia Planning District Commission (CVPDC) Regional Resiliency Plan.

The CVPDC completed the Central Virginia Planning District Commission Hazard Mitigation Plan 2020 Update, adopted by FEMA and all ten CVPDC localities in 2021. The regional HMP provides the foundation for the Regional Resiliency Plan and, more importantly, specifies within the Mitigation Strategies the need to execute "studies or maps that provide easily identifiable and understandable to evaluate vulnerable areas" and "encourage development of local or regional Resiliency Plans".

The CVPDC Commissioners, at their March 17, 2022, meeting unanimously endorsed the submittal of a CFPF to develop a Regional Resiliency Plan. Should the fiscal evaluation factors eliminate our region from a match waiver, the CVPDC is prepared and will fund the full cash match on its localities' behalf. Further, this letter confirms recognition that the CFPF is a reimbursement program and that the CVPDC has sufficient funds to cover costs preceding grant disbursement.

The HMP development effort highlighted the need for more detailed flood prone area evaluation. The Regional Resiliency Plan will develop priority project and engineering evaluations that will allow for the project mitigation implementation to protect identified vulnerable areas. We respectfully request approval of this application within the Round 3 Community Flood Preparedness Fund awards.

Sincerely,

Gary Christie

PLANNING DISTRICT COMMISSION

Round 3 Application for the
Virginia Community Flood
Preparedness Fund
2022 Grant Funding

Capacity and Planning
Resiliency Plan Development

Contents

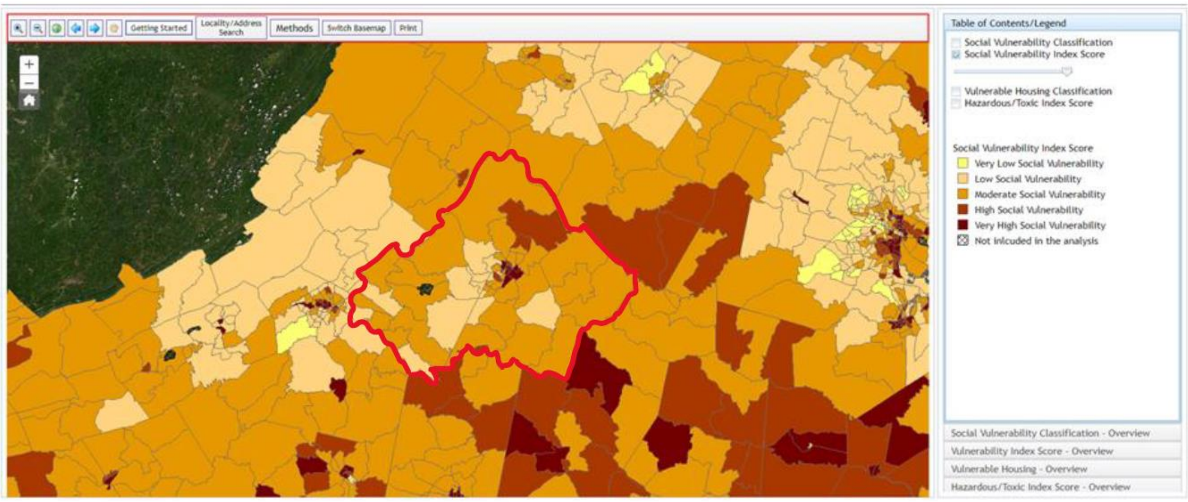
Introduction

The Central Virginia Planning District Commission ("CVPDC"), Planning District 11, is comprised of 4 counties, one city, and a number of towns, each listed below with links to their comprehensive plans and local floodplain ordinances:

- Amherst County - Comprehensive Plan and Floodplain Ordinance
- Appomattox County - Comprehensive Plan and Floodplain Ordinance
- Bedford County - Comprehensive Plan and Floodplain Ordinance
- Campbell County - Comprehensive Plan and Floodplain Ordinance
- City of Lynchburg - Comprehensive Plan and Floodplain Ordinance
- Town of Altavista - Comprehensive Plan and Floodplain Ordinance
- Town of Amherst - Comprehensive Plan and Floodplain Ordinance
- Town of Appomattox - Comprehensive Plan and Floodplain Ordinance
- Town of Bedford - Comprehensive Plan and Floodplain Ordinance[1]
- Town of Brookneal - Comprehensive Plan and Floodplain Ordinance

Most of the communities' comprehensive plans address flooding issues to some degree, and the CVPDC itself has a regional Hazard Mitigation Plan (*Central Virginia Planning District Commission Hazard Mitigation Plan 2020 Update*; "CVPDC HMP;" link) with a flood risk component detailing the number of flooding events in each county, the number of NFIP repetitive loss structures, and the dollar amount of property damage caused by flooding. However, what is missing is a region-wide overview of flooding issues, the specific communities that flooding affects, and a prioritized list of projects and an implementation roadmap to begin to address flooding resilience at a regional and local scale; the CVPDC is seeking funds from the Virginia Community Flood Preparedness Fund to support the development of a regional Resilience Plan to address the gaps.

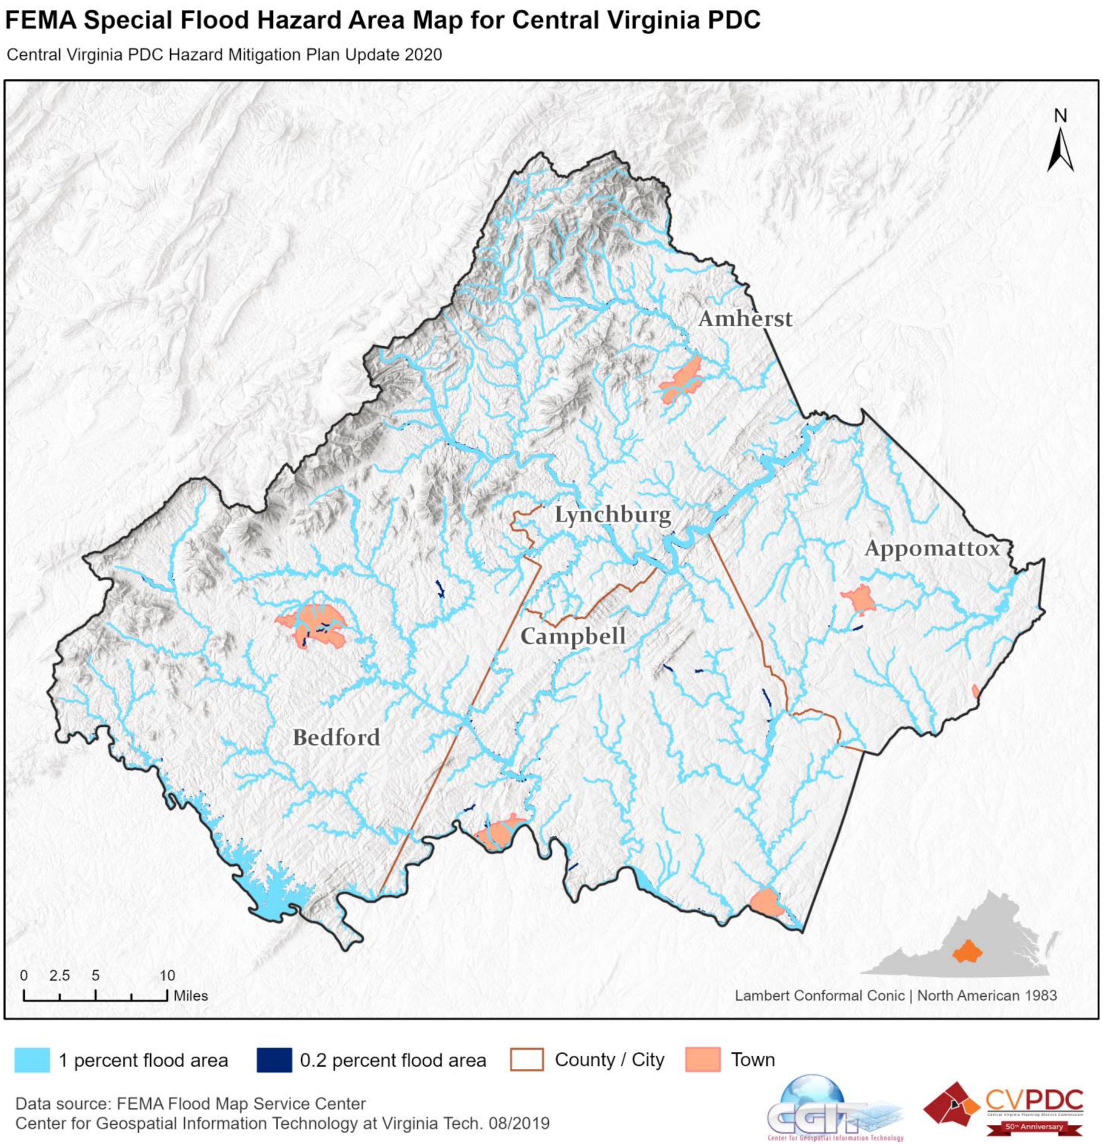
According to the AdaptVA Social Vulnerability Tool, the Social Vulnerability Score of Census Tracts within the CVPDC (outlined in red in the image below) range from *Low* to *Very High* vulnerability, with a maximum Social Vulnerability Index Score of 3.0, and a minimum of -0.9.



(Source: AdaptVA Vulnerability Viewer)

---

[1] Note: Town of Bedford Floodplain Overlay District repealed in 2010.



(Source: CVPDC Hazard Mitigation Plan)

In addition to containing several Census Tracts with Very High Social Vulnerability, the average of median household incomes of CVPDC localities ($52,296.20) ranks below 80% of the state median ($61,118.40), making the CVPDC a Low-income Geographic Area. Additionally, portions of each of the CVPDC's five localities are designated as qualified opportunities zones.

	CVPDC Counties and Cities						**Virginia**
	Amherst County	**Appomattox County**	**Bedford County**	**Campbell County**	**City of Lynchburg**	**Average**	
Median household income (in 2020 dollars), 2016-2020	$57,368	$55,457	$67,136	$52,319	$49,201	**$56,296.20**	$76,398
							80% of Virginia Median Household Income = $61,118.40

(Source: U.S. Census Bureau)

The Resilience Plan will help to inventory specific flooding issues from member localities and develop a region-wide plan for responding to them, especially those that occur in the most vulnerable communities. It will also provide for the prioritization of projects, to include cost estimates and provide an implementation roadmap to support local efforts. It will strive to address overarching region-wide goals, such as characterizing communities and their social vulnerability and their dependence on the built environment that is threatened by flooding, identifying areas for possible land acquisition or repetitive loss property buyouts, strategies and a roadmap toward shovel-ready projects for abating the worst flooding, and creating a region-wide knowledge base for the public and policy-makers.

Development of the Resilience Plan, including the identification, evaluation and prioritization of flood mitigation projects, is a direct mitigation strategy identified in the CVPDC HMP. Additional related objectives and strategies identified in the CVPDC HMP that will be addressed through the development of the Resilience Plan include:

- *Establish or update local flood and high hazard studies or maps that provide easily identifiable and understandable property identification to evaluate vulnerable properties and areas* (pg. 6-5);
- *Expand data capacity to assist in mitigation program analysis and project implementation* (pg. 6-5);
- *Encourage development of local and regional Resiliency Plans* (pg. 6-6);
- *Initiate studies in areas of repetitive flooding* (pg 6-7); and
- *Seek funding and technical assistance to assist in establishing sustainable evaluation and protection actions* (pg. 6-8).

Scope of Work Narrative

The development of the CVPDC Resilience Plan will involve three principal tasks:

- Kick-off meeting with CVPDC Staff and identified stakeholders (anticipated to include representatives of CVPDC local jurisdictions) to focus the development of the Plan and collect initial input;

- Development of a draft Resilience Plan with consultation and direction from PDC staff and identified stakeholders, and drawing upon the CVPDC HMP - adopted by FEMA and all ten CVPDC localities in 2021 - the draft Plan will describe the CVPDC's and localities' approach to flooding and meet the following criteria:

    1. It is project-based with projects focused on flood control and resilience.
    2. It incorporates nature-based infrastructure to the maximum extent possible.
    3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
    4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.

5. It is based on the best available science and incorporates climate change and current flood maps.

   Additionally, the Plan will include an action and implementation component, identifying regional and locality-level actions and projects, prioritize such actions and projects, and develop an implementation roadmap with identified cost estimates and potential funding sources.

- Based upon feedback and comments, a final Resilience Plan will be prepared and presented to the CVPDC Commission for consideration and adoption. Once adopted, the Plan will be submitted to the Virginia Department of Conservation and Recreation for approval. Following approval, the CVPDC will support local adoption of the Plan, as requested.

