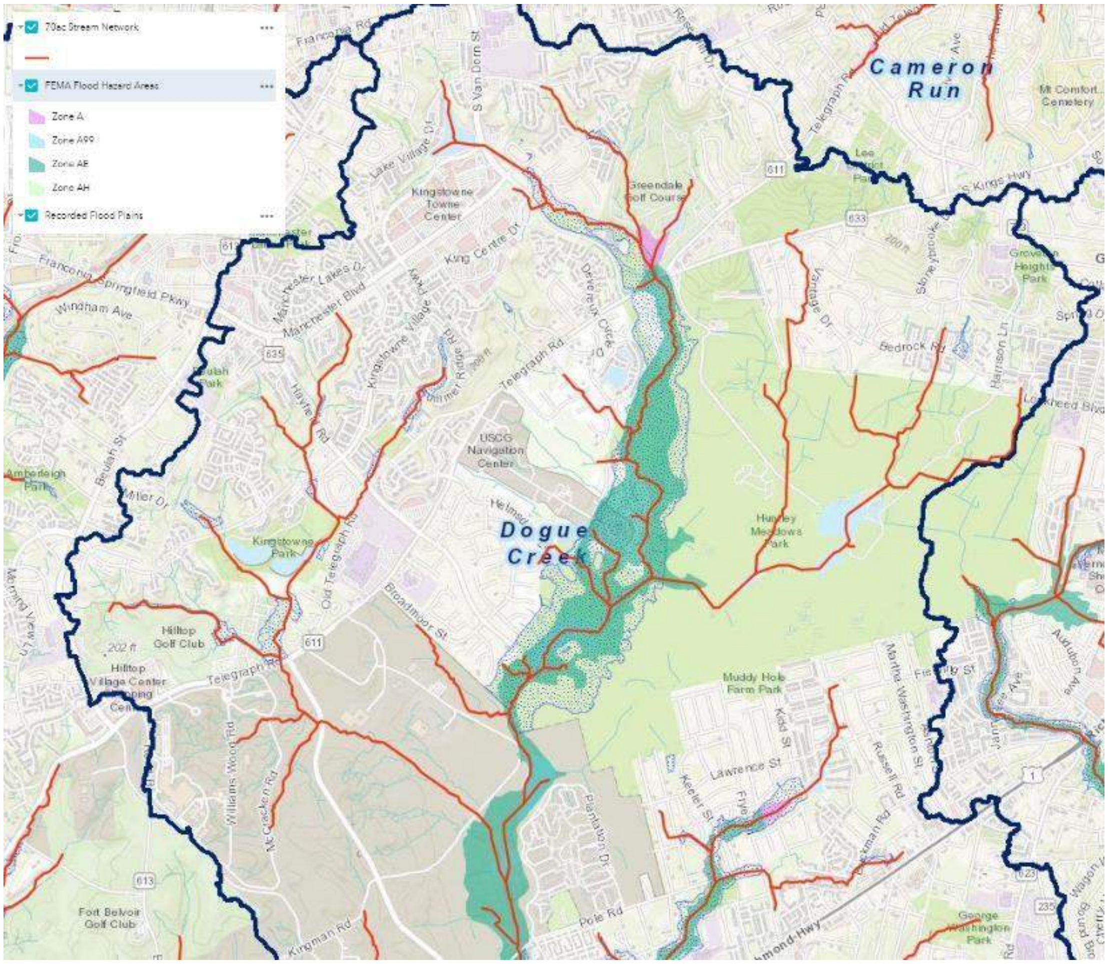
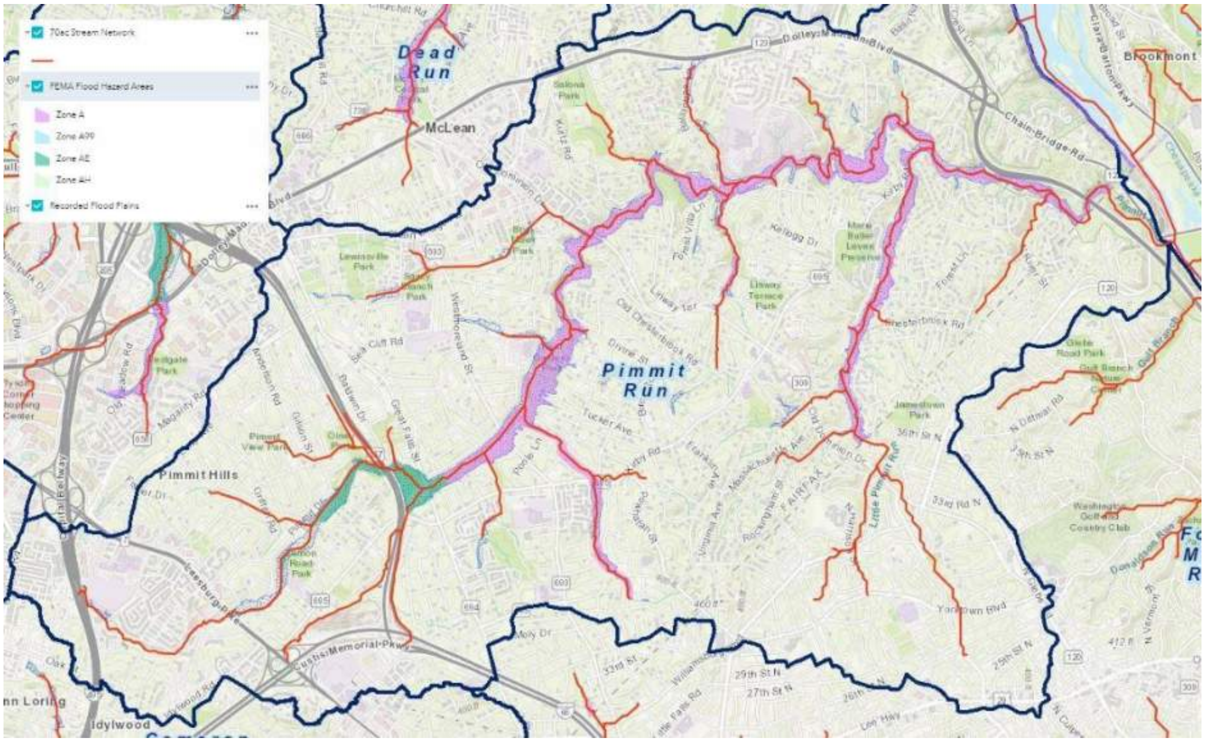
There are multiple County Geographic Information System (GIS) floodplain layers that each have their own history and uses; however, they are all referred to as floodplain and are used in the County's plan review process to flag potential construction in these areas. Available floodplain boundaries and water surface elevations come from several sources, including floodplain studies performed by the United States Geological Survey and FEMA and approved floodplain studies that have been performed by engineers in conjunction with prior land development. Floodplain information is available on the publicly accessible County Floodplain Viewer (https://fairfaxCountygis.maps.arcgis.com/apps/webappviewer/index.html?id=c62ab5b0d13a49c990480e456e70e45f&mobileBreakPoint=300).

Not all County regulated floodplain is mapped. For instance, Fairfax County has older neighborhoods that developed in the 1950s and 1960s prior to modern floodplain regulations. These communities may include piped or channelized streams in minor floodplains that lack mapped floodplain boundaries and BFEs. See examples in Maps 1 and 2 below. The red 70-acre stream network line represents potential County regulated floodplain. As shown on the maps, many sections of the regulated floodplain lack recorded floodplain boundaries.

Map 1. Unmapped regulated floodplain within Dogue Creek watershed



Map 2. Unmapped regulated floodplain within Pimmit Run watershed



As the County reaches buildout conditions and large tracts of green space are no longer available for new subdivisions, much of the residential development in these older neighborhoods has shifted to lot-by-lot infill redevelopment. For residential infill development in and adjacent to unmapped regulated floodplain, the County must rely on very limited floodplain studies completed as a part of the infill plan to review and enforce floodplain regulations.

Additionally, FEMA completed a multi-year project to reexamine Fairfax County's flood zones and produce detailed digital flood hazard maps. The preliminary updated FIRMs, which reflect the flood risk based on the latest data, have been released for public review. The County held a series of virtual public meetings to provide more information on the proposed changes and respond to questions from residents.

Study Description

Fairfax County will complete modeling and mapping of the remaining 757 stream miles with County regulated floodplains in the remaining 27 designated watersheds. This study includes both updates to prior mapped floodplains and new floodplain models and mapping. Given the size and complexity of this effort, the study will be split into a pilot and two phases.

The County is in the process of completing a pilot study on three watersheds- Dogue Creek, Pimmit Run, and Little Hunting Creek (total of 56 stream miles)- to establish standard means and methods to develop the regulated floodplain map updates. The pilot study will prepare the most current terrain data for the County and develop appropriate hydrologic and hydraulic modeling of all streams with drainage areas of 70 acres or greater. The pilot study scope includes obtaining and preparing terrain data for use in the hydrologic and hydraulic (H&H) analyses, identifying data for bridges and culverts, establishing 100-year elevations using steady-state one-dimensional modeling, and mapping the results for the three watersheds.

This grant application is for Phase I of the study to develop a preliminary HEC-RAS hydraulic model for the remaining 27 watersheds. The HEC-RAS models for each watershed will establish preliminary floodplain mapping (within RAS Mapper), flow velocities, profiles, and rating tables. Phase II of the study, which includes the final HEC-RAS model with bridges and culverts incorporated and final floodplain mapping, will be submitted as a separate study application under a future grant round.

The Phase I of the study will be completed by Atkins. The firm is a consultant with a County Basic Ordering Agreement (BOA) for Flood Mitigation and Monitoring and Dam Safety Program Services. Attachment 1 is the Request for Qualifications that the firm had to meet to be awarded this BOA.

Study Benefits

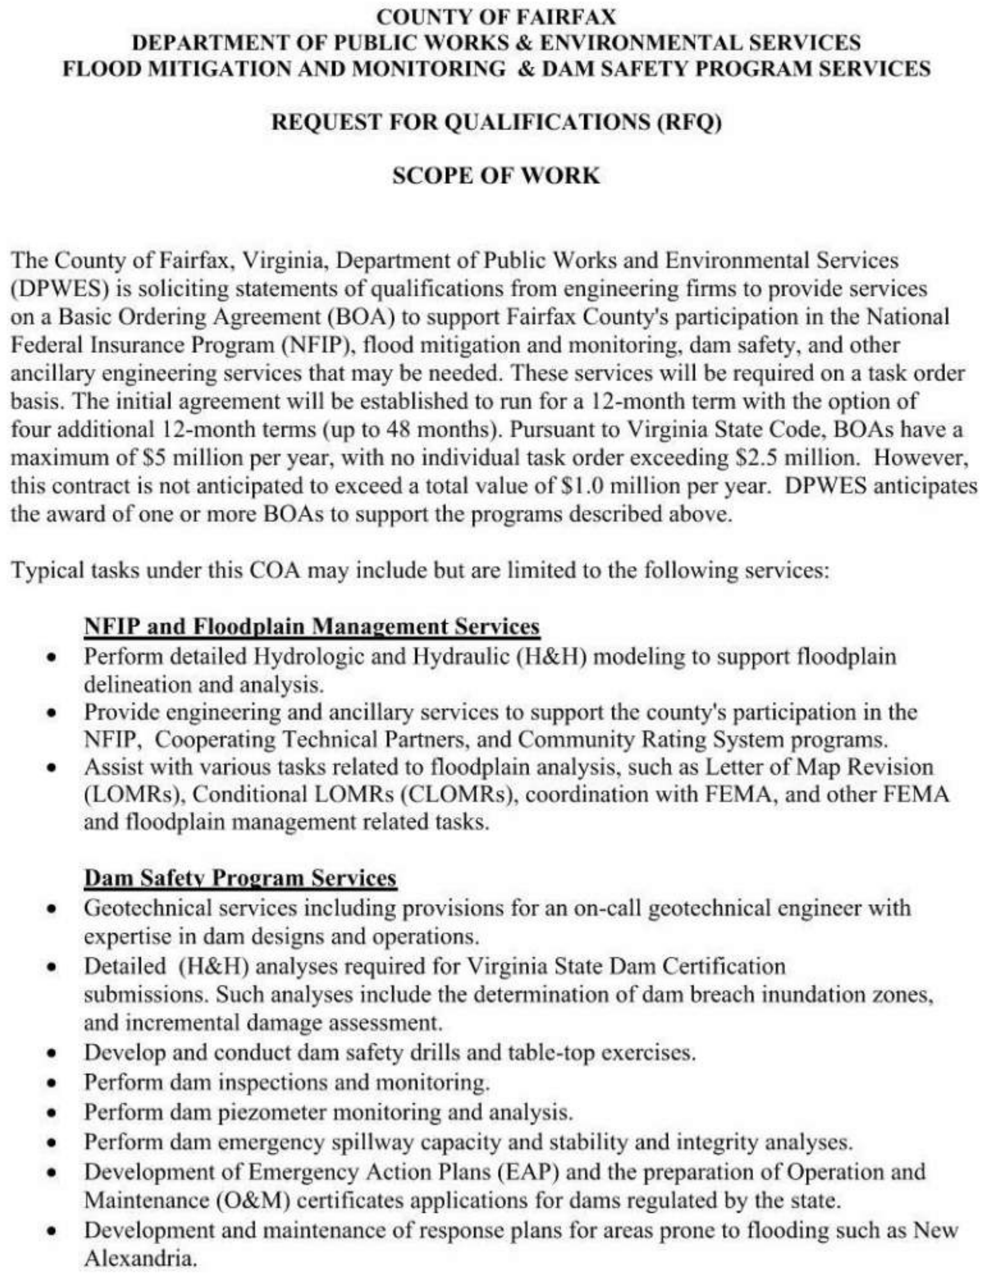
The County regulated floodplain updates will consolidate multiple flood hazard data sources into one comprehensive map for regulatory use, eliminating conflicting water surface boundaries and generating BFEs for unmapped regulated floodplains. The study will also revise and clarify various references to floodplain mapping studies in the Floodplain Ordinance, County Public Facilities Manual (PFM), and the County Code of Ordinances. Fairfax County floodplain management regulations are codified in Section 5105 of the Zoning Ordinance. The PFM details the appropriate methods and guidelines for water surface calculations and floodplain easements. Appendix A of the County code describes some of the maps and studies used to depict the areas designated as floodplain by Fairfax County. These three regulatory documents will be revised to reflect the new comprehensive County regulated floodplain map.

The study allows the County to integrate climate change into the regulated floodplains. The County is embarking on Resilient Fairfax, a formal and holistic effort to address climate adaption and resilience. The Resilient Fairfax plan will develop a climate projections report with future predicted climate conditions (https://www.fairfaxcounty.gov/environment-energy-coordination/resilient-fairfax). Data from this report can be integrated into the new or updated floodplain models to reflect anticipated future precipitation trends.

The study will also increase community flood risk awareness by mapping previously unmapped floodplain. Later phases of the study will encompass a significant public outreach program to notify residents that they are in a newly mapped floodplain, advise them on how to prepare for flooding, and share resources related to flood protection and insurance.

With 1,167,000 residents, Fairfax County is more populous than six states (Alaska, Montana, North Dakota, Rhode Island, South Dakota, Vermont, and the District of Columbia) and accounts for about 13% of the total population of Virginia. Providing comprehensive, accurate, and consistent regulated floodplain maps will benefit not only the County, but also more than a tenth of Virginia residents. The maps will help increase flood risk awareness for residents located in and adjacent to previously unmapped floodplains, developers to better incorporate flood prevention and protection techniques into their construction plans, and the County to better review and enforce its robust floodplain management regulations.

Attachment 1. Flood mitigation and monitoring and dam safety program services request for qualifications



COUNTY OF FAIRFAX
DEPARTMENT OF PUBLIC WORKS & ENVIRONMENTAL SERVICES
FLOOD MITIGATION AND MONITORING & DAM SAFETY PROGRAM SERVICES

REQUEST FOR QUALIFICATIONS (RFQ)

SCOPE OF WORK

The County of Fairfax, Virginia, Department of Public Works and Environmental Services (DPWES) is soliciting statements of qualifications from engineering firms to provide services on a Basic Ordering Agreement (BOA) to support Fairfax County's participation in the National Federal Insurance Program (NFIP), flood mitigation and monitoring, dam safety, and other ancillary engineering services that may be needed. These services will be required on a task order basis. The initial agreement will be established to run for a 12-month term with the option of four additional 12-month terms (up to 48 months). Pursuant to Virginia State Code, BOAs have a maximum of $5 million per year, with no individual task order exceeding $2.5 million. However, this contract is not anticipated to exceed a total value of $1.0 million per year. DPWES anticipates the award of one or more BOAs to support the programs described above.

Typical tasks under this COA may include but are limited to the following services:

NFIP and Floodplain Management Services

- Perform detailed Hydrologic and Hydraulic (H&H) modeling to support floodplain delineation and analysis.
- Provide engineering and ancillary services to support the county's participation in the NFIP, Cooperating Technical Partners, and Community Rating System programs.
- Assist with various tasks related to floodplain analysis, such as Letter of Map Revision (LOMRs), Conditional LOMRs (CLOMRs), coordination with FEMA, and other FEMA and floodplain management related tasks.

Dam Safety Program Services

- Geotechnical services including provisions for an on-call geotechnical engineer with expertise in dam designs and operations.
- Detailed (H&H) analyses required for Virginia State Dam Certification submissions. Such analyses include the determination of dam breach inundation zones, and incremental damage assessment.
- Develop and conduct dam safety drills and table-top exercises.
- Perform dam inspections and monitoring.
- Perform dam piezometer monitoring and analysis.
- Perform dam emergency spillway capacity and stability and integrity analyses.
- Development of Emergency Action Plans (EAP) and the preparation of Operation and Maintenance (O&M) certificates applications for dams regulated by the state.
- Development and maintenance of response plans for areas prone to flooding such as New Alexandria.

Project implementation Support and General Engineering Services

- Performance of detailed land surveys, bathymetric surveys, and the preparation of elevation certificates and plats.
- Delineation of wetlands.
- Support for the acquisition of hydrologic data, geotechnical. investigations, or other purposes.
- AutoCAD drafting and plan preparation services.
- Modeling green infrastructure and Stormwater management facility rehabilitation and retrofit designs.
- Acquire federal, state, and local permits required for construction.
- Preparing and conducting presentations at public meetings during non-business hours
- Other related ancillary services.

Consultants who wish to be considered for this work must submit eight (8) hard copies copies, as well as a PDF copy on a CD of their statements of qualifications to Roz Knox, Contract Specialist, Stormwater Planning Division, Department of Public Works and Environmental Services, 12000 Government Center Parkway, Suite 449, Fairfax, Virginia 22035-0052.

The submittal must include:

- Statements of Interest;
- GSA Standard Form 330 Part I and Part II for the primary firm and all major sub-consultants; and
- List of references with current addresses and telephone numbers for recently completed projects of a similar nature.

All submissions must be complete and clearly demonstrate the capability to provide the required services. The following weighted criteria and evaluation factors will be utilized by a Selection Advisory Committee to evaluate the statement of qualifications:

Criteria No.	Criteria Description	Weight
1.	The ability and experience of firm/team to deliver work as described	25%
2.	Project teams' personnel qualifications and experience	20%
3.	Past performance history	15%
4.	Ability to meet time and budget requirements	15%
5.	Location of key project staff	10%
6.	Volume of work previously awarded by the County within the last 3	5%
7.	Recent, current, and projected workload	5%
8.	Public presentations and community coordination	5%

All statements of qualifications shall be delivered no later than 4:00 p.m., local prevailing time on Wednesday April 8, 2020. Statements of qualifications received after the submission deadline will not be considered. The statement of qualifications, including GSA 330 forms, shall not exceed the equivalent of thirty-five (35) pages of content (printed double-sided copies). The cover letter and binding are not included in the 35 pages.

Fairfax County is committed to paying a living wage to all qualified County employees and encourages contractors and sub-contractors involved in all County programs, services, and activities to pay a living wage to their employees.

All questions related to this solicitation should be directed to Roz Knox, Contract Specialist , of Stormwater Planning Division at rosalind.knox@fairfaxcounty.gov or 703-324-5500, TTY 711.

♿ To request this information in an alternate format, please call Roz Knox, Contract Specialist, Stormwater Planning Division, Department of Public Works and Environmental Services at 703-324-5500, TTY 711.

B. Budget Narrative

The sections below outline the anticipated expenditures for the study including the estimated total study cost, the grant funds requested, and the corresponding match to be provided by the County.

1. Estimated Total Project Cost

The estimated total study cost is $1,200,000. In Fairfax County, there are 812 stream miles of regulatory floodplain. The pilot studies completed in Dogue Creek, Little Hunting Creek, and Pimmit Run covered 56 stream miles. Based on these pilot studies, the estimated cost to complete the preliminary hydraulic models for the remaining stream miles is $1,450 per mile. The total cost to complete the preliminary hydraulic models for the remaining 27 watershed (756 miles) is:

($1450/mile * 756 miles) = $1,096,200 + 10% contingency = ~$1,200,000

2. Funds Requested

The amount of funds requested from the Fund is $600,000. This is the total amount of any grant assistance sought from the Fund. 100% of this grant will be applied to the Atkins task order to complete Phase I of the Fairfax County regulated floodplain map updates. Attachment 2 includes the task order draft proposal scopes of work describing how this funding will be used.

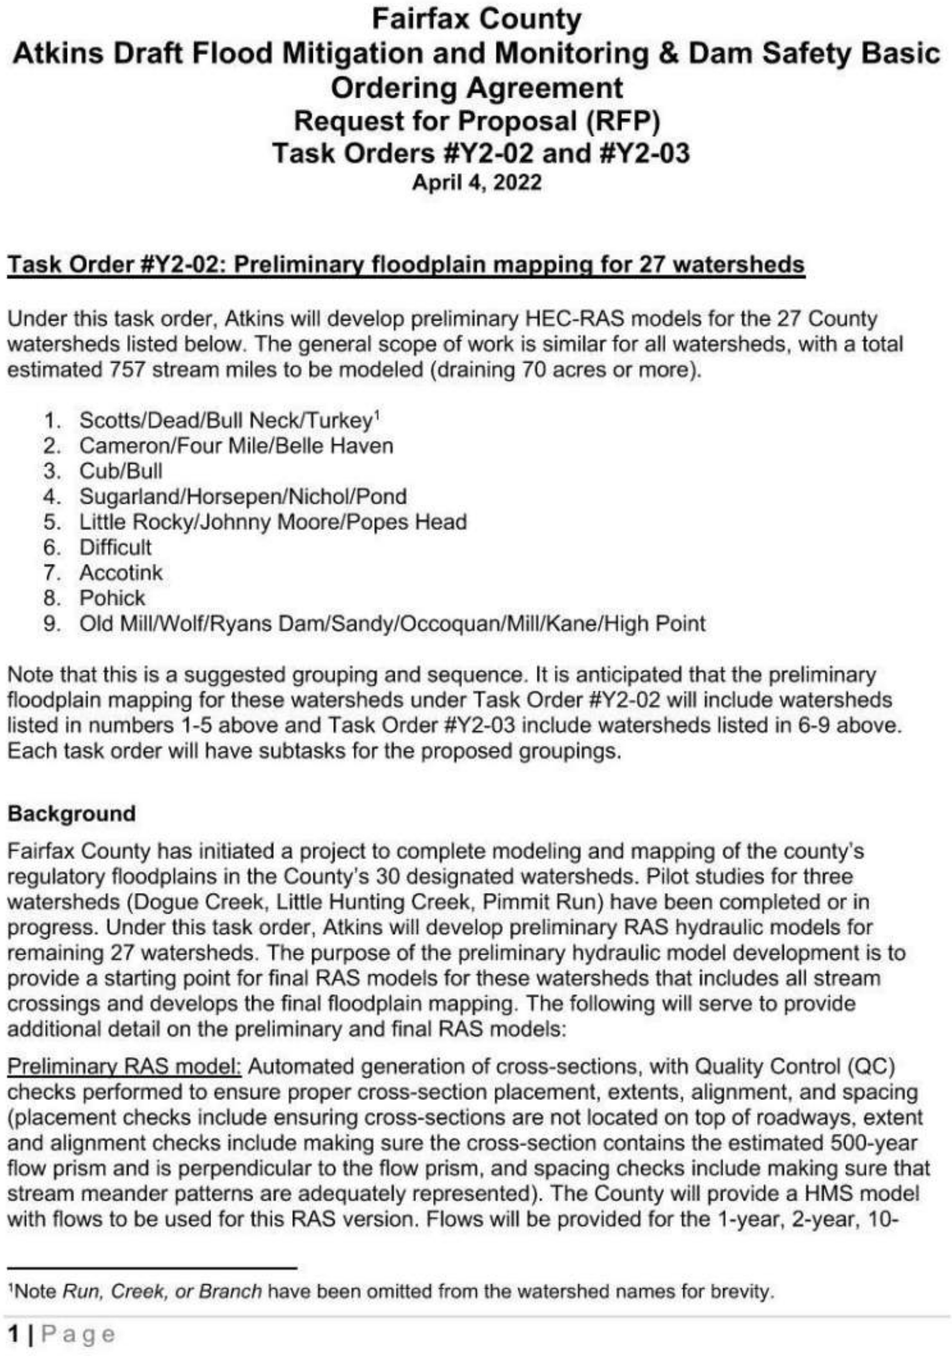
3. Available Funds

$600,000 of cash funds is available in *Regulatory Program Support* under Fund 40100 Stormwater Services in the proposed Fairfax County Fiscal Year 2023 budget. See Attachment 3 for the proposed Fiscal Year 2023 County budget plan document.

4. Authorization to Request for Funding

See Attachment 4 for the Not in Package (NIP) item to the Board of Supervisors authorizing a request for funding through the grant program.

Attachment 2. Regulated floodplain map updates draft task order scope of work



Fairfax County
Atkins Draft Flood Mitigation and Monitoring & Dam Safety Basic Ordering Agreement
Request for Proposal (RFP)
Task Orders #Y2-02 and #Y2-03
April 4, 2022

Task Order #Y2-02: Preliminary floodplain mapping for 27 watersheds

Under this task order, Atkins will develop preliminary HEC-RAS models for the 27 County watersheds listed below. The general scope of work is similar for all watersheds, with a total estimated 757 stream miles to be modeled (draining 70 acres or more).

1. Scotts/Dead/Bull Neck/Turkey[1]
2. Cameron/Four Mile/Belle Haven
3. Cub/Bull
4. Sugarland/Horsepen/Nichol/Pond
5. Little Rocky/Johnny Moore/Popes Head
6. Difficult
7. Accotink
8. Pohick
9. Old Mill/Wolf/Ryans Dam/Sandy/Occoquan/Mill/Kane/High Point

Note that this is a suggested grouping and sequence. It is anticipated that the preliminary floodplain mapping for these watersheds under Task Order #Y2-02 will include watersheds listed in numbers 1-5 above and Task Order #Y2-03 include watersheds listed in 6-9 above. Each task order will have subtasks for the proposed groupings.

Background

Fairfax County has initiated a project to complete modeling and mapping of the county's regulatory floodplains in the County's 30 designated watersheds. Pilot studies for three watersheds (Dogue Creek, Little Hunting Creek, Pimmit Run) have been completed or in progress. Under this task order, Atkins will develop preliminary RAS hydraulic models for remaining 27 watersheds. The purpose of the preliminary hydraulic model development is to provide a starting point for final RAS models for these watersheds that includes all stream crossings and develops the final floodplain mapping. The following will serve to provide additional detail on the preliminary and final RAS models:

<u>Preliminary RAS model:</u> Automated generation of cross-sections, with Quality Control (QC) checks performed to ensure proper cross-section placement, extents, alignment, and spacing (placement checks include ensuring cross-sections are not located on top of roadways, extent and alignment checks include making sure the cross-section contains the estimated 500-year flow prism and is perpendicular to the flow prism, and spacing checks include making sure that stream meander patterns are adequately represented). The County will provide a HMS model with flows to be used for this RAS version. Flows will be provided for the 1-year, 2-year, 10-

---

[1] Note *Run, Creek, or Branch* have been omitted from the watershed names for brevity.

year, 100-year, and 500-year events and used to establish water-surface elevation profiles and preliminary floodplain mapping (within RAS Mapper) for these events.

Final RAS model: This version will incorporate all stream crossings into preliminary RAS models previously reviewed and approved by the County. Additionally, for areas where there piped systems within the floodplain, the model will utilize headwater elevations obtained from an analysis of the piped system where the open channel system enters and exits the piped system. The final RAS version will be used be used to create final 100-year, 500-year floodplain mapping and associated products for the watershed.

Note: This RFP is only for preliminary RAS models, information on final RAS models is only provided for reference.

Subtasks

1. The County will provide the following data to enable the development and testing of the preliminary version of HEC-RAS models:

    a. Clipped 2018 Terrain data (Lidar raster layers) for all watersheds.

    b. GIS layers derived from Arc Hydro to be used in configuring the geometric data for the RAS Model. This includes 70-acre stream centerlines, confluence nodes, stream crossing point layer along with any other data needed.

    c. Final version of the configured HMS Models.

Atkins will review data provided for the County to ensure it is complete and will allow development of the preliminary RAS models detailed previously.

2. Atkins will utilize reach and river naming conventions in RAS developed as part of Task Order #Y1-05 (Little Hunting Creek preliminary floodplain mapping) to ensure consistency between the reach identifiers used in HMS and Arc Hydro. Naming conventions should allow users to efficiently locate flows used in RAS in the HMS models and then determine the relevant Arc Hydro elements to establish how hydrologic parameters in HMS were estimated.

3. Atkins will develop preliminary RAS models for the watersheds as detailed previously.

4. Atkins will use the HMS model provided by the county to assign flows in the RAS flow editor and impose normal depth as downstream boundary conditions.

5. Atkins will produce preliminary flood inundation maps and velocity maps in RAS Mapper for all profiles to ensure that the overall results are reasonable, and the cross-sections used in modeling the reach are extended sufficiently to capture the 500-year floodplain limits.

The final deliverables from this task would be a hydraulic model for the each watershed with brief documentation of the reaches modeled and naming convention.

Schedule

Atkins will provide a schedule for each task order showing when work will be initiated and completed for each watershed.

Attachment 3. Advertised Fiscal Year 2023 Stormwater Services County budget document

Fund 40100: Stormwater Services

Mission

To develop and maintain a comprehensive watershed and infrastructure management program to protect property, health, and safety; to enhance the quality of life; and to preserve and improve the environment for the benefit of the public. To plan, design, construct, operate, maintain, and inspect stormwater infrastructure; perform environmental assessments through coordinated stormwater and maintenance programs in compliance with all government regulations utilizing innovative techniques, customer feedback and program review; and to be responsive and sensitive to the needs of the residents, customers, and public partners.

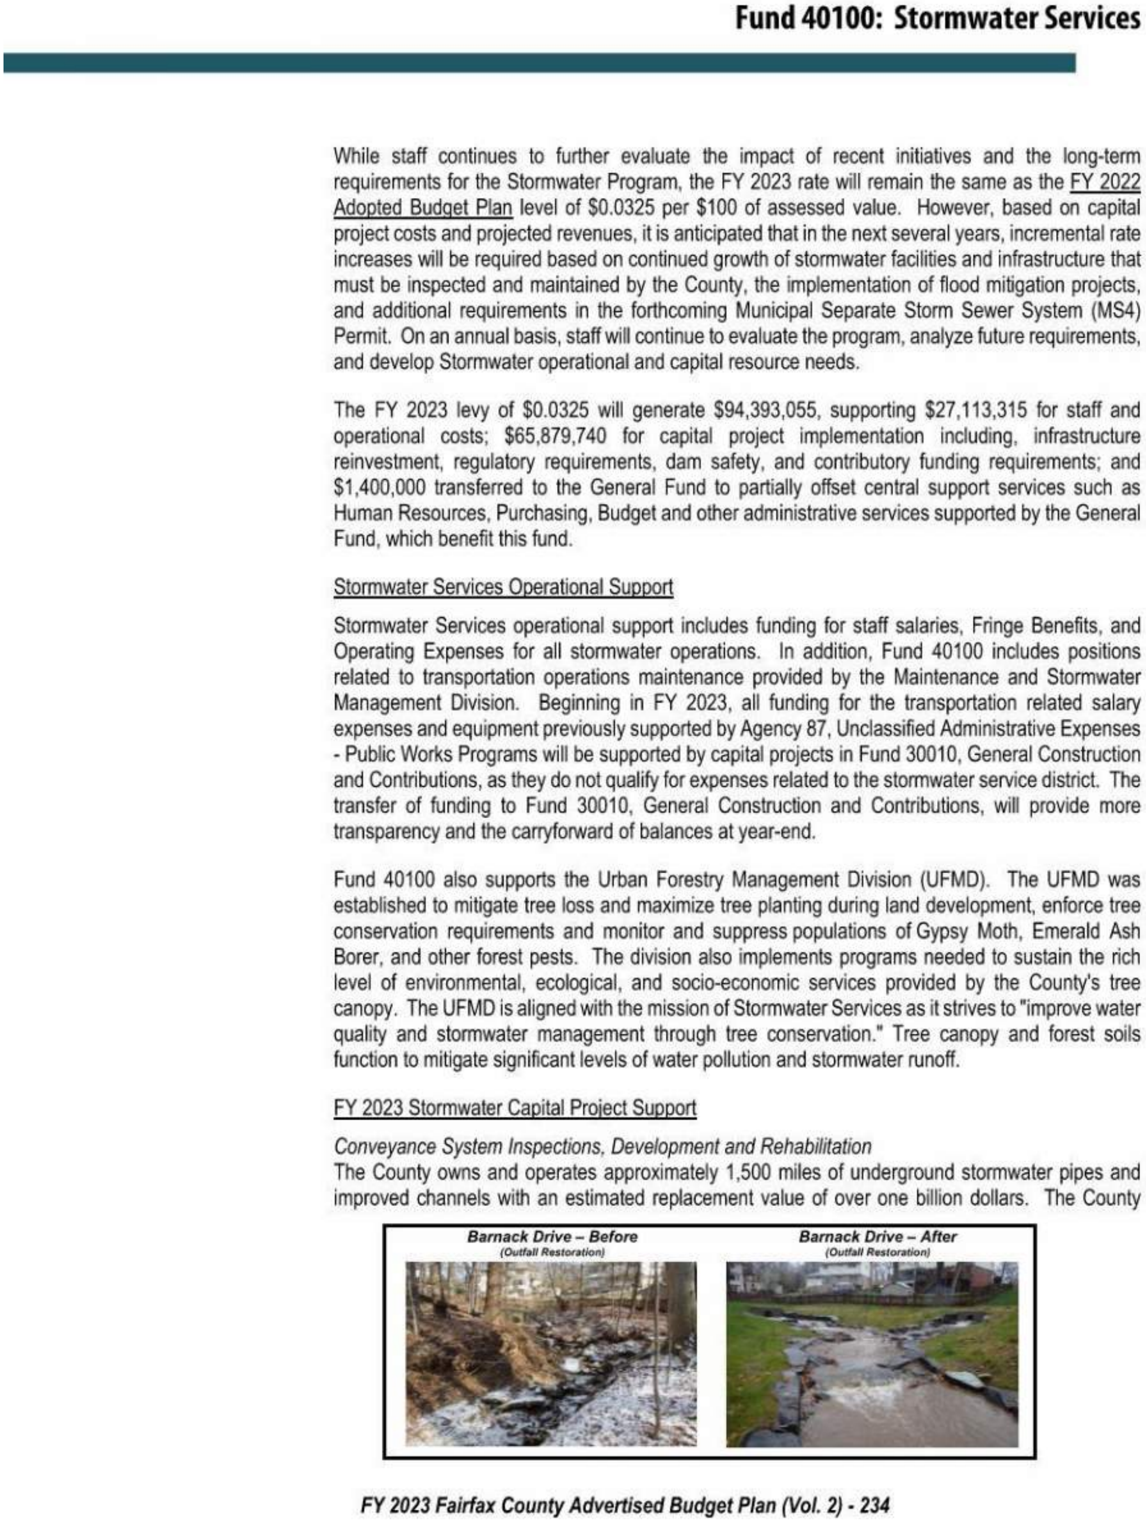
Focus

Stormwater Services are essential to protect public safety, preserve property values and support environmental mandates such as those aimed at protecting the Chesapeake Bay and the water quality of other local jurisdictional waterways. Projects in this fund include repairs to stormwater infrastructure, measures to improve water quality such as stream stabilization, rehabilitation, safety upgrades of state regulated dams, repair and rehabilitation of underground pipe systems, surface channels, flood mitigation, site retrofits and best management practices (BMP), and other stormwater improvements.

The Board of Supervisors approved a special service district to support the Stormwater Management Program as part of the FY 2010 Adopted Budget Plan. This service district provides a dedicated funding source for both operating and capital project requirements by levying a service rate per $100 of assessed real estate value, as authorized by Code of Virginia Ann. Sections 15.2-2400. Since FY 2010, staff has made significant progress in the implementation of watershed master plans, public outreach efforts, stormwater monitoring activities, water quality and flood mitigation project implementation and operational maintenance programs related to existing storm drainage infrastructure including stormwater conveyance, and regulatory requirements.

A rate of $0.0400 per $100 of assessed value has been estimated to be required to fully support the stormwater program in the future; however, staff is currently evaluating the long-term requirements for the program to address the growth in inventory and other community needs. Some of the additional community needs under evaluation include debt service to support the Board's approval of the dredging of Lake Accotink, the anticipation of additional flood mitigation requirements, and strengthening the role and financial support for the implementation of stormwater requirements associated with Fairfax County Public Schools sites under renovation. This enhanced program may require incremental changes to the rate over time and may result in a higher rate to fully support the program. Staff continues to evaluate these requirements, as well as the staffing to support them, and analyze the impact of increased real estate values and revenue projections.

One of the recent initiatives being funded by the Stormwater Fund is the new Public Works complex which will consolidate functions and operations and maximize efficiencies between the Stormwater and Wastewater Divisions. Stormwater operations are currently conducted from various locations throughout the County, and a new colocation of both Stormwater and Wastewater staff will provide efficiencies and sharing of resources. Another initiative in progress is the planned dredging of Lake Accotink. Lake Accotink is a 55-acre lake surrounded by managed conservation areas, wetlands, deciduous and evergreen forests, and historic and prehistoric sites. Over 300,000 patrons visit the park annually to enjoy a variety of facilities and activities that vary with the season. Sediment from the upstream areas of the watershed has continued to be deposited in Lake Accotink over the years filling in the lake and limiting recreational use. Estimates for the cost of dredging including sediment disposal are still under review. Staff has identified the option of a low interest loan via the Virginia Clean Water Revolving Loan Fund (VCWRLF) as the preferred funding mechanism to fund the dredging project costs. The Stormwater fund will pay the future debt costs.



While staff continues to further evaluate the impact of recent initiatives and the long-term requirements for the Stormwater Program, the FY 2023 rate will remain the same as the FY 2022 Adopted Budget Plan level of $0.0325 per $100 of assessed value. However, based on capital project costs and projected revenues, it is anticipated that in the next several years, incremental rate increases will be required based on continued growth of stormwater facilities and infrastructure that must be inspected and maintained by the County, the implementation of flood mitigation projects, and additional requirements in the forthcoming Municipal Separate Storm Sewer System (MS4) Permit. On an annual basis, staff will continue to evaluate the program, analyze future requirements, and develop Stormwater operational and capital resource needs.

The FY 2023 levy of $0.0325 will generate $94,393,055, supporting $27,113,315 for staff and operational costs; $65,879,740 for capital project implementation including, infrastructure reinvestment, regulatory requirements, dam safety, and contributory funding requirements; and $1,400,000 transferred to the General Fund to partially offset central support services such as Human Resources, Purchasing, Budget and other administrative services supported by the General Fund, which benefit this fund.

Stormwater Services Operational Support

Stormwater Services operational support includes funding for staff salaries, Fringe Benefits, and Operating Expenses for all stormwater operations. In addition, Fund 40100 includes positions related to transportation operations maintenance provided by the Maintenance and Stormwater Management Division. Beginning in FY 2023, all funding for the transportation related salary expenses and equipment previously supported by Agency 87, Unclassified Administrative Expenses - Public Works Programs will be supported by capital projects in Fund 30010, General Construction and Contributions, as they do not qualify for expenses related to the stormwater service district. The transfer of funding to Fund 30010, General Construction and Contributions, will provide more transparency and the carryforward of balances at year-end.

Fund 40100 also supports the Urban Forestry Management Division (UFMD). The UFMD was established to mitigate tree loss and maximize tree planting during land development, enforce tree conservation requirements and monitor and suppress populations of Gypsy Moth, Emerald Ash Borer, and other forest pests. The division also implements programs needed to sustain the rich level of environmental, ecological, and socio-economic services provided by the County's tree canopy. The UFMD is aligned with the mission of Stormwater Services as it strives to "improve water quality and stormwater management through tree conservation." Tree canopy and forest soils function to mitigate significant levels of water pollution and stormwater runoff.

FY 2023 Stormwater Capital Project Support

Conveyance System Inspections, Development and Rehabilitation
The County owns and operates approximately 1,500 miles of underground stormwater pipes and improved channels with an estimated replacement value of over one billion dollars. The County

Barnack Drive – Before
(Outfall Restoration)

Barnack Drive – After
(Outfall Restoration)

began performing internal inspections of the pipes in FY 2006. The initial results showed that approximately 5 percent of the pipes exhibit conditions of failure, and an additional 5 percent required maintenance or repair. MS4 Permit regulations require inspection and maintenance of these 1,500 miles of existing conveyance systems, 69,000 stormwater structures, and a portion of the immediate downstream channel at the 7,000 regulated pipe outlets. Acceptable industry standards indicate that one dollar reinvested in infrastructure saves seven dollars in the asset's life and 70 dollars if asset failure occurs. Once the initial internal inspections are complete, the goal of this program is to inspect pipes on a 20-year cycle and rehabilitate pipes and improve outfall channels before total failure occurs. Total funding in the amount of $9.0 million is included for Conveyance System Inspections, Development and Rehabilitation in FY 2023, including $2.0 million for inspections and development and $7.0 million for rehabilitation and outfall restoration.

Dam Safety and Facility Rehabilitation

There are approximately 7,900 stormwater management facilities in service that range in size from small rain gardens to large state regulated flood control dams. The County is responsible for inspecting approximately 5,500 privately-owned facilities and maintaining over 2,400 County owned facilities. This inventory increases annually and is projected to continually increase as new development and redevelopment sites occur in the County. This initiative also includes the removal of sediment that occurs in both wet and dry stormwater management facilities to ensure that adequate capacity is maintained to treat the stormwater. The program results in approximately 50 projects annually that require design and construction management activities as well as contract management and maintenance responsibilities. This program maintains the structures and dams that control and treat the water flowing through County owned facilities. This program improves dam safety by supporting annual inspections of 20 state-regulated dams and the Huntington Levee and by developing Emergency Action Plans required by the state. The Emergency Action Plans are updated annually. In addition, these plans include annual emergency drills and exercises, and flood monitoring for each dam. Total funding in the amount of $15.0 million is included in FY 2023, including $5.0 million for maintenance and $10.0 million for rehabilitation.

Popes Head View - Before
(Dam Rehabilitation)

Popes Head View - After
(Dam Rehabilitation)

Stormwater/Wastewater Facility

This project will provide funding for a Stormwater/Wastewater Facility which will consolidate functions and operations and maximize efficiencies between the Stormwater and Wastewater Divisions. Currently, Stormwater operations are conducted from various locations throughout the County, with the majority of staff located at the West Drive facility. Facilities for field maintenance operations and for field/office-based staff are inadequate and outdated for the increased scope of the stormwater program, and inadequate to accommodate future operations. This project is currently in design with construction anticipated to begin in early 2022. The facility is financed by EDA bonds with the Stormwater Services Fund and Wastewater Fund supporting the debt service. Funding in the amount of $4.2 million is included in FY 2023 to support the second year of debt service for the Stormwater/Wastewater Facility.

Emergency and Flood Response Projects

This program supports flood control projects for unanticipated flooding events that impact storm systems and structural flooding. The program provides annual funding for scoping, design, and construction activities related to flood mitigation projects. Funding in the amount of $7.0 million is included for the Emergency and Flood Response Projects in FY 2023.

Enterprise Asset Management-Work Order System

This project will provide funding for the transition from an Enterprise Asset Management (EAM) system to a more functional Asset Management Program (AMP). This funding will support the acquisition of software, servers and consultant services to migrate asset management and related work order management into the new system. The current system tracks assets, inspections, daily work management and associated contractor costs. Features of the replacement system include geographic information system (GIS) integration and field mobility. The Department of Public Works and Environmental Services (DPWES) Information Technology staff have collaborated with the Stormwater Management and the Wastewater Management staff to promote interagency capabilities, optimize performance, and improve system lifecycle management for the new system. This new system will meet the future expectations for both divisions and optimize service delivery for DPWES. Funding in the amount of $1.4 million is included in Capital Projects and an amount of $800,000 is included in Operating Expenses for this project in FY 2023.

Stormwater-Related Contributory Program

Contributory funds are provided to the Northern Virginia Soil and Water Conservation District (NVSWCD) and the Occoquan Watershed Monitoring Program (OWMP). The NVSWCD is an independent subdivision of the Commonwealth of Virginia that provides leadership in the conservation and protection of Fairfax County's soil and water resources. It is governed by a five-member Board of Directors - three members are elected every four years by the voters of Fairfax County and two members are appointed by the Virginia Soil and Water Conservation Board. Accordingly, the work of NVSWCD supports many of the environmental goals established by the Board of Supervisors. The goal of the NVSWCD is to continue to improve the quality of the environment and general welfare of the citizens of Fairfax County by providing them with a means of dealing with soil, water conservation and related natural resource problems. It provides County agencies with comprehensive environmental evaluations for proposed land use changes with particular attention to the properties of soils, erosion potential, drainage, and the impact on the surrounding environment. NVSWCD has consistently been able to create partnerships and leverage state, federal and private resources to benefit natural resources protection in Fairfax County. FY 2023 funding of $0.6 million is included in Fund 40100 for the County contribution to the NVSWCD.

The OWMP and the Occoquan Watershed Monitoring Laboratory (OWML) were established to ensure that water quality is monitored and protected in the Occoquan Watershed. Given the many diverse uses of the land and water resources in the Occoquan Watershed (agriculture, urban residential development, commercial and industrial activity, water supply, and wastewater disposal), the OWMP plays a critical role as the unbiased interpreter of basin water quality information. FY 2023 funding of $0.2 million is included in Fund 40100 for the County contribution to the OWMP.

Stormwater Allocation to Towns

On April 18, 2012, the State Legislature passed SB 227, which entitles the Towns of Herndon and Vienna to all revenues collected within their boundaries by Fairfax County's stormwater service district. An agreement was developed for a coordinated program whereby the Towns remain part of the County's service district and the County returns 25 percent of the revenue collected from properties within each town. This allows for the Towns to provide services independently such as

maintenance and operation of stormwater pipes, manholes, and catch basins. The remaining 75 percent remains with the County and the County takes on the responsibility for the Towns' Chesapeake Bay Total Maximum Daily Load (TMDL) requirements as well as other TMDL and MS4 requirements. This provides for an approach that is based on watersheds rather than on jurisdictional lines. Funding in the amount of $1.0 million is included for the Stormwater Allocations to Towns project in FY 2023.

Regulatory Program

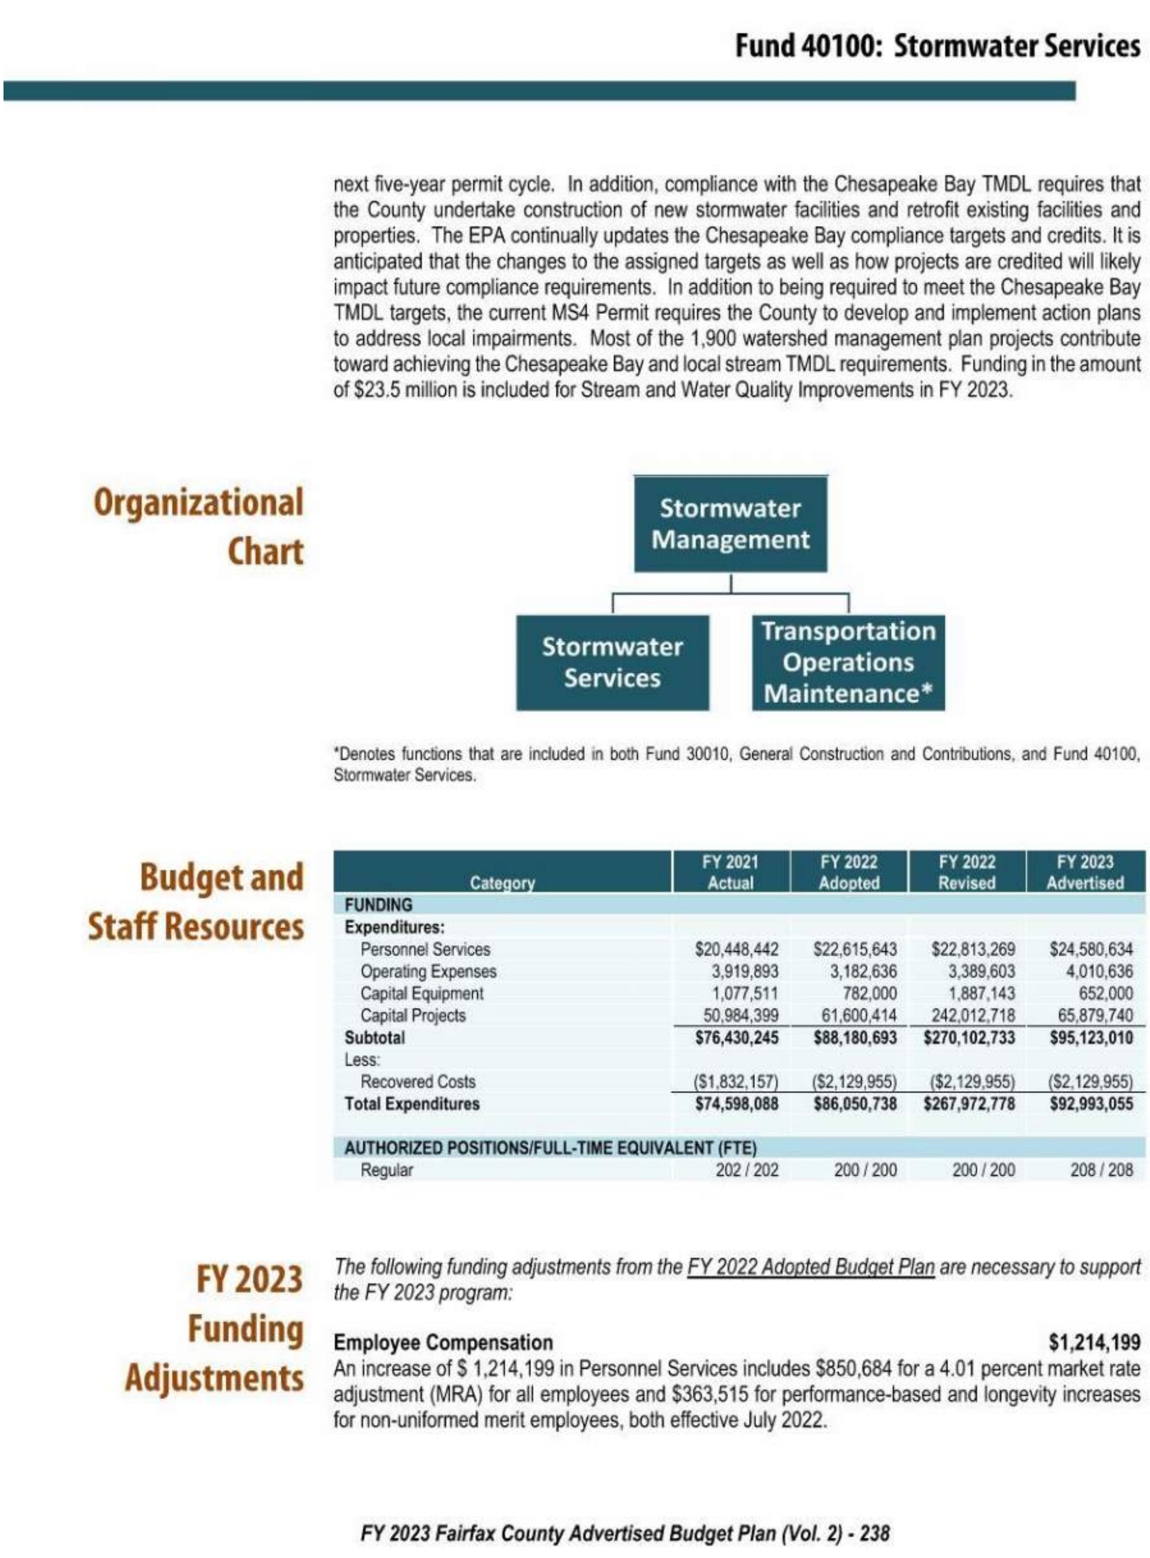
The County is required by federal law to operate under the conditions of a state issued MS4 Permit. Stormwater staff annually evaluates funding required to meet the increasing federal and state regulatory requirements pertaining to the MS4 Permit, and State and Federal mandates associated with controlling water pollution delivered to local streams and the Chesapeake Bay. The MS4 Permit allows the County to discharge stormwater from its stormwater systems into state and federal waters. The County currently owns and/or operates approximately 15,000 outfalls, and 7,000 of these outfalls are regulated outfalls governed by the permit. The current permit was issued to the County in April 2015 and expired in April 2020. The County is operating under an administrative continuance until a new permit is issued. The permit requires the County to document the stormwater management facility inventory, enhance public outreach and education efforts, increase water quality monitoring efforts, provide stormwater management and stormwater control training to all appropriate County employees. The permit requires the County to implement sufficient stormwater projects that will reduce the nutrients and sediment to comply with the Chesapeake Bay and local stream TMDL requirements. Funding in the amount of $4.0 million is included for the Stormwater Regulatory Program in FY 2023.

Stream and Water Quality Improvements

This program funds water quality improvement projects necessary to mitigate the impacts to local streams and the Chesapeake Bay resulting from urban stormwater runoff. This includes water quality projects such as construction and retrofit of stormwater management ponds, implementation of green stormwater infrastructure facilities, stream restoration, and water quality projects identified in the completed Countywide Watershed Management Plans. These projects will aid in the reduction of pollutants and improve water quality in county streams that are considered to be in fair to very poor condition and likely do not meet CWA water quality standards. In addition, Total Maximum Daily Load (TMDL) requirements for local streams and the Chesapeake Bay are the regulatory drivers by which pollutants entering impaired water bodies must be reduced. The Chesapeake Bay TMDL was established by the EPA and requires that MS4 communities as well as other dischargers implement measures to significantly reduce the nitrogen, phosphorous and sediment loads in waters that drain to the Chesapeake Bay by 2025. MS4 Permit holders must achieve 35 percent of the required reductions within the current five-year permit cycle and 60 percent of the required reductions in the

Lake Barton - Before
(Pre-Dredging)

Lake Barton - After
(Post-Dredging)



next five-year permit cycle. In addition, compliance with the Chesapeake Bay TMDL requires that the County undertake construction of new stormwater facilities and retrofit existing facilities and properties. The EPA continually updates the Chesapeake Bay compliance targets and credits. It is anticipated that the changes to the assigned targets as well as how projects are credited will likely impact future compliance requirements. In addition to being required to meet the Chesapeake Bay TMDL targets, the current MS4 Permit requires the County to develop and implement action plans to address local impairments. Most of the 1,900 watershed management plan projects contribute toward achieving the Chesapeake Bay and local stream TMDL requirements. Funding in the amount of $23.5 million is included for Stream and Water Quality Improvements in FY 2023.

FY 2023 Funding Adjustments

The following funding adjustments from the FY 2022 Adopted Budget Plan are necessary to support the FY 2023 program:

Employee Compensation **$1,214,199**

An increase of $ 1,214,199 in Personnel Services includes $850,684 for a 4.01 percent market rate adjustment (MRA) for all employees and $363,515 for performance-based and longevity increases for non-uniformed merit employees, both effective July 2022.

Other Post-Employment Benefits **($106,403)**
A decrease of $106,403 in Personnel Services reflects required adjustments associated with providing Other Post-Employment Benefits (OPEBs) to retirees, including the Retiree Health Benefits Subsidy. For more information on Other Post-Employment Benefits, please refer to Fund 73030, OPEB Trust, in Volume 2 of the FY 2023 Advertised Budget Plan.

New Positions **$885,195**
An increase of $885,195 including Personnel Services of $857,195 and Operating Expenses of $28,000 is necessary to fund requirements associated with 8/8.0 FTE new positions, including 1/1.0 Engineering Technician III, 1/1.0 FTE Planner III, 1/1.0 FTE Project Manager I, 1/1.0 FTE Senior Engineering Inspector, 1/1.0 FTE Senior Engineer III, and 3/3.0 FTE Senior Maintenance Workers. The Engineering Technician III position will support address the increased workload of permit required pond inspections and maintenance. The Planner III position will review and provide needed stormwater expertise, advanced technical analysis, support and recommendations on planning and development efforts during planning, pre-zoning and rezoning processes. The Project Manager I position will support the Tree Preservation and Planting Program and manage projects that support the tree planting goals of Virginia's Final Phase III Watershed Implementation Plan. The projects will be geared towards increasing tree canopy through street and landscape tree plantings, afforestation and reforestation, and assisting with outreach and education programs. The Senior Engineering Inspector position will be responsible for reviewing erosion and sediment control plans, reviewing project designs, understanding job specifications, inspecting County stormwater infrastructure, updating work orders and keeping a daily log of work performed on construction sites. The Senior Engineer III position will initiate flood mitigation projects, coordinate with property owners to address their flooding concerns, and execute flood mitigation project design and implementation services. The three Senior Maintenance Worker positions will form an additional crew that will be deployed into the field to perform maintenance on the storm drainage system throughout the County.

Asset Management Program **$800,000**
An increase of $800,000 in Operating Expenses will support a new Asset Management Program (AMP). Funding will support the acquisition of software, servers, and consultant services to migrate asset management and related work order management into the new system. This new system will meet the future expectations for both Stormwater and Wastewater divisions and optimize service delivery for the Department of Public Works and Environmental Services.

Capital Equipment **($130,000)**
Funding of $652,000 in Capital Equipment, a decrease of $130,000 from the FY 2022 Adopted Budget Plan, is included primarily associated with replacement equipment that has outlived its useful life and is critical to stormwater services activities. Replacement equipment includes: $390,000 to replace two dump trucks that support all maintenance and emergency response programs and $40,000 to replace three equipment trailers that support all maintenance and emergency response programs in transporting construction materials, light duty and snow removal equipment. New equipment includes $222,000 for the purchase of three new pickup trucks and one new utility truck to support the new positions in FY 2023.

Capital Projects **$4,279,326**
Funding of $65,879,740 in Capital Projects, an increase of $4,279,326 from the FY 2022 Adopted Budget Plan, has been included in FY 2023 for priority stormwater capital projects.

Changes to FY 2022 Adopted Budget Plan

The following funding adjustments reflect all approved changes in the FY 2022 Revised Budget Plan since passage of the FY 2022 Adopted Budget Plan. Included are all adjustments made as part of the FY 2021 Carryover Review, FY 2022 Mid-Year Review, and all other approved changes through December 31, 2021:

Carryover Adjustments **$182,312,873**

As part of the *FY 2021 Carryover Review*, the Board of Supervisors approved funding of $182,312,873 based on the carryover of unexpended project balances in the amount of $179,413,809 and a net adjustment of $2,899,064. This adjustment includes the carryover of $1,312,110 in operating and capital equipment encumbrances, an increase of $197,626 to Personnel Services to support a one-time compensation adjustment of $1,000 for merit employees and $500 for non-merit employees to be paid no later than November 2021, and an increase to capital projects of $1,389,328. The adjustment to capital projects is based on the appropriation of the remaining operational savings of $783,662, higher than anticipated revenues of $304,634, revenues of $203,600 collected through the land development process that will support tree preservation and planting projects in FY 2022, revenues of $44,841 associated with dam and facility maintenance projects, miscellaneous revenues in the amount of $45,652, and the appropriation of $6,939 from the ending balance that was due to an FY 2021 audit adjustment.

Mid-Year Adjustments **($1,555)**

As part of the *FY 2022 Mid-Year Review*, the Board of Supervisors approved a decrease of $1,555 due to an FY 2021 audit adjustment.

Position Detail

The FY 2023 Advertised Budget Plan includes the following positions:

STORMWATER SERVICES – 208 Positions			
MSMD Administration (10 positions)			
1	Director, Maintenance and SW	1	Safety Analyst I
1	HR Generalist II	1	Administrative Assistant IV
1	HR Generalist I	4	Administrative Assistants III
1	Safety Analyst II		
IT – Director's Office/Stormwater (1 position)			
1	Network/Telecom. Analyst I		
Finance – Wastewater and Stormwater (4 positions)			
1	Financial Specialist IV	1	Financial Specialist I
1	Financial Specialist II	1	Administrative Assistant III
Contracting Services/Material Support (5 positions)			
1	Material Mgmt. Specialist III	1	Financial Specialist II
2	Contract Analysts I	1	Inventory Manager
Dam Safety and Maintenance Projects/Projects and LID/Inspection and Maintenance (19 positions)			
1	Public Works-Env. Serv. Manager	5	Engineering Technicians III [+1]
1	Engineer IV	2	Engineering Technicians II
1	Senior Engineer III	1	Project Manager II
3	Engineers III	2	Project Managers I
1	Ecologist III	1	Assistant Project Manager
1	Ecologist II		
Field Operations (74 positions)			
2	Env. Services Supervisors	3	Masons
1	Public Works-Env. Serv. Manager	1	Vehicle Maintenance Coordinator
2	Public Works-Env. Bus. Operations	5	Engineering Technicians III
2	Public Works-Env. Serv. Specialists	2	Engineering Technicians II
8	Senior Maintenance Supervisors	1	Carpenter II
5	Maintenance Supervisors	2	Equipment Repairers

Field Operations			
2	Maintenance Crew Chiefs	1	Welder II
15	Senior Maintenance Workers [+3]	1	Welder I
10	Heavy Equipment Operators	1	Trades Supervisor
10	Motor Equipment Operators		
Stormwater Infrastructure Branch (16 positions)			
1	Public Works-Env. Serv. Manager	1	Senior Engineering Inspector [+1]
3	Engineers IV	2	Engineering Technicians II
2	Senior Engineers III [+1]	2	Engineering Technicians I
4	Engineers III	1	Project Manager I
Transportation Infrastructure Branch (7 positions)			
1	Engineer V	3	Project Managers I
1	Engineer IV	1	Engineering Technician II
1	Project Manager II		
Stormwater Planning Division (56 positions)			
1	Director, Stormwater Planning	1	Emergency Mgmt. Specialist III
1	Engineer V	1	Planner IV
4	Engineers IV	1	Planner III [+1]
1	Senior Engineer III	2	Landscape Architects III
8	Engineers III	1	Engineering Technician III
5	Project Managers II	1	Management Analyst II
2	Project Managers I	2	Code Specialists II
4	Ecologists IV	1	Financial Specialist II
5	Ecologists III	1	Financial Specialist I
3	Ecologists II	1	Contract Specialist II
2	Ecologists I	1	Assistant Contract Specialist
3	Project Coordinators	3	Administrative Assistants III
1	Public Works-Env. Serv. Manager		
Urban Forestry (16 positions)			
1	Director, Urban Forestry Division	3	Urban Foresters I
1	Urban Forester IV	1	Project Manager I [+1]
4	Urban Foresters III	1	Administrative Assistant II
5	Urban Foresters II		
+	**Denotes New Position(s)**		

Performance Measurement Results

The objective to receive no MS4 Permit violations related to inspection and maintenance of public and private stormwater management facilities was met in FY 2019, FY 2020, and FY 2021. It is expected that this objective will also be met in FY 2022 and FY 2023. The objective to update 100 percent of the Stormwater emergency action plans was met in prior years. It is expected that this trend will continue in both FY 2022 and FY 2023. Lastly, the objective to keep 100 percent of the commuter facilities operational for 365 days was met in prior years. It is expected that this goal will be met in FY 2022 and FY 2023.

Indicator	FY 2019 Actual	FY 2020 Actual	FY 2021 Estimate	FY 2021 Actual	FY 2022 Estimate	FY 2023 Estimate
MS4 permit violations received	0	0	0	0	0	0
Percent of Emergency Action Plans current	100%	100%	100%	100%	100%	100%
Percent of commuter facilities available 365 days per year	100%	100%	100%	100%	100%	100%

[1] In FY 2022, Economic Development Authority (EDA) Bonds were issued to support the construction of a Stormwater/Wastewater facility to consolidate functions and operations and maximize efficiencies between the Stormwater and Wastewater Divisions.

[2] Represents Virginia Department of Environmental Quality (VDEQ) Stormwater Local Assistance Fund (SLAF) grants which support stream and water quality improvement projects. An amount of $1,876,476 was received in FY 2021 and an amount of $3,596,793 is anticipated in FY 2022 and beyond.

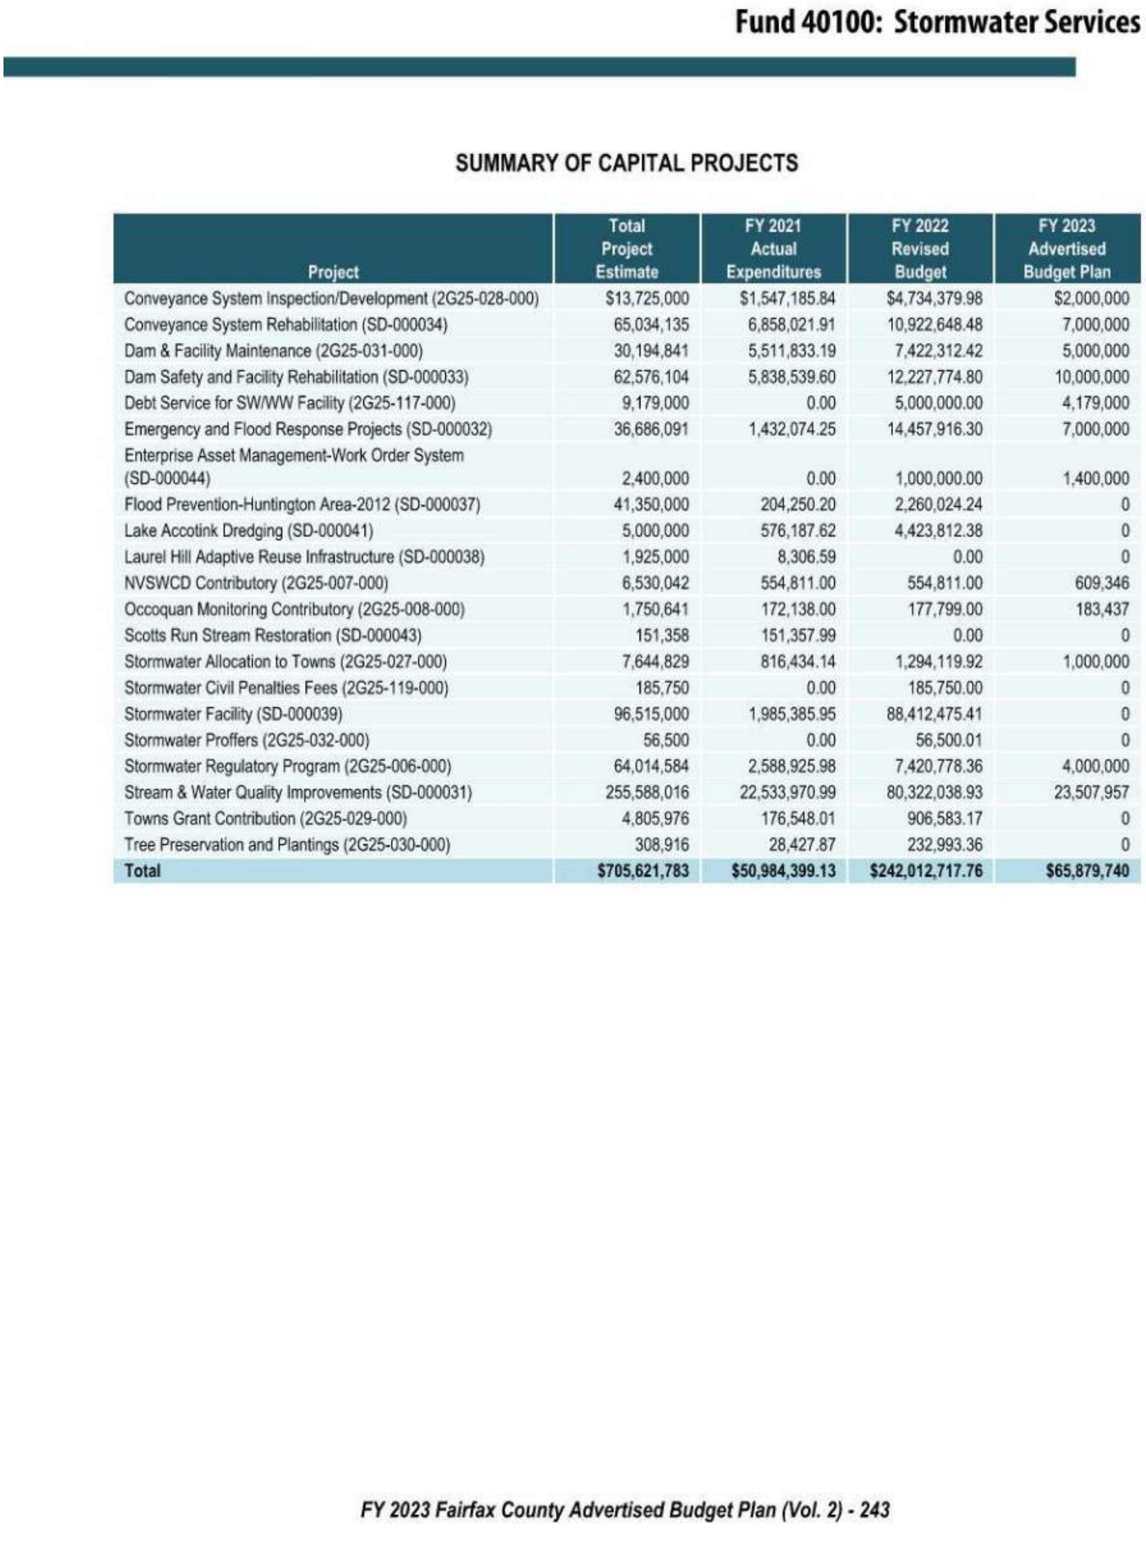
[3] Reflects revenues collected through the land development process that will support tree preservation and planting projects in FY 2022.

[4] In order to account for revenues and expenditures in the proper fiscal year, audit adjustments were reflected as an increase of $1,555.35 to FY 2021 Personnel Services expenditures to record expenditure accruals and an increase of $389,278.17 to FY 2021 Capital Projects expenditures to record expenditure accruals. This impacted the amount carried forward resulting in a decrease of $389,278.17 to the *FY 2022 Revised Budget Plan*. The projects affected by this adjustment were 2G25-006-000, Stormwater Regulatory Program, SD-000031, Stream & Water Quality Improvements, and SD-000033, Dam Safety and Facility Rehabilitation. The Annual Comprehensive Financial Report (ACFR) reflects all audit adjustments in FY 2021. Details of the audit adjustments were found in Attachment VI of the *FY 2022 Mid-Year Review*.

[5] Funding in the amount of $1,400,000 is transferred to the General Fund to partially offset central support services supported by the General Fund, which benefit Fund 40100. These indirect costs include support services such as Human Resources, Purchasing, Budget and other administrative services.

[6] Capital projects are budgeted based on the total project costs. Most projects span multiple years, from design to construction completion. Therefore, funding for capital projects is carried forward each fiscal year, and ending balances fluctuate, reflecting the carryover of these funds.

[7] The FY 2022 Adopted Budget Plan ending balance of $6,939 was due to an adjustment made to FY 2020, and it was adjusted as part of the *FY 2021 Carryover Review*.



SUMMARY OF CAPITAL PROJECTS

Project	Total Project Estimate	FY 2021 Actual Expenditures	FY 2022 Revised Budget	FY 2023 Advertised Budget Plan
Conveyance System Inspection/Development (2G25-028-000)	$13,725,000	$1,547,185.84	$4,734,379.98	$2,000,000

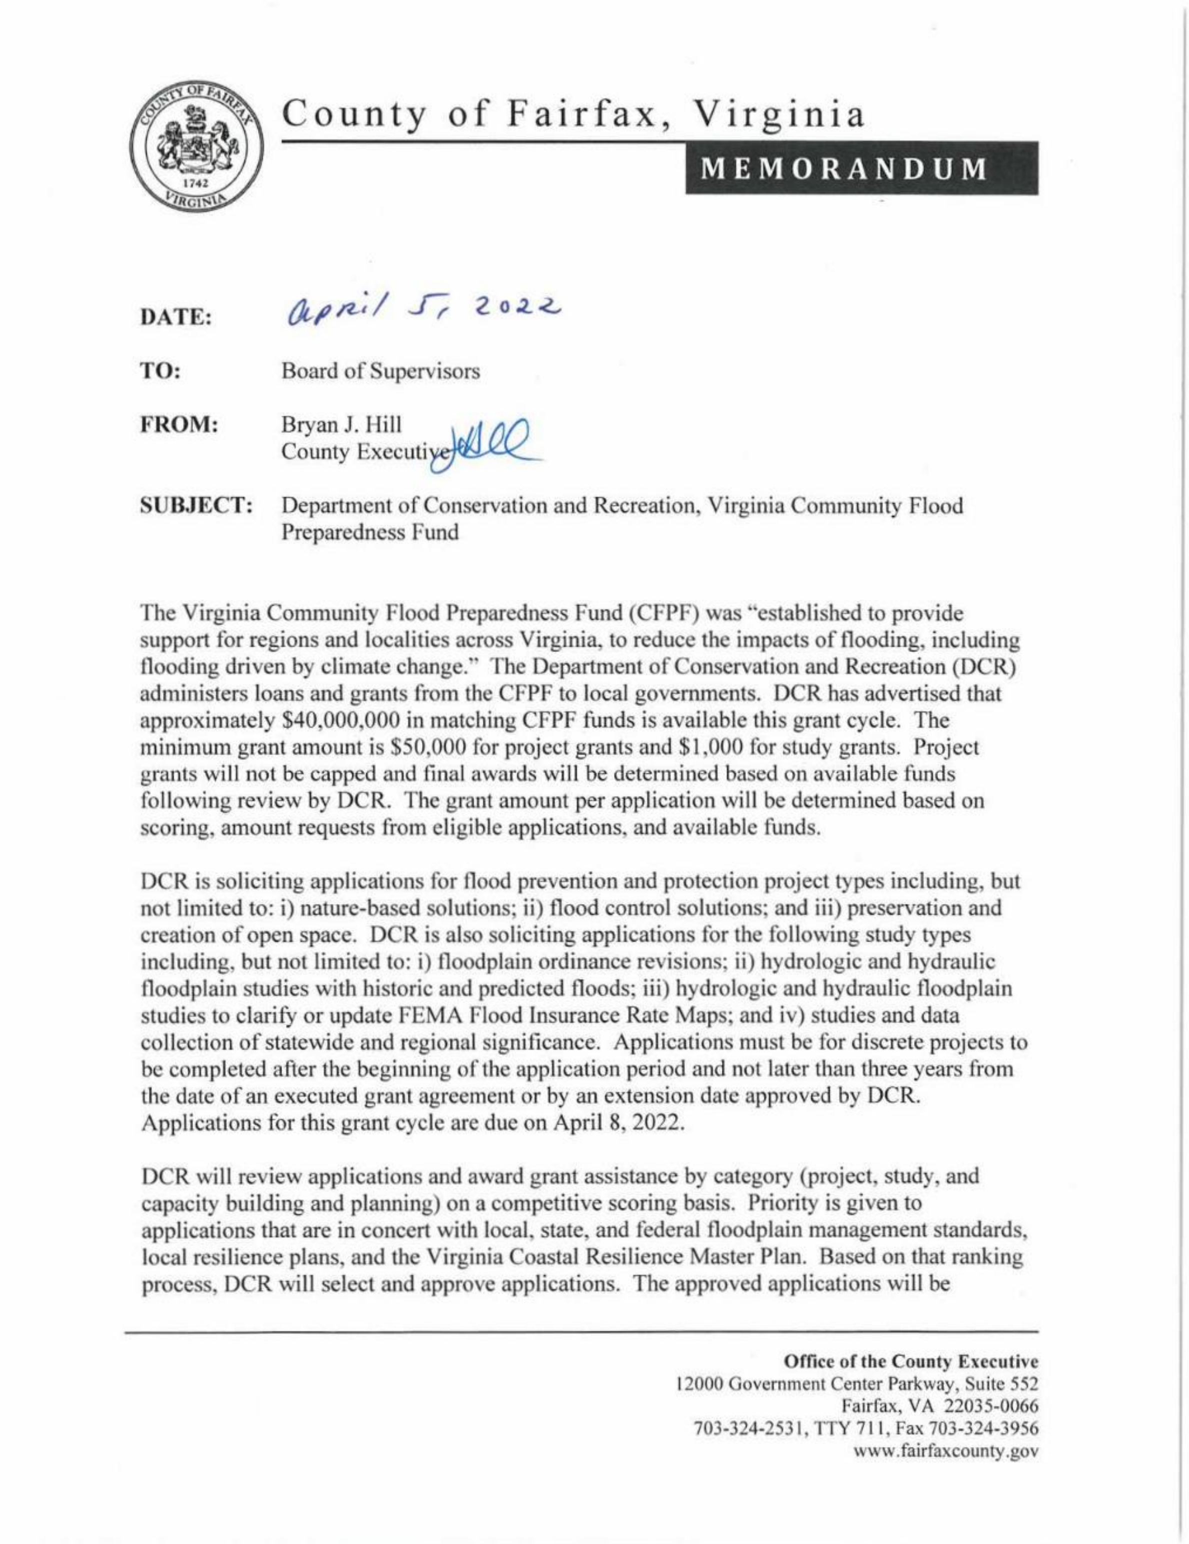
Attachment 4. Authorization to request funding



1742

County of Fairfax, Virginia

MEMORANDUM

DATE: april 5, 2022

TO: Board of Supervisors

FROM: Bryan J. Hill
County Executive

SUBJECT: Department of Conservation and Recreation, Virginia Community Flood Preparedness Fund

The Virginia Community Flood Preparedness Fund (CFPF) was "established to provide support for regions and localities across Virginia, to reduce the impacts of flooding, including flooding driven by climate change." The Department of Conservation and Recreation (DCR) administers loans and grants from the CFPF to local governments. DCR has advertised that approximately $40,000,000 in matching CFPF funds is available this grant cycle. The minimum grant amount is $50,000 for project grants and $1,000 for study grants. Project grants will not be capped and final awards will be determined based on available funds following review by DCR. The grant amount per application will be determined based on scoring, amount requests from eligible applications, and available funds.

DCR is soliciting applications for flood prevention and protection project types including, but not limited to: i) nature-based solutions; ii) flood control solutions; and iii) preservation and creation of open space. DCR is also soliciting applications for the following study types including, but not limited to: i) floodplain ordinance revisions; ii) hydrologic and hydraulic floodplain studies with historic and predicted floods; iii) hydrologic and hydraulic floodplain studies to clarify or update FEMA Flood Insurance Rate Maps; and iv) studies and data collection of statewide and regional significance. Applications must be for discrete projects to be completed after the beginning of the application period and not later than three years from the date of an executed grant agreement or by an extension date approved by DCR. Applications for this grant cycle are due on April 8, 2022.

DCR will review applications and award grant assistance by category (project, study, and capacity building and planning) on a competitive scoring basis. Priority is given to applications that are in concert with local, state, and federal floodplain management standards, local resilience plans, and the Virginia Coastal Resilience Master Plan. Based on that ranking process, DCR will select and approve applications. The approved applications will be

Office of the County Executive
12000 Government Center Parkway, Suite 552
Fairfax, VA 22035-0066
703-324-2531, TTY 711, Fax 703-324-3956
www.fairfaxcounty.gov

forwarded to the Virginia Resources Authority for the execution of a grant agreement and funding.

For this grant cycle, Fairfax County (County) proposes submitting the following five applications:

Project/Study Title	Project/Study Estimate	Grant Amount Requested
1. Tucker Avenue Neighborhood Stormwater Improvements	$9,834,000	$5,900,000
2. Chowan Avenue Flood Mitigation	$2,000,000	$1,200,000
3. Little Pimmit Run Tributary at Woodland Terrace	$4,279,000	$2,567,000
4. Tripps Run at Barrett Road Flood Mitigation	$12,836,000	$8,985,200
5. County Regulated Floodplain Map Updates	$1,200,000	$600,000
Total	$30,149,000	$19,252,200

The County is under no financial obligation to apply for CFPF grants. If DCR selects one or more of these applications, the grant(s) will be presented to the Board of Supervisors for approval.

cc: Rachel Flynn, Deputy, County Executive
Christopher Herrington, Director, Department of Public Works and Environmental Services (DPWES)
Eleanor Ku Codding, Deputy Director DPWES, Stormwater and Wastewater Divisions

BASE MAP SOURCE

Base map data obtained by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

NOTICE TO USER

Future revisions to this FIRM Index will only be issued to communities that are located on FIRM panels being revised. This FIRM Index therefore remains valid for FIRM panels dated September 17, 2010 or earlier. Please refer to the "MOST RECENT FIRM PANEL DATE" column in the Listing of Communities table to determine the most recent FIRM index date for each community.