Development of the Resilience Plan will address the following, as detailed:

1. **The Plan will assess capacity needs and assets to include**:

   a. **Resource needs identification - financial, human, technical assistance, training.** In developing the Resilience Plan, the CVPDC is building off of the CVPDC HMP, member locality Comprehensive Plans, and local knowledge of flooding issues to provide for a more complete inventory and assessment of the flooding problems in the region, the specific communities and geographies they affect, and potential projects to mitigate them.

   b. **Plan for developing, increasing, or strengthening knowledge, skills and abilities of existing or new staff. This may include training of existing staff, hiring personnel, contracting with expert consultants or advisors.** The Plan will identify education or resource capacity needs of the CVPDC and localities and present recommendations and best practices to address prioritized issues and opportunities.

   c. **Resource development strategies. Where capacity is limited by funding, what strategies will be developed to increase resources in the local government? This may include work with non-governmental organizations, or applying for grants, loans, or other funding sources.** The Plan will work to identify strategies to address identified resource capacity needs. Initiation of the development of the Plan by the CVPDC demonstrates a commitment to supporting the localities; further opportunities to leverage the CVPDC as a resource will be explored. Additionally, the Plan itself will qualify the CVPDC and localities (with local adoption) for further project funding, and will be leveraged to support other funding opportunities, such as FEMA HMA, BRIC, and FMA, among others.

   d. **Policy management and/or development.** The Plan will work to identify and inventory local policies pertaining to flooding and related resilience. Consistent with the CVPDC HMP, the Plan will also explore the relationship between resilience to flooding, and economic resilience of the region and its localities.

2. **Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.** The Resilience Plan will identify communities most affected by flooding and use a stakeholder engagement and data-focused approach to identify community-wide and region-wide benefits when selecting potential flood remediation projects. The Resilience Plan will be used as a tool for future flood planning.

3. **Stakeholder identification, outreach and education strategies.** At a minimum stakeholders will include representatives from CVPDC member localities and may also include emergency managers, state agency representatives, community champions, and other parties. Outreach and meetings will be mostly if not entirely virtual. The Resilience Plan may be disseminated online or otherwise used to inform the public and illustrate the work necessary to alleviate flooding issues.

4. **Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.** After receipt of award notice, a kick-off meeting will be held within 30 days. The Resilience Plan will be delivered within 60 days of that kick-off meeting. See "Scope of Services" below.

5. **Parties responsible for capacity building and/or plan development process.** CVPDC will utilize professional and non-professional services consultants to develop the plan in coordination with CVPDC staff and other stakeholders.

6. **Performance outputs and measures. Describe the expected results and benefits and how success will be measured.** Success will be measured firstly by adequately meeting the five requirements of a Resilience Plan as outlined by the Community Flood Preparedness Fund Manual, while also providing robust project prioritization metrics and carry-through to local adoption. The Resilience Plan will include an implementation roadmap, the success of which will be measured by its utility in leading to flood mitigation project implementation.

7. **Planning for maintaining capacity, as necessary, over the long term.** The Resilience Plan is an additional step in building institutional knowledge for the mitigation and prevention of flooding issues in the region and represents a direct mitigation action from the CVPDC HMP. The CVPDC is committed to helping its member localities tackle the threat to property, lives, and livelihoods resulting from preventable flood damage.

Budget Narrative

ESTIMATED TOTAL PROJECT COST

The estimated total project cost is $60,000, based upon a scope of services provided by The Berkley Group (Attachment 1) with additional incidentals accounted for to support Plan development and engagement.

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $54,000, or 90% of total project costs, as the project is located in and serves a low-income geographic area.

AMOUNT OF CASH FUNDS AVAILABLE

The Central Virginia Planning District Commission will appropriate the requisite 10% or $6,000 in required local cash match funds, to be combined with the $54,000 in grant assistance to equal the total estimated project cost. CVPDC's commitment to the match is addressed in the authorization to request funding, as the Application cover letter; as noted therein, the CVPDC maintains sufficient funds to cover the total costs of the project pending reimbursement of awarded funds.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is addressed in the Application cover letter.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

- ☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.
- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.
- ☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

- ☐ Floodplain Staff Capacity.
- ☒ Resilience Plan Development
  - ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  - ☒ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Central Virginia Planning District

NFIP Community Identification Number (CID#):(See appendix F 510016, 510030, 510028, 510093 510010, 510193, 510029, 510011, 510194

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Various; this proposal covers a region

Flood Insurance Rate Map Number(s) (If Applicable): See attached*

Appendix D: Scoring Criteria for Capacity Building & Planning

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	☑
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	☑
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	☑
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☑ **Yes** ☐ **No**

BERKLEY
GROUP

February 24, 2022

Mr. Gary F. Christie
Executive Director
Central Virginia Planning District Commission
828 Main Street, 12th Floor
Lynchburg, Virginia 24504

RE: Task Order #5: Grant Assistance and Resilience Plan

Dear Mr. Christie:

We are pleased to present the attached scope and fee to prepare an application for a Virginia Community Flood Preparedness Fund grant and to develop a Resilience Plan for the Central Virginia Planning District Commission. Assisting on this project as subconsultant, with a focus on the development of the action and implementation component of the Resilience Plan, will be Weston & Sampson, an interdisciplinary design, engineering, and environmental services firm (www.westonandsampson.com).

If you have any questions or need additional information, please feel free to contact me at any time.

Sincerely,

Andrew D. Williams, AICP
Chief Executive Officer

I have reviewed the scope and fee for the associated work order, and I hereby give the consultant notice to proceed for the work described herein.

____ ______________________
Mr. Gary Christie, Executive Director Date

SCOPE OF SERVICES

The Scope of Services will include the following phases, tasks, and deliverables:

Phase 1 - Grant Application

Task 1 - Application Preparation

The Berkley Group will work with the PDC to prepare an application seeking a grant under Round 3 of the Virginia Community Flood Preparedness Fund for the development of a Resilience Plan for the PDC.

Deliverables: The Berkley Group will provide the final application to the PDC no later than April 1, 2022, one week prior to the April 8, 2022 submittal deadline. The PDC will be responsible for filing the application.

Phase 2 - Development of Resilience Plan

Phase 2 is contingent upon the PDC being successfully awarded a Community Flood Preparedness Fund grant in the amount requested for the development of a Resilience Plan.

Task 1 - Project Management and Coordination

The Berkley Group, along with subconsultant Weston & Sampson, ("the Project Team") will manage the project and coordinate with PDC staff as needed to collect input, provide updates, and share information related to the project. This scope assumes that all meetings, as well as the associated tasks noted herein, will be conducted virtually. The Berkley Group will have overall responsibility for project management.

Task 2 - Kick-Off Meeting

The Project Team will conduct a kick-off meeting with PDC staff, as well as any stakeholders identified by PDC staff (anticipated to include representatives of PDC local jurisdictions), to review the scope, expectations, schedule, deliverables, and any additional considerations associated with the development of the Resilience Plan. This kick-off meeting will occur within 30 days of the Berkley Group's receipt of a notice to proceed with Phase 2 from the PDC (presumed to follow the award of the grant and/or the execution of a contract between the PDC and the funding agency).

Task 3 - Draft Plan

With consultation and direction from PDC staff and stakeholders identified by the PDC (presumed to include coordination and engagement with PDC local jurisdictions), and drawing upon the PDC's Hazard Mitigation Plan 2020 Update, the Project Team will prepare a draft of the Resilience Plan for the PDC with a focus on flooding. Pursuant to Virginia Department of Conservation and Recreation and Community Flood Preparedness Fund standards and requirements, the draft Plan will describe the PDC's and PDC localities' approach to flooding and meet the following criteria:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. It is based on the best available science and incorporates climate change and current flood maps.

Additionally, the Plan will include an action and implementation component, where the Project Team will work with PDC staff and stakeholders to identify regional and locality-level actions and projects, prioritize such actions and projects, and develop an implementation roadmap with identified cost estimates and potential funding sources.

Deliverables: The Project Team will provide a draft of the Resilience Plan to the PDC for review. The draft of the Resilience Plan will be provided to the PDC no later than 60 days following the date of the kick-off meeting conducted under Phase 2, Task 1.

Task 4 - Final Plan

Once all feedback and comments have been received from the PDC, the Project Team will address comments, make final revisions to the Plan, and produce a final Plan.

Deliverables: The Project Team will provide a final Resilience Plan to the PDC for review. The final Resilience Plan will be provided to the PDC no later than 30 days following the Project Team's receipt of feedback and comments from the PDC.

Task 5 - Plan Adoption

The Project Team will assist PDC staff, as requested, with the presentation of the Resilience Plan to the Commission for adoption. The Project Team will make any revisions to the Plan as requested by the Commission. Contingent upon the PDC's adoption of the Plan, the Project Team will assist the PDC in the submission of the Plan to the Virginia Department of Conservation and Recreation for approval. The Project Team will make any revisions to the Plan as requested by the Department of Conservation and Recreation which are necessary for Department approval.

Deliverables: Contingent upon revisions necessary under Phase 2, Task 4, the Project Team will provide a final Resilience Plan to the PDC incorporating revisions requested by the Commission and the Department of Conservation and Recreation.

ASSUMPTIONS

1. **Contact Person:** The PDC will provide a single staff contact that will be responsible for collecting and transmitting data, resources, and other related information to the Project Team.
2. **Deliverables:** Deliverables will be provided in digital format to the PDC.
3. **Covid-19:** The Project Team will adhere to all public health best practices as recommended by the Center for Disease Control (CDC) or state/local regulations, whichever is more stringent. When engaging in face-to-face meetings with clients and citizens, the Project Team will adhere to the Commonwealth of Virginia's prevailing guidelines as it pertains to social gatherings for business sectors and/or the locality's, in the event they are more stringent. For meetings where attendance from the general public is expected, the locality should consider if/how the prevailing safety guidelines will be enforced and what acceptable measures will be taken for those refusing compliance and communicate those plans to the Project Team prior to the meeting date.

FEE

The fee for the services to be provided under Phase 1 of the Scope of Services will be based upon the hours necessary to complete the work, at the following rates, but shall not exceed $3,600.

Hourly Rates	
Owner/Principal	$175
Executive Manager	$120
Director	$100
Principal Planner	$80
Senior Planner	$65
Planner	$50

The lump sum fee for services to be provided under Phase 2 of the Scope of Services for the development of a Resilience Plan is $55,000.

Dear Gary:

We understand and support the effort by the Central Virginia Planning District Commission to seek funding through the Virginia Community Flood Preparedness Fund (CFPF) by submitting an application to the Planning and Capacity Building grant for the purpose of developing a regional resiliency plan that will focus on flood issues.

It is understood that this effort represents an identified mitigation strategy from the *CVPDC Hazard Mitigation Plan – 2020 Update*, which has been adopted by FEMA, the CVPDC, and all ten localities.

We understand that a cash match waiver, designed for low-income geographic areas, will be submitted within the application. We further recognize and support, that the CVPDC is prepared to fund, on behalf of the region's localities, the full match.

I hereby give the CVPDC authorization to submit a regional proposal on our behalf.

Sincerely,

Gary Shanaberger

RE: Letter of Support
Community Flood Preparedness Fund
Regional Resiliency Plan

Dear Gary:

We are pleased to offer a letter of support for the Central Virginia Planning District Commission's (CVPDC) efforts to secure funding through the Virginia Community Flood Preparedness Fund for a Planning and Capacity Building grant, the purpose of which is the development of a regional resiliency plan that will focus on flood issues. This important planning document will help our region reduce the impacts of flooding, prioritize projects related to floodplain management and empower our region to complete vulnerability assessments, while developing an action-oriented implementation approach to enhance flood preparedness and resiliency throughout the Central Virginia region.

It is understood that this effort represents an identified mitigation strategy from the *CVPDC Hazard Mitigation Plan – 2020 Update*, which has been adopted by the Federal Emergency Management Agency (FEMA), the CVPDC, and all ten partner localities.

We understand that a cash match waiver, designed for low-income geographic areas, will be submitted within the application. We further recognize and support, that the CVPDC is prepared to fund, on behalf of the region's localities, the full match.

I hereby give the CVPDC authorization to submit a regional proposal on our behalf.

Round 3 CFPF Application

Central Virginia Planning District Commission (CVPDC) Capacity and Planning Application

On behalf of the localities of the Central Virginia Planning District Commission (CVPDC), it is my pleasure to submit the attached **CFPF Round 3 Capacity and Planning Application** to develop a the CVPDC Regional Resiliency Plan. The Resiliency Plan will be developed for all ten CVPDC member localities, which include Lynchburg City (CID 510093), Amherst County (CID 510010), Amherst Town (CID 510193), Appomattox County (CID 510011), Appomattox Town (CID 510194), Bedford County (CID 510016), Bedford Town (CID 510015), Campbell County (CID 510028), and towns of Brookneal (CID 510030)and Altavista (CID 510029). Support for this project has been provided by all the member localities

Developing regional or individual locality resiliency plans, identifying priority stormwater projects, to include project evaluation and cost estimates, and evaluation of vulnerable communities are identified mitigation strategies from the *CVPDC Hazard Mitigation Plan – 2020 Update*, adopted by FEMA and all member localities in 2021. Our region and member localities are eager to execute this project and respectfully request inclusion within the Round 3 CFPF application awards.

Your consideration of this application is appreciated. I am available to respond to any questions.

Kind regards,

Kelly Hitchcock

RE: 2022 Virginia Community Flood Preparedness Fund

Dear Sir or Ma’am:

Please accept this written correspondence as signed documentation authorizing the Hampton Roads Planning District Commission’s request for funding from the 2022 Virginia Community Flood Preparedness Fund (CFPF).

At its meeting on November 18, 2021, the HRPDC board authorized the staff to develop and submit proposals for the CFPF in consultation with the HRPDC Coastal Resiliency Committee. The studies described in this proposal would help inform local and regional resiliency planning efforts, identify specific activities for local capital improvement programs, and support the development and adoption of local and regional higher standards for more resilient development. The total cost of the proposed studies is $244,874.03. Following the 50% Fund/50% Match requirements for this category, the HRPDC respectfully requests funding from the CFPF in the amount of $115,000.00. Furthermore, the HRPDC will provide the 50% matching contribution in the amount $129,874.03 as in-kind services and additional cash support from its Coastal Resiliency Program.