MAP DATES

This FIRM Index displays the map date for each FIRM panel at the time this Index was printed. Because this Index may not be distributed to unaffected communities in subsequent revisions, users may determine the current map date for each FIRM panel by visiting the FEMA Map Service Center website at www.fema.gov/msc or by calling the Map Service Center at 1-800-358-9616.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Map Service Center at the number listed above.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

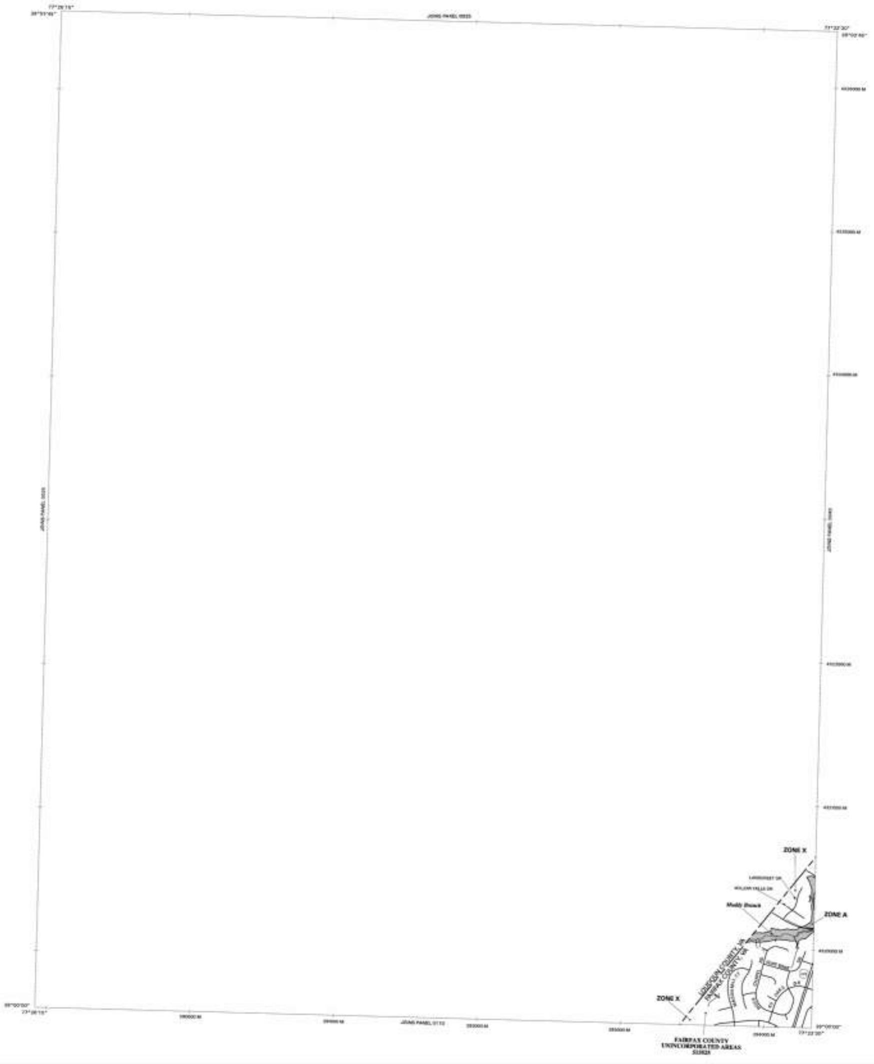
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No base flood elevations determined.
ZONE AE Base flood elevations determined.
ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99 Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photographs. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

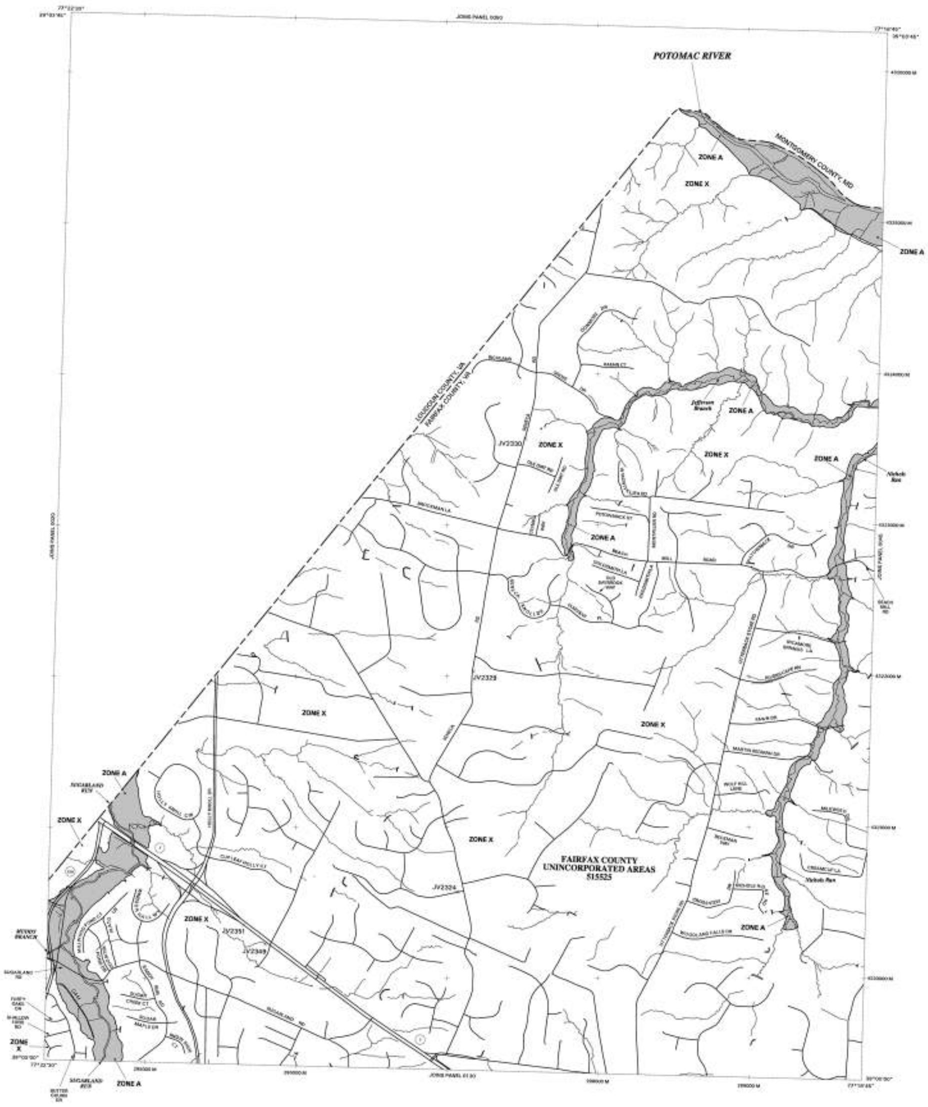
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
•••••••••••••••	CBRS and OPA boundary
▭ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

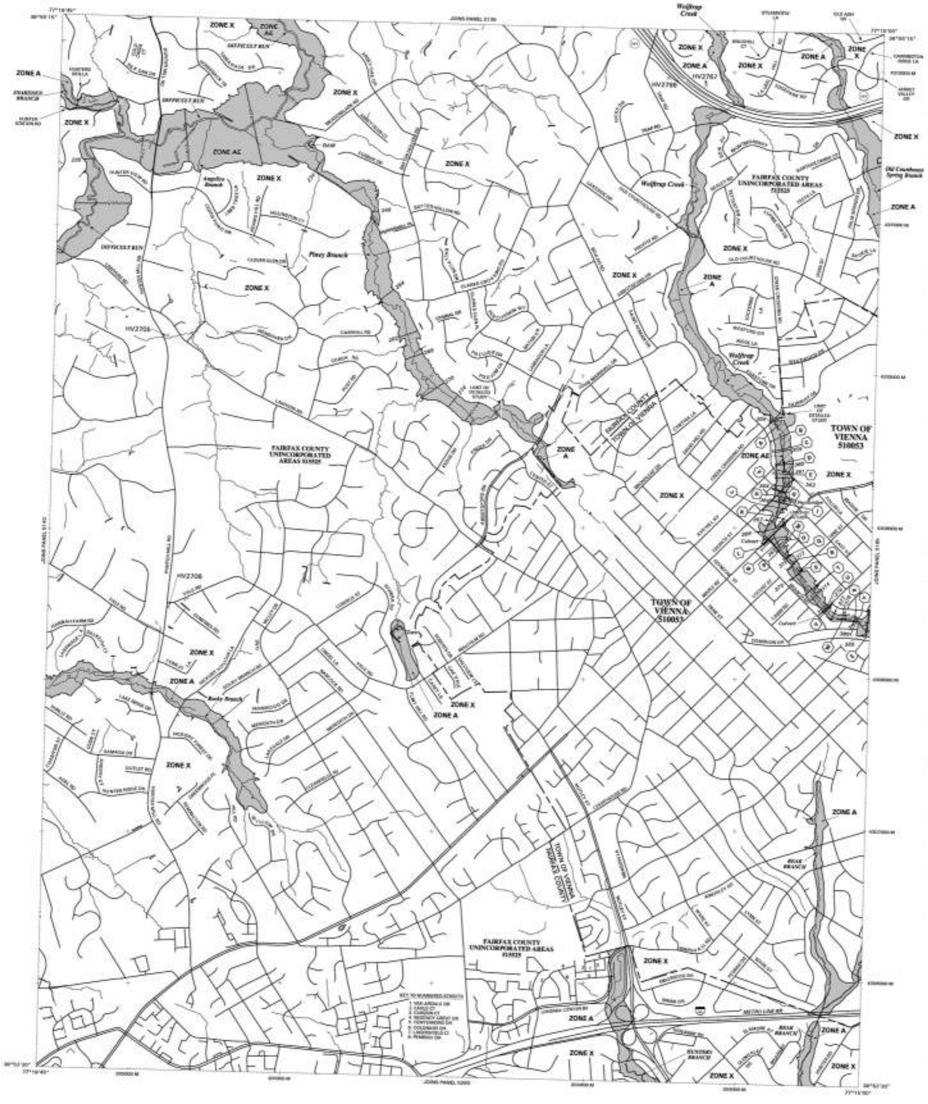
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/.

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

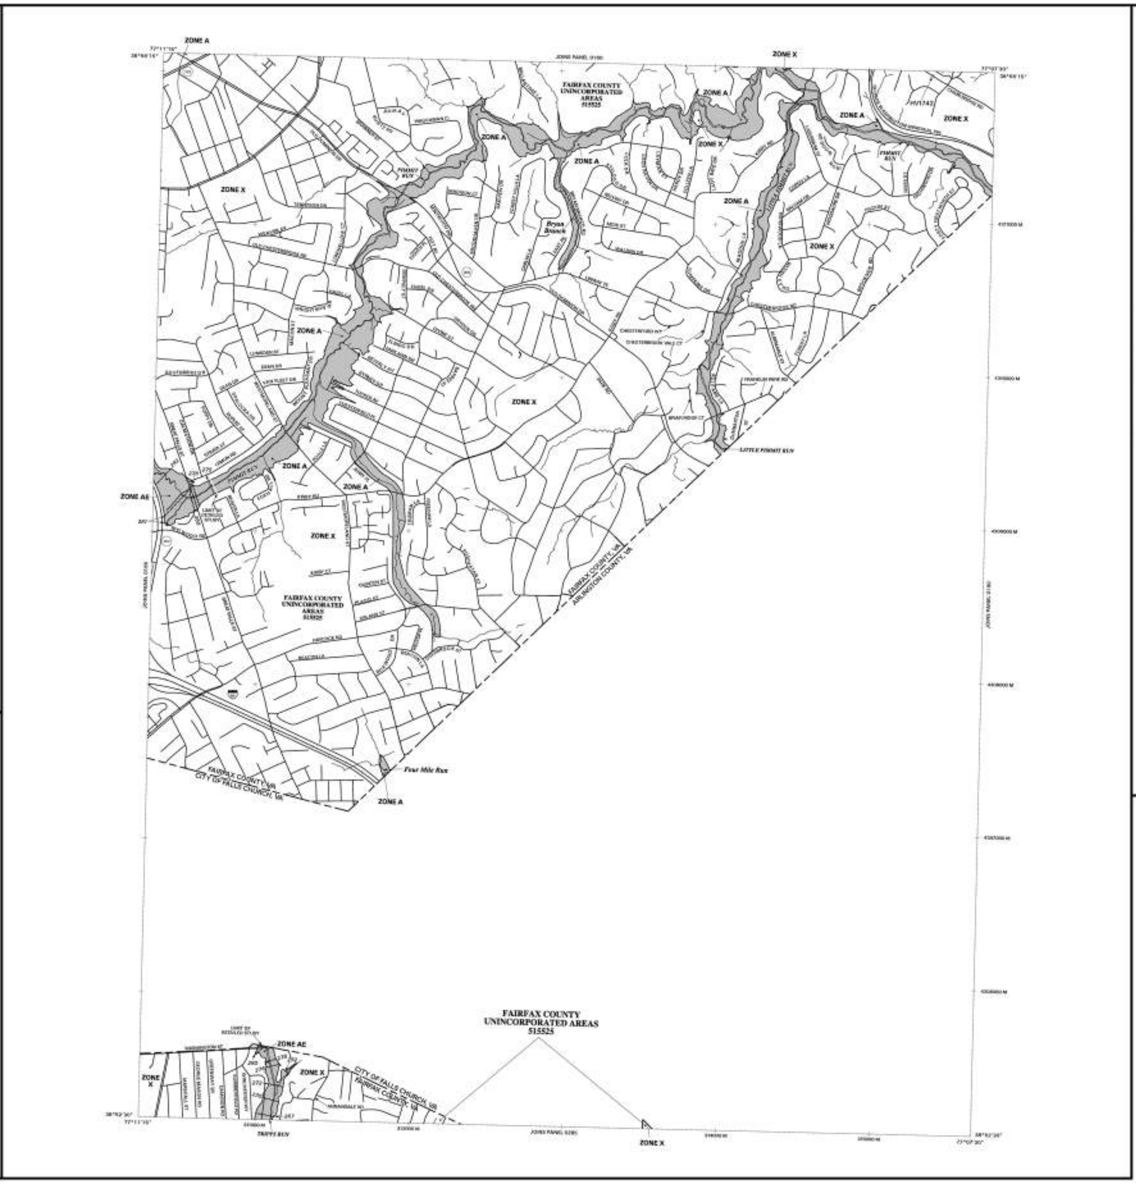
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▒ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

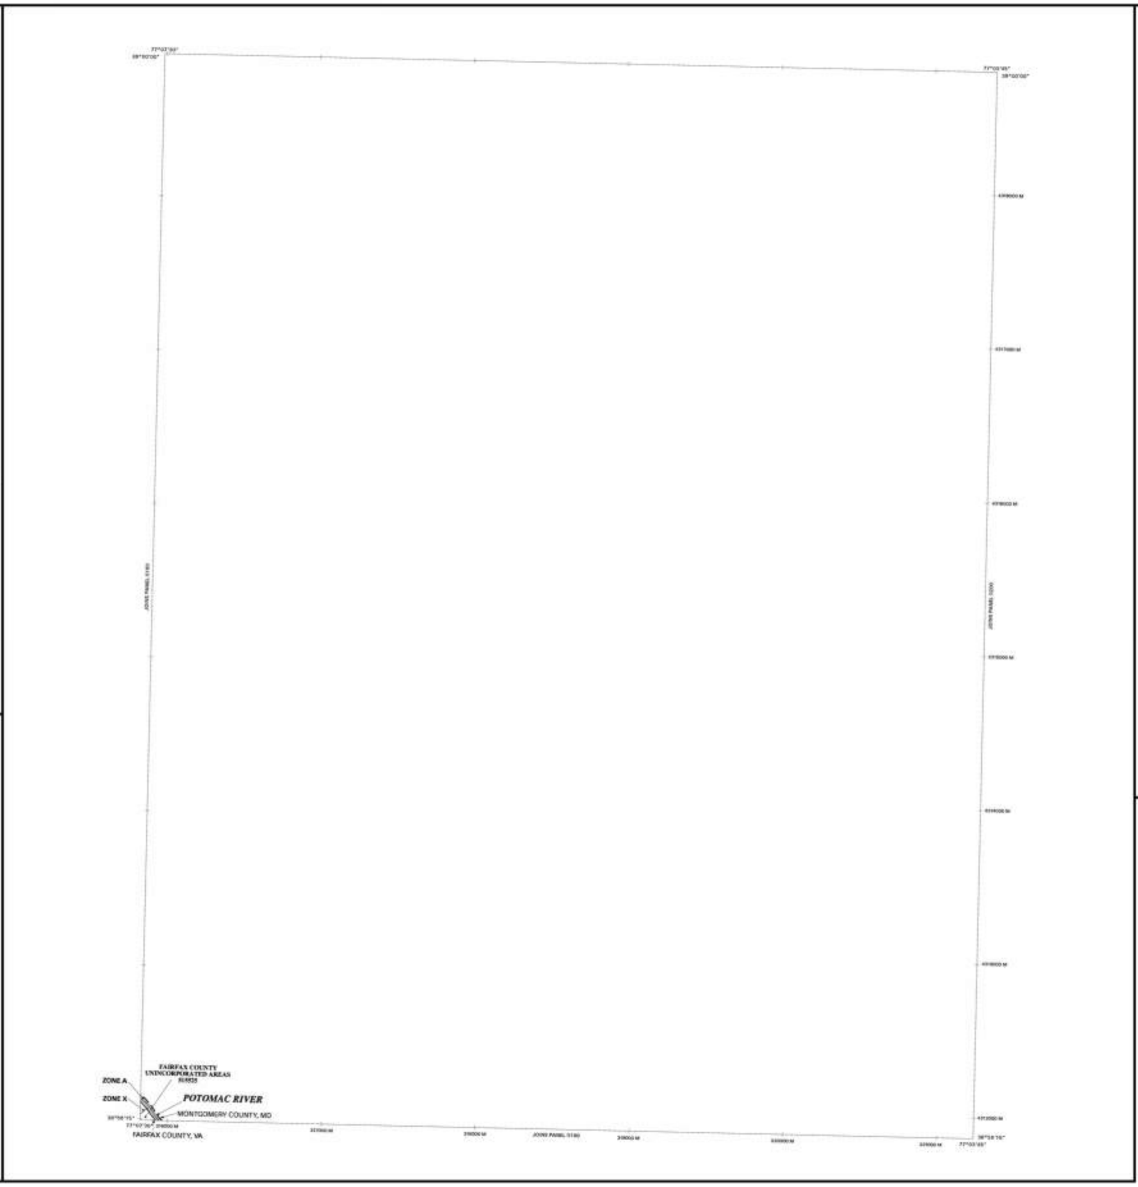
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

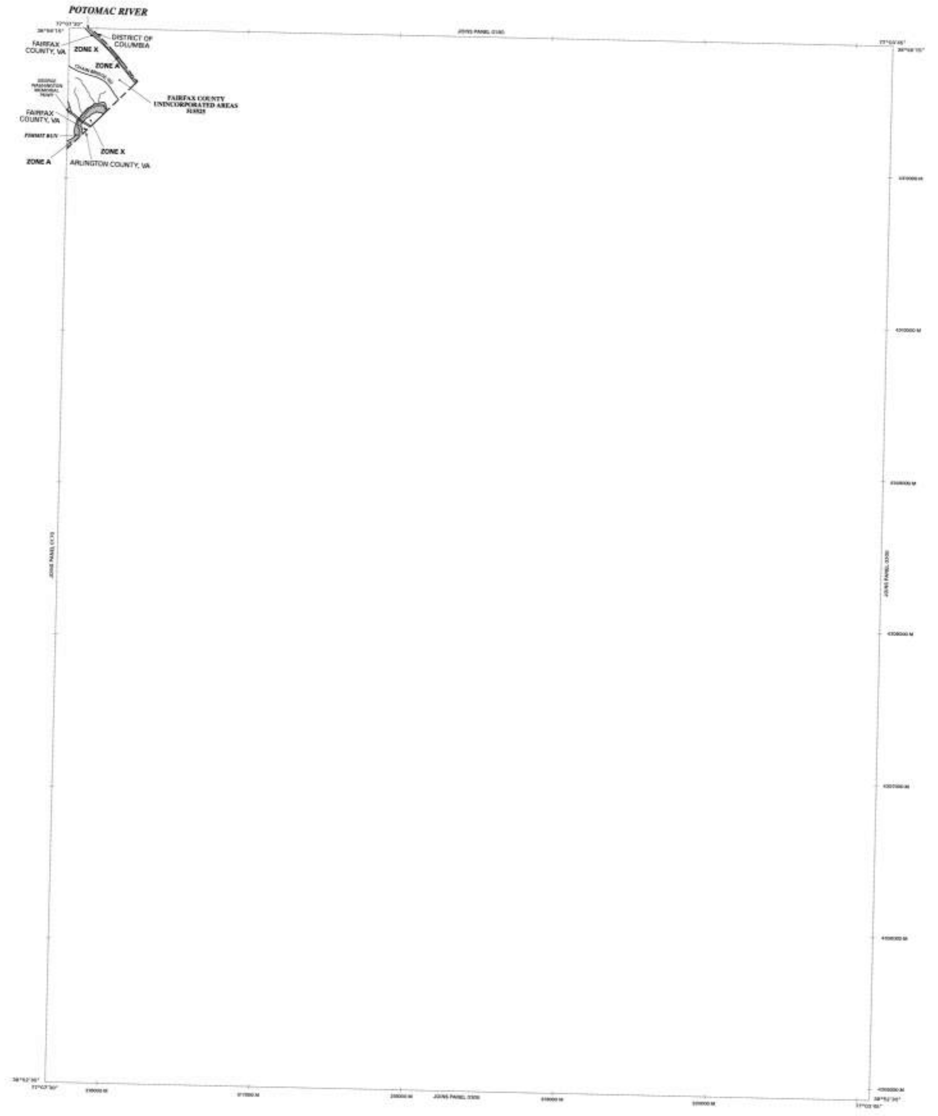
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

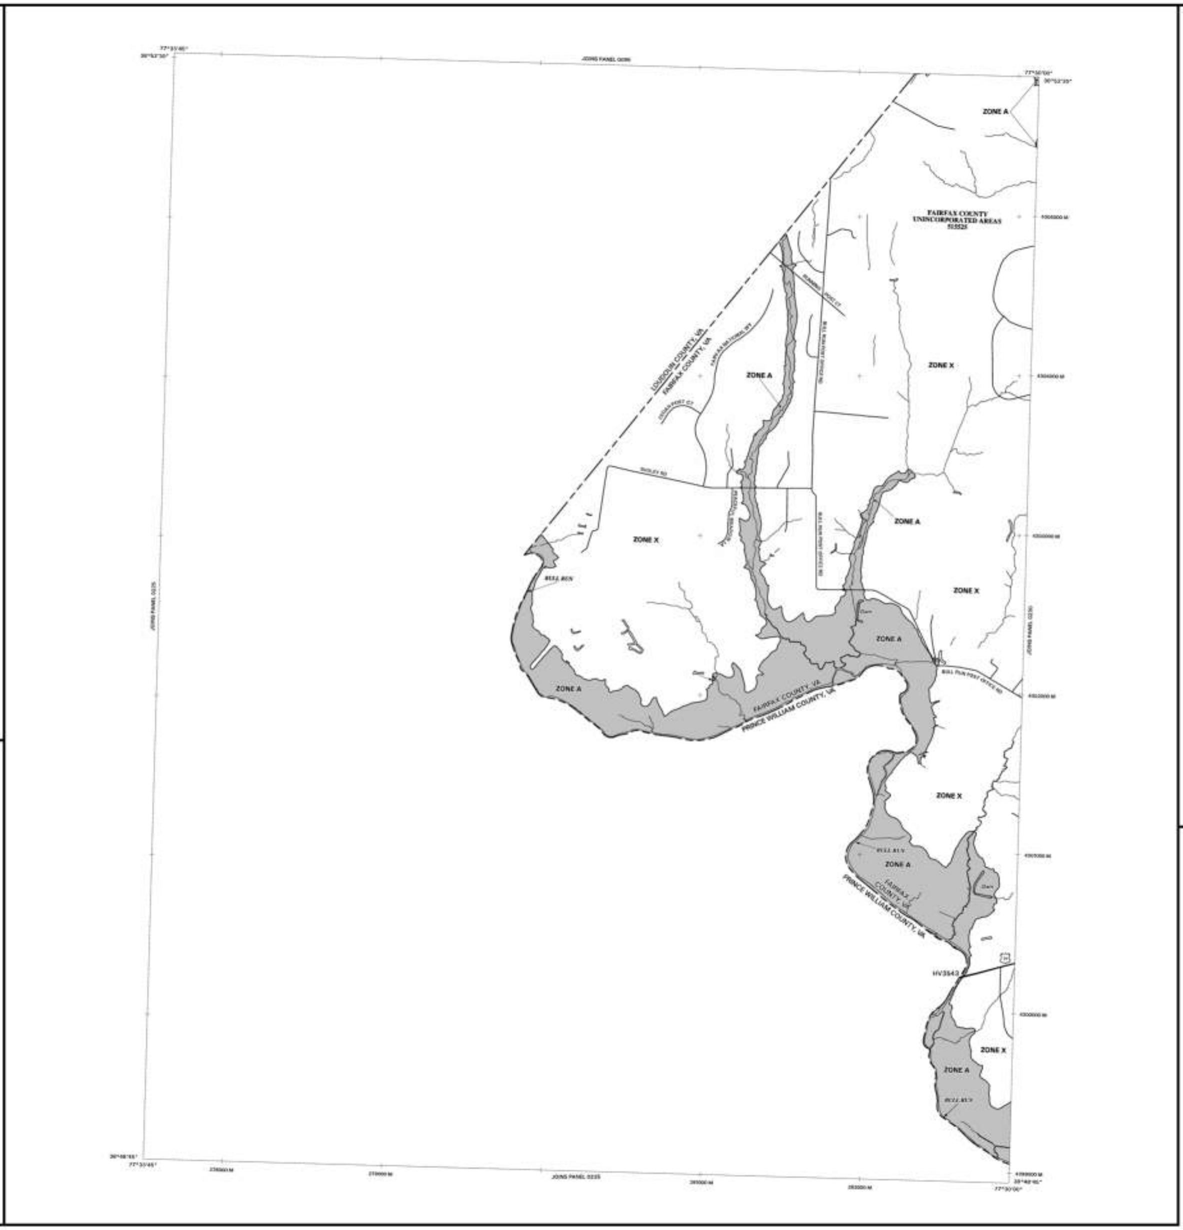
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of **FIRMs** for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

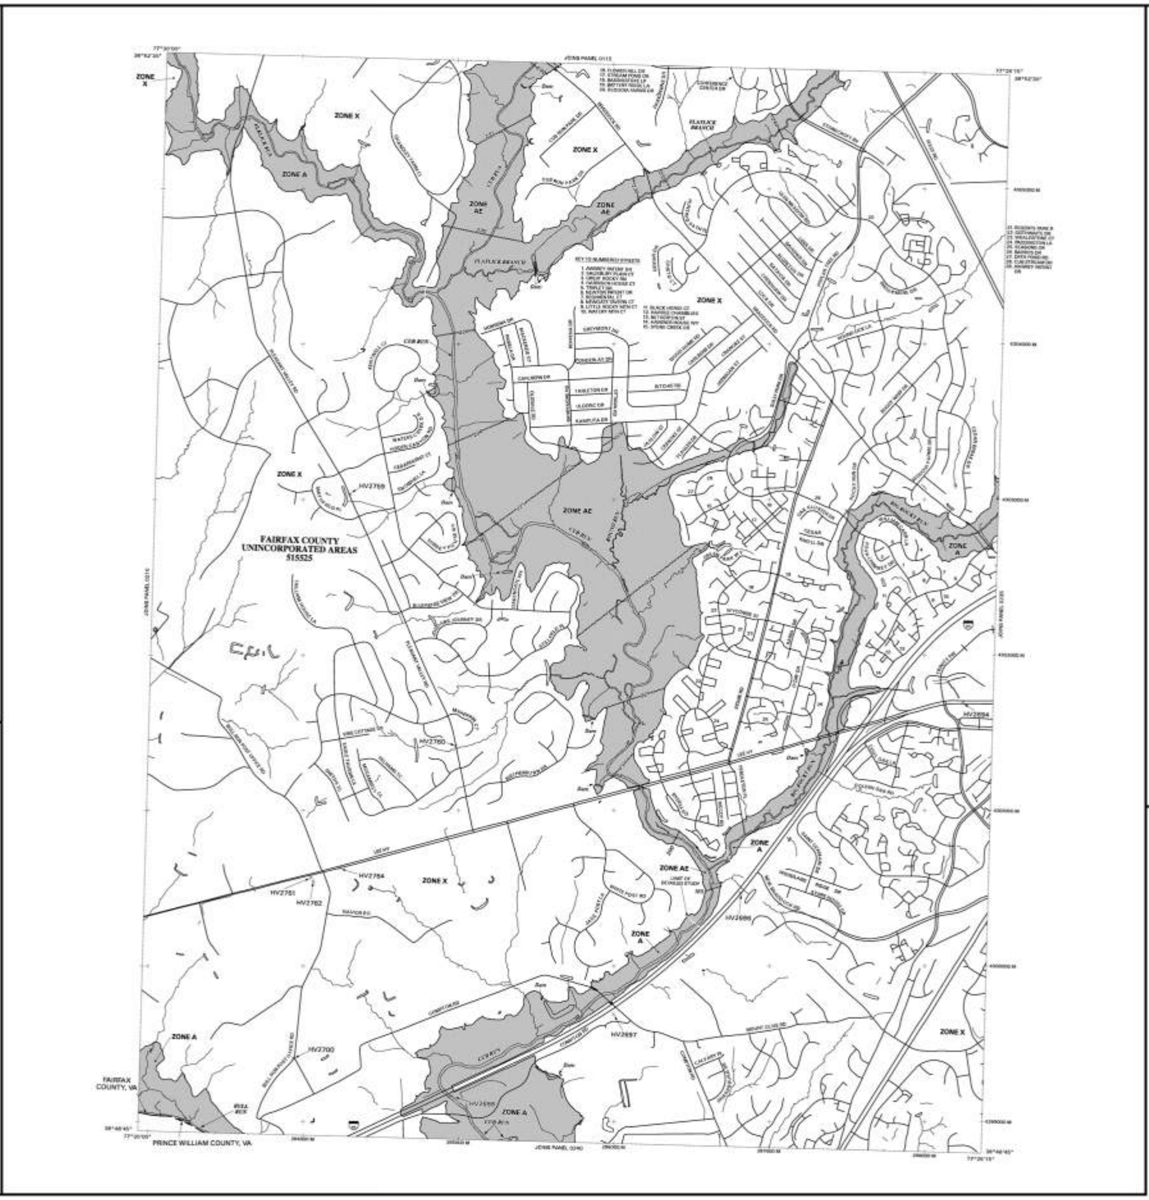
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

————	Floodplain boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

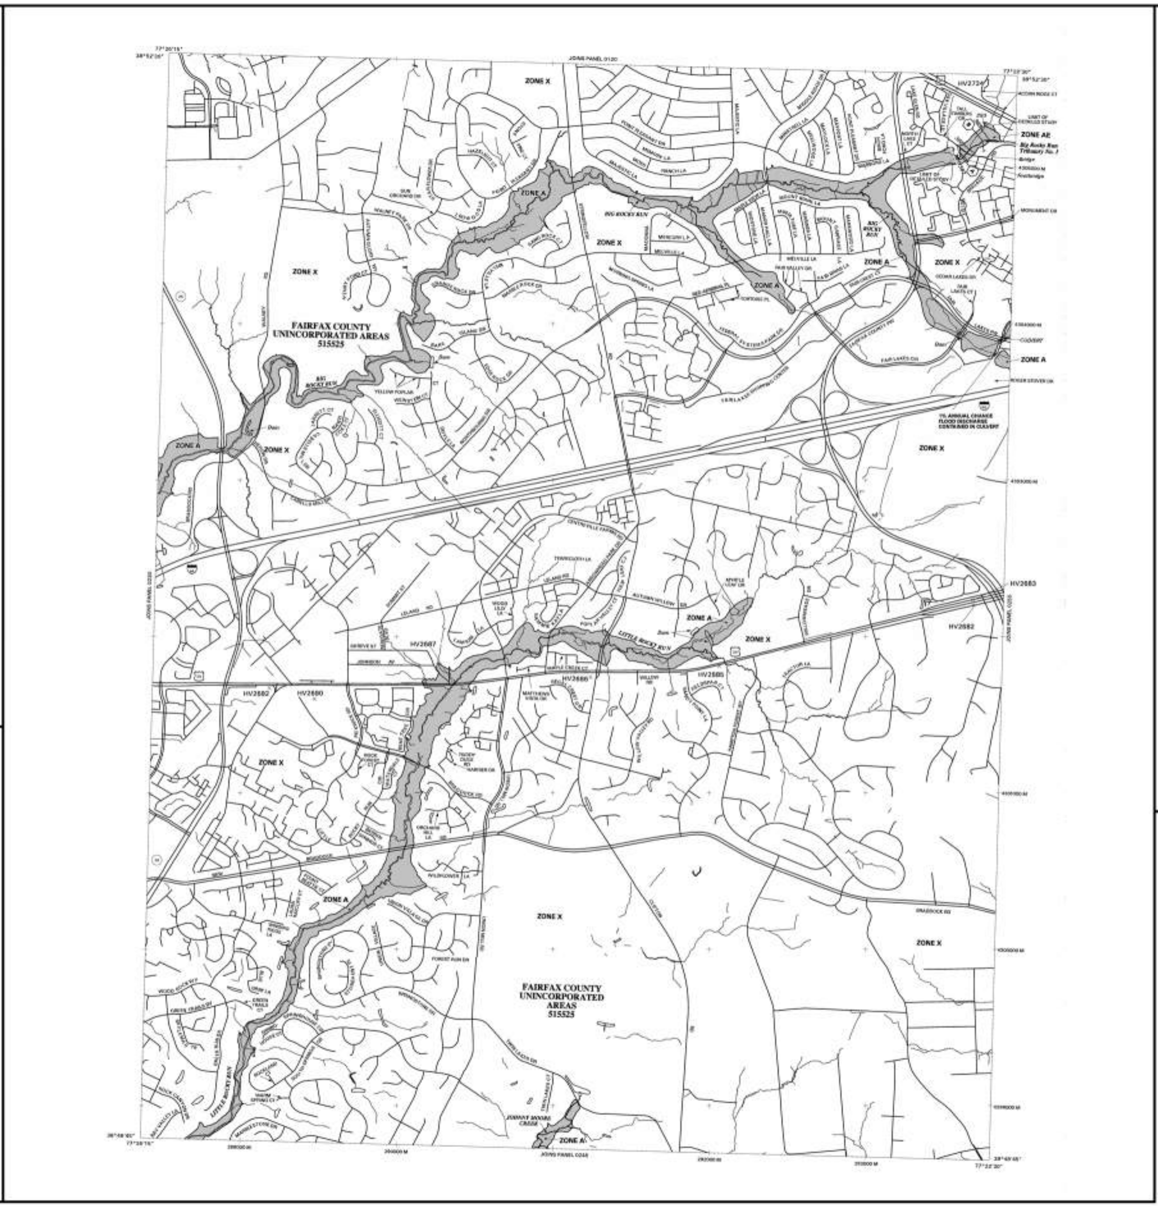
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this FIRM, may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
••••••••••••••••	CBRS and OPA boundary
▭ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevation** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevation (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

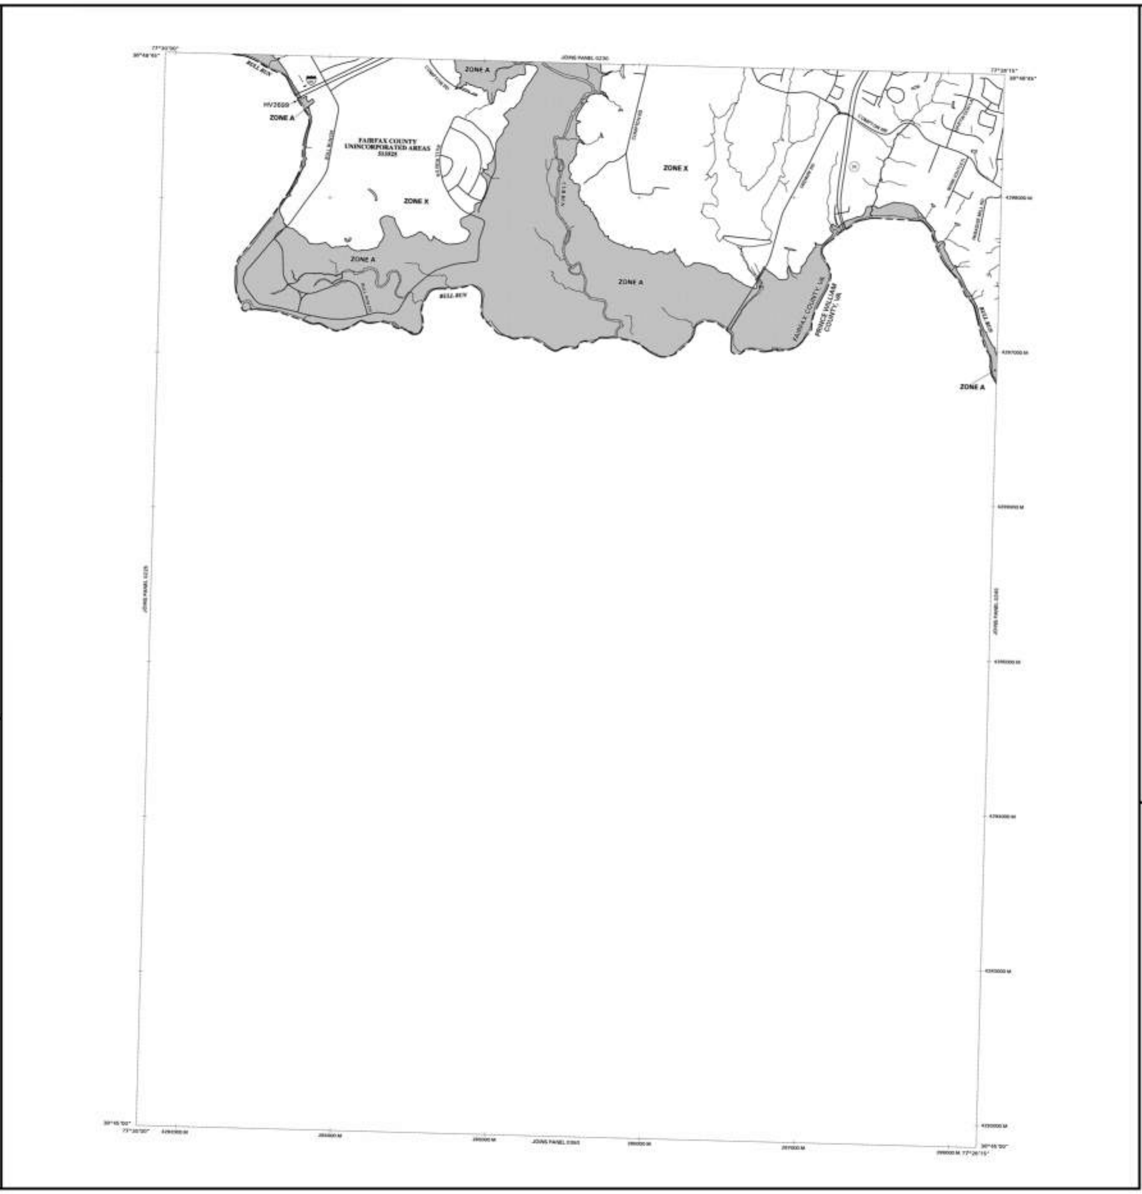
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

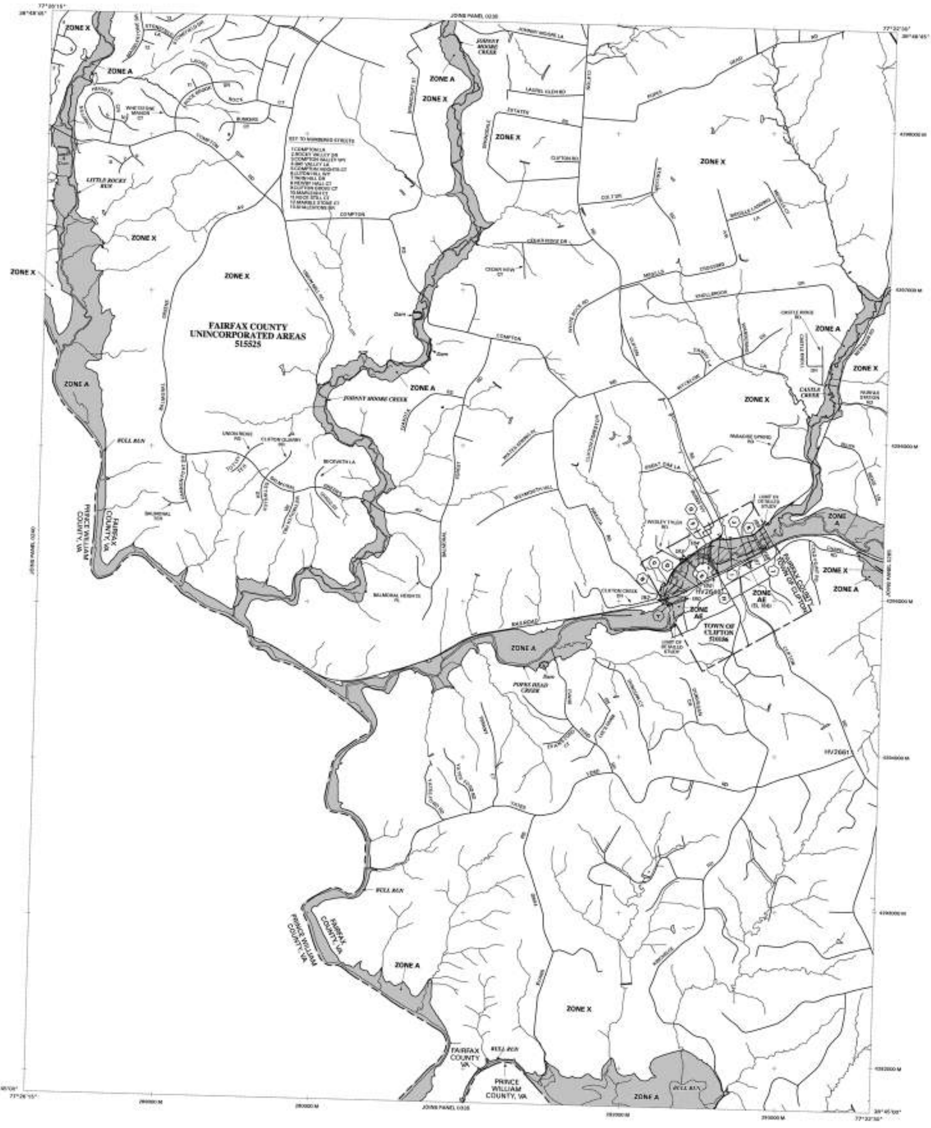
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▩ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▩ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
••••••••	CBRS and OPA boundary
▭ ◄——	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

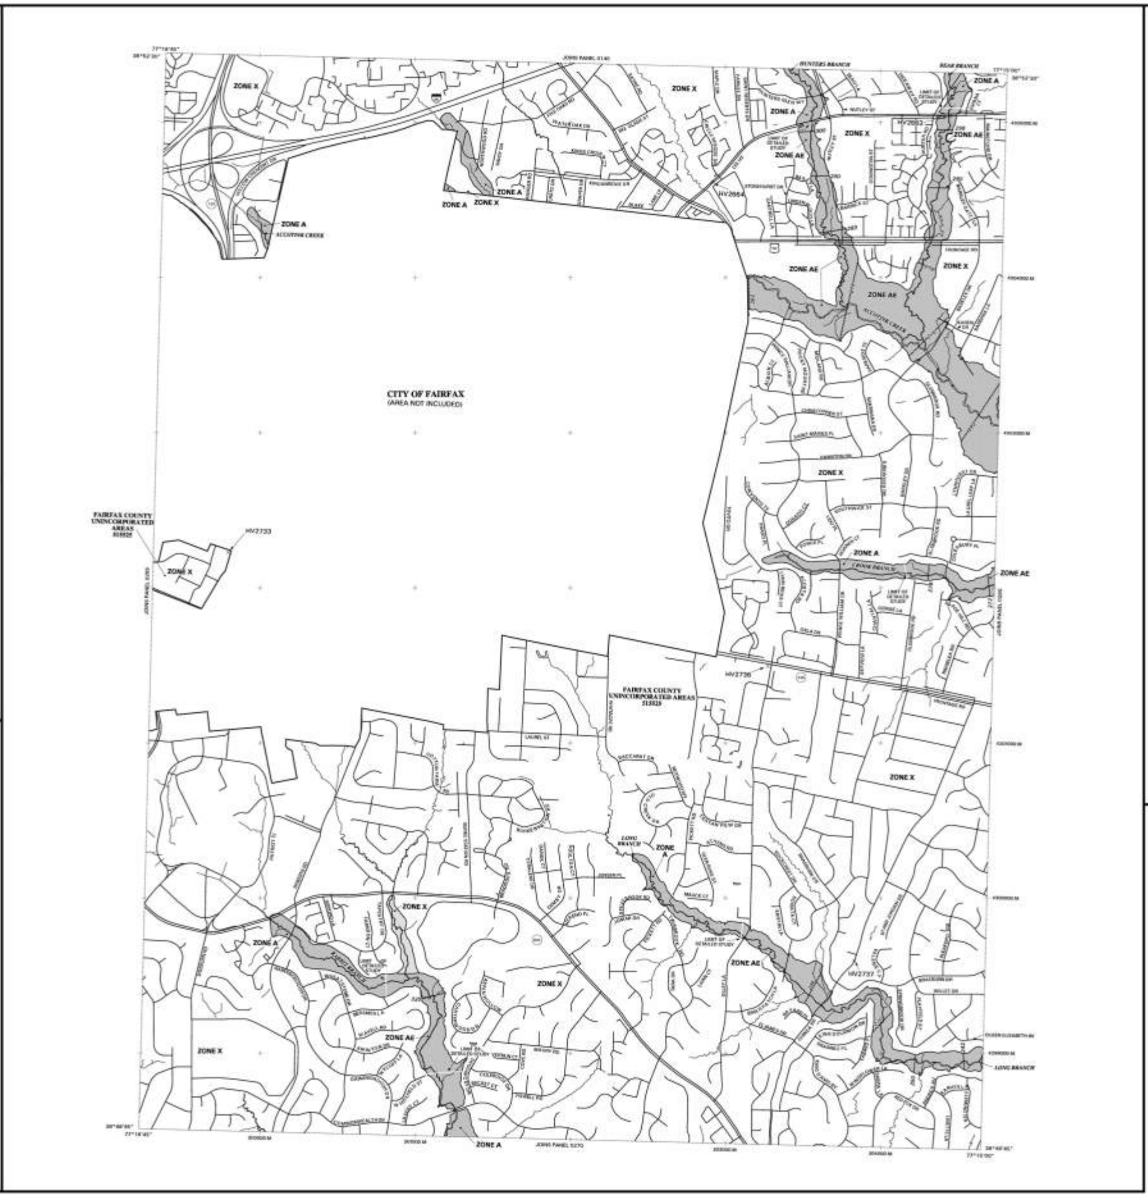
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Areas of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	Floodplain boundary
— — — —	Floodway boundary
— — — —	Zone D boundary
••••••••••••••••	CBRS and OPA boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **benchmarks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

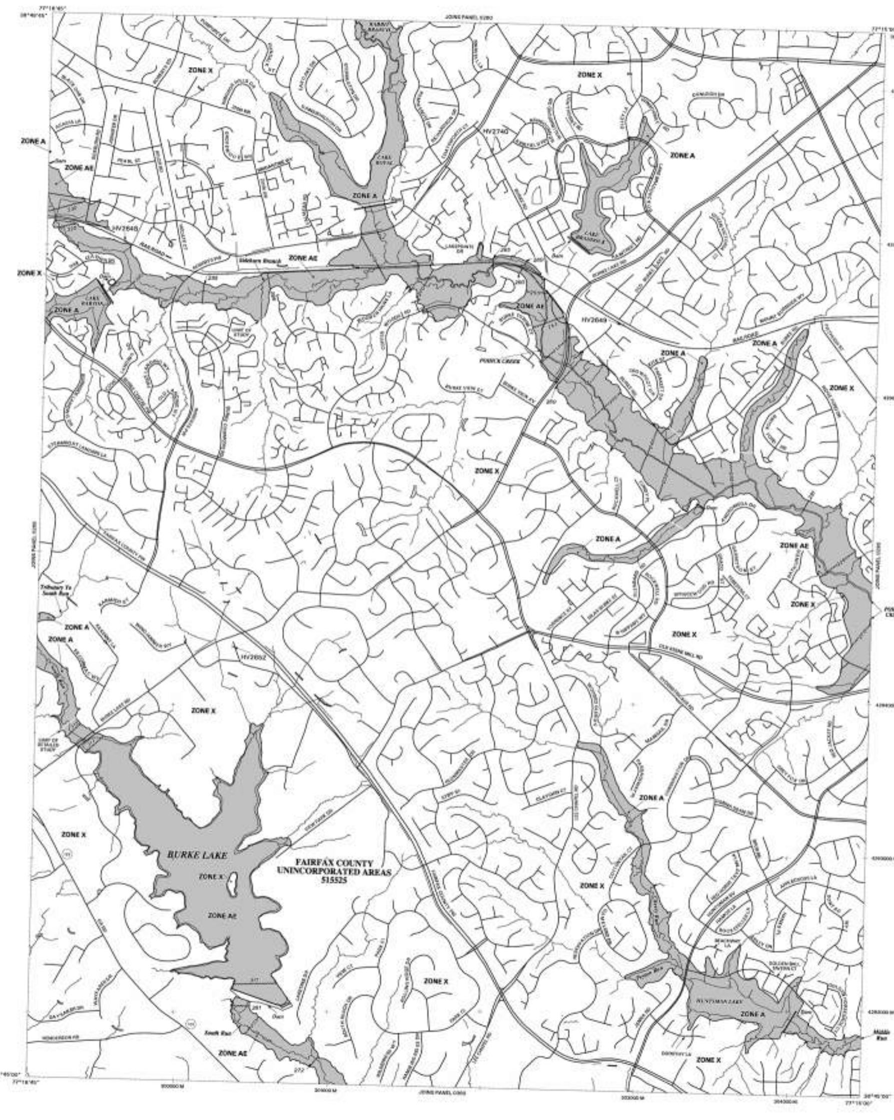
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

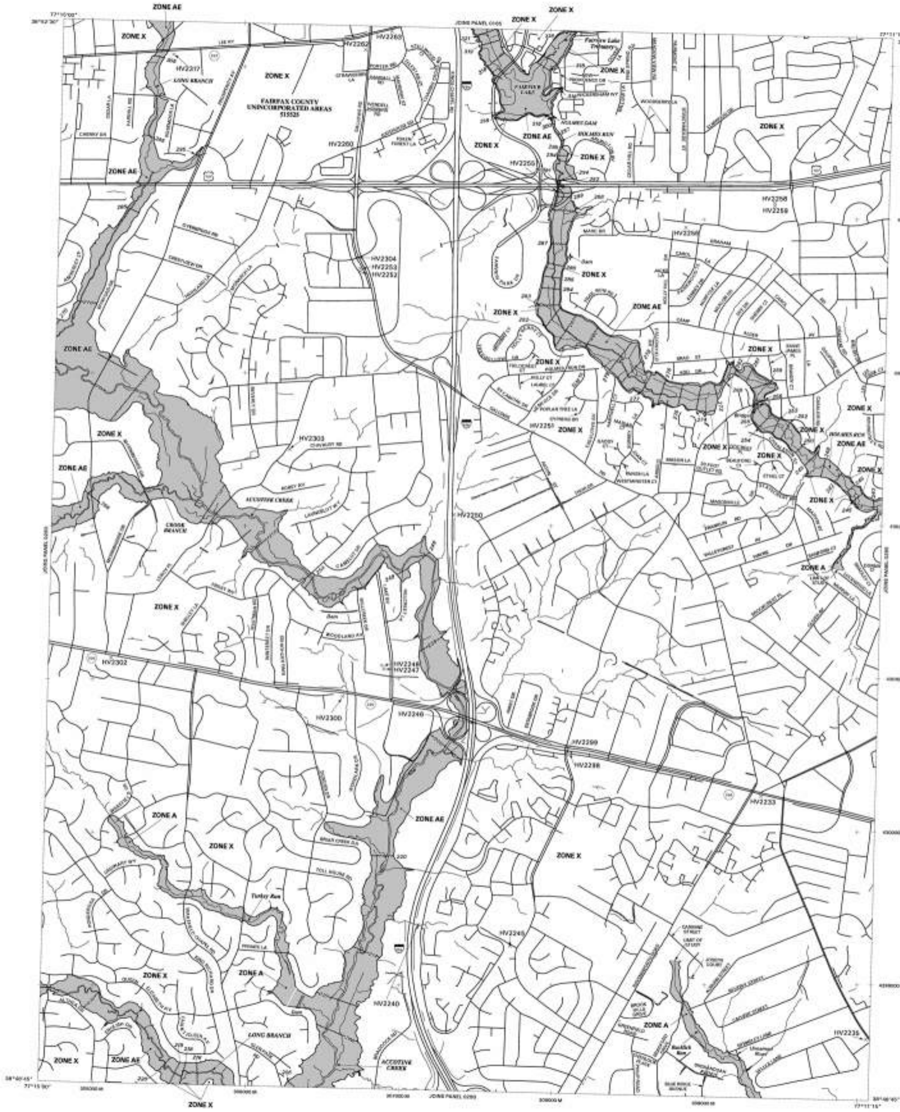
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevation** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevation (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

——	Floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
••••••••	CBRS and OPA boundary
▭	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.
~~513~~~~	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	Floodplain boundary
— — — —	Floodway boundary
— — — —	Zone D boundary
••••••••••••••	CBRS and OPA boundary
▒ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

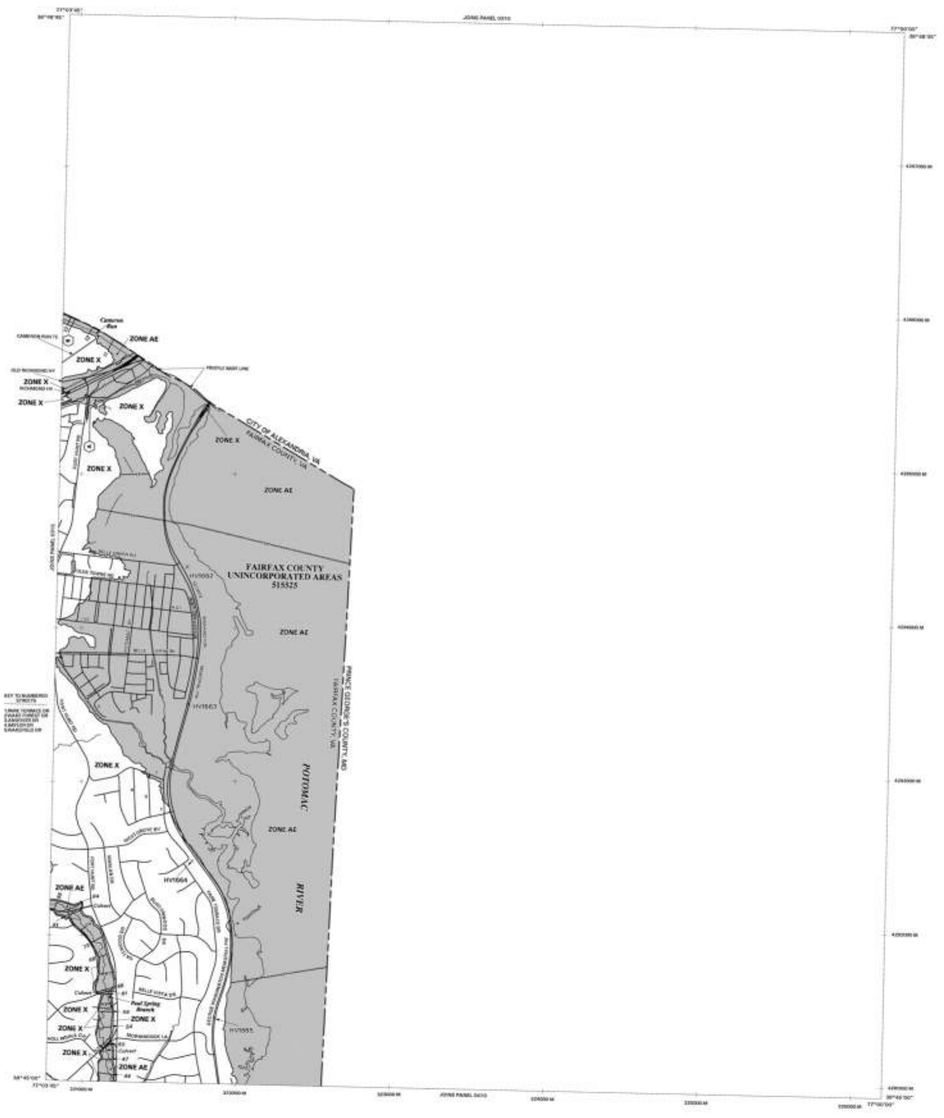
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———	Floodplain boundary
— — —	Floodway boundary
— — —	Zone D boundary
••••••••	CBRS and OPA boundary
▨ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

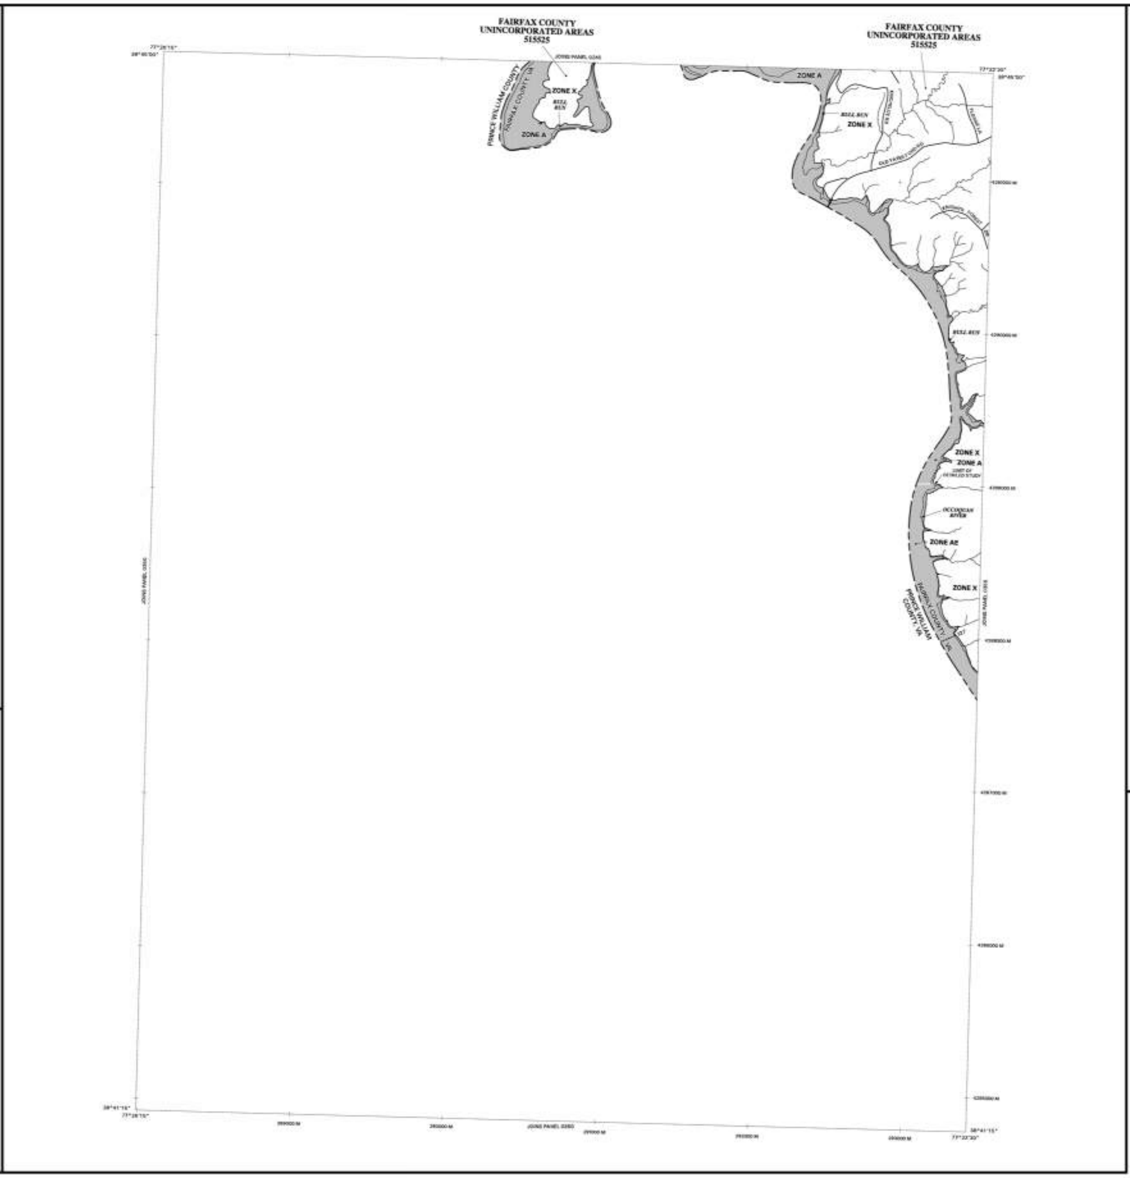
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▩ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▩ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NATIONAL FLOOD INSURANCE PROGRAM

Federal Emergency Management Agency

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevation** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevation (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

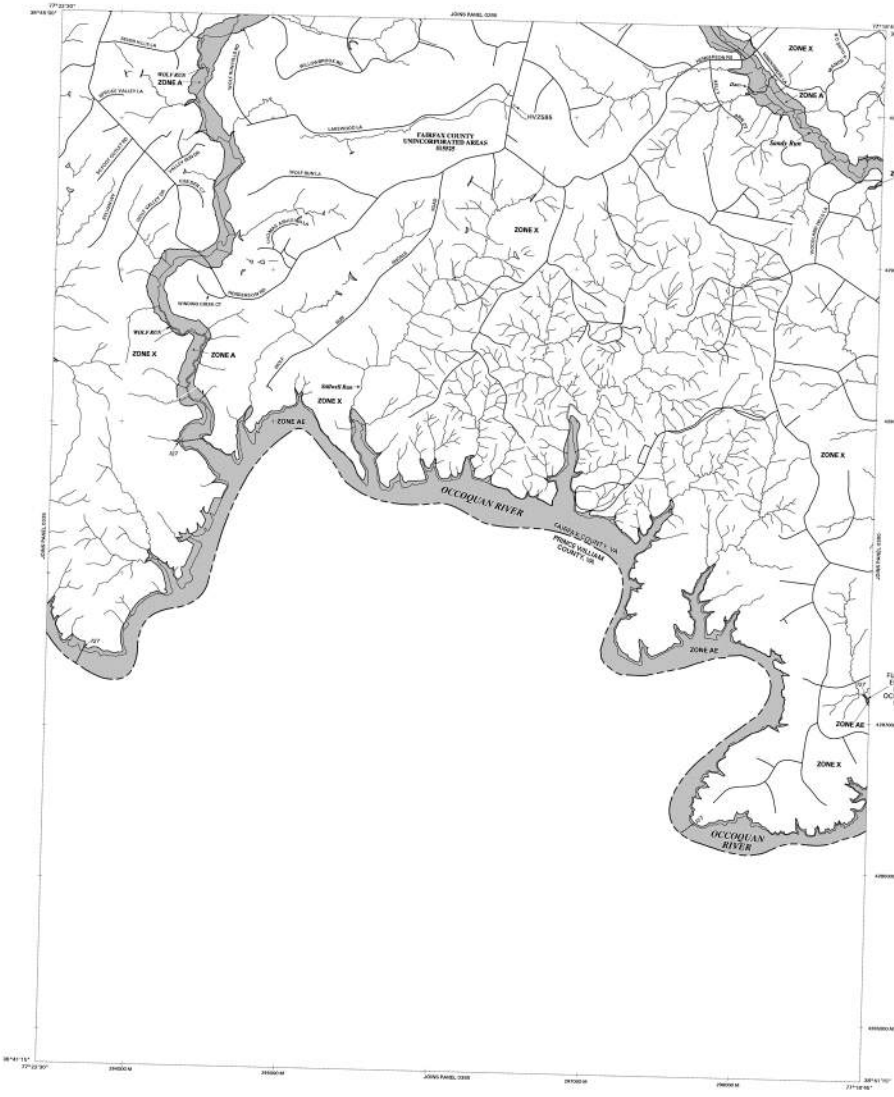
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

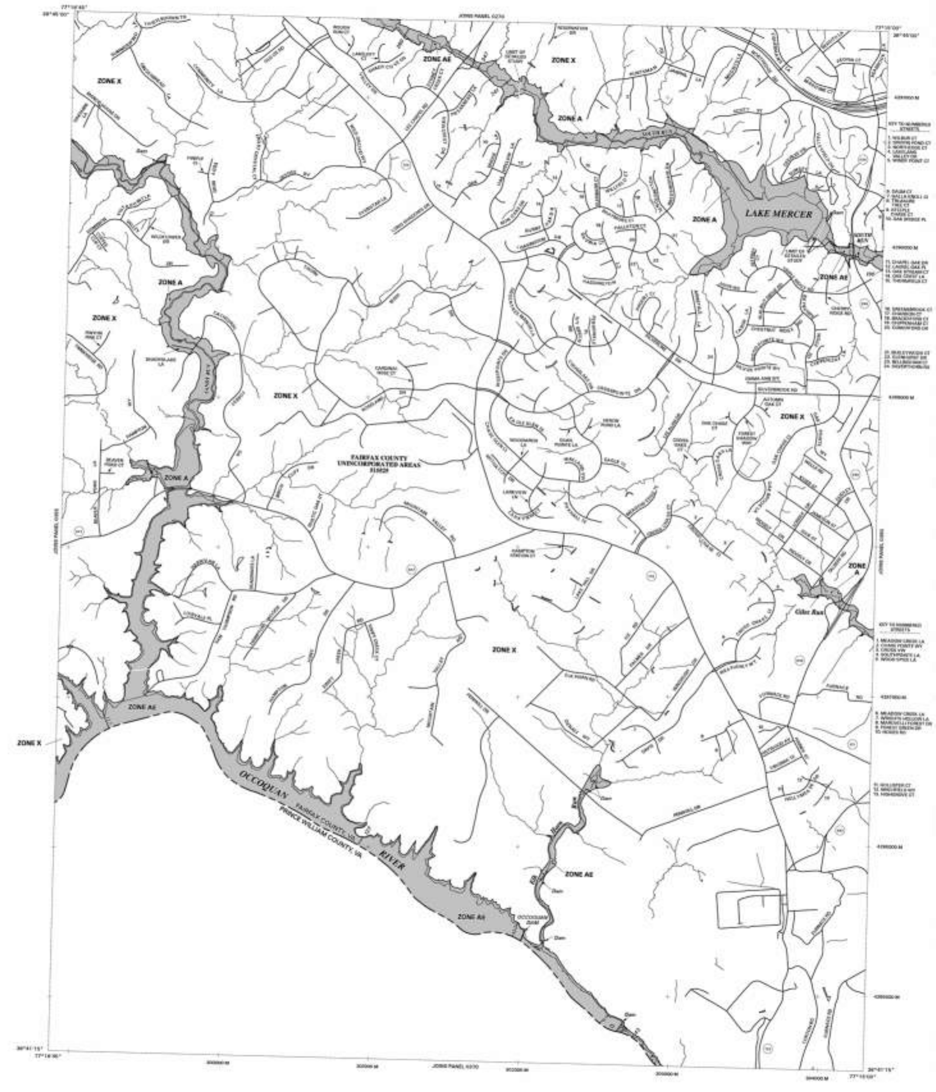
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	Floodplain boundary
— — — —	Floodway boundary
— - — - —	Zone D boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

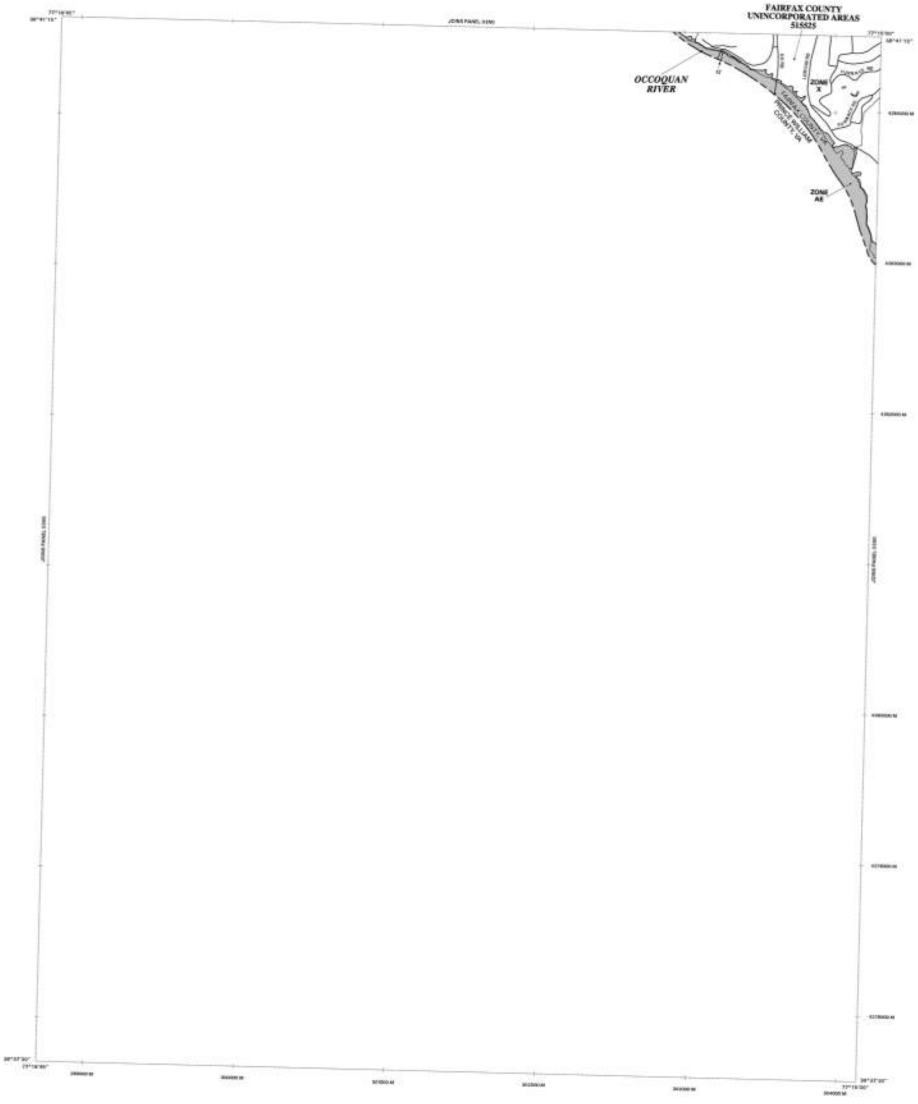
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	Floodplain boundary

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division

Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.

LEGEND

▨ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

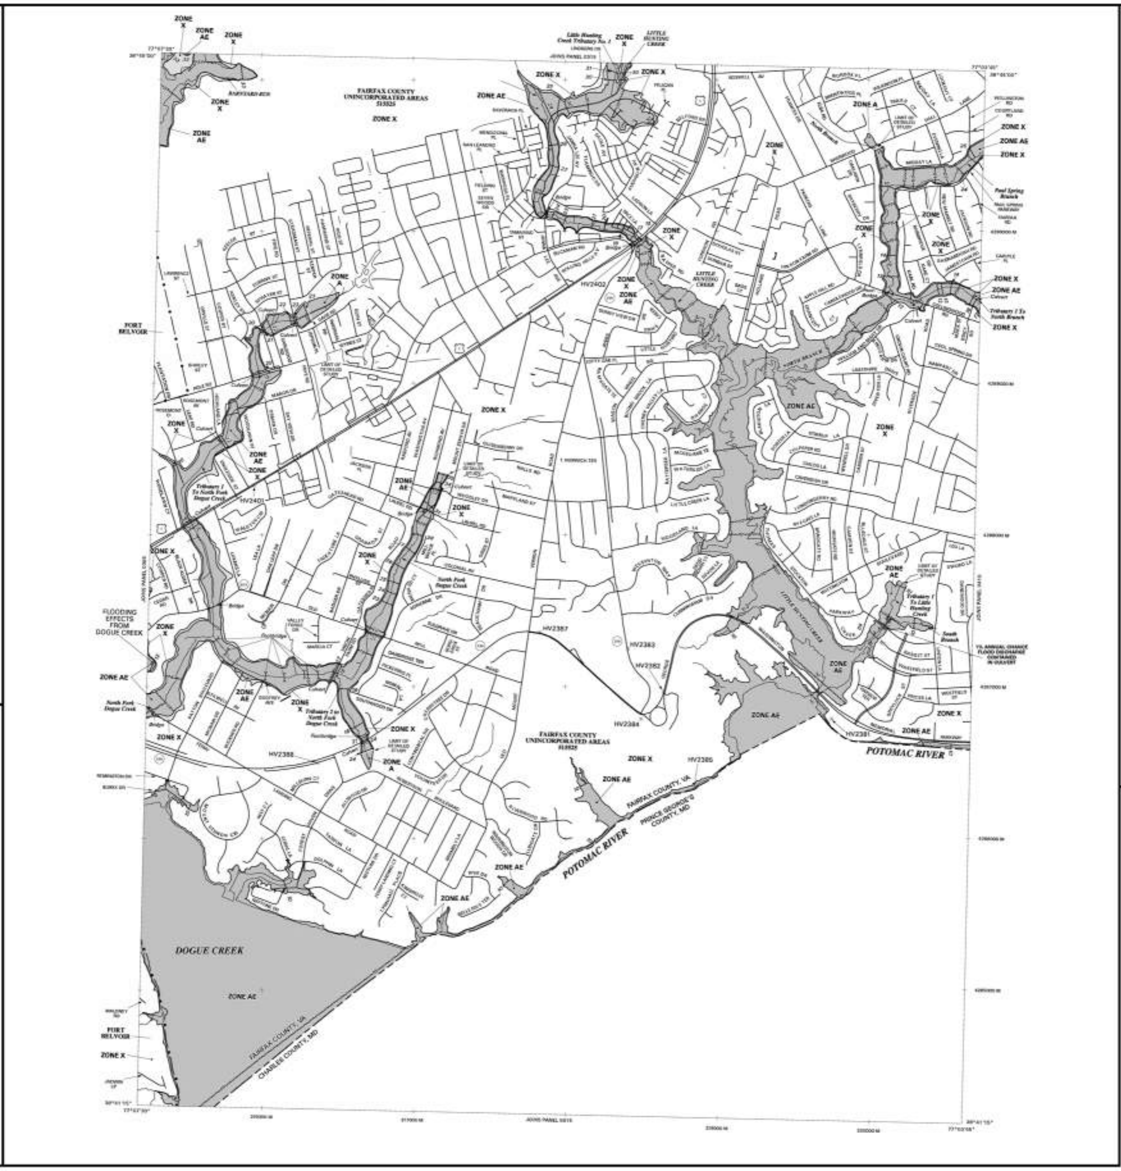
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations (BFEs) shown on this map apply only landward of 0.0' National Geodetic Vertical Datum (NGVD). Users of this FIRM should be aware that coastal flood elevations may also be provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this community. Elevations shown in the Summary of Stillwater Elevations table should be used for construction, and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map is Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** is NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit their website at www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the County of Fairfax GIS Department, including hydrography and political boundaries. These files were compiled at a scale of 1:2400 based on the available 2000 DOQQ aerial photography. Additional information may have been derived from other sources.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

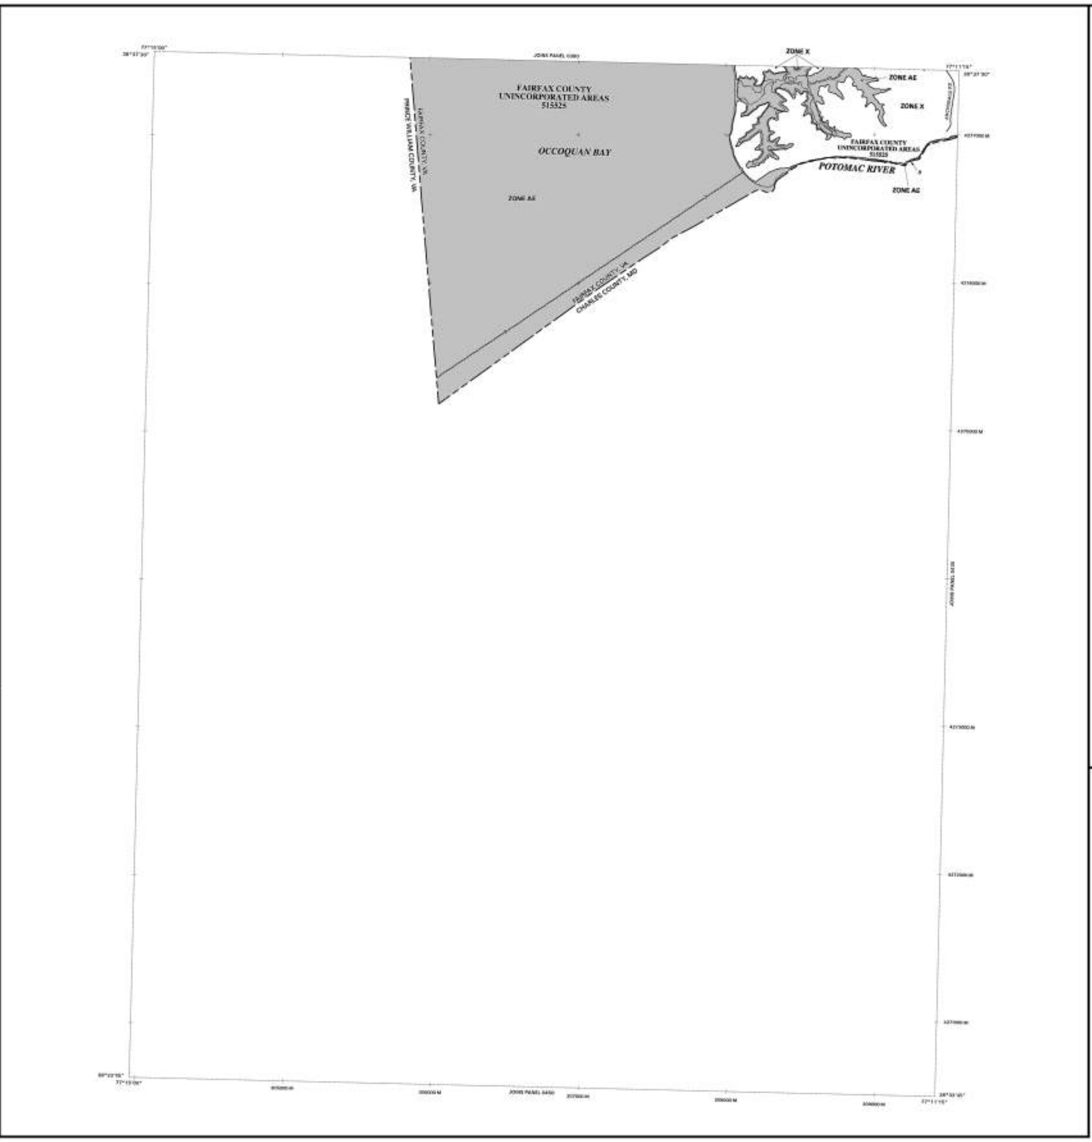
Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

An accompanying Flood Insurance Study report, Letters of Map Revision or Letters of Map Amendment revising portions of this panel, and digital versions of this PANEL may be available. Contact the **FEMA Map Service Center** at the following phone numbers and Internet address for information on all related products available from FEMA:

Phone: 800-358-9616
FAX: 800-358-9620
http://msc.fema.gov/

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip/

This map reflects more detailed and up-to-date stream channel configurations than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study report may reflect stream channel distances that differ from what is shown on this map.



LEGEND

▒ SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD EVENT

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water surface elevation of the 1% annual chance flood.

ZONE A	No base flood elevations determined.
ZONE AE	Base flood elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); base flood elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Area of special flood hazard formerly protected from the 1% annual chance flood event by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood event.
ZONE A99	Area to be protected from 1% annual chance flood event by a Federal flood protection system under construction; no base flood elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no base flood elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); base flood elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

░ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

————————	Floodplain boundary
— — — —	Floodway boundary
— — — —	Zone D boundary
••••••••••••••••	CBRS and OPA boundary
▒ ←	Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or velocities.

RE: Fairfax County Resilience Plan Submission - CFPF

Dear Ms. Calmbacher,

Thank you for providing an overview of your Resilience Plan, and informing DCR of the various plans that Fairfax County will be utilizing to fulfill the Resilience Plan submission requirements. After careful review and consideration, the Virginia Department of Conservation and Recreation has deemed the Plan complete and meets all the criteria outlined in the 2021 Community Flood Preparedness Grant Manual. This approval will remain in effect for a period of three years, ending on January 11, 2025.

The following elements were evaluated as part of this review:

1. **Element 1: It is project-based with projects focused on flood control and resilience. DCR RESPONSE**

   Meets criteria as written.

   a. Project-based: Fairfax County is divided into 30 watersheds which have been addressed in 11 major watershed management plans. Each of the watershed management plans contains projects and watershed management area restoration strategies. The 2017 *Northern Virginia Hazard Mitigation Plan* was a regional effort involving nineteen counties, including Fairfax County, and outlines specific mitigation projects for each participating community in order to reduce vulnerability and exposure to future hazards, including flooding events. The *Fairfax County FY 2022 - FY 2026 Capital Improvement Program, Stormwater Management* contains projects at various locations throughout Fairfax County. The projects included and described in the *Fairfax County FY 2022 - FY 2026 Capital Improvement Program, Stormwater Management* align with the established *Comprehensive Plan* objectives. The *Resilient Critical*

Infrastructure Roadmap for Northern Virginia contains a database of resilience projects throughout northern Virginia, including Fairfax County.

2. **Element 2: It incorporates nature-based infrastructure to the maximum extent possible. DCR RESPONSE**

   Meets criteria as written.

   a. The 2020 R*egional Collaboration to Build Community Resilience in Northern Virginia* expanded upon *The Roadmap*, to include maximization of green infrastructure. Nature-based solutions are also presented in the *Fairfax County Watershed Management Plan* and the *Fairfax County FY 2022 - FY 2026 Capital Improvement Program, Stormwater Management.*

3. **Element 3: It includes considerations of all parts of a locality regardless of socioeconomics or race. DCR RESPONSE**

   Meets criteria as written.

   a. All parts of a locality: The *Northern Virginia Hazard Mitigation Plan* discusses the demographic and economic trends throughout the entirety of Fairfax County.

   b. Social vulnerability: The R*egional Collaboration to Build Community Resilience in Northern Virginia* presents a more comprehensive approach that includes an assessment of the socioeconomic impacts of infrastructure disruptions on vulnerable populations that will be taken into account as well as the socioeconomic benefits of infrastructure investment. This expanded upon objectives contained within *The Roadmap*, to ensure equitable access to resilient critical infrastructure.

   c. Demographic Analysis: Population and demographic characteristics outlined within the *Northern Virginia Hazard Mitigation Plan*. The *Fairfax County Comprehensive Plan* also looks at demographics and social factors and utilizes this information to support the Human Services section of the *Comprehensive Plan*.

4. **Element 4: It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation. DCR RESPONSE**

   Meets criteria as written.

   a. Coordination with other local and inter-jurisdictional projects, plans and activities: Objective 4: Strengthen Regional Resilience Through Innovative Partnerships, Programs, and Pilots contained within *Resilient Critical Infrastructure Roadmap for Northern Virginia* focuses on coordination with local and inter-jurisdictional agencies and aligning strategies and programs. The *Comprehensive Plan for Fairfax County, Virginia* was adopted by the Board of Supervisors, Planning Commision, The Department of Planning and Zoning, and the Department of Transportation, and guides all of the plans presented in the Resilience Plan

submission for Fairfax County. The *Northern Virginia Hazard Mitigation Plan* was a collaborative effort that was adopted by all impacted localities.

b. Clearly articulated timeline or phasing plan for implementation: Timeline for deliverables is presented within the R*egional Collaboration to Build Community Resilience in Northern Virginia*. Timeline presented within the F*airfax County FY 2022 - FY 2026 Capital Improvement Program, Stormwater Management*. Phased implementation plans presented in the *Fairfax County Watershed Management Plans*.

5. **Element 5: Is based on the best available science, and incorporates climate change, sea level rise, storm surge (where appropriate), and current flood maps.**

Meets criteria as written.

a. The 2018 *Resilient Critical Infrastructure Roadmap for Northern Virginia (Roadmap)* incorporates best available science and identifies actions to potentially decrease the severity of future consequences emanating from climate and extreme weather, to include sea level rise and storm surge. *Sea Level Rise: Impact on Northern Virginia* is an interactive story map and dashboard that was created in 2019 to convey the impact of sea level rise scenarios. The *Northern Virginia Hazard Mitigation Plan* includes analyses of natural hazards based on best available science to include flooding, sea level rise and land subsidence, tropical and coastal storms, and shoreline erosion.

VA DCR looks forward to working with you as you work to make Fairfax County a more resilient community. If you have questions or need additional assistance, please contact us at cfpf@dcr.virginia.gov. Again, thank you for your interest in the Community Flood Preparedness Fund.

Sincerely,

Wendy Howard Cooper

Wendy Howard Cooper, Director
Dam Safety and Floodplain Management

Telephone Number: (703) 324-5500 **Cell Phone Number:** (____) N/A

Email Address: Craig.Carinci@fairfaxcounty.gov

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☒ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☒ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): 27 Fairfax County Watersheds

NFIP Community Identification Number (CID#):(See appendix F 515525

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Appendix C: Scoring Criteria for Studies

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	Fairfax County	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration	☒ Yes ☐ No
Applicant Name:	Fairfax County

Scoring Information

Criterion	Point Value	Points Awarded
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	**30**
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	**35**
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	
☒ Regional hydrologic and hydraulic studies of floodplains.	**45**	**45**
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	**0**
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	**0**
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	**0**
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	**0**
Total Points		**105**

Good afternoon,

Fairfax County is pleased to submit the following five applications for grant round 3 of the Virginia Community Flood Preparedness Fund:

1. CID515525_FairfaxCounty_CFPF-1 Tucker Avenue Neighborhood Stormwater Improvement Project Application
2. CID515525_FairfaxCounty_CFPF-2 Chowan Avenue Stormwater Improvement Project Application
3. CID515525_FairfaxCounty_CFPF-3 Little Pimmit Run Tributary at Woodland Terrace Project Application
4. CID515525_FairfaxCounty_CFPF-4 Tripps Run at Barrett Road Flood Mitigation Project Application
5. CID515525_FairfaxCounty_CFPF-5 Regulated Floodplain Map Updates Study Application

The applications are available for download at the following Sharefile link: https://fairfaxcounty-ent.sharefile.com/d-s52b8f9fb46c444d8a5ecbe1f4ad3dd45

Please let me know if you are unable to download the applications or if you have any questions.

Thank you,

Catie Torgersen

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

✓ Resilience Plan Development

  ✓ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ✓ Resource assessments, planning, strategies and development.
    ✓ Policy management and/or development.
    ✓ Stakeholder engagement and strategies.

Location of Project (Include Maps): Rappahannock-Rapidan Region

NFIP Community Identification Number (CID#):(See appendix F) 510041 (Culpeper County); 510042 (Town of Culpeper); 510055 (Fauquier County); 510094 (Madison County); 510203 (Orange

County); 510366 (Town of Orange); 510128 (Rappahannock County); 510056 (Town of Remington); 510057 (Town of Warrenton); 510288 (Town of Washington); 510137-DCR1 (Town of Gordonsville); 510061-DCR1 (Town of The Plains)??

Scope of Work Narrative

Introduction

The Rappahannock-Rapidan Regional Commission (RRRC) is a planning district commission in Virginia's Northern Piedmont and consists of Culpeper, Fauquier, Madison, Orange and Rappahannock Counties, and the incorporated towns within them. While not within the Coastal Zone, the Rappahannock-Rapidan Region is vulnerable to climate change, particularly extreme weather events. Portions of the Region are experiencing rapid development as the Washington, DC metropolitan area continues to move westward. The vulnerability of future buildings, infrastructure and critical facilities is of great concern to community leaders across the Region as are threats to its robust agricultural economy and agritourism.

The most common hazard identified in the Region's 2018 Hazard Mitigation Plan is flooding, which is primary focus of the proposed project. Three major rivers, the York, the Rappahannock and the Potomac, all of which have tributaries of significant size, drain the region to the Chesapeake Bay. Runoff from creeks and streams high in the Blue Ridge Mountains contribute to the downstream flow, often resulting in flash floods during periods of heavy rain and/or rapid snow melt.

Increases in the intensity of rain events is also a concern for the approximately one hundred state-regulated dams in the Region that have known hazard classifications, including fourteen high hazard potential dams and 27 significant hazard potential dams. Furthermore, lack of stormwater management on land developed prior to state stormwater law and stormwater practices not sized for the changing climate carry additional flood risk.

With these risk factors and others in mind, RRRC seeks grant funding to develop a regional resiliency plan to assist its member jurisdictions in assessing and mitigating these risks, as part of its overall Regional Hazard Mitigation Plan update process.

Capacity Needs and Assets

The Rappahannock-Rapidan Region is a semi-rural region of 183,197 residents, and as such, the majority of RRRC's member jurisdictions operate with limited resources and technical capacity. For this reason, RRRC is requesting grant funding to contract a consultant to provide technical and planning expertise in the development of a regional resiliency plan with locality-specific strategies as part of its Hazard Mitigation Plan update. By working regionally and incorporating resiliency plan development into the larger planning process, RRRC would be able to more efficiently and effectively utilize these limited resources. Additionally, the Region's localities would benefit from collaboration and information sharing throughout the process, taking advantage of the technical expertise within the more developed jurisdictions.

RRRC serves as the plan developer and coordinator for the Rappahannock-Rapidan Regional Hazard Mitigation Plan. The plan's most recent adoption date is December 13, 2018 and must be reviewed and updated within 5 years to ensure compliance and maintain eligibility for various FEMA grant programs. While RRRC staff previously conducted Hazard Mitigation Plan updates, the significant updates being required and the desire to include the resiliency component exceed current staff capacity.

Goals and Objectives

The proposed project seeks to incorporate DCR's Resilience Plan Elements into the next update of the Rappahannock-Rapidan Regional Hazard Mitigation Plan in order to address both cross-jurisdictional and locality-specific issues related to flood control and resilience. Objectives of this process include:

- Update Hazard Mitigation risk assessment data, including climate change considerations and current flood maps
- Include additional emphasis on stormwater management and nature-based solutions
- Conduct more comprehensive stakeholder outreach than previous Hazard Mitigation Plan updates, addressing cross-departmental considerations and environmental justice
- Develop lists of actionable locality-specific projects
- Approval of Resiliency/Hazard Mitigation Plan by each jurisdiction and DCR

Stakeholder Identification, Outreach and Education Strategies

RRRC will seek to expand the stakeholder identification and outreach component of past Hazard Mitigation Plan updates to include a broader cross-section of stakeholders from its jurisdictions in-line with a whole-community approach. As part of the plan development process, the steering committee made up of local government and RRRC staff will identify the most effective methods of community engagement to achieve that objective.

Planned tasks and activities include development of outreach materials in English and Spanish, media advisories and press releases delivered to local newspapers in the region, and public notice of stakeholder meetings and public comment opportunities. Public input will also be solicited via survey and feedback mechanisms as the plan update progresses.

Additionally, local governments participating in the plan update have agreed, through letters of intent to participate, to provide notices of the plan update on local government websites, providing notice through available media (including jurisdiction email lists and social media) and supporting public meetings and outreach within their jurisdiction. During the course of the plan update, it may be necessary to conduct virtual meetings. RRRC will follow Code of Virginia guidance to ensure that meetings are properly noticed and accessible and allow for public comment.

The planning process will make use of several existing mechanisms to ensure broad-based participation and involvement from local and regional stakeholders. In addition to the Steering Committee that will guide the project, the Regional Commission currently organizes several regional committees that will be briefed at the outset and during the Hazard Mitigation Plan update:

- Rappahannock-Rapidan Land Use & Environment Committee: includes representatives from Virginia Department of Health, Virginia Department of Environmental Quality, local governments, Soil & Water Conservation Districts, non-profit water quality organizations
- RRRC Chief Administrative Officers Committee
- Rappahannock-Rapidan Food Council
- RRRC Rural Transportation Committee / Planners Roundtable

VDEM Region II coordinates a Culpeper Area Emergency Coordinators meeting, at which project information will be shared throughout the planning process. This group includes representatives from Community Colleges, Hospitals, and local emergency management. The Regional Commission will also notify its neighboring Planning Districts of the plan update and communicate with them throughout the plan update process. All stakeholders, including businesses, will also be reached through the planned media releases.

Implementation Plan

The requested funds would be spent contracting a consultant to provide technical assistance to RRRC through the Plan development process. The consultant would be chosen through a competitive bid process and perform the same services for the overall Hazard Mitigation Plan update.

A grant application was submitted to the Virginia Department of Emergency Management (VDEM) and Federal Emergency Management Administration (FEMA) in late 2021. Rather than a stand-alone plan, the resiliency plan would be a part of the regional hazard mitigation plan with relevant sections on flooding, dam failure, etc. and locality-specific resiliency goals added to the locality summaries.

<u>Risk Assessment</u>

The consultant will compile data and update the existing Hazard Mitigation Plan risk assessment with participation and review by the steering committee. RRRC will seek new data regarding identified hazards as part of the plan update process. Where such data is unavailable, the hazard profiles included in the current plan (2018) will be used.

Community asset information is included in the current plan (2018) and those assets identified will form the baseline for the plan update. Following the initiation of the plan update, participating jurisdictions will review previously identified assets and will offer additional assets for inclusion with a focus on the following assets:

- Critical facilities (Public Safety, Public infrastructure)
- Lifeline Infrastructure
- Vulnerable Population facilities (Senior Centers, Schools, Assisted Living)
- Natural Resources with important environmental benefits
- Economic drivers (primary employers)
- Significant historic resources

As the plan update process begins, local and regional plans, studies and reports relevant to hazard mitigation will be inventoried. These plans may include local Emergency Operations Plans, Comprehensive Plans, Emergency Response plans (general or hazard-specific), and studies focused on those hazards identified as part of this plan update. The process will include requests to local government contacts, as well as to those regional and state agencies with specific focus on the hazards impacting the region (VDEM, DEQ, Soil & Water Conservation Districts, etc.).

Existing information from the Commonwealth of Virginia Hazard Mitigation Plan will be reviewed and incorporated for areas and hazards where statewide information is critical. Information on resiliency and climate change in the Commonwealth's Hazard Mitigation Plan and other resiliency efforts will be utilized to guide the inclusion and incorporation of such impacts into the region’s plan. Additionally, each of the participating jurisdictions in the Region will have an updated FIRM in place, which will be incorporated into the flood risk analysis.

The Risk Assessment Update will likewise build on methods utilized in the existing plan (2018) and will incorporate new data that is available at the beginning of the plan update process. The update process will include review and updates for regional and local hazard profiles, vulnerability assessments, loss estimates and risk rankings, as new data and information allows.

The Risk Assessment will include:
- Review and addition/subtraction of hazards included in the plan
- Review and incorporation of relevant information from Commonwealth of Virginia Hazard Mitigation Plan
- Identification of hazards that are not mitigation-related
- Identifying gaps and limitations of existing data
- Incorporating, by narrative, potential implications of climate change on the region

Based on feedback from FEMA Region III, the Rappahannock-Rapidan Regional Commission anticipates re-organizing the Regional Hazard Mitigation Plan to provide locality summary documents that are expected to enhance the connectivity between local risks and locally-developed mitigation strategies. As the overall planning process progresses, the Regional Commission will work with the selected consultant and the stakeholder committees to determine the preferred approach to incorporating resiliency within each locality summary sections, as well as creating a stand-alone section focused on flood resiliency information and strategies.

Mitigation Strategy Development

The mitigation strategy section of the current 2018 Regional Hazard Mitigation Plan includes documentation of local and region capability assessments, mitigation goals, mitigation actions, implementation plans and mitigation priorities for each participating jurisdiction. RRRC anticipates each participating jurisdiction reviewing the existing information and completing FEMA’s Local Capability Assessment Tool focused on the following areas:

- Planning & Regulatory
- Administrative & Financial
- Technical
- Education & Outreach

The 2018 plan includes mitigation goals for the Rappahannock-Rapidan region. As part of the update, RRRC will lead the steering committee in a review of those goals and incorporate new information and data gathered during the update to inform revisions and additional mitigation goals. This review will include information from the Commonwealth of Virginia Hazard Mitigation Plan, as well as incorporation of concerns identified by the public and/or other stakeholders.

The 2018 plan includes regional mitigation actions and local mitigation actions identified by each participating jurisdiction. The update will evaluate those identified actions and provide a status update for each action.

Participating jurisdictions may identify and evaluate new mitigation actions that will address goals and problem statements identified during this planning process. Those mitigation actions will focus on local plans/regulations, structural or infrastructure projects, natural resource/system protection, and/or education and outreach programs. Each identified mitigation action will be evaluated based on commonly accepted criteria, as appropriate for each action:

- Anticipated effectiveness
- Technical feasibility
- Administrative capability
- Local Champion/Political Will
- Legal authority
- Environmental constraints
- Social considerations
- Community objectives
- Benefit Cost Analysis (limited)

Each participating jurisdiction will then prioritize these mitigation actions as high/medium/low and as short/mid/long range actions. New mitigation actions will incorporate implementation plans that identify:

- Hazards addressed
- Responsible agency/department
- Possible Funding sources
- Timeline
- Initial/Next Steps

Plan Approval and Adoption

RRRC will coordinate approval and adoption processes for the Hazard Mitigation Plan/Resiliency Plan in coordination with the steering committee and participating jurisdictions.

Plan review, adoption, and approval efforts will include:

- A draft Plan will be prepared and shared for review with local and community partners
- The final draft Plan will be submitted, along with a completed Plan Review Tool, to the Virginia State Hazard Mitigation Officer (SHMO) for review. Any revisions requested by the State will be completed and the Plan Update resubmitted.
- After the SHMO is satisfied that the Plan Update meets all of the required elements and submits the documents to FEMA Region III for review, any revisions requested by FEMA Region III will be completed and the Plan Update resubmitted.
- After FEMA Region III is satisfied with the Plan Update and designates the Plan Update as "approvable pending adoption," an Adoption Resolution will be prepared for adoption by each Participating Jurisdiction. The Adoption Resolution will include the following:
  - Responsibility for overall coordination of plan maintenance and implementation including the requirement to provide periodic reporting to the Participating Jurisdiction's governing body on at least an annual basis
  - Continuing participation in plan maintenance and implementation by the Participating Jurisdiction's governing body, agencies, and organizations during the subsequent 5-year cycle
  - Specific roles and responsibilities for agencies and organizations as described in the Mitigation Strategy and the mitigation action implementation plans
- The governing body of each Participating Jurisdiction will formally adopt the final version of the Plan and the signed resolutions will be submitted by RRRC to the SHMO who will relay the documents to FEMA Region III for the issuance of approval letters.

Timeline

The process of updating the Region's Hazard Mitigation Plan, of which the resiliency plan will be a part of, is expected to last 18 to 24 months with the following estimated timeline, subject to change based on funding availability:

1. Grant planning/administration and contracting consultant: July – August 2022
2. Hazard identification and data collection: September 2022 – January 2023
3. Risk and vulnerability assessment: September 2022 – April 2023
4. Capability assessment: January 2023 – June 2023
5. Mitigation strategy development: April 2023 – September 2023
6. Draft plan review: October – November 2023
7. Submit plan to VDEM for review: December 2023
8. Submit plan to FEMA for review: January 2024
9. Local plan adoption: March – April 2024
10. Project closeout: July 2024

Responsible Parties

RRRC staff would handle grant administration, project coordination, meeting planning and facilitation. A consultant would provide technical assistance, data gathering, analysis and plan writing. Outreach activities are expected to be shared between RRRC, the participating local jurisdictions, and the consultant team.

Each participating jurisdiction has identified a primary and secondary contact person that will serve on the Hazard Mitigation Plan/Resiliency Plan steering committee, as identified in the included letters of intent to participate. These representatives bring experience in emergency management and response, planning and zoning, public works/utilities infrastructure, and community development. Each jurisdiction has also agreed to involve their floodplain administrator (if that individual is not the primary or secondary contact) and other relevant local staff and stakeholders as part of the plan review and update.

In many instances, the designated contacts have participated in previous updates to the regional hazard mitigation plan and are accustomed to the process of reviewing mitigation strategies, capability assessments and critical facilities. Should the steering committee identify areas with lower levels of expertise, the Regional Commission will reach out to partner agencies (VDEM, DEQ, DCR) or other regional organizations to provide guidance and input.

Performance outputs and Measures and Plans for Maintaining Capacity

The Rappahannock-Rapidan Regional Commission will include plan maintenance procedures in the Regional Hazard Mitigation/Resiliency Plan for monitoring of implementation efforts, evaluation of the Plan effectiveness in achieving local and regional goals and procedures for reviewing the Plan based on subsequent disaster events and within the context of FEMA's five-year Hazard Mitigation Plan update cycle.

Plan implementation procedures will be identified to track progress on implementation projects, methods of communicating funding opportunities tied to specific mitigation actions and incorporate co-benefits for identified mitigation actions.

Budget Narrative

The total project cost for the Rappahannock-Rapidan Regional Hazard Mitigation Plan update, inclusive of the incorporation of DCR's identified Resilience Plan Elements into the overall Hazard Mitigation Plan update, is budgeted at $150,000. A previous application to FEMA's Building Resilient Infrastructure and Communities (BRIC) program will provide $100,000 in funding for the Hazard Mitigation Plan update. This application requests $37,500 from the CFPF, with the Regional Commission contributing $12,500 in cash match, in order to incorporate the Resilience Plan Elements and locally resilience strategies into the plan update.

Included with this application package is a letter certifying authorization to request funding and confirming availability of matching funds.

Wendy C. Howard-Cooper
Division Director, Dam Safety & Floodplain Management
Virginia Department of Conservation & Recreation
600 East Main Street, 24th Floor
Richmond, VA 23219-2094

Re: Community Flood Preparedness Fund Application Pledge Agreement

Ms. Howard-Cooper,

At its meeting on February 23, 2022, the Rappahannock-Rapidan Regional Commission (RRRC) approved submission of an application to the Community Flood Preparedness Fund (CFPF) program administered by the Department of Conservation and Recreation. As part of the application, RRRC committed to match grant funds with cash, per the program guidelines. The source of funds will be local per capita dues provided by RRRC's member jurisdictions, or other allowable matching fund source.

Please accept this letter as authorization of the submission of the application and confirmation that, if the grant application is successful, RRRC will provide a cash match of $12,500, or 25% for the application request, unless a lower match is allowable based on DCR's review of the application. In the latter case, RRRC will provide the amount less than 25% not provided by the Department of Conservation and Recreation.

Thank you for your consideration of the request from RRRC.

Sincerely,

Patrick Mauney

Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
CULPEPER COUNTY

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, CULPEPER COUNTY is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the CULPEPER COUNTY:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:

- Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
- Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
- Support the Steering Committee selected to oversee the development of this plan.
- Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).
- Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:

    - Structure and facility inventory data
    - Identification of new development and anticipated development
    - Identification of natural hazard risk areas
    - Identification of natural hazard events and losses that have impacted your community in the last five years
    - Identification of plans, reports and ordinances addressing natural hazard risk
    - Identify mitigation activity in our community in the last five years, including progress on previously identified mitigation actions

- Support public outreach efforts in your community which may include:

    Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
    - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
    - Advertising and supporting public meetings in your area.

- Assist with the identification of stakeholders within our community that should be informed and potentially involved with the planning process.

- Review draft Plan sections when requested and provide comment and input as appropriate.

- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Each partner will be expected to complete their templates in a timely manner and according to the timeline specified by the Steering Committee. The Steering Committee will assure that technical and administrative resources are available to assist with the preparation and completion of the assessments.

- Identify specific mitigation actions to address each of the natural hazards posing high or medium risk to your community.

- Involve your local NFIP Floodplain Administrator in the planning process.

- Adopt the Plan by resolution of their governing body after FEMA conditional approval.

- Periodically provide the Steering Committee with summary or local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. We understand that these POCs are responsible for assuring local representation at steering committee meetings, and assuring that the other minimum requirements of jurisdictional participation, as detailed in the Planning Partner Expectations above, are met.

<u>Primary Project Contact</u>: Bill Ooten, Director of Emergency Management Services

Phone Number: 540-727-7161

Email Address: booten@culpepercounty.gov

Secondary Project Contact: Captain Thomas Dawson

Phone Number: 540-727-7161

Email Address: tdawson@culpepercounty.gov

4. Recognizes that failure to meet the minimum participation expectations and deadlines, as determined by the Steering Committee will result in our locality being excluded from the planning process.

Sincerely,

John Egertson

Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
Fauquier County

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, the County of Fauquier is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the County of Fauquier:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:

- Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
- Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
- Support the Steering Committee selected to oversee the development of this plan.
- Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).

- Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:
  - Structure and facility inventory data
  - Identification of new development and anticipated development
  - Identification of natural hazard risk areas
  - Identification of natural hazard events and losses that have impacted your community in the last five years
  - Identification of plans, studies, reports and ordinances addressing natural hazard risk
  - Identify mitigation activity in your community in the last five years, including progress on previously identified mitigation actions

- Support public outreach efforts in your community which may include:
  - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission websiteProviding notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
  - Advertising and supporting public meetings in your area.

- Assist with the identification of stakeholders within your community that should be informed and potentially involved with the planning process.

- Review draft Plan sections when requested and provide comment and input as appropriate.

- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Each partner will be expected to complete their templates in a timely manner and according to the timeline specified by the Steering Committee. The Steering Committee will assure that technical and administrative resources are available to assist with the preparation and completion of the assessments.

- Identify specific mitigation actions to address each of the natural hazards posing high or medium risk to your community.

- Involve your local NFIP Floodplain Administrator in the planning process.

- Adopt the Plan by resolution of their governing body after FEMA conditional approval.

- Periodically provide the Steering Committee with summary or local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. We understand that these POCs are responsible for assuring local representation at steering committee meetings, and assuring that the other minimum requirements of jurisdictional participation, as detailed in the Planning Partner Expectations above, are met.

Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
Madison County, VA

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, Madison County is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, Madison County:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:
    - Execute and return this “Authorization and Acknowledgement” letter to the Rappahannock-Rapidan Regional Commission.
    - Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
    - Support the Steering Committee selected to oversee the development of this plan.
    - Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).
    - Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:
        - Structure and facility inventory data

  - Identification of new development and anticipated development
  - Identification of natural hazard risk areas
  - Identification of natural hazard events and losses that have impacted your community in the last five years
  - Identification of plans, studies, reports and ordinances addressing natural hazard risk
  - Identify mitigation activity in your community in the last five years, including progress on previously identified mitigation actions
- Support public outreach efforts in your community which may include:
  - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
  - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
  - Advertising and supporting public meetings in your area.
- Assist with the identification of stakeholders within your community that should be informed and potentially involved with the planning process.
- Review draft Plan sections when requested and provide comment and input as appropriate.
- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
County of Orange

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, the County of Orange is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the County of Orange:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:

- Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
- Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
- Support the Steering Committee selected to oversee the development of this plan.
- Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).
- Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:
    - Structure and facility inventory data
    - Identification of new development and anticipated development
    - Identification of natural hazard risk areas
    - Identification of natural hazard events and losses that have impacted your community in the last five years

    - Identification of plans, studies, reports and ordinances addressing natural hazard risk
    - Identify mitigation activity in your community in the last five years, including progress on previously identified mitigation actions

- Support public outreach efforts in your community which may include:
    - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
    - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
    - Advertising and supporting public meetings in your area.

- Assist with the identification of stakeholders within your community that should be informed and potentially involved with the planning process.

- Review draft Plan sections when requested and provide comment and input as appropriate.

- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Each partner will be expected to complete their templates in a timely manner and according to the timeline specified by the Steering Committee. The Steering Committee will assure that technical and administrative resources are available to assist with the preparation and completion of the assessments.

- Identify specific mitigation actions to address each of the natural hazards posing high or medium risk to your community.

- Involve your local NFIP Floodplain Administrator in the planning process.

- Adopt the Plan by resolution of their governing body after FEMA conditional approval.

- Periodically provide the Steering Committee with summary or local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. We understand that these POCs are responsible for assuring local representation at steering committee meetings and assuring that the other minimum requirements of jurisdictional participation, as detailed in the Planning Partner Expectations above, are met.

Primary Project Contact: Nathan Mort, Chief of Fire and EMS
Phone Number: (540) 406-1484
Email Address: nmort@orangecountyva.gov

Secondary Project Contact: Roger Wilson, Assistant Chief of Operations
Phone Number: (540) 406-9245
Email Address: rwilson@orangecountyva.gov

4. Recognizes that failure to meet the minimum participation expectations and deadlines, as determined by the Steering Committee will result in our locality being excluded from the planning process.

Sincerely,

Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
Rappahannock County

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, the Rappahannock County, is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the Rappahannock County:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.
2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:
    - Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
    - Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
    - Support the Steering Committee selected to oversee the development of this plan.
    - Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).
    - Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:
        - Structure and facility inventory data
        - Identification of new development and anticipated development

    - Identification of natural hazard risk areas
    - Identification of natural hazard events and losses that have impacted your community in the last five years
    - Identification of plans, studies, reports and ordinances addressing natural hazard risk
    - Identify mitigation activity in your community in the last five years, including progress on previously identified mitigation actions
- Support public outreach efforts in your community which may include:
    - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
    - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
    - Advertising and supporting public meetings in your area.
- Assist with the identification of stakeholders within your community that should be informed and potentially involved with the planning process.
- Review draft Plan sections when requested and provide comment and input as appropriate.
- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Each partner will be expected to complete their templates in a timely manner and according to the timeline specified by the Steering Committee. The Steering Committee will assure that technical and administrative resources are available to assist with the preparation and completion of the assessments.
- Identify specific mitigation actions to address each of the natural hazards posing high or medium risk to your community.
- Involve your local NFIP Floodplain Administrator in the planning process.
- Adopt the Plan by resolution of their governing body after FEMA conditional approval.
- Periodically provide the Steering Committee with summary or local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. We understand that these POCs are responsible for assuring local representation at steering committee meetings, and assuring that the other minimum requirements of jurisdictional participation, as detailed in the Planning Partner Expectations above, are met.

Primary Project Contact: Emergency Management Coordinator (currently vacant, G. Curry interim)

Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update Authorization and Letter of Intent to Participate - Town of Gordonsville

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, the Town of Gordonsville is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the Town:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:

   - Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
   - Identify local government representatives to serve as the planning point of contacts (POC), below. These people will be responsible for representing their community and assuring that these participation expectations are met by their community.
   - Support the Steering Committee selected to oversee the development of this plan.
   - Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).

- Provide data and information about our community as requested by the Rappahannock-Rapidan Regional Commission, including:
    - Structure and facility inventory data
    - Identification of new development and anticipated development
    - Identification of natural hazard risk areas
    - Identification of natural hazard events and losses that have impacted our community in the last five years
    - Identification of plans, studies, reports and ordinances addressing natural hazard risk
    - Identify mitigation activity in our community in the last five years, including progress on previously identified mitigation actions

- Support public outreach efforts in our community which may include:
    - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
    - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g. newsletters, flyers, email blasts, social media, etc.)
    - Advertising and supporting public meetings in our area.
    - Assist with the identification of stakeholders within our community that should be informed and potentially involved with the planning process.
    - Review draft Plan sections when requested and provide comment and input as appropriate.
    - Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission. Templates and instructions to aid in the compilation of this information will be provided to all participating partners. Each partner will be expected to complete their templates in a timely manner and according to the timeline specified by the Steering Committee. The Steering Committee will assure that technical and administrative resources are available to assist with the preparation and completion of the assessments.
    - Identify specific mitigation actions to address each of the natural hazards posing high or medium risk to our community.
    - Involve our local NFIP Floodplain Administrator in the planning process.
    - Adopt the Plan by resolution of their governing body after FEMA conditional approval.
    - Periodically provide the Steering Committee with summary or local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. Subject: Rappahannock-Rapidan Regional Hazard Mitigation Plan Update
Authorization and Letter of Intent to Participate
Town of Warrenton, Virginia

Dear Mr. Mauney:

Per your letter, dated December 4, 2020, the Town of Warrenton is committed to participating in the Rappahannock-Rapidan Regional Hazard Mitigation Plan (HMP) Update project. By way of this letter, the Town of Warrenton:

1. Authorizes the Rappahannock-Rapidan Regional Commission to guide and direct this planning process, perform certain parts of the planning process, and prepare certain parts of the plan documents on our behalf.

2. Agrees to meet the minimum requirements of jurisdictional participation (a.k.a. the Planning Partner Expectations), specifically:

- Execute and return this "Authorization and Acknowledgement" letter to the Rappahannock-Rapidan Regional Commission.
- Identify local government representatives to serve as the planning points of contact (POCs) below.
- Support the Steering Committee selected to oversee the development of this plan.
- Provide representation at steering committee meetings (~ 3 meetings over 8-12 months likely beginning in 2022, including a Kick-Off Meeting and a Jurisdictional Review Workshop meeting).
- Provide data and information about your community as requested by the Rappahannock-Rapidan Regional Commission, including:
    - Structure and facility inventory data
    - Identification of new development and anticipated development
    - Identification of natural hazard risk areas
    - Identification of natural hazard events and losses that have impacted your community in the last five years
    - Identification of plans, studies, reports, and ordinances addressing natural hazard risk
    - Identify mitigation activity in your community in the last five years, including progress on previously identified mitigation actions

- Support public outreach efforts in your community, which may include:
    - Providing notices of the planning project on our locality website if available with links to a project website hosted on the Commission website
        - Providing notice of the planning project, the availability of Plan documents, and notice of public meetings via available local media (e.g., newsletters, flyers, email blasts, social media, etc.)
        - Advertising and supporting public meetings in your area.
- Assist with identifying stakeholders within your community that should be informed and potentially involved with the planning process.
- Review draft Plan sections when requested and provide comments and input as appropriate.
- Prepare and submit a local Capability Assessment to the Rappahannock-Rapidan Regional Commission.
- Identify specific mitigation actions to address each of the natural hazards posing a high or medium risk to your community.
- Involve your local NFIP Floodplain Administrator in the planning process.
- Adopt the plan by resolution of their governing body after FEMA's conditional approval.
- Periodically provide the Steering Committee with a summary of local government staff and volunteer labor spent on the planning process.

3. Assigns the following persons to be the Points of Contact for our jurisdiction. We understand that these POCs are responsible for assuring local representation at steering committee meetings and assuring that jurisdictional participation's other minimum requirements, as detailed in the Planning Partner Expectations above, are met.

CFPF Grant Round 3 - RRRC Application Submission

1 message

Patrick Mauney <plmauney@rrregion.org> Tue, Apr 5, 2022 at 2:44 PM
To: cfpf@dcr.virginia.gov
Cc: Michelle Edwards <medwards@rrregion.org>

Good Afternoon,

Per the 2022 Virginia Community Flood Preparedness Fund Round 3 Grant Manual, please find attached an application and required attachments from the Rappahannock-Rapidan Regional Commission (Planning District 9). While our application is a regional project, we did conform to the naming requirements using our office location as the Community Identification Number.

Our application is to support the development of Regional Resilience Plan as a complementary part of our existing Regional Hazard Mitigation Plan, which is slated for update beginning later this calendar year.

Please feel free to reach out to me or to Michelle Edwards (medwards@rrregion.org) with any questions. Thank you for your consideration,

Patrick Mauney

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes _X_ No ___

Categories (select applicable project): Project Grants

Project Grants (Check All that Apply)

- ☑ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☑ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☑ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Location of Project (Include Maps): Mathews County **-** Please see the attached corresponding maps for this application.

NFIP Community Identification Number (CID#) (See appendix F): 510096

Is Project Located in an NFIP Participating Community? Yes

Is Project Located in a Special Flood Hazard Area? Yes

Flood Zone(s) (If Applicable): Zones AE and VE

Flood Insurance Rate Map Number(s) (If Applicable): 51115C0130E eff. 12/9/2014

Total Cost of Project: $2,132,102

Total Amount Requested: $1,296,967

SCOPE OF WORK NARRATIVE

INTRODUCTION

This proposal requests funding for the dredging of an economically important channel, Davis Creek in Mathews County, which has been shoaled by flood action. Dredging and the upland disposal of the dredged material is vital for the protection and viability of Davis Creek as it serves to be critical infrastructure for County's water-based economic activities. In other words, the project serves to revive and bolster the economic and climate resilience of Mathews County. The project will implement a shovel-ready dredging design developed in 2020 by the Middle Peninsula Planning District Commission (MPPDC) in partnership with the VIMS Shoreline Studies Program. The scope of the proposed project involves three (3) principal tasks:

- selection of a disposal site for dredged material via a cost efficiency analysis,
- acquisition or site preparation for construction of an upland staging area for dredged material which may be mined to provide for future resilience and flood protection activities,
- and dredging of Davis Creek to enhance the economic resilience of Mathews County's water-dependent industries.

As detailed below, the shoaling of Davis Creek has resulted in the US Coast Guard removing aids to navigation (ATONs) from the Creek in October 2017. Since then, Mathews County has taken ownership of three ATONs on Davis Creek to ensure public safety, and in early 2020, several channel markers were reactivated. Three pilings that were removed by the Coast Guard in 2017 were outfitted with signs and lights. The County owned public landing and the Marina at Davis Creek provide critical access for landing, docking, and mooring in close proximity to public and private oyster grounds and public crabbing grounds in Mobjack Bay and the Chesapeake Bay. Maintenance dredging of Davis Creek is necessary to re-establish the authorized navigable depths to provide safe navigation for vessels utilizing the working waterfronts located on the creek.

Risks to natural hazards are increasing. Population growth along coastlines worldwide, in addition to technological and infrastructural development, inherently results in a concomitant increase in places prone to disasters. Modern society relies upon government for effective prevention and protection strategies for continued resilience and sustainability.

Natural hazards are hazards that exist within the natural environment and are considered "acts of God," and consist of atmospheric, geologic, hydrologic, seismic, and biologic agents. Such hazards include flooding, drought, hurricanes, landslides, wildfires, and more. They are thought be unpreventable and are associated with a perceived lack of control. As a result, the ability to manage risk to natural hazards greatly varies due to differences in background. Therefore, the identification of hazards is the foundation of effectively dealing with and avoiding risks. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties, and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program.

The 2018 United States National Climate Assessment noted that global climate model predictions, though imprecise, suggest an increased frequency of strong hurricanes (Categories 4 and 5) in the Atlantic Basin, including the Caribbean. It also includes a range of sea-level rise predictions with significant impacts, especially together with high tide flooding. Other estimates include more frequent and intense droughts with microburst and deluge events. This is especially the case for the Coastal Plain area of Virginia.

FEMA, the Virginia General Assembly, DCR's Floodplain Management Program, and the Middle Peninsula Planning District Commission (MPPDC) all recognize that natural hazards pose a serious risk to all levels of government including states, localities, tribes and territories and the citizens which reside and work there. These hazards include flooding, drought, hurricanes, landslides, wildfires and more. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program (www.FightTheFloodVA.com). To that end, this proposal is a partnership between the MPPDC and Mathews County (see Community Support Letter, **Attachment 1**).

- A link or copy to the approved MPPDC resilience plan: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf
- Middle Peninsula All Hazards Mitigation Plan (2016): https://www.mppdc.com/articles/reports/AHMP_2016_FEMA_Approved_RED.pdf
- Mathews County Comprehensive Plan: https://www.mathewscountyva.gov/196/Comprehensive-Plan

This project is consistent with multiple objectives and strategies outlined within the Regional All-Hazards Mitigation Plan. Relevant strategies include the following:

- Objective 1.1: Provide protection for future development to the greatest extent possible.
    - Strategy 1.1.1: Reduce or eliminate flood damage to residential/business structures that are highly vulnerable for continual flood damage.
    - Strategy 1.1.3: Protect public buildings and public infrastructure from flood waters resulting from 100-year flood storm events.
    - Strategy 1.3.1: Mitigation projects that will result in protection of public or private property from natural hazards.

Until recently, most flood risk management involved conventional engineering measures. These measures are sometimes referred to as "hard" engineering or "gray" infrastructure. Examples include building embankments, dams, levees, and channels to control flooding. Recently the concept of “nature-based solutions”, “ecosystem based adaptation,” “eco-DRR,” or “green infrastructure” has emerged as a good alternative or complement to traditional gray approaches.

Nature-based solutions make use of natural processes and ecosystem services for functional purposes, such as decreasing flood risk or improving water quality. These interventions can be completely “green” (i.e., consisting of only ecosystem elements) or “hybrid” (i.e., a combination of ecosystem elements and hard engineering approaches). Nature-based solutions can help mitigate flood (the focus of this document), drought, erosion, and landslide. In addition, they may help decrease vulnerability to climate change while also creating multiple benefits to the environment and local communities. These include sustaining livelihoods, improving food security, and sequestering carbon. Such solutions can be applied to river basins (e.g., reforestation and green embankments), coastal zones (e.g., mangroves and wetlands), and cities (e.g., urban parks).

There is increasing momentum for the use of nature-based solutions as part of resilience-building strategies, sustainable adaptation, and disaster risk management portfolios. Awareness of nature-based solutions from communities, donors, and policy- and decision-makers is growing. Further, investors and the insurance industry are increasingly interested in nature-based solutions. From a climate change perspective, ecosystem-based adaptation has been highlighted as a priority investment area as noted in this DCR opportunity.

The intent of the proposed project design is to incorporate flood damage abatement measures which consider and mitigate any potential impacts to neighboring properties. However, the final designs ultimately will require approval by the permit issuing authority (Local Wetland Board on behalf of the VMRC, the Local Chesapeake Bay Preservation Act/Wetland Board on behalf of the VDEQ, and any agencies overseeing the Joint Permit Application process), and we will abide by the final design in the approved permits.

PROJECT INFORMATION

Project Description

Davis Creek is located in Mathews County, Virginia and is a tributary of the Mobjack Bay, in the lower Chesapeake Bay. The creek has a narrow mouth that splits into three prongs. The eastern prong is shortest at 2,200 ft from the mouth, and the western prong is the longest extending about 3,000 ft from the mouth. The County-owned public landing and the Marina on Davis Creek occur on this prong. Land use adjacent to the creek is mostly residential with some agriculture and wooded properties. The headwaters do not have extensive marsh. Instead, the creek terminates soon after the channel narrows at the headwaters. Davis Creek has historically been the location of for some of the greatest levels of seafood industry activity among creeks in the Commonwealth and is an active working waterfront that is threatened immensely by shoaling impacts driven by storm activity and climate change.

Davis Creek is a federal navigation project that was authorized in 1950 with a 1-mile-long channel and turning basin. The original maximum depth was -10 ft MLLW, but more recent documentation by the US Army Corps of Engineers (USACE) lists -8 ft MLLW as the controlling depth. It is 80 ft wide along most of its length and has a turning basin that is 165 ft by 450 ft. The nearshore has sand shoals and submerged aquatic vegetation (SAV). An interior **flood shoal** also existed which reduced the channel depths inside the creek. In 1956, about 244,050 cubic yards (cy) of material was dredged from the channel and placed east of the creek along the shoreline. Maintenance dredging occurred in 1962 with 119,080 cy removed and placed in the same disposal area. Maintenance dredging occurred again in December 1970/January 1971 with 53,497 cy of material removed. That was the last time that it was dredged as Federal funding for shallow draft dredging maintenance was defunded by Congress beginning around 2010.

At Davis Creek today, the nearshore has sand shoals and submerged aquatic vegetation (SAV). A **flood shoal** occurs just inside the creek. The narrow mouth, though, has widened over time. In 1937, the mouth was 147 ft wide, but in 2017, it was 255 ft wide. East of the creek, where the material was placed in the nearshore along the adjacent shoreline in 1956, new land has been created. The 2017 shoreline in this area is about 900 ft in front of the 1937 shoreline. The center part of the disposal is relatively high, and several houses have since been constructed on it. On either end, extensive marshes have been created. However, the natural trend along this shoreline is very low to low erosion (0 to -2 ft/yr).

Since then, the creek has experienced shoaling to the point that on October 10, 2017, the US Coast Guard removed aids to navigation (ATONs) from Davis Creek. The Corps considered the channel unstable and therefore discontinued the federal aids, and mariners were cautioned to proceed at their own risk due to shallow water depths. Mathews County has taken ownership of three ATONs on Davis Creek. Early in 2020, several channel markers were reactivated. Three pilings that were removed by the Coast Guard in 2017 were outfitted with signs and lights. Much of the shoaling in the channel occurs in the approach to Davis Creek where the sand shoals are compromising the channel. The Marina at Davis Creek provides seasonally critical access for landing, docking, and mooring in close proximity to public and private oyster grounds and public crabbing grounds in Mobjack Bay. Maintenance dredging of Davis Creek is necessary to re-establish the authorized navigable depths to provide safe navigation for vessels utilizing the working waterfront located on the creek.

The rate of channel sedimentation from the initial dredging in 1956 to the first maintenance dredging in 1962 (119,080 cy) over 6 years is about 20,000 cy/yr. Between 1962 and 1971 (53,497 cy), the rate of infilling was 6,000 cy/yr. The actual depth to which the channel was dredged is not known. Because the volumes for the dredging amounts and the calculated infilling rates are very different, we can speculate that the channel was dredged to 10 ft the first two times but only to 8 ft the third time. Post dredging sedimentation may occur in the same manner as the historic infilling. The alongshore and nearshore sands will continue to fill in the creek mouth, outbound channel, and **flood shoal**. The inside channel may get fines brought in by tidal flow and the contribution from upland sources. The interior channel remains relatively deep, about -9 ft MLLW which seems to indicate that not many fines are being input to the creek from upland sources or they are being transported into Mobjack Bay. The VIMS Shoreline Studies surveys conducted during 2020 determined that the material to be dredged from Davis Creek is too fine to be utilized for placement along shorelines and upland reuse is the optimal alternative.

Simply put, navigation and recreational and economic activity at Davis Creek and its working waterfronts have been impacted by **flooding** causing the channel to shoal, and impacts must be abated and continuously mitigated to preserve the integrity and resilience of the community.

Principal project tasks will include analyzing several upland staging areas nearby where the dredged materials may be placed in geotubes. The analysis will consider the nearby Dutchman Point property owned by the Middle Peninsula Chesapeake Bay Public Access Authority (MPCBPAA) (see **Figure 4**) as well as other nearby land currently for sale. It is known that the MPCBPAA Dutchman Point property contains some wetland areas, so a qualified engineer will be contracted to delineate wetlands on the property. Once a delineation is complete, the site will be assessed to see if the placement of geotubes at the site is an option and if not, then the costs of wetland mitigation credit purchases will be calculated. Concurrently, nearby properties currently for sale without wetland areas will be identified and a comparison of costs between identified property alternatives will be conducted to identify the most cost-effective approach.

For the selected site, the staging area consist of Geotubes® that are 5 ft tall with a 25 ft circumference and a 10 ft filled width can be stacked along the perimeter of the site to create the dike (see ***Approach, Milestones, and Deliverables section****)*. Once the material is staged at the site, the material may be mined and used for resilience and flood mitigation purposes. Beginning in 2021, the MPPDC, MPCBPAA, and VA Sea Grant have partnered on a project to advance innovative resilience solutions for rural coastal Virginia through the private sector. The endeavor involved a series of business competitions for research and development of innovative technologies which may be applied in rural coastal areas. The propopsed project will utilize some of the strategies arising from the business competitions involving the beneficial reuse of dredged material. Specifically, the material dredged from Davis Creek may be reused to create concrete which can be used for a variety of different flood purposes including shoreline protection structures, impermeable pavements, etc. The dredged material concrete has the potential of being produced on site via either cast concrete process or 3-D printing. Once the material from the initial dredging of Davis Creek is used up, additional material can be placed inside the dike from subsequent rounds of dredging. In essence, the upland staging area will serve as a resilience hub for advancing resilience solutions throughout the watershed and beyond.

Project Location Information

The Middle Peninsula is the second of three large peninsulas on the western shore of Chesapeake Bay in Virginia as seen in **Figure 1**. It lies between the Northern Neck and the Virginia Peninsula. The region is predominantly rural, with large, scattered farms and forested tracts; close-knit waterfront communities; an active regional arts association; broad-based civic involvement; and an excellent transportation infrastructure that provides easy access to urban markets. The area contains 3.2% of Virginia's land mass but only 1.1% of the Commonwealth’s total population of approximately 93,000 as seen in **Figure 2**.

Figure 1. Middle Peninsula Geographic Area

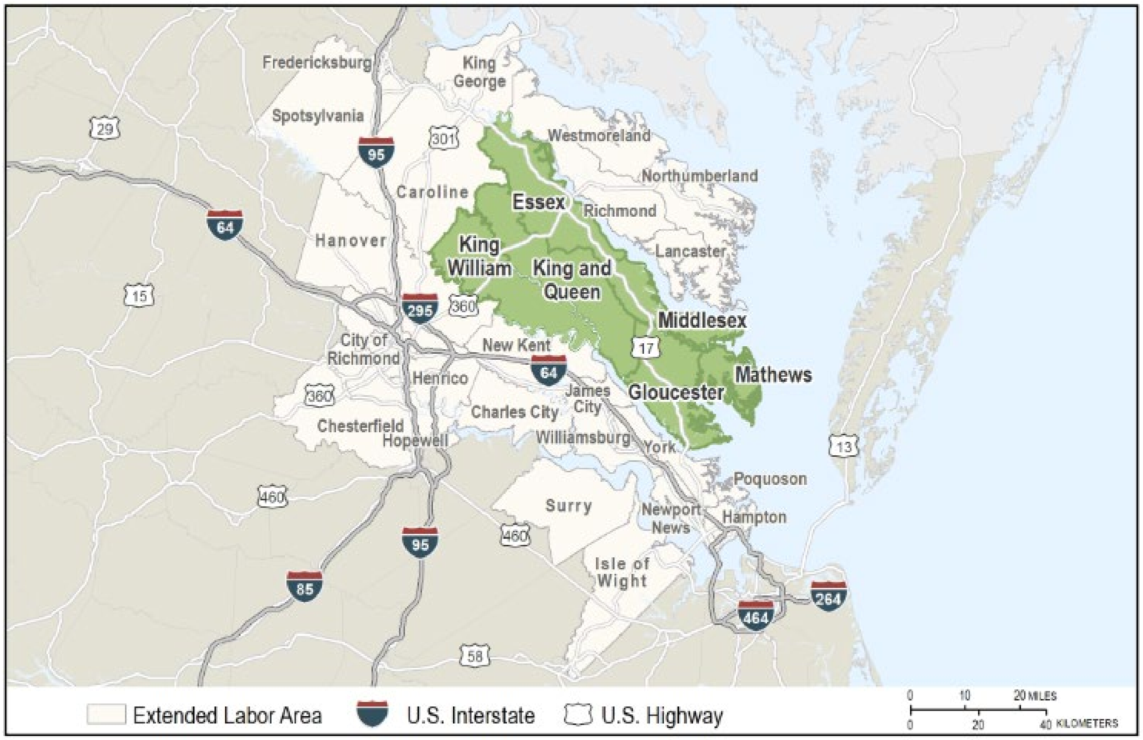

Figure 2. Middle Peninsula Population

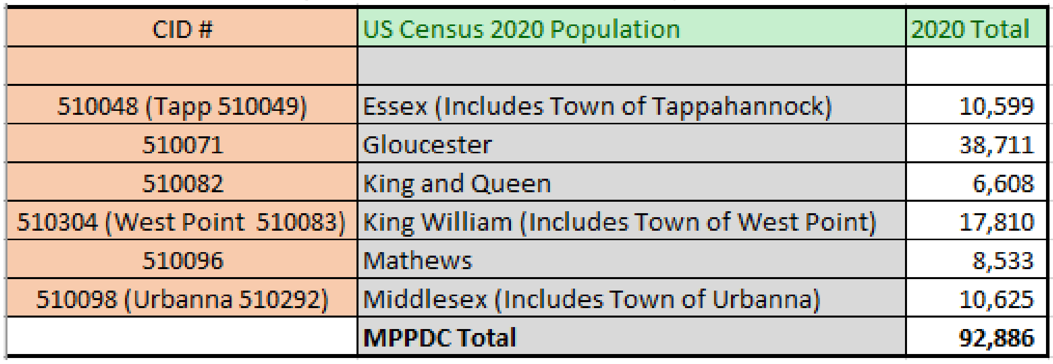

CID #	US Census 2020 Population	2020 Total
510048 (Tapp 510049)	Essex (Includes Town of Tappahannock)	10,599
510071	Gloucester	38,711
510082	King and Queen	6,608
510304 (West Point 510083)	King William (Includes Town of West Point)	17,810
510096	Mathews	8,533
510098 (Urbanna 510292)	Middlesex (Includes Town of Urbanna)	10,625
	MPPDC Total	**92,886**

This project proposes to dredge Davis Creek and stage dredged material in an upland area adjacent to the creek so that it may be used to drive further resilience and shoreline protection solutions via innovative and beneficial reuses as shown in **Figures 3 and 4**.

Figure 3. County Map of Project Location

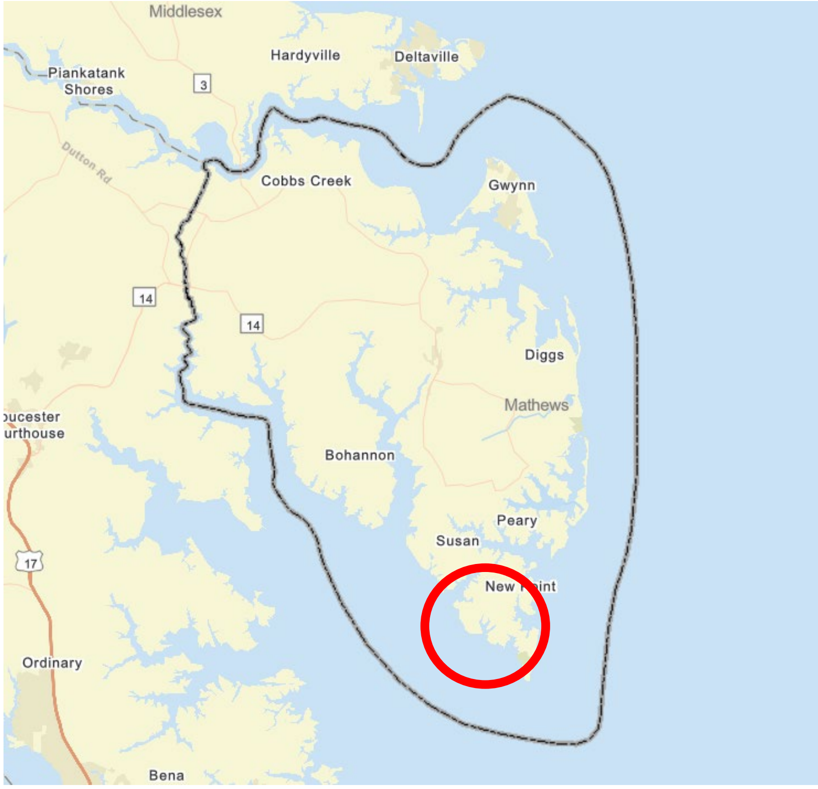

Figure 4. Parcel Map of Project Location

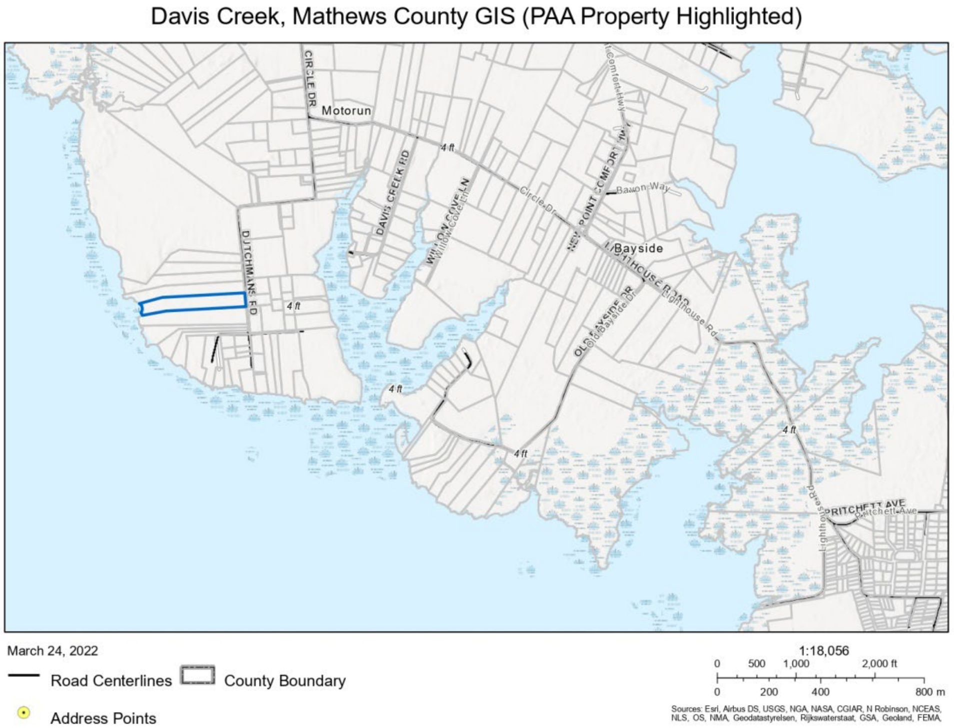


Population Information

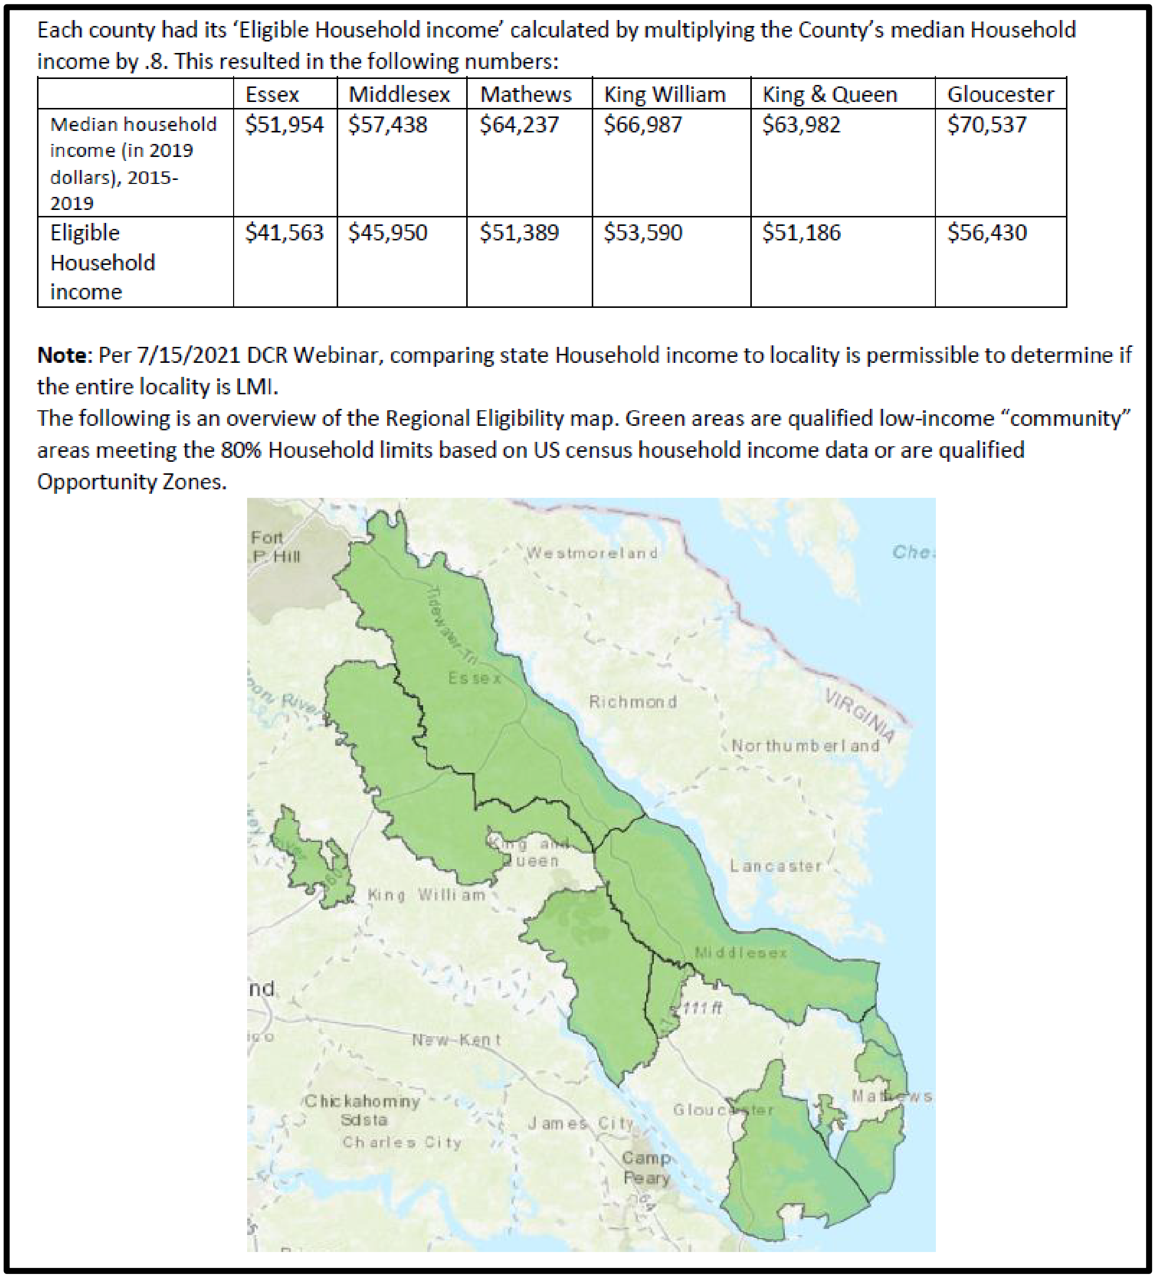
Mathews County is located at Virginia's Middle Peninsula and is an agriculture, forestry, and water-based economy. The County is comprised of 86 square miles of land 166 miles of shorelines. Based on 2020 Census Data, Mathews County's population totals 8,533 which makes it the largest Middle Peninsula locality. According to DCR guidelines, a portion of the County is considered a low-income geographic area.

In **Figure 5,** the green areas qualified as low-income "community" areas meeting the 80% Household limits based on US census household income data[1] or are qualified Opportunity Zones.

---

[1] Based upon 2015-2019 U.S. Census American Community Survey data available on January 4, 2022, when CFPF Round 3 opened; 2016-2020 ACS data was not released until March 17, 2022.

Figure 5. Map of Middle Peninsula Low Income Qualifying Geographic Areas



Each county had its 'Eligible Household income' calculated by multiplying the County's median Household income by .8. This resulted in the following numbers:

	Essex	Middlesex	Mathews	King William	King & Queen	Gloucester
Median household income (in 2019 dollars), 2015-2019	$51,954	$57,438	$64,237	$66,987	$63,982	$70,537
Eligible Household income	$41,563	$45,950	$51,389	$53,590	$51,186	$56,430

Note: Per 7/15/2021 DCR Webinar, comparing state Household income to locality is permissible to determine if the entire locality is LMI.

The following is an overview of the Regional Eligibility map. Green areas are qualified low-income "community" areas meeting the 80% Household limits based on US census household income data or are qualified Opportunity Zones.

Please see **Figure 6** for a zoomed in map of the project location and the green low-income area overlay. This shows that the project location is within the low-income area.

Figure 6. Map of the Project Location within the Green Low-Income Area

Source: Esri, Maxar, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community

According to the VDAPT Virginia’s Social Vulnerability Index Score, this project location has a moderate social vulnerability score as seen in **Figure 7**.

Figure 7. Virginia's Social Vulnerability Index Score Map of the Project Location

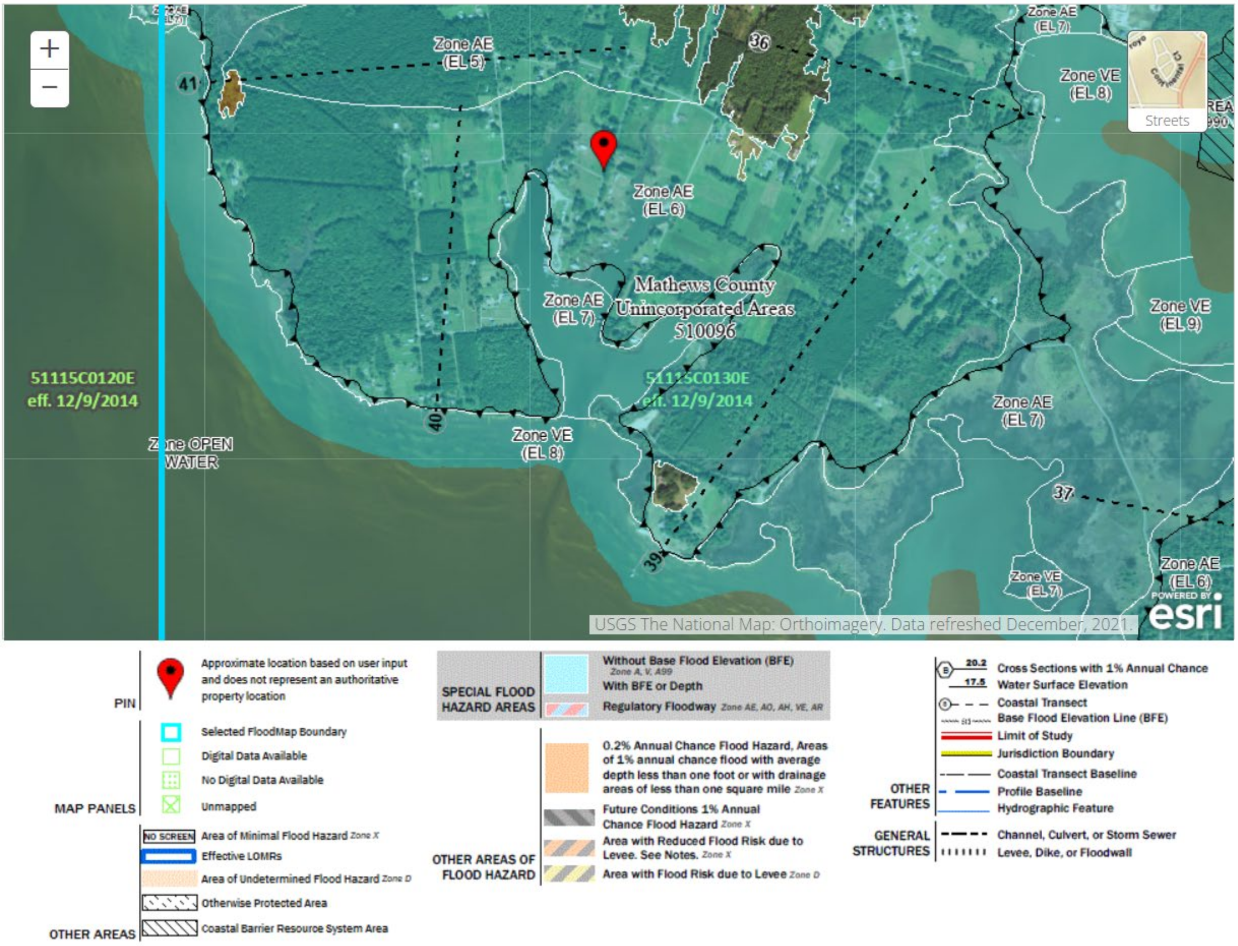
Created from the Virginia Vulnerability Viewer

Flood Risk Information

The project is generally located at the Davis Creek Marina at 346 Davis Creek Rd, Port Haywood Virginia 23138 (37.332835057172844, -76.29944371765536), and the entirety of the site is located within a mapped floodplain, with portions located within FEMA Flood Zones AE and VE (**Figure 8**). Mathews County's Planning and Zoning Department administers the requirements of the NFIP program, and the County's Floodplain Management Ordinance may be accessed at the following link: https://www.co.Mathews.va.us/DocumentCenter/View/422/Floodplain-Management-PDF?bidId=

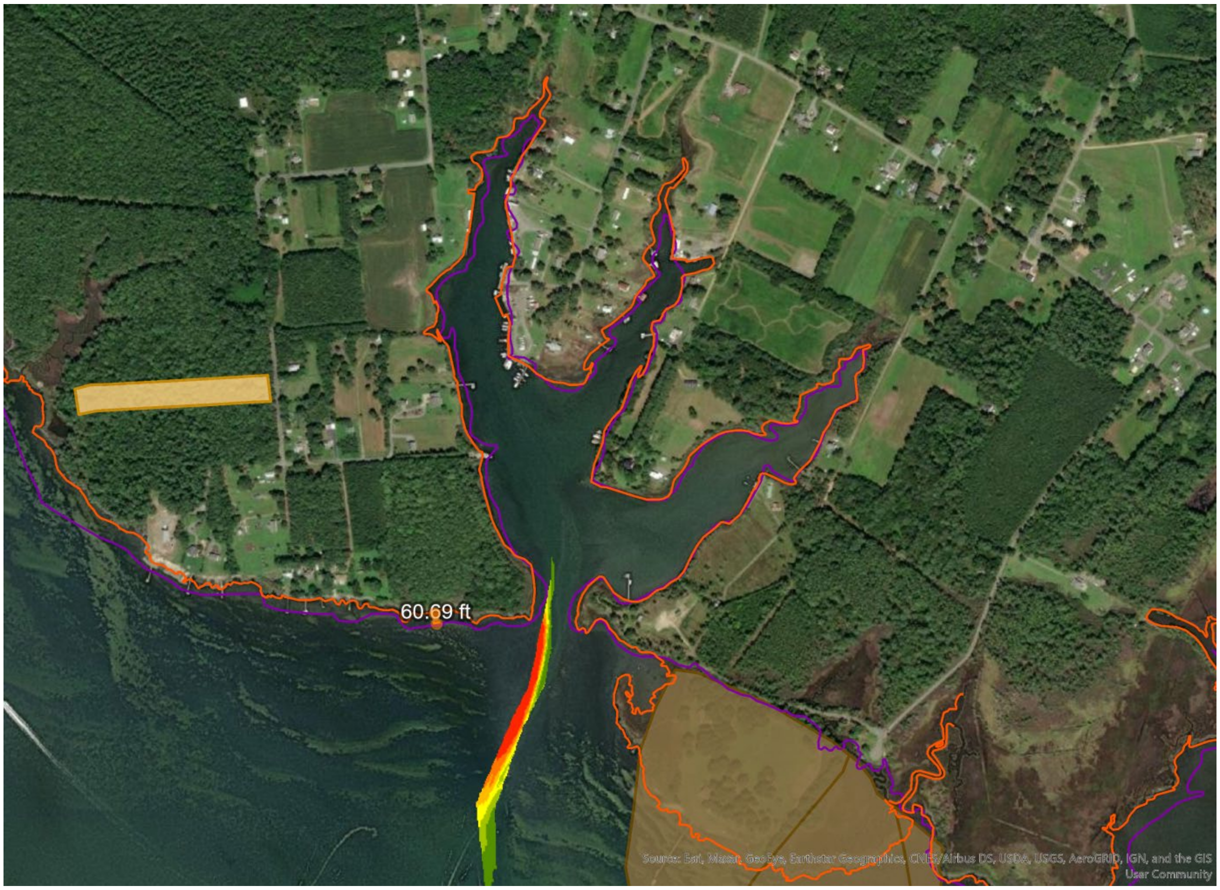
Losses in Mathews County are spread throughout the county with pockets of higher loss in the northern one-third of the county. Approximately $210,000 US Dollars (or 45%) of estimated annualized damages can be attributed to the northern one-third of the County; versus approximately $145,000 US Dollars (or 31%) in the center and $109,000 US Dollars (or 24%) in the southern one-third.

Figure 8: Map of FEMA Flood Zones of Project Location



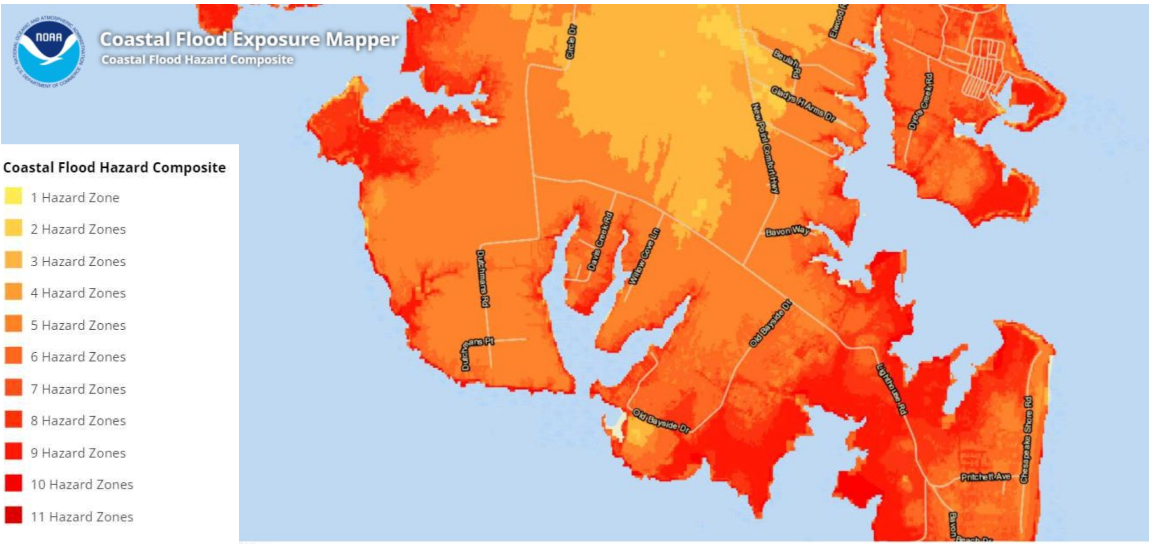
Due to the project site’s proximity to the water and relatively low elevation, the site has an extensive history of experiencing flooding events that have resulted in significant impacts to infrastructure and the environment. Based on the historical shoreline data from the Virginia Institute of Marine Science Shoreline Studies Program, **Figure 9** shows the 1937 and the 2017 shorelines. From the figure one can see the change in the shoreline at the project location and the approximate loss of square feet of shoreline, with roughly 60 ft of erosion at some points. The project location has and continues to be impacted by tropical, sub-tropical, and nor’easter events. **Appendix 4** lists 79 storm events and provides a map with the project location. Without the dredging measures proposed to abate the consequences of flooding on the channel, the land and maritime infrastructure will be compromised, resulting in degradation of the environment and revenue loss to the local tax base. Furthermore, the innovative reuse of dredged material for shoreline and flood protection is anticipated to advance solutions for the observed extreme erosion occurring in the vicinity of Davis Creek.

Figure 9. Project Location and Map of the Shoreline Change between 1937 (purple) and 2017



Finally, according to NOAA's Coastal Flood Mapper, this project is at the highest risk of coastal flooding as seen in **Figure 10**.

Figure 10. Map of Project Location and Risk of Coastal Flooding (NOAA, 2021)



NEED FOR ASSISTANCE

The Middle Peninsula Planning District Commission (MPPDC) is a political subdivision of the Commonwealth of Virginia formed under VA Code §15.2-4203 to provide solutions to problems of greater than local significance and cost-savings through economies of scale. The MPPDC serves nine localities of the Middle Peninsula including Essex, Gloucester, King & Queen, King William, Mathews, and Middlesex counties, as well as the Towns of Tappahannock, West Point, and Urbanna.

MPPDC is staffed using multiple methods including co-operative procurement, hourly, and burdened FTE staff. MPPDC staff consists of an Executive Director, Deputy Director, Chief Financial Officer, Senior Project Planner, and clerical support staff; a Director of Planning, General Planner, Certified Flood Plain Manager, Transportation Planner, and Emergency Planner are co-operative procured; Housing, Community Development Planner and Public Relations staff are hourly.

The Planning District staffing team assists localities with long-term and/or regional planning efforts. The MPPDC Executive Director, Deputy Director, and Chief Financial Officer have decades of experience in managing and administering project grants at multiple scales - from grants in excess of $1,000,000 to small grants. MPPDC is an entrepreneurial-based government agency with an annual operating budget ranging from $750,000 to more than $1,000,000. Annually, the MPPDC manages 25-30 concurrent federal and state grants utilizing industry standard Grants Management Software and other software (e.g., GIS, Microsoft Office) as required and/or necessitated by different grants. The MPPDC operates service centers in the topical areas of coastal zone management, emergency planning, housing, transportation planning and transportation demand management, economic development, social assistance, small business development, general planning and technical assistance, as well as other areas determined by the Commission. MPPDC has more than 25 years of experience managing multiple revolving loan programs. In the 25 years that the Executive Director has been employed by the Commission, no audit findings have occurred.

The need for assistance is two-fold. First, Mathews County is along the Chesapeake Bay and numerous tidal rivers that contribute to the area's high risk to coastal flooding, sea-level rise, and storm surge. Based on tidal gauge data from the Virginia Institute of Marine Science (VIMS), relative sea-level rise rates ranging from 0.11-0.23 in./yr. (2.9-5.8 mm/yr.; period: 1976-2007; 10 stations) within the Chesapeake Bay region, which are the highest rates reported along the U.S. Atlantic coast (Boon et. al., 2010). In addition to sea-level rise, Mathews County has a history of being impacted by hurricanes and tropical storms. As storms pass over or near the coast, the atmospheric pressure drops, causing a large volume of sea water to build up, eventually being pushed ashore by the storm's winds as storm surge. When a storm makes landfall at high tide, the storm surge and the added water from the tidal fluctuation combine to create a "storm tide".

Nor'easters, like hurricanes and tropical storms, can dump heavy amounts of rain and sediment, and produce hurricane-force winds that push large amounts of seawater inland. A strong indicator that Mathews County is experiencing the impact of coastal hazards (i.e., flooding, hurricanes, sea-level rise, and storm surge) is the number of repetitive loss and severe repetitive loss claims submitted by residents and businesses to FEMA. As of 2015, Mathews County had over 1,000 NFIP claims with claims topping $20.5 Million. The County has implemented several preventative measures, property protection policies, public information activities, and emergency service measures to decrease impacts on its communities. This project will therefore build on local efforts moving toward a more resilient community.

Second, this project location is primed for co-benefits derived from dredging and beneficial reuse activities. The proposed upland staging for innovative reuse via the production of concrete for shoreline protection or other resilience measures will facilitate multiple, simultaneous activities that will contribute to economic growth in the area while fostering innovation.

Business Development

As explained previously, Davis Creek represents a key economic engine for Mathews County. The dredging activities will greatly benefit the commercial and recreational industries that have been severely threatened by the hazardous navigability conditions present in the creek. Additionally, the reuse of the material staged in the upland area will represent new economic activity with the potential to bring additional business and jobs to the County.

Community Scale Benefits

As explained in previous sections, the proposed activities represent a coordinated effort to address accelerating climate impacts altering and accelerating sediment migration patterns driven by storm surge and wave energy. The MPPDC and Mathews County will work together to protect the highly vulnerable water-based marine and recreational economies and properties along Davis Creek. The activities will have direct benefit to the general public in the form of navigability for the recreational and commercial boating activities occurring on these creeks as well as new and improved public access to the water from land, which is currently restricted in the vicinity. Additionally, and most importantly, the shoaled conditions of the creek and flood vulnerabilities of the properties adjacent to the creeks represent an immediate and dire public safety issue desperately in need of DCR Flood Fund assistance. Due to the multitude of public investment for shoreline protection and flood research and innovation, we believe this site meets the test of "Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk." The Davis Creek project serves as one of the Commonwealth's best chances to innovate shoreline resilience projects in "live time" so that all of coastal Virginia can benefit. This creek has provided critical community scale benefits for generations, and it is essential that action be taken now to ensure that the site can continue to provide similar benefit to the citizens, businesses, and visitors of Mathews County and the Commonwealth.

ALTERNATIVES

The submission of alternatives is not applicable in this application. Nature-based and hybrid solutions are anticipated, and the project cost is less than $3 million.

GOALS AND OBJECTIVES

The focused goals and objectives of this project are as follows:

Goal 1: Improve coastal resiliency within the community and the Commonwealth.

- Objective A: Increase economic and flood resiliency by abating current flood damage and developing a system for mitigating recurrent, repetitive, and future flood shoaling within the project area using a hybrid design approach.

- Objective B: Stabilize the shoreline to ensure that the County's tax base does not erode and reduce the overall erosion rate within the project area using a hybrid design approach.

Goal 2: Improve water quality for the Chesapeake Bay area.

- Objective A: Improve nitrogen, phosphorus, and sediment using a hybrid design approach. Although some SAV may be temporarily impacted, water quality within Davis Creek may improve with deeper channel access.

Goal 3: Transferability to other communities.

- Objective A: Improve the implementation of Fight the Flood projects and project as an example program to be replicated in other communities within the region or the Commonwealth.

The MPPDC expects the following results and benefits of the completed project:

1. **Foster economic growth in the area over the useful life of site infrastructure and most likely, beyond.** Enabling public access to this creek which represents a major county asset while ensuring its sustainability will protect and enhance the area's recreational economies and has the potential to positively impact related commercial endeavors.

2. **Prevent loss of property without cementing an alternative.** Building resilient structures and facilities at the project site as outlined will help prevent loss of property and property value, while capitalizing on the useful life of the site as much as possible.

3. **Provide ecosystem services to the community toward increased quality of life.** Increased public access to recreational, educational and cultural opportunities leverage

the provisioning and cultural services associated with the site's natural resources, services that provide benefits to safety, health and well-being for all visitors.

APPROACH, MILESTONES, AND DELIVERABLES

The proposed project is to create a -6 ft MLLW channel and 1 ft of overdepth (Total dredge depth -7 ft MLLW), hydraulically dredging approximately 24,150 cy of material that will then be pumped to an upland disposal site where it will be staged in geotubes and within a geotube walled area (see **Figure 11**). Once the material is staged it may be mined for beneficial reuse activities.

Upon receiving notification of an award to proceed, the Middle Peninsula PDC will commence work in moving forward with the project in partnership with Mathews County.

The proposed project includes three principal phases of activities over the course of a nine-month period.

The anticipated timeline for the proposed project could be quicker than 9 months but will be completed well in advance of the maximum three-year limit required per the DCR Grant Manual. The timeline range is due to the potential delays in project initiation, contractor availability, and permitting.

The principal project tasks are described in detail below.

Project Milestone Schedule

TASK 1 - Selection of a staging site for dredged material via a cost efficiency analysis (2 months)

MPPDC staff will work with the MPCBPAA, and Mathews County conduct a cost efficiency analysis of the available property alternatives discussed previously to select the most suitable and effective site for the staging of dredged material.

Once the site has been selected, Mathews County will submit the Joint Permit Application developed by VIMS during 2020 to dredge Davis Creek and pump the material for upland staging at the identified optimal property, where it may be used beneficially for resilience or other use.

TASK 2 – Acquisition and/or site preparation for construction of an upland disposal area (2 months)

After a property is selected for staging the dredged material, MPPDC staff will work with the MPCBPAA and the County to prepare the property for the desired activities.

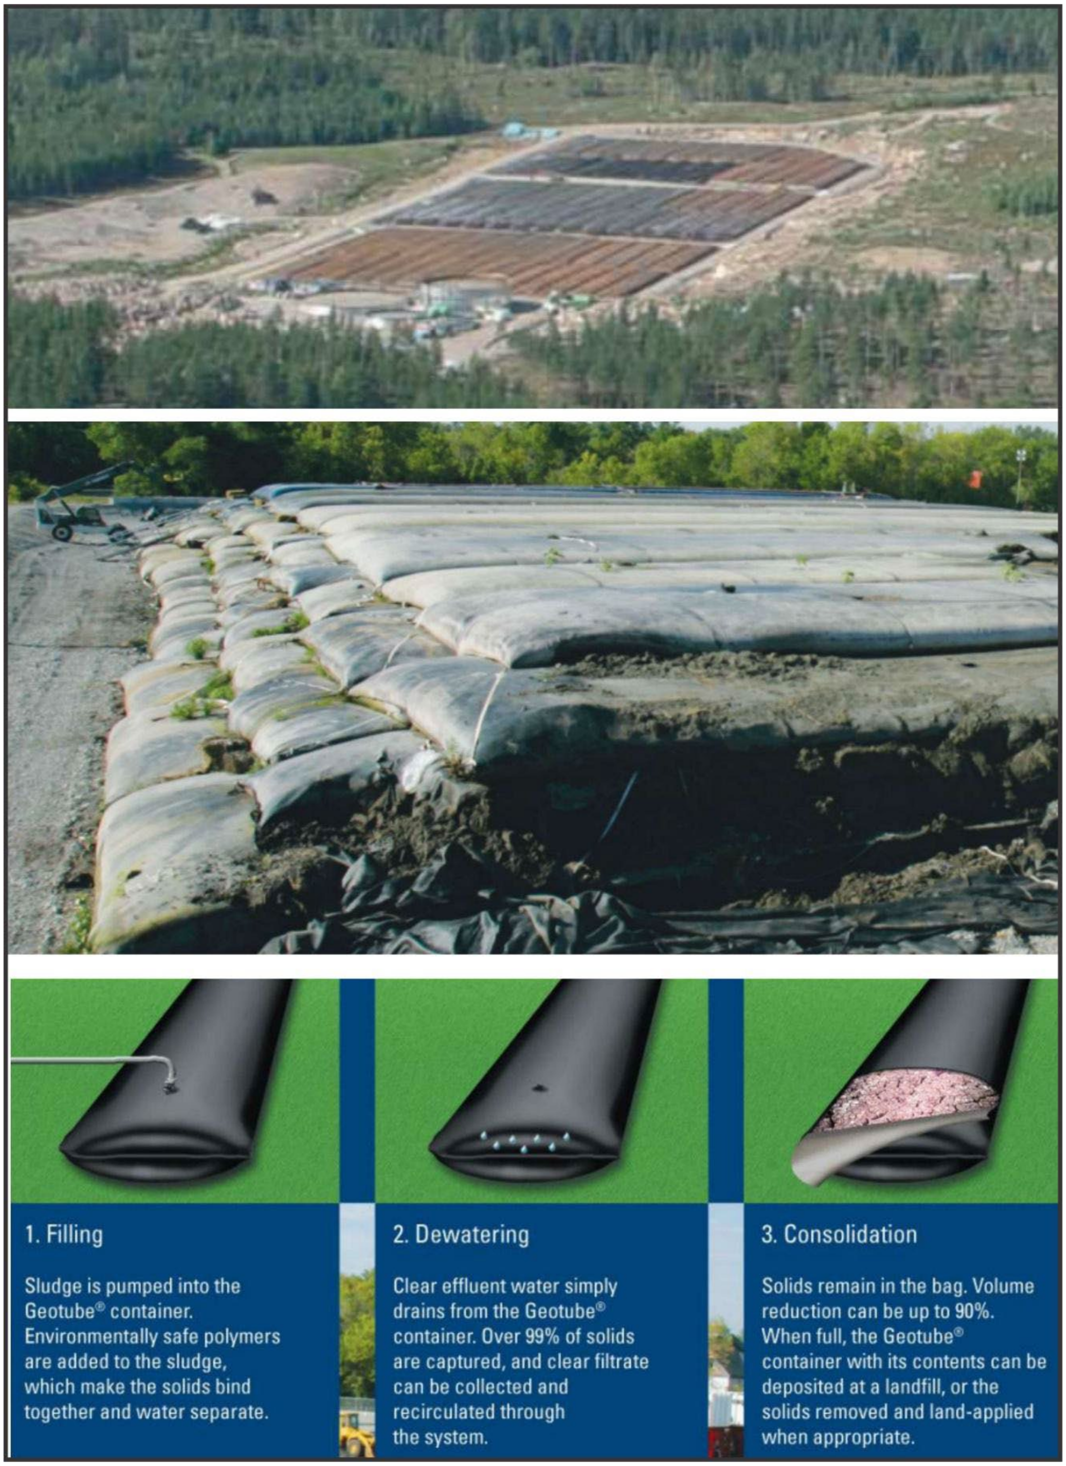
If it is found that the MPCBPAA Dutchman Point property is the optimal alternative, then the property will first be transferred to County ownership in accordance of MPCBPAA policy adopted during June 2021, where any MPCBPAA properties to be utilized for dredged material disposal areas will be returned to the County wherein the property is located and said County will assume ownership and maintenance responsibilities of the activity from that point forward. For the Dutchman Property, funding is requested to prepare the site as necessary per the permit terms and conditions The County will oversee any required erosion and sediment control and enforcement actions that may be required by permitting agencies for this alternative.