Thank you for consideration of this grant proposal. If you have any questions about this proposal, please contact Ben McFarlane at bmcfarlane@hrpdcva.gov.

Sincerely,

Robert A. Crum, Jr.
Executive Director
Hampton Roads Planning District Commission

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☒ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☒ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☒ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☒ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Hampton Roads Planning District

NFIP Community Identification Number (CID#):(See appendix F N/A

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): N/A

Flood Insurance Rate Map Number(s) (If Applicable): N/A

Total Cost of Project: $244,874.03

Total Amount Requested $115,000

Appendix C: Scoring Criteria for Studies

Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:		
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration	☒ **Yes** ☐ **No**
Applicant Name:	

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	30
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	40
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	35
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	15
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	0
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
Total Points		120

Study Proposal:

Hampton Roads Regional Resiliency Studies and Analyses

Scope of Work Narrative

1. ***The specific type of study proposed including whether the study is new or updates a prior study***

The Hampton Roads Planning District Commission (HRPDC) proposes to complete a set of new studies of regional significance to support the development and implementation of local and regional resilience plans, policies, and projects. These studies will collectively inform locality capital improvements programs as well as stormwater, floodplain, and other ordinances and land use and development regulations, including comprehensive plans. Guidance and research from federal and state sources on best practices for implementing forward-looking policies and incorporating future expected conditions into local decision-making is limited. Individual communities often do not have the knowledge or the capacity to consider these factors without such assistance. The studies identified in this proposal will directly support the needs of Hampton Roads communities to better address current and future flood risk and become more resilient to climate change.

The proposed studies, which are described below, were identified in consultation with the HRPDC's Coastal Resiliency Committee and will build upon previous and ongoing efforts by the committee and the HRPDC staff.

I. Assessment of local hydraulic and hydrologic data and models

Local governments in Hampton Roads individually maintain stormwater infrastructure data and models for their individual systems. As a result, the extent, format, and quality of the data and models varies across the region. A comprehensive, regional hydraulic and hydrologic (H&H) model would help enable localities to 1) better identify areas at risk from current and future flooding, and 2) development and implement for reducing that risk individually and cooperatively. A regional model would support potential multi-jurisdictional projects that follow watershed boundaries instead of political boundaries. Before a regional H&H model can be developed, the stormwater infrastructure data currently maintained by each locality will need to be collected to identify gaps and assess compatibility. This information will inform a plan for creating a comprehensive regional model or suite of sub-regional models. Tasks to complete this study will be performed by the HRPDC staff and a contractor to be selected and will include:

a) Meeting with locality public works and stormwater staff individually and collectively to identify existing data and models
b) Obtaining existing stormwater infrastructure data and H&H models from each Hampton Roads locality
c) Evaluating existing data and models for quality, extent, and format to determine compatibility
d) Developing priorities for data acquisition and model development to support the creation of a regional H&H model or sub-regional models

II. Assessment of local, state, and federal policies and regulations regarding hazardous materials or contaminated sites and vulnerability to flooding and sea level rise, including development of policy recommendations

To better understand hazardous or contaminated sites in Hampton Roads that are vulnerable to flooding and sea level rise, the HRPDC has been inventorying industrial sites within potential inundation areas. This mapping effort supports the development of a risk assessment and associated regulatory, policy, and infrastructure response. This assessment will help determine which sites are most susceptible to climate risks, such as increased rainfall, coastal flooding, sea level rise, and storm surge, that may result in the release of hazardous chemicals, fuels, and other contaminants into surrounding communities or waterways. Federal and state laws and regulations exist to curtail certain disasters; however, it is unclear how many facilities are truly protected by these laws and regulations and whether those laws and regulations account for increased risks due to climate change. In addition, it is unclear to what extent local governments are requiring additional protections. To identify policy gaps, a detailed local-level ordinance review is required. Tasks to complete this study will be performed by the HRPDC staff and a contractor to be selected and will include:

a) A review of existing federal, state, and local laws, regulations, and ordinances concerning industrial facilities, hazardous materials, and contaminated sites, including a thorough review of building and fire codes and stormwater, zoning, and waste control ordinances in Hampton Roads localities
b) Development of a matrix and report documenting existing policies in place that local governments can utilize for siting, maintaining, and/or regulating hazardous material and fuels in the floodplain or other areas vulnerable to flooding from sea level rise or increased precipitation, including enforcement actions
c) Completion of a risk assessment and gap analysis using the data collected to identify vulnerable watersheds and communities
d) Development of potential policy or other recommendations for implementation by federal, state, or local authorities

III. Case study analysis of potential costs and benefits of implementation of regional resilient stormwater management design guidelines

The HRPDC has been working with its Coastal Resiliency Committee on the development of regional recommendations for resilient stormwater management design guidelines that account for projected climate change impacts. These guidelines include sea level rise planning scenarios (based on NOAA-published regional sea level rise projections), design tailwater elevations (based on FEMA and USACE analyses and incorporating sea level rise), precipitation depths (based on analysis by RAND/MARISA on behalf of the Chesapeake Bay Program), and design storms that account for both rainfall and tidal conditions (based on analysis and policy development by the City of Virginia Beach). The intended purpose of these recommendations is that they are incorporated into local ordinances and design standards, such as public facilities manuals. This analysis will help develop an understanding of the practical implications on site development of incorporating higher standards into local codes and ordinances, which will inform local decision-making on whether to adopt all or some of the regional recommendations. Tasks to complete this study will be performed by the HRPDC staff and a contractor to be selected and will include:

a) Development of case studies of representative uses (such as ultra-urban, suburban commercial, and residential development) and associated inputs and conditions for stormwater models, such as the Runoff Reduction Method spreadsheet
b) Conversion of regional resilient stormwater management design guidelines to equivalent inputs for stormwater calculations
c) Running models for each of the representative uses under existing standards and proposed resilient standards using inputs developed in B, including the identification of measures to address compliance
d) Comparison of required measures to comply with existing versus proposed standards and estimated associated costs

IV. Assessment of the performance of water quantity management practices in the Coastal Plain

As part of a project funded by the Virginia Coastal Zone Management Program and NOAA, in 2012-2013 the HRPDC assessed various water quality stormwater best management practices (BMPs) for their performance in the coastal plain, which introduces several potential constraints on BMP performance such as flat terrain, poorly drained soils, and a high water table. The report, *Land and Water Quality Protection in Hampton Roads Phase II*[1], included a table classifying sixteen BMPs as either preferred, accepted, or restricted. This assessment will evaluate those previously identified BMPs and others more specifically intended for water quantity control to identify which perform the best under those conditions found in Hampton Roads communities. Tasks to complete this study will be performed by the HRPDC staff and a contractor to be selected and will include:

a) Literature review of research since 2012 on performance of stormwater BMPs in the coastal plain for water quality and water quantity
b) Assessment of BMP suitability from *Land and Water Quality Protection in Hampton Roads Phase II* report to determine whether any updates or amendments should be made to BMP suitability assessment
c) Identification and assessment of water quantity management practices for their suitability to use under coastal plain conditions as described in *Land and Water Quality Protection in Hampton Roads Phase II* report and including assessment of vulnerability to performance degradation due to sea level rise or other climate change impacts

2. *The relationship of the study to the local government's needs for flood prevention and protection, equity, community improvement, identification of nature-based solutions or other priorities contained in this manual.*

---

[1] https://www.hrpdcva.gov/uploads/docs/11212013-PDC-E3A.pdf

Communities in Hampton Roads are vulnerable to flooding from multiple sources, including storm surge, high tides, rainfall, and river discharge. Increasingly, due to climate change, flooding is being caused due to a combination of these factors. Current and future flood vulnerability have been documented in the region's hazard mitigation plan (the public comment period for the draft 2022 Hampton Roads Hazard Mitigation Plan closed on March 9, 2022[2]) and in several studies completed with assistance from the Virginia Coastal Zone Management Program, which are available on the HRPDC's website.[3] The HRPDC is currently pursuing several initiatives to support local and regional resilience efforts, including development of regional resilience standards and the installation of a regional network of roadway flooding sensors. The proposed studies included in this proposal will support the HRPDC's comprehensive resiliency program in additional to efforts by individual localities.

3. The qualifications of the individuals or organizations charged with conducting the study or the elements of any request for proposal that define those qualifications

The proposed studies will be completed by contractors to be selected by the HRPDC under direction from and with support from the HRPDC's Water Resources Department. The contractor will be selected from those qualified firms already under "on-call" contract with the HRPDC. These firms have already been evaluated and selected by the HRPDC to provide various services and expertise, including those related to:

- Policy and regulatory analysis
- General engineering studies
- Water resources and environmental planning
- Coastal engineering, sea level rise, climate change, and recurrent flooding studies
- Water quality
- GIS

The HRPDC will issue a task order solicitation to those qualified firms to determine the best overall approach to completing the proposed studies.

4. The expected use of the study results in the context of the local resilience plan or, in the case of regional plans, how the study improves any regional approach.

These regional studies and analyses will support local, regional, and state resiliency initiatives. These studies will primarily support the local adoption of regionally consistent policies and practices related to stormwater management, land use, and floodplain management. The findings from these studies will also be directly applicable to and appropriate for inclusion in local resilience plans. The studies will also support future regional policy and outreach initiatives related to resilience.

---

[3] https://www.hrpdcva.gov/departments/water-resources/research-and-analysis-

5. ***If applicable, how the study may improve Virginia's flood protection and prevention abilities in a statewide context***

In addition to the local and regional benefits, these studies will be directly exportable to other regions in the Commonwealth, particularly Virginia's other coastal planning district commissions. The approaches and methodologies used for the proposed studies will be documented as part of the overall effort with the intention of sharing results and lessons learned with state agencies and other communities throughout the Commonwealth. In addition, findings related to state regulations and policies will be shared directly with the relevant state agencies and officials.

Budget Narrative

The total projected cost for the studies proposed under this effort is $244,874.03. According to the guidance outlines in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund, proposals in the Study category are eligible for 50% funding from the Fund with a 50% match requirement. Therefore, the HRPDC respectfully requests financial assistance from the Fund in the amount of $115,000.00, which will cover the provision of consultant services for this effort, and the HRPDC commits to fund the remaining $129,874.03 via in-kind contributions from staff time and additional cash support for consultant services.

Estimated total project cost: $244,874.03

Amount of funds requested from the Fund: $115,000.00

Amount of cash funds available: $129,874.03

Good afternoon,

Please find attached the Hampton Roads Planning District Commission's submittal for the third round of grant funding for the Community Flood Preparedness Fund. The submittal contains the official and authorized application from the HRPDC to DCR to conduct a Flood Prevention and Protection Study for Hampton Roads.

The attached electronic file contains the following information:

- Application Form for Grant Requests for All Categories
- Scoring Criteria for Studies
- Checklist for All Categories
- Scope of Work Narrative
- Budget Narrative
- Supporting Documentation

We appreciate the opportunity to apply for this funding. Please let me know if you have any questions regarding our proposal or if you require additional information.

Sincerely,

Ben McFarlane

RE: 2022 Virginia Community Flood Preparedness Fund

Dear Sir or Ma'am:

Please accept this written correspondence as signed documentation authorizing the Hampton Roads Planning District Commission's request for funding from the 2022 Virginia Community Flood Preparedness Fund (CFPF).

At its meeting on November 18, 2021, the HRPDC board authorized the staff to develop and submit proposals for the CFPF in consultation with the HRPDC Coastal Resiliency Committee. Funding from the CFPF would enable the HRPDC to expand its capacity to assist its member local governments with participation in the National Flood Insurance Program's Community Rating System (CRS) by helping to identify and develop specific regional products and activities that qualify under CRS elements. The total cost of the proposed Capacity Building activity is $21,149.33. Following the 75% Fund/25% Match requirements for this category, the HRPDC respectfully requests funding from the CFPF in the amount of $15,000.00. Furthermore, the HRPDC will provide the 25% matching contribution in the amount $6,149.33 as in-kind services from its Coastal Resiliency Program.

Thank you for consideration of this grant proposal. If you have any questions about this proposal, please contact Ben McFarlane at bmcfarlane@hrpdcva.gov.

Sincerely,

Robert A. Crum, Jr.
Executive Director
Hampton Roads Planning District Commission

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☒ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☒ Resource assessments, planning, strategies and development.
  - ☒ Policy management and/or development.
  - ☒ Stakeholder engagement and strategies.

Location of Project (Include Maps): Hampton Roads Planning District

NFIP Community Identification Number (CID#):(See appendix F N/A

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): N/A

Flood Insurance Rate Map Number(s) (If Applicable): N/A

Total Cost of Project: $21,149.33

Total Amount Requested $15,000.00

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	

Eligibility Information

Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☒ **Yes** ☐ **No**

Capacity Building Proposal:

Hampton Roads Regional Community Rating System Support

Scope of Work Narrative

The HRPDC proposes to increase local and regional capacity for floodplain management by conducting an assessment and developing a plan for providing regional products for communities in Hampton Roads that participate in the National Flood Insurance Program's (NFIP) Community Rating System (CRS) program. Communities in Hampton Roads participating in the CRS as of April 2022 include Chesapeake (Class 7, Community Number 510034), Franklin (9, 510060), Gloucester County (6, 510071), Hampton (7, 515527), Newport News (7, 510103), Norfolk (5, 510104), Poquoson (8, 510183), Portsmouth (7, 515529), Virginia Beach (7, 515531), and York County (7, 510182). Full and effective participation in this program can require significant effort on the part of localities to develop and implement new policies and programs. The HRPC has developed several regional products as part of its Coastal Zone Management and coastal resiliency programs, including mapping of flood hazards, developing a database of elevation certificates, promotion of flood insurance and other outreach efforts, and development of higher recommended standards. Some of these programs, such as GetFloodFluent.org, are already used by Hampton Roads localities to receive CRS points for public outreach. The HRPDC is interested in providing these products and other services to Hampton Roads localities participating in the CRS program to help them earn additional points. Specifically, the HRPDC proposes to assess the potential for regional products that would earn points under the following elements:

- Element 310 (Elevation Certificates)
- Element 320 (Map Information Services)
- Element 330 (Outreach Projects)
- Element 350 (Flood Protection Information)
- Element 410 (Floodplain Mapping)
- Element 430 (Higher Regulatory Standards)
- Element 440 (Flood Data Maintenance)
- Element 450 (Stormwater Management)
- Element 510 (Floodplain Management Planning)
- Others as determined in consultation with HRPDC member localities

In addition, the HRPDC proposes to assess the viability of a regional Program for Public Information and to develop an implementation plan for such a program. Tasks to complete this effort will be performed by the HRPDC staff and a contractor to be selected and will include:

a) Assessment of the applicability of existing, planned, and potential regional products or initiatives to the requirements of the identified CRS elements
b) Recommendations for the development of new products or changes to existing HRPDC products to earn localities additional points
c) Assessment of the utility of a regional Program for Public Information (Element 330)
d) Development of a framework and implementation plan/work plan for a regional Program for Public Information

1. *Assessment of Capacity Needs and Assets*

The HRPDC requests assistance from the Community Flood Preparedness Fund to fund consultant services to support the activities described above. The HRPDC's Water Resources Department currently has sufficient staffing to support the HRPDC's overall resiliency program. Funding is currently provided for the Coastal Resiliency Program, which covers matters related to floodplain management and the NFIP, through dedicated annual contributions from HRPDC member localities. Although the department staff possesses knowledge and experience with the NFIP and CRS, including having a Certified Floodplain Manager in the department, the organization does not have the staff capacity to conduct the specific research and programmatic activities envisioned in this proposal. Use of consultant resources will help the HRPDC identify recommended approaches and potential changes to its resiliency program, including the possibility of increasing financial support from localities or state and federal grants to support local and regional CRS-related activities. Establishment of a regional Program for Public Information will necessitate ongoing support from HRPDC member localities, which will be incorporated into the HRPDC Coastal Resiliency Program's annual budget and work program.

2. *Goals and objectives tied to improving flood protection and prevention in a whole community approach to resilience. Identify and describe the goals and objectives of the project.*

The primary goal of this effort is to provide a resource-effective means for regional products to support locality participation in the Community Rating System. Community participation in the CRS provides discounts on NFIP flood insurance policies, which is becoming increasingly important due to changes in FEMA's flood insurance rating methodology as part of Risk Rating 2.0. These discounts accrue to all policy holders in a community, including both property owners and renters. This effort will support local and regional initiatives to encourage Hampton Roads residents to have flood insurance, which will increase community resilience.

3. *Stakeholder identification, outreach and education strategies.*

The primary stakeholders for this effort will be local government staff representatives who work on their localities' floodplain management and CRS programs. This effort will include outreach and engagement with individual localities and as groups through existing processes such as the HRPDC's Coastal Resiliency Committee and the Coastal Virginia CRS User Group. The HRPDC will coordinate these efforts with Wetlands Watch, which coordinates the user group, to identify possible opportunities for collaboration and enhancement and to avoid duplication of efforts.

4. *Implementation plan and timelines for specific elements of completion such as training, certifications, plan development, etc.*

The expected timeline for completion of this capacity building project is approximately one year.

- Months 1-3: Project initiation, meetings with stakeholders

- Months 2-5: review of existing CRS elements for opportunities for regional product development and delivery, assessment of existing HRPDC products, stakeholder discussions on regional CRS PPI
- Months 6-10: development of recommendations and discussion with stakeholders, finalizing of recommendations
- Months 11-12: outreach and education with communities, training on use of regional products

5. Parties responsible for capacity building and/or plan development process.

This effort will be managed by the HRPDC's Water Resources Department. The tasks described in the project narrative will be completed by the selected consultant with assistance from the HRPDC staff. All products and recommendations developed will be reviewed with HRPDC localities through the HRPDC Coastal Resiliency Committee and the Coastal Virginia CRS Users Group.

6. Performance outputs and measures. Describe the expected results and benefits and how success will be measured.

The expected outcomes of this effort will be a report documenting how localities can receive CRS credit for use of regional products, including specific guidance on how to use those regional products. The report will also include recommendations for the development of additional regional products. Another expected output of this project will be a viability assessment and work plan for establishing a regional Program for Public Information. Potential points received by communities through application of these regional products, including participation in the regional Program for Public Information, will also be documented in the report.

7. 7. Plans for maintaining capacity, as necessary, over the long term.

The HRPDC intends to incorporate the recommended actions, including ongoing product maintenance, development of additional products, and management of a regional Program for Public Information into its Coastal Resiliency Program, which receives funding annually through a special assessment from Hampton Roads localities as part of the HRPDC's annual budget process.

Budget Narrative

The total projected cost for capacity and planning under this effort is $21,149.33. According to the guidance outlines in the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund, proposals in the Capacity Building and Planning category are eligible for 75% funding from the Fund with a 25% match requirement. Therefore, the HRPDC respectfully requests financial assistance from the Fund in the amount of $15,000.00, which will cover the provision of consultant services for this effort, and the HRPDC commits to fund the remaining $6,149.33 via in-kind contributions from staff time.

Estimated total project cost: $21,149.33

Amount of funds requested from the Fund: $15,000.00

Amount of cash funds available: $6,149.33

	Budget Summary Worksheet		
Category	**CFPF Request**	**HRPDC Matching Funds**	**Total**

2022 CFPF Grant Application HRPDC 2 - Capacity Building

1 message

Ben McFarlane <bmcfarlane@hrpdcva.gov> Fri, Apr 8, 2022 at 3:38 PM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: "Robert A. Crum, Jr." <rcrum@hrpdcva.gov>, Cynthia Mulkey <cmulkey@hrpdcva.gov>, Whitney Katchmark <wkatchmark@hrpdcva.gov>

Good afternoon,

Please find attached the Hampton Roads Planning District Commission's submittal for the third round of grant funding for the Community Flood Preparedness Fund. The submittal contains the official and authorized application from the HRPDC to DCR to conduct a Capacity Building project for Hampton Roads.

The attached electronic file contains the following information:

- Application Form for Grant Requests for All Categories
- Scoring Criteria for Capacity Building and Planning
- Checklist for All Categories
- Scope of Work Narrative
- Budget Narrative
- Supporting Documentation

We appreciate the opportunity to apply for this funding. Please let me know if you have any questions regarding our proposal or if you require additional information.

Sincerely,

Ben McFarlane

Ms. Wendy Howard-Cooper
Director of Dam Safety and Floodplain Management
Virginia Department of Conservation and Recreation
600 East Main Street, 24th Floor
Richmond, VA 23219

RE: Authorization of City of Petersburg CFPF Project Application

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

The City of Petersburg has assembled the attached Project grant application to request Community Flood Preparedness Fund assistance to include demolition, and revitalization of the Roper Building site located near the center of Historic Pocahontas Island. This tiny peninsula on the Appomattox River is thought to be Petersburg's earliest predominantly African-American neighborhood – with the first enslaved blacks being brought there in 1732 to work tobacco and becoming its own town 20 years later. The demolition, and revitalization of the Roper Building site will meet many of the Department's criteria for a successful project including a nature-based approach of removal of a commercial structure from the floodplain. The resulting land conversion from impervious area to conserved open space will provide a multitude of floodplain related benefits – as the SFHA boundaries on Pocahontas Island are incrementally creeping inland considering the latest iteration of FEMA Mapping in process of being adopted by the City.

The City has been struggling to address purpose of this property for years, using it primarily as a storage facility while exploring many avenues; however, one of the biggest barriers may be the proximity of the floodway and floodplain of the Appomattox River and Channel. This source of funding perfectly aligns many symbiotic objectives. As the City is a documented low-income geographic area, and the project site is within a designated Qualified Opportunity Zone, with a high social vulnerability index score, the City respectfully requests full funding of this project and a waiver of match funds. Please accept this letter as my authorization of the request for CFPF assistant to enable the City to make significant progress toward Resilience and equitable management of our floodplains.

Sincerely,

Kenneth Miller
Interim City Manager

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☒ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☒ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): 130 Pocohontas Street, Petersburg, VA 23803

NFIP Community Identification Number (CID#):(See appendix F 510112

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): AE

Flood Insurance Rate Map Number(s) (If Applicable): 5101120007C eff. 2/4/2011

Total Cost of Project: $526,746.00

Total Amount Requested $526,746.00

Table of Contents

Appendices

A. Detailed Map of the Project Area (Qualified Opportunity Zone Map)
B. FIRMette of the Project Area
C. Historic flood damage data and/or images
D. Non-fund financed maintenance and management plan for project extending a minimum of 5 years from project close
E. Social Vulnerability Index
F. Completed Scoring Criteria Sheet and Checklist
G. Estimate of Work to be Completed by a Third Party

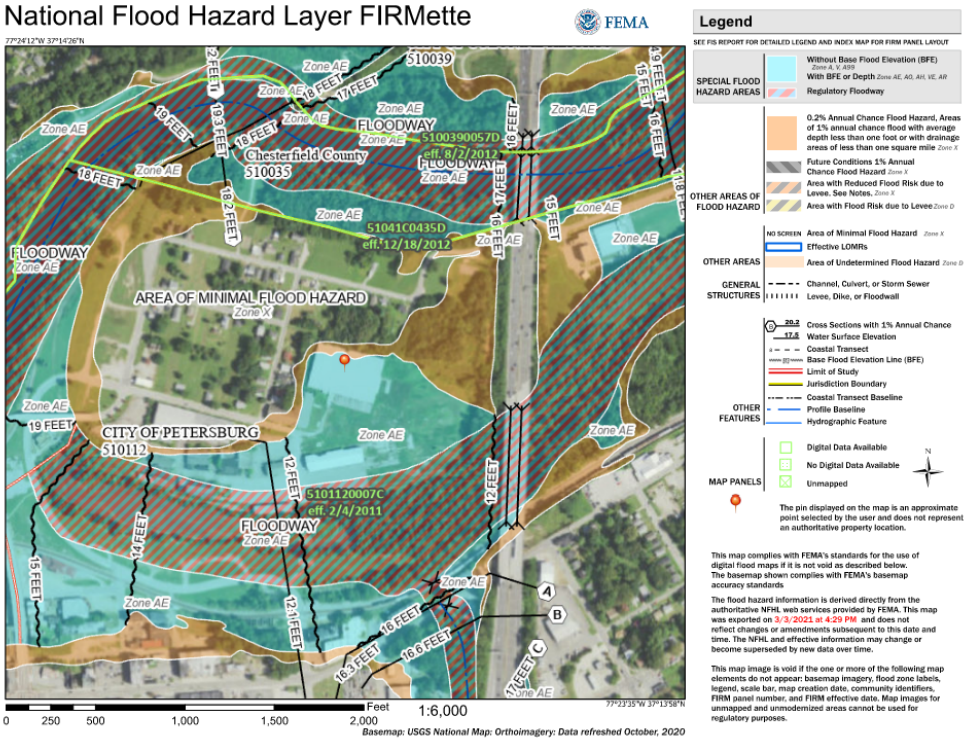
Scope of Work Narrative

1.0. Project Information

The City of Petersburg is applying for Community Flood Preparedness Fund assistance to include demolition of the Roper Building at 130 Pocahontas Street in the City of Petersburg. The City is respectfully seeking assistance with this flood prevention/protection activity to reduce property damage caused by flooding. The project will result in removal of the dilapidated commercial structure from the floodplain, and restoration of the floodplain resulting in preservation and creation of open space along the Appomattox River.

- *Population*. The City of Petersburg has a population of 31,362 as of 2019. The City is a low-income geographic area, as defined in the CFPF Grant Manual, as an area where the median household income ($38,679) is significantly less than 80% of the local median household income ($74,222 in VA), according to the US Census Data in 2019[1].

- *Historic flooding data and hydrologic studies projecting flood frequency*. The building footprint is almost entirely located in the 1% Annual Chance Special Flood Hazard Area and entirely in the 0.2% Annual Chance Flood Hazard, as illustrated below. The effective mapping is presented in Appendix B, as well as the Preliminary Firm, dated 2/12/2021. The updated preliminary mapping is expected to be finalized in 2023; there are no substantial changes to the mapping in the vicinity of the building, though the SFHA boundaries are creeping inland.



The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/3/2021 at 4:29 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

---

[1] https://www.census.gov/quickfacts/fact/table/petersburgcityvirginia,VA,US/PST045219

- *The ability of the local government to provide its share of the cost.* The City has been struggling to address the purpose of this property for years, using it primarily as s storage facility while exploring many avenues; however, one of the biggest barriers may be the proximity of the floodway and floodplain of the Appomattox River and Channel. The City does not presently have the funding required to demolish the building and restore the floodplain.