If it is found that it is more cost effective to acquire a new property near Davis Creek, then all efforts will be made to identify a nearby property with sufficient elevation and lack of wetland areas to support the desired activities without any regulatory or permitting issues. The US Army Corps of Engineers has been working for years to identify a property owner willing to partner with the Corps to construct a disposal alternative to no avail. The Corps' efforts are severely restricted because they cannot use their federal allocations for property acquisition which necessitates a different approach. Therefore, the local solutions posed here for property acquisition represent the most likely alternative for ever getting Davis Creek dredged. A recent online search of such properties turned up multiple suitable options of properties for sale with most being priced near the $100,000 level and all suitable properties for sale being below the $200,000 level. Funding will be utilized for the County to purchase, close, and prepare the site should it be necessary. The County will oversee any required erosion and sediment control and enforcement actions that may be required by permitting agencies for this alternative as well.

TASK 3 – Dredge Davis Creek and stage dredged material at upland site (5 months)

MPPDC and Mathews County will work with legal counsel to create a bid packet to procure a contractor to dredge Davis Creek. Once a contractor is selected, they will dredge the channel based on the design, terms and conditions included in the approved the JPA. MPPDC and Mathews County will work with the selected contractor to stage the material on the site selected under Tasks 1 and 2. Once the material is on site and dewatered, MPPDC staff will engage Mathews County and the suite of MPPDC Fight the Flood businesses to consider and advance reuse solutions involving the staged material.

Figure 11. Geotube Disposal Method



1. Filling

Sludge is pumped into the Geotube® container. Environmentally safe polymers are added to the sludge, which make the solids bind together and water separate.

2. Dewatering

Clear effluent water simply drains from the Geotube® container. Over 99% of solids are captured, and clear filtrate can be collected and recirculated through the system.

3. Consolidation

Solids remain in the bag. Volume reduction can be up to 90%. When full, the Geotube® container with its contents can be deposited at a landfill, or the solids removed and land-applied when appropriate.

Geotube® Fabric Type:	**GT1000MOLAP**		Axial Direction FS (AFS) =	**7.1**	FS
Geotube® Fabric Type:	**Rigid Mechanical**		FS of Fill Port Failure =	**6.1**	FS

The equations used in the Geotube® Simulator are based on the paper "Two-dimensional analysis of geosynthetic tubes" by R. H. Plaut and S. Suherman, Acta Mechanica, Volume 129, 1998, pages 207-218, and on further research by Professor Raymond H. Plaut. The software was developed by Benjamin Z. Dymond. The work was performed at Virginia Tech.

RELATIONSHIP TO OTHER PROJECTS

As explained previously, the proposed project represents the culmination and nexus for multiple MPPDC endeavors.

For over 40 years the Middle Peninsula PDC and its participating localities have worked diligently on topics associated with the land water interface, including coastal use conflicts and policies, sea level rise, stormwater flooding, roadside ditch flooding, erosion, living shorelines, coastal storm hazards (i.e., hurricanes, tropical storms), riverine and coastal flooding, and coastal resiliency.

The proposed project is a priority project generated from the Middle Peninsula Regional Flood Resilience Plan, which was approved by DCR in August of 2021. This Flood Resiliency Plan serves as the MPPDC's guiding document for its flood resiliency programs and is comprised of two primary MPPDC-approved policy documents. These documents frame the foundation and implementation of the Middle Peninsula flood protection approach and are indirectly and directly supported by specific regional planning documents each approved by federal, regional, and/or local partners as required by statute.

Other plans and resources integral to the implementation of the Flood Resiliency Plan include:

Long Term Planning

- Middle Peninsula All Hazard Mitigation Plan - FEMA and Middle Peninsula locality, approved 2016 (MPPDC Website)
    - This overarching project provides updates every five years on the hazards within the region; it identifies the top hazards within the region and provides a HAZUS assessment that analyzes flooding (riverine and coastal), sea-level rise and hurricane storm surge impacts in the region. Additionally, this plan lists strategies and objectives that guide member localities to mitigate for these strategies.
- Middle Peninsula Comprehensive Economic Development Strategy – MPPDC, approved March 2021
- Middle Peninsula VDOT Rural Long Range Transportation Plan – MPPDC, approved annually

Short Term Implementation

- Middle Peninsula Planning District Commission Fight the Flood Program Design - MPPDC Commission, approved June 2020; Chairman approved update 8/6/21
- Middle Peninsula Planning District Commission Living Shoreline Resiliency Incentive Funding Program - Virginia Revolving Loan Fund Program Design and Guidelines, approved 2015

The MPPDC has a history of continuous work on flooding and coastal resiliency topics, as described in **Attachment 5**. These projects have built upon each other to establish within the

MPPDC a solid foundation of regional expertise in flooding and coastal resiliency. Now, given this history of accumulated information and knowledge, the MPPDC can move beyond research and studies to begin implementing projects on the ground. One such effort, launched in 2020 following the Commission's authorization, was developed in response to emerging flood challenges. This effort, the **Middle Peninsula Fight the Flood (FTF) Program**, leverages state and federal funding to deliver flood mitigation solutions directly to constituents, for both the built and natural environments with an emphasis on nature-based flood mitigation solutions. The Middle Peninsula **FTF** program helps property owners gain access to programs and services to better manage challenges posed by flood water. MPPDC staff have partnered with private property owners registered for the FTF program to assist them in finding funding for their shoreline.

Finally, the Flood Resiliency Plan and associated programs strive to carry out the guiding principles and goals set forth in the Virginia Coastal Resilience Master Planning Framework established in 2020. The proposed activities are proposed in accordance with the guiding principles and with the intent that their outcomes will help the Commonwealth meet the goals set forth in the planning framework.

MAINTENANCE PLAN

A maintenance plan is not applicable in this application. The proposed project is to develop a hybrid solution and its cost does not require ongoing operation and future maintenance.

CRITERIA

Describe how the project meets each of the applicable scoring criteria contained in ***Appendix B*** *and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application.* ***Appendix B*** *must be completed and submitted with the application.*

For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

    - Yes; the applicant is a regional planning district commission.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or**

a link provided?

- Yes; the MPPDC's DCR-approved resilience plan may be accessed at the following link: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

    - Yes; please see **Attachment 1**

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

    - Yes; please see **Attachment 1**

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

    - Yes

BUDGET NARRATIVE

ESTIMATED TOTAL PROJECT COST

Based upon the identified scope of work, as well as the Davis Creek Dredge Channel Data Report prepared by VIMS which included cost estimates from private sector dredging operators, the total estimated project cost is $2,132,102. This total estimate is based upon the following estimated cost breakdowns:

- Upland Staging Area Cost Efficiency Analysis: $5,000
- Upland Staging Area Site Preparation/Site Acquisition: $200,000
- Bid Document and Procurement Preparation and Oversight: $20,000
- Dredging Project including mobilization and demobilization of dredging equipment and geotube staging equipment, all installation of pipe, all costs for other associated work that is necessary to advance the actual dredging operations, dewatering and polymer for geotubes, and purchase of the needed eight geotube units per design specs: $1,558,000

MPPDC staff will manage and administer this project. Thus, personnel time is needed to ensure that project deliverables are completed within the project timeline. Along with personnel expenses, MPPDC fringe is needed. This includes health insurance, retirement, group life insurance, workman's comp, and unemployment insurance. MPPDC fringe rate for FY23 is

26.21% and comprised of: Health Insurance – 48.58%, Retirement – 18.06%, Workers Comp – 0.28%, Social Security – 28.55%, Life Insurance – 4.39%, Unemployment – 0.14%. Direct charges are costs associated with overall projects costs consistent with general accounting principles. MPPDC also prepares an indirect cost (IDC) plan annually per 2 CFR 200 Appendix VII. Following annual audit, the plan is submitted to NOAA for acceptance. MPPDC's IDC rate has a basis of Modified Total Direct Costs (MTDC), with a planned rate of 27.92%. IDC is only applied to the first $25,000 of each contract. IDC calculated on MTDC (modified total direct cost)-Personnel, supplies, travel, and first $25,000 of each subcontract, etc.; excludes equipment.

Other Match:								
Source of Match						$0	$0	$0
GRAND TOTAL						**$1,296,967**	**$835,135**	**$2,132,102**

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $1,296,967 or 65% of total project costs, as the project is located in and serves a low-income geographic area and the project results in hybrid solutions. These funds, combined with local match, would be used for the services identified above.

AMOUNT OF CASH FUNDS AVAILABLE

Mathews County will appropriate the requisite 35% or $835,135 in required local match funds, to be combined with the $1,296,967 in grant assistance to equal the total estimated project cost. The County's match commitment letter is included as **Attachment 1**.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is included as **Attachment 1**.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Middle Peninsula Planning District Commission**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☑ **Yes** ☐ **No**
Applicant Name:	**Middle Peninsula Planning District Commission**

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	35
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	8
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension		

from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		78

County Administration

March 21, 2022

Lewie Lawrence, Executive Director
Middle Peninsula Planning District Commission
P.O. Box 286
Saluda, VA 23149

RE: Support Letter for Whites Creek Landing, East River Boat Yard, and Davis Creek Dredging Proposals

Dear Mr. Lawrence,

Mathews County supports the three proposals for Whites Creek landing resilience, East River Boat Yard resilience, and Davis Creek dredging for VDCR Community Flood Preparedness Funding.

If any or all of the projects are funded by the VDCR, the County plans to provide the required matching funds.

Should you have any questions concerning our support for this project, please contact the County Administration office at (804) 725-7172

Respectfully,

Paul Hudgins

Attachment 5: Flood Prevention Project and its Relevance to Other Projects

MPPDC staff have worked throughout the years to understand the policy, research and impacts of flooding (i.e., stormwater, coastal, riverine, sea level rise) and coastal resiliency to the region. Below is a list of projects that have built upon each other over the year that have contributed to our understanding.

Climate Change & Sea Level Rise (2009 to 2012)
The MPPDC was funded for a 3 Phase project through the Virginia Coastal Zone Management Program to assess the impacts of climate and sea level rise throughout the region. With over 1,000 miles of linear shoreline, the Middle Peninsula has a substantial amount of coast under direct threat of accelerated climate change and more specifically sea-level. In Phase 1, MPPDC staff assessed the potential anthropogenic and ecological impacts of climate change. Phase 2 focused on the facilitating presentations and develop educational materials about sea level rise and climate change for the public and local elected officials. Finally Phase 3 focused on developing adaptation public policies in response to the assessments.

Phase 1: Middle Peninsula Climate Change Adaptation: Facilitation of Presentations and Discussions of Climate Change Issues with Local Elected Officials and the General Public
Phase 2: Climate Change III: Initiating Adaptation Public Policy Development
Phase 3: Phase 3 Climate Change: Initiating Adaptation Public Policy Development

Emergency Management - Hazard Mitigation Planning (2009 to Present): Since 2009, the Middle Peninsula Planning District Commission has assisted regional localities in meeting the federal mandate to have an adopted local hazard plan. *The Regional All Hazards Mitigation Plan addresses the natural hazards prone to the region, including hurricanes, winter storms, tornadoes, coastal flooding, coastal/shoreline erosion, sea level rise, winter storms, wildfire, riverine flooding, wind, dam failures, drought, lightning, and earthquakes. This plan also consists of a HAZUS assessment of hurricane wind, sea level rise* (i.e., Mean High Higher Water and the NOAA 2060 intermediate-high scenario), *and flooding (coastal and riverine flooding) that estimates losses from each hazard.* The Middle Peninsula All-Hazard Mitigation Plan Update 2021 is currently being updated. The 2021 All Hazards Mitigation Plan builds off and updates previous mitigation plans.

Land and Water Quality Protection (2014): In light of changing Federal and State regulations associated with Bay clean up-nutrient loading, nutrient goals, clean water, OSDS management, storm water management, TMDLs, etc., staff from the Middle Peninsula Planning District Commission (MPPDC) will develop a rural pilot project which aims to identify pressing coastal issue(s) of local concern related to Bay clean up and new federal and state legislation which ultimately will necessitate local action and local policy development. Staff has identified many cumulative and secondary impacts that have not been researched or discussed within a local public policy venue. Year 1-3 will include the identification of key concerns related to coastal

land use management/water quality and Onsite Sewage Disposal System (OSDS) and community system deployment. Staff will focus on solution based approaches, such as the establishment of a regional sanitary sewer district to manage the temporal deployment of nutrient replacement technology for installed OSDS systems, assessment of land use classifications and taxation implications associated with new state regulations which make all coastal lands developable regardless of environmental conditions; use of aquaculture and other innovative approaches such as nutrient loading offset strategies and economic development drivers.

Department of Conservation and Recreation Stormwater Management (2014)
The Virginia General Assembly created a statewide, comprehensive stormwater management program related to construction and post-construction activities (HB1065 - Stormwater Integration). The Virginia Department of Conservation and Recreation requires stormwater management for projects with land disturbances of one acre or more. This new state mandate requires all Virginia communities to adopt and implement stormwater management programs by July 1, 2014, in conjunction with existing erosion and sediment control programs. Additionally, the communities within the MPPDC are required to address stormwater quality as stipulated by the Chesapeake Bay TMDL Phase II Watershed Implementation Plan and the Virginia Stormwater Regulations. The MPPDC Stormwater Program helped localities develop tools specific to the region necessary to respond to the state mandate requirement for the development of successful stormwater programs.

Stormwater Management-Phase II (2014): MPPDC staff and Draper Aden Associates worked with localities (i.e., Middlesex, King William, and Mathews Counties and the Town of West Point) interested in participating in a Regional Stormwater Management Program. While each locality sought different services from the regional program, this project coordinated efforts, developed regional policies and procedures, and the proper tools to implement a regional VSMP.

Mathews County Rural Ditch Enhancement Study (2015): In contract with Draper Aden Associates, a comprehensive engineering study was developed to provide recommendations and conceptual opinions of probable costs to improve the conveyance of stormwater and water quality through the ditches in Mathews County.

Drainage and Roadside Ditching Authority (2015): This report explored the enabling mechanism in which a Regional Drainage and Roadside Ditching Authority could be developed. An Authority would be responsible for prioritizing ditch improvement needs, partnering with Virginia Department of Transportation (VDOT) to leverage available funding, and ultimately working toward improving the functionality of the region's stormwater conveyance system.

Living Shoreline Incentive Program (2016 to present)
In 2011 Virginia legislation was passed designating living shorelines as the preferred alternative for stabilizing Virginia tidal floodplain shorelines. The Virginia Marine Resources Commission, in cooperation with the Virginia Department of Conservation and Recreation and with technical

assistance from the Virginia Institute of Marine Science (VIMS), established and implemented a general permit regulation that authorizes and encourages the use of living shorelines however, no financial incentives were put in place to encourage consumers to choose living shorelines over traditional hardening projects in the Commonwealth. To fill this, need the MPPDC developed the MPPDC Living Shoreline Incentives Program to offer loans and/or grants to private property owners interested in installing living shorelines to stabilize their shoreline. Currently, loans are available to assist homeowners to install living shorelines on suitable properties. Loans up to $10,000 can be financed for up to 5 years (60 months). Loans over $10,000 can be financed for up to 10 years (120 months). Interest is at the published Wall Street Journal Prime rate on the date of loan closing - currently at 5.25% (11/29/18). Minimum loan amount is $1,000. Maximum determined by income and ability to repay the loan. Finally, there are currently no grants available in this program. Since 2016 under the MPPDC Living Shoreline Revolving Loan program, 8 living shorelines have been financed and built to date encumbering ~$500,000 in VRA loan funding and ~$400,000 in NFWF grant funding. Living Shoreline construction cost to date range per job $14,000- $180,000. MPPDC oversees all aspects (planning, financing, constriction, and loan servicing) of these projects from cradle to grave.

Mathews County Ditch Project - VCPC White Papers (2017): This report investigated the challenges presented by the current issues surrounding the drainage ditch network of Mathews County. The study summarized research conducted in the field; examined the law and problems surrounding the drainage ditches; and proposed some next steps and possible solutions.

Mathews County Ditch Mapping and Database Final Report (2017): This project investigated roadside ditch issues in Mathews County through mapping and research of property deeds to document ownership of ditches and outfalls. This aided in understanding the needed maintenance of failing ditches and the design of a framework for a database to house information on failing ditches to assist in the prioritization of maintenance needs.

Virginia Stormwater Nuisance Law Guidance (2018): This report was developed by the Virginia Coastal Policy Center to understand the ability of a downstream recipient of stormwater flooding to bring a claim under Virginia law against an upstream party, particularly a nuisance claim. The report summarizes how Virginia courts determine stormwater flooding liability between two private parties.

Oyster Bag Sill Construction and Monitoring at Two Sites in Chesapeake Bay (2018): VIMS Shoreline Studies Program worked with the PAA to (1) install oyster bag sills as shore protection at two PAA sites with the goal of determining effective construction techniques and placement guidelines for Chesapeake Bay shorelines and (2) assess the effectiveness for shore protection with oyster bags on private property through time.

Fight the Flood Program (2020): The Fight the Flood was launched in 2020 to connect property owners to contractors who can help them protect their property from rising flood waters. FTF also offers a variety of financial tools to fund these projects including but limited to the Septic

Repair revolving loan program, Living Shoreline incentives revolving loan fund program, and plant insurance for living shorelines

Greetings,

The MPPDC is respectfully submitting five proposals for consideration under Round 3. These projects were requested by our member jurisdictions as projects of highest priority with regards to flood mitigation and resilience needs. The projects are located on and involve publicly-owned property and infrastructure and were identified as sites with the greatest potential for community scale benefits within the locality/region.

The proposals may downloaded via the following links:

- CID510071_GloucesterCounty_Public_CFPF.doc.pdf
- CID510098_MiddlesexCounty_Public_CFPF.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-1.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-2.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-3.pdf

We thank you in advance for your consideration. Please contact me directly should you have any questions.

Best,

Curt

Email Address: jrickards@mppdc.com

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X__ No ___

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☑ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☑ Storm water system upgrades.
- ☐ Medium and large-scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☑ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Location of Project (Include Maps): Mathews County, Diggs, Virginia

NFIP Community Identification Number (CID#) (See appendix F): 510096

Is Project Located in an NFIP Participating Community? Yes

Is Project Located in a Special Flood Hazard Area? Yes

Flood Zone(s) (If Applicable): Zones AE and VE

Flood Insurance Rate Map Number(s) (If Applicable): 51115C0060E eff. 12/9/2014

Total Cost of Project: **$213,740**

Total Amount Requested: **$131,507**

SCOPE OF WORK NARRATIVE

INTRODUCTION

This proposal focuses on necessary resilience enhancements including erosion management and improvement of public access for the landing and pier of publicly owned property (822 Whites Creek Lane) located on Whites Creek in Diggs, Virginia (Mathews County). The public waterfront site experiences severe flooding and erosion from storm surge and sea-level rise, eroding the drive area and resulting in sand intrusion in the right-of-way and drainage ditches, causing issues for neighboring properties. During the most recent nor'easter, the end of the pier was damaged, requiring closure until repairs can be made. The project scope includes conducting a stormwater drainage study and design of BMPs to address overwash and sand intrusion, the development of a shovel ready design and draft JPA for a shoreline erosion control structure (i.e. living shoreline) allowing public access in the form of a kayak/small skiff launch, and repair and replacement of the pier in the same footprint (approximately 215' in length, 5' wide, with a 20' x 12' L-head) at an increased elevation to make it more resistant to damage during high water events, and the development of a small turnaround and parking area for 2 vehicles. Whites Creek is a key access point to the Chesapeake Bay and the design and implementation of resilient structures and shoreline stabilization will preserve this key access point and hub for recreation along the Virginia Water Trails.

FEMA, the Virginia General Assembly, DCR's Floodplain Management Program, and the Middle Peninsula Planning District Commission (MPPDC) all recognize that natural hazards pose a serious risk to all levels of government including states, localities, tribes and territories and the citizens which reside and work there. These hazards include flooding, drought, hurricanes, landslides, wildfires and more. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program (www.FightTheFloodVA.com). To that end, this proposal is a partnership between the MPPDC and Mathews County (see Community Support Letter, **Attachment 1**).

- A link or copy to the approved MPPDC resilience plan: https://fighttheflood va.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf
- Middle Peninsula All Hazards Mitigation Plan (2016): https://www.mppdc.com/articles/reports/AHMP_2016_FEMA_Approved_RED.pdf
- Mathews County Comprehensive Plan: https://www.mathewscountyva.gov/196/Comprehensive-Plan

This project is consistent with multiple objectives and strategies outlined within the Regional All-Hazards Mitigation Plan. Relevant strategies include the following:

- Objective 1.1: Provide protection for future development to the greatest extent possible.
    - Strategy 1.1.1: Reduce or eliminate flood damage to residential/business structures that are highly vulnerable for continual flood damage.
    - Strategy 1.1.3: Protect public buildings and public infrastructure from flood waters resulting from 100-year flood storm events.
    - Strategy 1.3.1: Mitigation projects that will result in protection of public or private property from natural hazards.

PROJECT INFORMATION

Project Description

The project site is the **Whites Creek Public Landing**, with waterfront access on Whites Creek in Mathews County, Virginia. The approximately one-acre property consists of a fishing pier, boat launch, and public beach and water access. There are no designated parking spaces, and the site accommodates limited traffic while allowing flow of traffic to the boat launch and beach. Whites Creek is a key access point for recreational fishing, and is one of the County's only public accesses with direct access to the Chesapeake Bay. Currently, the shoreline erosion is limiting access to key community and recreational features of the site. Studying stormwater drainage and addressing shoreline erosion will increase the site's resilience to coastal weather events and sea level rise. Further replacement of the pier with a resilient design is essential to long term viability of this resource. The site is relatively small, however, it represents a significant amount of commercial and economic activity, and as such, the County would like to protect the site for continued public access.

Specifically, this project proposes to:

1. Conduct a stormwater drainage study and design of BMPs to address overwash and sand intrusion;
2. Develop a shovel ready design and draft JPA for a shoreline erosion control structure;
3. Replacement of the pier in the same footprint (215' long, 5' wide, 20' x 12' L-head) at an increased elevation to make it more resistant to damage during high water events; and
4. Develop a small turnaround and parking for 2 parking spaces, based upon developed designs.

Project Location Information

The Middle Peninsula is the second of three large peninsulas on the western shore of Chesapeake Bay in Virginia, as seen in **Figure 1**. It lies between the Northern Neck and the Virginia Peninsula. The region is predominantly rural, with large, scattered farms and forested tracts; close-knit waterfront communities; an active regional arts association; broad-based civic involvement; and an excellent transportation infrastructure that provides easy access to urban markets. The area contains 3.2% of Virginia's land mass but only 1.1% of the Commonwealth’s total population of approximately 93,000 as seen in **Figure 2**.

Figure 1. Middle Peninsula Geographic Area

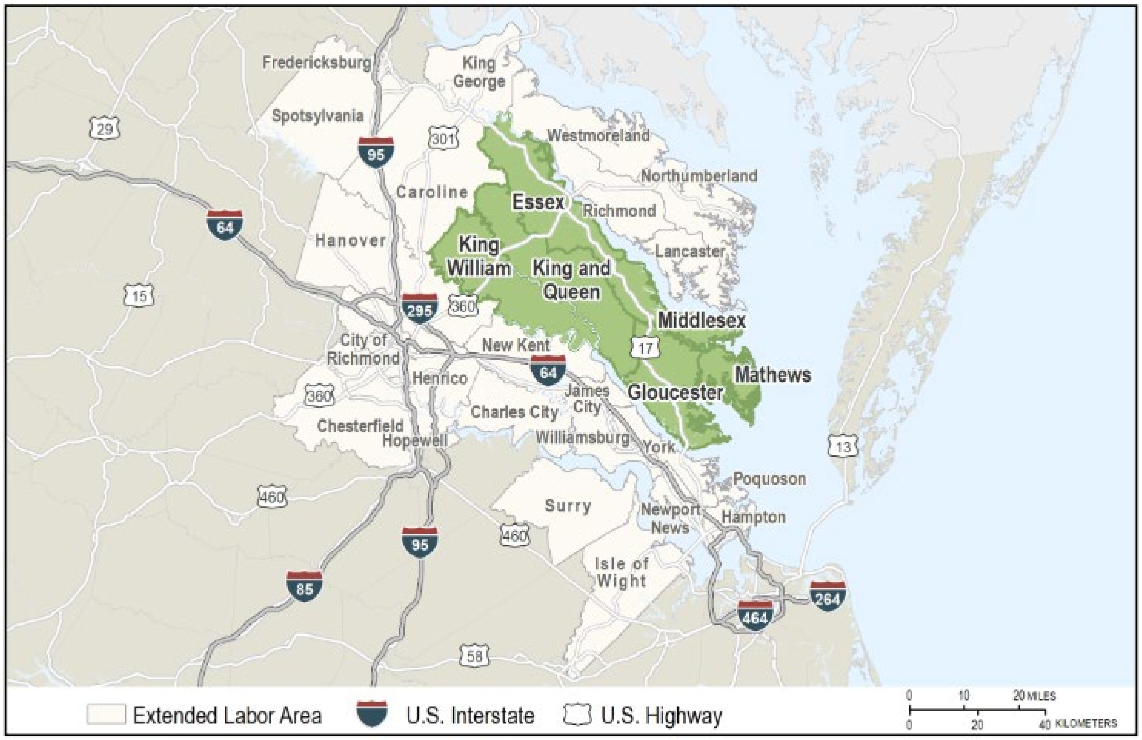

Figure 2. Middle Peninsula Population

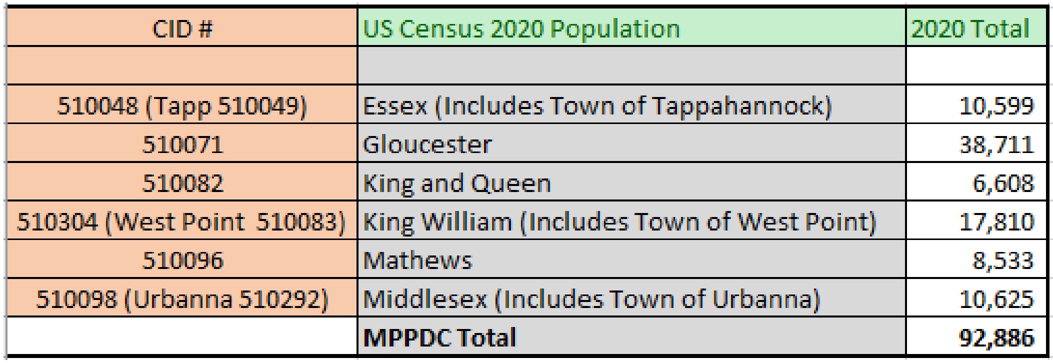
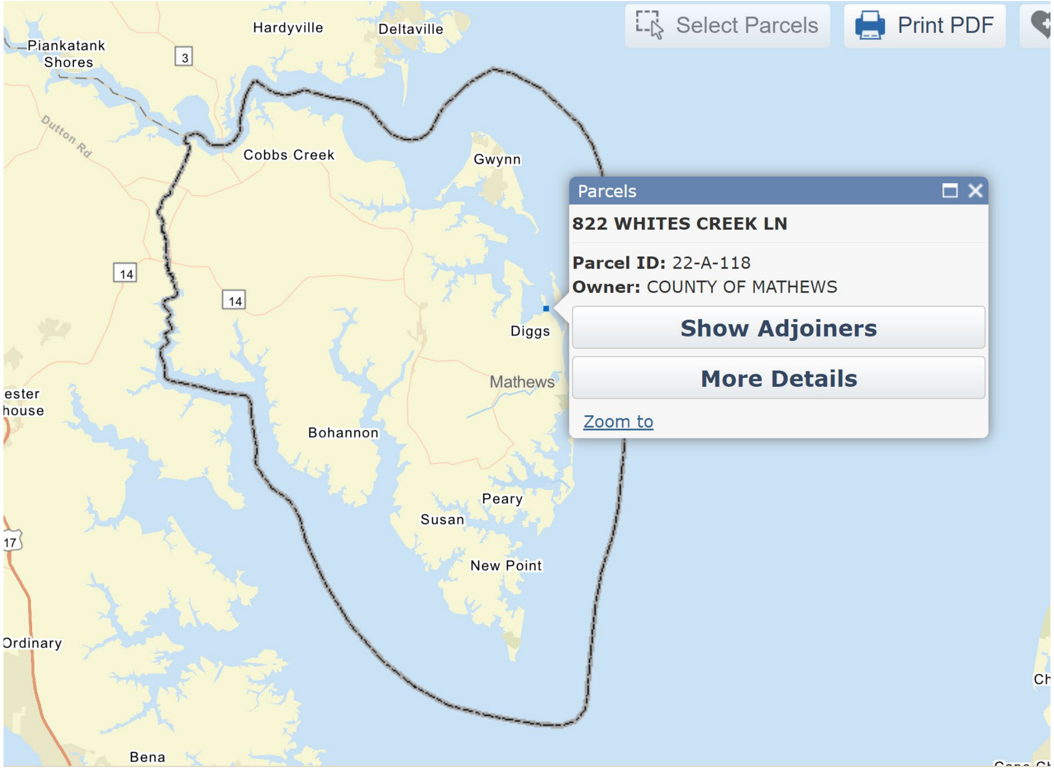


CID #	US Census 2020 Population	2020 Total
510048 (Tapp 510049)	Essex (Includes Town of Tappahannock)	10,599
510071	Gloucester	38,711
510082	King and Queen	6,608
510304 (West Point 510083)	King William (Includes Town of West Point)	17,810
510096	Mathews	8,533
510098 (Urbanna 510292)	Middlesex (Includes Town of Urbanna)	10,625
	MPPDC Total	**92,886**

The project proposes to study and implement measures to enhance the resiliency of the Whites Creek Landing site, an approximately 1-acre property located in Mathews County, along Whites Creek in Diggs, Virginia. (**Figures 3 and 4**).

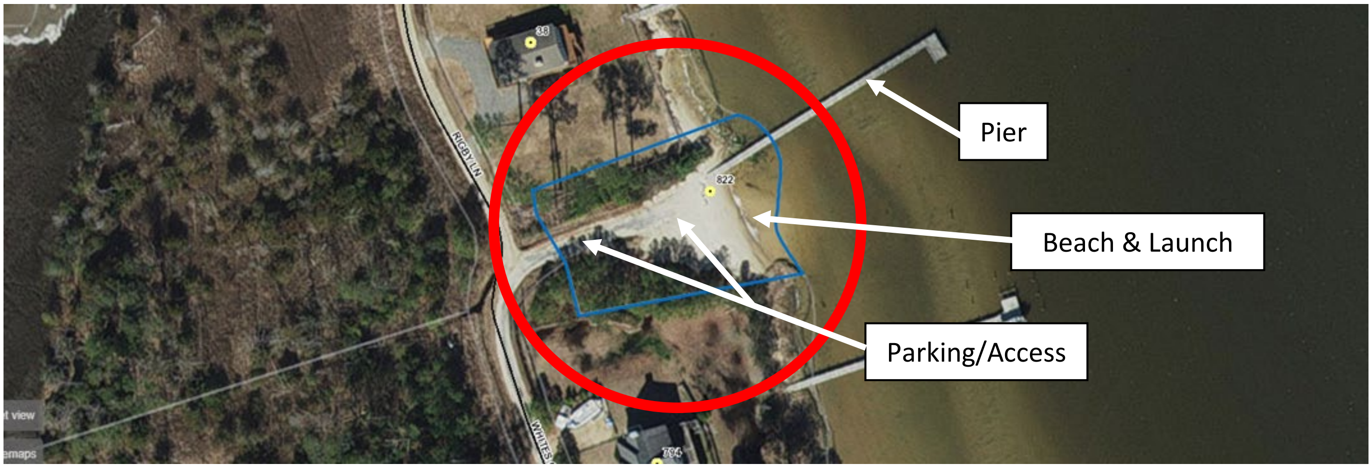
Figure 3. County Map of Project Location



822 WHITES CREEK LN

Parcel ID: 22-A-118
Owner: COUNTY OF MATHEWS

Figure 4. Parcel Map of Project Location

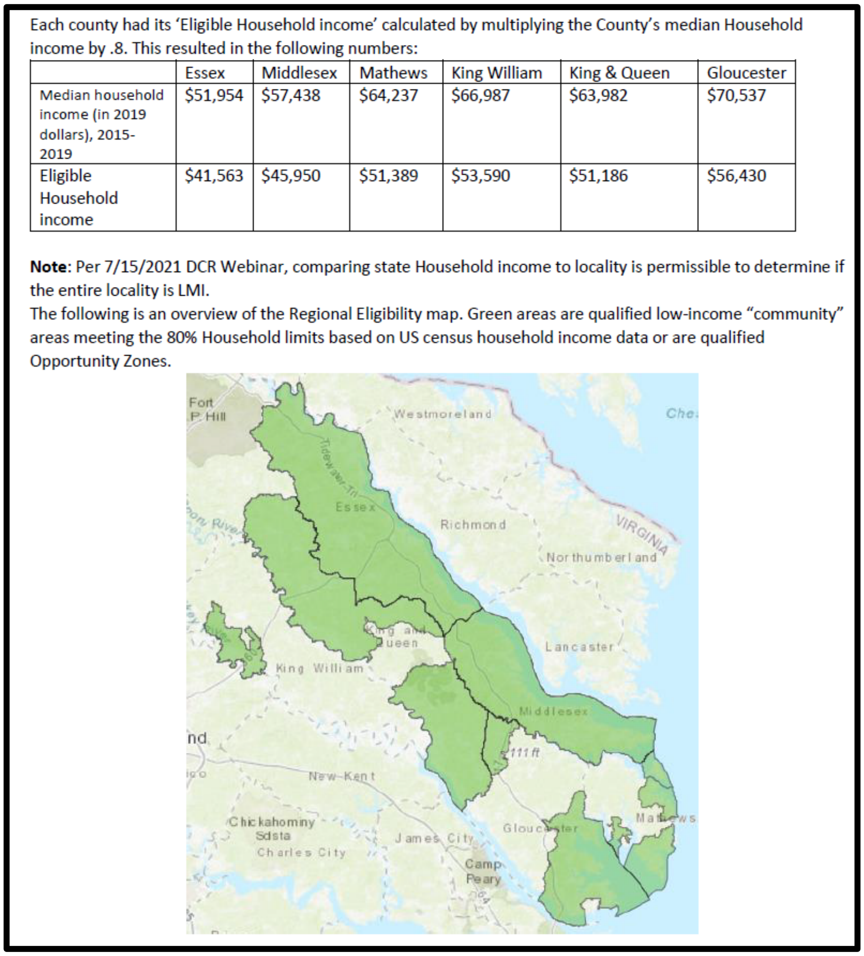


Population Information

Mathews County is located on the easternmost portion of Virginia's Middle Peninsula and is an agriculture, forestry and water-based economy. The County is a coastal community located between the Mobjack Bay, Piankatank River and the Chesapeake Bay. Mathews County has more than 200 miles of shoreline. Based on 2020 Census Data, Mathews County's population totals 18,533 (**Figure 2**).

According to DCR guidelines, a portion of the county is considered a low-income geographic area. In **Figure 5**, the green areas depict qualified low-income "community" areas meeting the 80% Household limits based on US census household income data[1] or are qualified Opportunity Zones.

Figure 5. Map of Middle Peninsula Low Income Qualifying Geographic Areas



Each county had its 'Eligible Household income' calculated by multiplying the County's median Household income by .8. This resulted in the following numbers:

	Essex	Middlesex	Mathews	King William	King & Queen	Gloucester
Median household income (in 2019 dollars), 2015-2019	$51,954	$57,438	$64,237	$66,987	$63,982	$70,537
Eligible Household income	$41,563	$45,950	$51,389	$53,590	$51,186	$56,430

Note: Per 7/15/2021 DCR Webinar, comparing state Household income to locality is permissible to determine if the entire locality is LMI.

The following is an overview of the Regional Eligibility map. Green areas are qualified low-income "community" areas meeting the 80% Household limits based on US census household income data or are qualified Opportunity Zones.

---

[1] Based upon 2015-2019 U.S. Census American Community Survey data available on January 4, 2022, when CFPF Round 3 opened; 2016-2020 ACS data was not released until March 17, 2022.

Please see **Figure 6** for a detailed map of the project location and the green low-income area overlay. This shows that the project location is within the low-income area.

Figure 6. Map of the Project Location within in the Green Low-Income Area

With respect to social vulnerability, according to ADAPTVA's Social Vulnerability Index Score, this project location has a Social Vulnerability Index Score of 0.6, classified as Moderate Social Vulnerability (**Figure 7)**

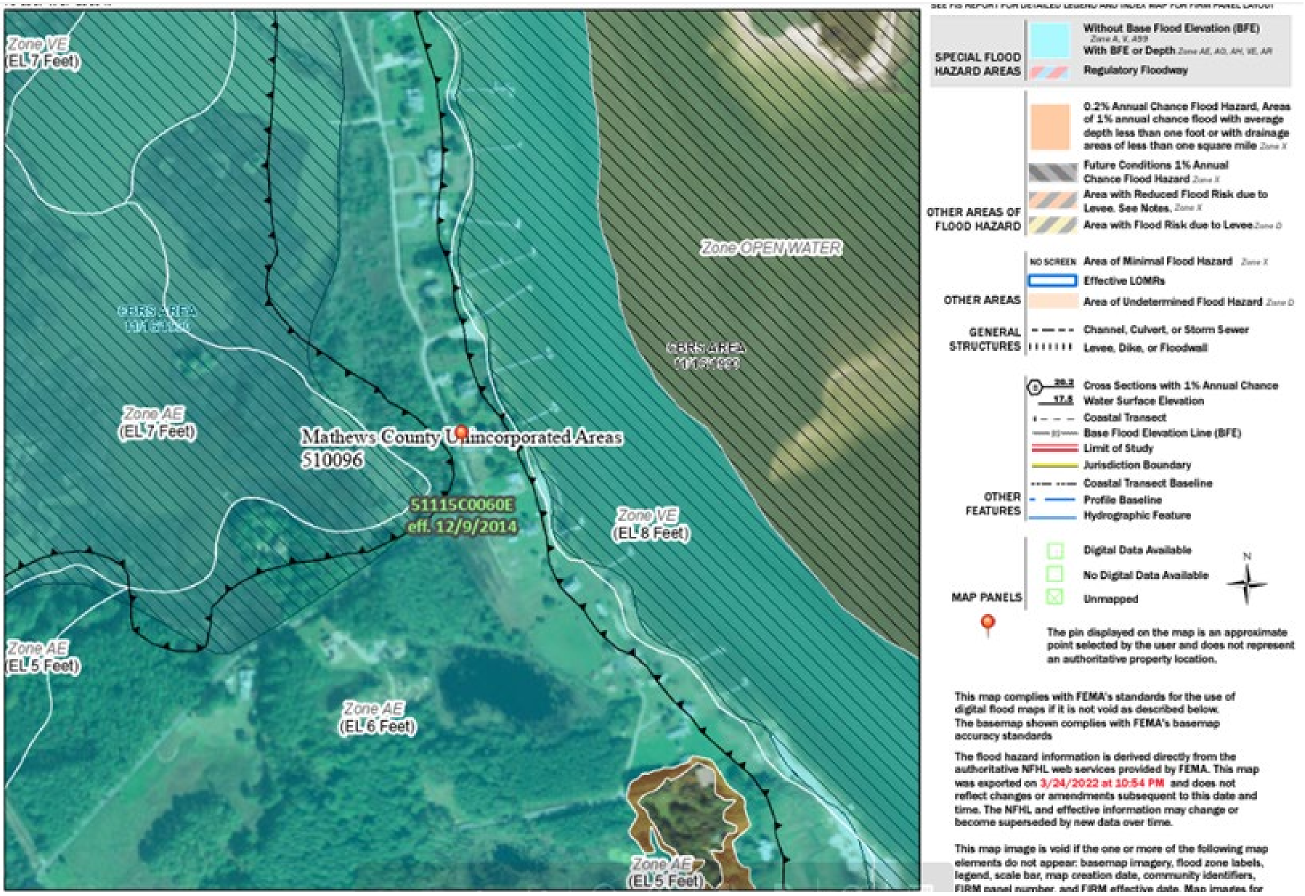
Figure 7. ADAPTVA Social Vulnerability Index Score Viewer

Flood Risk Information

The entirety of the site (822 Whites Creek Lane, Diggs, Virginia, 37.44691, -76.26051) is located within a mapped floodplain, with portions located within FEMA Flood Zones AE and VE (**Figure 8**). Mathews County's Planning and Zoning Department administers the requirements of the NFIP program, and the County's Floodplain Management Ordinance may be accessed at the following link:

https://www.co.Mathews.va.us/DocumentCenter/View/422/Floodplain-Management-PDF?bidId=

Figure 8. Map of FEMA Flood Zones



The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/24/2022 at 10:54 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for

Due to the project site's proximity to the water and low elevation, the site has an extensive history of being subject to extreme weather events that have resulted in significant impacts to infrastructure and the environment. For example, the project location has long been, and continues to be, impacted by tropical, sub-tropical, and Nor'easter events (**Attachment 3**). During the most recent nor'easter, the end of the pier was damaged, requiring closure until repairs can be made. According to NOAA's Coastal Flood Mapper, this project location is at the highest risk of coastal flooding (**Figure 9**). Collectively, these reoccurring and storm-related events have contributed to shoreline loss at site. **Figure 10** depicts the shoreline in 1937 and the 2017, based on historical shoreline data from the Virginia Institute of Marine Science Shoreline Studies Program; illustrated are an approximate loss of 5,000 square feet of shoreline at the site location over an eighty-year period. The site was historically sheltered from the wind and wave forces of the Chesapeake Bay by Rigby Island, which is a rapidly disintegrating barrier island due east of the site. Rigby Island was connected to the mainland to the south until it breached and became disconnected in 1960. Since 1960, Whites Creek has become increasingly open to the Chesapeake Bay and currently only ~1 acre or less of

Rigby Island remains and the mainland shorelines are virtually fully exposed to the fetch and high energy of the Chesapeake Bay. Protection at Whites Creek landing is more necessary than ever due to these drastic changes which have put the viability of the site at great risk.

Figure 9. Map of Project Location and Risk of Coastal Flooding (NOAA, 2021)

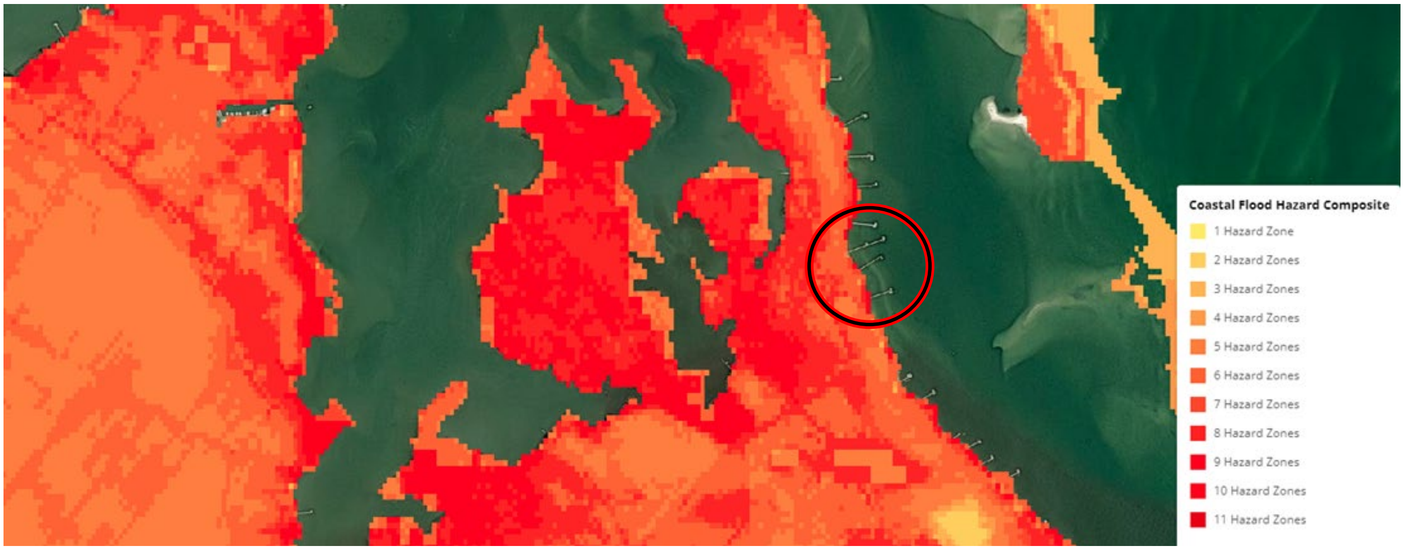


Figure 10. Project Location and Map of Associated Shoreline Change Between 1937 and 2017

NEED FOR ASSISTANCE

The Middle Peninsula Planning District Commission (MPPDC) is a political subdivision of the Commonwealth of Virginia formed under VA Code §15.2-4203 to provide solutions to problems of greater than local significance and cost-savings through economies of scale. The MPPDC serves nine localities of the Middle Peninsula including Essex, Gloucester, King & Queen, King William, Mathews, and Middlesex counties, as well as the Towns of Tappahannock, West Point, and Urbanna.

MPPDC is staffed using multiple methods including co-operative procurement, hourly, and burdened FTE staff. MPPDC staff consists of an Executive Director, Deputy Director, Chief Financial Officer, Senior Project Planner, and clerical support staff; a Director of Planning, General Planner, Certified Flood Plain Manager, Transportation Planner, and Emergency Planner are co-operative procured; Housing, Community Development Planner and Public Relations staff are hourly.

The Planning District staffing team assists localities with long-term and/or regional planning efforts. The MPPDC Executive Director, Deputy Director, and Chief Financial Officer have decades of experience in managing and administering project grants at multiple scales - from grants in excess of $1,000,000 to small grants. MPPDC is an entrepreneurial-based government agency with an annual operating budget ranging from $750,000 to more than $1,000,000. Annually, the MPPDC manages 25-30 concurrent federal and state grants utilizing industry standard Grants Management Software and other software (e.g., GIS, Microsoft Office) as required and/or necessitated by different grants. The MPPDC operates service centers in the topical areas of coastal zone management, emergency planning, housing, transportation planning and transportation demand management, economic development, social assistance, small business development, general planning and technical assistance, as well as other areas determined by the Commission. MPPDC has more than 25 years of experience managing multiple revolving loan programs. In the 25 years that the Executive Director has been employed by the Commission, no audit findings have occurred.

As noted, the Whites Creek Public Landing site is subject to shoreline erosion, limiting access to key community and recreational features of the site. Studying shoreline erosion and implementing a living shoreline design for the site will increase access for kayaks and skiffs in addition to increasing resilience to coastal weather events and sea level rise. Without the erosion protection measures proposed, the land, habitat and public infrastructure will be compromised, resulting in degradation of the environment and loss of public assets. Coastal flooding resilience remains the biggest weakness of the Whites Creek Landing site. The area around the Whites Creek site is prone to erosion from weather events as evidenced by neighboring living shoreline and shoreline protection features. Any category of storm surge will affect the Whites Creek site, depositing sediment in the drainage features, eroding the shoreline, and precluding access. Moreover, rising sea levels will have a negative impact on the property, increasing the potential for shoreline erosion and loss of public assets.

Figure 11 illustrates flood levels combined with sea-level rise and their effects on the site. Notably, floods in 60 years pose an issue to the site; key construction techniques will need to be employed to increase overall resilience in order to mitigate the effects of exceptional floods and sea level rise 60 years and out.

Figure 11. Sea Level and Flood Elevation

Sea Level for 2020 *Sea Level Projection for 2080*

The need for assistance is two-fold. First, Mathews County is along the Chesapeake Bay and numerous tidal rivers that contribute to the area's high risk to coastal flooding, sea-level rise, and storm surge. Based on tidal gauge data from the Virginia Institute of Marine Science (VIMS), relative sea-level rise rates ranging from 0.11-0.23 in./yr. (2.9-5.8 mm/yr.; period: 1976-2007; 10 stations) within the Chesapeake Bay region, which are the highest rates reported along the U.S. Atlantic coast (Boon et. al., 2010). In addition to sea-level rise, Mathews County has a history of being impacted by hurricanes and tropical storms. As storms pass over or near the coast, the atmospheric pressure drops, causing a large volume of sea water to build up, eventually being pushed ashore by the storm's winds as storm surge. When a storm makes landfall at high tide, the storm surge and the added water from the tidal fluctuation combine to create a "storm tide".

Nor'easters, like hurricanes and tropical storms, can dump heavy amounts of rain and sediment, and produce hurricane-force winds that push large amounts of seawater inland. A strong indicator that Mathews County is experiencing the impact of coastal hazards (i.e., flooding, hurricanes, sea-level rise, and storm surge) is the number of repetitive loss and severe repetitive loss claims submitted by residents and businesses to FEMA. As of 2015, Mathews County had over 1,000 NFIP claims with claims topping $20.5 Million. The County has implemented several preventative measures, property protection policies, public information activities, and emergency service measures to decrease impacts on its communities. This project will therefore build on local efforts moving toward a more resilient community.

Second, this project location is primed for co-benefits derived from shoreline erosion mitigation efforts. The proposed application of shoreline protection features, boat launch improvements, and increased public access that provides strategic protection of the infrastructure and landscape at this point of interest. For example, the proposed improvements will facilitate multiple, simultaneous activities that will contribute to economic growth in the area while fostering innovation.

Business Development

The potential of increased community interest drawn to the site is significant. Visitors seeking access to local waterways could be drawn to activities available at Whites Creek Landing, supporting the local economy with outside revenue in their pursuits. The project proposes to design a resilient fishing pier, study and design of a living shoreline, and study and design for dredging Whites Creek with beneficial reuse of sediments. Close proximity to recreational opportunities has increasingly become a factor in where businesses decide to locate. The provision of a public access site with enhanced amenities thus has the potential to drive continued economic growth through business development in the area. Moreover, the boat launch and fishing pier provide key access to the waterways for the community and visitors to Whites Creek Landing.

Community Scale Benefits

Due to the multitude of public investment for shoreline protection and flood research and innovation, we believe this site meets the test of “Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk.” The Whites Creek Landing site serves as one of the Commonwealth’s best chances to innovate shoreline resilience projects in “live time” so that all of coastal Virginia can benefit.

MPPDC believes that proposing resilience projects at the parcel scale and where possible, partnering with neighbors can accomplish more in terms of linear shoreline protected than urban areas which have smaller sized parcels.

Benefit of Natural Based solutions

Adapt VA contains a data layer illustrating areas of less than ten feet in elevation that show locations in the Middle Peninsula offering benefits of NNBF to coastal buildings, habitat, and community protection (see **Figure 12**). The project site offers multiple community protection benefits which include combinations of mitigating coastal flooding, protecting buildings/community facilities and CRS credit.

Figure 12. Natural and Nature-Based Features at the Project Site

ALTERNATIVES

The submission of alternatives is not applicable in this application. Nature-based and hybrid solutions are anticipated, and the project cost is less than $3 million.

GOALS AND OBJECTIVES

This proposal will develop a comprehensive strategy to increase resilience of the site against multiple shoreline erosion inputs while providing co-benefits that foster resilience at the Whites Creek Landing site. The focused goals and objectives of the project are as follows:

Goal 1: Improve public access to local coastal waterways.

- Objective A: Increase public access to the Chesapeake Bay with improved conditions and mitigation of recurrent and repetitive flooding and erosion using a nature-based approach on site.
- Objective B: Enhance quality of life for local residents and visitors alike through recreation, educational and cultural opportunities, and commercial fishing at the point of interest.
- Objective C: Leverage improved public access and coastal resiliency for economic growth within Mathews County.

Goal 2: Improve coastal resiliency within the community and the Commonwealth.

- Objective A: Mitigate recurrent and repetitive flooding and erosion alongside storm surge and sea level rise using natural and nature-based solutions that benefit people and the economy as well as the environment.
- Objective B: Prevent loss of life and reduce property damage by mitigating for recurrent, repetitive, and future flooding within the project area using a nature-based design approach.
- Objective C: Enhance the resilience of public infrastructure, ensuring longer-term viability.

Goal 3: Transferability to other communities.

- Objective A: Model natural and nature-based solutions for coastal sites exploring development potential.
- Objective B: Foster innovative research and solutions-oriented studies on site focused on coastal adaptation and mitigation for external transfer.
- Objective C: Improve the implementation of Fight the Flood as a model program to be replicated in other communities within the region and/or Commonwealth.

The MPPDC expects the following results and benefits of the completed project:

1. **Foster economic growth in the area over the useful life of site infrastructure and most likely, beyond.** Enabling public access to this county asset while ensuring its sustainability will protect and enhance the area's recreational economies and has the potential to positively impact related commercial endeavors.

2. **Prevent loss of property without cementing an alternative.** Building resilient structures and facilities at the project site as outlined will help prevent loss of property and property value, while capitalizing on the useful life of the site as much as possible.

3. **Provide ecosystem services to the community toward increased quality of life.** Increased public access to recreational, educational and cultural opportunities leverage the provisioning and cultural services associated with the site's natural resources, services that provide benefits to safety, health and well-being for all visitors.

APPROACH, MILESTONES, AND DELIVERABLES

As noted, the intent of this project is to focus on erosion management and improvement of public access for the landing and pier located at Whites Creek Landing. This project will utilize and incorporate sustainable planning, design, environmental management, and engineering practices that weave natural features together and allow for floodwater inundation and stormwater flow to reduce the exposure to public facilities while promoting adaptation and resilience.

The principal tasks and milestones are as follows:

- Conduct a stormwater drainage study and design of BMPs to address overwash and sand intrusion;
- Develop a shovel ready design and draft JPA for a shoreline erosion control structure;
- Replacement of the pier in the same footprint (215' long, 5' wide, 20' x 12' L-head) at an increased elevation to make it more resistant to damage during high water events; and
- Develop a small turnaround and parking area for 2 vehicles, based upon developed designs.

The expected timeline for the project milestones, and deliverables, is as follows. All activities are contingent upon approval of the relevant permitting authorities, and as such, the schedule and milestones should be considered estimates at best. The ultimate project schedule will be dictated predominantly by the permitting process; however, the proposed activities are not anticipated to exceed the 3 years allowed per the DCR Grant Manual:

<u>Year 1/Months 1-3 - Stormwater drainage study and design of BMPs</u>

<u>Year 1/Months 4-6 - Develop design and draft JPA for shoreline erosion control structure/living shoreline</u>

Year 1/Months 6-12 - Replacement of the pier

Year 2/Months 13-18 - Improvement of site access/parking

RELATIONSHIP TO OTHER PROJECTS

While the specific proposed project bears no direct relationship to specific past, future, or future resilience projects, the project does relate to larger regional resilience efforts. For more than 40 years, the Middle Peninsula Planning District Commission (MPPDC) and its participating localities have worked diligently on topics associated with the land water interface, including coastal use conflicts and policies, sea level rise, stormwater flooding, roadside ditch flooding, erosion, living shorelines, coastal storm hazards (e.g., hurricanes, tropical storms), riverine and coastal flooding, and coastal resiliency.

The proposed project is a priority project generated from the Middle Peninsula Regional Flood Resilience Plan, which was approved by DCR in August of 2021. This Flood Resiliency Plan serves as the MPPDC's guiding document for its flood resiliency programs and is comprised of two primary MPPDC-approved policy documents. These documents frame the foundation and implementation of the Middle Peninsula flood protection approach, and are indirectly and directly supported by specific regional planning documents each approved by federal, regional, and/or local partners as required by statute.

Other plans and resources integral to the implementation of the Flood Resiliency Plan include:

Long Term Planning

- Middle Peninsula All Hazard Mitigation Plan - FEMA and Middle Peninsula locality, approved 2016 (MPPDC Website)
    - This overarching project provides updates every five years on the hazards within the region; it identifies the top hazards within the region and provides a HAZUS assessment that analyzes flooding (riverine and coastal), sea-level rise and hurricane storm surge impacts in the region. Additionally, this plan lists strategies and objectives that guide member localities to mitigate for these strategies.
- Middle Peninsula Comprehensive Economic Development Strategy – MPPDC, approved March 2021
- Middle Peninsula VDOT Rural Long Range Transportation Plan – MPPDC, approved annually

Short Term Implementation

- Middle Peninsula Planning District Commission Fight the Flood Program Design - MPPDC Commission, approved June 2020; Chairman approved update 8/6/21
- Middle Peninsula Planning District Commission Living Shoreline Resiliency Incentive Funding Program - Virginia Revolving Loan Fund Program Design and Guidelines, approved 2015

The MPPDC has a history of continuous work on flooding and coastal resiliency topics, as described in **Attachment 5**. These projects have built upon each other to establish within the MPPDC a solid foundation of regional expertise in flooding and coastal resiliency. Now, given this history of accumulated information and knowledge, the MPPDC can move beyond research and studies to begin implementing projects on the ground. One such effort, launched in 2020 following the Commission's authorization, was developed in response to emerging flood challenges. This effort, the **Middle Peninsula Fight the Flood (FTF) Program**, leverages state and federal funding to deliver flood mitigation solutions directly to constituents, for both the built and natural environments with an emphasis on nature-based flood mitigation solutions. The Middle Peninsula **FTF** program helps property owners gain access to programs and services to better manage challenges posed by flood water. MPPDC staff have partnered with private property owners registered for the FTF program to assist them in finding funding for their shoreline.

Finally, the Flood Resiliency Plan and associated programs strive to carry out the guiding principles and goals set forth in the Virginia Coastal Resilience Master Planning Framework established in 2020. The proposed activities are proposed in accordance with the guiding principles and with the intent that their outcomes will help the Commonwealth meet the goals set forth in the planning framework.

MAINTENANCE PLAN

A maintenance plan is not applicable in this application. The proposed project is to develop a nature-based design solution and its cost does not require ongoing operation and future maintenance.

CRITERIA

Describe how the project meets each of the applicable scoring criteria contained in ***Appendix B*** *and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application.* ***Appendix B*** *must be completed and submitted with the application.*

For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

    - Yes; the applicant is a regional planning district commission.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**

    - Yes; the MPPDC's DCR-approved resilience plan may be accessed at the following link: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

    - Yes; please see **Attachment 1**

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

    - Yes; please see the match commitment letter in **Attachment 1**

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

    - Yes

BUDGET NARRATIVE

ESTIMATED TOTAL PROJECT COST

Based upon the identified scope of work, the estimated total project cost is $213,740. A cost breakdown of project elements is as follows:

- Stormwater Drainage Study and BMP Designs: $25,000
- Living Shoreline Design and Draft JPA: $15,000
- Pier Design and Replacement: $56,975 (215' at $265 per linear foot)
- Vehicle Turnaround/Parking Design and Install: $60,000 (6,000 sq. ft. at $10 per sq. ft.)
- Legal Bid Documents and Procurement Preparation and Oversight: $15,000

MPPDC staff will manage and administer this project. Thus, personnel time is needed to ensure that project deliverables are completed within the project timeline. Along with personnel expenses, MPPDC fringe is needed. This includes health insurance, retirement, group life insurance, workman's comp, and unemployment insurance. MPPDC fringe rate for FY23 is 26.21% and comprised of: Health Insurance – 48.58%, Retirement – 18.06%, Workers Comp – 0.28%, Social Security – 28.55%, Life Insurance – 4.39%, Unemployment – 0.14%. Direct charges are costs associated with overall projects costs consistent with general accounting principles. MPPDC also prepares an indirect cost (IDC) plan annually per 2 CFR 200 Appendix VII. Following annual audit, the plan is submitted to NOAA for acceptance. MPPDC's IDC rate has a basis of Modified Total Direct Costs (MTDC), with a planned rate of 27.92%. IDC is only applied to the first $25,000 of each contract. IDC calculated on MTDC (modified total direct cost)-Personnel, supplies, travel, and first $25,000 of each subcontract, etc.; excludes equipment.

Other Match:							
Source of Match					$0	$0	$0
GRAND TOTAL					**$131,507**	**$82,233**	**$213,740**

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $131,507, or 65% of total project costs, as the project is located in and serves a low-income geographic area and the project results in hybrid solutions. These funds, combined with local match, would be used for the services identified above.

AMOUNT OF CASH FUNDS AVAILABLE

Mathews County will appropriate the requisite 35% or $82,233 in required local cash match funds, to be combined with the $131,507 in grant assistance to equal the total estimated project cost. The County's match commitment letter is included as **Attachment 1**.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is included as **Attachment 1**.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Middle Peninsula Planning District Commission**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☑ **Yes** ☐ **No**
Applicant Name:	**Middle Peninsula Planning District Commission**

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
X Wetland restoration, floodplain restoration X Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal X Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	**45**
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (**Based on [ADAPT VA's Social Vulnerability Index Score.)](#)**		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	8
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**

County Administration

March 21, 2022

Lewie Lawrence, Executive Director
Middle Peninsula Planning District Commission
P.O. Box 286
Saluda, VA 23149

RE: Support Letter for Whites Creek Landing, East River Boat Yard, and Davis Creek Dredging Proposals

Dear Mr. Lawrence,

Mathews County supports the three proposals for Whites Creek landing resilience, East River Boat Yard resilience, and Davis Creek dredging for VDCR Community Flood Preparedness Funding.

If any or all of the projects are funded by the VDCR, the County plans to provide the required matching funds.

Should you have any questions concerning our support for this project, please contact the County Administration office at (804) 725-7172

Respectfully,

Paul Hudgins

Attachment 5: Flood Prevention Project and its Relevance to Other Projects

MPPDC staff have worked throughout the years to understand the policy, research and impacts of flooding (i.e., stormwater, coastal, riverine, sea level rise) and coastal resiliency to the region. Below is a list of projects that have built upon each other over the year that have contributed to our understanding.

Climate Change & Sea Level Rise (2009 to 2012)
The MPPDC was funded for a 3 Phase project through the Virginia Coastal Zone Management Program to assess the impacts of climate and sea level rise throughout the region. With over 1,000 miles of linear shoreline, the Middle Peninsula has a substantial amount of coast under direct threat of accelerated climate change and more specifically sea-level. In Phase 1, MPPDC staff assessed the potential anthropogenic and ecological impacts of climate change. Phase 2 focused on the facilitating presentations and develop educational materials about sea level rise and climate change for the public and local elected officials. Finally Phase 3 focused on developing adaptation public policies in response to the assessments.

Phase 1: Middle Peninsula Climate Change Adaptation: Facilitation of Presentations and Discussions of Climate Change Issues with Local Elected Officials and the General Public
Phase 2: Climate Change III: Initiating Adaptation Public Policy Development
Phase 3: Phase 3 Climate Change: Initiating Adaptation Public Policy Development

Emergency Management - Hazard Mitigation Planning (2009 to Present): Since 2009, the Middle Peninsula Planning District Commission has assisted regional localities in meeting the federal mandate to have an adopted local hazard plan. *The Regional All Hazards Mitigation Plan addresses the natural hazards prone to the region, including hurricanes, winter storms, tornadoes, coastal flooding, coastal/shoreline erosion, sea level rise, winter storms, wildfire, riverine flooding, wind, dam failures, drought, lightning, and earthquakes. This plan also consists of a HAZUS assessment of hurricane wind, sea level rise* (i.e., Mean High Higher Water and the NOAA 2060 intermediate-high scenario), *and flooding (coastal and riverine flooding) that estimates losses from each hazard.* The Middle Peninsula All-Hazard Mitigation Plan Update 2021 is currently being updated. The 2021 All Hazards Mitigation Plan builds off and updates previous mitigation plans.

Land and Water Quality Protection (2014): In light of changing Federal and State regulations associated with Bay clean up-nutrient loading, nutrient goals, clean water, OSDS management, storm water management, TMDLs, etc., staff from the Middle Peninsula Planning District Commission (MPPDC) will develop a rural pilot project which aims to identify pressing coastal issue(s) of local concern related to Bay clean up and new federal and state legislation which ultimately will necessitate local action and local policy development. Staff has identified many cumulative and secondary impacts that have not been researched or discussed within a local public policy venue. Year 1-3 will include the identification of key concerns related to coastal

land use management/water quality and Onsite Sewage Disposal System (OSDS) and community system deployment. Staff will focus on solution based approaches, such as the establishment of a regional sanitary sewer district to manage the temporal deployment of nutrient replacement technology for installed OSDS systems, assessment of land use classifications and taxation implications associated with new state regulations which make all coastal lands developable regardless of environmental conditions; use of aquaculture and other innovative approaches such as nutrient loading offset strategies and economic development drivers.

Department of Conservation and Recreation Stormwater Management (2014)

The Virginia General Assembly created a statewide, comprehensive stormwater management program related to construction and post-construction activities (HB1065 - Stormwater Integration). The Virginia Department of Conservation and Recreation requires stormwater management for projects with land disturbances of one acre or more. This new state mandate requires all Virginia communities to adopt and implement stormwater management programs by July 1, 2014, in conjunction with existing erosion and sediment control programs. Additionally, the communities within the MPPDC are required to address stormwater quality as stipulated by the Chesapeake Bay TMDL Phase II Watershed Implementation Plan and the Virginia Stormwater Regulations. The MPPDC Stormwater Program helped localities develop tools specific to the region necessary to respond to the state mandate requirement for the development of successful stormwater programs.

Stormwater Management-Phase II (2014): MPPDC staff and Draper Aden Associates worked with localities (i.e., Middlesex, King William, and Mathews Counties and the Town of West Point) interested in participating in a Regional Stormwater Management Program. While each locality sought different services from the regional program, this project coordinated efforts, developed regional policies and procedures, and the proper tools to implement a regional VSMP.

Mathews County Rural Ditch Enhancement Study (2015): In contract with Draper Aden Associates, a comprehensive engineering study was developed to provide recommendations and conceptual opinions of probable costs to improve the conveyance of stormwater and water quality through the ditches in Mathews County.

Drainage and Roadside Ditching Authority (2015): This report explored the enabling mechanism in which a Regional Drainage and Roadside Ditching Authority could be developed. An Authority would be responsible for prioritizing ditch improvement needs, partnering with Virginia Department of Transportation (VDOT) to leverage available funding, and ultimately working toward improving the functionality of the region’s stormwater conveyance system.

Living Shoreline Incentive Program (2016 to present)

In 2011 Virginia legislation was passed designating living shorelines as the preferred alternative for stabilizing Virginia tidal floodplain shorelines. The Virginia Marine Resources Commission, in cooperation with the Virginia Department of Conservation and Recreation and with technical

assistance from the Virginia Institute of Marine Science (VIMS), established and implemented a general permit regulation that authorizes and encourages the use of living shorelines however, no financial incentives were put in place to encourage consumers to choose living shorelines over traditional hardening projects in the Commonwealth. To fill this, need the MPPDC developed the MPPDC Living Shoreline Incentives Program to offer loans and/or grants to private property owners interested in installing living shorelines to stabilize their shoreline. Currently, loans are available to assist homeowners to install living shorelines on suitable properties. Loans up to $10,000 can be financed for up to 5 years (60 months). Loans over $10,000 can be financed for up to 10 years (120 months). Interest is at the published Wall Street Journal Prime rate on the date of loan closing - currently at 5.25% (11/29/18). Minimum loan amount is $1,000. Maximum determined by income and ability to repay the loan. Finally, there are currently no grants available in this program. Since 2016 under the MPPDC Living Shoreline Revolving Loan program, 8 living shorelines have been financed and built to date encumbering ~$500,000 in VRA loan funding and ~$400,000 in NFWF grant funding. Living Shoreline construction cost to date range per job $14,000- $180,000. MPPDC oversees all aspects (planning, financing, constriction, and loan servicing) of these projects from cradle to grave.

Mathews County Ditch Project - VCPC White Papers (2017): This report investigated the challenges presented by the current issues surrounding the drainage ditch network of Mathews County. The study summarized research conducted in the field; examined the law and problems surrounding the drainage ditches; and proposed some next steps and possible solutions.

Mathews County Ditch Mapping and Database Final Report (2017): This project investigated roadside ditch issues in Mathews County through mapping and research of property deeds to document ownership of ditches and outfalls. This aided in understanding the needed maintenance of failing ditches and the design of a framework for a database to house information on failing ditches to assist in the prioritization of maintenance needs.

Virginia Stormwater Nuisance Law Guidance (2018): This report was developed by the Virginia Coastal Policy Center to understand the ability of a downstream recipient of stormwater flooding to bring a claim under Virginia law against an upstream party, particularly a nuisance claim. The report summarizes how Virginia courts determine stormwater flooding liability between two private parties.

Oyster Bag Sill Construction and Monitoring at Two Sites in Chesapeake Bay (2018): VIMS Shoreline Studies Program worked with the PAA to (1) install oyster bag sills as shore protection at two PAA sites with the goal of determining effective construction techniques and placement guidelines for Chesapeake Bay shorelines and (2) assess the effectiveness for shore protection with oyster bags on private property through time.

Fight the Flood Program (2020): The Fight the Flood was launched in 2020 to connect property owners to contractors who can help them protect their property from rising flood waters. FTF also offers a variety of financial tools to fund these projects including but limited to the Septic

Repair revolving loan program, Living Shoreline incentives revolving loan fund program, and plant insurance for living shorelines

MPPDC Round 3 CFPF New Applications

2 messages

Curt Smith <csmith@mppdc.com> Fri, Apr 8, 2022 at 11:46 AM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: Lewis Lawrence <llawrence@mppdc.com>, Jackie Rickards <jrickards@mppdc.com>, Heather Modispaw <Hmodispaw@mppdc.com>, "Howard-cooper, Wendy" <wendy.howard-cooper@dcr.virginia.gov>

Greetings,

The MPPDC is respectfully submitting five proposals for consideration under Round 3. These projects were requested by our member jurisdictions as projects of highest priority with regards to flood mitigation and resilience needs. The projects are located on and involve publicly-owned property and infrastructure and were identified as sites with the greatest potential for community scale benefits within the locality/region.

The proposals may downloaded via the following links:

- CID510071_GloucesterCounty_Public_CFPF.doc.pdf
- CID510098_MiddlesexCounty_Public_CFPF.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-1.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-2.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-3.pdf

We thank you in advance for your consideration. Please contact me directly should you have any questions.

Best,

Curt

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
☐ Wetland restoration.
☑ Floodplain restoration.
☐ Construction of swales and settling ponds.
☑ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large-scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☑ Stream bank restoration or stabilization.
☑ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Location of Project (Include Maps): Mathews County, 502 Mill Lane Rd, Bohannon, VA 23021

NFIP Community Identification Number (CID#) (See appendix F): 510096

Is Project Located in an NFIP Participating Community? Yes

Is Project Located in a Special Flood Hazard Area? Yes

Flood Zone(s) (If Applicable): Zones AE and VE

Flood Insurance Rate Map Number(s) (If Applicable): 51115C0090E eff. 12/9/2014

Total Cost of Project: **<u>$966,987</u>**

Total Amount Requested: **<u>$580,192</u>**

SCOPE OF WORK NARRATIVE

INTRODUCTION

This proposal focuses on advancing a holistic approach to enhancing the current and future resilience and utility of the publicly owned East River Boat Yard site located on the East River and Mill Creek in Bohannon, Virginia (Mathews County). The site has served as a hub for commercial and recreational marine activity for Mathews County for centuries and is currently experiencing severe shoreline erosion issues, which are likely contributing to the shoaling and need for dredging of the mouth of Mill Creek. The proposed project will accomplish the following six unique tasks which holistically will transform the site in a manner which will allow for continued productivity from the site for decades to come:

1. Develop shovel ready resilient designs for a wharf or dock on the East River for commercial users to load/offload catch and gear,
2. Develop shovel ready designs for a resilient boat ramp and tending pier on Mill Creek that can withstand increased coastal flooding conditions and sea-level rise,
3. Shovel ready designs for improvements to an existing commercial building that has served the commercial seafood industry but is in need of repair due to recurrent flood damages,
4. Designs for improvements to the parking area which has been damaged from repeated flooding,
5. Design for a living shoreline to protect the site from future erosion and to serve as best practice examples of E&S measures while also increasing overall resilience, and
6. to design and perform dredging of the mouth of Mill Creek and study beneficial reuse options for the material, whether for on-site fill or as living shoreline materials.

The East River Boat Yard is a key asset to Mathews County, for residents, visitors, and for commercial enterprise, and development of designs focused on resilience are vital to the site's success and long-term viability. The project represents an opportunity to advance and implement sitewide resilience for a publicly owned working waterfront which must be designed in a manner to remain resilient in the face of increased flooding and sea-level rise so that it may continue to serve the community and local economy. It is anticipated that the outcomes may serve as a model for the hundreds of similar working waterfronts which exist in locations vulnerable to flooding and sea-level rise throughout coastal Virginia.

The primary purpose of this project is to stabilize the property perimeter with several types of shoreline protection measures. Additional primary and secondary purposes include the development of public amenities in the form of a public boat ramp and public fishing pier.

FEMA, the Virginia General Assembly, DCR's Floodplain Management Program, and the Middle Peninsula Planning District Commission (MPPDC) all recognize that natural hazards pose a serious risk to all levels of government including states, localities, tribes and territories and the citizens which reside and work there. These hazards include flooding, drought, hurricanes, landslides, wildfires and more. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program (www.FightTheFloodVA.com). To that end, this proposal is a partnership between the MPPDC and Mathews County (see Community Support Letter, **Attachment 1**).

- A link or copy to the approved MPPDC resilience plan: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf
- Middle Peninsula All Hazards Mitigation Plan (2016): https://www.mppdc.com/articles/reports/AHMP_2016_FEMA_Approved_RED.pdf
- Mathews County Comprehensive Plan: https://www.mathewscountyva.gov/196/Comprehensive-Plan

This project is consistent with multiple objectives and strategies outlined within the Regional All-Hazards Mitigation Plan. Relevant strategies include the following:

- Objective 1.1: Provide protection for future development to the greatest extent possible.
    - Strategy 1.1.1: Reduce or eliminate flood damage to residential/business structures that are highly vulnerable for continual flood damage.
    - Strategy 1.1.3: Protect public buildings and public infrastructure from flood waters resulting from 100-year flood storm events.
    - Strategy 1.3.1: Mitigation projects that will result in protection of public or private property from natural hazards.

PROJECT INFORMATION

Project Description

The project site is the East River Boat Yard property, with waterfront access on the East River and Mill Creek in Mathews County, Virginia. The approximately one-acre property current includes a 1-story metal boathouse building and remnants of the former pier and dock structures. Given existing site conditions, including shoreline erosion, as well as the need to dredge the mouth of Mill Creek, the project involves a master redesign of the site, taking into account existing and proposed elements, and consideration of the site as a recreational and commercial asset.

The County is proposing to improve the existing property by first demolishing existing dilapidated structures that include old timber pilings and piers, bulkheading, and various mounds of rubble concrete and debris. The new improvements feature a concrete boat ramp (16 feet wide and 63 feet long), a tending pier (6 feet wide and 63 feet long), gravel parking, including an ADA parking stall, and five (5) trailered parking spaces. The shoreline protection structures are comprised of two segments of riprap revetment (75 feet and 155 feet), two sill segments (220 feet and 50 feet), and wetland plantings (3,732 sq ft E2EM and 834 sq ft E2SS) at the waterfront park.

Nearly all of the site is a previously disturbed parcel that was associated with a small marine repair yard prior to the County obtaining the land. Most of the original structures have been demolished and the County has steadily been cleaning the property up. Impacts to onsite resources have been minimized by designing the smallest footprint possible for the boat ramp)14,3% slope approaching maximum) and shoreline stabilization measures, while maintaining green space within the interior (including planted wetlands and upland buffer areas)

The project also includes constructing an open-pile, fixed pier for the intent of providing public fishing access at the waterfront park. The fishing pier covers approximately 955 sq ft of subaqueous lands and extends out to depths of approximately 7 feet (MLW).

The revetment structures will be placed on a coarse aggregate bedding, while the sill will be placed directly upon filter fabric. Sand for planting medium will be imported from the dredged material from the mouth of Mill Creek adjacent to the site or from an approved supplier should it be needed, and filter fabric will also be used underneath the revetment. The boat ramp will be constructed of concrete over coarse aggregate and the tending pier will be constructed from treated wood suitable for the marine environment.

Specifically, this project proposes to:

1. Assess of site conditions;
2. Replace and establish shoreline protection in areas where there are currently dilapidated structures or no structures;
3. Demolish and remove existing concrete debris and foundations;
4. Add gravel substrate to create a turnaround and parking spaces for vehicles and trailers;
5. Enhance two wetlands areas that will be located behind proposed sills and planted with tidal wetland species;
6. Construct a new concrete boat ramp and tending pier;
7. Construct a new public fishing pier; and
8. Dredge Mill Creek and incorporate beneficial reuse to the greatest extent possible.

A conceptual site layout with project components is provided in **Figure 1** below, along with cost estimates for all project activities.

Table 43. Implementation Costs for Mill Creek 2

PHASE AND COST COMPONENT	COSTS FOR INITIAL PROJECT	COSTS FOR EACH SUBSEQUENT DREDGING CYCLE
PRE-CONSTRUCTION PHASE:		
Preliminary Engineering & Design for Dredging Activities (Including Joint Permit Application)	$50,000	$30,000
Preliminary Engineering & Design for Disposal Activities Not Included in Dredging Activities Above (Including Joint Permit Application)	$50,000	$30,000
Grant and Loan Applications	$10,000	$10,000
Community Engagement	$6,000	$3,000
Environmental Assessment	$30,000	$30,000
Federal, State, and Local Permits	$25,000	$25,000
Legal Coordination	$10,000	$0
Financial Coordination	$25,000	$10,000
Dredge Material Placement Site Acquisition[76]	$0	$0
Subtotal	$206,000	$138,000
Contingencies (10% of Pre-Construction Phase Costs)	$20,600	$13,800
TOTAL PRE-CONSTRUCTION PHASE COSTS	$226,600	$151,800
CONSTRUCTION PHASE:		
Final Engineering and Design/Plans and Specifications for Dredging Activities	$25,000	$15,000
Final Engineering and Design/Plans and Specifications for Disposal Activities Not Included in Dredging Activities Above	$25,000	$15,000
Bonds and Insurance	$1,215	$1,215
Mobilization/Demobilization	$5,000	$5,000
Dredge Material Placement Site Preparation	$1,691	$1,691
Dredging	$33,810	$33,810
Disposal (Placement) of Dredge Material	--	--
Supervision and Administration for Dredging Oversight	$1,127	$1,127
Supervision and Administration for Disposal (Placement) Oversight	$1,127	$1,127
Subtotal	$93,970	$73,970
Contingencies (25% of Construction Phase Costs)	$23,492	$18,492
TOTAL CONSTRUCTION PHASE COSTS	$117,462	$92,462
POST CONSTRUCTION PHASE:		
Monitoring and/or Mitigation	$3,381	$3,381
Project Condition Survey	$25,000	$25,000
Subtotal	$28,381	$28,381
Contingencies (25% of Post Construction Phase Costs)	$7,095	$7,095
TOTAL POST CONSTRUCTION PHASE COSTS	$35,476	$35,476
TOTAL COST ALL PHASES	$379,538	$279,738

Project Location Information

The Middle Peninsula is the second of three large peninsulas on the western shore of Chesapeake Bay in Virginia, as seen in **Figure 2**. It lies between the Northern Neck and the Virginia Peninsula. The region is predominantly rural, with large, scattered farms and forested tracts; close-knit waterfront communities; an active regional arts association; broad-based civic involvement; and an excellent transportation infrastructure that provides easy access to urban markets. The area contains 3.2% of Virginia's land mass but only 1.1% of the Commonwealth's total population of approximately 93,000 as seen in **Figure 3**.