- *The administration of local floodplain management regulations*. The City has an existing floodplain ordinance but requested and been notified of award of CFPF assistance in the Round 2 cycle to hire a CFM and update the existing ordinance to address the updated FEMA mapping. The existing ordinance can be found at the following web address: https://library.municode.com/va/petersburg/codes/code_of_ordinances?nodeId=PTIICO_CH58FL).

- *Other necessary information to establish project or study priority.*
    - *Repetitive loss and/or severe repetitive loss properties.*
    - *Residential and/or commercial structures*. This funding request is to remove one large commercial structure from the floodplain.
    - *Critical facilities*. There are no critical facilities within the project site.

2.0 Need for Assistance

The City of Petersburg's need for assistance is well documented in terms of financial and staff resources. For this project, the City has exhausted several avenues of funding assistance and recently received a quote from Pryor Hauling, Inc., **Appendix G**. As mentioned previously in Section 1.0, the City is a low-income geographic area. The project site is within a Qualified Opportunity Zone (ID 51730811300), as presented in **Appendix A**. Further, the project site is in an area designated as High Social Vulnerability (Index score: 1.4), as presented in **Appendix E**, which is in census tract 8113.

3.0. Goals and Objectives

The primary goal of the project is to remove the commercial structure from the floodplain and restore the floodplain within the project area, resulting in preservation and creation of open space along the Appomattox River. The goals are consistent with preservation of the historic island, which is discussed in the Wikipedia article presented in **Appendix C**. Further, the City studied this parcel for TMDL credit for land conversion, the Memorandum discussing this approach is also presented in **Appendix C**.

4.0. Approach, Milestones, and Deliverables

The City will use a qualified Contractor procured following Virginia Procurement Law to demolish the Roper Building at 130 Pocahontas Street and restore the floodplain to conserved open space. The proposed work will be accomplished within three years of grant authorization. A general plan of action is outlined in the following table.

Milestone	Deliverable	Timeline
Revise Floodplain Ordinance	Codify Floodplain Overlay authority	In accordance with CFPF Round 2 grant terms
Demolition of Roper Building	The building will be demolished, and all materials removed and disposed of properly.	June 2022 – December 2022
Revitalization of project site and creation of open space	The floodplain will be restored with native vegetation.	Perpetuity. The City will establish a conservation easement in accordance with the Floodplain overlay.

5.0. Relationship to Other Projects

The City requested and was notified of award CFPF assistance in Round 2 to complete updates to the City’s existing Floodplain Ordinance to equitably manage the City’s floodplains. This project represents the City’s commitment to nature-based solutions addressing properties with buildings in the floodplain. Further, this project is consistent with the City’s Chesapeake Bay TMDL requirements for which land conversion from impervious to managed turf or conserved open space will result in credit for nutrients and sediment pollutants.

In addition to the information provided in **Appendix C**, refer to the Petersburg excerpt of the regional Hazard Mitigation Plan identifies in Petersburg-1 the high priority of enforcing zoning and building codes with emphasis on floodplain management and Petersburg-15 which includes acquisition of flood prone property.

6.0. Maintenance Plan

The City will establish a conservation easement along the floodplain limits to prohibit future encroachment into the floodway and floodplain at this site.

7.0. Criteria

This project will meet many of the Department’s criteria for award of CFPF assistance, including restoration of the floodplain, and a nature-based approach consisting of removal of the old commercial building. The project site is in an area of high social vulnerability and a low-income geographic area. Conversion of impervious space to open space is consistent with the Chesapeake Bay TMDL. Finally, the project does provide “community scale” benefits as the existing structure is situated on the historic Pocahontas Island, and the City is committed to supporting efforts to protect and preserve this space. Please refer to the completed scoring criteria sheet presented in **Appendix F**.

8.0. Supporting Documentation

The following is a list of supporting documentation as required by the CFPF grant manual and associated links or location in the Appendix where more data is provided.

- Detailed map of the project area (**Appendix A**)
- FIRMette of the project area (**Appendix B**)

- Historic flood damage data and/or images (**Appendix C**)
- A link to the current floodplain ordinance: https://library.municode.com/va/petersburg/codes/code_of_ordinances?nodeId=PTIICO_CH58FL
- Non-fund financed maintenance and management plan for project extending a minimum of 5 years from project close (**Appendix D**)
- A link to the current hazard mitigation plan: https://www.craterpdc.org/environment/hazard_plan_2017.htm
- A link to the current comprehensive plan: http://www.petersburg-va.org/378/Comprehensive-Plan
- Social vulnerability index score(s) for the project area: 1.4, the project site is located in census tract 8113, which according to the Virginia Vulnerability Viewer is classified has high social vulnerability (Map attached in **Appendix E**).
- Letters of support from affected communities: N/A
- Completed Scoring Criteria Sheets (**Appendix F**)

Budget Narrative

The following is the budget narrative requested per the Grant Manual:

- Estimated total project cost: $526,746 (represents estimate provided by Pryor Hauling, Inc., plus a 10% contingency due to current market volatility and supply chain issues.)

- Amount of funds requested from the Fund: $526,746

- Amount of cash funds available: The City respectfully requests full funding of this project and for a waiver of match funds, per the letter signed by the Interim City Manager.

- Please refer to the cover letter for the City’s authorization to request for funding.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Base map information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). This information was derived from digital orthophotography at a 2-foot resolution from photography dated 2016.

Pocahontas Island

Pocahontas Island is a peninsula in Petersburg, Virginia once on the opposite side of the Appomattox River from Petersburg. Since 1915 a new channel for the river separated it from Chesterfield County and the former channel no longer separates it from the city. Once a warehouse and wharf-filled urban landscape initially platted in 1749, the island was devastated by a 1993 tornado before citizen involvement caused creation of the Pocahontas Island Historic District, which in 2006 achieved listing on the National Register of Historic Places (NRHP) as a historic district because of its significance in African-American history and for its prehistoric indigenous archeological assets.

Archeologists found evidence of prehistoric Native American settlement dating from 6500 B.C.[3] The indigenous Appomattoc people inhabited this region and encountered European colonists by the early 18th century, when the first enslaved Africans were brought to work here.

In the 19th century, Pocohontas Island became a notable freedom colony.[4] the first predominately free black settlement in the state and, by mid-19th century, one of the largest in the nation (although enslaved people also lived on the island, and some free blacks owned slaves).[5] In 1860 slightly more than half of Petersburg's population was black, and 3,224 or one-third of those people were free; they constituted the largest free black population of the time. During the 20th century, the island's population declined as people moved north in the Great Migration. In 1975 residents secured renewed residential zoning to protect their neighborhoods from industrial development proposed by the city.[5]

History

Archaeological evidence of a prehistoric Native American community dated to 6500 BC has been found on the island.[3] This is at the beginning of the Middle Archaic Period (6500 BC to 3000 BC) or end of Early Archaic Period (8000 BC to 6500 BC)[6]

When European colonists first arrived in Virginia and established the colonial settlement of Jamestown in 1607, the Appomattoc people who were part of the Powhatan Confederacy inhabited this region. The first colonial settlement on the peninsula was established in the 18th century. A group of enslaved Africans were brought here in 1732 to work in John Bolling's tobacco warehouses. Colonial surveyors platted the land in 1749, and white settlers named the village "Wittontown."[7] When formally organized as a town in 1752, it was renamed Pocahontas after the Native American daughter of Powhatan, who was important in early Virginian colonial history and, together with her husband, John Rolfe, became an ancestor of numerous First Families of Virginia.[5]

In 1757 Petersburg built a bridge to link the peninsula to the city, and for some early years, a board of trustees managed the "island" and its development.[5] Incorporated within the city limits in 1784 after the American Revolutionary War, the Pocahontas Island neighborhood became a center of a free black population. Pocahontas Island's large free black residential community is the oldest in the nation and its commercial center developed into a destination for the state's free blacks. By 1797 free blacks established the Sandy River Baptist Church, and some members in 1818 moved across the then-river channel into the city's center and built the Gillfield Baptist Church. The growth of industrial jobs attracted free blacks to Petersburg. Artisans and craftsmen could make a living, while others worked as boatmen and fishermen on the river. By 1860, Petersburg's population was half black - of those, one-third were free. It was the largest free black population in the nation.[8]

From 1830 until 1860, Pocahontas island's (recently excavated 30x300 foot) railroad depot was the terminus of the Richmond and Petersburg Railroad. It was Petersburg's main freight and passenger station until the American Civil War, when it also transported many Confederate troops and supplies.[3] The island was filled with many wharves and warehouses, in addition to residential streets.[9] No sign of the Confederate fortifications on the island remains, and the short railroad line built in 1863 to simplify transshipment of goods from Norfolk and Danville railroad lines to Richmond via Petersburg was removed immediately after the war; the Union Signal Corps filed many reports of railroad activity on Pocahontas during the war.[10] However, Petersburg City's government, despite building another bridge in 1851, often neglected the neighborhood, usually more concerned with development in white areas.[5] Numerous antebellum houses survive, especially on the island's east end, and archeologists have also unearthed the foundations of the railroad depot and the Petersburg Distilling Company, Inc. (1911-1916).[11] Two surviving houses were linked to the Underground Railroad before the American Civil War: the Jarratt House (808-810 Logan Street, predates 1820 on tax records and is the island's sole surviving brick building), and the double house at 215 Witten Street is informally called the "Underground Railroad House" (predating 1838, it once had a pseudo-brick facade).[3] The island's remaining 19th-century houses were built in the "shotgun style" usually associated with larger southern cities such as New Orleans, Houston, Atlanta and Louisville to make maximum use of narrow urban lots as well as local ventilation patterns.

It took decades for Petersburg to rebuild after the American Civil War, although one railroad line was rebuilt sufficiently by November 1867 for General Robert E. Lee to stop at the city en route to his son's wedding. Pocahontas had mixed industrial, commercial and residential use, including a sawmill by 1877 and a powder magazine on land now occupied by a waste treatment plant.[12] Postwar employment cycles continued to affect less educated blacks severely, especially the Panic of 1893. The original Pocahontas Chapel was built at the war's end by the New York Freedman's Relief Society,[13] and also served as a school for freedmen. Destroyed by the 1993 windstorm, it was rebuilt and remains a community center.[14] Although the original building was locally rumored to have once served as a headquarters for General Grant at nearby City Point (Hopewell, Virginia) and transported to Pocahontas, that building was actually dismantled and taken to Philadelphia for an exhibition, and most of the City Point structures were tents.[15] After the war, Pocahontas-born free black William N. Stevens became a lawyer and the first African American to serve in both houses of the Virginia General Assembly, although his legislative district centered on nearby Sussex County. Stevens maintained a house on the island (which still survives), though he died relatively young of throat cancer in 1889.[16]

Increasing industrialization in Petersburg and nearby Hopewell provided continued opportunities for blacks, even though the white-dominated Virginia legislature imposed racial segregation and disfranchisement in the late 19th century. Ice, coal, oil and lumber companies operated on Pocahontas by the early 20th century, although the island suffered devastating floods in 1910 and 1920, and the river rechannelled midway between. Furthermore, the DuPont company established a munitions factory in nearby Hopewell by 1914, and although that city burned the following year, it then prospered, and many blacks chose to live on Pocahontas. Largely excluded from the political system, blacks created their own opportunities. As the 20th century progressed, the more ambitious and younger people tended to leave the island (and many southern states) for other opportunities. The Great Migration to northern industrial cities, starting about World War I, is the time Islanders refer to as "when they lost the 'cream of the crop', and the majority of the remaining population being elderly retirees who sustain themselves on small fixed incomes."[5] The neighborhood shared economic troubles with Petersbburg, which lost jobs to other areas and increasingly to Richmond, long the state capital and which became the region's and state's financial center.

In 1971 the Petersburg city government rezoned some of the island for light industrial use. This caused the homes of 250 residents to be threatened with condemnation, making it impossible for owners to get financing for renovations. In 1975 residents won a battle to restore residential zoning. Allied groups began to survey and document the many historic properties.[5] The **Pocahontas Island Historic District** was added to the National Register of Historic Places in 2006 because of its abundance of archaeological sites from prehistory through historic times, and of numerous antebellum buildings marking its history as a free black community.[17]

A 1993 tornado severely damaged some houses and the chapel, and in 2015 the neighborhood was still listed among the state's most endangered historic sites.[18] By the late 20th century, the population had declined to fewer than 100 on the island from a high of 1700 earlier.[19]

Recognition

Because of its significant resources, ranging from prehistoric to historic, the Pocahontas Island Historic District is listed on both the Virginia Landmarks Register and the National Register of Historic Places (NRHP). It is also the location of the Pocahontas Island Black History Museum.

MEMORANDUM

TO: City of Petersburg

FROM: Timmons Group

DATE: September 17, 2021

RE: Petersburg Surplus Property Evaluation for Chesapeake Bay TMDL Action Plan

Introduction and Purpose:

The purpose of this memo is to provide accompanying information presented in the meeting between the City of Petersburg and Timmons Group on September 17, 2021, whereby Timmons Group presented the results of a surplus property evaluation as related to the City's Chesapeake Bay TMDL Action. For this memo, discussion will be centered on strategies recommended for the City to achieve the entire anticipated regulatory Chesapeake Bay TMDL pollutant of concern (POC) load reduction requirement. The present regulatory requirement (due June 30, 2023) is a net 40% reduction in overall calculated progress toward achieving the L2 scoping runs, as specified in the Commonwealth's Watershed Implementation Plan (WIP). The third permit cycle (ending June 30, 2028), where the final 100% reduction will be required has not yet been written, and therefore, is anticipated. Timmons Group believes it is prudent for the City to be planning for implementation strategies to achieve the entire anticipated POC load reduction requirement, though the TMDL Action Plan may be specifically geared toward achieving the current regulatory requirement of 40% progress.