Figure 2. Middle Peninsula Geographic Area

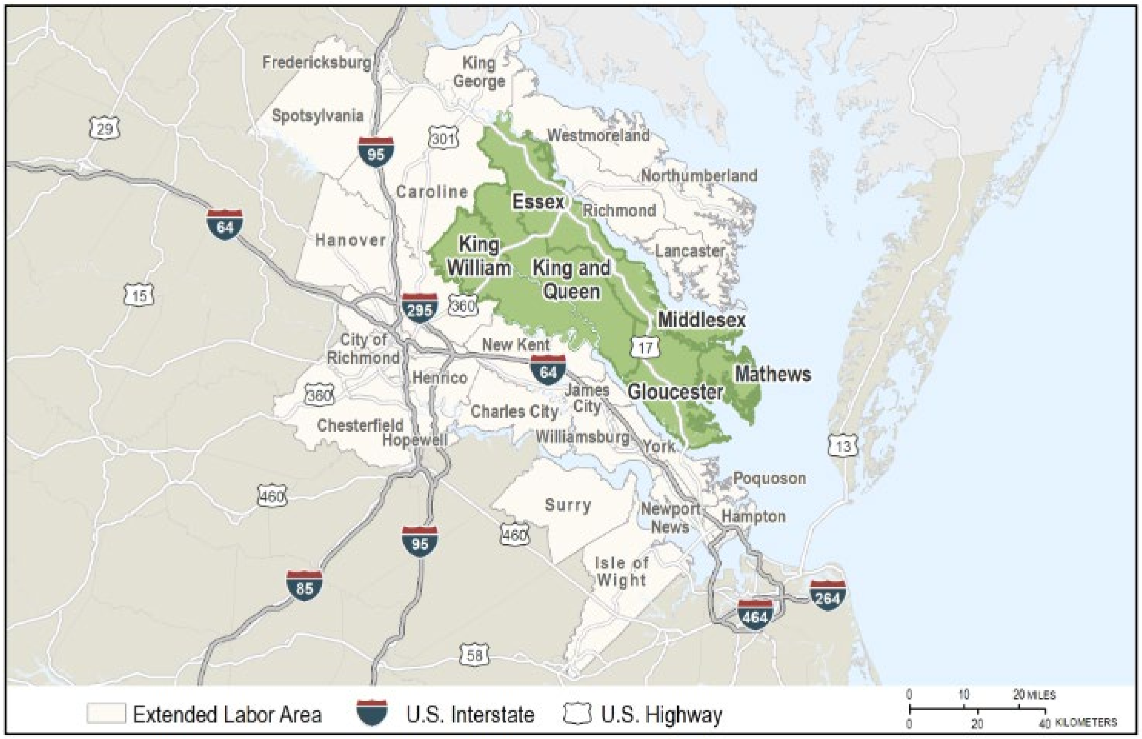

Figure 3. Middle Peninsula Population

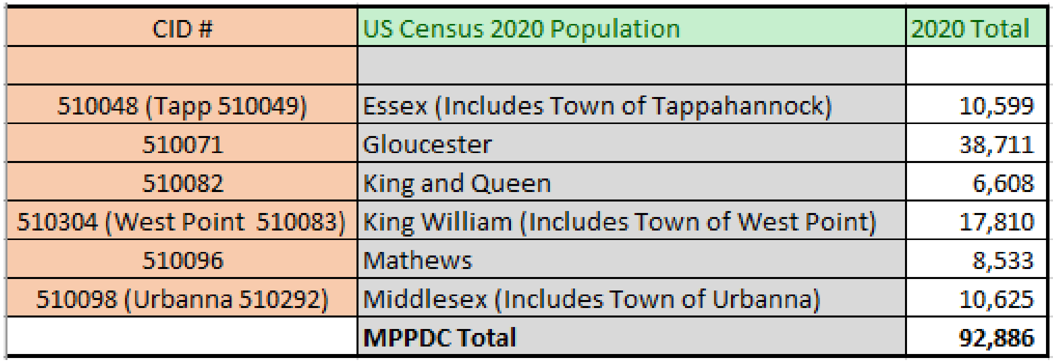
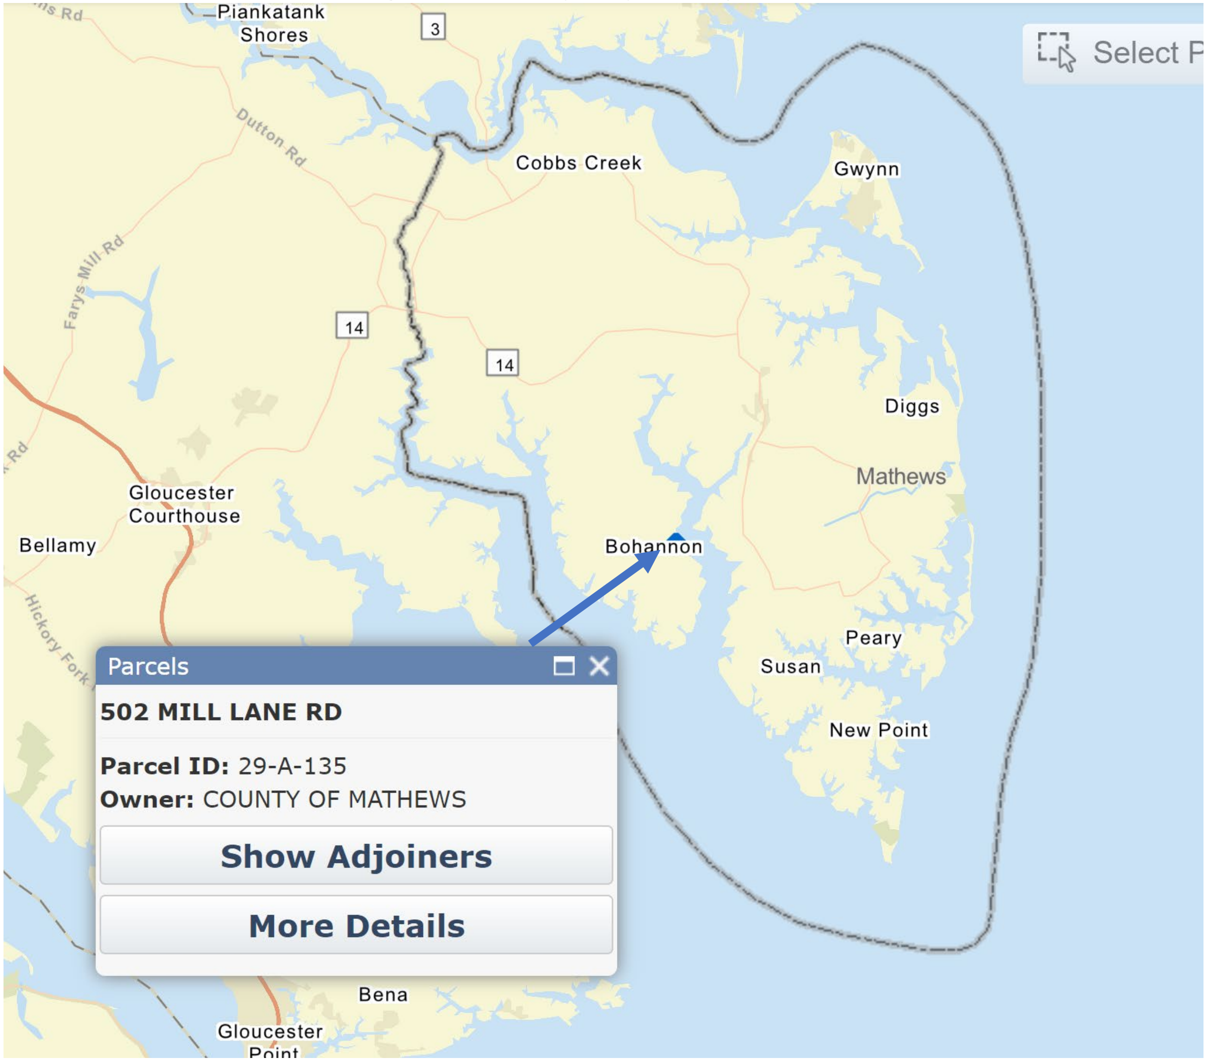


CID #	US Census 2020 Population	2020 Total
510048 (Tapp 510049)	Essex (Includes Town of Tappahannock)	10,599
510071	Gloucester	38,711
510082	King and Queen	6,608
510304 (West Point 510083)	King William (Includes Town of West Point)	17,810
510096	Mathews	8,533
510098 (Urbanna 510292)	Middlesex (Includes Town of Urbanna)	10,625
	MPPDC Total	**92,886**

The project proposes to study and implement measures to enhance the resiliency of the East River Boat Yard site, an approximately 1-acre property located in Mathews County, along the East River and Mill Creek in Bohannon, Virginia. (**Figures 4, 5, and 6**).

Figure 4. County Map of Project Location



502 MILL LANE RD

Parcel ID: 29-A-135

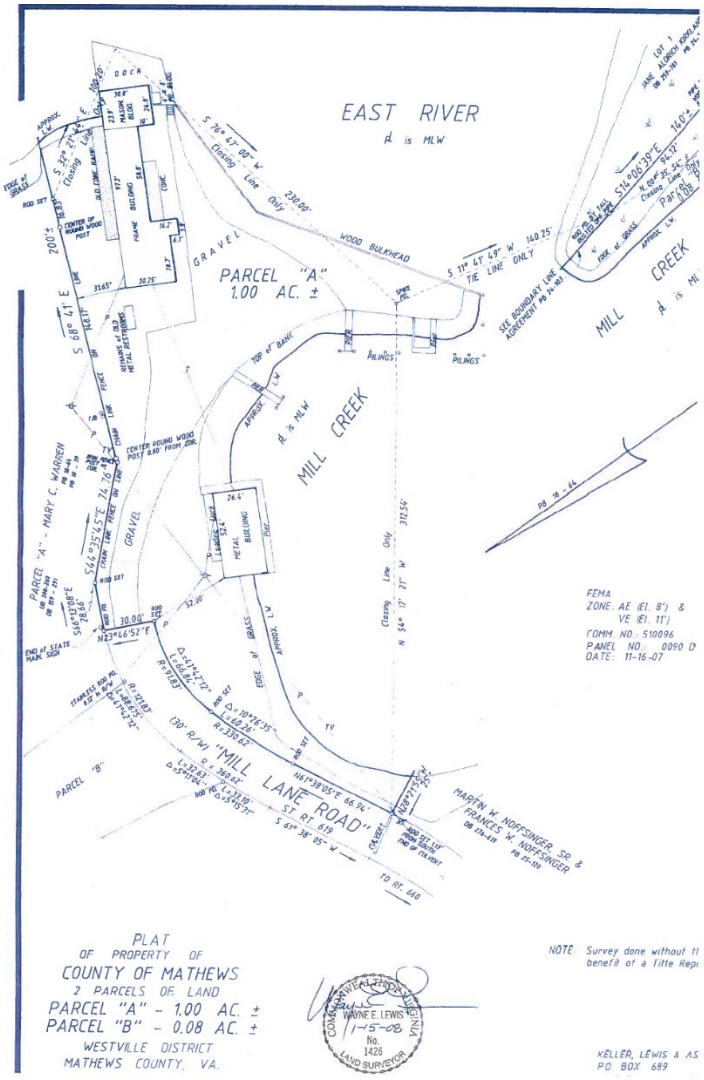

Figure 7. Site Photographs

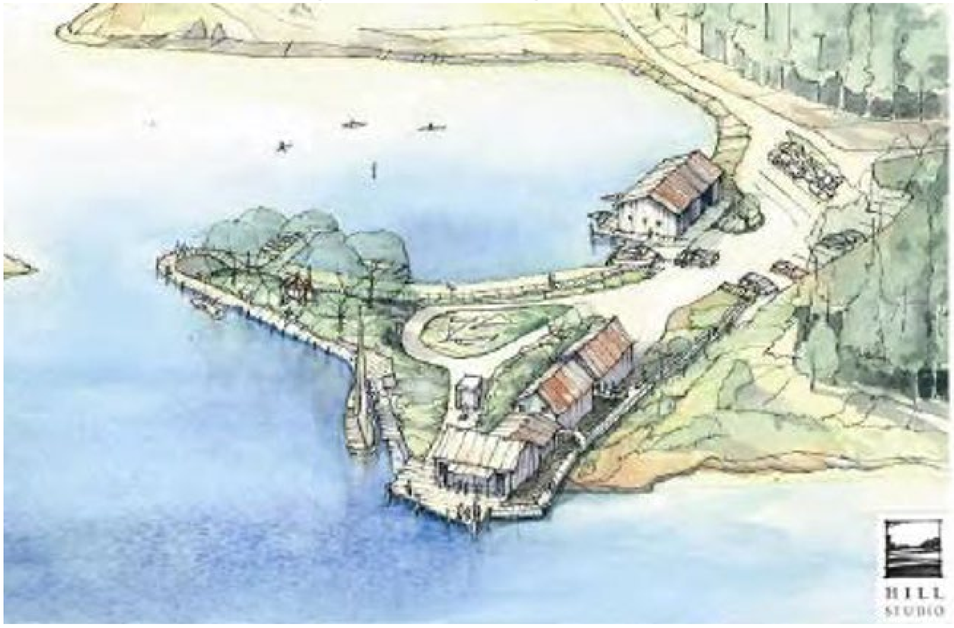
The images of site damages are all a result of flooding and coastal weather events.

Figure 8. Rendering of Improved Site

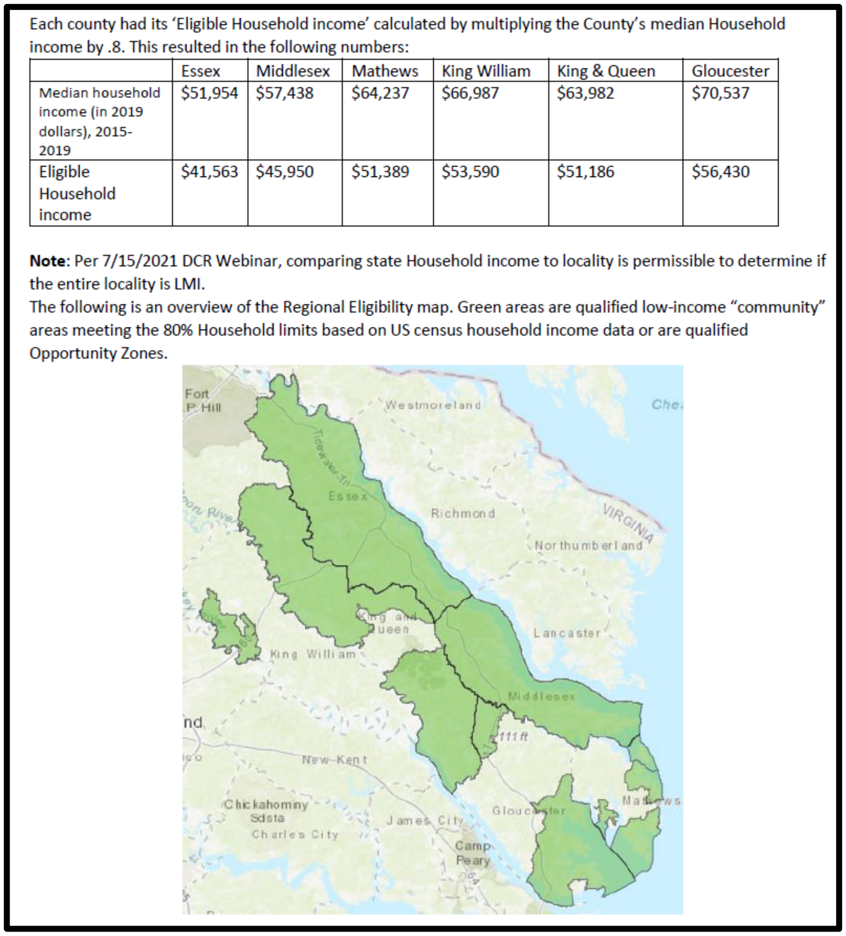


Population Information

Mathews County is located on the easternmost portion of Virginia's Middle Peninsula and is an agriculture, forestry and water-based economy. The County is a coastal community located between the Mobjack Bay, Piankatank River and the Chesapeake Bay. Mathews County has more than 200 miles of shoreline. Based on 2020 Census Data, Mathews County's population totals 18,533 (**Figure 3**).

According to DCR guidelines, a portion of the County is considered a low-income geographic area. In **Figure 9**, the green areas depict qualified low-income "community" areas meeting

Figure 9. Map of Middle Peninsula Low Income Qualifying Geographic Areas



Each county had its 'Eligible Household income' calculated by multiplying the County's median Household income by .8. This resulted in the following numbers:

	Essex	Middlesex	Mathews	King William	King & Queen	Gloucester
Median household income (in 2019 dollars), 2015-2019	$51,954	$57,438	$64,237	$66,987	$63,982	$70,537
Eligible Household income	$41,563	$45,950	$51,389	$53,590	$51,186	$56,430

Note: Per 7/15/2021 DCR Webinar, comparing state Household income to locality is permissible to determine if the entire locality is LMI.

The following is an overview of the Regional Eligibility map. Green areas are qualified low-income "community" areas meeting the 80% Household limits based on US census household income data or are qualified Opportunity Zones.

the 80% Household limits based on US census household income data[1] or are qualified Opportunity Zones.

Please see **Figure 10** for a detailed map of the project location and the green low-income area overlay. This shows that the project location is not within the low-income area.

Figure 10. Map of the Project Location within the Green Low-Income Area

With respect to social vulnerability, according to ADAPTVA's Social Vulnerability Index Score, this project location has a Social Vulnerability Index Score of 0.6, classified as Moderate Social Vulnerability (**Figure 11)**

Figure 11. ADAPTVA Social Vulnerability Index Score Viewer

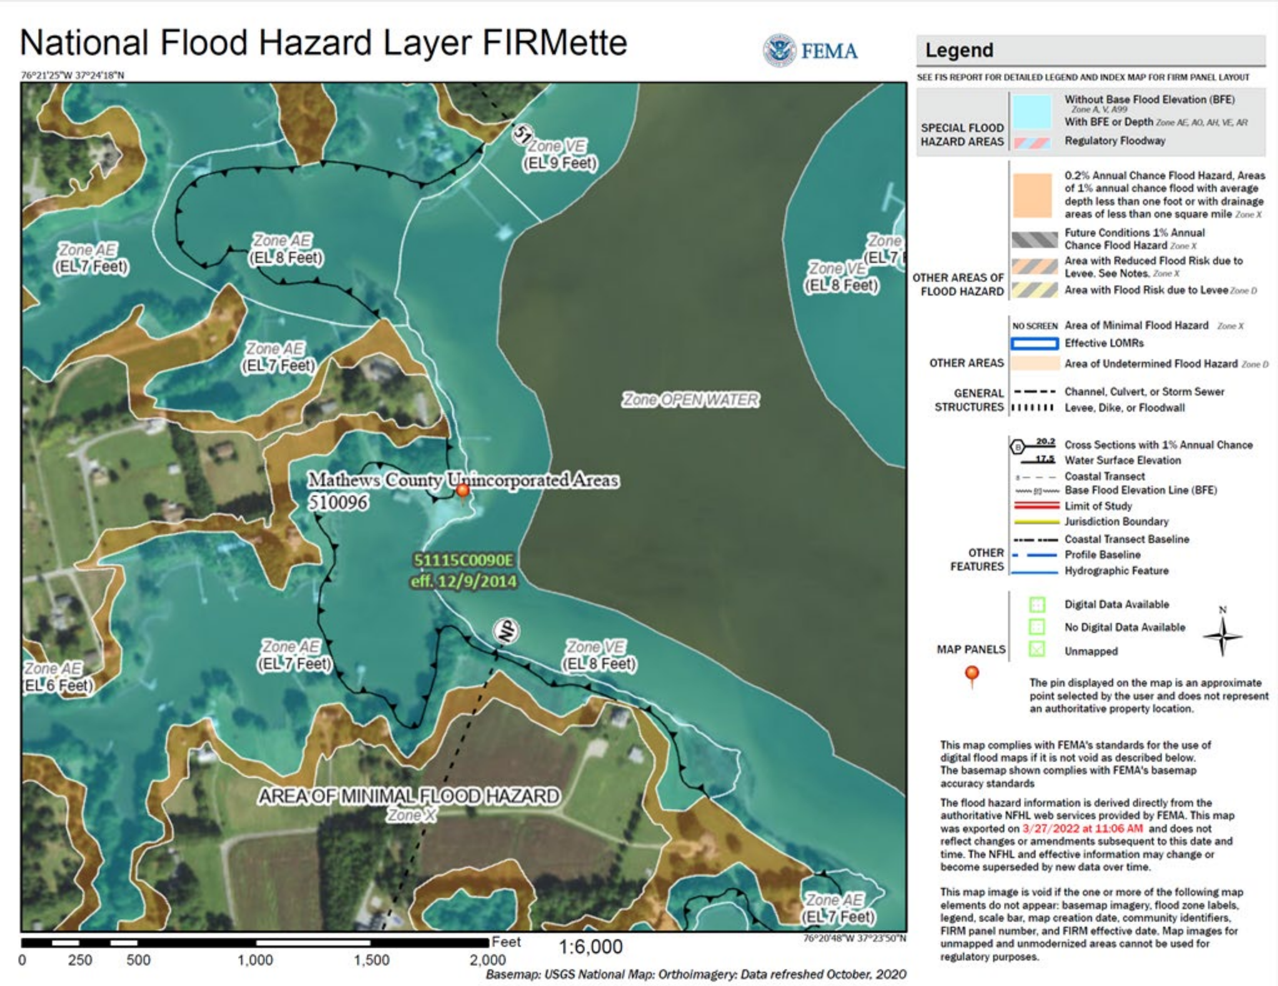
[1] Based upon 2015-2019 U.S. Census American Community Survey data available on January 4, 2022, when CFPF Round 3 opened; 2016-2020 ACS data was not released until March 17, 2022.

Flood Risk Information

The entirety of the site (502 Mill Lane Rd, Bohannon, Virginia, 37.4013787568471, -76.35289892950684) is located within a mapped floodplain, with portions located within FEMA Flood Zones AE and VE (**Figure 12**). Mathews County's Planning and Zoning Department administers the requirements of the NFIP program, and the County's Floodplain Management Ordinance may be accessed at the following link: https://www.co.Mathews.va.us/DocumentCenter/View/422/Floodplain-Management-PDF?bidId=

Figure 12. Map of FEMA Flood Zones



The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/27/2022 at 11:06 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Due to the project site's proximity to the water and low elevation, the site has an extensive history of being subject to extreme weather events that have resulted in significant impacts to infrastructure and the environment. For example, the project location has long been, and continues to be, impacted by tropical, sub-tropical, and Nor'easter events (**Attachment 3**). According to NOAA's Coastal Flood Mapper, this project location is at the higher range for risk of coastal flooding (**Figure**

13). Collectively, these reoccurring and storm-related events have contributed to shoreline loss at site. **Figure 14** depicts the shoreline in 1937 and the 2017, based on historical shoreline data from the Virginia Institute of Marine Science Shoreline Studies Program; illustrated is an approximate loss of 12,000 square feet of site area at the project location over an eighty-year period.

Figure 13. Map of Project Location and Risk of Coastal Flooding (NOAA, 2021)

Figure 14. Project Location and Map of Associated Shoreline Change Between 1937 and 2017

NEED FOR ASSISTANCE

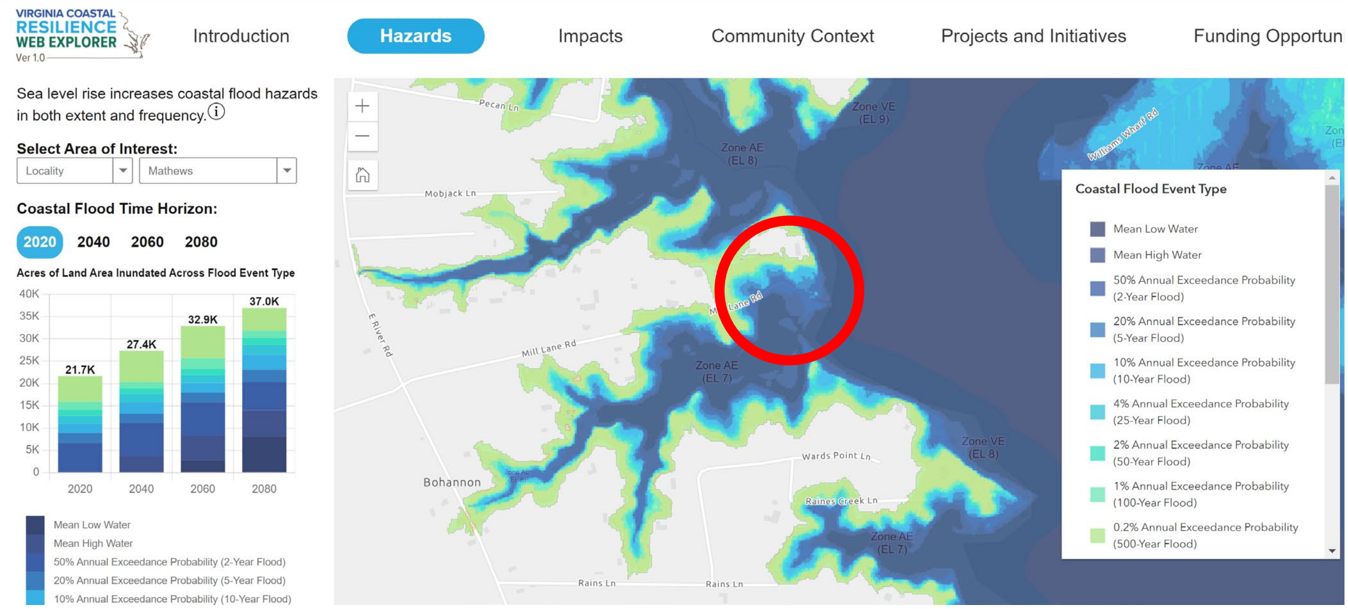
The Middle Peninsula Planning District Commission (MPPDC) is a political subdivision of the Commonwealth of Virginia formed under VA Code §15.2-4203 to provide solutions to problems of greater than local significance and cost-savings through economies of scale. The MPPDC serves nine localities of the Middle Peninsula including Essex, Gloucester, King & Queen, King William, Mathews, and Middlesex counties, as well as the Towns of Tappahannock, West Point, and Urbanna.

MPPDC is staffed using multiple methods including co-operative procurement, hourly, and burdened FTE staff. MPPDC staff consists of an Executive Director, Deputy Director, Chief Financial Officer, Senior Project Planner, and clerical support staff; a Director of Planning, General Planner, Certified Flood Plain Manager, Transportation Planner, and Emergency Planner are co-operative procured; Housing, Community Development Planner and Public Relations staff are hourly.

The Planning District staffing team assists localities with long-term and/or regional planning efforts. The MPPDC Executive Director, Deputy Director, and Chief Financial Officer have decades of experience in managing and administering project grants at multiple scales - from grants in excess of $1,000,000 to small grants. MPPDC is an entrepreneurial-based government agency with an annual operating budget ranging from $750,000 to more than $1,000,000. Annually, the MPPDC manages 25-30 concurrent federal and state grants utilizing industry standard Grants Management Software and other software (e.g., GIS, Microsoft Office) as required and/or necessitated by different grants. The MPPDC operates service centers in the topical areas of: coastal zone management, emergency planning, housing, transportation planning and transportation demand management, economic development, social assistance, small business development, general planning and technical assistance, as well as other areas determined by the Commission. MPPDC has more than 25 years of experience managing multiple revolving loan programs. In the 25 years that the Executive Director has been employed by the Commission, no audit findings have occurred.

As noted, the East River Boat Yard site is compromised by shoreline erosion issues, which likely contributes to the need to dredge the mouth of Mill Creek. Further, the site needs to be comprehensively reviewed to identify measures to increase overall resilience, but to also ensure that the site serves as an asset for recreational and commercial users. **Figure 15**, from the Virginia Coastal Resilience Master Plan - Virginia Coastal Resilience Web Explorer, illustrates flood levels combined with sea-level rise and their effects on the site. Notably, sea-level rise combined with flooding over the next 60 years is expected to pose an issue to the site, resulting in inundation and increased flooding risk; key construction techniques will need to be employed to increase overall resilience in order to mitigate the effects of exceptional floods and sea level rise 60 years and out.

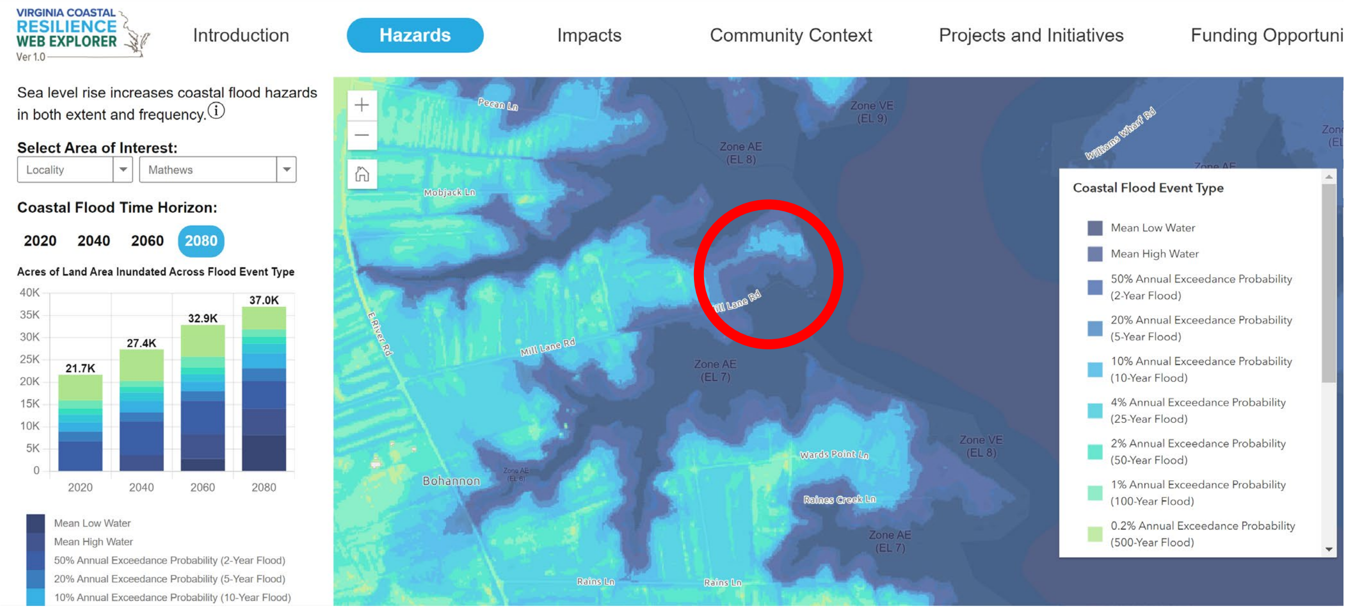
Figure 15. Sea Level and Flooding, 2020 - 2080



Sea level rise increases coastal flood hazards in both extent and frequency.

Select Area of Interest: Locality, Mathews

Coastal Flood Time Horizon: 2020



Sea level rise increases coastal flood hazards in both extent and frequency.

Select Area of Interest: Locality, Mathews

Coastal Flood Time Horizon: 2080

The need for assistance is two-fold. First, Mathews County is along the Chesapeake Bay and numerous tidal rivers that contribute to the area’s high risk to coastal flooding, sea-level rise, and storm surge. Based on tidal gauge data from the Virginia Institute of Marine Science (VIMS), relative sea-level rise rates ranging from 0.11-0.23 in./yr. (2.9-5.8 mm/yr.; period: 1976-2007; 10 stations) within the Chesapeake Bay region, which are the highest rates reported along the U.S. Atlantic coast (Boon et. al., 2010). In addition to sea-level rise, Mathews County has a history of being impacted by hurricanes and tropical storms. As storms pass over or near the coast, the atmospheric pressure drops, causing a large volume of sea water to build up, eventually being pushed ashore by the storm's winds as storm surge. When a storm makes landfall at high tide, the storm surge and the added water from the tidal fluctuation combine to create a "storm tide".

Nor'easters, like hurricanes and tropical storms, can dump heavy amounts of rain and sediment, and produce hurricane-force winds that push large amounts of seawater inland. A strong indicator that Mathews County is experiencing the impact of coastal hazards (i.e., flooding, hurricanes, sea-level rise, and storm surge) is the number of repetitive loss and severe repetitive loss claims submitted by residents and businesses to FEMA. As of 2015, Mathews County had over 1,000 NFIP claims with claims topping $20.5 Million. The County has implemented several preventative measures, property protection policies, public information activities, and emergency service measures to decrease impacts on its communities. This project will therefore build on local efforts moving toward a more resilient community.

Second, this project location is primed for co-benefits derived from shoreline erosion mitigation efforts. The proposed application of shoreline protection features, boat launch improvements, and increased public access that provides strategic protection of the infrastructure and landscape at this point of interest. For example, the proposed improvements will facilitate multiple, simultaneous activities that will contribute to economic growth in the area while fostering innovation.

Business Development

The potential of increased community interest drawn to the site is significant. Visitors seeking access to local waterways could be drawn to activities available at the East River Boat Yard, supporting the local economy with outside revenue in their pursuits. Additionally, the site has the unique opportunity to support and serve as an incubator for commercial seafood or other ecotourism or water management-related businesses. The provision of a public access site with enhanced amenities thus has the potential to drive continued economic growth through business development.

Community Scale Benefits

Due to the multitude of public investment for shoreline protection and flood research and innovation, we believe this site meets the test of "Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk." The East River Boat Yard site serves as one of the Commonwealth's best chances to innovate shoreline resilience projects in "live time" so that all of coastal Virginia can benefit. This public working waterfront has provided critical community scale benefits for generations and it is essential that action be taken now to ensure that the site can continue to provide similar benefit to the citizens, businesses, and visitors of Mathews County and the Commonwealth.

Benefit of and Suitability for Natural Based Solutions

Adapt VA contains a data layer illustrating areas of less than ten feet in elevation that show locations in the Middle Peninsula offering benefits of NNBF to coastal buildings, habitat, and community protection; additionally, the platform contains a layer identifying areas suitable for living shorelines given the presence of marsh, ranked for co-benefits (see **Figure 16**). The project site offers multiple community protection benefits which include combinations of mitigating coastal flooding, protecting buildings/community facilities and CRS credit. Additionally, shoreline is identified as suitable for living shorelines resulting in co-benefits.

Figure 16. Natural and Nature-Based Features at the Project Site

ALTERNATIVES

The submission of alternatives is not applicable in this application. Nature-based and hybrid solutions are anticipated, and the project cost is less than $3 million.

GOALS AND OBJECTIVES

This proposal will develop a comprehensive strategy to increase resilience of the site against multiple shoreline erosion inputs while providing co-benefits that foster resilience. The focused goals and objectives of the project are as follows:

Goal 1: Improve public access to local coastal waterways.

- Objective A: Increase public access to the Chesapeake Bay with improved conditions and mitigation of recurrent and repetitive flooding and erosion using a nature-based approach on site.
- Objective B: Enhance quality of life for local residents and visitors alike through recreation, educational and cultural opportunities, and commercial fishing at the point of interest.

- Objective C: Leverage improved public access and coastal resiliency for economic growth within Mathews County.

Goal 2: Improve coastal resiliency within the community and the Commonwealth.

- Objective A: Mitigate recurrent and repetitive flooding and erosion alongside storm surge and sea level rise using natural and nature-based solutions that benefit people and the economy as well as the environment.
- Objective B: Prevent loss of life and reduce property damage by mitigating for recurrent, repetitive, and future flooding within the project area using a nature-based design approach.
- Objective C: Enhance the resilience of public infrastructure, ensuring longer-term viability.

Goal 3: Transferability to other communities.

- Objective A: Model natural and nature-based solutions for coastal sites exploring development potential.
- Objective B: Foster innovative research and solutions-oriented studies on site focused on coastal adaptation and mitigation for external transfer.
- Objective C: Improve the implementation of Fight the Flood as a model program to be replicated in other communities within the region and/or Commonwealth.

The MPPDC expects the following results and benefits of the completed project:

1. **Foster economic growth in the area over the useful life of site infrastructure and most likely, beyond.** Enabling public access to this county asset while ensuring its sustainability will protect and enhance the area's recreational economies and has the potential to positively impact related commercial endeavors.

2. **Prevent loss of property without cementing an alternative.** Building resilient structures and facilities at the project site as outlined will help prevent loss of property and property value, while capitalizing on the useful life of the site as much as possible.

3. **Provide ecosystem services to the community toward increased quality of life.** Increased public access to recreational, educational and cultural opportunities leverage the provisioning and cultural services associated with the site's natural resources, services that provide benefits to safety, health and well-being for all visitors.

APPROACH, MILESTONES, AND DELIVERABLES

As noted, the intent of this project is to focus on shoreline erosion, dredging with beneficial reuse, and overall site planning with resilient designs for the East River Boat Yard site. This project will utilize and incorporate sustainable planning, design, environmental management, and engineering practices, coupled with a focus on programs and services to support recreation and commercial development, to promote overall adaptation and resilience of the site.

The principal tasks and milestones are as follows:

- Assessment of site conditions;
- Replacing and establishing shoreline protection in areas where there are currently dilapidated structures or no structures
- Demolishing and removing existing concrete debris and foundations
- Adding gravel substrate to create a turnaround and parking spaces for vehicles and trailers
- Enhancing two wetlands areas that will be located behind proposed sills and planted with tidal wetland species
- Constructing a new concrete boat ramp and tending pier
- Constructing a new public fishing pier
- Dredging of Mill Creek and beneficial reuse options for the material, whether on-site fill or as living shoreline materials (not included in estimate)

Expected outcomes include the development of plans to allow for the redevelopment of the site for overall resilience, including with living shoreline treatments to reduce erosion and exposure to sea-level rise and flooding, and dredging of Mill Creek to improve access and navigability.

The expected timeline for the project milestones, and deliverables, is as follows. All activities are contingent upon approval of the relevant permitting authorities, and as such, the schedule and milestones should be considered estimates at best. The ultimate project schedule will be dictated predominantly by the permitting process; however, the proposed activities are not anticipated to exceed the 3 years allowed per the DCR Grant Manual:

Year 1/Months 1-6 - Site Evaluation

- Months 1-6: Assessment of site conditions

Year 1/Months 7-9 - Development of Design Plans

Months 7-9: Replacing and establishing shoreline protection in areas where there are currently dilapidated structures or no structures, demolishing and removing existing concrete debris and foundations, and adding gravel substrate to create a turnaround and parking spaces for vehicles and trailers.

Year 1/Months 10-18 – Construction and Dredging

- Months 10-18: Enhancing two wetlands areas that will be located behind proposed sills and planted with tidal wetland species, constructing a new concrete boat ramp and tending pier, constructing a new public fishing pier, and dredging of Mill Creek. Dredging Mill Creek will ensure key waterfront access while using materials for beneficial reuse such as living shoreline materials.

RELATIONSHIP TO OTHER PROJECTS

While the specific proposed project bears no direct relationship to specific past, future, or future resilience projects, the project does relate to larger regional resilience efforts. For more than 40 years, the Middle Peninsula Planning District Commission (MPPDC) and its participating localities have worked diligently on topics associated with the land water interface, including coastal use conflicts and policies, sea level rise, stormwater flooding, roadside ditch flooding, erosion, living shorelines, coastal storm hazards (e.g., hurricanes, tropical storms), riverine and coastal flooding, and coastal resiliency.

The proposed project is a priority project generated from the Middle Peninsula Regional Flood Resilience Plan, which was approved by DCR in August of 2021. This Flood Resiliency Plan serves as the MPPDC's guiding document for its flood resiliency programs and is comprised of two primary MPPDC-approved policy documents. These documents frame the foundation and implementation of the Middle Peninsula flood protection approach, and are indirectly and directly supported by specific regional planning documents each approved by federal, regional, and/or local partners as required by statute.

Other plans and resources integral to the implementation of the Flood Resiliency Plan include:

Long Term Planning

- Middle Peninsula All Hazard Mitigation Plan - FEMA and Middle Peninsula locality, approved 2016 (MPPDC Website)
    - This overarching project provides updates every five years on the hazards within the region; it identifies the top hazards within the region and provides a HAZUS assessment that analyzes flooding (riverine and coastal), sea-level rise and hurricane storm surge impacts in the region. Additionally, this plan lists strategies and objectives that guide member localities to mitigate for these strategies.
- Middle Peninsula Comprehensive Economic Development Strategy – MPPDC, approved March 2021
- Middle Peninsula VDOT Rural Long Range Transportation Plan – MPPDC, approved annually

Short Term Implementation

- Middle Peninsula Planning District Commission Fight the Flood Program Design - MPPDC Commission, approved June 2020; Chairman approved update 8/6/21

- Middle Peninsula Planning District Commission Living Shoreline Resiliency Incentive Funding Program - Virginia Revolving Loan Fund Program Design and Guidelines, approved 2015

The MPPDC has a history of continuous work on flooding and coastal resiliency topics, as described in **Attachment 5**. These projects have built upon each other to establish within the MPPDC a solid foundation of regional expertise in flooding and coastal resiliency. Now, given this history of accumulated information and knowledge, the MPPDC can move beyond research and studies to begin implementing projects on the ground. One such effort, launched in 2020 following the Commission's authorization, was developed in response to emerging flood challenges. This effort, the **Middle Peninsula Fight the Flood (FTF) Program**, leverages state and federal funding to deliver flood mitigation solutions directly to constituents, for both the built and natural environments with an emphasis on nature-based flood mitigation solutions. The Middle Peninsula **FTF** program helps property owners gain access to programs and services to better manage challenges posed by flood water. MPPDC staff have partnered with private property owners registered for the FTF program to assist them in finding funding for their shoreline.

Finally, the Flood Resiliency Plan and associated programs strive to carry out the guiding principles and goals set forth in the Virginia Coastal Resilience Master Planning Framework established in 2020. The proposed activities are proposed in accordance with the guiding principles and with the intent that their outcomes will help the Commonwealth meet the goals set forth in the planning framework.

MAINTENANCE PLAN

A maintenance plan is not applicable in this application. The proposed project is to develop a nature-based design solution and its cost does not require ongoing operation and future maintenance.

CRITERIA

*Describe how the project meets each of the applicable scoring criteria contained in **Appendix B** and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application. <u>**Appendix B** must be completed and submitted with the application.</u>*

For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

- Yes; the applicant is a regional planning district commission.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**

   - Yes; the MPPDC's DCR-approved resilience plan may be accessed at the following link: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

   - Yes; please see **Attachment 1**

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

   - Yes; please see the match commitment letter in **Attachment 1**

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

   - Yes

BUDGET NARRATIVE

ESTIMATED TOTAL PROJECT COST

Based upon the identified scope of work, the estimated total project cost is $966,987. This estimate is based on previously furnished costs estimates for project components, provided in **Figure 1**.

MPPDC staff will manage and administer this project. Thus, personnel time is needed to ensure that project deliverables are completed within the project timeline. Along with personnel expenses, MPPDC fringe is needed. This includes health insurance, retirement, group life insurance, workman's comp, and unemployment insurance. MPPDC fringe rate for FY23 is 26.21% and comprised of: Health Insurance – 48.58%, Retirement – 18.06%, Workers Comp – 0.28%, Social Security – 28.55%, Life Insurance – 4.39%, Unemployment – 0.14%. Direct charges are costs associated with overall projects costs consistent with general accounting principles. MPPDC also prepares an indirect cost (IDC) plan annually per 2 CFR 200 Appendix VII. Following annual audit, the plan is submitted to NOAA for acceptance. MPPDC's IDC rate has a basis of Modified Total Direct Costs (MTDC), with a planned rate of 27.92%. IDC is only applied to the first $25,000 of each contract. IDC calculated on MTDC (modified total direct cost)-Personnel, supplies, travel, and first $25,000 of each subcontract, etc.; excludes equipment.

Source of Match					$0	$0	$0
GRAND TOTAL					**$580,192**	**$386,795**	**$966,987**

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $580,192 or 60% of total project costs, as the project is located outside of a low-income geographic area and the project results in hybrid solutions. These funds, combined with local match, would be used for the services identified above.

AMOUNT OF CASH FUNDS AVAILABLE

Mathews County will appropriate the requisite 40% or $386,795 in required local cash match funds, to be combined with the $580,192 in grant assistance to equal the total estimated project cost. The County's match commitment letter is included as **Attachment 1**.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is included as **Attachment 1**.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Middle Peninsula Planning District Commission**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration		☑ **Yes** ☐ **No**
Applicant Name:	**Middle Peninsula Planning District Commission**	
Scoring Information		

Criterion	Point Value	Points Awarded
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☑ Wetland restoration, floodplain restoration ☑ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☑ Stream bank restoration or stabilization. ☑ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	45
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	8
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		88

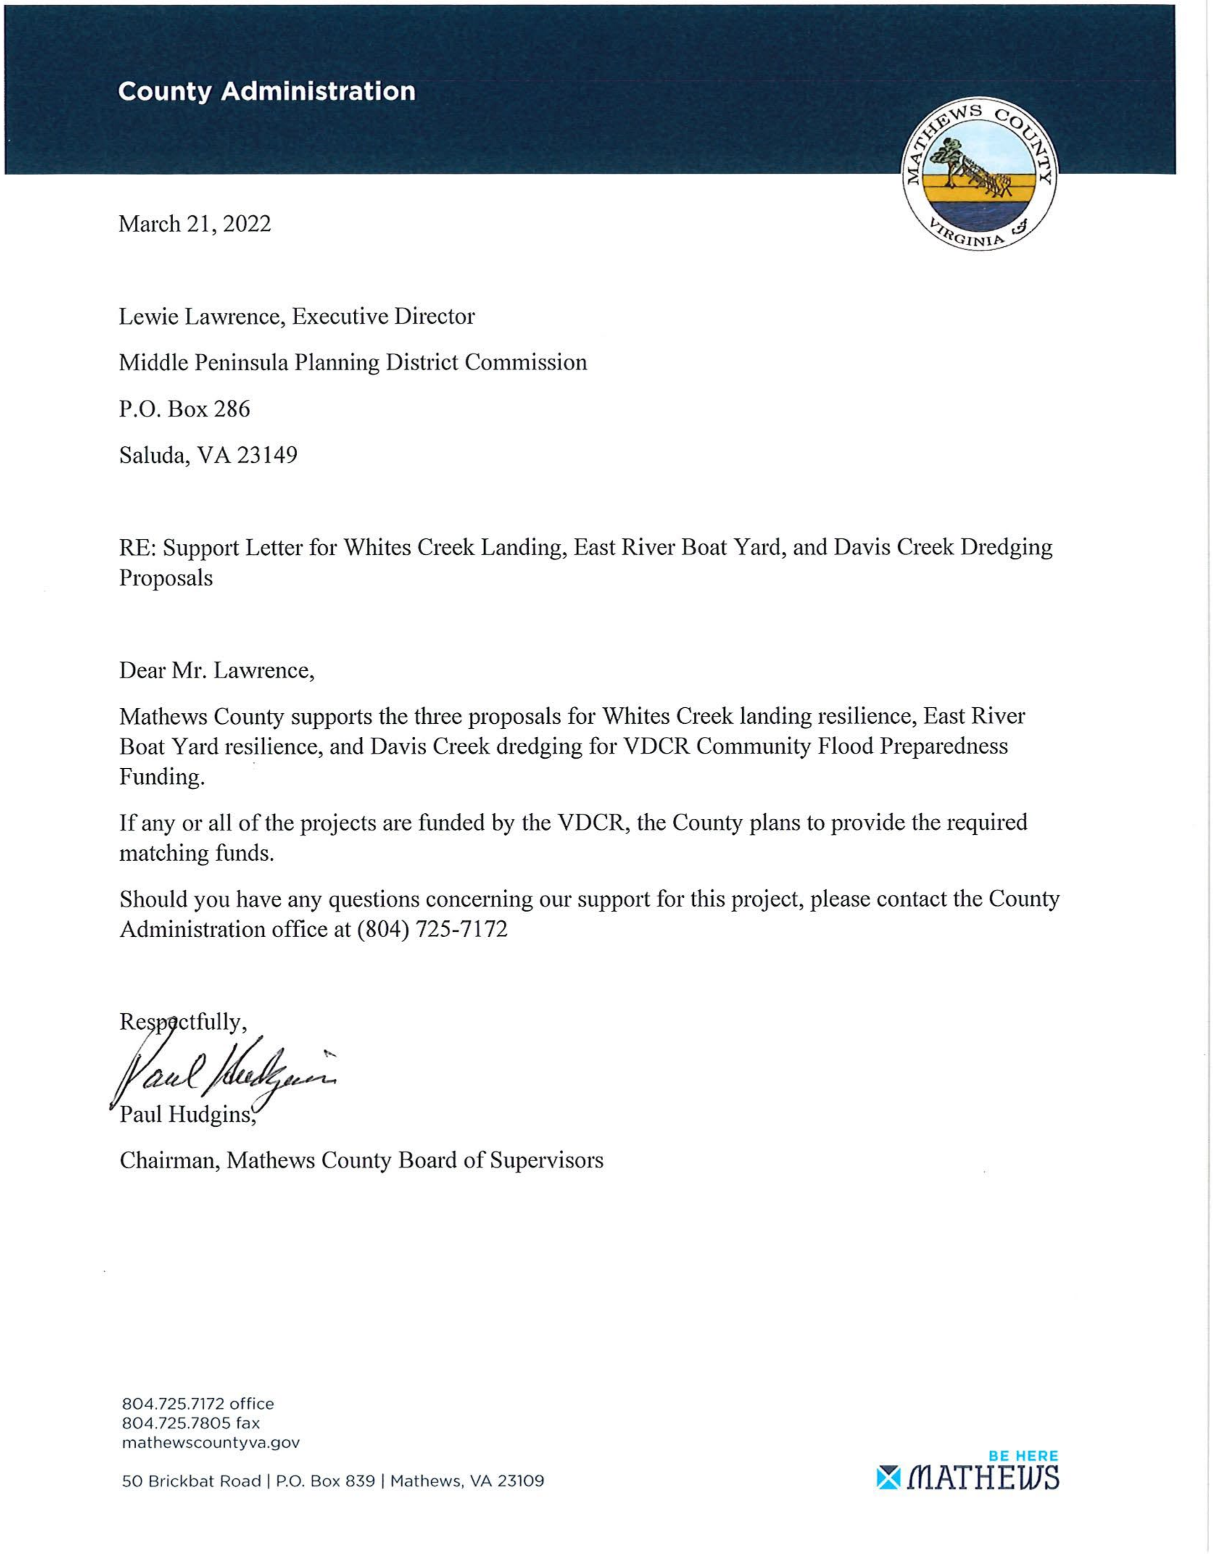
Attachment 1: Community Support/Match Commitment/Authorization Letter



County Administration

March 21, 2022

Lewie Lawrence, Executive Director
Middle Peninsula Planning District Commission
P.O. Box 286
Saluda, VA 23149

RE: Support Letter for Whites Creek Landing, East River Boat Yard, and Davis Creek Dredging Proposals

Dear Mr. Lawrence,

Mathews County supports the three proposals for Whites Creek landing resilience, East River Boat Yard resilience, and Davis Creek dredging for VDCR Community Flood Preparedness Funding.

If any or all of the projects are funded by the VDCR, the County plans to provide the required matching funds.

Should you have any questions concerning our support for this project, please contact the County Administration office at (804) 725-7172

Respectfully,

Paul Hudgins

Paul Hudgins,

Chairman, Mathews County Board of Supervisors

Attachment 5: Flood Prevention Project and its Relevance to Other Projects

MPPDC staff have worked throughout the years to understand the policy, research and impacts of flooding (i.e., stormwater, coastal, riverine, sea level rise) and coastal resiliency to the region. Below is a list of projects that have built upon each other over the year that have contributed to our understanding.

Climate Change & Sea Level Rise (2009 to 2012)
The MPPDC was funded for a 3 Phase project through the Virginia Coastal Zone Management Program to assess the impacts of climate and sea level rise throughout the region. With over 1,000 miles of linear shoreline, the Middle Peninsula has a substantial amount of coast under direct threat of accelerated climate change and more specifically sea-level. In Phase 1, MPPDC staff assessed the potential anthropogenic and ecological impacts of climate change. Phase 2 focused on the facilitating presentations and develop educational materials about sea level rise and climate change for the public and local elected officials. Finally Phase 3 focused on developing adaptation public policies in response to the assessments.

> *Phase 1:* Middle Peninsula Climate Change Adaptation: Facilitation of Presentations and Discussions of Climate Change Issues with Local Elected Officials and the General Public
> *Phase 2:* Climate Change III: Initiating Adaptation Public Policy Development
> *Phase 3:* Phase 3 Climate Change: Initiating Adaptation Public Policy Development

Emergency Management - Hazard Mitigation Planning (2009 to Present): Since 2009, the Middle Peninsula Planning District Commission has assisted regional localities in meeting the federal mandate to have an adopted local hazard plan. *The Regional All Hazards Mitigation Plan addresses the natural hazards prone to the region, including hurricanes, winter storms, tornadoes, coastal flooding, coastal/shoreline erosion, sea level rise, winter storms, wildfire, riverine flooding, wind, dam failures, drought, lightning, and earthquakes. This plan also consists of a HAZUS assessment of hurricane wind, sea level rise* (i.e., Mean High Higher Water and the NOAA 2060 intermediate-high scenario), *and flooding (coastal and riverine flooding) that estimates losses from each hazard.* The Middle Peninsula All-Hazard Mitigation Plan Update 2021 is currently being updated. The 2021 All Hazards Mitigation Plan builds off and updates previous mitigation plans.

Land and Water Quality Protection (2014): In light of changing Federal and State regulations associated with Bay clean up-nutrient loading, nutrient goals, clean water, OSDS management, storm water management, TMDLs, etc., staff from the Middle Peninsula Planning District Commission (MPPDC) will develop a rural pilot project which aims to identify pressing coastal issue(s) of local concern related to Bay clean up and new federal and state legislation which ultimately will necessitate local action and local policy development. Staff has identified many cumulative and secondary impacts that have not been researched or discussed within a local public policy venue. Year 1-3 will include the identification of key concerns related to coastal

land use management/water quality and Onsite Sewage Disposal System (OSDS) and community system deployment. Staff will focus on solution based approaches, such as the establishment of a regional sanitary sewer district to manage the temporal deployment of nutrient replacement technology for installed OSDS systems, assessment of land use classifications and taxation implications associated with new state regulations which make all coastal lands developable regardless of environmental conditions; use of aquaculture and other innovative approaches such as nutrient loading offset strategies and economic development drivers.

Department of Conservation and Recreation Stormwater Management (2014)

The Virginia General Assembly created a statewide, comprehensive stormwater management program related to construction and post-construction activities (HB1065 - Stormwater Integration). The Virginia Department of Conservation and Recreation requires stormwater management for projects with land disturbances of one acre or more. This new state mandate requires all Virginia communities to adopt and implement stormwater management programs by July 1, 2014, in conjunction with existing erosion and sediment control programs. Additionally, the communities within the MPPDC are required to address stormwater quality as stipulated by the Chesapeake Bay TMDL Phase II Watershed Implementation Plan and the Virginia Stormwater Regulations. The MPPDC Stormwater Program helped localities develop tools specific to the region necessary to respond to the state mandate requirement for the development of successful stormwater programs.

Stormwater Management-Phase II (2014): MPPDC staff and Draper Aden Associates worked with localities (i.e., Middlesex, King William, and Mathews Counties and the Town of West Point) interested in participating in a Regional Stormwater Management Program. While each locality sought different services from the regional program, this project coordinated efforts, developed regional policies and procedures, and the proper tools to implement a regional VSMP.

Mathews County Rural Ditch Enhancement Study (2015): In contract with Draper Aden Associates, a comprehensive engineering study was developed to provide recommendations and conceptual opinions of probable costs to improve the conveyance of stormwater and water quality through the ditches in Mathews County.

Drainage and Roadside Ditching Authority (2015): This report explored the enabling mechanism in which a Regional Drainage and Roadside Ditching Authority could be developed. An Authority would be responsible for prioritizing ditch improvement needs, partnering with Virginia Department of Transportation (VDOT) to leverage available funding, and ultimately working toward improving the functionality of the region’s stormwater conveyance system.

Living Shoreline Incentive Program (2016 to present)

In 2011 Virginia legislation was passed designating living shorelines as the preferred alternative for stabilizing Virginia tidal floodplain shorelines. The Virginia Marine Resources Commission, in cooperation with the Virginia Department of Conservation and Recreation and with technical

assistance from the Virginia Institute of Marine Science (VIMS), established and implemented a general permit regulation that authorizes and encourages the use of living shorelines however, no financial incentives were put in place to encourage consumers to choose living shorelines over traditional hardening projects in the Commonwealth. To fill this, need the MPPDC developed the MPPDC Living Shoreline Incentives Program to offer loans and/or grants to private property owners interested in installing living shorelines to stabilize their shoreline. Currently, loans are available to assist homeowners to install living shorelines on suitable properties. Loans up to $10,000 can be financed for up to 5 years (60 months). Loans over $10,000 can be financed for up to 10 years (120 months). Interest is at the published Wall Street Journal Prime rate on the date of loan closing - currently at 5.25% (11/29/18). Minimum loan amount is $1,000. Maximum determined by income and ability to repay the loan. Finally, there are currently no grants available in this program. Since 2016 under the MPPDC Living Shoreline Revolving Loan program, 8 living shorelines have been financed and built to date encumbering ~$500,000 in VRA loan funding and ~$400,000 in NFWF grant funding. Living Shoreline construction cost to date range per job $14,000- $180,000. MPPDC oversees all aspects (planning, financing, constriction, and loan servicing) of these projects from cradle to grave.

Mathews County Ditch Project - VCPC White Papers (2017): This report investigated the challenges presented by the current issues surrounding the drainage ditch network of Mathews County. The study summarized research conducted in the field; examined the law and problems surrounding the drainage ditches; and proposed some next steps and possible solutions.

Mathews County Ditch Mapping and Database Final Report (2017): This project investigated roadside ditch issues in Mathews County through mapping and research of property deeds to document ownership of ditches and outfalls. This aided in understanding the needed maintenance of failing ditches and the design of a framework for a database to house information on failing ditches to assist in the prioritization of maintenance needs.

Virginia Stormwater Nuisance Law Guidance (2018): This report was developed by the Virginia Coastal Policy Center to understand the ability of a downstream recipient of stormwater flooding to bring a claim under Virginia law against an upstream party, particularly a nuisance claim. The report summarizes how Virginia courts determine stormwater flooding liability between two private parties.

Oyster Bag Sill Construction and Monitoring at Two Sites in Chesapeake Bay (2018): VIMS Shoreline Studies Program worked with the PAA to (1) install oyster bag sills as shore protection at two PAA sites with the goal of determining effective construction techniques and placement guidelines for Chesapeake Bay shorelines and (2) assess the effectiveness for shore protection with oyster bags on private property through time.

Fight the Flood Program (2020): The Fight the Flood was launched in 2020 to connect property owners to contractors who can help them protect their property from rising flood waters. FTF also offers a variety of financial tools to fund these projects including but limited to the Septic

Repair revolving loan program, Living Shoreline incentives revolving loan fund program, and plant insurance for living shorelines

Greetings,

The MPPDC is respectfully submitting five proposals for consideration under Round 3. These projects were requested by our member jurisdictions as projects of highest priority with regards to flood mitigation and resilience needs. The projects are located on and involve publicly-owned property and infrastructure and were identified as sites with the greatest potential for community scale benefits within the locality/region.

The proposals may downloaded via the following links:

- CID510071_GloucesterCounty_Public_CFPF.doc.pdf
- CID510098_MiddlesexCounty_Public_CFPF.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-1.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-2.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-3.pdf

We thank you in advance for your consideration. Please contact me directly should you have any questions.

Best,

Curt

Total Cost of Project: $174,312

Total Amount Requested: $113,303

SCOPE OF WORK NARRATIVE

INTRODUCTION

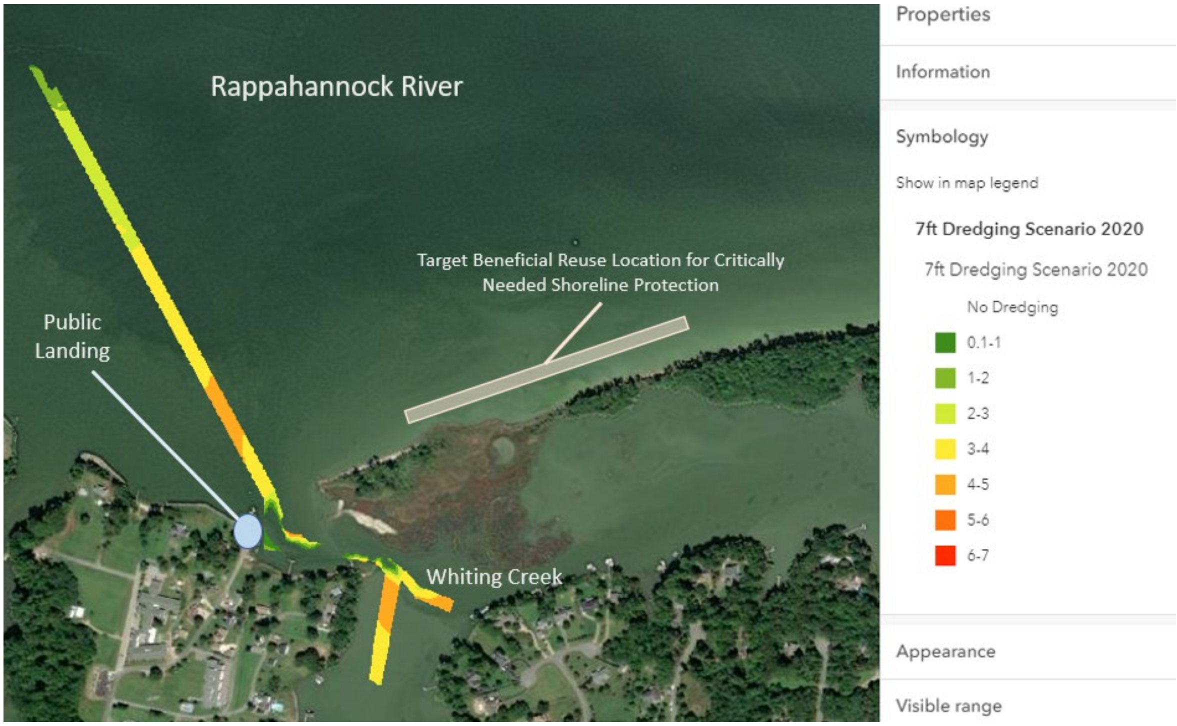
This proposal involves a multi-faceted approach to enhancing resilience on Whiting Creek in Locust Hill, Virginia (Middlesex County). Whiting Creek and the publicly owned working waterfront on the creek serve as critical infrastructure for the commercial and recreational marine economies for Middlesex County and the Middle Peninsula. Whiting Creek has experienced extreme shoaling from flooding and climate change driven coastal dynamics to the point where public safety and commerce have been severely impacted. The public working waterfront has experienced similar flooding and erosion related challenges which are compromising the site's viability to serve as the important economic hub that it has been for decades. The proposal consists of two specific elements: 1) enhancing resilience and flood protection at the Whiting Creek Public Landing and 2) designing a dredging and beneficial reuse project for Whiting Creek. This project will utilize and incorporate sustainable planning, design, environmental management, and engineering practices that weave natural features together and allow for floodwater inundation and stormwater flow to reduce the exposure to public facilities while promoting adaptation and resilience. The final outcomes are intended to represent a holistic and comprehensive resilience solution for Whiting Creek and the public working waterfront.

Middlesex County wishes to achieve comprehensive resilience to critical public infrastructure within Whiting Creek, which is a highly vulnerable location adjacent to the Rappahannock River and Chesapeake Bay. To do this the County will complete a permitted and initiated bulkhead project, and design a dredging and beneficial reuse project for Whiting Creek; the bulkhead project began after the January 4, 2022 opening of CFPF Round 3, and no project funds were spent prior to January 4, 2022. The bulkhead element of the project involves the construction and backfill 80 feet of vinyl sheet-pile bulkhead. This will extend a maximum of four feet channelward of mean low water into Whiting Creek and expand the public parking area and improve public access for commercial watermen and recreational users to the existing public boat ramp. The County's funds committed to this work will serve as match for the grant project per the DCR Grant Manual which states that "each application submitted must be for a discrete project to be completed after the beginning of the application period and not later than 3 years from the date of an executed agreement...". The Round 3 application period of the Community Flood Preparedness Fund opened on January 4, 2022, and therefore the County's funding will serve as eligible source of match for the proposed activities.

Additionally, the County will commission a study to investigate the shoaling of the boat ramp, shoreline erosion, and sedimentation within Whiting Creek, opportunities for dredging of Whiting Creek, and design for beneficial reuse of sediments. Whiting Creek is a Federally authorized channel which has not been dredged since 2003 as result of Congress defunding the US Army Corps of Engineers Shallow Draft Navigation Program. As result, the MPPDC has been working diligently and successfully to pursue alternative funding sources to address critical funding sources for channel maintenance including a 2020 project funded by the VA Port

Authority which characterized the regional dredging needs of the Middle Peninsula. For that study, Middlesex County identified Whiting Creek as a highest priority channel for which dredging and beneficial reuse solutions are needed. The proposed design will build on preliminary investigation of shoaling within the creek completed by MPPDC and the VIMS Shoreline Studies Program during the 2020 study which found that ~31,000 cubic yards of predominantly sandy material suitable for placement along shorelines for erosion protection needs to be dredged from the channel to achieve the desired 6 ft depth below mean lower low water (MLLW) and to include 1 ft overdepth dredging. The final design of the project will consider and select beneficial reuse opportunities for placing the dredged sand along adjacent shorelines where severe erosion has and continues to occur as well as beneficial reuse solutions for the boat ramp at the public landing (**Figure 1**). A narrow peninsula of land to the east of the mouth of Whiting Creek separates much of the Whiting Creek watershed from the Rappahannock River. This narrow piece of land is likely to erode to the point where a complete breach could occur in the near future or with the onset of a single severe storm event. If no action were to be taken to prevent erosion and breach of this area, the tidal dynamics of the creek would be greatly altered and have a severely negative impact on shoaling of the Whiting Creek navigation channel. The proposed beneficial reuse design will consider buffering the

<u>Figure 1. Project Location and Description</u>



The project will involve resilience enhancements at a Publicly Owned Working Waterfront and Design of a Dredging and Beneficial Reuse Project. The image below shows the areas in need of dredging (VIMS, 2020) to attain the desired 6 ft MLLW depth with 1 ft overdepth dredging and highlights an adjacent shoreline in critical need of protection which is to be targeted for beneficial reuse. If this very thin peninsula breaches and a new inlet is created, the entire tidal dynamics of the watershed will be drastically changed and likely result in worsened shoaling within the mouth and inner segments of the creek.

shoreline via placement of dredged sand as well as designing nature-based shoreline protection structures, potentially by creating concrete structures on site using the dredged material itself as the media for the concrete. Similar methods for using concrete made from the dredged material will be explored for the boat ramp improvement design as well. The MPPDC currently is partnering with VA Sea Grant to host a RISE Resilience Business Competition to advance innovate private sector resilience solutions for rural coastal communities and one of the outcomes of this effort involves an innovative solution from a company associated with the Middle Peninsula Fight the Flood program where concrete structures may be created on site using dredged material and a 3-D printer capable of making structures of any shape and size up to 700 pounds. The end dredging and beneficial reuse design will be incorporated into a draft Joint Permit Application to achieve near shovel ready project status.

FEMA, the Virginia General Assembly, DCR's Floodplain Management Program, and the Middle Peninsula Planning District Commission (MPPDC) all recognize that natural hazards pose a serious risk to all levels of government including states, localities, tribes and territories and the citizens which reside and work there. These hazards include flooding, drought, hurricanes, landslides, wildfires and more. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program (www.FightTheFloodVA.com). To that end, this proposal is a partnership between the MPPDC and Middlesex County (see Community Support Letter, **Attachment 1**).

- A link or copy to the approved MPPDC resilience plan: https://fighttheflood va.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf
- Middle Peninsula All Hazards Mitigation Plan (2016): https://www.mppdc.com/articles/reports/AHMP_2016_FEMA_Approved_RED.pdf
- Middlesex County Comprehensive Plan: https://www.co.middlesex.va.us/252/Comprehensive-Plan

This project is consistent with multiple objectives and strategies outlined within the Regional All-Hazards Mitigation Plan. Relevant strategies include the following:

- Objective 1.1: Provide protection for future development to the greatest extent possible.
    - Strategy 1.1.1: Reduce or eliminate flood damage to residential/business structures that are highly vulnerable for continual flood damage.
    - Strategy 1.1.3: Protect public buildings and public infrastructure from flood waters resulting from 100-year flood storm events.
    - Strategy 1.3.1: Mitigation projects that will result in protection of public or private property from natural hazards.

PROJECT INFORMATION

Project Description

Whiting Creek and the Whiting Creek Public Landing are public assets serve as critical infrastructure to aid in bolstering commercial and recreational marine economic activities for Middlesex County and the overall Middle Peninsula region. The project site is the **Whiting Creek Public Landing**, with waterfront access near the mouth of Whiting Creek in Middlesex County, Virginia. The approximately one-acre property consists of a public fishing pier, public boat ramp, beach access, and shoreline stabilization features. The parking area is a smooth paved surface but there are no designated parking spaces. The site can accommodate about six vehicles while allowing flow of traffic to the boat ramp. The dimensions of the area are 50 by 100 feet, which allows sufficient space for vehicles to maneuver and access the boat ramp.

The project involves the scope of the existing permitted and commenced project to construct and backfill 80 feet of vinyl sheet-pile bulkhead, extending a maximum of four feet channelward of mean low water into Whiting Creek, to expand the public parking area and improve public access to an existing boat ramp. It is significant to accommodate for these improvements as the landing and ramp are considered to be the primary uses of the site, according to the Middle Peninsula Public Access Master Plan.

A second phase will involve a study and dredging beneficial reuse project design and draft joint permit application. The design will target the shoaling of the boat ramp, shoreline erosion, and sedimentation within Whiting Creek and opportunities for dredging and beneficial reuse of dredged materials. A priority of the beneficial reuse refers to preventing the peninsula on the east side of the creek’s mouth from breaching, changing the tidal dynamics, and exacerbating shoaling at the mouth of the creek (**Figure 1**). The study will be used to develop designs for identified solutions and to fund the implementation of physical solutions.

As noted in the Introduction, the overall scope of this project is to present a holistic approach to enhance resilience on Whiting Creek and the related working public waterfront (i.e., Public Landing). Whiting Creek has suffered from extreme shoaling caused by flooding and climate change-driven coastal dynamics, which in turn severely affects public safety and local commerce. The public waterfront has experienced similar flooding and erosion-related issues which compromises the viability of the site to serve as an economic hub for Middlesex County.

Project Location Information

The Middle Peninsula is the second of three large peninsulas on the western shore of Chesapeake Bay in Virginia, as seen in **Figure 2**. It lies between the Northern Neck and the Virginia Peninsula. The region is predominantly rural, with large, scattered farms and forested tracts; close-knit waterfront communities; an active regional arts association; broad-based civic involvement; and an excellent transportation infrastructure that provides easy access to urban markets. The area contains 3.2% of Virginia's land mass but only 1.1% of the Commonwealth's total population of approximately 93,000 as seen in **Figure 3**.

Figure 2. Middle Peninsula Geographic Area

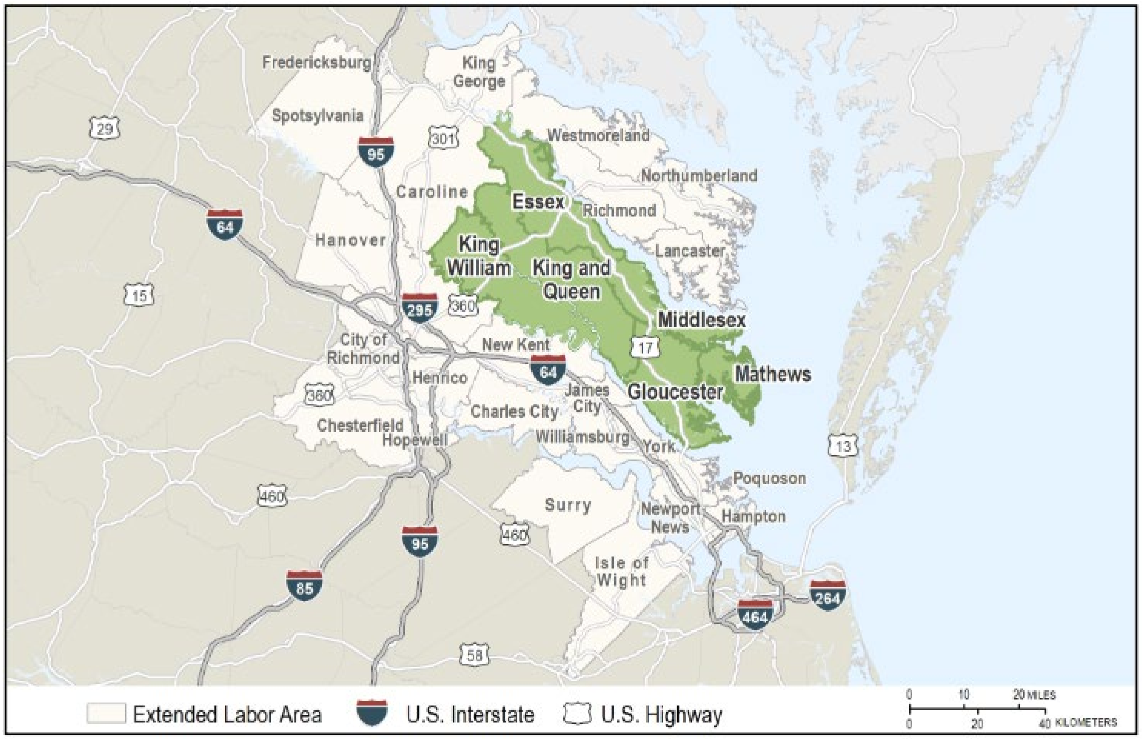


Figure 3. Middle Peninsula Population

CID #	US Census 2020 Population	2020 Total
510048 (Tapp 510049)	Essex (Includes Town of Tappahannock)	10,599
510071	Gloucester	38,711
510082	King and Queen	6,608
510304 (West Point 510083)	King William (Includes Town of West Point)	17,810
510096	Mathews	8,533
510098 (Urbanna 510292)	Middlesex (Includes Town of Urbanna)	10,625
	MPPDC Total	**92,886**

Project implementation would take place along Whiting Creek in an area of Middlesex County, Virginia known as Locust Hill (**Figures 4 and 5**).

Figure 4. County Map of Project Location

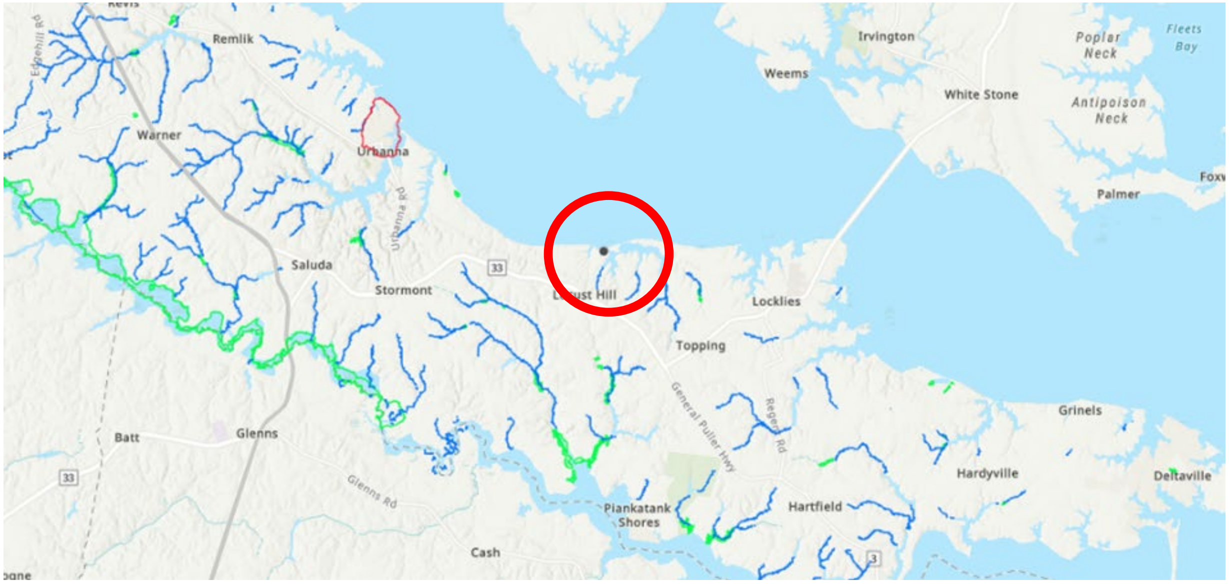

Figure 5. Parcel Map of Project Location

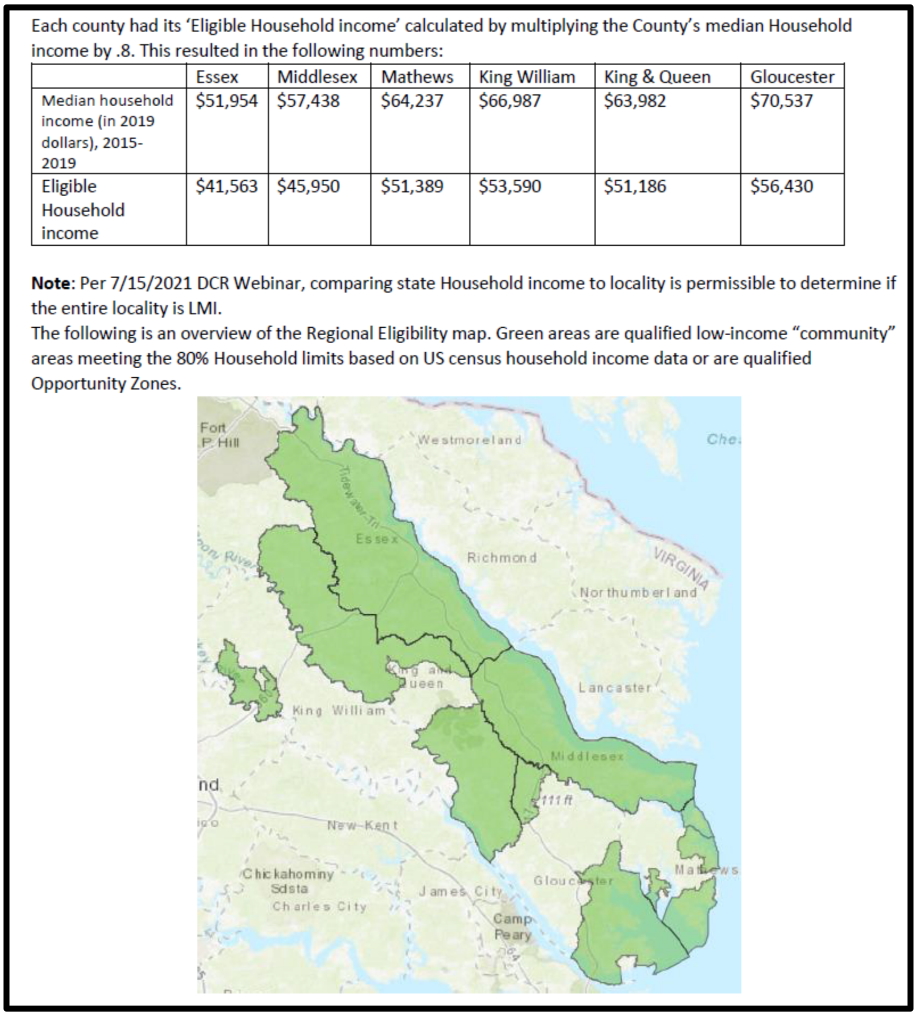
Population Information

Middlesex County is located in the central portion of Virginia's Middle along the Rappahannock River. Middlesex County has approximately 135 miles of shoreline. Based on 2020 Census Data, Middlesex County's population totals 10,625 (**Figure 2**).

According to DCR guidelines, the county is considered a low-income geographic area. In **Figure 6**, the green areas depict qualified low-income "community" areas meeting the 80% Household limits based on US census household income data[1] or are qualified Opportunity Zones.

Figure 6. Map of Middle Peninsula Low Income Qualifying Geographic Areas



Each county had its 'Eligible Household income' calculated by multiplying the County's median Household income by .8. This resulted in the following numbers:

	Essex	Middlesex	Mathews	King William	King & Queen	Gloucester
Median household income (in 2019 dollars), 2015-2019	$51,954	$57,438	$64,237	$66,987	$63,982	$70,537
Eligible Household income	$41,563	$45,950	$51,389	$53,590	$51,186	$56,430

Note: Per 7/15/2021 DCR Webinar, comparing state Household income to locality is permissible to determine if the entire locality is LMI.

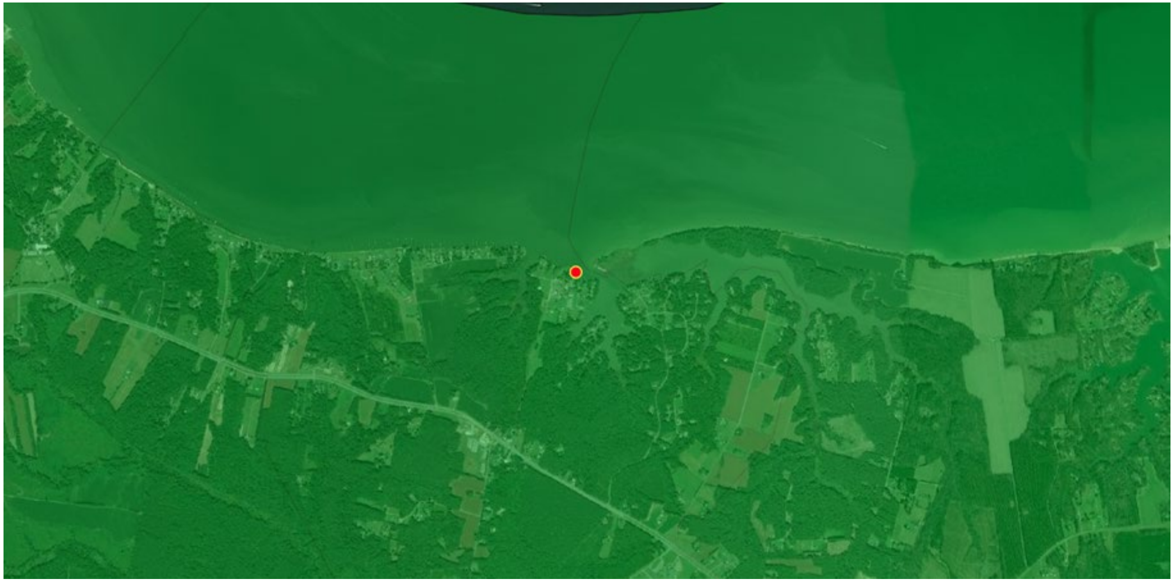
The following is an overview of the Regional Eligibility map. Green areas are qualified low-income "community" areas meeting the 80% Household limits based on US census household income data or are qualified Opportunity Zones.

Please see **Figure 7** for a detailed map of the project location and the green low-income area overlay. This shows that the project location is within the low-income area.

---

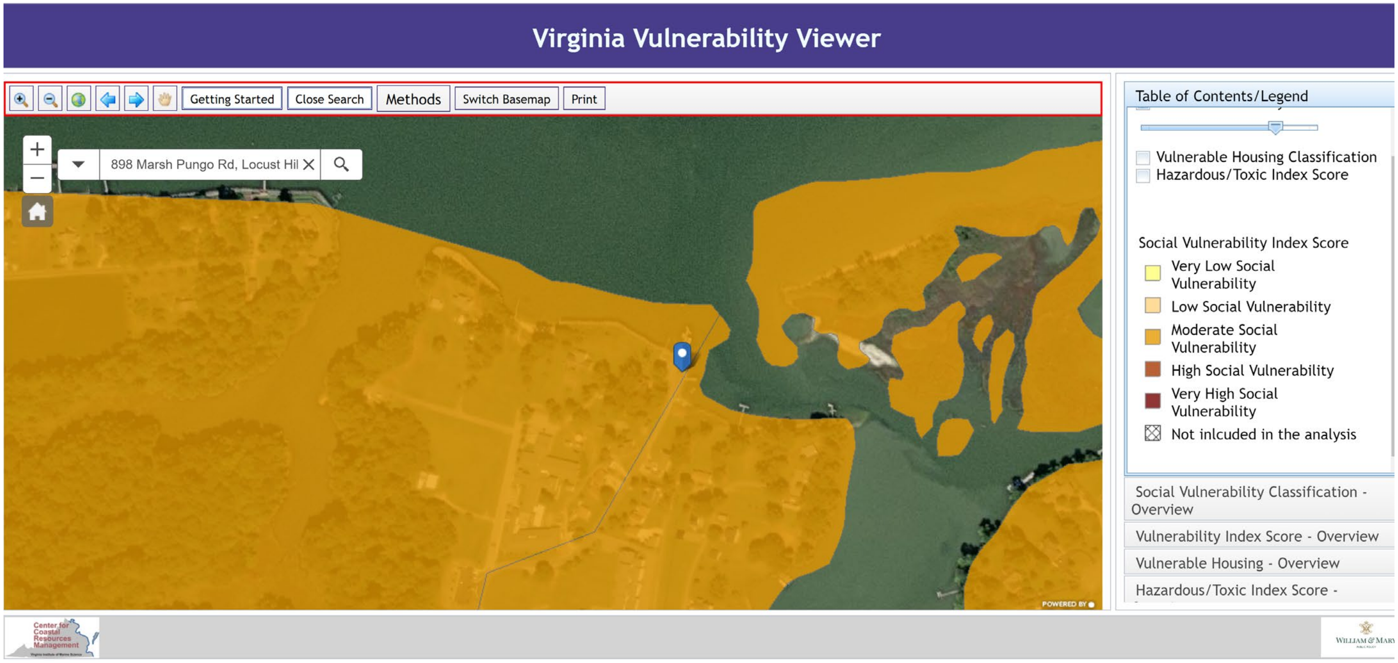
[1] Based upon 2015-2019 U.S. Census American Community Survey data available on January 4, 2022, when CFPF Round 3 opened; 2016-2020 ACS data was not released until March 17, 2022.

Figure 7. Map of the Project Location within in the Green Low-Income Area



With respect to social vulnerability, according to ADAPTVA's Social Vulnerability Index Score, this project location has a Social Vulnerability Index Score of 0.2, classified as Moderate Social Vulnerability (**Figure 8)**

Figure 8. ADAPTVA Social Vulnerability Index Score Viewer

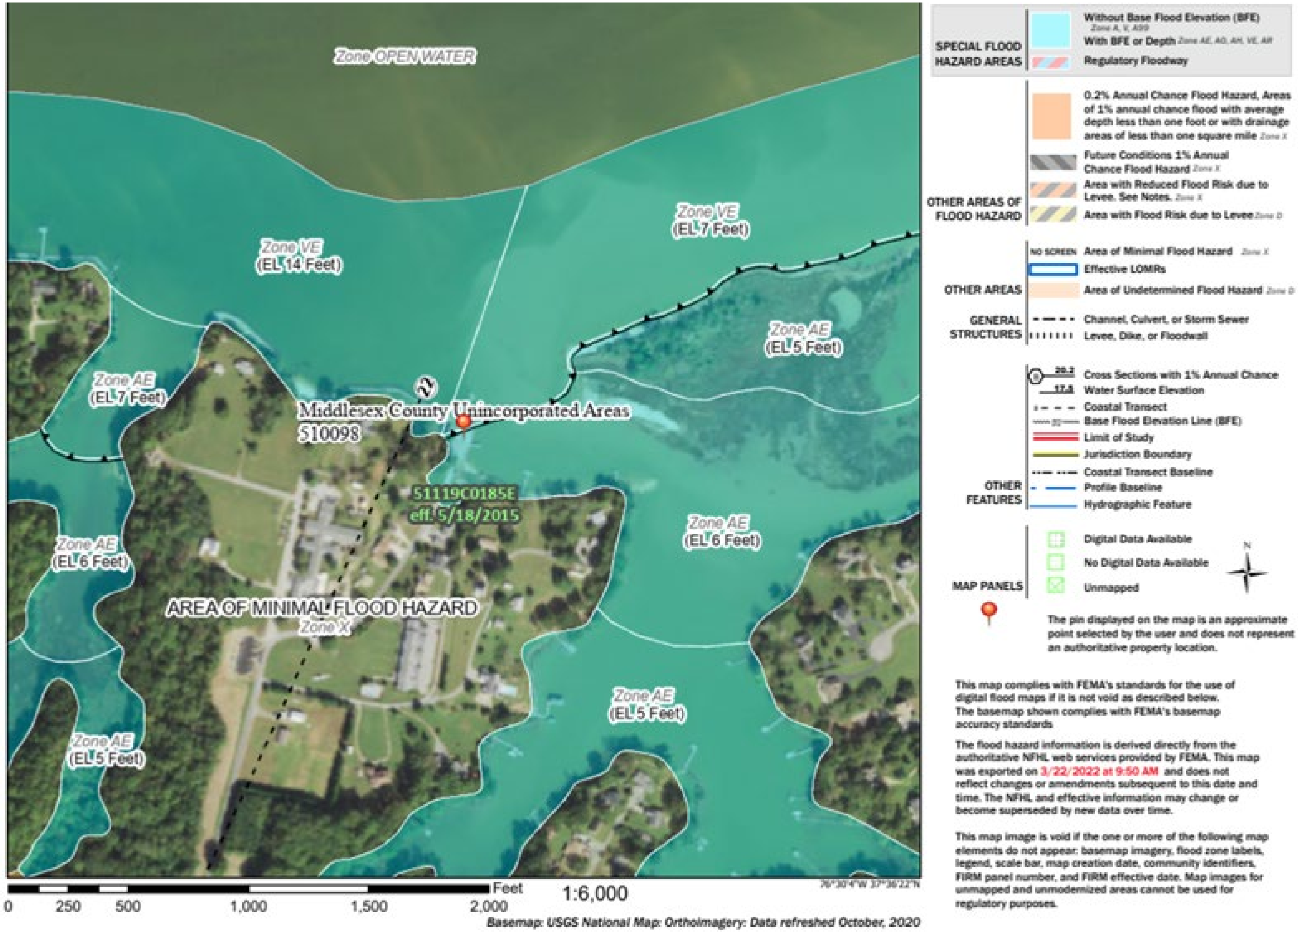


898 Marsh Pungo Rd, Locust Hil

Flood Risk Information

The entirety of the site (898 Marsh Pungo Road, Locust Hill, VA 23092, 37.61005, -76.50619) is located within a mapped floodplain, with portions located within FEMA Flood Zones AE and VE (**Figure 9**). Middlesex County's Planning and Zoning Department administers the requirements of the NFIP program, and the County's Floodplain Management Ordinance may be accessed at the following link: https://www.co.middlesex.va.us/DocumentCenter/View/422/Floodplain-Management-PDF?bidId=

Figure 9. Map of FEMA Flood Zones



The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/22/2022 at 9:50 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Basemap: USGS National Map: Orthoimagery: Data refreshed October, 2020

Due to the project site's proximity to the water and low elevation, the site has an extensive history of experiencing extreme weather events that have resulted in significant impacts to infrastructure and the environment. For example, the project location has long been, and continues to be, impacted by tropical, sub-tropical, and Nor'easter events (**Attachment 3**). According to NOAA's Coastal Flood Mapper, this project location is at the highest risk of coastal flooding (**Figure 10**). Collectively, these reoccurring and storm-related events have contributed to erosion and shoreline loss at site.

Figure 10. Map of Project Location and Risk of Coastal Flooding (NOAA, 2021)

NEED FOR ASSISTANCE

The Middle Peninsula Planning District Commission (MPPDC) is a political subdivision of the Commonwealth of Virginia formed under VA Code §15.2-4203 to provide solutions to problems of greater than local significance and cost-savings through economies of scale. The MPPDC serves nine localities of the Middle Peninsula including Essex, Gloucester, King & Queen, King William, Mathews, and Middlesex counties, as well as the Towns of Tappahannock, West Point, and Urbanna.

MPPDC is staffed using multiple methods including co-operative procurement, hourly, and burdened FTE staff. MPPDC staff consists of an Executive Director, Deputy Director, Chief Financial Officer, Senior Project Planner, and clerical support staff; a Director of Planning, General Planner, Certified Flood Plain Manager, Transportation Planner, and Emergency Planner are co-operative procured; Housing, Community Development Planner and Public Relations staff are hourly.

The Planning District staffing team assists localities with long-term and/or regional planning efforts. The MPPDC Executive Director, Deputy Director, and Chief Financial Officer have decades of experience in managing and administering project grants at multiple scales - from grants in excess of $1,000,000 to small grants. MPPDC is an entrepreneurial-based government agency with an annual operating budget ranging from $750,000 to more than $1,000,000. Annually, the MPPDC manages 25-30 concurrent federal and state grants utilizing industry standard Grants Management Software and other software (e.g., GIS, Microsoft Office) as required and/or necessitated by different grants. The MPPDC operates service centers in the topical areas of coastal zone management, emergency planning, housing, transportation planning and transportation demand management, economic development, social assistance, small business development, general planning and technical assistance, as well as other areas determined by the Commission. MPPDC has more than 25 years of experience managing multiple revolving loan programs. In the 25 years that the Executive Director has been employed by the Commission, no audit findings have occurred.

Whiting Creek is a key access point for recreational and commercial seafood fishing as well as access to water and beach fronts. And as noted above, the site is currently constrained, and current improvements will serve to improve access and use of the site. The site's boat ramp is subject to shoaling, and there is shoreline erosion, compounded by other site conditions contributing to sedimentation within Whiting Creek. The objectives of these improvements are meant to align with the Middlesex Public Access Plan, completed in recent years, by allowing for a public use of access points with a private residential section to coexist with properly delineated boundaries indicated by signage, fencing, and other structures.

Existing site conditions (**Figure 11**) serve to limit usability of the landing, a key access point to the Rappahannock River, thereby negatively impacting recreation and commercial seafood activities. According to the Middle Peninsula Dredging Implementation Plan, Whiting Creek requires dredging in order to "establish navigable depths to provide safe navigation for commercial and recreational vessels". Therefore, studying and completing a dredge design for the materials from the creek bed and ensuring beneficial reuse of the sediments will increase access for boats and commercial interests into Whiting Creek.

Additionally, as the study and implementation of a shoreline solution will reduce erosion of the property this will reduce flood risks at the project site. Without the erosion protection measures proposed, the land, habitat and public infrastructure will continue to be compromised, resulting in degradation of the environment and loss of public assets. Stormwater resilience remains the biggest weakness of the Whiting Creek Landing site. The area around the Whiting Creek Landing site is prone to erosion from weather events as evidenced by neighboring living shoreline and shoreline protection features. Any category of storm surge will hit the Whiting Creek site, depositing sediment in the creek eroding the shoreline, precluding access. Moreover, rising sea levels will have a negative impact on the property, increasing the potential for shoreline erosion and loss of public assets.

Finally, it is important to note that Whiting Creek is a Condemned Shellfish Area; this applies to bivalve molluscan shellfish since they may concentrate bacteria and viruses from the water, and this designation would benefit from water quality improvements offered by advancing dredging of the creek and shoreline and stormwater best management practices.

Figure 11. Photos of Existing Site Conditions.

Whiting Creek Boat Ramp to be targeted for improvement in the proposed beneficial reuse design.

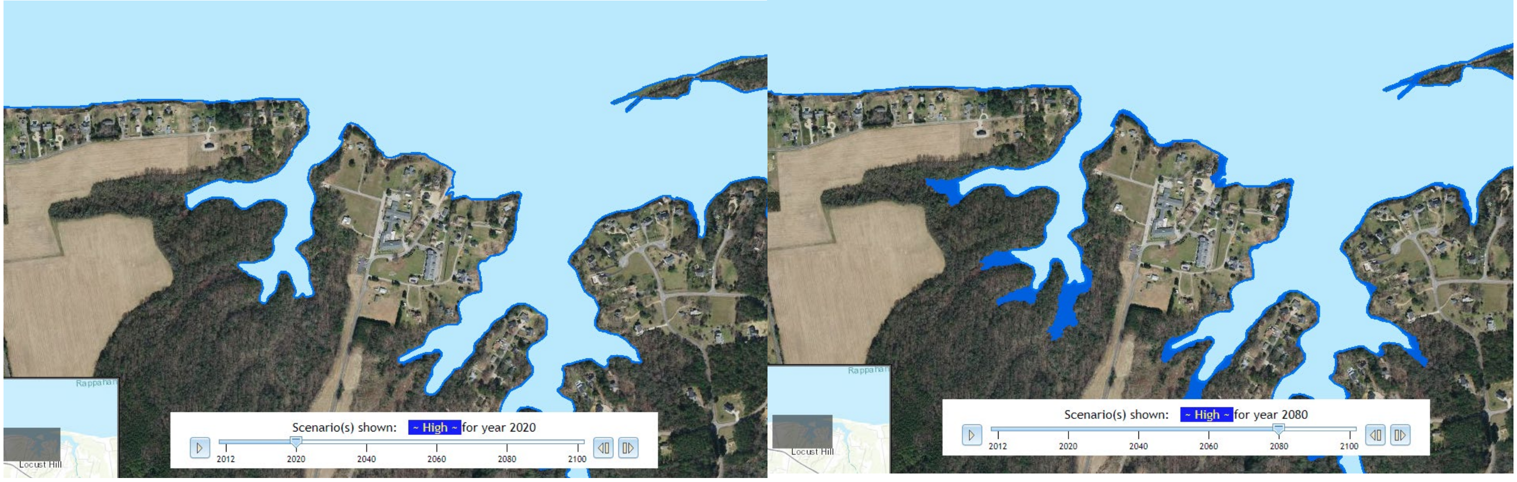
Eroded shoreline at project site from fishing pier prior to improvements. Note commercial fishing boat and active use by recreational and commercial boaters.

Shoreline protection improvements, initiated after the Jan. 4, 2022 opening of CFPF Round 3; photo taken March 1, 2022

Figure 12 illustrates flood levels combined with sea-level rise and their effects on the site. Notably, floods in 50 years pose an issue to the many structures on site; key construction techniques will need to be employed to retrofit each structure in order to mitigate the effects of exceptional floods and sea level rise 50 years and out.

Figure 12. Sea Level and Flood Elevation



Sea Level for 2020 *Sea Level Projection for 2080*

The need for assistance is two-fold. **First, Middlesex County is near the Chesapeake Bay and numerous tidal rivers that contribute to the area's high risk to coastal flooding, sea-level rise, and storm surge.** Based on tidal gauge data from the Virginia Institute of Marine Science (VIMS), relative sea-level rise rates ranging from 0.11-0.23 in./yr. (2.9-5.8 mm/yr.; period: 1976-2007; 10 stations) within the Chesapeake Bay region, which are the highest rates reported along the U.S. Atlantic coast (Boon et. al., 2010). In addition to sea-level rise, Middlesex County has a history of being impacted by hurricanes and tropical storms. As storms pass over or near the coast, the atmospheric pressure drops, causing a large volume of sea water to build up, eventually being pushed ashore by the storm's winds as storm surge. When a storm makes landfall at high tide, the storm surge and the added water from the tidal fluctuation combine to create a "storm tide".

Nor'easters, like hurricanes and tropical storms, can dump heavy amounts of rain and sediment, and produce hurricane-force winds that push large amounts of seawater inland. A strong indicator that Middlesex County is experiencing the impact of coastal hazards (i.e., flooding, hurricanes, sea-level rise, and storm surge) is the number of repetitive loss and severe repetitive loss claims submitted by residents and businesses to FEMA. As of 2015, Middlesex County had 429 repetitive loss properties with claims topping $44 Million. The county has implemented several preventative measures, property protection policies, public information activities, and emergency service measures to decrease impacts on its communities. This project will therefore build on local efforts moving toward a more resilient community.

Second, this project location is primed for co-benefits derived from shoreline erosion mitigation efforts.
The proposed application of shoreline protection features, boat ramp improvements, and a Whiting Creek dredge design provides strategic protection of the infrastructure and landscape at this point of interest. For example, the proposed improvements will facilitate multiple, simultaneous activities that will contribute to economic growth in the area while fostering innovation.

Business Development
The potential of increased tourism drawn to the recreational site is significant. Visitors seeking access to local waterways could be drawn to activities available at Whiting Creek Landing, supporting the local economy with outside revenue in their pursuits. The project proposes and includes a newly constructed bulkhead, study to investigate the shoaling of the boat ramp, shoreline erosion, and sedimentation within Whiting Creek, and study and design for dredging Whiting Creek with beneficial reuse of sediments. Close proximity to recreational opportunities has increasingly become a factor in where businesses decide to locate. The provision of a public access site with enhanced amenities thus has the potential to drive continued economic growth through business development in the area. Moreover, the site is inventoried in the Middle Peninsula's Working Waterfront Inventory, and the boat ramps and fishing pier provide key access to the waterways for commercial seafood fishing industries.

Community Scale Benefits
Due to the multitude of public investment for shoreline protection and flood research and innovation, we believe this site meets the test of "Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk." The Whiting Creek Landing site serves as one of the Commonwealth's best chances to innovate shoreline resilience projects in "live time" so that all of coastal Virginia can benefit. MPPDC believes that proposing resilience projects at the parcel scale and where possible, partnering with neighbors can accomplish more in terms of linear shoreline protected than urban areas which have smaller sized parcels.

Further, the Whiting Creek Public Landing Site is an important access point in Middlesex County, to both the Rappahannock River and Chesapeake Bay, as acknowledged by the Middle Peninsula Public Access Master Plan and Middlesex County Public Access Site Assessment Report; however, use of the site in limited due to lack of parking, and access and usability are potentially limited by a need for dredging.

ALTERNATIVES

The submission of alternatives is not applicable in this application. Nature-based and hybrid solutions are anticipated, and the project cost is less than $3 million.

GOALS AND OBJECTIVES

This proposal will develop a comprehensive strategy to increase resilience of the site against multiple shoreline erosion inputs while providing co-benefits that foster resilience at the Whiting Creek Landing. The focused goals and objects of the project are as follows:

Goal 1: Improve public access to local coastal waterways.

- Objective A: Increase public access to Whiting Creek and the Rappahannock River with improved conditions and mitigation of recurrent and repetitive flooding using a nature-based approach on site.
- Objective B: Enhance quality of life for local residents and visitors alike through recreation, educational and cultural opportunities, and commercial fishing at the point of interest.
- Objective C: Leverage improved public access and coastal resiliency for economic growth within Middlesex County.

Goal 2: Improve coastal resiliency within the community and the Commonwealth.

- Objective A: Mitigate recurrent and repetitive flooding alongside storm surge and sea level rise using natural and nature-based solutions that benefit people and the economy as well as the environment.
- Objective B: Prevent loss of life and reduce property damage by mitigating for recurrent, repetitive, and future flooding within the project area using a nature-based design approach.
- Objective C: Enhance the resilience of public infrastructure, ensuring longer-term viability.

Goal 3: Transferability to other communities.

- Objective A: Model natural and nature-based solutions for coastal sites exploring development potential.
- Objective B: Foster innovative research and solutions-oriented studies on site focused on coastal adaptation and mitigation for external transfer.
- Objective C: Improve the implementation of Fight the Flood as a model program to be replicated in other communities within the region and/or Commonwealth.

The MPPDC expects the following results and benefits of the completed project:

1. **Foster economic growth in the area over the useful life of site infrastructure and most likely, beyond. at the project location**. Enabling public access to this county asset while ensuring its sustainability will protect and enhance the area's recreational economies and has the potential to positively impact related commercial endeavors.

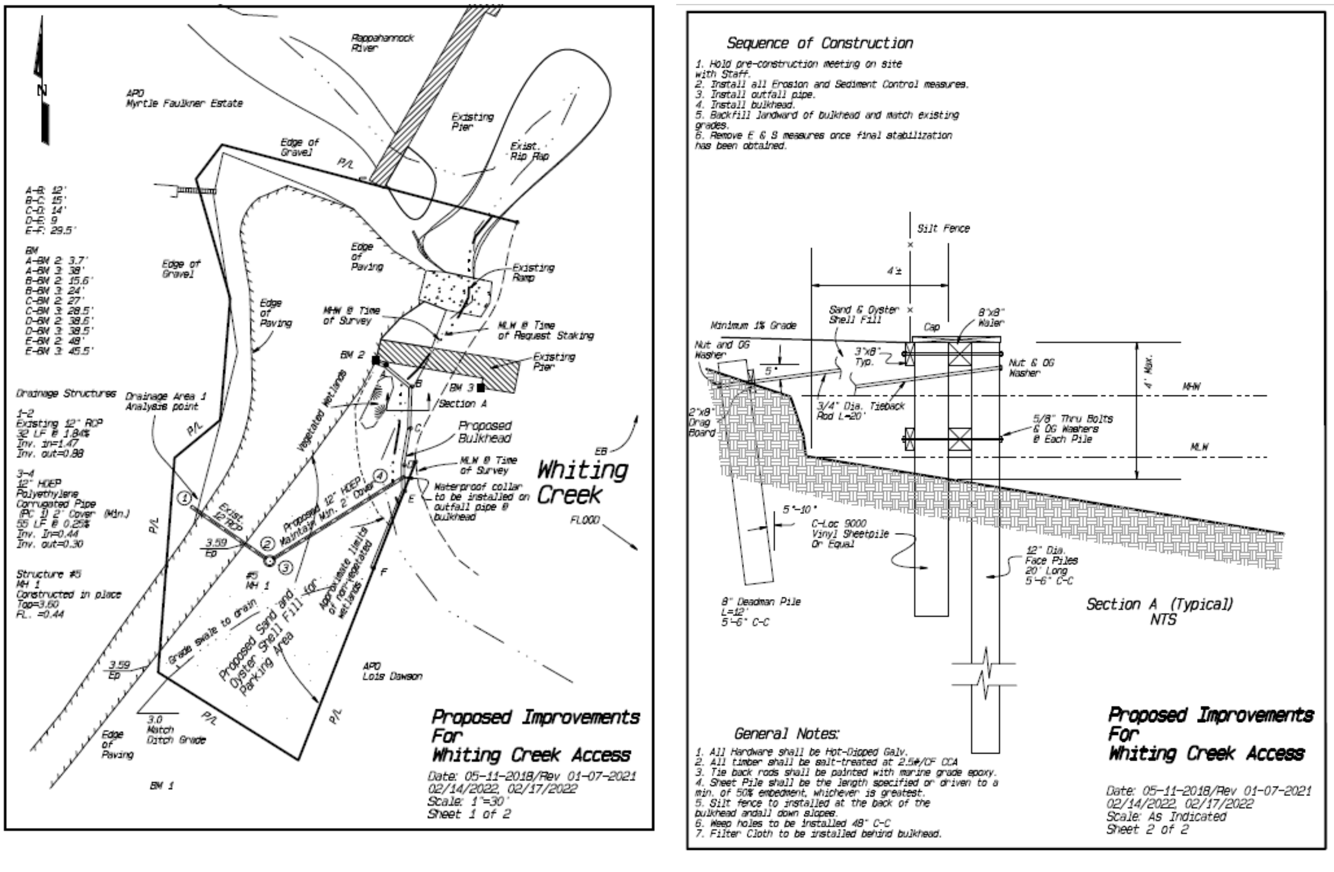
2. **Prevent loss of property without cementing an alternative.** Building resilient structures and facilities at the project site as outlined will help prevent loss of property and property value, while capitalizing on the useful life of the site as much as possible.

3. **Provide ecosystem services to the community toward increased quality of life.** Increased public access to support recreational and economic opportunities leverage the provisioning and services associated with the site's natural resources, services that provide benefits to and increase the quality of life of users.

APPROACH, MILESTONES, AND DELIVERABLES

The project involves the scope of the existing permitted and initiated project (after January 4, 2022) to construct and backfill 80 feet of vinyl sheet-pile bulkhead, extending a maximum of four feet channelward of mean low water into Whiting Creek, to expand the public parking area and improve public access to an existing boat ramp (see **Figure 13)** for project plans and scope of work). A second phase will involve a study of the site to investigate the shoaling of the boat ramp, shoreline erosion, and sedimentation within Whiting Creek and opportunities for dredging and beneficial reuse of dredged materials. The study will be used to develop designs for identified solutions and to fund the implementation of physical solutions.

Figure 13. Permitted Site Plans for Shoreline and Parking Improvements at the Whiting Creek Landing



Proposed Improvements For Whiting Creek Access

Date: 05-11-2018/Rev 01-07-2021
02/14/2022, 02/17/2022
Scale: 1"=30'
Sheet 1 of 2

Sequence of Construction

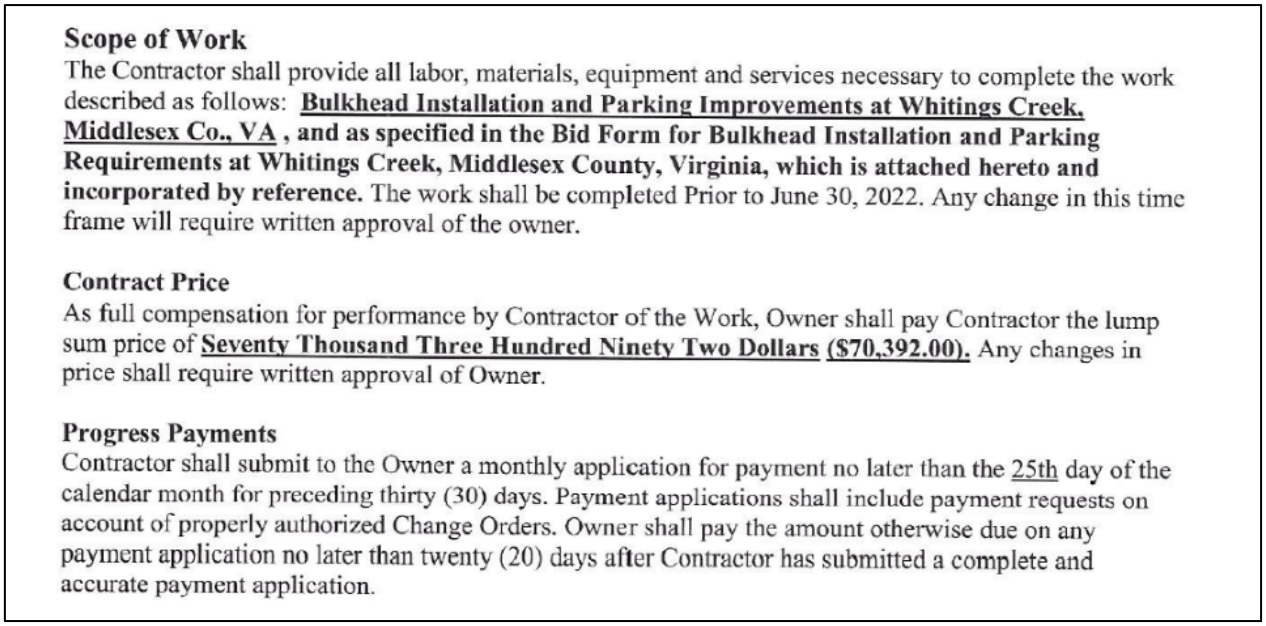
1. Hold pre-construction meeting on site with Staff.
2. Install all Erosion and Sediment Control measures.
3. Install outfall pipe.
4. Install bulkhead.
5. Backfill landward of bulkhead and match existing grades.
6. Remove E & S measures once final stabilization has been obtained.

General Notes:

1. All Hardware shall be Hot-Dipped Galv.
2. All timber shall be salt-treated at 2.5#/CF CCA
3. Tie back rods shall be painted with marine grade epoxy.
4. Sheet Pile shall be the length specified or driven to a min. of 50% embedment, whichever is greatest.
5. Silt fence to installed at the back of the bulkhead andall down slopes.
6. Weep holes to be installed 48" C-C
7. Filter Cloth to be installed behind bulkhead.

Proposed Improvements For Whiting Creek Access

Date: 05-11-2018/Rev 01-07-2021
02/14/2022, 02/17/2022
Scale: As Indicated
Sheet 2 of 2



Scope of Work

The Contractor shall provide all labor, materials, equipment and services necessary to complete the work described as follows: **Bulkhead Installation and Parking Improvements at Whitings Creek, Middlesex Co., VA , and as specified in the Bid Form for Bulkhead Installation and Parking Requirements at Whitings Creek, Middlesex County, Virginia, which is attached hereto and incorporated by reference.** The work shall be completed Prior to June 30, 2022. Any change in this time frame will require written approval of the owner.

Contract Price

As full compensation for performance by Contractor of the Work, Owner shall pay Contractor the lump sum price of **Seventy Thousand Three Hundred Ninety Two Dollars ($70,392.00).** Any changes in price shall require written approval of Owner.

Progress Payments

Contractor shall submit to the Owner a monthly application for payment no later than the 25th day of the calendar month for preceding thirty (30) days. Payment applications shall include payment requests on account of properly authorized Change Orders. Owner shall pay the amount otherwise due on any payment application no later than twenty (20) days after Contractor has submitted a complete and accurate payment application.

Virginia Department of Wildlife Resources owns the public boat ramp, while the County manages the site. The project will occur within the regulatory floodplain identified as the AE and VE Zones. New construction in this zone will result in a ‘no-rise’ scenario meaning that construction activities will not increase the risk of flooding to new or existing structures

The principal tasks and milestones are as follows:

- Construction and backfill of bulkhead, expansion of parking area and improvement of access to existing ramp;
- Site study to investigate shoaling of boat ramp, shoreline erosion, and sedimentation within Whiting Creek; and
- Study of dredging opportunities and design of beneficial reuse of dredged materials.

The expected timeline for the project milestones, and deliverables, is as follows:

Year 1/Months 1-12 - Bulkhead Construction; Site Evaluation & Study

- Months 1-6: Bulkhead construction and completion (initiated during Spring 2022 after the January 4, 2022 Round 3 start date and to be completed prior to June 30, 2022). Initiate necessary channel characterization surveys (bathymetric, LiDAR, sediment grain size and chemical sampling, as necessary) with VIMS Shoreline Studies Program or other Virginia academic institution.
- Months 6-12: Finalize dredging and beneficial reuse project design plans and develop draft Joint Permit Application.

RELATIONSHIP TO OTHER PROJECTS

While the specific proposed project bears no direct relationship to specific past, future, or future resilience projects, the project does relate to larger regional resilience efforts. For more than 40 years, the Middle Peninsula Planning District Commission (MPPDC) and its participating localities have worked diligently on topics associated with the land water interface, including coastal use conflicts and policies, sea level rise, stormwater flooding, roadside ditch flooding, erosion, living shorelines, coastal storm hazards (e.g., hurricanes, tropical storms), riverine and coastal flooding, and coastal resiliency.

The proposed project is a priority project generated from the Middle Peninsula Regional Flood Resilience Plan, which was approved by DCR in August of 2021. This Flood Resiliency Plan serves as the MPPDC's guiding document for its flood resiliency programs and is comprised of two primary MPPDC-approved policy documents. These documents frame the foundation and implementation of the Middle Peninsula flood protection approach and are indirectly and directly supported by specific regional planning documents each approved by federal, regional, and/or local partners as required by statute.

Other plans and resources integral to the implementation of the Flood Resiliency Plan include:

Long Term Planning

- Middle Peninsula All Hazard Mitigation Plan - FEMA and Middle Peninsula locality, approved 2016 (MPPDC Website)
    - This overarching project provides updates every five years on the hazards within the region; it identifies the top hazards within the region and provides a HAZUS assessment that analyzes flooding (riverine and coastal), sea-level rise and hurricane storm surge impacts in the region. Additionally, this plan lists strategies and objectives that guide member localities to mitigate for these strategies.
- Middle Peninsula Comprehensive Economic Development Strategy – MPPDC, approved March 2021
- Middle Peninsula VDOT Rural Long Range Transportation Plan – MPPDC, approved annually

Short Term Implementation

- Middle Peninsula Planning District Commission Fight the Flood Program Design - MPPDC Commission, approved June 2020; Chairman approved update 8/6/21
- Middle Peninsula Planning District Commission Living Shoreline Resiliency Incentive Funding Program - Virginia Revolving Loan Fund Program Design and Guidelines, approved 2015

The MPPDC has a history of continuous work on flooding and coastal resiliency topics, as described in **Attachment 5**. These projects have built upon each other to establish within the MPPDC a solid foundation of regional expertise in flooding and coastal resiliency. Now, given this history of accumulated information and knowledge, the MPPDC can move beyond research and studies to begin implementing projects on the ground. One such effort, launched in 2020 following the Commission's authorization, was developed in response to emerging flood challenges. This effort, the **Middle Peninsula Fight the Flood (FTF) Program**, leverages state and federal funding to deliver flood mitigation solutions directly to constituents, for both the built and natural environments with an emphasis on nature-based flood mitigation solutions. The Middle Peninsula **FTF** program helps property owners gain access to programs and services to better manage challenges posed by flood water. MPPDC staff have partnered with private property owners registered for the FTF program to assist them in finding funding for their shoreline.

Finally, the Flood Resiliency Plan and associated programs strive to carry out the guiding principles and goals set forth in the Virginia Coastal Resilience Master Planning Framework established in 2020. The proposed activities are proposed in accordance with the guiding principles and with the intent that their outcomes will help the Commonwealth meet the goals set forth in the planning framework.

MAINTENANCE PLAN

A maintenance plan is not applicable in this application. The proposed project is to develop a nature-based design solution and its cost does not require ongoing operation and future maintenance.

CRITERIA

Describe how the project meets each of the applicable scoring criteria contained in ***Appendix B*** *and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application.* ***Appendix B*** *must be completed and submitted with the application.*

For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

    - Yes; the applicant is a regional planning district commission.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**

- Yes; the MPPDC's DCR-approved resilience plan may be accessed at the following link: https://fightthefloodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

   - Yes; please see **Attachment 1**

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

   - Yes; please see the match commitment letter in **Attachment 1**

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

   - Yes

BUDGET NARRATIVE

ESTIMATED TOTAL PROJECT COST

Based upon the identified scope of work, the estimated total project cost is $174,312. This total estimate is based upon the following estimated cost breakdowns:

- Shoreline Protection and Parking Improvements Construction: $70,392
- Dredging and Beneficial Reuse Design and Draft JPA Development: $70,000

MPPDC staff will manage and administer this project. Thus, personnel time is needed to ensure that project deliverables are completed within the project timeline. Along with personnel expenses, MPPDC fringe is needed. This includes health insurance, retirement, group life insurance, workman's comp, and unemployment insurance. MPPDC fringe rate for FY23 is 26.21% and comprised of: Health Insurance – 48.58%, Retirement – 18.06%, Workers Comp – 0.28%, Social Security – 28.55%, Life Insurance – 4.39%, Unemployment – 0.14%. Direct charges are costs associated with overall projects costs consistent with general accounting principles. MPPDC also prepares an indirect cost (IDC) plan annually per 2 CFR 200 Appendix VII. Following annual audit, the plan is submitted to NOAA for acceptance. MPPDC's IDC rate has a basis of Modified Total Direct Costs (MTDC), with a planned rate of 27.92%. IDC is only applied to the first $25,000 of each contract. IDC calculated on MTDC (modified total direct cost)-Personnel, supplies, travel, and first $25,000 of each subcontract, etc.; excludes equipment.

					$140,392			
SUBTOTAL: Direct Costs						$104,944	$56,508	$161,452
Indirect/IDC/Facilities & Administrative Costs				27.92%	$12,860	$8,359	$4,501	$12,860
Total						**$113,303**	**$61,009**	**$174,312**
Other Match:								
Source of Match						$0	$0	$0
GRAND TOTAL						**$113,303**	**$61,009**	**$174,312**

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $113,303, or 65% of total project costs, as the project is located in and serves a low-income geographic area and the project results in hybrid solutions. These funds, combined with local match, would be used for the services identified above.

AMOUNT OF CASH FUNDS AVAILABLE

Middlesex County will appropriate the requisite 35% or $61,009 in required local cash match funds, to be combined with the $113,303 in grant assistance to equal the total estimated project cost. The County’s match commitment letter is included as **Attachment 1**.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is included as **Attachment 1**.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Middle Peninsula Planning District Commission**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration			☑ Yes ☐ No
Applicant Name:	**Middle Peninsula Planning District Commission**		
Scoring Information			
Criterion		**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)			
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.			
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.		**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.		**45**	**45**
1.b. any other nature-based approach		**40**	
All hybrid approaches whose end result is a nature-based solution		**35**	
All other projects		**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)			
Very High Social Vulnerability (More than 1.5)		**15**	
High Social Vulnerability (1.0 to 1.5)		**12**	
Moderate Social Vulnerability (0.0 to 1.0)		**8**	8
Low Social Vulnerability (-1.0 to 0.0)		**0**	
Very Low Social Vulnerability (Less than -1.0)		**0**	

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		88

RE: Support Letter for Applications Submitted by MPPDC to Virginia Community Flood Preparedness Fund

Dear Mr. Lawrence:

Middlesex County supports all eligible applications requesting funding under the DCR Flood Preparedness Fund. Proposals submitted by MPPDC on behalf of our constituents are part of our necessary governmental functions and are consistent with regional and local resilience planning efforts. We further support project proposals that demonstrate a primary purpose of prevention or protection to reduce coastal, riverine or inland flooding. The MPPDC Fight the Flood (FTF) Program serves as the region's flood resiliency coordination program. The MPPDC Living Shoreline Program Design and the MPPDC FTF Program provide the operational and administrative oversite for resiliency planning, coordination and implementation for our constituents suffering from flooding challenges. These programs assist to secure the tax base of coastal localities and reduce the inherent risk to the delivery of essential governmental services, including public safety, posed by coastal storms and recurrent flooding of all types.

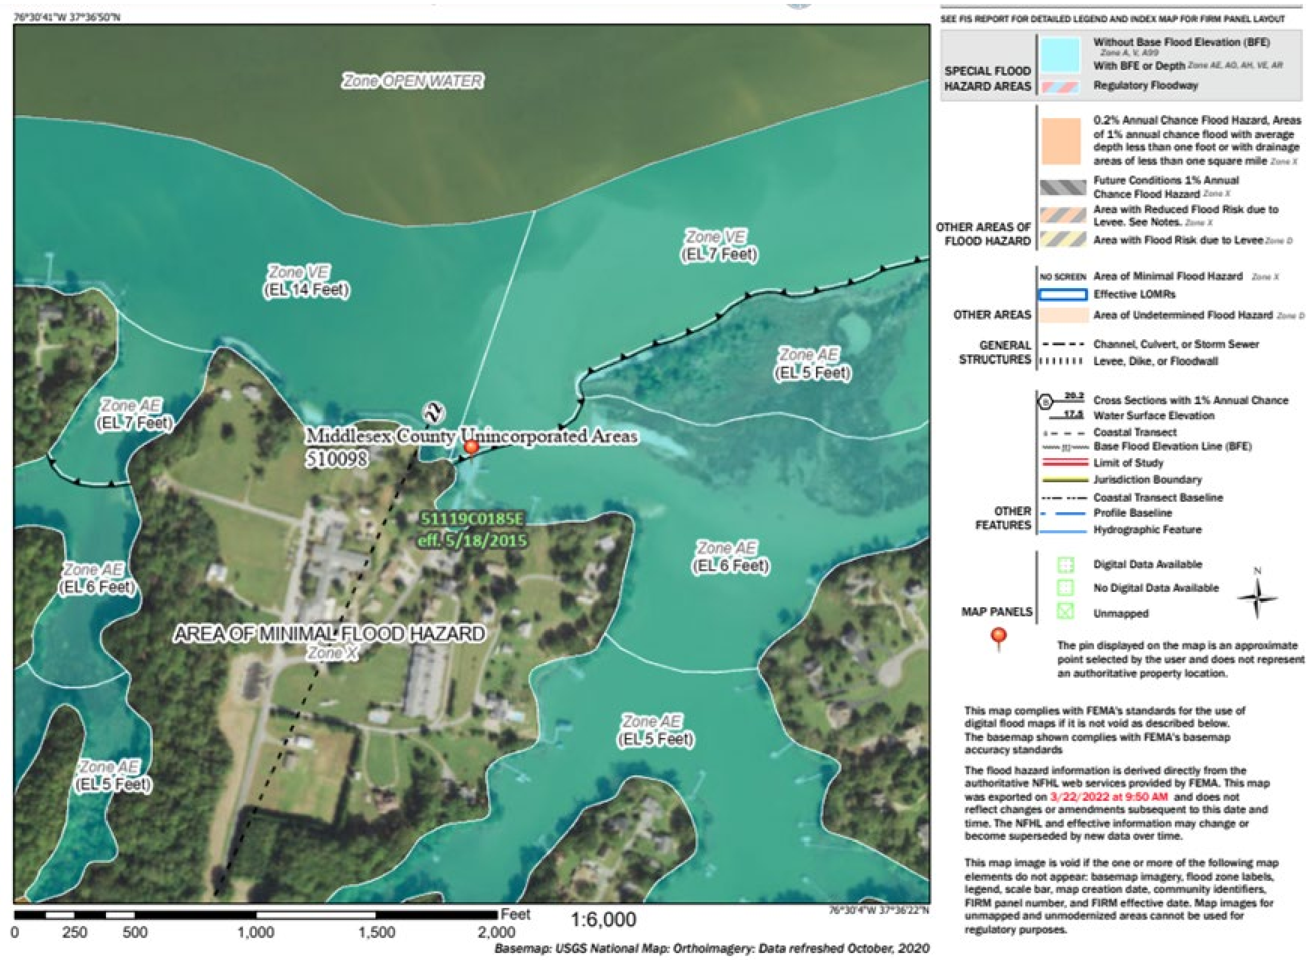
The FTF and the Living Shoreline programs exist to help the owners of flood-prone properties access programs and services to better manage challenges posed by flood water and to direct constituents to appropriate mitigation solutions, such as nature-based solutions. When grants and loans are available, we fully support the MPPDC to provide such to qualified constituents, to support the public purpose(s) for which the funds, such as the Virginia Community Flood Preparedness Funds, have been allocated.

Should you have any questions concerning our support for the work of the MPPDC, I can be reached at 804-758-4330.

Respectfully,

Matt Walker
County Administrator

Attachment 2: Project Location FIRMette



Basemap: USGS National Map: Orthoimagery: Data refreshed October, 2020

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/22/2022 at 9:50 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

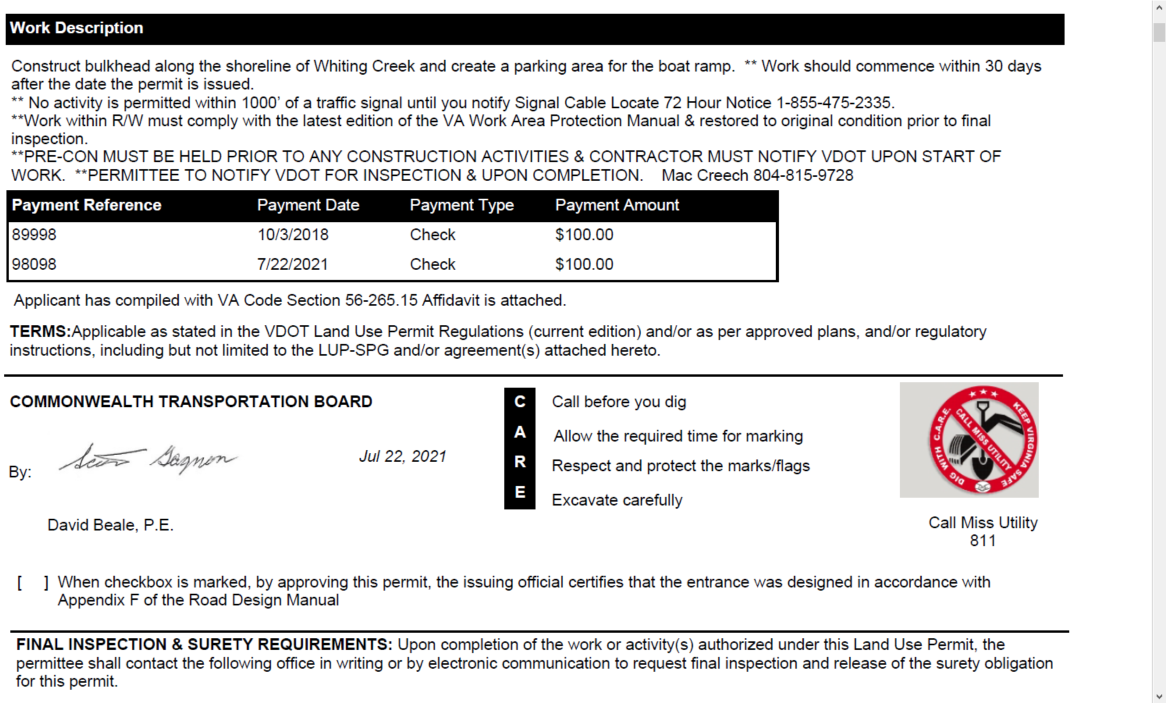
Name Middlesex County Board of Supervisors
Surety Account 02022016
Surety Type Resolution
Amount 1,000,000.00
Obligation Amount 5,000.00
Surety Holder CUSTOMER

AUTHORIZATION: In compliance with your application, permission is hereby given insofar as the Commonwealth Transportation Board has the right, power, and authority under sections 33.2 - 210;33.2 - 240;33.2 - 241 of the Code of Virginia as amended, to grant by Special Agreement and/or by Land Use Permit for you to perform the work and or activity(s) described below:

Location

County/City/Town	Middlesex County	Highway Route(s)	634 - Marsh Pungo Road
From Route Number	33	From Route Name	General Puller Hwy
To Route Number	634	To Route Name	Marsh Pungo Road



Work Description

Construct bulkhead along the shoreline of Whiting Creek and create a parking area for the boat ramp. ** Work should commence within 30 days after the date the permit is issued.
** No activity is permitted within 1000' of a traffic signal until you notify Signal Cable Locate 72 Hour Notice 1-855-475-2335.
**Work within R/W must comply with the latest edition of the VA Work Area Protection Manual & restored to original condition prior to final inspection.
**PRE-CON MUST BE HELD PRIOR TO ANY CONSTRUCTION ACTIVITIES & CONTRACTOR MUST NOTIFY VDOT UPON START OF WORK. **PERMITTEE TO NOTIFY VDOT FOR INSPECTION & UPON COMPLETION. Mac Creech 804-815-9728

Payment Reference	Payment Date	Payment Type	Payment Amount
89998	10/3/2018	Check	$100.00
98098	7/22/2021	Check	$100.00

Applicant has compiled with VA Code Section 56-265.15 Affidavit is attached.

TERMS: Applicable as stated in the VDOT Land Use Permit Regulations (current edition) and/or as per approved plans, and/or regulatory instructions, including but not limited to the LUP-SPG and/or agreement(s) attached hereto.

FINAL INSPECTION & SURETY REQUIREMENTS: Upon completion of the work or activity(s) authorized under this Land Use Permit, the permittee shall contact the following office in writing or by electronic communication to request final inspection and release of the surety obligation for this permit.

Attachment 5: Flood Prevention Project and its Relevance to Other Projects

MPPDC staff have worked throughout the years to understand the policy, research and impacts of flooding (i.e., stormwater, coastal, riverine, sea level rise) and coastal resiliency to the region. Below is a list of projects that have built upon each other over the year that have contributed to our understanding.

Climate Change & Sea Level Rise (2009 to 2012)
The MPPDC was funded for a 3 Phase project through the Virginia Coastal Zone Management Program to assess the impacts of climate and sea level rise throughout the region. With over 1,000 miles of linear shoreline, the Middle Peninsula has a substantial amount of coast under direct threat of accelerated climate change and more specifically sea-level. In Phase 1, MPPDC staff assessed the potential anthropogenic and ecological impacts of climate change. Phase 2 focused on the facilitating presentations and develop educational materials about sea level rise and climate change for the public and local elected officials. Finally Phase 3 focused on developing adaptation public policies in response to the assessments.

Phase 1: Middle Peninsula Climate Change Adaptation: Facilitation of Presentations and Discussions of Climate Change Issues with Local Elected Officials and the General Public
Phase 2: Climate Change III: Initiating Adaptation Public Policy Development
Phase 3: Phase 3 Climate Change: Initiating Adaptation Public Policy Development

Emergency Management - Hazard Mitigation Planning (2009 to Present): Since 2009, the Middle Peninsula Planning District Commission has assisted regional localities in meeting the federal mandate to have an adopted local hazard plan. *The Regional All Hazards Mitigation Plan addresses the natural hazards prone to the region, including hurricanes, winter storms, tornadoes, coastal flooding, coastal/shoreline erosion, sea level rise, winter storms, wildfire, riverine flooding, wind, dam failures, drought, lightning, and earthquakes. This plan also consists of a HAZUS assessment of hurricane wind, sea level rise* (i.e., Mean High Higher Water and the NOAA 2060 intermediate-high scenario), *and flooding (coastal and riverine flooding) that estimates losses from each hazard.* The Middle Peninsula All-Hazard Mitigation Plan Update 2021 is currently being updated. The 2021 All Hazards Mitigation Plan builds off and updates previous mitigation plans.

Land and Water Quality Protection (2014): In light of changing Federal and State regulations associated with Bay clean up-nutrient loading, nutrient goals, clean water, OSDS management, storm water management, TMDLs, etc., staff from the Middle Peninsula Planning District Commission (MPPDC) will develop a rural pilot project which aims to identify pressing coastal issue(s) of local concern related to Bay clean up and new federal and state legislation which ultimately will necessitate local action and local policy development. Staff has identified many cumulative and secondary impacts that have not been researched or discussed within a local public policy venue. Year 1-3 will include the identification of key concerns related to coastal

land use management/water quality and Onsite Sewage Disposal System (OSDS) and community system deployment. Staff will focus on solution based approaches, such as the establishment of a regional sanitary sewer district to manage the temporal deployment of nutrient replacement technology for installed OSDS systems, assessment of land use classifications and taxation implications associated with new state regulations which make all coastal lands developable regardless of environmental conditions; use of aquaculture and other innovative approaches such as nutrient loading offset strategies and economic development drivers.

Department of Conservation and Recreation Stormwater Management (2014)
The Virginia General Assembly created a statewide, comprehensive stormwater management program related to construction and post-construction activities (HB1065 - Stormwater Integration). The Virginia Department of Conservation and Recreation requires stormwater management for projects with land disturbances of one acre or more. This new state mandate requires all Virginia communities to adopt and implement stormwater management programs by July 1, 2014, in conjunction with existing erosion and sediment control programs. Additionally, the communities within the MPPDC are required to address stormwater quality as stipulated by the Chesapeake Bay TMDL Phase II Watershed Implementation Plan and the Virginia Stormwater Regulations. The MPPDC Stormwater Program helped localities develop tools specific to the region necessary to respond to the state mandate requirement for the development of successful stormwater programs.

Stormwater Management-Phase II (2014): MPPDC staff and Draper Aden Associates worked with localities (i.e., Middlesex, King William, and Mathews Counties and the Town of West Point) interested in participating in a Regional Stormwater Management Program. While each locality sought different services from the regional program, this project coordinated efforts, developed regional policies and procedures, and the proper tools to implement a regional VSMP.

Mathews County Rural Ditch Enhancement Study (2015): In contract with Draper Aden Associates, a comprehensive engineering study was developed to provide recommendations and conceptual opinions of probable costs to improve the conveyance of stormwater and water quality through the ditches in Mathews County.

Drainage and Roadside Ditching Authority (2015): This report explored the enabling mechanism in which a Regional Drainage and Roadside Ditching Authority could be developed. An Authority would be responsible for prioritizing ditch improvement needs, partnering with Virginia Department of Transportation (VDOT) to leverage available funding, and ultimately working toward improving the functionality of the region's stormwater conveyance system.

Living Shoreline Incentive Program (2016 to present)
In 2011 Virginia legislation was passed designating living shorelines as the preferred alternative for stabilizing Virginia tidal floodplain shorelines. The Virginia Marine Resources Commission, in cooperation with the Virginia Department of Conservation and Recreation and with technical

assistance from the Virginia Institute of Marine Science (VIMS), established and implemented a general permit regulation that authorizes and encourages the use of living shorelines however, no financial incentives were put in place to encourage consumers to choose living shorelines over traditional hardening projects in the Commonwealth. To fill this, need the MPPDC developed the MPPDC Living Shoreline Incentives Program to offer loans and/or grants to private property owners interested in installing living shorelines to stabilize their shoreline. Currently, loans are available to assist homeowners to install living shorelines on suitable properties. Loans up to $10,000 can be financed for up to 5 years (60 months). Loans over $10,000 can be financed for up to 10 years (120 months). Interest is at the published Wall Street Journal Prime rate on the date of loan closing - currently at 5.25% (11/29/18). Minimum loan amount is $1,000. Maximum determined by income and ability to repay the loan. Finally, there are currently no grants available in this program. Since 2016 under the MPPDC Living Shoreline Revolving Loan program, 8 living shorelines have been financed and built to date encumbering ~$500,000 in VRA loan funding and ~$400,000 in NFWF grant funding. Living Shoreline construction cost to date range per job $14,000- $180,000. MPPDC oversees all aspects (planning, financing, constriction, and loan servicing) of these projects from cradle to grave.

Mathews County Ditch Project - VCPC White Papers (2017): This report investigated the challenges presented by the current issues surrounding the drainage ditch network of Mathews County. The study summarized research conducted in the field; examined the law and problems surrounding the drainage ditches; and proposed some next steps and possible solutions.

Mathews County Ditch Mapping and Database Final Report (2017): This project investigated roadside ditch issues in Mathews County through mapping and research of property deeds to document ownership of ditches and outfalls. This aided in understanding the needed maintenance of failing ditches and the design of a framework for a database to house information on failing ditches to assist in the prioritization of maintenance needs.

Virginia Stormwater Nuisance Law Guidance (2018): This report was developed by the Virginia Coastal Policy Center to understand the ability of a downstream recipient of stormwater flooding to bring a claim under Virginia law against an upstream party, particularly a nuisance claim. The report summarizes how Virginia courts determine stormwater flooding liability between two private parties.

Oyster Bag Sill Construction and Monitoring at Two Sites in Chesapeake Bay (2018): VIMS Shoreline Studies Program worked with the PAA to (1) install oyster bag sills as shore protection at two PAA sites with the goal of determining effective construction techniques and placement guidelines for Chesapeake Bay shorelines and (2) assess the effectiveness for shore protection with oyster bags on private property through time.

Fight the Flood Program (2020): The Fight the Flood was launched in 2020 to connect property owners to contractors who can help them protect their property from rising flood waters. FTF also offers a variety of financial tools to fund these projects including but limited to the Septic

Repair revolving loan program, Living Shoreline incentives revolving loan fund program, and plant insurance for living shorelines

MPPDC Round 3 CFPF New Applications

2 messages

Curt Smith <csmith@mppdc.com> Fri, Apr 8, 2022 at 11:46 AM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: Lewis Lawrence <llawrence@mppdc.com>, Jackie Rickards <jrickards@mppdc.com>, Heather Modispaw <Hmodispaw@mppdc.com>, "Howard-cooper, Wendy" <wendy.howard-cooper@dcr.virginia.gov>

Greetings,

The MPPDC is respectfully submitting five proposals for consideration under Round 3. These projects were requested by our member jurisdictions as projects of highest priority with regards to flood mitigation and resilience needs. The projects are located on and involve publicly-owned property and infrastructure and were identified as sites with the greatest potential for community scale benefits within the locality/region.

The proposals may downloaded via the following links:

- CID510071_GloucesterCounty_Public_CFPF.doc.pdf
- CID510098_MiddlesexCounty_Public_CFPF.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-1.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-2.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-3.pdf

We thank you in advance for your consideration. Please contact me directly should you have any questions.

Best,

Curt

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X__ No ___

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ **Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.**

☐ **Wetland restoration.**

☑ **Floodplain restoration.**

☐ **Construction of swales and settling ponds.**

☑ **Living shorelines and vegetated buffers.**

☐ **Structural floodwalls, levees, berms, flood gates, structural conveyances.**

☑ **Storm water system upgrades.**

☑ **Medium and large-scale Low Impact Development (LID) in urban areas.**

☐ **Permanent conservation of undeveloped lands identified as having flood resilience value by Conserve Virginia Floodplain and Flooding Resilience layer or a similar data driven analytic tool.**

☐ **Dam restoration or removal.**

☐ **Stream bank restoration or stabilization.**

☑ **Restoration of floodplains to natural and beneficial function.**

☐ **Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.**

Location of Project (Include Maps): Gloucester County, Gloucester Point

NFIP Community Identification Number (CID#) (See appendix F): 510071

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Zones AE and VE

Flood Insurance Rate Map Number(s) (If Applicable): 51073C0257F

Total Cost of Project: $1,276,332

Total Amount Requested: $829,616

SCOPE OF WORK NARRATIVE

INTRODUCTION

This proposal is requesting funding for a project to improve the site-wide resilience of the Gloucester Point Beach Park located in Gloucester County at 1255 Greate Road. The project involves three distinct elements which will represent a site-wide resilience strategy: 1) Stormwater Study and Designs, 2) Boat Ramp Design, and 3) Building Demolition and Reconstruction. An approximately 5-acre publicly owned site, the Park has been in operation for 40 years and is at a gateway to the County crossing the York River on the Coleman Memorial Bridge from Yorktown. While the Park's facilities are aging, maintenance and long-term viability of the Park are impacted by ever increasing effects of coastal and tidal influences, resulting in site flooding and drainage issues, and compromising the maintenance and usability of the Park's facilities. In addition, the boat ramp requires a redesigning effort that improves its resiliency against shoaling and sediment deposition. The new design would help slow or prevent sediment from entering the ramp, and other new, complementary structures can help redirect sand to bypass the pier and enter deeper water where it is not detrimental to access at the ramp.

FEMA, the Virginia General Assembly, DCR's Floodplain Management Program, and the Middle Peninsula Planning District Commission (MPPDC) all recognize that natural hazards pose a serious risk to all levels of government including states, localities, tribes and territories and the citizens which reside and work there. These hazards include flooding, drought, hurricanes, landslides, wildfires and more. Because of climate change, many natural hazards are expected to become more frequent and more severe. Reducing the impacts these hazards have on lives, properties and the economy is a top priority for the Middle Peninsula PDC and the Middle Peninsula Fight the Flood (FTF) program (www.FightTheFloodVA.com). To that end, this proposal is a partnership between the MPPDC and Gloucester County (see Community Support Letter, **Attachment 1**).

- A link or copy to the approved MPPDC resilience plan: https://fighttheflood va.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf
- Middle Peninsula All Hazards Mitigation Plan (2016): https://www.mppdc.com/articles/reports/AHMP_2016_FEMA_Approved_RED.pdf
- Gloucester County Comprehensive Plan: https://www.gloucesterva.info/DocumentCenter/View/5777/2016-Gloucester-County-Comprehensive-Plan

This project is consistent with multiple objectives and strategies outlined within the Regional All-Hazards Mitigation Plan. Relevant strategies include the following:

- Objective 1.1: Provide protection for future development to the greatest extent possible.

- Strategy 1.1.1: Reduce or eliminate flood damage to residential/business structures that are highly vulnerable for continual flood damage.
- Strategy 1.1.3: Protect public buildings and public infrastructure from flood waters resulting from 100-year flood storm events.
- Strategy 1.3.1: Mitigation projects that will result in protection of public or private property from natural hazards.

PROJECT INFORMATION

Project Description

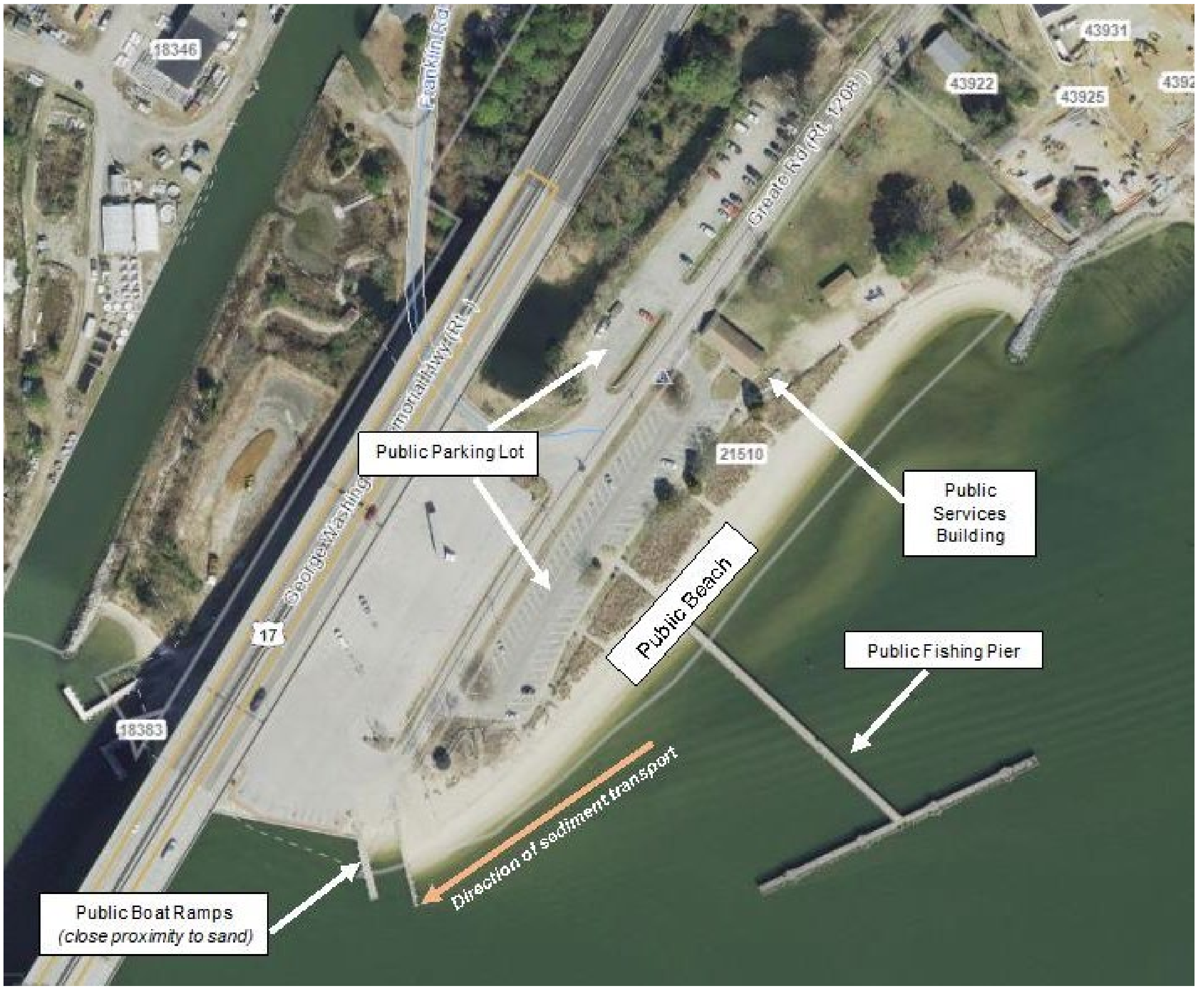
Gloucester Point Beach Park (**Figure 1**) is an extremely visible and popular recreational site, as well as a hub for commercial seafood activity, supporting fishing, boating, beach and general recreational activities. The 5-acre property includes a 2,000 square foot building that houses public restroom facilities, staff storage and a concession room, an accessible shoreline, free public fishing pier, two boat landings, a playground, paved parking areas, and open green space.

As noted in the *Introduction*, while the Park's facilities are aging, maintenance and long-term viability of the Park are impacted by ever increasing effects of coastal and tidal influences, resulting in site flooding and drainage issues, and compromising the maintenance and usability of the Park's facilities. The Park consistently floods during heavy rains and larger storms. The building located on the site is over 40 years old and has been damaged several times in storms, the playground has deteriorated and is being removed for safety reasons, and boat landings are compromised by shoaling. Drainage and updated facilities need to be addressed to protect the property and ensure continued viability.

Like many aging park facilities, amplified by the effects of coastal and tidewater influences, drainage and maintenance concerns at the Park are increasing and the time has come to invest in upgrades and improvements to the Park grounds and facilities to ensure resilience and preparedness against the increase in the frequency and magnitude of natural hazards.

The proposed project involves an overall evaluation and study of the site with respect to stormwater and flooding impacts, site surveying and environmental assessment, development of design plans for the site and facilities taking into account programming and service needs, with a focus on resilience goals and objectives, to include civil engineering, landscaping, and architectural services, demolition and reconstruction of the services building located on the site, and development of designs for the boat ramp to lessen the deposit of sediment.

Figure 1. Gloucester Point Beach Park Existing Conditions



Priorities of this project include addressing site drainage and ponding issues, building flooding issues, and impacts to the site's pier and boat landings. The proposed project will rescue and enhance a currently existing outdoor recreation site, and the improvement of site conditions will also result in economic benefits in the area, such as increased retail sales for bait and gas, restaurant sales, and support for commercial seafood industries.

With respect to the boat ramp located within the Park, this feature is currently experiencing persistent shoaling and sediment deposition due to the configuration of the ramp in relation to adjacent piers. In effect, the project would include developing a new, resilient design for the ramp that would be an extension between the ramp and the beach or new structures that can be placed at the end of the pier. The reconfigured design of the ramp can help slow or prevent sediment from entering the ramp and new structures can help with redirect sand to bypass the pier and enter deeper water where it is not detrimental to access at the ramp.

For the existing 2,000 square foot building which houses public restroom facilities, staff storage, and a concession room, the proposal involves the demolition of this building and replacement with a similar, but considerably more resilient facility, with flood resistant features such as drop-in flood gates at entrances, outlets above base flood elevation where possible, and elevated HVAC mechanical equipment. Under FEMA's Hazard Mitigation Assistance (HMA) Program, FEMA recognizes developing projects that include "total or partial demolition" which results in the "construction of code-compliant and hazard-resistant structures" to be an approved and cost-efficient flood mitigation activity. Consequently, it is proposed that DCR funding will be utilized in a manner that is intended to align with and achieve outcomes consistent with FEMA's HMA program principles and approved flood mitigation activities. To that end, the proposed building will meet or exceed local, state and federal regulatory floodplain requirements. The new structures will also meet American Disability Act design requirements to allow non-ambulatory and other patrons to safely and easily enjoy the Park's features.

Project Location Information

The Middle Peninsula is the second of three large peninsulas on the western shore of Chesapeake Bay in Virginia, as seen in **Figure 2**. It lies between the Northern Neck and the Virginia Peninsula. The region is predominantly rural, with large, scattered farms and forested tracts; close-knit waterfront communities; an active regional arts association; broad-based civic involvement; and an excellent transportation infrastructure that provides easy access to urban markets. The area contains 3.2% of Virginia's land mass but only 1.1% of the Commonwealth's total population of approximately 93,000 as seen in **Figure 3**.

Figure 2. Middle Peninsula Geographic Area

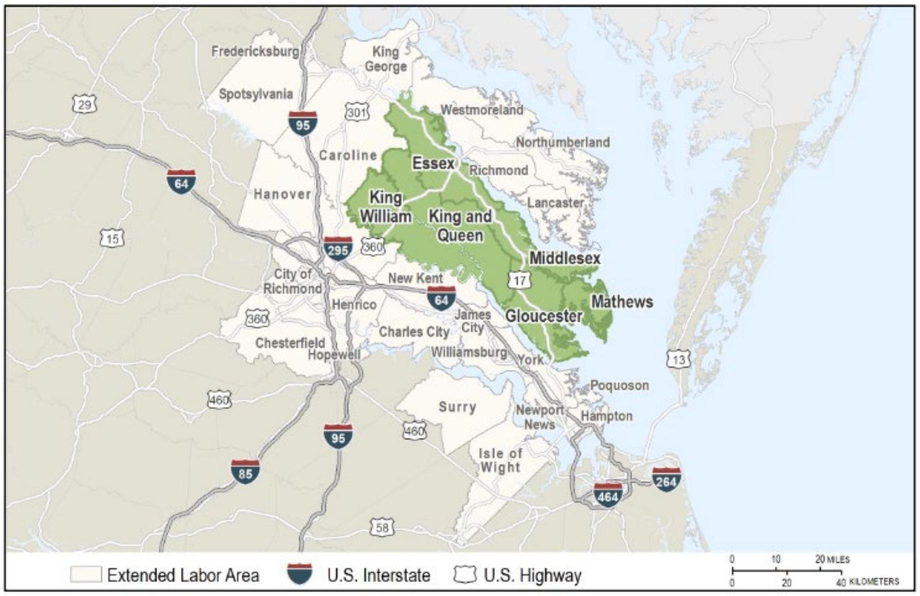


Figure 3. Middle Peninsula Population

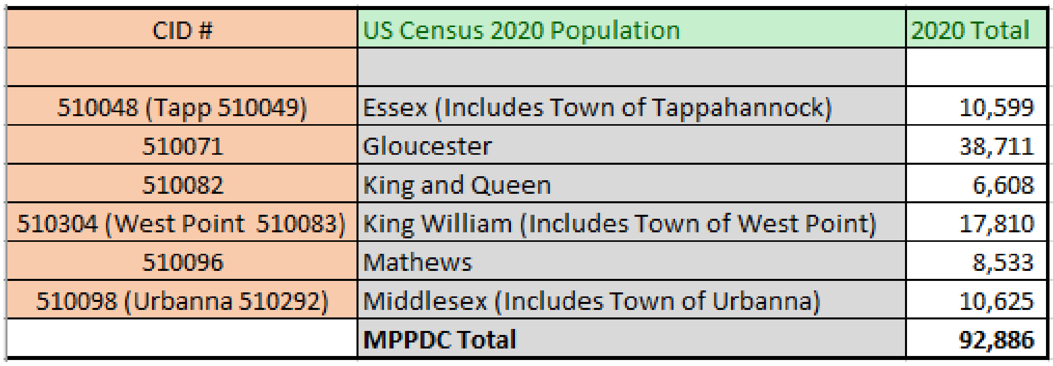

CID #	US Census 2020 Population	2020 Total

	MPPDC Total	**92,886**

The project proposes to study and assess site conditions and develop designs to enhance the resiliency of Gloucester Point Beach Park, an approximately 5-acre property located in Gloucester County on the York River, at the southern entrance to the County from Yorktown and adjacent to the Virginia Institute of Marine Science. A partnership exists with the Virginia Department of Wildlife Resources which manages one of the public boat ramps. (**Figures 4 and 5**).

Figure 4. County Map of Project Location

Figure 5. Parcel Map of Project Location

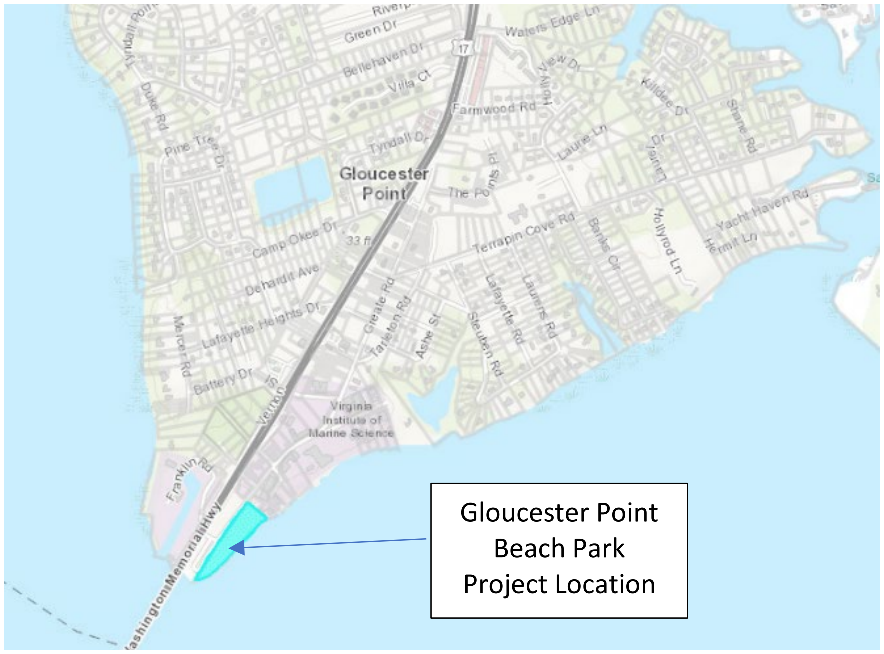

Figure 5. Map of Middle Peninsula Low Income Qualifying Geographic Areas

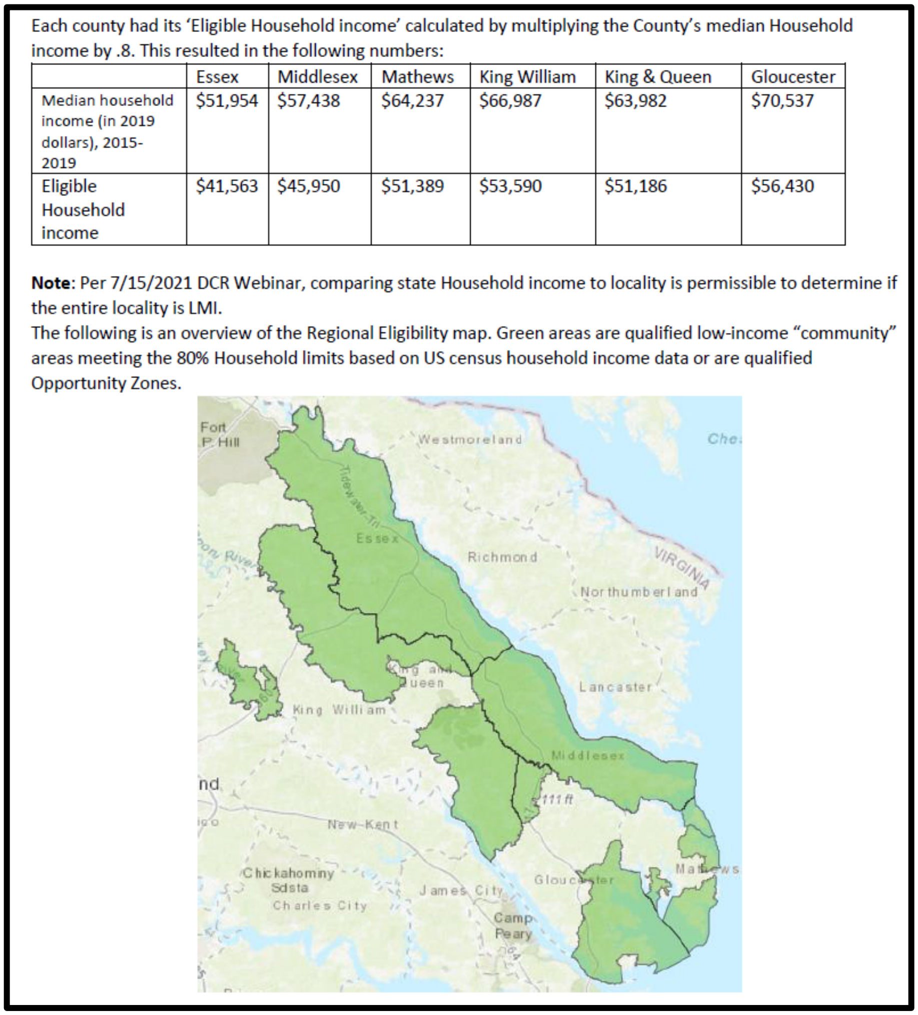


Each county had its 'Eligible Household income' calculated by multiplying the County's median Household income by .8. This resulted in the following numbers:

	Essex	Middlesex	Mathews	King William	King & Queen	Gloucester
Median household income (in 2019 dollars), 2015-2019	$51,954	$57,438	$64,237	$66,987	$63,982	$70,537
Eligible Household income	$41,563	$45,950	$51,389	$53,590	$51,186	$56,430

Note: Per 7/15/2021 DCR Webinar, comparing state Household income to locality is permissible to determine if the entire locality is LMI.

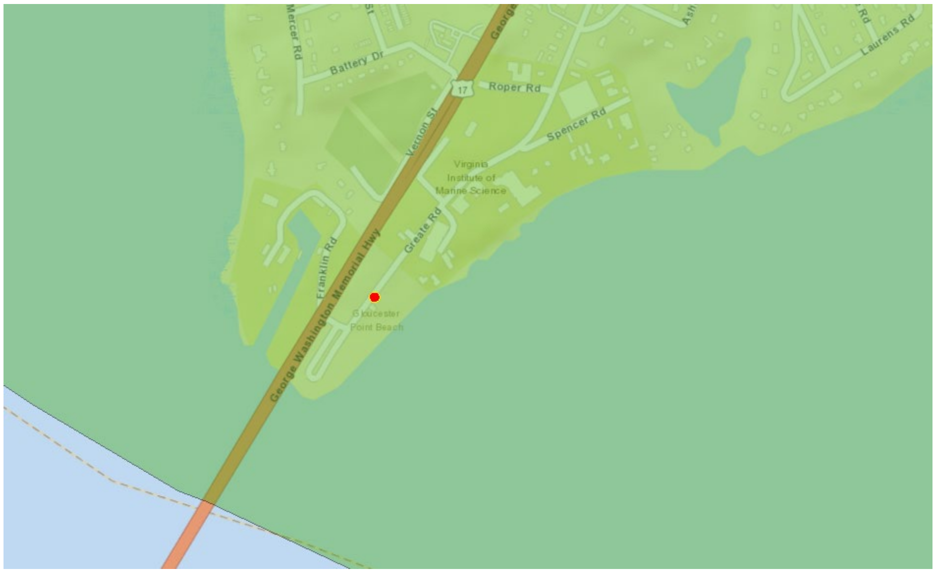
The following is an overview of the Regional Eligibility map. Green areas are qualified low-income "community" areas meeting the 80% Household limits based on US census household income data or are qualified Opportunity Zones.

Population Information

Gloucester County is located at the southern tip of the Middle Peninsula and is an agriculture, forestry and water-based economy. The County is comprised of 218 square miles of land and 296 miles of shorelines. Based on 2020 Census Data, Gloucester County's population totals 38,711, making it the largest of the six Middle Peninsula localities (**Figure 3**).

According to DCR guidelines, a portion of the county is considered a low-income geographic area. In **Figure 5**, the green areas depict qualified low-income “community” areas meeting the 80% Household limits based on US census household income data[1] or are qualified Opportunity Zones.

Figure 6. Map of the Project Location (red dot) within in the Green Low-Income Area



Please see **Figure 6** (above) and **Figure 7** (right) for detailed maps of the project location showing the green low-income area overlay and Designated Opportunity Zone, respectively. This shows that the project location is within the low-income area and a Designated Opportunity Zone.

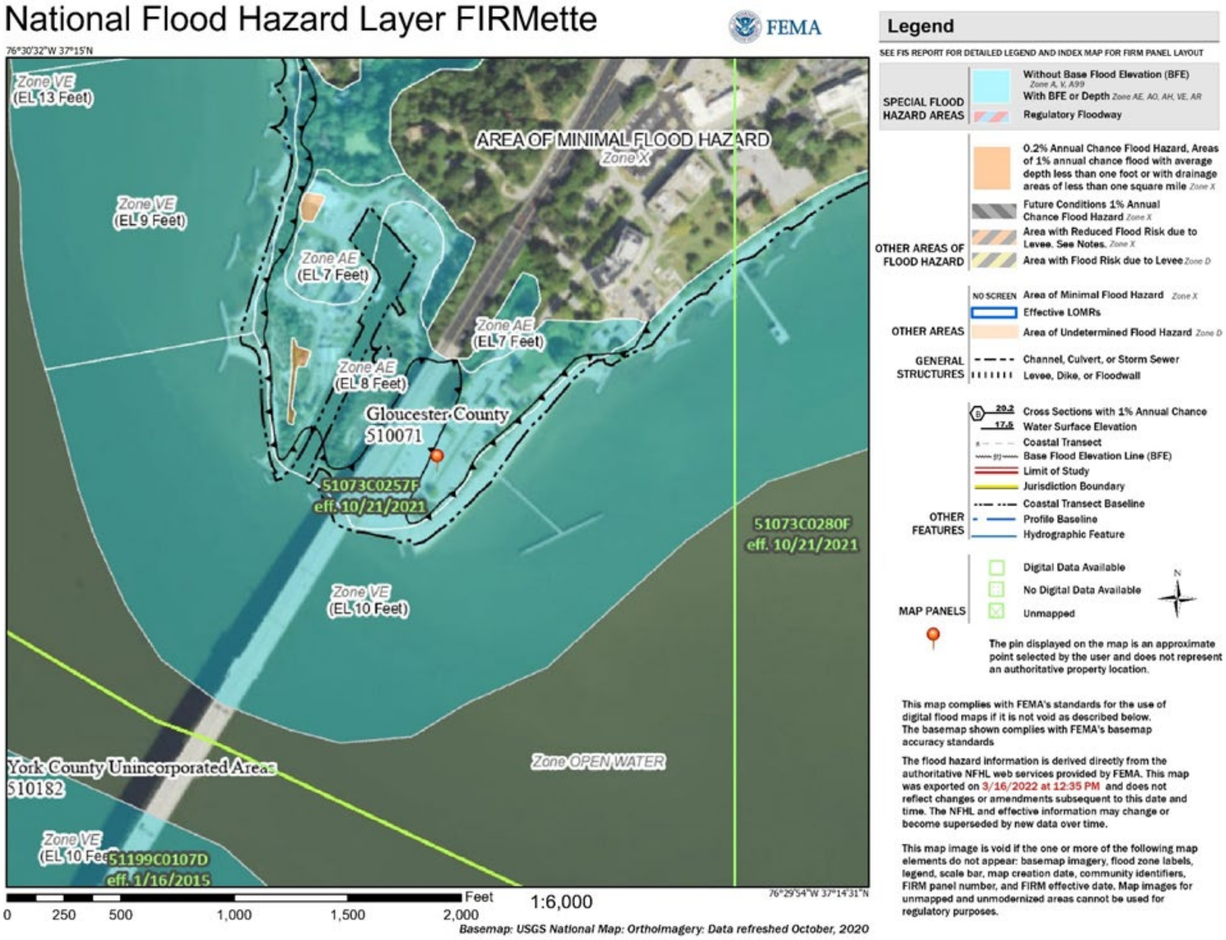
Flood Risk Information

The entirety of the site (1255 Greate Road, Gloucester Point, VA 23062, 37.24634, -76.50287) is located within a mapped floodplain, with portions located within FEMA Flood Zones AE and VE (**Figure 9**). Gloucester County's Building and Engineering Department administers the requirements of the NFIP program, and the County's Floodplain Management Ordinance may be accessed at the following link: http://gloucestercounty-va.elaws.us/code/coor_ch8.5

Figure 9. Map of FEMA Flood Zones



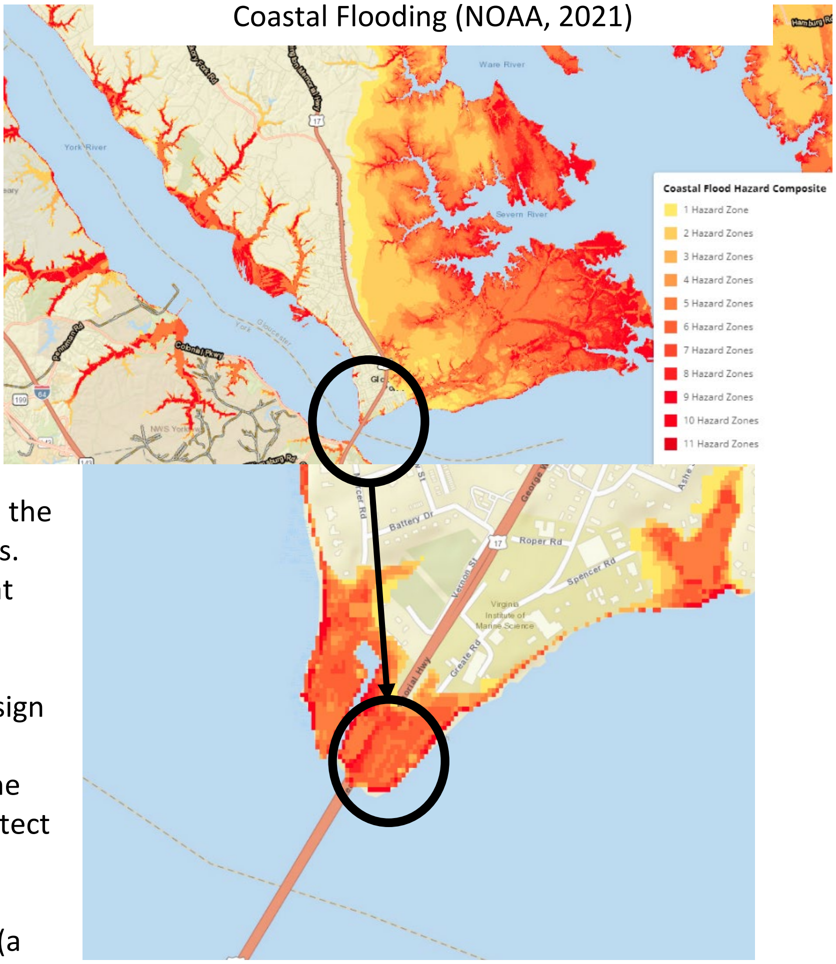
As noted in the *Introduction* and represented in photographs contained herein, the project site is impacted by ever increasing effects of coastal and tidal influences, resulting in site flooding and drainage issues. Due to the project site's adjacency to the York River and relatively low elevation, the site has an extensive history of experiencing flooding events that have resulted in significant impacts to infrastructure and the environment. For example, the project location has long been, and continues to be, impacted by tropical, sub-tropical, and Nor'easter events. **Attachment 3** lists 87 storm events dating to 1851 in the general project location. According to NOAA's Coastal Flood Mapper, this project location is at the highest risk of coastal flooding (**Figure 10**).

Since 2003 there have been at least 7 significant coastal events resulting in flooding impacts to the services building:

- Hurricane Isabel in 2003, resulting in 5' of water in the building,
- a nor-easter in 2005 resulting in 3' of water in the building,
- a nor'easter in 2010,
- a nor'easter in June 2011,

- Hurricane Irene in August 2011 that resulted in 1’ of water in the building,
- a nor’easter in 2012,
- and a coastal storm in October 2015.

Figure 10. Map of Project Location and Risk of Coastal Flooding (NOAA, 2021)



The damage from Hurricane Isabel in 2003 was extensive, likely the storm of record in the Park’s 40-year existence. In addition to approximately 5’ of water in the building, the storm ripped up the Park’s pier, pushed the stage through one of the services building’s cinderblock walls (**Figure 13**) and damaged the playground.

Despite not being named storm events, the site is subjected to regular flooding events, that result in damages, although perhaps not to the degree of the aforementioned events. With nearly every nor’easter the boat landing, parking lot, and park flood. During other smaller storms, water ponds within the park and lots. A design is needed to achieve the goals of stormwater management, to keep the Park as usable as possible and to protect the expensive infrastructure and amenities. While flood insurance is maintained for the services building (a claim was filed for approximately $47,000 in 2003 due to Hurricane Isabel) retaining the building in a condition that is subject to flooding impacts is not the best way to manage resilience long term, subjecting the County, its taxpayers, and even state and federal taxpayers to incremental and varying costs.