As an overall project update, and for reference, the status of the TMDL Action Plan update is that Timmons Group has been tasked with revisions to the City's plan using the following four strategies:

- *Reduce the City's load reduction requirement by excluding forested lands from the Chesapeake Bay Urban Regulated Area,*
- *Examine the updated TMDL Guidance regarding street sweeping and storm drain clean out and make recommendations to the City,*
- *Analyze sites that have potential for stream restoration and/or outfall restoration identified through an updated site selection process*, and
- *To exhaust all potential cost-effective solutions, Timmons Group proposed an evaluation of the City's surplus properties to determine the potential for land use change.*

Detailed in the following sections is a brief progress update on the first three tasks outlined above, and an extensive presentation of the analysis of the potential of exploring land conversion as a best management practice for surplus properties through out the City.

Brief Progress Update:

Exclusion of Forested Lands from the City's Regulated Area.

Timmons Group has completed an exercise to define the City's forested lands and remove the load from the anticipated total required reduction in pollutants of concern (POC).

Table 1. Reduction in POC Loads Attributed to Removing Forested Lands from the City's Regulated Area.

Pollutant of Concern (POC)	**Sub source**	**Regulated Area, 2015 (acres)**	**Regulated Area, 2020 (acres)**	**Loads (lb/yr) 2015**	**Loads (lb/yr) 2020**	**Anticipated Target POC Load Reduction, 2015 (lb/yr)**	**Anticipated Target POC Load Reduction, 2020 (lb/yr)**	**Reduction in Target POC Load (lb/yr)**
Nitrogen	Impervious	1,597.88	1,597.88	15,004.09	15,004.09	3,242.03	2,758.58	483.45
	Pervious	4,510.40	3,357.69	31,529.69	23,470.25			
Phosphorus	Impervious	1,597.88	1,597.88	2,812.27	2,812.27	613.46	571.68	41.78
	Pervious	4,510.40	3,357.69	2,255.20	1,678.85			
Sediment	Impervious	1,597.88	1,597.88	1,081,668.89	1,081,668.89	256,226.00	246,030.87	10,195.13
	Pervious	4,510.40	3,357.69	455,911.15	339,395.31			

*Forested lands must meet the definition set forth in DEQ's Chesapeake Bay TMDL Guidance.

The exercise resulted in a significant POC load reduction of 483 lb/yr of nitrogen, nearly 42 lb/yr of phosphorus, and more than 10,000 lb/yr of sediment.

Update City's Progress toward Implementation of Best Management Practices with DEQ's Revised Guidance.

Timmons Group reviewed the revised Guidance Memo[1] issued by DEQ in February 2021 and associated revisions to the Street Sweeping BMP. The revisions resulted in a dramatically reduced credit given to street sweeping activities for which the City of Petersburg had previously relied upon to achieve a significant portion of Chesapeake Bay TMDL compliance. Timmons Group updated the credits which can be applied to the City of Petersburg's practices per Appendix V.G.1 of the Guidance Memo, as presented in Table 2, below. Note, the City is required to document the street sweeping activities as follows:

1. "Actual sweeper routes (and type of road)
2. Total curb miles swept on each route
3. Average parking conditions and controls along the route (optional) Expert Panel Report on Street Sweeping and Storm Drain Cleaning
4. Sweeper technology used (AST or MBT)
5. Number of sweeping passes per year on each qualifying route. In addition, the locality should maintain records of the actual miles swept, by date, for entire the MS4 sweeper fleet, over the reporting year."

In addition to the updated street sweeping credits, a summary of progress toward Chesapeake Bay TMDL implementation projects is presented in Table 2. Progress achieved to-date results in a deficit of 786 lb/yr TN, 91 lb/yr TP, and nearly 50,000 lb/yr of TSS by June 30, 2023, and an overall target of 2,441 lb/yr TN, 434 lb/yr TP, and nearly 200,000 lb/yr TSS for which the City needs to plan additional implementation measures and/or projects.

The revised Guidance Memo also offers credit methodology for Storm Drain Cleaning, which requires documentation and record keeping. Timmons Group strongly recommends that the City consider implementation of a proactive storm drain cleaning maintenance program to track the quantity of dry sediment and associated nutrient removed prior to proper disposal. Such a program could feasibly be implemented in conjunction or upon completion of the upcoming inventory effort on which the City intends to embark and could be managed geospatially using an asset management program such as Cityworks® or other similar program.

---

Table 2. Summary of Progress of Planned and/or Implemented Best Management Practices To-Date.

Best Management Practice	Pollutant of Concern Removal (lbs)		
	TN	TP	TSS
Street Sweeping (Lane Miles Method)	6.04	0.38	871.54
Culpeper Avenue	14.43	1.15	604.00
Fleets Branch, Phase 2	296.04	136.34	47,003.31
Canal Street	1.29	0.16	45.20
Credits Achieved To-date	**317.80**	**138.03**	**48,524.05**
Total Reduction Required (2 permit cycles)	1,103.43	228.67	98,412.35
Total Reduction Required (3 permit cycles)	2,758.58	571.68	246,030.87
Phase 2 Deficit (2023)	785.63	90.64	49,888.30
Anticipated Phase 3 Deficit (2028)	***2,440.78***	***433.65***	***197,506.82***

Use Updated Site Selection Process to Identify Candidates for Stream Restoration and/or Outfall Retrofit.

While previous efforts at identifying potential sites for stream restoration had been focused solely on publicly owned properties, as presented in the 2013 Water Quality Master Plan, the current effort expanded upon the recent outfall inventory scope, in which many candidate projects were sited on private properties.

The current analysis resulted in the identification of a total of ten (10) sites that varied in length from 290 LF to 3,170 LF and were ranked with consideration for overall cost, $/lb of TP removed, access/perceived constructability, and restoration priority potential. Completion of all ten identified projects could result in the following estimated POC reduction potential:

- TN - 3,918.10 lb/yr,
- TP - 918.6 lb/yr
- TSS - 287,984 lb/yr

If all ten identified projects were completed, the City of Petersburg would likely exceed the anticipated (Phase 3) Chesapeake Bay TMDL requirement for all three pollutants of concern (POC) given the previously presented calculations. When taking into consideration progress to-date, as presented in Table 2, it was determined the City would need to complete a total of seven (7) projects before reaching the anticipated total POC reduction requirement for a total estimated cost of $5,436,000. However, several of the projects identified utilized baseline reductions to estimate potential pollutant removal; thus, enhanced pollutant removal could be realized during engineering design and project implementation.

Surplus Property Evaluation for Land Cover Conversion Credit.

The following sections provide, in detail, the methodology, results and recommendations stemming from the Surplus Property Evaluation. As detailed below, the analysis considered conversion from existing land use (pervious, impervious, or both) to either Forested or Mixed Open Space.

Methodology:

Timmons Group analyzed the data provided by the City which included 42 discrete properties (referred to as Surplus Properties). Of these 42 properties, 38 properties are at least partially located within the Chesapeake Bay Urban Regulated Area and were studied for potential TMDL credit for Land Use Change per the revised Guidance Memo. The original dataset provided by the City included properties at 1600 Shirley Avenue and 300 St John Street that were erroneously geolocated; however, upon aerial inspection both lots are presently under forest land cover and thus were excluded from further analysis. The Shirley Avenue property was identified for potential stream restoration as Project J, which will be discussed further in the Recommendations section. 36 properties were further considered for potential Land Use Change POC removal credits.

The Surplus Property GIS data layer was intersected with the City's updated Chesapeake Bay Urban Regulated Area layer that included pervious and impervious land cover. Forested areas were excluded from the Chesapeake Bay Urban Regulated Area as briefly described above and are not eligible for land use change credits. Therefore, any surplus properties that currently have significant forest cover were excluded from this analysis.

Source data for existing land use comes from a geodatabase provided by Timmons Group. The data was developed when Petersburg instituted a stormwater utility fee program based on 2011 land cover, which has been historically adopted as the regulated 2009 land cover since it is the best available data.

Two discrete sets of analyses were performed for the surplus properties: 1) existing land cover to Forested and 2) existing land cover to Mixed Open. The purpose of this was to provide the City a level of flexibility, as some parcels may not be suitable for conversion to a forested land use change, as defined in the Guidance document, but may still afford the City significant potential if converted to mixed open space. Reduction efficiencies in the James River Basin for the various proposed land cover types are presented in Table 3 below.

Table 3. Excerpt from Table V.H.1 – Land Use Change Conversion Efficiency Table from the Chesapeake Bay TMDL Special Condition Guidance.

Land Use from	Conversion to	TN (lbs/ac/yr)	TP (lbs/ac/yr)	TSS (lbs/ac/yr)
Impervious	Forest	11.84	0.78	1,327
Pervious (Turf)	Forest	6.37	1.39	465
Impervious	Mixed Open	11.36	0.5	389
Pervious (Turf)	Mixed Open	5.89	1.12	0.00

In addition to strictly looking at potential for pounds removed of total phosphorus, consideration was given to cost, *i.e.*, cost per conversion of land was developed and then applied to each case. Factors used to develop planning level cost data for conversion of impervious to Mixed Open or Forested cover included demo of the pavement and/or buildings, hauling/disposal, grading, and topsoil addition, plus a mobilization factor which was considered in the unit costs. If the existing parcel included buildings, an additional planning level cost to demolish the building and cap existing utility service lines was included in the cost analysis and was estimated based on building footprint. No differentiation was given to height of the existing building, as that data is not readily available; so, caution should be used when considering this planning level cost data. The intent of the cost estimate is to provide proof-of-concept data for decision making moving forward. If a site was to be converted to Forested Lands, this cost analysis included the costs for seedlings, stakes and mattings around the plantings, and manual labor costs to perform the plantings.

Conversion to Forested Lands included the following cost assumptions:

1. 400 seedlings required per acre to meet the density requirement listed in Table V.H.2 of the Guidance Memo.

2. Seedling costs of $35 per acre planted based on a previous case study.

3. Staking, tree matting, and bird netting costs estimated at $5 per tree.
4. A labor estimate of $9,650 per acre was applied to the cost determination based on a previous case study.

Estimates for the demolition of pavement was based on a study of recent VDOT District Averages and Statewide Average data, amounting to an assumed value of $34 per square yard of pavement demolished ($3.78 per square foot). Estimates for the topsoil addition assumed that all acreage currently designated as impervious would require 6” (0.5’) of topsoil amendment for impervious demolition or 2” (0.167’) of topsoil amendment for existing pervious development. The square footage of impervious was multiplied by 0.5’ or 0.167’ to yield a volume estimate of fill. Fill placement and associated earthwork costs (hauling, labor, E&S etc.) was estimated at $50 per cubic yard for existing impervious areas or $20 per cubic yard for existing pervious areas, based on 2021 VDOT District and Statewide Average Data for similar line items.

Results:

For each of the Surplus Properties, the potential POC reductions were tabulated as existing land cover conversion to Forested or Mixed Open. Presented in Tables 4 and 5 below are the summary results for the properties analyzed. The summary includes a listing of the area of each property considered available for land conversion (i.e., any areas already considered forested or removed from the regulated area were excluded), the potential POC credit for land conversion, and the relative cost in $/lb of TP. While the cost effectiveness for nitrogen and sediment were analyzed, only phosphorus was presented due to its prevalence as the indicator pollutant in Virginia. Please note that if all available surplus properties were converted to forested land cover, the City could potentially realize a maximum of 71.58 lb/yr of TP removal, which is considerably short of the required 40% progress required by June 30, 2023. Further, the planning level cost effectiveness averages $12,000/lb of TP, which is generally less cost effective than most identified stream/outfall restoration projects.

As presented in Table 4, any properties which would be ineligible to meet the forested land cover requirements (30-meter x 30-meter area and specified tree density per acre, as defined in the Guidance Memo) were greyed out and further excluded from additional consideration. Further, any properties that would achieve >1lb/yr removal of TP were highlighted green, which included the additional two properties at 343 Rolfe Street and 800 Magazine Road, due to their relative proximity to other Pocahontas Island properties. Proximity to this defined “planning area” would increase the effectiveness and efficiency of the land conversion. As a result, seven (7) discrete sites and/or properties were further considered for conversion to forested land cover.

Table 4. Land Use Change to Forested POC Removal Potential and Relative Cost per Surplus Property

	Planning Area	Address	PIN	Area	Existing Cover to Forest Land POC Removal			Relative Cost – Forest Conversion
#				Acres	TN, lb/yr	TP, lb/yr	TSS, lb/yr	TP $/lb
1	Pocahontas Island	130 Pocahontas St	007-070009	21.81	202.87	23.18	20,220.17	$168,794.51

			SUM		**518.63**	**71.58**	**48,528.63**	

Like the forest conversion analysis, a summary is presented in Table 5, of the analysis for conversion from existing land cover to mixed open space. ‘Mixed Open’ is defined in the Guidance Memo as “herbaceous cover that is minimally disturbed (periodically bush hogged, meadows, etc.)” and has no nutrient application. Therefore, conversion to mixed open space from existing land cover will be considerably more cost effective, primarily due to the extensive labor required to plant and establish a successful forest at the density prescribed. However, using the >1lb/yr TP threshold to consider a site worthwhile for further consideration, the number of discrete sites/properties dwindles to five (5).