NEED FOR ASSISTANCE

The Middle Peninsula Planning District Commission (MPPDC) is a political subdivision of the Commonwealth of Virginia formed under VA Code §15.2-4203 to provide solutions to problems of greater than local significance and cost-savings through economies of scale. The MPPDC serves nine localities of the Middle Peninsula including Essex, Gloucester, King & Queen, King William, Mathews, and Middlesex counties, as well as the Towns of Tappahannock, West Point, and Urbanna.

MPPDC is staffed using multiple methods including co-operative procurement, hourly, and burdened FTE staff. MPPDC staff consists of an Executive Director, Deputy Director, Chief Financial Officer, Senior Project Planner, and clerical support staff; a Director of Planning, General Planner, Certified Flood Plain Manager, Transportation Planner, and Emergency Planner are co-operative procured; Housing, Community Development Planner and Public Relations staff are hourly.

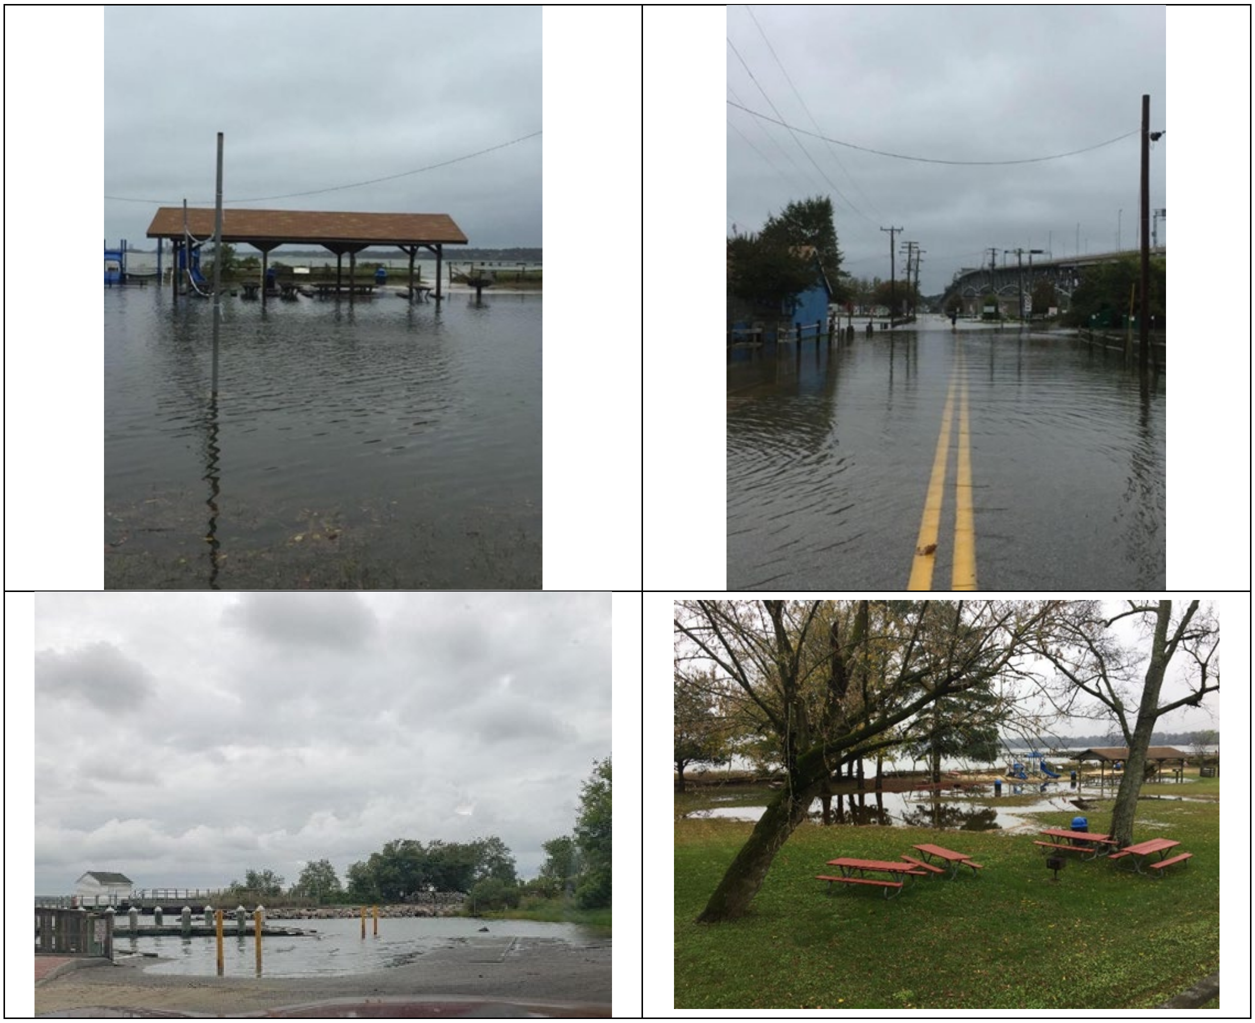
The Planning District staffing team assists localities with long-term and/or regional planning efforts. The MPPDC Executive Director, Deputy Director, and Chief Financial Officer have decades of experience in managing and administering project grants at multiple scales - from grants in excess of $1,000,000 to small grants. MPPDC is an entrepreneurial-based government agency with an annual operating budget ranging from $750,000 to more than $1,000,000. Annually, the MPPDC manages 25-30 concurrent federal and state grants utilizing industry standard Grants Management Software and other software (e.g., GIS, Microsoft Office) as required and/or necessitated by different grants. The MPPDC operates service centers in the topical areas of: coastal zone management, emergency planning, housing, transportation planning and transportation demand management, economic development, social assistance, small business development, general planning and technical assistance, as well as other areas determined by the Commission. MPPDC has more than 25 years of experience managing multiple revolving loan programs. In the 25 years that the Executive Director has been employed by the Commission, no audit findings have occurred.

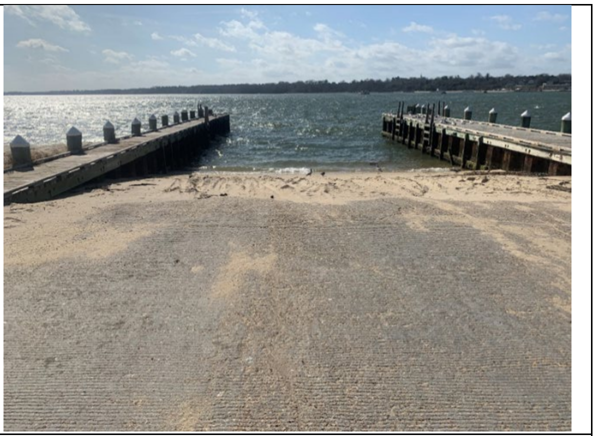
As noted, the Gloucester Point Beach Park serves as a popular and important recreational and economic resource. The Park was consistently ranked as *Very Important* in the 2016 Needs Assessment conducted by GreenPlay, LLC, wherein open-ended comments note that the beach needs to be cleaned up and improved, and general improvements ranked very high as a general maintenance note for the County. In 2019, ecotourism in the Middle Peninsula region including $33.1 million total impact, which increased by about 13.5 percent from 2014. Ecotourism in the region includes: aquaculture tours, canoeing and kayaking tours, oyster harvesting tours, and wildlife charter cruises. Recent growth suggests ecotourism is an emerging opportunity in the region as sales grew at an average annual rate of 3.2 percent between 2014 and 2019. For Gloucester County specifically, the marine economy (i.e., businesses dependent on marine resources) accounts for 11.4 percent of the total employment in the County, generating approximately $19 million in wages (according to NOAA Coastal County snapshots). It should also be noted that these economic activities are more significant during the peak season, such as warmer weather months. Despite continued maintenance of the facilities, the long-term viability of the site is in question without a resilience focused design intervention and the retrofitting and reconstruction of certain facilities.

Presently, there is no managed drainage in the Park, and during periods of heavy rain or storms, the park holds water, limiting and preventing use, including parking. The boat ramp experiences persistent shoaling and sediment deposition due to the current configuration of the ramp and adjacent piers which limits access and is in need of a more resilient design to protect from increased storm events and recurrent shoaling. Specifically, the shoaling is occurring from sediment moving along the shoreline at the public beach area at the site. The current pier adjacent to the ramp catches much of the sediment however, the current design is resulting in the sediment bypassing the pier where it is filling in the ramp. A design is needed to slow or prevent sand entering the boat ramp. It is known that there is deep water near the foot of the ramp and a plausible design would be to reconfigure the pier or deploy rock or concrete structures which would allow for greater trapping and blocking capacity of sand. Additionally, a reconfigured design could allow for any sand that does bypass the pier to be redirected into deeper water where it is not detrimental to access at the ramp and could even provide for improved gradient and reduced drop off into deep water at beyond the foot of the ramp.

The park is one of the first things seen from the bridge when entering Gloucester, and without this project it will become an eyesore and a monumental loss for the economy of Gloucester County and the Middle Peninsula. **Figure 11** illustrates present site conditions, including instances of flooding and the vulnerability of facilities.

Figure 11. Photos of Project Site Existing Conditions

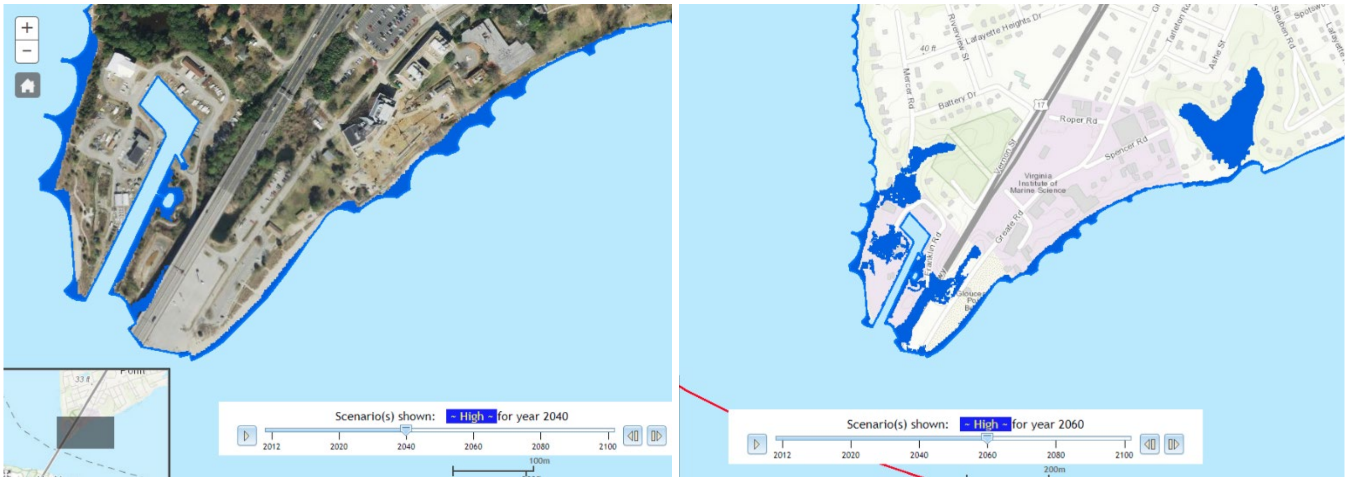




Without considering design interventions and construction proposed, the site and public infrastructure will be compromised, resulting in degradation of the site and loss of public assets. Flooding propensity remains the biggest weakness of Gloucester Point Beach Park. The area around the Gloucester Point Beach Park site is prone to frequent flooding and lies within the floodplain of the York River. Any category of storm will flood the site, damaging the property and precluding access. Moreover, rising sea levels will have a negative impact on the property, inching the water closer to the site's active resources, increasing the likelihood of significant flooding.

Figure 12 illustrates flood levels combined with sea-level rise and their effects on the site. Notably, floods in 50 years pose an issue to the many structures on site; key construction techniques will need to be employed to retrofit each structure in order to mitigate the effects of exceptional floods and sea level rise 50 years and out.

Figure 12. Sea Level and Flood Elevation



Projection for 2040 Sea Levels *Projection for 2060 Sea Levels*

The need for assistance is two-fold. First, Gloucester County is near the Chesapeake Bay and numerous tidal rivers that contribute to the area’s high risk to coastal flooding, sea-level rise, and storm surge. Based on tidal gauge data from the Virginia Institute of Marine Science (VIMS), relative sea-level rise rates ranging from 0.11-0.23 in./yr. (2.9-5.8 mm/yr.; period: 1976-2007; 10 stations) within the Chesapeake Bay region, which are the highest rates reported along the U.S. Atlantic coast (Boon et. al., 2010). In addition to sea-level rise, Gloucester County has a history of being impacted by hurricanes and tropical storms. As storms pass over or near the coast, the atmospheric pressure drops, causing a large volume of sea water to build up, eventually being pushed ashore by the storm’s winds as storm surge. Strong East and Northeast winds in Gloucester County can push water from the Chesapeake Bay into the mouth of the York and Rappahannock rivers, as well as Mobjack Bay, flooding much of the county’s low-lying areas (MPPDC, 2005). When a storm makes landfall at high tide, the storm surge and the added water from the tidal fluctuation combine to create a “storm tide”. In Gloucester County, tidal waters fluctuate twice daily from 1.2 feet above mean sea level to 1.2 feet below (FEMA 1987, 6). If a severe hurricane were to make landfall during high tide, an additional 1.2 feet of water would be added to the highest storm surge possible, potentially creating a storm tide of 16.2 feet (Rygel, 2005).

Nor’easters, like hurricanes and tropical storms, can dump heavy amounts of rain and produce hurricane-force winds that push large amounts of seawater inland. The public services building itself has suffered from four to five different hurricane and nor’easter events that have led to flooding issues in the building. Other issues rose from long-term exposure to flooding issues have led to the deterioration of the entire playground structure by breaking down toys sooner than expected. The most significant flood damages to the site resulted from Hurricane Isabel in 2003 (see **Figure 13**). The storm created a new record of damages to the site’s 40-year history, flooding the public services building with up to 5’ of water. In addition, the storm ripped through the fishing pier, pushed the stage through the cinderblock wall of the public services building, and severely damaged the children’s playground.

Figure 13. Aftermath Conditions of Hurricane Isabel (2003)

According to a recent study conducted by the Center for Coastal Resources Management, a one-and-a-half-foot rise in sea level coupled with a three-foot storm surge - similar to what would be experienced in a strong tropical storm - would lead to 13% of Gloucester County’s land mass being flooded – including 118 miles of roads. Notably, only 3% of this projected flood area is currently developed.

A strong indicator that Gloucester County is experiencing the impact of coastal hazards (i.e., flooding, hurricanes, sea-level rise, and storm surge) is the number of repetitive loss and severe repetitive loss claims submitted by residents and businesses to FEMA. As of 2015, Gloucester County had 147 repetitive loss properties with claims topping $3.3 Million and 13 severe repetitive loss properties with claims totaling nearly $1.9 Million. The county has implemented several preventative measures, property protection policies, public information activities, and emergency service measures to decrease impacts on its communities. This project will therefore build on local efforts moving toward a more resilient community.

Second, this project location is primed for co-benefits derived from flood mitigation efforts. While the proposed application of flood resilient facilities and implementation of stormwater drainage will facilitate the flow of stormwater toward new drainage features, providing increased public access to the infrastructure at this point of interest, secure public access and the sustainability of site infrastructure has implications that will reverberate throughout the community. Strategic protection of the infrastructure and landscape at this point of interest will, for example, facilitate multiple, simultaneous activities that will contribute to economic growth in the area while fostering innovation.

Business Development

The potential of continued and increased tourism drawn to the recreational site and continued and enhanced accessibility for commercial users at the boat ramp are significant. Visitors seeking a variety of outdoor activities could be drawn to activities available at Gloucester Point beach Park, supporting the local economy with outside revenue in their pursuits. The project proposes demolishing and replacing an existing structure with public restroom facilities, storage for park staff and a separate room for concession operations. Close proximity to recreational opportunities has increasingly become a factor in where businesses decide to locate. The provision of a public access site with enhanced amenities thus has the potential to drive continued economic growth through business development in the area. Moreover, the boat ramps and fishing pier provide key access to the waterways for commercial seafood fishing industries. Lastly, VIMS' faculty endeavors offer the potential for research and development on site leading to new start-up businesses within the county. Notably, the MPPDC and Gloucester County Economic Development Authority are actively identifying resilience and water management-related businesses as a strategy to actively expand existing businesses and recruit new ones to the region and county.

Community Scale Benefits

Due to the multitude of public investment for flood research and innovation, we believe this site meets the test of "Priority shall be given to projects that implement community-scale hazard mitigation activities that use nature-based solutions to reduce flood risk." The Gloucester Point Beach Park site serves as one of the Commonwealth's best chances to innovate flood projects in "live time" so that all of coastal Virginia can benefit.

ALTERNATIVES

The submission of alternatives is not applicable in this application. Nature-based and hybrid solutions are anticipated, and the project cost is less than $3 million.

GOALS AND OBJECTIVES

This proposal will develop a comprehensive strategy to increase resilience of a site against multiple flooding inputs while providing co-benefits that foster resilience at the Gloucester Point Beach Park. The focused goals and objects of the project are as follows:

Goal 1: Improve public access to local coastal waterways.

- Objective A: Increase public access to the York River with improved conditions and mitigation of recurrent and repetitive flooding using a nature-based approach on site.
- Objective B: Enhance quality of life for local residents and visitors alike through recreation, educational and cultural opportunities, and commercial fishing at the point of interest.
- Objective C: Leverage improved public access and coastal resiliency for economic growth within Gloucester County.

Goal 2: Improve coastal resiliency within the community and the Commonwealth.

- Objective A: Mitigate recurrent and repetitive flooding alongside storm surge and sea level rise using natural and nature-based solutions that benefit people and the economy as well as the environment.
- Objective B: Prevent loss of life and reduce property damage by mitigating for recurrent, repetitive, and future flooding within the project area using a nature-based design approach.
- Objective C: Enhance the resilience of public infrastructure, ensuring longer-term viability.

Goal 3: Transferability to other communities.

- Objective A: Model natural and nature-based solutions for coastal sites exploring development potential.
- Objective B: Foster innovative research and solutions-oriented studies on site focused on coastal adaptation and mitigation for external transfer.
- Objective C: Improve the implementation of Fight the Flood as a model program to be replicated in other communities within the region and/or Commonwealth.

The MPPDC expects the following results and benefits of the completed project:

1. **Foster economic growth in the area over the useful life of site infrastructure and most likely, beyond.** Enabling public access to this county asset while ensuring its sustainability will protect and enhance the area's recreational economies and has the potential to positively impact related commercial endeavors.

2. **Prevent loss of property without cementing an alternative.** Building resilient structures and facilities at the project site as outlined will help prevent loss of property and property value, while capitalizing on the useful life of the site as much as possible.

3. **Provide ecosystem services to the community toward increased quality of life.** Increased public access to recreational, educational and cultural opportunities leverage the provisioning and cultural services associated with the site's natural resources, services that provide benefits to safety, health and well-being for all visitors.

APPROACH, MILESTONES, AND DELIVERABLES

As noted, the intent of this project is to enhance the resilience of the Park by addressing persistent and increasing flooding impacts, which have compromised on-going maintenance activities and long-term viability of the Park. The project would involve an overall evaluation and study of the site with respect to stormwater and flooding impacts, site surveying and environmental assessment, development of design plans for the site and facilities taking into account programming and service needs, with a focus on resilience goals and objectives, to include civil engineering, landscaping, and architectural services, and demolition and reconstruction of the services building located on the site. This plan will include nature-based and hybrid mitigation designs where possible, and will utilize and integrate sustainable planning, design, environmental management and engineering practices that capitalize on natural features while allowing for floodwater inundation and reducing the exposure to public facilities, promoting adaptation and resilience in the process. Ultimately, the project will ensure continued access and usability of the site, with developed designs and construction addressing and accounting for flooding and impacts of sea-level rise.

As referenced above, the principal tasks and milestones are as follows:

- Stormwater Flooding Resilient Study and Design: Evaluation and study of the site with respect to stormwater and flooding impacts including site improvement designs and cost estimates;
- Boat Ramp Resilient Design and Cost Estimates;
- Resilience Enhancements for Building to include:
  - Site surveying and environmental assessment;
  - Development of design plans for the site and facilities, to include civil engineering, landscaping, and architectural services;
  - Demolition and reconstruction of the services building located on the site; and

A partnership exists with the Virginia Department of Wildlife Resources, which manages one of the public boat ramps and will be engaged in the design and implementation of the project. With respect to the replacement building, designs will incorporate drop-in flood gates to protect the interior, and if funding is sufficient, the project will exceed requirements for waterproofing and dry floodproofing by including these design features above the 100-year flood level to the greatest extent possible in order to prepare for the effects of sea level rise. The project will occur within the AE regulatory floodplain with a base flood elevation of 8’. New construction in this zone will result in a ‘no-rise’ scenario, meaning that construction activities will not increase the risk of flooding to new or existing structures.

The proposed activities will comply with all regulatory and permitting authorities. Additionally, the proposed project construction will occur near existing dunes and dune grasses. Construction activities will be designed to prevent damage to dunes and dune grasses by including additional perimeter fencing around the dunes and restricting any excavation work such that no dunes are destabilized. A coastal sand beach and shoreline exists on the other side of the dune (seaward side of the dune) and shall not be disturbed by construction activities related to this project.

The expected timeline for the project milestones, and deliverables, is as follows:

Year 1/Months 1-12 - Site Evaluation and Design

- Months 1-8: Occurring contemporaneously, the site will be surveyed, an environmental assessment will be performed, and the site will be evaluated and studied with respect to stormwater and flooding impacts. Deliverables will include a site survey and reports on the environmental assessment and stormwater/flooding studies.
- Months 7-12: Design plans for the site and facilities will be developed. Design plans will include engineering and landscape plans for the site, as well as architectural plans for the reconstructed building.

Year 2/Months 12-24 - Site Development

- Months 13-16: Based upon design plans and costs estimates, the County will consider prioritization and programming of site improvements beyond building demolition and reconstruction.
- Months 16-24: Site development activities will be initiated, to principally focus on demolition and reconstruction of the Park's services building.

Year 3/Months 24-30 - Project Completion

- Months 24-30: Site development activities, including building reconstruction, will be completed.

RELATIONSHIP TO OTHER PROJECTS

While the specific proposed project bears no direct relationship to specific past, future, or future resilience projects, the project does relate to larger regional resilience efforts. For more than 40 years, the Middle Peninsula Planning District Commission (MPPDC) and its participating localities have worked diligently on topics associated with the land water interface, including coastal use conflicts and policies, sea level rise, stormwater flooding, roadside ditch flooding, erosion, living shorelines, coastal storm hazards (e.g., hurricanes, tropical storms), riverine and coastal flooding, and coastal resiliency.

The proposed project is a priority project generated from the Middle Peninsula Regional Flood Resilience Plan, which was approved by DCR in August of 2021. This Flood Resiliency Plan serves as the MPPDC's guiding document for its flood resiliency programs and is comprised of two primary MPPDC-approved policy documents. These documents frame the foundation and implementation of the Middle Peninsula flood protection approach and are indirectly and directly supported by specific regional planning documents each approved by federal, regional, and/or local partners as required by statute.

Other plans and resources integral to the implementation of the Flood Resiliency Plan include:

Long Term Planning

- Middle Peninsula All Hazard Mitigation Plan - FEMA and Middle Peninsula locality, approved 2016 (MPPDC Website)
    - This overarching project provides updates every five years on the hazards within the region; it identifies the top hazards within the region and provides a HAZUS assessment that analyzes flooding (riverine and coastal), sea-level rise and hurricane storm surge impacts in the region. Additionally, this plan lists strategies and objectives that guide member localities to mitigate for these strategies.
- Middle Peninsula Comprehensive Economic Development Strategy – MPPDC, approved March 2021
- Middle Peninsula VDOT Rural Long Range Transportation Plan – MPPDC, approved annually

Short Term Implementation

- Middle Peninsula Planning District Commission Fight the Flood Program Design - MPPDC Commission, approved June 2020; Chairman approved update 8/6/21
- Middle Peninsula Planning District Commission Living Shoreline Resiliency Incentive Funding Program - Virginia Revolving Loan Fund Program Design and Guidelines, approved 2015

The MPPDC has a history of continuous work on flooding and coastal resiliency topics, as described in **Attachment 4**. These projects have built upon each other to establish within the MPPDC a solid foundation of regional expertise in flooding and coastal resiliency. Now, given this history of accumulated information and knowledge, the MPPDC can move beyond research and studies to begin implementing projects on the ground. One such effort, launched in 2020 following the Commission's authorization, was developed in response to emerging flood challenges. This effort, the **Middle Peninsula Fight the Flood (FTF) Program**, leverages state and federal funding to deliver flood mitigation solutions directly to constituents, for both the built and natural environments with an emphasis on nature-based flood mitigation solutions. The Middle Peninsula **FTF** program helps property owners gain access to programs and services to better manage challenges posed by flood water. MPPDC staff have partnered with private property owners registered for the FTF program to assist them in finding funding for their shoreline.

Finally, the Flood Resiliency Plan and associated programs strive to carry out the guiding principles and goals set forth in the Virginia Coastal Resilience Master Planning Framework established in 2020. The proposed activities are proposed in accordance with the guiding principles and with the intent that their outcomes will help the Commonwealth meet the goals set forth in the planning framework.

MAINTENANCE PLAN

A maintenance plan is not applicable in this application. The proposed project is to develop a nature-based design solution and its cost does not require ongoing operation and future maintenance.

CRITERIA

Describe how the project meets each of the applicable scoring criteria contained in ***Appendix B*** *and provide the required documentation where necessary. Documentation can be incorporated into the Scope of Work Narrative or included as attachments to the application.* ***Appendix B*** *must be completed and submitted with the application.*

For local governments that are not towns, cities, or counties, the documentation provided for the criteria below should be based on the local government or local governments in which the project is located and/or directly impacts.

1. **Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these or a recognized state or federal Indian tribe?**

    - Yes; the applicant is a regional planning district commission.

2. **Does the local government have an approved resilience plan meeting the criteria as established by this grant manual? Has it been attached or a link provided?**

    - Yes; the MPPDC's DCR-approved resilience plan may be accessed at the following link: https://fighttheflooodva.com/wp-content/uploads/2021/08/Approved-8_19_DCR-packet_letterandplan.pdf

3. **For local governments that are not towns, cities, or counties, have letters of support been provided from affected local governments?**

    - Yes; please see **Attachment 1**

4. **Has the applicant provided evidence of an ability to provide the required match funds?**

    - Yes; please see **Attachment 1**

5. **Has the applicant demonstrated to the extent possible, the positive impacts of the project or study on prevention of flooding?**

    - Yes

BUDGET NARRATIVE

ESTIMATED TOTAL PROJECT COST

Based upon the identified scope of work, the estimated total project cost is $1,276,332. This total estimate is based upon the following estimated cost breakdowns:

- Stormwater/Flood Site Evaluation and Study; Site Surveying; Environmental Assessment; Site and Building Design Plans (Engineering, Landscaping, and Architectural Services): $25,000
- Boat Ramp Resilient Design and Development of Necessary Draft Permit Applications: $25,000
- Demolition and Reconstruction of Building: $1,000,000
- Legal Services for Development of Bid Documents and Procurement: $15,000

Please note, the estimated costs for Stormwater/Flood Site Evaluation and Study; Site Surveying; Environmental Assessment; Site and Building Design Plans services is based upon a proposal for such services provided by Timmons Group, dated September 10, 2021, and attached as **Attachment 5**, which resulted is the production of schematic design plans (30%) only.

MPPDC staff will manage and administer this project. Thus, personnel time is needed to ensure that project deliverables are completed within the project timeline. Along with personnel expenses, MPPDC fringe is needed. This includes health insurance, retirement, group life insurance, workman's comp, and unemployment insurance. MPPDC fringe rate for FY23 is 26.21% and comprised of: Health Insurance – 48.58%, Retirement – 18.06%, Workers Comp – 0.28%, Social Security – 28.55%, Life Insurance – 4.39%, Unemployment – 0.14%. Direct charges are costs associated with overall projects costs consistent with general accounting principles. MPPDC also prepares an indirect cost (IDC) plan annually per 2 CFR 200 Appendix VII. Following annual audit, the plan is submitted to NOAA for acceptance. MPPDC's IDC rate has a basis of Modified Total Direct Costs (MTDC), with a planned rate of 27.92%. IDC is only applied to the first $25,000 of each contract. IDC calculated on MTDC (modified total direct cost)-Personnel, supplies, travel, and first $25,000 of each subcontract, etc.; excludes equipment.

					$1,065,000			
SUBTOTAL: Direct Costs						$796,088	$428,662	$1,224,750
Indirect/IDC/Facilities & Administrative Costs				**27.92%**	$51,582	$33,528	$18,054	$51,582
Total						**$829,616**	**$446,716**	**$1,276,332**
Other Match:								
Source of Match						$0	$0	$0
GRAND TOTAL						**$829,616**	**$446,716**	**$1,276,332**

AMOUNT OF FUNDS REQUESTED

The total amount of requested grant assistance is $829,616, or 65% of total project costs, as the project is located in an opportunity zone and serves a low-income geographic area and the project results in hybrid solutions. These funds, combined with local match, would be used for the services identified above.

AMOUNT OF CASH FUNDS AVAILABLE

Gloucester County will appropriate the requisite 35% or $446,716 in required local cash match funds, to be combined with the $829,616 in grant assistance to equal the total estimated project cost. The County's match commitment letter is included as **Attachment 1**.

AUTHORIZATION TO REQUEST FUNDING

The authorization to request funding is included as **Attachment 1**.

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Middle Peninsula Planning District Commission**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	☑ **Yes** ☐ **No**
Applicant Name:	**Middle Peninsula Planning District Commission**

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☑ Wetland restoration, floodplain restoration ☑ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☑ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	45
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	
7. Is the project area socially vulnerable? (**Based on ADAPT VA's Social Vulnerability Index Score.)**		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	0
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		

Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide “community scale” benefits?		
Yes	**20**	20
No	**0**	
Total Points		80

Appendix D: Checklist All Categories

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Scope of Work Narrative	
Supporting Documentation	**Included**
Detailed map of the project area(s) (Projects/Studies)	☑Yes ☐ No ☐ N/A
FIRMette of the project area(s) (Projects/Studies)	☑Yes ☐ No ☐ N/A
Historic flood damage data and/or images (Projects/Studies)	☑Yes ☐ No ☐ N/A
A link to or a copy of the current floodplain ordinance	☑Yes ☐ No ☐ N/A
Non-Fund financed maintenance and management plan for project extending a minimum of 5 years from project close	☐ Yes ☐ No ☑ N/A
A link to or a copy of the current hazard mitigation plan	☑ Yes ☐ No ☐ N/A
A link to or a copy of the current comprehensive plan	☑ Yes ☐ No ☐ N/A
Social vulnerability index score(s) for the project area from ADAPT VA's Virginia Vulnerability Viewer	☑ Yes ☐ No ☐ N/A
If applicant is not a town, city, or county, letters of support from affected communities	☑ Yes ☐ No ☐ N/A
Completed Scoring Criteria Sheet in Appendix B, C, or D	☑ Yes ☐ No ☐ N/A

Budget Narrative	
Supporting Documentation	**Included**
Authorization to request funding from the Fund from governing body or chief executive of the local government	☑ Yes ☐ No ☐ N/A
Signed pledge agreement from each contributing organization	☐ Yes ☐ No ☑ N/A

Gloucester County
Administrator's Office
Telephone 804-693-4042 *6489 Main Street, Gloucester, Virginia 23061* *Fax 804-693-6004*

March 31, 2022

Lewie Lawrence, Executive Director
Middle Peninsula Planning District Commission
P.O. Box 286
Saluda, VA 23149

RE: Support Letter for Gloucester Point Beach Park Proposal

Dear Mr. Lawrence,

Gloucester County supports the proposal for Virginia Department of Conservation and Recreation (VDCR) Community Flood Preparedness Funding for resilience enhancements at the Gloucester Point Beach Park and Landing. If the project is funded by VDCR, the County plans to provide the required matching funds.

Should you have any questions concerning our support for this project, please contact me directly at 804-693-4042.

Sincerely,

Carol E. Steele
Acting County Administrator

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 3/16/2022 at 12:35 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Attachment 4: Flood Prevention Project and its Relevance to Other Projects

MPPDC staff have worked throughout the years to understand the policy, research and impacts of flooding (i.e., stormwater, coastal, riverine, sea level rise) and coastal resiliency to the region. Below is a list of projects that have built upon each other over the year that have contributed to our understanding.

Climate Change & Sea Level Rise (2009 to 2012)

The MPPDC was funded for a 3 Phase project through the Virginia Coastal Zone Management Program to assess the impacts of climate and sea level rise throughout the region. With over 1,000 miles of linear shoreline, the Middle Peninsula has a substantial amount of coast under direct threat of accelerated climate change and more specifically sea-level. In Phase 1, MPPDC staff assessed the potential anthropogenic and ecological impacts of climate change. Phase 2 focused on the facilitating presentations and develop educational materials about sea level rise and climate change for the public and local elected officials. Finally Phase 3 focused on developing adaptation public policies in response to the assessments.

> *Phase 1:* Middle Peninsula Climate Change Adaptation: Facilitation of Presentations and Discussions of Climate Change Issues with Local Elected Officials and the General Public
> *Phase 2:* Climate Change III: Initiating Adaptation Public Policy Development
> *Phase 3:* Phase 3 Climate Change: Initiating Adaptation Public Policy Development

Emergency Management - Hazard Mitigation Planning (2009 to Present): Since 2009, the Middle Peninsula Planning District Commission has assisted regional localities in meeting the federal mandate to have an adopted local hazard plan. *The Regional All Hazards Mitigation Plan addresses the natural hazards prone to the region, including hurricanes, winter storms, tornadoes, coastal flooding, coastal/shoreline erosion, sea level rise, winter storms, wildfire, riverine flooding, wind, dam failures, drought, lightning, and earthquakes. This plan also consists of a HAZUS assessment of hurricane wind, sea level rise* (i.e., Mean High Higher Water and the NOAA 2060 intermediate-high scenario), *and flooding (coastal and riverine flooding) that estimates losses from each hazard.* The Middle Peninsula All-Hazard Mitigation Plan Update 2021 is currently being updated. The 2021 All Hazards Mitigation Plan builds off and updates previous mitigation plans.

Land and Water Quality Protection (2014): In light of changing Federal and State regulations associated with Bay clean up-nutrient loading, nutrient goals, clean water, OSDS management, storm water management, TMDLs, etc., staff from the Middle Peninsula Planning District Commission (MPPDC) will develop a rural pilot project which aims to identify pressing coastal issue(s) of local concern related to Bay clean up and new federal and state legislation which ultimately will necessitate local action and local policy development. Staff has identified many cumulative and secondary impacts that have not been researched or discussed within a local public policy venue. Year 1-3 will include the identification of key concerns related to coastal land use management/water quality and Onsite Sewage Disposal System (OSDS) and community system deployment. Staff will focus on solution based approaches, such as the establishment of a regional sanitary sewer district to manage the temporal deployment of nutrient replacement technology for installed OSDS systems, assessment of land use classifications and taxation implications associated with new state regulations which make all coastal lands developable regardless of environmental conditions; use of aquaculture and other innovative approaches such as nutrient loading offset strategies and economic development drivers.

Department of Conservation and Recreation Stormwater Management (2014)
The Virginia General Assembly created a statewide, comprehensive stormwater management program related to construction and post-construction activities (HB1065 - Stormwater Integration). The Virginia Department of Conservation and Recreation requires stormwater management for projects with land disturbances of one acre or more. This new state mandate requires all Virginia communities to adopt and implement stormwater management programs by July 1, 2014, in conjunction with existing erosion and sediment control programs. Additionally, the communities within the MPPDC are required to address stormwater quality as stipulated by the Chesapeake Bay TMDL Phase II Watershed Implementation Plan and the Virginia Stormwater Regulations. The MPPDC Stormwater Program helped localities develop tools specific to the region necessary to respond to the state mandate requirement for the development of successful stormwater programs.

Stormwater Management-Phase II (2014): MPPDC staff and Draper Aden Associates worked with localities (i.e. Middlesex, King William, and Mathews Counties and the Town of West Point) interested in participating in a Regional Stormwater Management Program. While each locality sought different services from the regional program, this project coordinated efforts, developed regional policies and procedures, and the proper tools to implement a regional VSMP.

Mathews County Rural Ditch Enhancement Study (2015): In contract with Draper Aden Associates, a comprehensive engineering study was developed to provide recommendations and conceptual opinions of probable costs to improve the conveyance of stormwater and water quality through the ditches in Mathews County.

Drainage and Roadside Ditching Authority (2015): This report explored the enabling mechanism in which a Regional Drainage and Roadside Ditching Authority could be developed. An Authority would be responsible for prioritizing ditch improvement needs, partnering with Virginia Department of Transportation (VDOT) to leverage available funding, and ultimately working toward improving the functionality of the region's stormwater conveyance system.

Living Shoreline Incentive Program (2016 to present)
In 2011 Virginia legislation was passed designating living shorelines as the preferred alternative for stabilizing Virginia tidal floodplain shorelines. The Virginia Marine Resources Commission, in cooperation with the Virginia Department of Conservation and Recreation and with technical assistance from the Virginia Institute of Marine Science (VIMS), established and implemented a general permit regulation that authorizes and encourages the use of living shorelines however, no financial incentives were put in place to encourage consumers to choose living shorelines

over traditional hardening projects in the Commonwealth. To fill this, need the MPPDC developed the MPPDC Living Shoreline Incentives Program to offer loans and/or grants to private property owners interested in installing living shorelines to stabilize their shoreline. Currently, loans are available to assist homeowners to install living shorelines on suitable properties. Loans up to $10,000 can be financed for up to 5 years (60 months). Loans over $10,000 can be financed for up to 10 years (120 months). Interest is at the published Wall Street Journal Prime rate on the date of loan closing - currently at 5.25% (11/29/18). Minimum loan amount is $1,000. Maximum determined by income and ability to repay the loan. Finally, there are currently no grants available in this program. Since 2016 under the MPPDC Living Shoreline Revolving Loan program, 8 living shorelines have been financed and built to date encumbering ~$500,000 in VRA loan funding and ~$400,000 in NFWF grant funding. Living Shoreline construction cost to date range per job $14,000- $180,000. MPPDC oversees all aspects (planning, financing, constriction, and loan servicing) of these projects from cradle to grave.

Mathews County Ditch Project - VCPC White Papers (2017): This report investigated the challenges presented by the current issues surrounding the drainage ditch network of Mathews County. The study summarized research conducted in the field; examined the law and problems surrounding the drainage ditches; and proposed some next steps and possible solutions.

Mathews County Ditch Mapping and Database Final Report (2017): This project investigated roadside ditch issues in Mathews County through mapping and research of property deeds to document ownership of ditches and outfalls. This aided in understanding the needed maintenance of failing ditches and the design of a framework for a database to house information on failing ditches to assist in the prioritization of maintenance needs.

Virginia Stormwater Nuisance Law Guidance (2018): This report was developed by the Virginia Coastal Policy Center to understand the ability of a downstream recipient of stormwater flooding to bring a claim under Virginia law against an upstream party, particularly a nuisance claim. The report summarizes how Virginia courts determine stormwater flooding liability between two private parties.

Oyster Bag Sill Construction and Monitoring at Two Sites in Chesapeake Bay (2018): VIMS Shoreline Studies Program worked with the PAA to (1) install oyster bag sills as shore protection at two PAA sites with the goal of determining effective construction techniques and placement guidelines for Chesapeake Bay shorelines and (2) assess the effectiveness for shore protection with oyster bags on private property through time.

Fight the Flood Program (2020): The Fight the Flood was launched in 2020 to connect property owners to contractors who can help them protect their property from rising flood waters. FTF also offers a variety of financial tools to fund these projects including but limited to the Septic Repair revolving loan program, Living Shoreline incentives revolving loan fund program, and plant insurance for living shorelines

A Proposal for A/E Design Services
for the Gloucester Point Beach Park
Improvement Project

Submitted to:
Katie Legg, CPRP, Director
Gloucester County
Parks, Recreation and Tourism

September 10, 2021

Project Understanding

On Tuesday, August 31, 2021, Timmons Group met with Gloucester County officials and staff at the Gloucester Point Beach Park to review concerns and on-going maintenance issues with the property. Like many aging park facilities, amplified by the effects of coastal/tidewater influences, drainage and maintenance concerns at the park are heightening and the time has come to invest in upgrades and improvements to the park grounds and architectural facilities. Based upon this meeting, Timmons Group understands that the County is seeking Architectural and Engineering design services to adequately plan for and guide the development of the park now and into the future. Through a possible phased approach, our team will prepare an overall vision for the park, consistent with goals and visions set forth by the County and its residents, as well as a phase one plan for development.

Our scope of work will begin with an accurate survey of the site and appropriate environmental diligence, then will involve architectural, engineering, and landscape architectural design through a schematic design level document set. This 30% set of drawings will be accompanied by an opinion of probable construction cost and will be suitable for the Parks, Recreation, and Tourism Department to decisively move forward with a phase one construction project that takes advantage of CIP funding as it becomes available. This scope of services does not include design development, construction drawings, or any sort of public bid documents or processes beyond schematic design. These services will be provided later once a phase one project has been identified and fully funded. For the purposes of identifying an order of magnitude project budget, as well as the appropriate design fees that correlate, we have made the assumption that the site construction work will be approximately $1M and the building replacement construction will also be approximately $1M, for a total project cost of $2M. Our team in confident that the County can achieve a very successful project with this budget and we will work diligently to assure the project is aligned with or well below the budget at the outset.

Our staff will be available as a resource to assist the County in pursuit of various grant opportunities to achieve the ultimate funding necessary for the development of the park. Our proposed scope of work for Timmons Group and Guernsey Tingle is as follows:

Base Scope of Services

Survey Services

Timmons Group's licensed land surveyor will prepare a design and topographic survey that will be used in the planning and preliminary design of the park improvements. Anticipated scope of work includes the following:

- Topographic survey in with Horizontal Datum based on the VA. State Plane Coord.- South Zone (NAD 1983) Gloucester County Survey Control Mark Data. RTK GPS will be used to localize to the datum.
- Elevations for the project will be expressed in feet and based on the Gloucester County Survey Mark Data, which refers to NAVD 88. The vertical control will be established by conventional differential leveling methods from Station 180. If this station is destroyed an additional fee may be required. A temporary benchmark will be placed on site.
- Boundary of record will be tied to existing onsite boundary monumentation. A full boundary survey and intensive easement research is not included herein.
- Underground utilities will be based on Miss Utility markings and visible field located structures only.
- Location of visible gravity sanitary sewer main line manholes will be shown with rim elevation. Where accessible and visible within the manhole pipe invert elevations, pipe sizes and pipe material will be shown within the survey area. Visible cleanouts will be shown on the survey, however, invert elevations for cleanouts cannot be field determined.
- Location of visible water valves, hydrants and visible meters will be shown within the survey areas.
- Location of visible storm drainage main manholes will be shown with rim elevation. Where accessible and visible within the manhole pipe invert elevations, pipe sizes and pipe material will be shown within the survey area. Visible cleanouts will be shown on the survey, however, invert elevations for cleanouts and roof drains cannot be field determined.
- Cross sections and spot elevations will be provided at approximately 50' stations. One- foot contours will be provided. Items such as, but not limited to ditches, edge of pavement, edge of concrete, buildings, curbing, fences, etc. will be located.

Environmental Services

Timmons Group's environmental scientists will perform field work necessary for the planning and preliminary design of the park improvements. Anticipated scope of work includes the following:

- Wetland Delineation
- Wetland Confirmation
- Resource Protection Area Determination

Park Programming, Planning, and Design

Timmons Group's landscape architecture and planning team will work with the County through a series of meetings, site visits, and visioning exercises to program and plan the park improvements. Anticipated scope of work includes the following:

- Park Site and Building Programming
- County and Stakeholder Design Charrettes
- Preliminary Park Planning and Design
- Park Phasing Plan

(2) meetings on site or in-person are included in this task as well as up to (3) virtual meetings.

Civil Engineering Schematic Design

Timmons Group's Civil Engineers will prepare schematic design (30%) plans to show all site plan layout, grading and drainage, stormwater management, erosion and sediment control, and utility design elements. Anticipated scope of work includes the following:

- 30% Existing conditions and demolition plans
- 30% Site layout plans
- 30% Grading and drainage plans, including preliminary drainage study
- 30% Stormwater management plans
- 30% Erosion and sediment control plans
- 30% Utility plans
- 30% Notes, details, and specifications pertaining to the work above

(2) meetings on site or in-person are included in this task as well as up to (3) virtual meetings.

Landscape Architectural Schematic Design

Timmons Group's Landscape Architects will prepare schematic design (30%) plans to show all park playground, shelter, furnishing, and landscape design elements. Anticipated scope of work includes the following:

- 30% Specialty hardscape layout and material plans
- 30% Site furnishing plans
- 30% Landscape plans
- 30% Site lighting/photometric plans
- 30% Notes, details, and specifications pertaining to the work above

(2) meetings on site or in-person are included in this task as well as up to (3) virtual meetings.

Architectural Schematic Design (Subconsultant Guernsey Tingle)

Timmons Group will partner with Guernsey Tingle to prepare complete preliminary architectural drawings for the project. Anticipated scope of work includes the following:

- 30% Architectural plans including floor plans and 3D model
- 30% Structural engineering plans related to the building scope
- 30% Plumbing plans related to the building scope
- 30% Mechanical engineering plans related to the building scope
- 30% Electrical engineering plans related to the building scope

(1) meeting on site or in-person are included in this task as well as up to (3) virtual meetings.

Reimbursable Expenses Budget

This task will cover incidental reimbursable expenses related to the design process (i.e., printing, mileage, parking, etc.)

Proposed Fee

We propose to provide the services outlined above on a fixed fee basis.

Survey Services	$	10,240.00
Environmental Services	$	8,030.00
Park Programming, Planning, and Design	$	12,090.00
Civil Engineering Schematic Design	$	19,200.00
Landscape Architectural Schematic Design	$	8,770.00
Architectural Schematic Design (Subconsultant Guernsey Tingle)	$	19,500.00
Reimbursable Expenses Budget	$	1,000.00
Total:	**$**	**78,830.00**

Items not included in the Scope of Services of this Agreement:

Timmons Group will not perform the following services under this Agreement. At the request of the Client, these services can be added for an additional fee, but are not included in this Agreement.

1. SUE / Underground Utility Designation
2. Traffic Analysis/Studies
3. Geotechnical Investigation or Studies
4. Design Development and Construction Documents for Site or Building Scope
5. Agency Review Meetings or other Coordination
6. LEED Design Calculations or Planning
7. Maintenance of Traffic Plans, Traffic Analysis or Studies
8. Irrigation Design
9. Design of Off-site improvements for Roads or Utilties
10. Envrionmental Permits, Perennial Stream Assessments and/or Flow Determinations, Historical Resource Coordination, Mitigation Design, Wetland Impact Permitting/Permit Compliance, Environmental Abatement, Corps of Engineers or DEQ permits, VSMP/RSMP permitting, WQIA – Major or Minor
11. Permit/Application Fees unless authoirzied as a reimbursable expense above and beyond current reimbursable budget
12. Private Utility Location, Design, Coordination, or Relocation (i.e. power, cable, fiber, telephone, etc.)
13. Post-approval Changes to the Schematic Design Plans
14. Easement and R/W plats and vacations, Additional Right of Way or Easement Acquisition, Private Road Certification
15. Special inspections, materials testing, construction management, construction inspection

MPPDC Round 3 CFPF New Applications

2 messages

Curt Smith <csmith@mppdc.com> Fri, Apr 8, 2022 at 11:46 AM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>
Cc: Lewis Lawrence <llawrence@mppdc.com>, Jackie Rickards <jrickards@mppdc.com>, Heather Modispaw <Hmodispaw@mppdc.com>, "Howard-cooper, Wendy" <wendy.howard-cooper@dcr.virginia.gov>

Greetings,

The MPPDC is respectfully submitting five proposals for consideration under Round 3. These projects were requested by our member jurisdictions as projects of highest priority with regards to flood mitigation and resilience needs. The projects are located on and involve publicly-owned property and infrastructure and were identified as sites with the greatest potential for community scale benefits within the locality/region.

The proposals may downloaded via the following links:

- CID510071_GloucesterCounty_Public_CFPF.doc.pdf
- CID510098_MiddlesexCounty_Public_CFPF.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-1.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-2.doc.pdf
- CID510096_MathewsCounty_Public_CFPF-3.pdf

We thank you in advance for your consideration. Please contact me directly should you have any questions.

Best,

Curt

Curtis Smith

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☒ Floodplain Staff Capacity.

☒ Resilience Plan Development

- ☒ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☒ Resource assessments, planning, strategies and development.
  - ☒ Policy management and/or development.
  - ☒ Stakeholder engagement and strategies.

Location of Project (Include Maps): Countywide Planning and Capacity Building - All

NFIP Community Identification Number (CID#):(See appendix F 510119

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Countywide Project-All

Flood Insurance Rate Map Number(s) (If Applicable): Countywide Project-All

Total Cost of Project: $1,698,304.90

Total Amount Requested $1,360,000

Virginia Community Flood Preparedness Fund Application

Section #1: Scope of Work Narrative

April 2022

PRINCE WILLIAM
COUNTY

Capacity Building and Planning Narrative

Project Type

Development of a Flood Resilience Master Plan and Associated Staffing for Prince William County, VA

Project Overview

Flooding and flash flooding routinely occur in Prince William County (PWC) impacting many neighborhoods and commonly traveled roads. Flooding has been identified as one of the highest risk hazards for PWC in the Northern Virginia Hazard Mitigation Plan. The PWC Office of Emergency Management (PWC EM) coordinates the PWC Hazard Mitigation Workgroup which focuses on building resilience to threats and hazards that have the potential to impact the PWC community through coordination and implementation of whole community, cross-sector projects, and planning efforts to increase community resilience.

The Virginia Community Flood Preparedness Fund (CFPF) was established to provide support for regions and localities across Virginia to reduce the impacts of flooding. The CFPF is managed by the Virginia Department of Conservation and Recreation (DCR) and empowers communities to complete vulnerability assessments and develop and implement action-oriented approaches to bolster flood preparedness and resilience. PWC's Hazard Mitigation Workgroup has recommended that this funding be used to retain a consultant that will develop *Flood Resilience Master Plan* that integrates historical data, stakeholder projects, and mitigation concepts to enhance our community's resilience to floods. To support implementation of the master plan and enhance coordination among stakeholders, the grant will also include funding for three (3) full-time date-certain salary and benefit employees, a Hazard Mitigation Program Coordinator and a Hazard Mitigation Program Administrative Specialist in the Office of Emergency Management, and a Flood Resilience Coordinator in the Department of Public Works. Finally, enhanced coverage of rainfall, flood stage, discharge, and water quality sensors will help validate planning assumptions and fill data gaps to justify future projects and grant applications.

The completion of this project will result in a comprehensive planning and capacity building effort that meets the Resilience Plan criteria outlined in the CFPF Grant Manual, as follows:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science, and incorporates climate change, sea level rise, and storm surge (where appropriate), and current flood maps.

Project Background

The County participates in the Northern Virginia Hazard Mitigation Plan (NOVA HMP), as required by 44 CFR 201.6 to maintain eligibility for Federal Emergency Management Agency (FEMA) Hazard Mitigation Grant Program (HMGP) and other post-disaster federal financial assistance. The PWC Hazard Mitigation Workgroup was established in 2017 to implement the PWC-specific mitigation strategies outlined in the NOVA HMP. The Workgroup is facilitated by PWC EM and includes representatives from the Departments of Public Works, Development Services, Transportation, Information Technology, Parks, Recreation, and Tourism (DPRT), Public Safety Communications, Police (PD), the Fire and Rescue System (FRS), and the Virginia Department of Transportation (VDOT). Additional agencies and partners, such as utility or transportation providers, the School Division, town representatives and others are consulted on hazard-specific and project-specific strategies, as they are identified.

To date, the Workgroup has utilized a project management framework to coordinate efforts around specific grant programs and individual mitigation strategies. As flooding is one of the top hazards in PWC, recent efforts have focused on collecting data on flood stage elevations in flood-prone areas, providing enhanced warning about imminent flooding conditions, and increasing participation in the National Flood Insurance Program (NFIP). Examples of recent initiatives include:

> **Automated Flood Warning System (AFWS)** - To obtain more data on flood-prone areas, the Office of Emergency Management is coordinating implementation of the county's Automated Flood Warning System (AFWS). To date, AFWS sensors have been installed at 14 of the most vulnerable flooding locations within the County and has provided key data to inform future planning efforts for Transportation, DPRT and informed flood emergency response protocols for PWC PD, FRS, PWC EM, and VDOT.
>
> **Flood Insurance Awareness** – The County participates in the NFIP, along with the Community Rating System (CRS), a voluntary incentive program recognizes and encourages community floodplain management practices that exceed the minimum requirements of the NFIP. In advance of the County's recent five-year renewal site visit, the workgroup coordinated with stakeholder groups to implement stormwater management standards, flood and dam emergency response plans, robust community outreach efforts, and other activities. These efforts will yield additional flood insurance premium rate discounts for policyholders in the County.

While the County's existing hazard mitigation workgroup has been successful in coordinating and implementing small projects for specific grant opportunities, there are insufficient staff resources to continue to build sustainable planning capacity and develop a local mitigation framework that coordinates mitigation strategy implementation in a cohesive, comprehensive, and holistic way.

Capacity Building and Planning Scope of Work Requirements

The following are the objectives of the scope of work for this project, as outlined in the CFPF Grant Manual:

1. **Assess Capacity Needs and Assets**
    a. Prince William County has identified the following resource needs:
        i. **Financial**: – Development and adoption of a resilience plan is required before the County can apply for project-based funding from the CFPF. No funding is available or planned in the FY2022 or FY2023 budgets to support the development of a resilience plan or the related staff support requested in this application.
        ii. **Human:** – As a rapidly growing community, the County's existing staff positions in floodplain and watershed management are focused on the backlog of stormwater maintenance issues and review of new development. In addition, the County's Emergency Management program does not have sufficient staff resources to facilitate a whole-community, stakeholder-driven mitigation framework. Given these circumstances, the County is seeking CFPF funding to implement a Mitigation Program Coordinator, a Flood Resilience Coordinator, and a Hazard Mitigation Program Administrative Specialist for three years.
        iii. **Technical Assistance:** The County is seeking CFPF funding to retain an outside consultant to develop a flood resilience master plan. The fiscal and human capital constraints above do not allow for the development of a resilience plan with existing resources.
        iv. **Training:** Based on the strategies outlined in the Flood Resilience Master Plan will be implemented by the Mitigation Program Coordinator and Administrative Specialist as a component of the Ready Prince William community engagement program.
    b. This project will enhance program management and whole-community engagement to build capacity for hazard mitigation and flood resilience efforts with three (3) date-certain salary and benefit employees for the functions of a Hazard Mitigation Program Coordinator, a Flood Resilience Coordinator, and a Hazard Mitigation Program Administrative Specialist. Currently, all hazard mitigation and flood mitigation functions are divided up among existing staff, with no single full-time employee assigned as the comprehensive program manager for hazard mitigation and flood mitigation. In addition, this project will utilize contractual services to hire consultants to assist in the development and implementation of a PWC Flood Resilience Master Plan that will serve as the overall framework to guide hazard mitigation projects and flood resilience efforts for the next 10 years. Every component of this project seeks to increase and strength the collective knowledge, skills, and abilities of PWC to increase flood resilience and hazard mitigation efforts for the whole community.
    c. PWC EM coordinates all hazard mitigation grant applications and tracks federal and state grant funding opportunities as they apply to identified projects in the NOVA Hazard Mitigation Plan. This process will continue with the development and implementation of the PWC Flood Resilience Plan. The addition of a Hazard Mitigation Program Coordinator

position will allow us to expand participation in the Hazard Mitigation Workgroup, to key public-private partnerships, community organizations, and other whole-community partners that have a role in increasing flood resiliency in PWC.

   d. The outcome and recommended actions from the flood resilience master plan will be used to inform the County's Comprehensive and Strategic plans at their next scheduled revisions. Master plan recommendations will also be integrated into the County's mitigation strategies under the Northern Virginia Hazard Mitigation Plan and will complement the County's ongoing participation in the NFIP Community Rating System.

2. **Goals and Objectives**

   PWC Mitigation Workgroup members have identified the need for a combined planning effort as county agencies, regional partners, and private sector businesses are working relatively independently of one another to increase flood resilience in PWC. Departments and stakeholders are developing agency-specific mitigation strategies for the next five to ten years – many of which are project-oriented and in need of future funding. The CFPF is a permanent revolving fund that allows for project proposals but requires an approved resilience plan before the County can apply for or receive funding from the "project" category.

   To align these efforts with the action-oriented nature of the CFPF, the whole-community principles of the County's Emergency Management program and the needs of the County's floodplain and stormwater management functions, the Office of Emergency Management and Department of Public Works will apply for a CFPF project with the following goals, objectives and deliverables:

   a. To develop and implement a PWC Flood Resilience Master Plan that will serve as the overall framework to guide hazard mitigation projects and flood resilience efforts for the next 10 years. Effective mitigation begins with a comprehensive understanding of risk based on vulnerability to threats and hazards. This planning framework will consolidate relevant planning efforts, policy, regulatory requirements, and flood event data to ensure unity of effort in ongoing and emerging risks relating to flooding in the greater Prince William area.
   b. To enhance program management and whole-community engagement to build capacity for Hazard Mitigation and flood resilience efforts with three date-certain salary and benefit employees. These programs do not currently have positions or funding available to support the increased workload of managing contractors, coordinating with stakeholders, monitoring the implementation of mitigation strategies, and building long-term capacity in the PWC Hazard Mitigation Program. This project will build Hazard Mitigation and flood resilience planning capacity for the following functions:
      i. Hazard Mitigation Program Coordinator – Office of Emergency Management. This position will:
         1. Coordinate with the selected consultant to develop and implement the Master Plan.
         2. Develop and synchronize a local PWC Mitigation Framework with the Northern Virginia Hazard Mitigation Plan, the CRS program, the AFWS, and the Ready Prince William preparedness program.

        3. Manage the PWC Hazard Mitigation Workgroup and enhance coordination with other groups, such as the Local Emergency Planning Committee (LEPC), private sector partners, and non-profit organizations to increase whole-community coordination of all threats and hazards.
        4. Develop projects and manage the application and award lifecycle for state and local hazard mitigation grant opportunities.
    ii. Flood Resilience Coordinator – Department of Public Works. This position will:
        1. Coordinate with the selected consultant to develop and implement the Master Plan.
        2. Provide programmatic support to flood resilience and climate adaptation studies and develop strategies to mitigate flood risk in flood-prone areas.
        3. Work closely with the Hazard Mitigation Program Coordinator to implement findings of the Master Plan as it relates to floodplain and stormwater management.
        4. Evaluate related policies, procedures, and regulations and make recommendations on alternatives that will improve the community's resilience to flooding.
    iii. Hazard Mitigation Program Administrative Specialist – Emergency Management. This position will:
        1. Assist the Hazard Mitigation Program Coordinator with administrative functions relating to the CFPF grant, including, but not limited to preparing meeting notes, maintaining records, monitoring project timelines, and other requests for administrative assistance.
        2. Coordinate hazard mitigation grant administrative duties including maintaining budget, expense details, quarterly status reports, and other grant-specific requirements.
        3. Monitoring all project activities to ensure compliance with grant requirements and County procurement and grants management policies and procedures.
        4. Assist with hazard mitigation and flood awareness outreach activities to include as serving as the single point of contact for citizen inquiries.
c. Enhance coverage of rainfall, flood stage, discharge, and water quality sensors to support flood detection and warning efforts and the County's Municipal Separate Storm Sewer System (MS4) permit and Virginia Stormwater Management Program (VSMP) regulations.

3. Stakeholder Identification, Outreach and Education Strategies

Engaged Partnerships and Inclusiveness is identified as one of the four guiding principles for mitigation outlined in FEMA's National Mitigation Framework. The Framework notes that "Mitigation is advanced through the actions of many groups to collectively reduce risk vulnerability to the whole community." This project seeks to increase the coordination and partnerships that already existing in the community to enhance flood resilience and hazard mitigation priorities, where applicable, by bringing in partners and members of the community that have not traditionally been involved in the PWC Hazard Mitigation Workgroup.

The PWC Hazard Mitigation Workgroup is facilitated by PWC EM and currently includes representatives from the Departments of Public Works, Development Services, Transportation, Information Technology, Parks, Recreation, and Tourism (DPRT), Public Safety Communications, Police (PD), the Fire and Rescue System (FRS), and the Virginia Department of Transportation (VDOT). Additional agencies and partners, such as utility or transportation providers, the School Division, town representatives and others are consulted on hazard-specific and project-specific strategies, as they are identified.

This project will support enhanced stakeholder identification, outreach and education strategies by hiring dedicated staff to build a Mitigation Framework with a focus on flood resilience efforts. A major component of the mitigation framework will be to expand the existing PWC Hazard Mitigation program to incorporate additional stakeholders and provide opportunities for integrating resilience and preparedness messaging and programs with PWC's existing *Ready Prince William* community outreach and engagement program. In addition, PWC will leverage existing partnerships with key community leaders and organization to provide flood resilience information and overall hazard mitigation information and education to their constituents through their existing communications platforms including newsletters, town hall meetings, Facebook, Twitter, and Nextdoor.

A comprehensive outreach and engagement strategy will be developed as part of the development of the PWC Flood Resilience Master Plan. This will include staff actively engaging with stakeholders from the four incorporated towns within PWC, staff from the cities of Manassas and Manassas Park, key private stakeholders who have a role in flood mitigation to expand their knowledge and understanding of mitigation, flooding impacts in PWC, and how their agency may assist in reducing risk and increasing resilience to flooding by enhancing existing projects and programs. Stakeholder interviews, workshops, and surveys will be utilized to identify current and future projects, unmet needs, and ideas to organize priorities and develop a comprehensive Master plan that reflects the projects and desires by the community and stakeholders in PWC.

4. Implementation Plan and Timeline

Upon notification of award, PWC EM will identify a grant project manager to coordinate project deliverables, including hiring of personnel, procuring contractual services, and procurement and installation of flood sensors to aid in the development of the Flood Resilience Master Plan. Assuming an anticipated award date of June 1, 2022, the project period of performance will be June 2022 – June 2025.

Key programmatic roles and responsibilities of the three staff positions will be ongoing throughout the period of performance to ensure continuous program development and improvements. The following is an estimated timeline and approach for the implementation of key deliverables in this project.

Timeframe	**Milestones/Deliverables**
April 8, 2022	CFPF Round 3 Applications Due
June 2022	Anticipated Award
June-August 2022	Hiring of the three staff positions
June-September 2022	Identification of sites and selection of equipment for flood sensors
July-September 2022	Detailed contract scope of work for PWC Flood Resilience Master Plan developed and contractor selected
August-December 2022	PWC Mitigation Framework Development
September -December 2022	Installation of Flood Sensors
October 2022 – July 2023	PWC Flood Resilience Master Plan development process including: research and gathering of existing plans, collection of data from flood sensors, policies and procedures, stakeholder outreach for unmet needs and ideas for future projects, and first draft development.
September 2023	Master Plan completed
October 2023-May 2025	Plan Implementation and revision based on Mitigation program needs
May-June 2025	Project Closeout

5. Responsible parties for capacity building and/or plan development process

The 2022 VA CFPF grant funding, program elements, contract support, Hazard Mitigation Program Coordinator, and the Hazard Mitigation Program Administrative Specialist will be managed by PWC EM to ensure the PWC Mitigation Framework, with particular focus on flood resilience, is maintained and enhanced to ensure cross-sector, whole community partnerships are leveraged to maximize all resources and future funding for mitigation efforts in PWC. The Flood Resilience Program Manager will report to Public Works with oversight from PWC EM. These three positions are date certain positions and will no longer exist when the grant expires three years after the award date. In addition, PWC EM will serve as the fiduciary agency for this grant funding. The PWC Hazard Mitigation Workgroup will serve as the core planning team for the development of the PWC Flood Resilience Master Plan.

6. Performance Outputs and Measures

Performance outputs and measures for this project will be based on specific project elements:

- PWC Flood Resilience Master Plan – The key performance output for this deliverable will be the completion of a final plan that is actionable, integrating all known, relevant plans, projects, policies and procedures, identifies specific projects for implementation including identification of any necessary funding. Specific metrics for the success of the recommendations of this plan will include the development of a flood mitigation story map that identifies problem areas, projects, and successful mitigation outcomes for each area. This story map will allow real-time tracking of the success of specific strategies and actions, while also identifying the number of projects identified and completed.

- Three staff positions – Key performance outcomes and measures will be based on position roles, responsibilities and program expectations, with successful completion of assigned projects and program areas.
- Flood Sensors – The key performance measure for this portion of the project will be the successful installation and receipt of real-time data based on information gathered during the planning process.

In addition, in PWC, all projects must be tied to the impact it will make toward meeting the goals and strategies outlined in the Strategic Plan. One of the goals of the PWC 2021-2024 Strategic Plan is *Environmental Conservation*. Within this goal, objective EC-5, *reduce and mitigate the impacts of flooding in communities*, contains the following action strategies:

- EC5: B. Continue to update maps and monitor flood prone locations in the county.
- EC5: C. Work with local, state, and federal agencies to identify funding for projects that would reduce or eliminate the risk of repetitive flooding.
- EC5: D. Work with emergency management agencies to create and implement flood risk education programs.

Development and implementation of a flood resilience master plan and enhanced coordination of hazard mitigation and flood resilience efforts directly supports strategies EC5 B, C, and D. While the County's existing hazard mitigation workgroup has been successful in coordinating and implementing small projects for specific grant opportunities, there are insufficient staff resources to continue to build sustainable planning capacity and develop a local mitigation framework that coordinates mitigation strategy implementation in a cohesive, comprehensive, and holistic way. If awarded, the grant will support three (3) date-certain salary and benefit employees, a Hazard Mitigation Program Manager and a Hazard Mitigation Program Administrative Specialist in PWC EM, and a Flood Resilience Manager in PWC Public Works, to implement the recommendations of the *Master Plan,* building long-term sustainable planning capacity and directly coordinate projects and partnerships to implement these strategic plan objectives.

Another goal of the 2021-2024 Strategic Plan is *Safe and Secure Community*. Within this goal, objective SS-4, *continued and enhanced preparation for and response to public health and other emergencies* details the need for adequate coordination between PWC EM and whole-community partners.

Enhancing coverage of rainfall, flood stage, and discharge sensors directly supports flood detection and warning efforts by providing the National Weather Service with timely, accurate data about flood conditions in the County. The availability of timely, accurate, and relevant alerts will support SS-4 key performance indicator 5: increase percentage of residents who subscribe to PWC emergency notifications, because residents will be more likely to subscribe to notifications that are relevant to them.

7. Plan Maintenance

The grant supports the initial hire of three staff positions for the full 36-month project period of performance. During this time, each position will develop, maintain, and improve assigned program areas to ensure the program will continue to be operational beyond the grant period of performance. These positions will also create necessary program standard operating procedures and frameworks to allow for the continuation of activities even if these positions do not receive additional funding. PWC EM will continue to seek administrative support for the implementation of project activities in future hazard mitigation funding opportunities and, as part of future budget processes.

The initial Flood Resilience Master Plan will develop a 10-year implementation plan as part of its scope of work, including the identification of future projects, anticipated timelines, and eligible funding sources, if applicable. The PWC Hazard Mitigation Workgroup will use the Master Plan as a tool to continue to prioritize and manage ongoing program efforts and all recommendations and projects will be incorporated into the PWC Jurisdictional Annex of the Hazard Mitigation Plan mitigation actions. This plan will be the strategic and operational backbone for the next 10 years of flood mitigation and resilience activities across the County.

Supporting Documentation and Information

1. Comprehensive Plan

Prince William's current comprehensive plan was last adopted in October 2017, with revisions underway.The plan is available at http://www.pwcva.gov/CompPlan includes several areas thatare addressed by this proposal:

  i. Safe and Secure Communities
  ii. Environmental Conservation
  iii. Mobility

Of note, there are many residential structures that are constructed within 100-year floodplains that pre-date the County's comprehensive planning and land use regulations, thus this project will allow a the PWC Hazard Mitigation Workgroup to explore flood impact and related resilience

2. PWC Strategic Plan

The County's 2021-2024 Strategic Plan is the short-term tool that is used to enact comprehensive planning priorities. The plan is available at: https://www.pwcva.gov/strategic-plan.

3. Social Vulnerability Index Score

- According to ADAPT Virginia's Social Vulnerability Index, all of Prince William County's Census Tracts fall under the "Not Socially Vulnerable" classification, except for Census Tract 9005.02 near Opitz Boulevard and Route 1, which has a "High Social Vulnerability" classification due to urban/suburban socio-economic characteristics, and very high nursing home populations. This area experiences intermittent flash flooding and will be a highlighted area in the Flood Resilience Master Plan to identify mitigation actions, projects, and strategies for ongoing flood risk reduction. A past obstruction here in 2011 resulted in approximately 145 mobile homes and 16 apartments affected by flooding. An adjacent mobile home community resides in a floodway and 100-year floodplain.

4. **PWC Floodplain Ordinance** available at: https://library.municode.com/va/prince_william_county/codes/code_of_ordinances?nodeId=CH32ZO

5. **Hazard Mitigation Plan**

   Prince William County is part of the 2017 Northern Virginia Hazard Mitigation Plan, which was adopted by the PWC Board of County Supervisors on June 20, 2017. The County's Approval Letter from FEMA is attached. The plan is available at http://www.pwcgov.org/government/dept/FR/OEM/Documents/NHMP_2017.pdf

   The Northern Virginia Hazard Mitigation Plan is currently under revision with an estimated adoption date of Fall 2022. There is a current delay in the planning process due to the extreme circumstances and emergency management staff time required to respond to the COVID-19 disaster. In accordance with 44 C.F.R. § 201.6 (a)(1), PWC falls under the exception to the Local Hazard Mitigation Plan (LHMP) requirement due to the extraordinary circumstances relating to significant disruption from declared disasters and other events that have impact PWC's ability to complete the planning process within the required timeframe. Extraordinary circumstances exist when a determination is made by the Applicant and FEMA that the proposed project is consistent with the priorities and strategies identified in the State or Tribal (Standard or Enhanced) Mitigation Plan and that the jurisdiction meets at least one of the criteria outlined in the FEMA Unified Hazard Mitigation Assistance Guidance 2015. When project funding is awarded under extraordinary circumstances, the Recipient shall acknowledge in writing to the grant administrator that a plan will be completed within 12 months of the subaward.

   PWC's letter of extraordinary circumstances with additional details is attached to this application. Due to these extraordinary circumstances, PWC is requesting that DCR provide an exception to the Hazard Mitigation Plan requirement for this grant application as this plan will be completed this fall; during the initial stages of the 36-month CFPF grant period of performance and within the required 12-month timeframe outlined in 44 C.F.R. § 201.6 (a)(1).

RE: Virginia Community Flood Preparedness Fund Grant Extraordinary Circumstances Exception request for Prince William County's Flood Resilience Master Plan and Staffing Grant Application

Dear Ms. Howard-Cooper;

Due to the extraordinary circumstances of the COVID-19 pandemic, Prince William County (PWC) will not meet the Hazard Mitigation Plan prerequisite for our Virginia Community Flood Prevention Fund grant application for a Flood Resilience Master Plan and Staffing. Revisions to the 2017 Northern Virginia Hazard Mitigation Plan are well underway, however the plan has lapsed as of April 1, 2022. Concurrent with the process outlined in 44 C.F.R. § 201.6 (a)(1) for federal hazard mitigation awards, Prince William County requests that the Department of Conservation and Recreation (DCR) grant an exception to the Local Hazard Mitigation Plan (LHMP) requirement due to the following extraordinary circumstances:

- The County has been determined to have had insufficient capacity due to lack of available staffing or necessary expertise to satisfy the mitigation planning requirement prior to the current VA CFPF grant application deadline due to the following events:
    - Public Health Emergency (COVID-19) March 12, 2020 – Present (EM-3448-VA)
    - April 2, 2020: COVID, DR-4515-VA
        - Delaying in the LHMP development due to telework transitioning, reduced workforce focus (Pandemic Response) and new Virtual Engagement Plan implementation.
- The County has experienced significant disruption from declared disasters and other events that have impacted PWC's ability to complete the LHMP planning process prior to award or final approval of a project award for the VA CFPF for PWC's Flood Resilience Master Plan and Staffing project. Please find the following events which have caused this disruption:
    - Several flooding emergencies throughout 2019
    - Public Health Emergency (COVID-19) March 12, 2020 – Present (EM-3448-VA)
    - April 2, 2020: COVID-19, DR-4515-VA
    - Feb. 11, 2021: anticipated winter weather, Executive Order number 76 (2021); FEMA-4602-DR-VA. State and federal declaration
    - May 9, 2021: Colonial pipeline shutdown (Regional Emergency/Federal Motor Carrier Safety Administration)
    - Jan. 20, 2022: severe winter weather, Executive Order number 12 (2022); State declaration

Prince William County's Flood Resilience Master Plan and Staffing project is consistent with the priorities and strategies identified in the 2018 Virginia State Hazard Mitigation Plan, the 2017 PWC Comprehensive Plan, the County's 2021-2024 Strategic Plan, and is an essential component to our community's hazard mitigation and flood resilience efforts.

To remedy this situation and meet the FEMA extraordinary circumstance requirements, Prince William County has participated in the Northern Virginia (NOVA) Multi-Jurisdictional HMP planning process, will be submitting the NOVA Multi-Jurisdictional HMP in September 2022 for review and approval by VDEM and FEMA, and is prepared to adopt the NOVA Multi-Jurisdictional HMP within 90 days of receipt of the FEMA Approval Pending Adoption (APA) letter.

We understand if this exception is granted, the NOVA Multi-Jurisdictional HMP must be approved by FEMA and adopted by Prince William County within 12 months of the date of our VA CFPF award or final/conditional approval. Moreover, we understand that if this does not occur, a Virginia CFPF grant award for a Flood Resilience Master Plan and Staffing may be terminated, and any costs incurred after the notice of termination may not be reimbursed by DCR.

If you have any additional questions about these extraordinary circumstances, please do not hesitate to contact me via bmisner@pwcgov.org or 703-792-5627.

Sincerely,

Brian Misner

Virginia Community Flood Preparedness Fund Application

Section #2: Budget Narrative

April 2022

PRINCE WILLIAM
COUNTY

Planning and Capacity Building Budget Narrative

The estimated total project cost is $1,698,304.90. The total amount of funds requested from the fund is 1,360,000 to be used to fund three staff positions, contract support to develop the *PWC Flood Resilience Master Plan*, and purchase and installation of the flood gauges for data integration into the plan and subsequent projects.

Grant Cost Estimates

Detailed cost estimates are shown below:

Description	Estimated Cost	Notes
PWC Flood Resilience Master Plan	$250,000	The estimated cost based on contractual services engagement for plan development services in year one and technical assistance with plan revision and maintenance in years two and three
Hazard Mitigation Program Manager	$352,490	Annual salary and benefits are estimated to be $117,497 for a three-year estimated total of $352,490. Costs are based off mid-point hiring range for PWC Position Classification: C-42 Senior Emergency Management Specialist
Flood Resilience Coordinator	$425,140	Annual salary and benefits are estimated to be $141,714 for a three-year estimated total of $425,140. Costs are based off mid-point hiring range for PWC Position Classification: C-45 Principal Engineer
Hazard Mitigation Program Administrative Specialist	$81,515	Annual salary and benefits are estimated to be $81,515 for a three-year estimated total of $242,515. Costs are based off mid-point hiring range for PWC Position Classification: B-23 Administrative Specialist
Flood Sensors	$87,500	Estimated costs of equipment and installation for these efforts, to include the first three years These costs are based off small, rapidly deployable flood sensors that PWC is participating in a pilot with Virginia Department of Emergency Management (VDEM) and the Department of Homeland Security.

In-Kind Match

The CFPF requires a 25% local match for all planning and capacity-building projects, totaling $339,661 for this application. Existing projects from the PWC Stormwater Management Fund, managed by the Department of Public Works, will be utilized as the local match. The fund is used to facilitate stream restoration, stormwater management facility retrofits, culvert modifications, channel improvements, and drainage improvements within countywide watersheds to reduce flooding and erosion problems and/or improve water quality. The specific project to be used for the match for this project is a major stream restoration project on Powell's Creek. These activities are eligible mitigation activities under the CFPF and complement the anticipated projects and strategies that will be developed in the *PWC Flood Resilience Master Plan.*

Section #5: Board of County Supervisors Resolution Authorization for Application

April 2022

PRINCE WILLIAM
COUNTY

MOTION: **BAILEY**

SECOND: **FRANKLIN**

April 5, 2022
Regular Meeting
Res. No. 22-169

RE: **AUTHORIZE A GRANT APPLICATION TO THE 2022 VIRGINIA COMMUNITY FLOOD PREPAREDNESS FUND GRANT FOR THE DEVELOPMENT OF A PRINCE WILLIAM COUNTY FLOOD RESILIENCE MASTER PLAN AND CONTINGENT UPON GRANT AWARD, ACCEPT, BUDGET, AND APPROPRIATE UP TO $1,360,000 IN ANTICIPATED GRANT REVENUES**

ACTION: **APPROVED**

WHEREAS, one of the highest natural risks to affect Prince William County (PWC) according to the 2018 Northern Virginia Hazard Mitigation Plan is flooding and flash flooding; and

WHEREAS, The PWC Office of Emergency Management (PWC EM) coordinates the PWC Hazard Mitigation Workgroup which focuses on building capacity and resilience to threats and hazards that have the potential to impact the PWC community through coordination and implementation of whole community, cross-sector projects, and planning efforts to increase community resilience; and

WHEREAS, The Virginia Department of Conservation and Recreation (DCR) manages the Virginia Community Flood Preparedness Fund (CFPF) to provide support for regions and localities across Virginia to reduce the impacts of flooding through empowering communities to complete vulnerability assessments and develop and implement action-oriented approaches to bolster flood preparedness and resilience; and

WHEREAS, DCR has solicited applications for competitive awards through three (3) eligible categories: planning and capacity building, flood prevention and protection studies, and projects. The fund prioritizes the availability of funding for localities to develop and implement a comprehensive, whole community approach to flood preparedness and resilience to ensure coordinated mitigation efforts are maintained and enhanced by all stakeholders; and

WHEREAS, PWC's Hazard Mitigation Workgroup has recommended that this funding be used to retain a consultant that will develop a Flood Resilience Master Plan that integrates historical data, stakeholder projects, and mitigation concepts to enhance our community's resilience to floods. To support implementation of the master plan, increase long-term planning capacity, and enhance coordination among stakeholders, the grant will also include funding for three (3) full-time date-certain salary and benefit employees, a Hazard Mitigation Program Coordinator, and Hazard Mitigation Program Administrative Specialist in the Office of Emergency Management, and a Flood Resilience Coordinator in the Department of Public Works. Finally, enhance coverage of rainfall, flood stage, discharge, and water quality sensors will help validate planning assumptions and fill data gaps to justify future projects and grant applications; and

WHEREAS, the PWC EM was notified in January 2022 that DCR will be accepting applications for the CFPF grant, with a competitive application including a signed Prince William Board of County Supervisors (Board) resolution approving the application be submitted to DCR no later than April 8, 2022; and

WHEREAS, if awarded, the grant period of performance will be three (3) years after date of award; and

WHEREAS, the grant budget will be established on a reimbursement basis; and

WHEREAS, the CFPF grant requires a 25% funding match for all planning and capacity-building projects, totaling $339,661 for this application. Two (2) stream restoration projects funded by the PWC Stormwater Management Fund, managed by the Department of Public Works, will be utilized as the local match for this grant. These project activities funded by the PWC Stormwater Management Fund are eligible mitigation activities under the CFPF and complement the anticipated projects and strategies that will be developed in the Master Plan; and

WHEREAS, Katie Kitzmiller, Deputy Emergency Management Coordinator, will be the grant project coordinator; and Susan Sablinski, Fire and Rescue Administrative Services Division Chief, will be the grant fiscal agent;

NOW, THEREFORE, BE IT RESOLVED that the Prince William Board of County Supervisors hereby authorizes the grant application for the 2022 Virginia Community Flood Preparedness Fund for the development of a Prince William County Flood Resilience Master Plan and contingent upon grant award, accepts, budgets, and appropriates up to $1,360,000 in anticipated grant revenue;

BE IT FURTHER RESOLVED that the Prince William Board of County Supervisors hereby authorizes that the Acting County Executive, or designee, will serve as the signatory on all necessary documents to carry out the requirements of the grant as approved to form by the County Attorney’s Office upon notification of award.

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
☐ Storm water system upgrades.
☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☒ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): **All areas located within the municipal boundaries of the Town of Blacksburg.**

NFIP Community Identification Number (CID#):(See appendix F **510100**

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☐ Yes ☐ No **Community-Wide**

Flood Zone(s) (If Applicable): **Community-Wide**

Flood Insurance Rate Map Number(s) (If Applicable): **51121C0040C, 5112C0045C, 51121C0127C 51121C0131C, 5112C0132C, 51121C0129C 51121C0133C, 5112C0134C, 51121C0141C & 51121C0142C**

Total Cost of Project: **$100,000**

Total Amount Requested **$75,000**

Scope of Work Narrative (Town of Blacksburg Resilience Plan):

Summary

The Town of Blacksburg desires to establish a Resilience Plan analyze to study existing and future flood hazards for riverine and stormwater flooding as affected by the projected rainfall change due to climate change. The study will provide the Town with a baseline of information with which to inform and guide future *policy development*, community programs and regulatory structure. This Resilience plan will be the first step toward the goal to address and adapt in the future to maintain climate sustainability.

The Resilience Plan shall consist of the following:

- Technical Study of the current vulnerabilities specific to the Town of Blacksburg;
- Analysis of the future flooding hazards based upon anticipated changes in flood frequency;
- Estimate impacts to Town resources, critical sectors and infrastructure;
- Identify areas with social vulnerability that could become disproportionately impacted;
- Establish a toolbox of project types that could aid in addressing regional needs; and
- Provide a list of resources to aid in the future adaptability to new project types and data metrics.

Goals and Objectives:

The Town of Blacksburg has identified in the Comprehensive Plan that climate vulnerability, adaptation and resiliency is part of our Town plan for the future, we need to gather data to provide our leadership with the most accurate analysis of risk and cost effective options for solutions. Our goal with this Resilience Plan is to get a better understanding of how Blacksburg is vulnerable in the changing climate of the future using the best available data and climate modeling anticipated for our region. This plan will meet the following criteria:

- It is project-based with projects focused on flood control and resilience.
- It incorporates nature-based infrastructure to the maximum extent possible.
- It includes considerations of all parts of a local government regardless of socioeconomics or race.
- It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
- It is based on the best available science and incorporates climate change and current flood maps.

Stakeholder Identification, Outreach and Education Strategies

The Town of Blacksburg's list of stakeholders are the following:

- Town Council of the Town of Blacksburg
- Town Administration
- Departments of Planning and Engineering
- Sustainability Department

Parties Responsible for Plan Development Process

The Town's Department of Engineering and GIS will be responsible for the plan development process. This will occur in conjunction with the Planning and Sustainability departments.

Performance Outputs and Measures
The completion of a Town Resilience Plan would be a measure of success for this initial effort. This plan will provide for a baseline of information with which to inform and guide future policy development, community programs and regulatory structure.