Table 5. Land Use Change to Mixed Open POC Removal Potential and Relative Cost per Surplus Property

			SUM		**488.47**	**54.78**	**8,927.81**	

Of the 36 surplus properties analyzed, most are not cost effective or feasible for land cover conversion in an appreciable manner. Once the top properties highlighted in green presented in Table 4 are removed from the analysis, the sum of the remaining potential phosphorus removal is only around 5 lbs. The administrative effort to develop and establish conservation easements around isolated properties throughout the City is not worth the small net return for Chesapeake Bay TMDL compliance.

Thus, the final sites/properties remaining in consideration for land conversion, include:

- Pocahontas Island,
- 801 S Adams Street (former Southside Regional Medical Center),
- 627 REAR N South Street (Patton Park),
- 2120 Dock Street,
- 39 REAR River Street,
- 522 Hinton Street, and
- 527 E Bank Street

Recommendations:

A desktop investigation of each of these sites was performed to make recommendations to the City regarding the viability of land conversion as a Chesapeake Bay TMDL best management practice and the next steps with regards to the City's TMDL Action Plan.

1. Pocahontas Island on the Appomattox River is a historic landmark location and hosts the site of the Oldest Black Community in the United States, as well as the Pocahontas Island Black History Museum. The largest parcel on the site is 130 Pocahontas Street, which if fully conserved as forest or open space, could potentially realize a total phosphorus reduction of 23.18 lb/yr or 17.17 lb/yr, respectively. The demolition of the existing warehouse buildings is an important cost consideration. Although the dollar per pound figure for the 130 Pocahontas Street property is high (>100,000 $/lb TP removal), there may be intrinsic aesthetic value in the demolition of the pavement and existing buildings in addition to POC removal. However, as illustrated in Figure 1 below, there may be considerable potential to redevelop multiple properties, while also providing land conversion. The total potential phosphorus removal for conversion of all publicly owned land on Pocahontas Island is nearly 34 lb/yr; however, the City may wish to consider sub-dividing multiple parcels along the outer boundary of the island and set them aside in forest conversion easements while using the inner portions of properties for re-development efforts. Timmons Group recommends the City consider the future of Pocahontas Island as a planning area, rather than discrete parcels, and when considering redevelopment and economic development, consider land conversion of contiguous lands with intrinsic environmental value, as well.

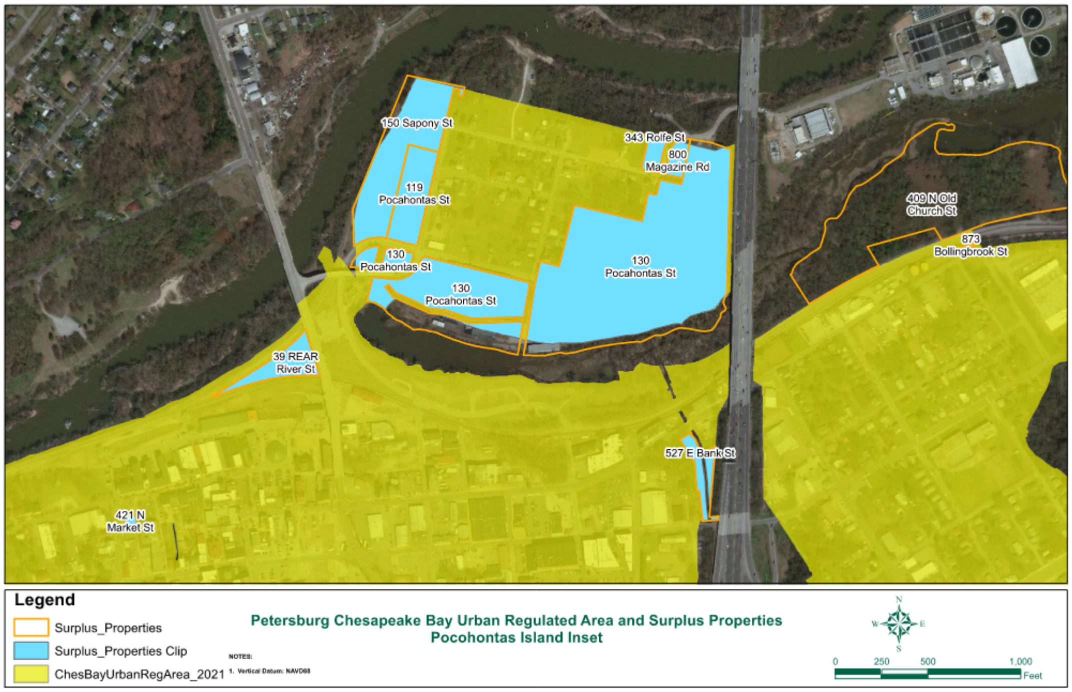

Figure 1. Pocahontas Island Planning Area.

2. 801 South Adams St (Former Southside Regional Medical Center), presented below in Figure 2 initially appears to be a good candidate for land conversion based on its high percentage of existing impervious area (~50%). However, Timmons Group realizes this site is a candidate for economic development grants. Further, enhanced potential for stormwater management was briefly explored, such as a constructed wetland in addition to land conversion and it was determined that the drainage patterns in the watershed are not a good match. Additionally, the City's notes in the surplus property database indicate the site has "extensive underground utility infrastructure and water transmission mains from the old hospital." Should economic development plans for this site fall through, the large parcel lends itself to potential land conversion and conservation. Should re-development proceed, the City could benefit from additional potential POC reduction credit through the redevelopment process.

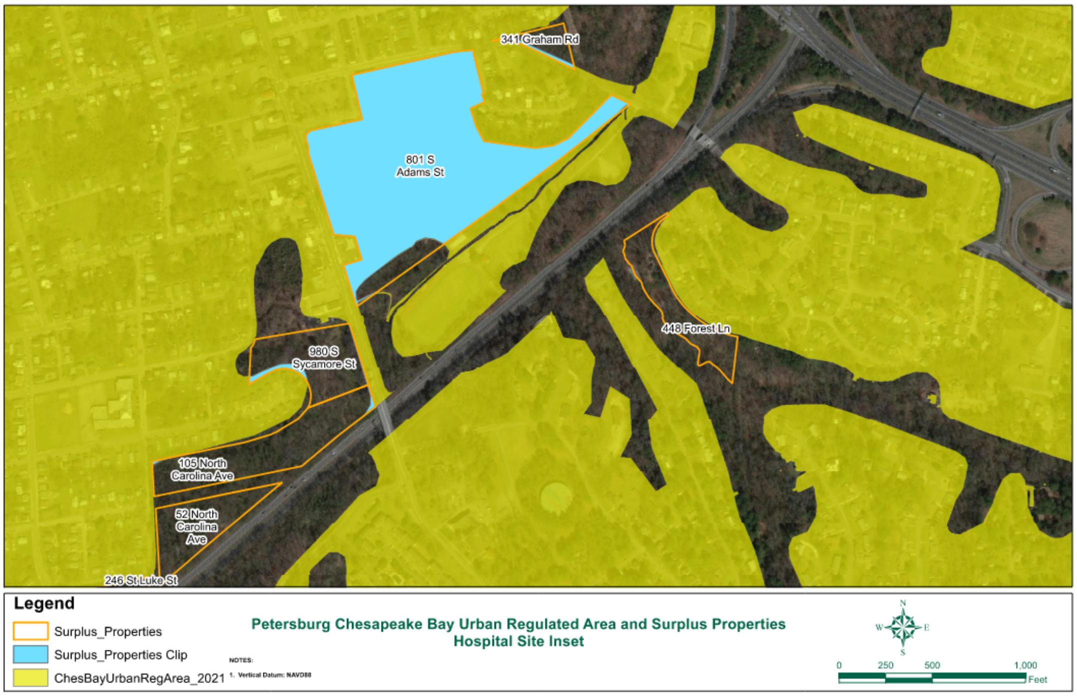

Figure 2. 801 S Adams Street.

3. 627 REAR N South Street (Patton Park) is a publicly owned site included in the data for surplus property evaluation. During the summary analysis, the property initially appeared to have potential for land conversion from a pollutant removal and efficiency perspective; however, upon closer inspection, this site is the existing parking lot of Patton Park, and does not have as much potential for land conversion as initially appeared. It should be noted that a large portion of this parcel is already excluded from consideration as it is outside of the regulated area. This site is excluded from further land cover conversion consideration based on its active land use, consisting of parking, trails, and river access along the Appomattox.

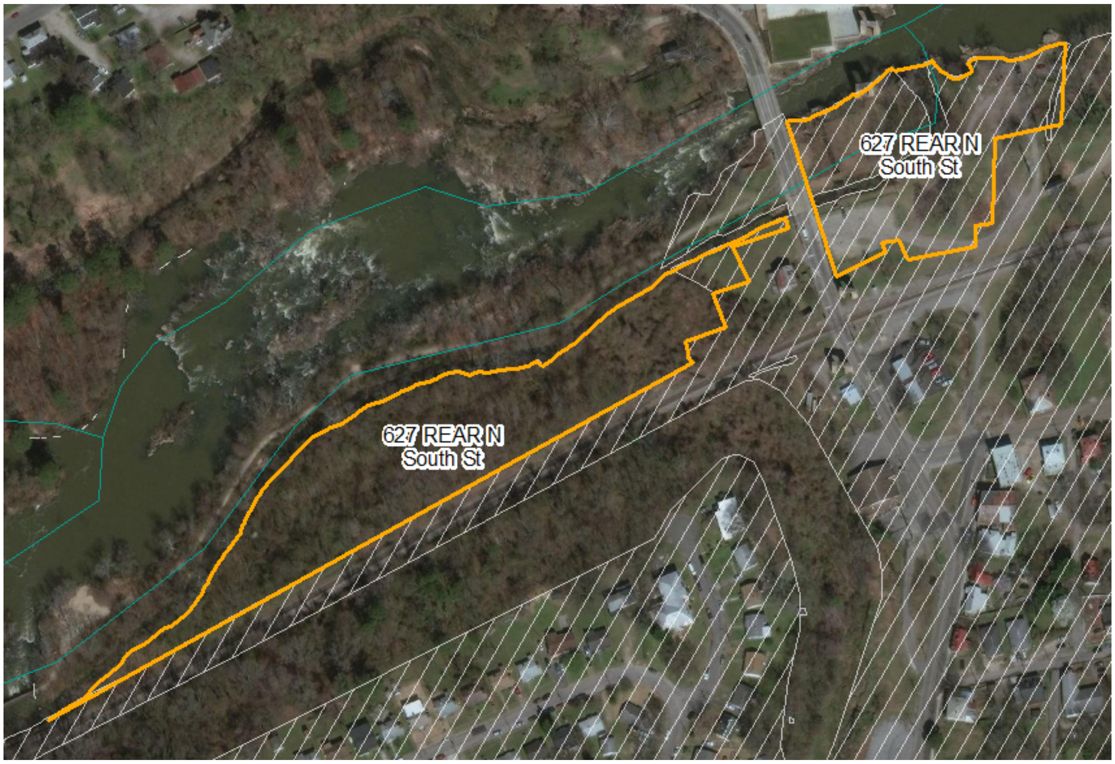

Figure 3. Patton Park.

4. 2120 Dock Street initially appeared to have potential for POC removal for land conversion at a relatively efficient cost ratio; however, upon inspection of current land use, the property appears to be a sliver of existing forest with an access road behind an active maintenance yard that is privately owned. The site is also noted to consist of a water transmission line and sewer trunkline; thus, perpetual access along these major utilities is required. Most of the site is outside of the regulated area (regulated area is depicted with cross hatches in the image). Conversion of the access road to conserved forest or open space is not likely, nor does the prospect yield a significant POC reduction; therefore, no further action is recommended for this parcel.

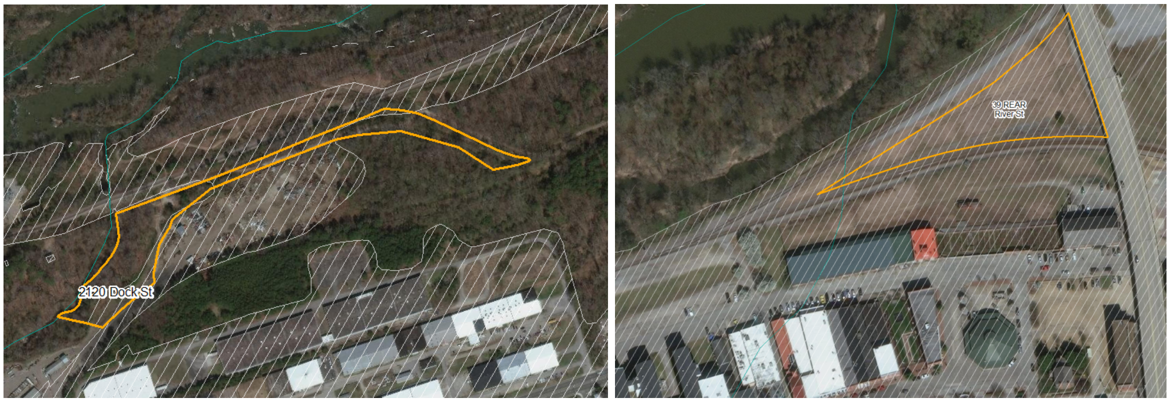

Figure 4. 2120 Dock Street (left) and 39 REAR River Street (right).

5. 39 REAR River Street is a triangle of land between two railroad spurs and US Hwy 1. This parcel of land is presently mowed or bush-hogged, but not maintained otherwise. Timmons Group did calculate a potential land conversion credit from pervious to open space and/or forest; however, claiming credit for this conversion will not make an appreciable difference toward the City’s overall goals and may not be worth the administrative headache. This action could also prompt

additional scrutiny into the validity of land conversion as a best management practice, as the site is arguably already considered open space.

6. 522 Hinton is the site of the attempted Brickhouse Run stream restoration. Though a small site (0.81 acre), based on the issues encountered during the stream restoration project, this may be a good candidate site for conserved open space, which if documented, could get nearly 1 lb of total phosphorus removal to add to the City's TMDL progress. There are several adjacent parcels, which when considered together could have potential as an urban park and conservation area, should the City wish to explore further. The total potential phosphorus removal for conversion could range from 1.41 – 1.76 lb/yr or more if the parcel at 100 Lafayette Street could be obtained.

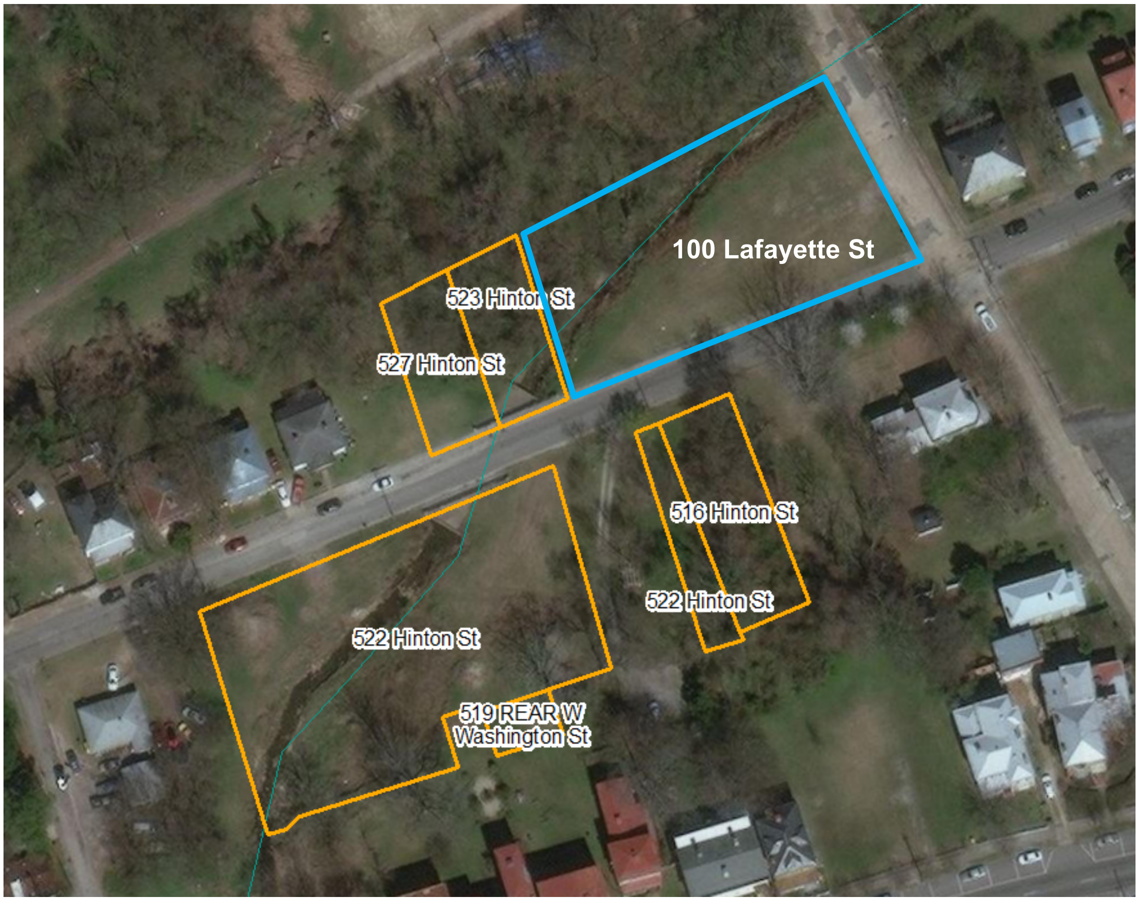

Figure 5. 522 Hinton Street.

7. 527 E Bank Street is bisected by Lieutenant Run, adjacent to I-95. As this site is already forested and undevelopable, this site is not a candidate for land conversion.

Figure 6. 527 E Bank Street.

Summary:

Based on an extensive review of surplus properties owned by the City, Timmons Group has concluded the following observations:

- While some potential exists for land conversion throughout the City, there is already a significant portion of land owned by the City in a forested state of land cover that is excluded from consideration for land conversion and has been accounted for through other means.
- There are few parcels that consist of a significant amount of impervious land that would be cost effective to convert to conserved forest or open space.
    - A planning area identified in the surplus property evaluation includes several adjoining or adjacent parcels on Pocahontas Island. The Island represents significant potential for land cover change; however, it was noted that the land cover conversion could be accomplished in concert with economic and/or re-development.
    - The former southside regional hospital site may have potential for land cover change should economic development projects fall though; or enhanced pollutant removal could be achieved through redevelopment.
    - The parcel at 522 Hinton Street, as well as surrounding parcels, may have potential for land cover change.

In consideration of the City's current progress toward achieving Chesapeake Bay TMDL compliance and the upcoming 40% target in June 2023, Timmons Group recommends further exploring Project J, identified during the stream restoration/outfall identification task. Coincidentally, the parcel on which this project site is mostly situated was also included in the surplus property evaluation: 1600 Shirley Avenue. Attached to this memo is the project one sheet created for Project J for the City's consideration. Project J at 1600 Shirley Avenue has an estimated TP load reduction on the order of 153.7 lbs/yr, which, with the other projects the City is implementing, would meet the City's 2023 target load reduction.

Appendix D

Maintenance and Management Plan

June 2022 – June 2027

The City of Petersburg will demolish and revitalize the site of the Roper Building located at 130 Pocohontas Street, Petersburg, VA 23830. Once the initial project is complete, the City will commence the following Maintenance and Management Plan. Over the next five years, the City will establish a floodplain easement incorporating the boundary of the restored floodplain to overlay the conserved open space created at the site of the demolished building. The overlay will be permitted and authorized by the City's updated floodplain ordinance, expected to be completed during the same timeframe.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Petersburg, VA	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☒ **Yes** ☐ **No**
Applicant Name:	City of Petersburg, VA

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☒ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	45
1.b. any other nature-based approach	**40**	40
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on [ADAPT VA's Social Vulnerability Index Score.)](#)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	12
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide “community scale” benefits?		
Yes	**20**	20
No	**0**	
Total Points		132

Bradley Shupp
Property Maintenance Official
106 W. Tabb St
Petersburg, VA 23803

Reference: 709 Logan St. – Budget Pricing

SCOPE OF WORK

Pryor Hauling, Inc. appreciates this opportunity to provide you the following quote to render you demolition services. Scope of work will include:

- Demolition of warehouse
- Demolition of ramp
- Demolition of loading dock
- Demolition of parking lot
- Demolition of concrete at loading dock
- Removal of dirt under slab and haul away
- Dispose of all debris in an approved landfill
- Grade, seed and straw lot
- Miss Utility notification
- DOL notification

Note: Any changes made to this proposal will make it void.

COST OF WORK

Pryor Hauling, Inc. will provide all equipment and materials to perform the above scope of work for the lump sum price of **FOUR HUNDRED SEVENTY EIGHT THOUSAND EIGHT HUNDRED SIXTY DOLLARS AND ZERO CENTS ($478,860.00). THIS QUOTE IS GOOD FOR 30 DAYS.**

EXCLUSIONS

Pryor Hauling, Inc., has not included within the lump sum price given, any cost for the removal of any hazardous material; the removal of any underground storage tanks, all erosion control except for seed and straw, no import of fill unless otherwise stated, footing not to exceed 2ft in depth, concrete of footing not to exceed 1ft thick, no basements, well abandonment, testing, utility disconnects, permits, bonds, and/or related fees, nor any unforeseen issues, no dewatering.

Upon award of the contract, or upon commencement of the work to be performed, all materials located on site, designated to be removed from the site, will become the property of Pryor Hauling, Inc.

PAYMENT TERMS

Payment is due upon the completion of work. Five days after payment due date interest and late fees will apply to unpaid balances. Upon signing this contract the client acknowledges that he/she will be responsible for any fees imposed for unpaid balances, including interest, late fees, collection and/or attorney fees.

Certificates of Insurance and copies of licenses must be requested when signing this agreement. Requests made after completion of the scope of work cannot be a prerequisite for payment.

INSURANCE

General Liability and Workers Compensation insurance certificates will be provided upon request, after award of the contract. Current certificates have proven to be adequate in prior projects of this nature and should be well within the limits required to perform the above referenced scope of work.

I hope that the information provided herein suits your current needs. If you should have any questions, or if you require any additional information, please do not hesitate to contact me at (804) 360-2120.

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

On behalf of the City of Petersburg, please find attached two completed grant applications for the current cycle of Community Flood Preparedness Funds.

Due to file size limitations, please download the entire application packages, including scope and budget narratives and appendices, here: City of Petersburg CFPF Round 3 Applications

Should you have any questions on the application, please direct them to the City's Stormwater Program Manager, Darryl Walker (copied), or me. Thank you for your consideration.

Sincerely,

Aislinn

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

We were not quite able to full complete the application for demolition of the Roper Building…we just got the attached demo estimate from staff this morning (per the attached email). Nonetheless, I wanted to send you **everything we have right now** – including a cover letter signed by our Interim City Manager – in hopes that we will be able to proceed as demolition of the Roper Building has been deemed **very important** to DCR.

Please review the attached…and if feasible let me know if/how we can proceed. Thank you!!

Respectfully submitted,

Darryl E. Walker

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

On behalf of the City of Petersburg, please find attached two completed grant applications for the current cycle of Community Flood Preparedness Funds.

Due to file size limitations, please download the entire application packages, including scope and budget narratives and appendices, here: City of Petersburg CFPF Round 3 Applications

Should you have any questions on the application, please direct them to the City's Stormwater Program Manager, Darryl Walker (copied), or me. Thank you for your consideration.

Sincerely,

Aislinn

Hey Aislinn,

I took a look at the "Lakemont" application documents, and the only comment I have at this point is that the "Appendix C" PDF seems to be the one for the Old Ramada Inn instead of the Lakemont Projects. If this was just an oversight and you have the Lakemont Historic Flood Data/Images file done and ready to review, please provide.

Thanks again for your help,

Darryl E. Walker

Darryl/Joanne,

I am aware of some comments to the cover letter and that I need to update the signatory for the application for CFPF-1 Old Ramada Inn, so I've attached those two documents for your review.

Here is the link for the CFPF-2 Lakemont package: CFPF-2

Could you please kindly review and provide comment for both by COB Wednesday, April 6, so that I can make the revisions and consolidate the package for submittal before Friday? This should include obtaining Mr. Miller's signature on the Cover Letter and the application.

Thanks,

Aislinn

Subject: RE: CID 510112 - Resilience Plan

Darryl,

Please follow this link to download CFPF Round 3 draft application components for the Old Ramada Inn site (380 E. Washington Street et al.): CFPF-1 Old Ramada Inn

The package includes as complete an application as I am able to assemble, given the information I have been provided to-date. Please note, the word document of the application which includes the cover and the scope and budget narratives has a few comments and one complete highlighted portion where input from the City would be beneficial.

Other items to note:

1. The application and the cover letter need to be signed by Mr. Turille
2. Please provide comments for the word document
3. Please review the Maintenance and Management Plan. We could consider using N/A in place of this document, but I will leave that up to the City's discretion and can revise accordingly.

Please provide comment/additional information as soon as possible.

Thanks,

Aislinn

Subject: FW: CID 510112 - Resilience Plan

Darryl,

I sent the initial Resilience Plan to Ms. Howard-Cooper since it will take her about a week to review, but if you have any comments or revisions please let me know, and I will make them at once! She wrote this, via email, in response to my question about whether it needed to go before Council: *"The plan can be a compilation of already adopted plans provided per instructions in Attachment G of the grant manual. If you are creating a new plan, it will need to be adopted by the community."* I will leave that decision up to the City.

Tomorrow, I will begin in earnest on the applications. Please provide any and all information in addition to what Joanne sent last week, specifically in regards to cost, about the old Ramada Inn building and the Roper Building. I also plan to reiterate the information from the BRIC grant for Lakemont, so if you can forward me any information you have from December that I might not have already, please do. Any information will help me to strengthen the City's applications.

Thanks,

Aislinn

Dear Ms. Howard-Cooper and Members of the CFPF Review Team:

On behalf of the City of Petersburg, please find attached two completed grant applications for the current cycle of Community Flood Preparedness Funds.

Due to file size limitations, please download the entire application packages, including scope and budget narratives and appendices, here: City of Petersburg CFPF Round 3 Applications

Should you have any questions on the application, please direct them to the City's Stormwater Program Manager, Darryl Walker (copied), or me. Thank you for your consideration.

Sincerely,

Aislinn

Aislinn Creel, PE
Sr. Project Manager: Stormwater Services