Plans for Maintaining Capacity over the Long-Term
The Town plans to utilize this Resilience Plan as a working document and starting point for future policy development. As new information becomes available, this plan will be updated to reflect the new information. Changes can be made to the guidance as the available science changes and methods for protection and adaptation becomes more robust.

Budget Narrative (Town of Blacksburg Resilience Plan):

Summary
The Town of Blacksburg desires to establish a Resilience Plan analyze to study existing and future flood hazards for riverine and stormwater flooding as affected by the projected rainfall change due to climate change. The study will provide the Town with a baseline of information with which to inform and guide future *policy development*, community programs and regulatory structure. This Resilience plan will be the first step toward the goal to address and adapt in the future to maintain climate sustainability.

Estimated Total Project Cost
The Town estimates the project cost for a Resilience Plan will be approximately $100,000. This estimate provides for the engagement of a Consulting Firm to provide the Town with the following information: (1) A technical study of the current vulnerabilities specific to the Town of Blacksburg, (2) an analysis of the future flooding hazards based upon anticipated changes in flood frequency, (3) an estimation of impacts to Town resources, critical sectors and infrastructure, (4) the identification of areas with social vulnerability that could become disproportionately impacted, (5) the establishment of a toolbox of project types that could aid in addressing regional needs; and (6) list of resources to aid in the future adaptability to new project types and data metrics.

Amounts of Funds Requested:
The Town of Blacksburg is requesting **$75,000** grant assistance from the Fund. This will be paid directly to the Consulting Firm for the generation of the complete Resilience Plan that meets the criteria listed above. The Town is prepared to provide a match of **$25,000** for this Resilience Plan.

RESOLUTION 4-___-22

A RESOLUTION SUPPORTING THE TOWN'S VIRGINIA COMMUNITY FLOOD PREPAREDNESS GRANT APPLICATION FOR 2022

WHEREAS, the Council of the Town of Blacksburg desires to submit an application for the 2022 Virginia Community Flood Preparedness Fund in an amount of $100,000 through the Virginia Department of Conservation and Recreation and the Virginia Resources Authority;

WHEREAS, funds from the Virginia Community Flood Preparedness Fund are dedicated solely for the purposes of enhancing flood prevention or protection in Virginia, so the Town must use such funds primarily for the purpose of implementing flood prevention and protection projects and studies in areas that are subject to recurrent flooding as confirmed by a certified floodplain manager;

WHEREAS, the Town acknowledges climate change and its consequences and desires to base its decision making on the best available science, and it pledges to work to identify and address socioeconomic inequalities and to enhance equity through adaptation and protection efforts;

WHEREAS, the Council agrees that the Virginia Community Flood Preparedness Grant requires a 25% match with local funds for planning grants; and

WHEREAS, these funds are requested for the development of a Town of Blacksburg Resilience Plan in which the Town will utilize community and regional scale planning to the maximum extent possible, seeking region specific approaches tailored to the needs of individual communities.

NOW, THEREFORE, BE IT RESOLVED by the Council of the Town of Blacksburg that the Council acknowledges the preceding recitals and hereby expresses its support for the Town's application for the allocation of funds in the amount of $25,000 through the Virginia Community Flood Preparedness Grant Program.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**Town of Blacksburg, Virginia**	
	Eligibility Information	
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	✓
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	✓
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		*N/A*
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	✓
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	
No	Not eligible for consideration	✓
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☑ Yes ☐ No
Applicant Name:	**Town of Blacksburg, Virginia**

Scoring Information

Criterion	Point Value	Points Awarded
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	55	
Development of a new resilience plan.	55	55
Resource assessments, planning, strategies and development.	45	
Policy management and/or development.	40	
Stakeholder engagement and strategies.	25	
Goal planning, implementation and evaluation.	25	
Long term maintenance strategy.	25	
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.	15	
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	15	
High Social Vulnerability (1.0 to 1.5)	12	
Moderate Social Vulnerability (0.0 to 1.0)	8	8
Low Social Vulnerability (-1.0 to 0.0)	0	
Very Low Social Vulnerability (Less than -1.0)	0	
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	10	
No	0	0

Dear Department,

Please accept this attached Grant Request for the development of a Resilience Plan for the Town of Blacksburg. We have included all materials in the attached application document. Please let me know if you have any questions.

Thanks

Kafi

Re: Application for the 2022 Virginia Community Flood Preparedness Fund.

Dear Ms. Howard-Cooper

Dickenson County is pleased to submit an application for the 2022 Virginia Community Flood Preparedness Fund.

In our proposal, we have outlined:

I. Scope of Project

II. An abundance of expertise to complete this project.

III. That Dickenson County has the resources to maintain accurate records and provide information to the appropriate officials.

We look forward to an opportunity to share with you in more detail our ideas for making your project a success.

Sincerely yours,

Larry Barton
Dickenson County Administrator

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes X No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☑ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☑ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☑ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☑ Stream bank restoration or stabilization.
- ☑ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Center to Northeastern part of Dickenson County VA "see project map"

NFIP Community Identification Number (CID#):(See appendix F 510253

Is Project Located in an NFIP Participating Community? ■ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ■ Yes ☐ No

Flood Zone(s) (If Applicable): A & AE

Flood Insurance Rate Map Number(s) (If Applicable): 51051C0145 D

Total Cost of Project: $ 2,232,415.00

Total Amount Requested $ 2,232,415.00

Table of Contents

Scope of Project

Dickenson County proposes to provide improvements to the floodplain areas along the Russell Fork River and Lick Creek Special Flood Hazard A and/or AE zones. Dickenson County will work to achieve our goals that are within the Dickenson County Flood Resilience Plan. This project will work separately from the U. S. Army Corps of Engineers 202 "USACE 202 program" program that is currently underway. To be edible for the USACE 202 program qualifying properties must have the lowest living floor at or below the level of the 1977 flood and occupied. Since within the project area the 1977 flood level is 2 feet higher than the 1% annual flood chance, many homes do not qualify for the 202 program. This grant will target those houses along with houses that have unsuitable foundations. All items within this project will be conducted under the requirements of the Dickenson County's Floodplain Ordinance along with State and Federal regulations. These improvements will be as follows:

1. Acquire properties which may cause an increased flood impact and are within the Special Flood Hazard A or AE zones through voluntary acquisition. See the map of the project area.
    a. Demolish acquired properties after the required asbestos testing and possible asbestos abatement.
    b. Remove all debris from site along with outbuildings.
    c. Fill in foundations and basements with material for site if possible, preventing any elevation of the ground surface.
    d. Plant grasses and other native vegetation. Approximately 100 feet away for the ordinary high water mark we intend on planting perennial vegetation that will also serve as a food source for the native wildlife.

2. Where feasible and where the cost is less than the acquisition cost, flood proof the structures. Where elevation is used or any elevation is established it will consist of, FEMA Base Flood Elevation or the April 1977 flood elevation whichever is greater, plus an additional 1 foot Freeboard.
    a. Elevate structures on a reinforced engineered foundation with flood openings meeting or exceeding the FEMA Technical Bulletin 1, 2 & 11 requirements.
    b. Elevate all mechanical and HVAC equipment.
    c. Provide safe, code approved access to the elevated property.

3. Where land is acquired either through USACE acquisition or through the Virginia Community Flood Preparedness Fund. Also where landowners give permission to access the river banks across their properties.
    a. Perform streambank restoration as needed, removing falling trees and debris that would endanger proper river flow in the event of a heavy rains or flooding.
    b. Without getting equipment into the river, remove debris and items that will constrict natural water flow. This will conducted only after receiving approval from USACE and Virginia Fish & Wildlife Services. Relocation of the Big Sandy

    Crayfish (Cambarus callainus) may be required within some areas, but this disturbance will be keep to a minimum.
  c. Remove berms or other obstructions that may prevent or slow flood waters from entering these areas. This will allow for the flood waters to have additional storage.
  d. Plant native vegetation as needed along the river bank to stabilize eroding soils.
  e. Approximately 100 feet away for the ordinary high water mark we intend on planting perennial vegetation that will also serve as a food source for the native wildlife.

4 Abandoned structures the owners are unreachable or unresponsive, Dickenson County may invoke our Ordinance to Compel the Repair or Removal of Buildings "Ordinance Book 1 Page 753".
  a. Demolish derelict properties after the required asbestos testing and possible asbestos abatement.
  b. Remove all debris from site along with unstable outbuildings.
  c. Fill in foundations and basements with material for site if possible, preventing any elevation of the ground surface.
  d. Plant grasses and other native vegetation.
  e. If access is obtained to the river banks, perform item #3 Streambank restoration.

Experience with prior grants

Dickenson County has vast experience with different types of grants. We have successfully completed multimillion dollar grants with combined funding sources such as ARC, DHCD, Rural Development, AML, etc. Several of these grants involved in working in and around rivers and streams.

Qualifications and experience of the individuals leading this project

Dickenson County staff will work closely with the Virginia Department of Conservation and Recreation and others contracted as needed to help administrator this program. We will coordinate tasks and avoid duplication of staff and services. Our availability of person-power enables our County to assign quality people to the task consistently from project start to final close out. Our employee that will be heading up this project is Chris Rakes see his bio below:

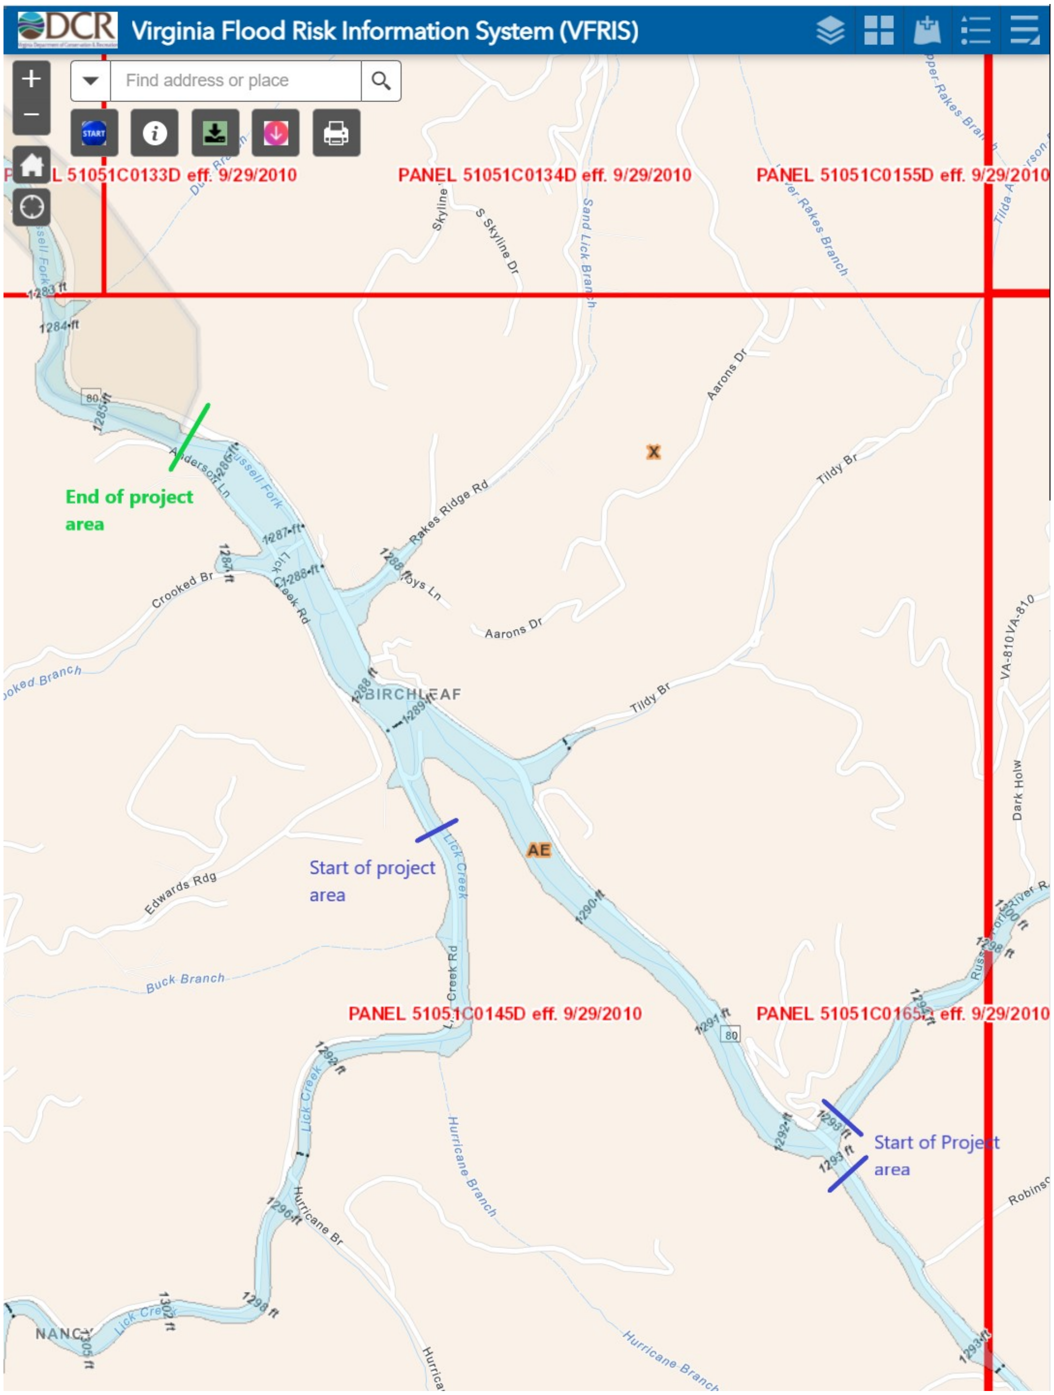
Larry K. Barton, CPA – County Administrator
Mr. Barton has been employed for Dickenson County for 1 ½ years. As County Administrator, he is responsible for all day-to-day activities of the County, including budget, economic development, grant administration, and supervision of staff.
Mr. Barton has been a Certified Public Accountant for the past 21 years, and has spent his career in finance and administration. Before becoming the County Administrator for Dickenson County, Mr. Barton served 5 years as Chief Financial Officer for Dickenson County Public Schools and worked 24 years in private industry before that.

Chris Rakes — Building Official / Erosion and Control Specialist
Mr. Rakes has been employed with Dickenson County for 6 years. He is Dickenson County's Certified Building Official, Certified Erosion and Sediment Control Combined Administrator. Before becoming the Building Official for Dickenson County, Mr. Rakes worked for 23 years as for a Non-Profit organization and 10 years as a licensed contractor before that. He is a Certified Floodplain Manager, Certified Erosion & Sediment Control Administrator and a Certified Building Official. He is a Virginia Licensed Asbestos Inspector and performs asbestos testing on Dickenson County properties.

Ability to maintain accurate records and provide information to appropriate officials

Dickenson County has a very capable staff to ensure that accurate records are maintained and that information is provided to the appropriate officials in an accurate, timely basis. We have worked with many grants over the years from various funding agencies, and have experience in this field. Mr. Barton will be overseeing the project finances, and has a staff of 4 in his office that are well versed in grant administration.

Maps



The project area will consist of only the A & AE Zones within the project area. The project area will start at the blue marks on the map near the intersection of Sandlick Rd. / Russell Fork River Rd and 0.75 mile up Lick Creek Rd. Ending at the green mark, at the Town of Haysi jurisdictional boundary.

Population affected by this project.

Approximately 53 structures are located within the project area.
Of those 41 is residential, 11 are business's and 1 is an Elementary School
With an estimated population of 110 people living within this area with many more working in the project area.

The population of people effected downstream of this project that could also see flood relief form this project would exceed a thousand. This area would include The Town of Haysi Virginia, Elkhorn City Kentucky and many homes in between.

Historic Flooding Data & hydrologic studies.

Since 1977, Dickenson County has had 11 federally-declared disasters due to severe storms and/or flooding.

Year of Declaration Date	Declaration Title	Disaster Number
1977	Severe Storms & Flooding	530
1984	Severe Storms & Flooding	707
1993	Severe Winter Storm	3112
1994	Severe Ice Storms & Flooding	1014
1996	Blizzard of 96 (Severe Snow Storm)	1086
2000	Severe Winter Storms	1318
2001	Severe Storms & Flooding	1386
2002	Severe Storms & Flooding	1406
2003	Severe Winter Storm, Record/Near Record Snowfall, Heavy Rain, Flooding, and Mudslide	1458
2006	Severe Storms, Tornadoes, and Flooding	1655
2010	Severe Winter Storm and Snowstorm	1874

Matching funds Wavier for Dickenson County Virginia.

The USACE 202 project could provide Dickenson County with matching funds as the work is very similar in nature. However all of this funding is Federal dollars.
The economy has not been good for Dickenson County would be an understatement.
Attached is a letter asking for the Virginia Community Flood Preparedness Fund
Match to be waived.

Maintenance Plan

All properties acquired will be returned to a natural state. All plants use in the on these properties and stream restoration will be native and ubiquitous to Dickenson County. The permanent plants will be perennial and once finished no further maintenance will be needed.

Dickenson County Nonstructural Project through the USACE "202 project"

The USACE 202 project included 225 structures that was eligible for voluntary flood proofing or acquisition. Relocation of three schools are also included with this project including one within our intended project area. To be edible for the USACE 202 program qualifying properties must have the lowest living floor at or below the level of the 1977 flood and occupied. Since within this project area the 1977 flood level is 2 feet higher than the 1% annual flood chance, many homes do not qualify for the 202 program. This grant will target those houses along with houses that have unsuitable foundations that are in the A & AE Zones.

Virginia Community Flood Preparedness Fund

Match Waiver

April 5, 2022

I would like to request a waiver for the local match on our Virginia Community Flood Preparedness Fund application.

Pre-wavier amounts:	
Total project cost	$2,232,415.00
Total required match 20%	$446,483.00

*Purposed in-kind local match amounts:	
Local Demolition & Building permit fees	$375.36
Labor for Asbestos testing pre-demo	$4,500.00
Erosion & Sediment Control permits	$642.60
Total local match	$5,517.96

*Based on 10 properties being demolished or flood proofed, up to 9 homes needing asbestos testing before demo, and 18 properties requiring Erosion & Sediment permits.

Documentation of request of Waiver for Local Match Money:

Dickenson County, Virginia has one of the lowest poverty rates in the State of Virginia. According to the US Census Bureau 19.3% of the people in Dickenson County is in poverty compared to 9.2% statewide.

Dickenson County has the lowest Median household income (in 2020 dollars), 2016-2020 of all the Counties in the Commonwealth of Virginia.
Data Source:
https://www.census.gov/quickfacts/fact/table/dickensoncountyvirginia,VA/PST045221

The Russell Fork River, for which this project is targeting, flows through the Breaks Interstate Park. There are camp sites along this river and more could be added to help increase our economy through tourism. This will especially help the Town of Haysi Virginia which has suffered two catastrophe floods, first in January 1957, with flood waters around eight feet inside the buildings on Main Street. In April 1977 the Town experienced another flood that damaged ever building and business on Main Street with approximately nine feet of flood waters inside the buildings. Floods are the most common natural disaster. Each year, about 200 Americans die because of floods and flood damage throughout the Nation exceeds 3 billion dollars. It is estimated that one inch of water in a home can cause up to $25,000.00 in damage. Due to changing climate conditions becoming more flood resilient is more crucial now that ever before.

Dickenson County borders the Commonwealth of Kentucky, which the Russell Fork River flows into. Flood prevention in Virginia along the Russell Fork River will benefit thousands of people not only in Virginia but also in Kentucky.

Dickenson County is pleased to apply for the 2022 Virginia Community Flood Preparedness Fund.

Attached is our application.
If you have any questions please let myself or Larry Barton know.

Larry Barton's email address is: lbarton@dickensonva.org

Thanks

INLET CAPACITY AND NEW INLET PROGRAM

Grant Application

CITY OF ALEXANDRIA, VIRGINIA

Community Flood Preparedness Fund Round 3

April 8, 2022

Inlet Capacity and New Inlet Program

The City of Alexandria (City) is applying for grant assistance under the Virginia Department of Conservation and Recreation (DCR) Community Flood Preparedness Fund (CFPF) Round 2 ‘Project’ category to help mitigate flooding in Alexandria, Virginia. The project, *Inlet Capacity and New Inlet Program (“Inlet Program”)*, will build on existing efforts undertaken with the Flood Action Alexandria initiative, launched in 2021, to help improve the resiliency of the City against increased precipitation and flash flooding events caused by climate change. The *Inlet Program* will improve drainage through increased stormwater inlet capacity by enlarging exiting inlets and building new inlets leading to pipes with adequate conveyance capacity. This approach allows for greater surface runoff to enter the pipe system and mitigate flooding.

The *Inlet Program* seeks to identify undersized inlets and identify locations for new inlets that will improve the efficiency of the City’s storm sewer system. The *Inlet Program* also will incorporate the design and construction of both upgrading existing storm sewer inlets and the installation of new inlets, within “pilot” neighborhoods.

The City will take a “watershed approach” to developing the Inlet Program by systematically identifying inlet capacity within two of the City’s eight local watersheds: Hooff’s Run and Four Mile Run. The approach will be applied to identify, design, and implement needed increases to the storm sewer inlet capacity for neighborhoods within these two watersheds. The *Inlet Program* will be replicable across the remaining six watersheds and corresponding neighborhoods (see Figure 1).

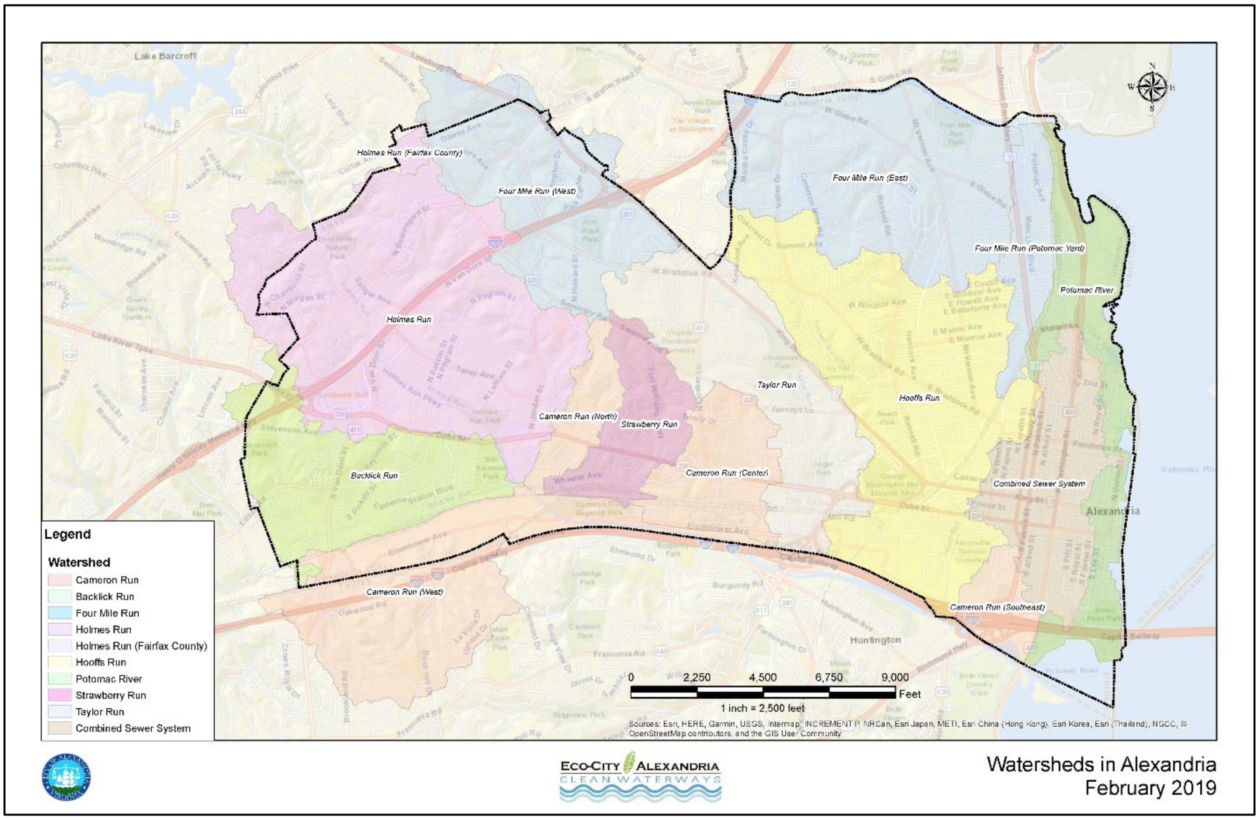

Figure 1. City of Alexandria's Local Watersheds

Virginia DCR approved the City of Alexandria's Resilience Plan September 10, 2021. The City has integrated flood mitigation and resilience goals across areas of the local government, with flood resilience a priority addressed holistically through master planning, environmental planning, small area planning, waterfront planning, and capital project planning and implementation, and this project will advance the priorities identified in these various plans. The City has established requirements for development controls in the floodplain through zoning and the local floodplain ordinance. The City's Transportation and Environmental Services Department (T&ES) is implementing resilient stormwater system upgrades informed by the City of Alexandria Storm Sewer Capacity Analysis (CASSCA), neighborhood investigations, and making spot improvements to high priority flood risk areas, along with accelerated frequent operations and maintenance under the Flood Action Alexandria program. Additionally, the City understands the importance of engaging with communities in high-risk areas impacted by frequent urban flooding events. The City performed neighborhood investigations and meeting with residents following a series of intense storm events driven by climate change that caused urban flooding in 2019, 2020 and 2021. The City launched a flood mitigation grant program in August 2021 for property owners to make improvements to, and protect, their private property through flood barrier implementation and structural adaptations. In 2019, the City released an update to the Environmental Action Plan with a roadmap for climate mitigation and resilience activities, accompanied by the Energy and Climate Change Task Force. These initiatives are grounded by the City's new Equity ordinance, which commits to addressing racial, social, and economic disparities in all areas of local government. The project proposed in this application fulfil the requirements and support the goals of each of these resilience planning efforts and accelerate the City's efforts to deliver flood mitigation measures for the Arlandria area of Alexandria.

1. Project Information

The City of Alexandria is a dense, highly urban community with over 200 miles of roadways and 185 miles of storm sewer pipe. Inlets allow stormwater to enter the storm sewer network and are found in various states of good repair across the City. Increasing inlet capacity enables more stormwater to enter the network which helps to prevent ponding which leads to increased flooding as storms become more intense and severe. Another issue with undersized inlets is runoff bypass in which the inlets get overwhelmed at one spot and flood, transferring some of that excess runoff to other undersized inlets, causing worse flooding at those locations. Additionally, the City of Alexandria Storm Sewer Capacity Analysis (CASSCA) model completed in 2016 included the baseline assumption that all inlets operate at the same capacity however, we have observed on-the-ground this is not the case and the full storm sewer pipe capacity may be underutilized, a critical factor during severe flooding. Figures 2-4 show various inlets across the City. Increasing inlet capacity and adding new inlets is a cost-effective and time efficient way to ensure the full capacity of the storm sewer network is optimized. Inlets are located within the City's Right-of-Way and require no additional acquisitions, easements, nor other private property negotiations. Typically, an inlet project is under construction from one-to-two weeks, weather dependent and causes less road closures and other neighborhood disturbances in other typical infrastructure projects. Incorporating green infrastructure into these projects, where feasible, seeks to improve the overall resilience of the neighborhood, watershed, and City.

Figure 2. Image of Inlet in City of Alexandria

Figure 3. Image of Inlet in City of Alexandria

Figure 4. Image of Inlet in City of Alexandria

The *Inlet Project* will first analyze the capacity of the storm sewer network in Hooff's Run and Four Mile Run watersheds. Inlet capacity will be evaluated with the hydraulic modeling using XP-SWMM for the current 10-year 24-hour design storm to determine whether the inlets possess the necessary capacity and CCTV investigations will be performed to determine if there were any structural failures within the pipes. To get a better understanding of how the storm drain inlets may contribute to the flooding in the neighborhood, a spread analysis of the existing inlets may be performed.

The Inlet Program builds off a "proof of concept" undertaken by City consultants in the aftermath of severe storm events in 2019 and 2020. The Park Fairfax neighborhood, within the Four Mile Run watershed, reported severe flooding from flash floods. Developed in the 1940s as housing for the post-World War II workforce, the Park Fairfax neighborhood is located south of Four Mile Run with Martha Custis Drive serving as its north, west, and south boundaries and Gunston Road serving as its east boundary. Within this neighborhood are privately owned townhomes and condominiums, and the Charles Barrett Elementary School at the northern boundary along Martha Custis Drive. During storm events, flooding primarily occurs along Martha Custis Drive and Holmes Lane which is the lowest point in the neighborhood. Seventy-five (75) inlets were identified in the Park Fairfax neighborhood alone (see Figure 5).

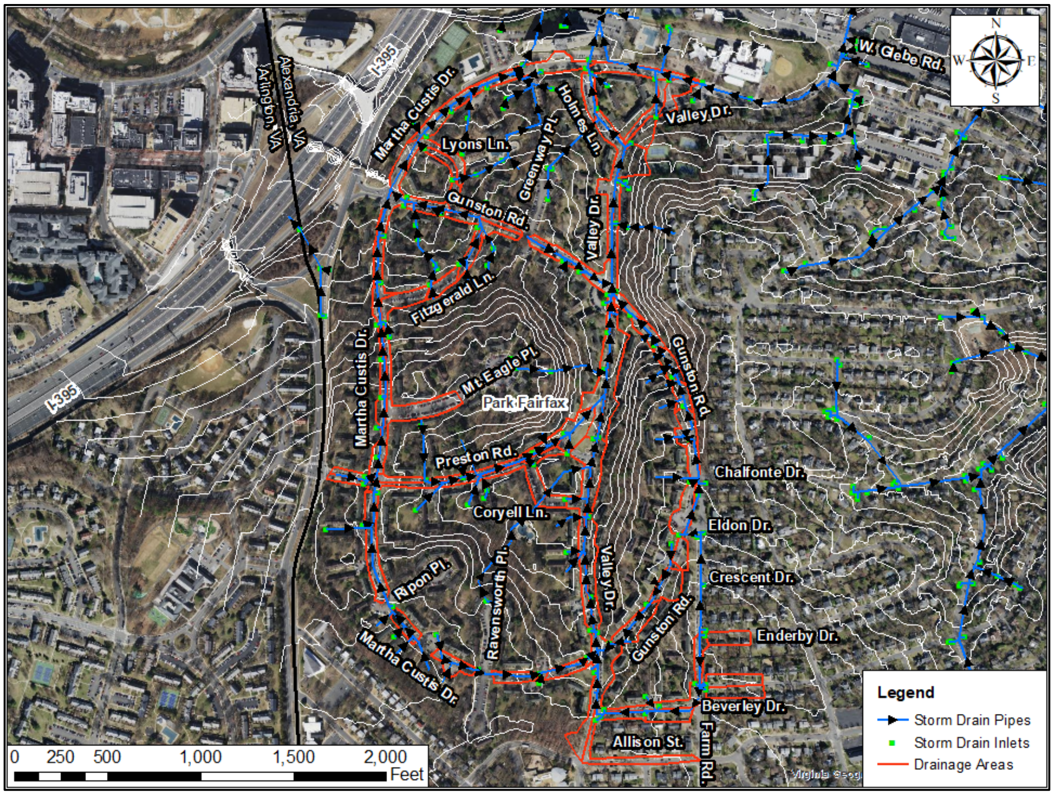

Figure 5. Inlets in Park Fairfax

The City anticipates potentially piloting permeable gutters and other types of green infrastructure, where feasible, in coordination with the *Inlet Program*. For example, permeable gutters (Figure 6) allow water to pass through and offer a way to reduce impervious surface in this neighborhood and the City. Currently the City does not own any permeable gutter systems. Figure 7 and 8 show other types of green infrastructure which may be under consideration.

Figure 6. Permeable Concrete Gutter Installation

Figure 7. Green Infrastructure

Figure 8. Tree Box Filters

a) Population and Equity

Alexandria has a population of 159,467 (U.S. Census Bureau, 2020) and is the densest city in Virginia with a population density of about 9,460 people per square mile. The median household income in Alexandria is currently $120,000; 80% of this is $96,000. For the purposes of this proposal, the population and social vulnerability index are based on the two watersheds of focus for the *Inlet Program* through this grant application: Four Mile Run and Hooff's Run watersheds (see Figure 9). The average score is -0.98 (removing duplicates) which is considered Very Low, however there is one census tract ranked as "Moderate" and one ranked as "High". Two census area (2001.06 and 2012.03) have median household income less than 80%.

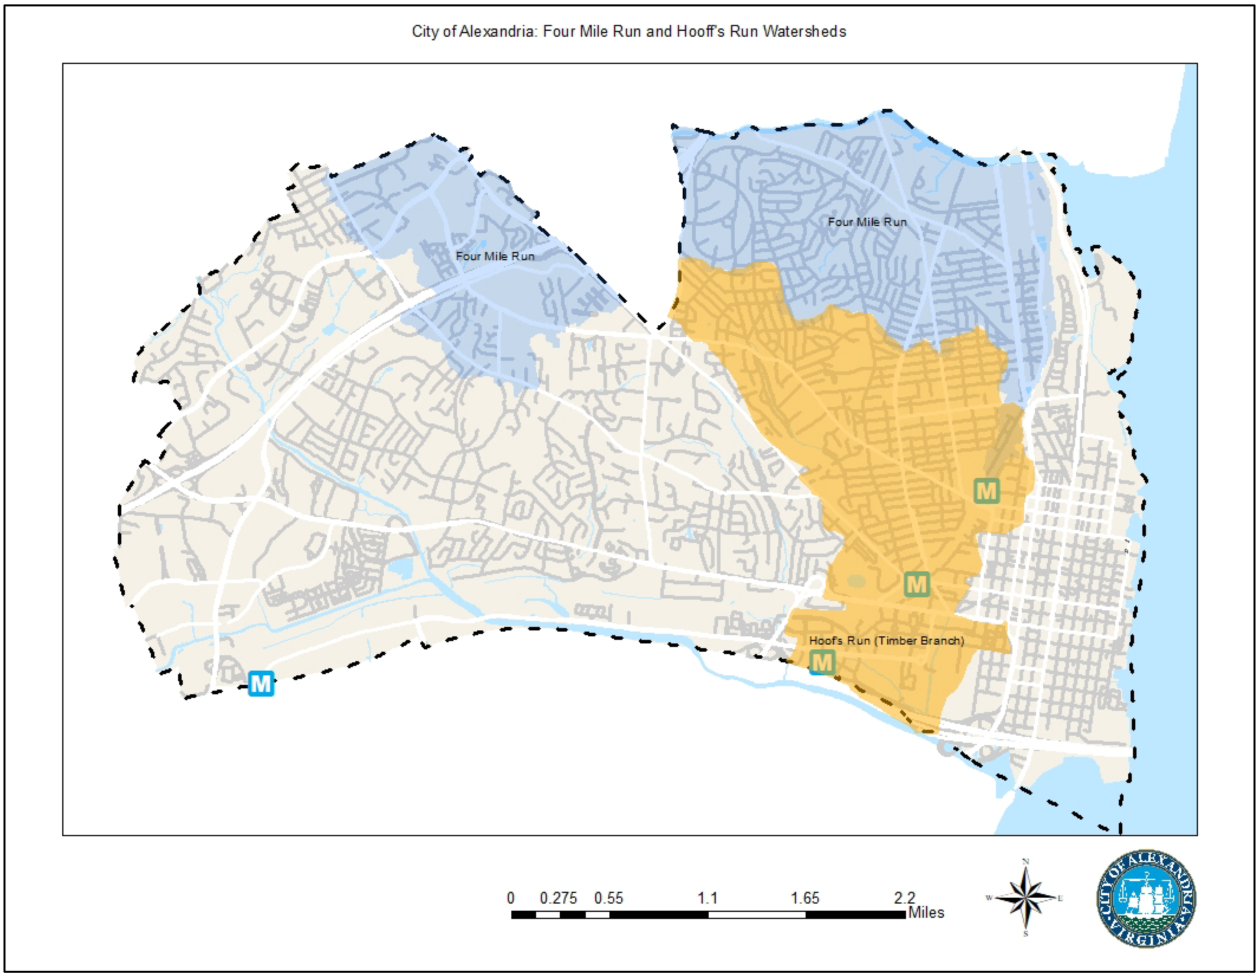

Figure 9. Four Mile Run and Hooff's Run Watersheds

Four Mile Run Watershed

Four Mile Run watershed within the City is 2,307.54 acres with a population of 77,080. The Social Vulnerability Index Scores and Index Classification for Census Tracts that intersect with Hooff's Run are included in Table 1. Four Mile Run also includes a Federal Opportunity Zone, ID 51510201203.

Table 1. Social Vulnerability Classification for Census Tracts in Four Mile Run Watershed

Census Tract ID	Social Vulnerability Classification	Vulnerability Index Score
2001.02	Low	-0.7
2001.05	Low	-0.9
2001.06	Moderate	0.3
2001.07	Very Low	-1.6
2002.01	Low	-0.7
2003	Not Socially Vulnerable	-0.5
2009	Not Socially Vulnerable	-1.1
2010	Very Low	-1.6
2011	Very Low	-1.6
2012.02	Very Low	-1.2
2012.03	High	1.1
2012.04	Low	-0.5
2013	Low	-0.9
2014	Very Low	-1.1
2016	Low	-0.8
2018	Very Low	-1.6

Hooff's Run Watershed

Hooff's Run, also incorporates Timberbranch, and has an area of 1,618.86 acres with a population of 77,080. The Social Vulnerability Index Scores and Index Classification for Census Tracts that intersect with Hooff's Run are included in Table 2.

Table 2. Social Vulnerability for Census Tracts in Hooff's Run watershed

Census Tract ID	Index Classification	Vulnerability Index Score
2007.01	Very Low	-2.4
2007.02	Very Low	-1.8
2008.01	Very Low	-1.0
2008.02	Low	-0.6
2009	Very Low	-1.1
2013	Low	-0.9
2014	Very Low	-1.1
2015	Low	-0.3
2016	Low	-0.8
2019	Very Low	-2.1

b) Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

The City is experiencing more frequent and severe flash flooding from extreme precipitation events which have occurred more frequently in the last few years. These flash flood events damage residential and commercial properties, impact critical assets, and cause day-to-day disruptions and economic losses. The City has experienced several major flooding events since 2019, including July 8, 2019, July 23, 2020, September 10, 2020, and most recently August 15, 2021 and September 16, 2021. These events are characterized between 50 to 500-year level rainstorm events. The City's Intensity-Duration-Frequency (IDF) curves developed in the 1980's were compared to other localities in the region and available climate predictions during the CASSCA study completed in 2016, and were found to be more conservative than many surrounding localities' design storms, more conservative than the NOAA Atlas-14, and were found to compare favorable to climate predictions available in 2016. The City is currently planning to further analyze these local IDF curves in comparison to regional efforts and more recent climate predictions.

The August and September 2021 storms were recorded by recently installed rain gauges that expand the City's gauge network to gather more localized storm information. Actual accumulation of over 5-inches in two hours, to be between 100 and 500-year level rain when compared to the statistical expectations derived for the City's curves developed in the 1980's for the City, which are more conservative than NOAA's predictions for the region. Meaning, what NOAA would call a 12-hour 25-year rainfall, Alexandria would call it closer to a 15-year rainfall.

c) Ability of Alexandria to Provide its Share of the Project Cost

In response to these recurring flooding events, in May 2021 the City Council unanimously adopted an ordinance to double our Stormwater Utility Fee with a 50% increase in the rate for the May 2021 billing and an additional 50% increase in the rate for the October billing to significantly increase local resources available for investments in our storm sewer infrastructure. The development of the FY 2022 – FY 2031 Stormwater Management Utility Ten Year Plan for funding of operating and capital improvement program (CIP) costs, included the identification and funding schedule for 11 top priority flooding mitigation capacity projects that include a mix of storage, conveyance, and green infrastructure. The 10-Year Plan also includes annually increasing funding for spot improvement projects and increased maintenance activities citywide. The Stormwater Utility Fee, paid by all property owners in the City (including non-taxable properties), will enable an acceleration of major capacity projects and spot improvement projects, an increase in channel maintenance, new state-of-good repair investments, property owner grants, and new staffing in support of these projects. The City confirms that it can cover the Cost Share required for this project with funding identified in the FY 2022 CIP Stormwater Sewer Spot Improvement program.

d) Alexandria is an Active Participant in the National Flood Insurance Program

The City began participating in the regular phase of Federal Emergency Management Agency (FEMA) National Flood Insurance Program (NFIP) on May 8, 1970. The City is recognized for exceeding the goals of the NFIP Community Rating System (CRS) program. Alexandria is one of two Virginia localities to achieve a Class 6 rating. As a result, residents and businesses purchasing flood insurance for properties in Alexandria are eligible to receive up to a 20% discount on flood insurance premiums. The City also has established a Floodplain Ordinance to regulate development and redevelopment in the floodplain. More information is available on the City's Flood Map webpage. Flood maps for the Four Mile Run and Hooff's Run watershed are shown as Figures 10 - 12.

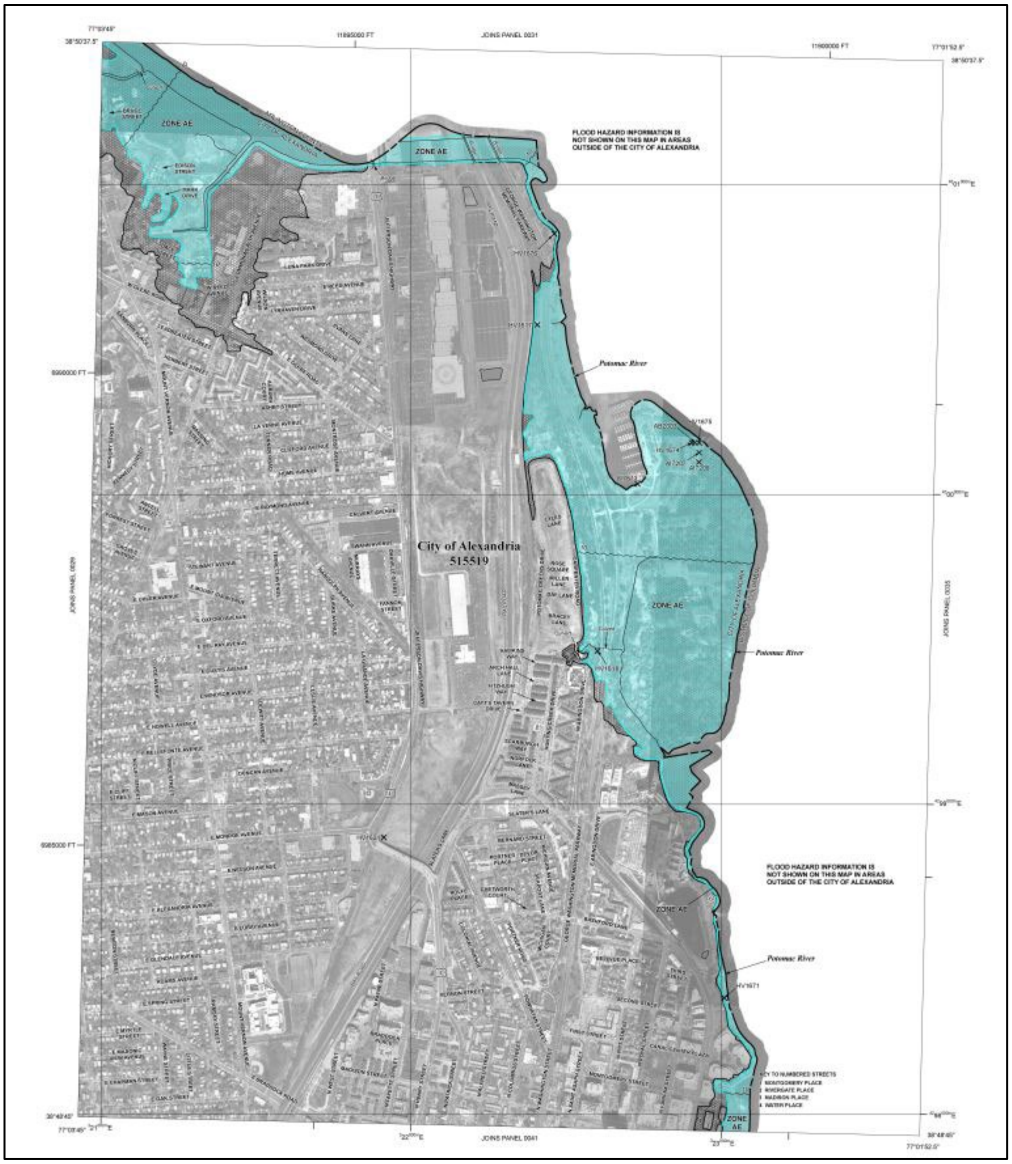

Figure 10. FEMA Map 5155190033E

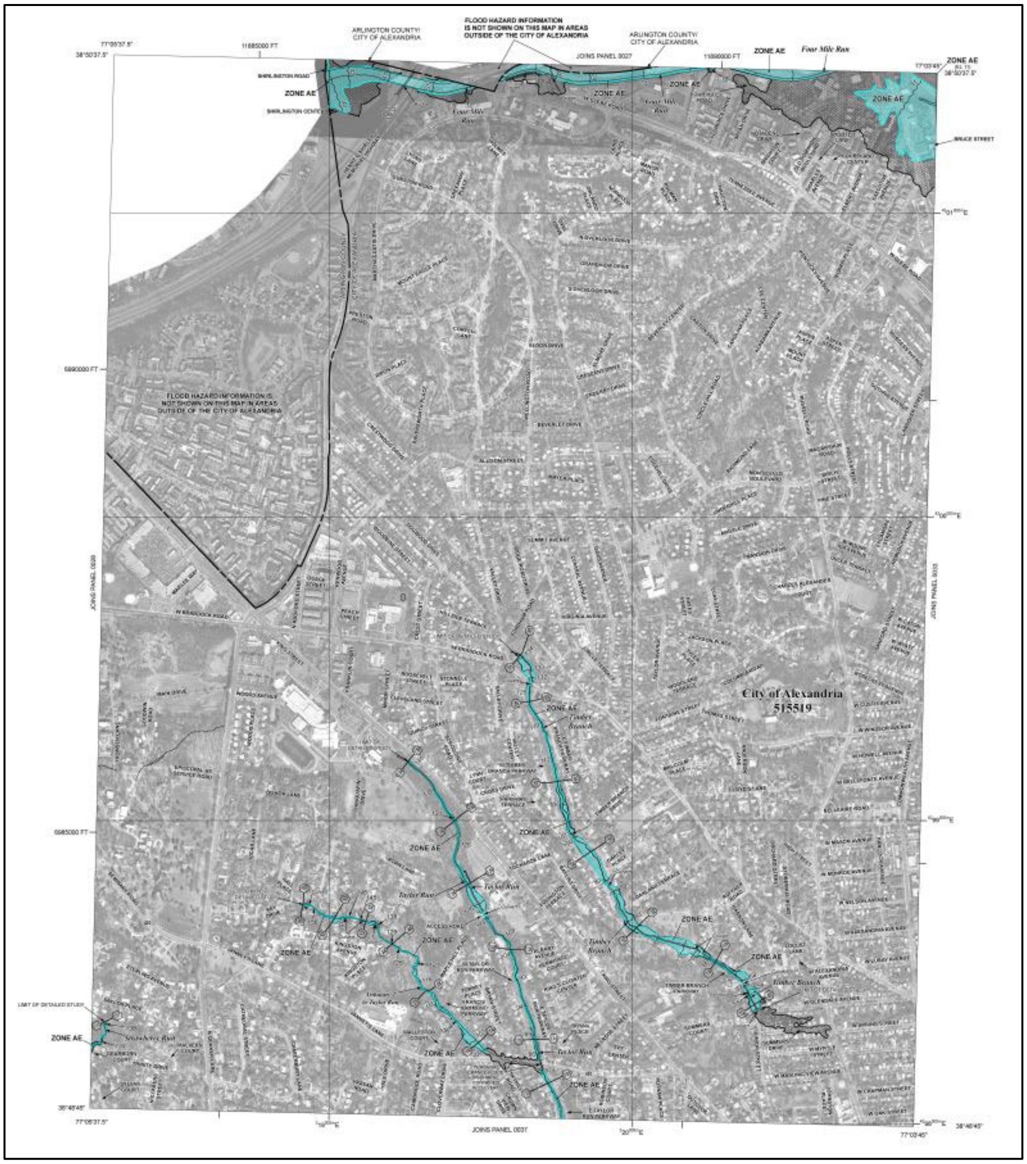

Figure 11. FEMA Map 5155190029E

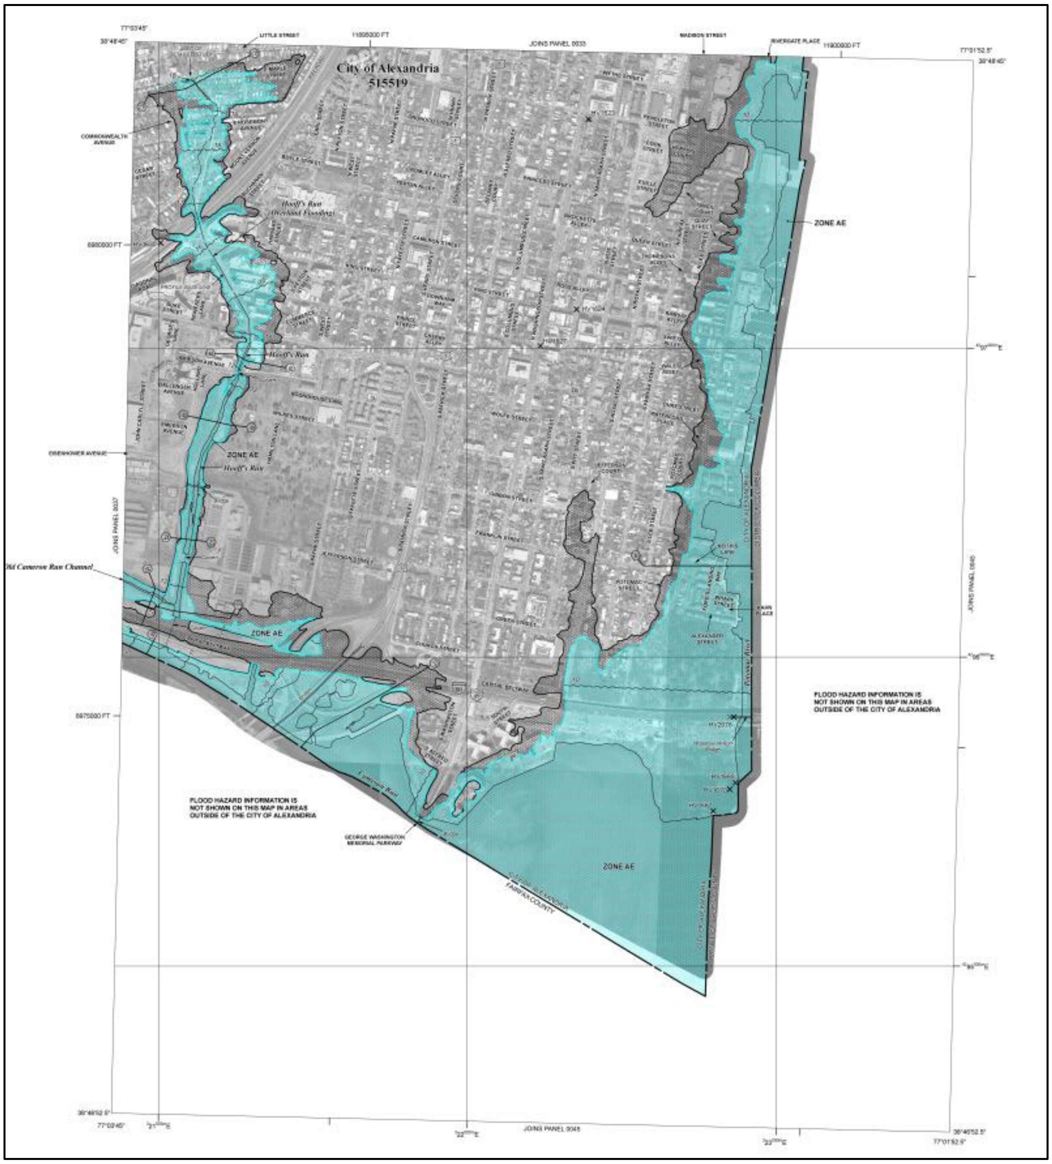

Figure 12. FEMA Map 5155190041E

Repetitive loss is defined by any insurable building for which two or more claims of more than $1,000 were paid by the NFIP within any rolling 10-year period, since 1978. A severe repetitive loss is defined by a family residence that has had four or more claims of more than $5,000 or at least two claims that cumulatively exceed the building value as defined by the Flood Insurance Reform Act of 2004. There were 12 repetitive loss sites in Alexandria as of 2015, of which six are residential and six are non-residential. These 12 repetitive loss sites have experienced a collective 30 losses, with a total payment of $1,871,287 as described in the 2017 Northern Virginia Hazard Mitigation Plan. A more updated list of repetitive losses across the City is forthcoming but preliminary assessment indicates more than 35 properties, more than triple that of 2015.

e) Other Necessary Information to Establish Project Priority

The Northern Virginia Hazard Mitigation Plan identified flooding as one of Alexandria's predominant hazards due to riverine, precipitation, tidal, and storm surge flooding. The Hazard Mitigation Plan ranked natural hazards for Alexandria using historical weather-related events based on the Storm Event Database by NOAA's NCDC1. Hazards were ranked using a semi-quantitative scoring system that involved grouping the data values (normalized to account for inflation) based on statistical methods (see Figure 13). This method prioritizes hazard risk based on a blend of quantitative factors extracted from National Climatic Data Center and other available data sources. The parameters considered include:

- Historical occurrences;
- Vulnerability of population in the hazard area; and
- Historical impact, in terms of human lives and property and crop damage.

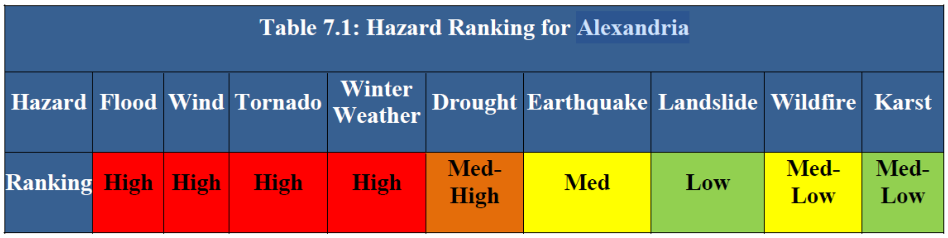

Table 7.1: Hazard Ranking for Alexandria

Hazard	Flood	Wind	Tornado	Winter Weather	Drought	Earthquake	Landslide	Wildfire	Karst
Ranking	High	High	High	High	Med-High	Med	Low	Med-Low	Med-Low

Figure 6. Hazard Ranking, Northern Virginia Hazard Mitigation Plan, 2017

Alexandria's watersheds have a significant percentage of impervious surfaces. Forty-three percent of the City's surface area is comprised of roads, buildings, parking lots, and sidewalks. Impervious surface contributes to the accumulation of stormwater because water is not able to convey and recharge. This type of flooding threatens the continuous operation of roads, emergency access, and property during precipitation events.

Critical Facilities located within the Four Mile Run and Hooff's Run watersheds include four fire stations; eight public schools; two libraries; three health facilities; and City facilities (parks, recreation centers, etc.) and offices.

2. Need for Assistance

The City has the staff and resources (SWM/SWU CIP), BSEGS 5 rating, CRS Class 6, to implement this project as soon as funding became available. DCR's financial support will help create a more resilient Alexandria while enhancing and improving the City's built infrastructure within Hooff's Run and Four Mile Run watersheds.

a) Goals and Objectives

The purpose of this project is to help mitigate flooding across the City of Alexandria by identifying and increasing inlet capacity with the support of green infrastructure. This project will address local area flooding where inlet capacity is insufficient, as well as facilitate upstream improvements in the drainage area by ensuring adequate conveyance to support future upgrades and ensuring the full capacity of the storm sewer pipe is utilized. The City cost-share for the project will be funded through the FY 2022 – FY 2031 Stormwater Management CIP under the Storm Sewer Spot Improvement program.

b) Approach, Milestones, and Deliverables

The City of Alexandria's *Inlet Program* will work to identify and correct systemic deficiencies with the City's inlets due to the increased strain placed on the public systems from climate change. In tandem, the

City plans to incorporate green infrastructure solutions where possible and cost effective. These green infrastructure solutions have the added benefit of beautification of the local area and align with the City's 2040 Environmental Action Plan. Upon completion of the pilot inlet projects, the project approach will be modified to account for lessons learned and applied to a series of subsequent neighborhoods with the ultimate goal of helping to mitigate the impacts of severe storms and flash flooding in the City.

The City anticipates utilizing a contractor/consultant team to analyze the inlets in Four Mile Run and Hooff's Run watershed in a similar fashion to what was done in the Park Fairfax neighborhood referenced in Section 1. The analysis will be developed into a report with recommendations for new and upgraded inlets as well as opportunities for green infrastructure. The Project Management Team overseeing the Inlet Program consists of experts from Transportation and Environmental Services Stormwater Management Division as the project sponsor and the Department of Project Implementation providing project management in project delivery, along with City consultants. In consultation with the contractor, the Project Management Team will select up to 75 new and/or upgraded inlets to focus on within these two watersheds. These inlets will be designed and constructed under one or more "Contracts" to streamline the effort. Green infrastructure will be included in these on-the-ground projects where feasible as determined by the Project Management Team.

Additional details on the project delivery approach and project teaming will be detailed in a project management plan developed by the City. The City's project management plan is a living document that is continually updated through the life of the project. Input from the design contractor and construction manager will be included in the document as the project progresses. At a minimum, project management plan will clearly identify the projects scope, team member roles and responsibilities, critical stakeholders, project risks and the project procurement plan.

The City's Engineer of Record Contract or an equivalent existing procured agreement will be utilized to develop contract documents including design plans, construction specifications, and costs estimates. A basis of design report and public rendering of impacts and improvements may be included to support the green infrastructure aspect of the project, contingent on the design development process. The City expects that the inlet construction work in the pilot area will be performed using a contractor that is already under contract with the City procured per state requirements.

Table 3 summarizes project milestones for the *Inlet Program* and Table 4 summarizes the deliverables.

Table 3. Milestones

Milestone	Date
Watershed Inlet Analysis focused on Four Mile Run and Hooff's Run	FY2023, Q1 – Q2
Report Writing and Recommendations	FY2023, Q3
Pilot Inlet Project Selection for Implementation	FY2023, Q3 – Q4
Pilot Project Planning	*FY2024, Q1*
Design Services Task Order	*FY2024, Q2*
Design Phase	*FY2024, Q2*
Construction Purchase Order and NTP	*FY2024, Q3*
Construction	*FY2024, Q4, FY2025, Q1*
Post-Construction	*FY2025, Q2*
Evaluation of Pilot Inlet Projects: Success and Lessons Learned	FY2025, Q2 – Q3
Final Inlet Report	FY2025, Q4

Table 4. Milestones and Deliverables

Milestone	Deliverable
Project Planning	• Project Charter • Project Management Plan • Project Work Breakdown Structure • Project Schedule
Watershed Inlet Analysis focused on Four Mile Run and Hooff's Run Task Order	• Task Order Request based on existing contract • Task Order approval • Purchase Order and Notice to Proceed
Watershed Inlet Analysis focused on Four Mile Run and Hooff's Run Report and Prioritization	• Analysis on Four Mile Run and Hooff's Run • Recommendations for inlet upsizing and new inlets • Recommendations for incorporating green infrastructure, where feasible
Design Services Task Order	• Task Order Request based on existing contract • Task Order approval • Purchase Order and Notice to Proceed
Design Phase	• Design Plans Sketch and/or 30% and Final Design • Construction Specifications at Final Design • Basis of Design including Hydraulic Calculations at 30% and Final Design • Cost Estimate at 30% and Final Design
Construction Procurement	• Invitation to Bid at contract award • Contractor Proposal at contract award • Purchase Order at contract award
Construction/Post Construction	• Sign & Sealed As-builts following project close out • Site photographs following project close out
Watershed Inlet Analysis focused on Four Mile Run and Hooff's Run Final Deliverables	• Report finalized based on project work and Team feedback • Materials and methods, including analysis and data, able to be applied to other flood-prone watersheds and neighborhoods in the City

3. Relationship to Other Projects

The City has experienced repeated and increasingly frequent flooding from storm events, with several large severe storm event occurring in 2019 and 2020. These events lead to the development of the Flood Action Alexandria initiative. Information gathered via the City's 311 response center regarding flooding complaints and inquiries in addition to the 2016 City of Alexandria Storm Sewer Capacity Analysis (CASSCA) study provided a roadmap for City staff to undertake neighborhood investigations. Increasing inlet capacity and adding new inlets, especially in areas experiencing frequent and severe flooding impacts from climate change will help create a more resilient Alexandria.

The *Inlet Program* falls within the City's Flood Action Alexandria initiative. The Spot Improvement Program includes a 10-year, $28.4 million capital improvement plan focused delivering small to medium sized capital projects at the watershed sub-basin and neighborhood scale across the City. The proposed project for funding will increase the resiliency for residents in the Hooff's Run and Four Mile Run watersheds, and the City of Alexandria as the *Inlet Program* will be replicable to other watersheds. This is a critical need given the City's sensitivity to climate change induced severe storm events caused by rising global temperatures and increased humidity.

4. Maintenance Plan

City sewer infrastructure 'state of good repair' program maintenance objectives includes inspection and maintenance on a rotating 3-5 year service schedule. The City also performs inspection and maintenance in response to Alex311 service requests an in advance of forecasted storm events. The initial work will be inspected regularly early on to ensure proper functioning prior to the routine, rotating schedule being implemented. More information is available on the City's Sewer Maintenance webpage.

5. Criteria

This project scoring criteria is found in Appendix B.

Budget Narrative

The *Inlet Capacity and New Inlet Program* is budgeted for design and construction for a total cost of $1,528,000. The City respectfully requests 50% of the total project cost to be covered by this grant: $764,000. This project is anticipated to also provide nature-based green infrastructure solutions.

The project cost share is funded by the City through the FY 2022 CIP Stormwater Sewer Spot Improvement program.

Cost Category	City of Alexandria Match	DCR CFPF Request	Total
Personnel	$0	$0	$0

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X__ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.

☐ Wetland restoration.
☐ Floodplain restoration.
☐ Construction of swales and settling ponds.
☐ Living shorelines and vegetated buffers.
☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.

X Storm water system upgrades.

☐ Medium and large scale Low Impact Development (LID) in urban areas.
☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
☐ Dam restoration or removal.
☐ Stream bank restoration or stabilization.
☐ Restoration of floodplains to natural and beneficial function.
☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
- ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): Four Mile Run and Hooff's Run Watersheds

NFIP Community Identification Number (CID#): See appendix F CID515519

Is Project Located in an NFIP Participating Community? X Yes ☐ No

Is Project Located in a Special Flood Hazard Area? **X Yes** □ No

Flood Zone(s) (If Applicable): **AE**

Flood Insurance Rate Map Number(s) (If Applicable): **5155190033E and 5155190029E and 5155190041E**

Total Cost of Project: **$1,528,000**

Total Amount Requested **$764,000**

Appendix B – Scoring Criteria

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**City of Alexandria, VA**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration	**X Yes** **☐ No**
Applicant Name:	**City of Alexandria, VA**

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	**35**
All other projects	**25**	
7. Is the project area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	0

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	5
No	**0**	
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		70

Good morning –

Attached, please find the City of Alexandria CFPF Round 3 grant application. This is the second of two grant applications we are submitting this round. The other application was emailed earlier this morning.

Thank you so much for allowing the City the opportunity to apply to this highly valuable program to help enhance our community resilience and mitigate the impacts of flooding.

Sincerely,

Jessica

Virginia Community Flood Preparedness Fund Grant Application

April 8, 2022

Hydrology and Hydraulic Studies of Floodplains to update FEMA Flood Insurance Rate maps (FIRMS) for the Town of Front Royal

Town of Front Royal

Town of Front Royal, Virginia

Town of Front Royal

102 East Main Street

Front Royal, VA 22630

Phone: 540-635-8007

1.Community Information and Grant Application Category

The Town of Front Royal is located within a Virginia Opportunity Zone (Census Tract ID: 51187020601)

Community Identification Number (CID #): 510167 – Town of Front Royal, Warren County

Virginia Vulnerability Social Index- Front Royal, VA: 0.2

Grant Category: B. Studies

1.1 Introduction

The Town of Front Royal (Warren County, VA) is located within the Shenandoah River Watershed a major contributing member of the Potomac River, and ultimately the Chesapeake Bay. Front Royal was one of the first areas of the Shenandoah Valley to become occupied by European settlements, due to the confluence of the South Fork and the North Fork Shenandoah Rivers, which served as a main point of commerce in the Valley. (**Fig. 1**). Besides the North and South Fork of the Shenandoah River, Cabin Run, Leach Run and Happy Creek, there are watersheds within the Town limits, which contribute to significant flooding.

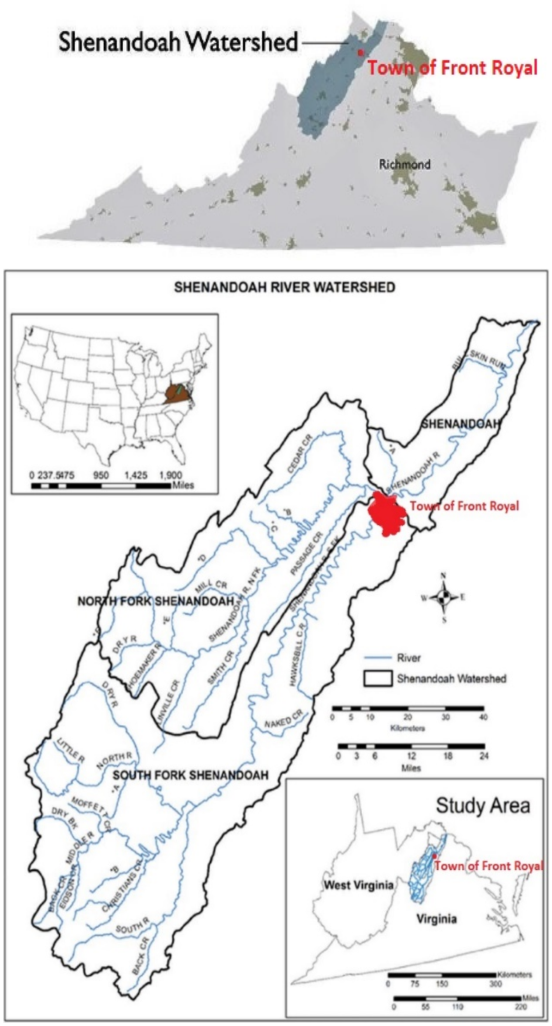

Fig. 1. *Town of Front Royal location within the Shenandoah Watershed.*

The South Fork Shenandoah River begins at the confluence of the North River and South River near Port Republic and flows north 97 miles to meet the North Fork Shenandoah at the Town of Front Royal. The South Fork Shenandoah watershed covers 1,659 square miles. Much of the western boundary of the Town abuts the South Fork, while a small northern portion abuts the North Fork of the Shenandoah. The Town is located at within -78.2205 to -78.1414 longitude and 38.8919 to 38.9538 latitude. Based on census of 2020, the population is 15,011.

There are 1,329 parcels in Front Royal (~25% of total households) that are susceptible to being severely affected by flooding (see **Fig. 2** for the FEMA Flood Hazard Layer). Although flood risk can never be eliminated, communities can develop policies to help minimize impacts to the public during floods, through an updated flood study of the major watersheds within the community.

With the planning tools of a modern and relevant flood study, more informed decisions in the extent of flood risk within the community can be realized. The National Flood Insurance Program allows communities to develop planning tools to reduce the risk of flooding, which also allow for lower flood insurance costs that can be shared with the community.

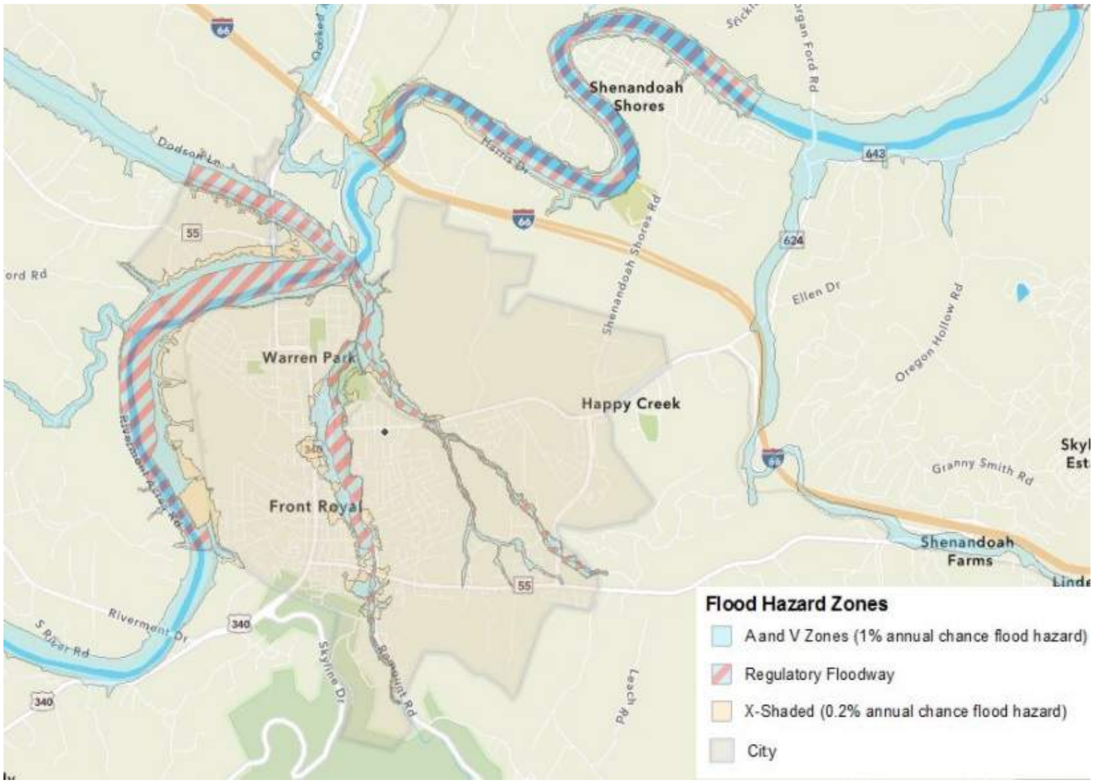

***Fig. 2** FEMA's National Flood Hazard Layer (NFHL) at Town of Front Royal*

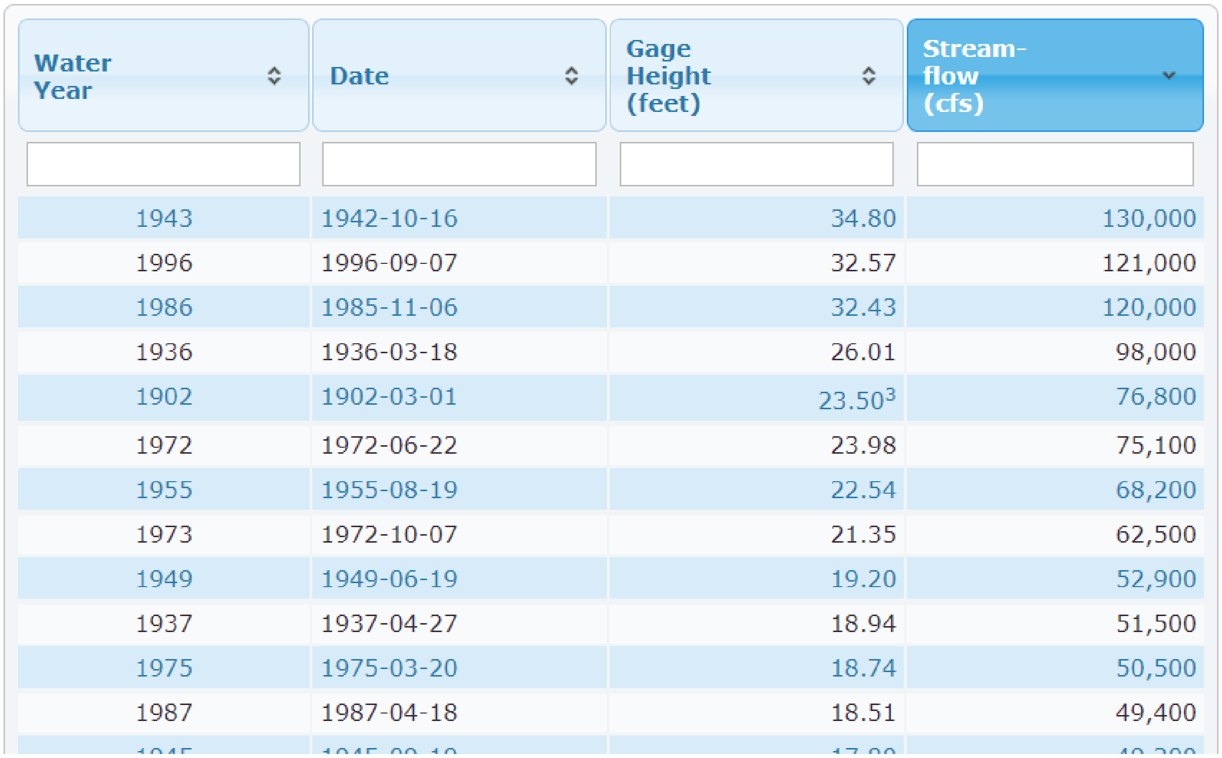
The current Flood Insurance Rate Map (FIRM) shows the flood zones at the Town of Front Royal are 51187C0103C, 51187C0104C, 51187C0108C, 51187C0110C, 51187C0111C, 51187C0112C, 51187C0115C, 51187C0116C, 51187C0117C and 51187C0118C. Most of the flood zone delineations were initially evaluated in 1974 and the flood hazard boundary map revised in 1976 and then in 1988 the entire study was converted to the North American Vertical Datum of 1988 (NAVD 88) but it has not been updated since then. Thus, the hydrology and hydraulics evaluations of the special flood hazard areas (SFHAs) has not been re-evaluated for over 45 years.

1.2 The Impacts of Historical Floods

The Shenandoah River has contributed to major flood events, historically speaking. The five largest flood events on record, have occurred in 1943, 1996, 1986, 1936, and 1902.



Water Year	Date	Gage Height (feet)	Stream-flow (cfs)
1943	1942-10-16	34.80	130,000
1996	1996-09-07	32.57	121,000
1986	1985-11-06	32.43	120,000
1936	1936-03-18	26.01	98,000
1902	1902-03-01	23.50[3]	76,800
1972	1972-06-22	23.98	75,100
1955	1955-08-19	22.54	68,200
1973	1972-10-07	21.35	62,500
1949	1949-06-19	19.20	52,900
1937	1937-04-27	18.94	51,500
1975	1975-03-20	18.74	50,500
1987	1987-04-18	18.51	49,400

Fig. 3 *Peak Annual Flow (cfs) SF Shenandoah River at Front Royal, VA*

In September 2003, flooding was reported in Shenandoah Farms along the Warren County border. The following roads closed by high water included Happy Creek Road, Route 55 East, Free Land Road, Morgan Hollow Road, and Newton Road. The South Fork of the Shenandoah River rose above its flood stage of 12 feet at Front Royal caused the worst flooding in over 20 years which led to inundate many homes and businesses and force many evacuations along the river. The high density of urban and suburban development within this watershed, including a high percentage of impervious surfaces, have significantly contributed to the severity of this and other more recent flooding events. The frequent and larger flooding events in the past century were primarily a result of the pronounced increase in precipitation from 1930 to 2018. The average annual precipitation for Virginia is increasing at a rate of more than 1 inch every 10 years. In fact, the frequency of days having one inch of rainfall has nearly doubled.

1.3 The Necessity of this Study Flood risks each year are increasing due to a number of climatic, environmental, and planning related changes. The risks related to floods also disproportionately impact low-income residents more than higher income residents. This is recognized by the Virginia Department of Environmental Quality statement on climate, as "impacts of climate change, which not only affect the environment, but also human health".

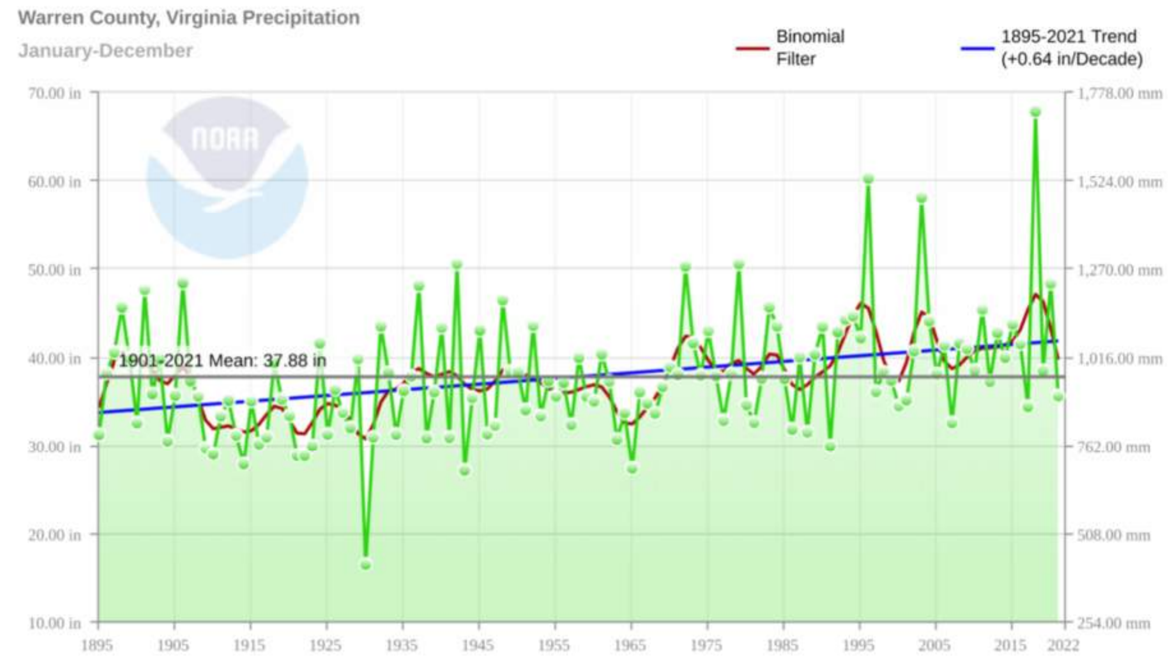


__Fig. 4__ Warren County, VA Annual Precipitation Trend (1895-2021)

While the Town of Front Royal is located many hundreds of miles inland of any tidal waters of the Atlantic Ocean and Chesapeake Bay, the influence of climate change does directly influence many climatic weather conditions here. Above, is a trend analysis of the recorded annual precipitation from 1895 to 2021. Whereby, when averaging the annual rainfall from 1895 to 2021, the past century has a trend of annual precipitation increasing 0.64 inch per decade (**Fig. 4**). It is easy to observe in the above graphic that occurrence and magnitude of recorded annual precipitation is increasing within the last 40 years. In **Fig. 5**, below, the trend analysis of the recorded annual precipitation for a shorter time period of 1977 to 2021 shows the trend of annual precipitation increasing 1.22 inch per decade. Considering precipitation directly contributes to stream flow, an increase in annual precipitation and intensity of events will require flood studies of the major streams within the Town of Front Royal limits to be updated to ensure flood mapping is up to date and future planning for growth is properly informed of the flood risks around major floodplain areas.

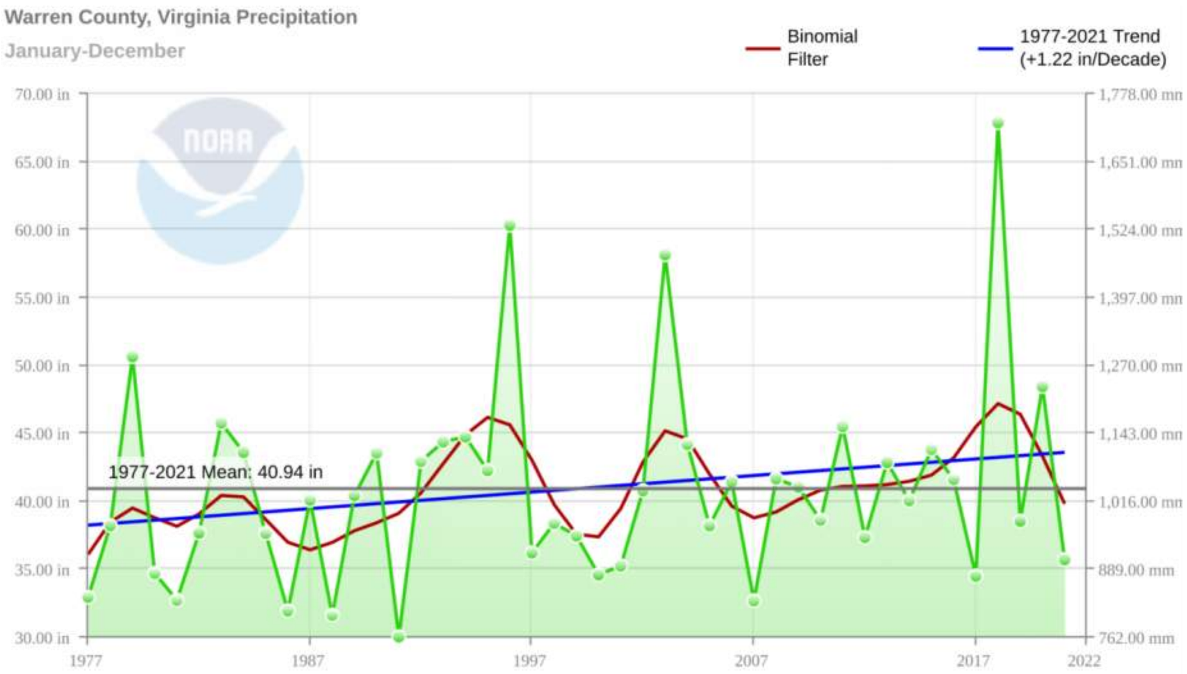

Fig. 5 *Warren County, VA Annual Precipitation Trend (1977-2021)*

Changing environment means higher sea levels, new weather patterns, and stronger storms. As the atmosphere warms, there is more evaporation, and consequently, more water available when it rains. A warmer atmosphere also means warmer oceans, which can intensify flooding from hurricanes and offshore storms. Sea level rise also increases coastal flood risks, as higher sea levels mean there is more water available when high tides and coastal storms cause flooding. Adaptation at the local, state, and federal levels is often more effective and cost-efficient than individual efforts, but each plays an important role in reducing physical and financial flood risks. Town of Front Royal is considered a low-income community since the median household income ($51.9 K)[1] is less than 70% of the state median household income ($74.2 K)[2]. The area is also located within the moderate social vulnerability range according to the Virginia vulnerability viewer[3].

The current FIRMs showing the Special Flood Hazard Areas (SFHA) flood zones (A, AE and X) for the Town of Front Royal were prepared mostly in 1988. Accordingly, the updated rainfall data

---

[1] U.S. Census, https://www.census.gov/quickfacts/fact/table/frontroyaltownvirginia/INC110219

[2] U.S. Census, https://www.census.gov/quickfacts/fact/table/VA,US/INC1102193

[3] https://cmap2.vims.edu/SocialVulnerability/SocioVul_SS.html

should be applied to do the hydrology and hydraulic modeling and assessment to revise the FIRMs in the region.

A recent hydrologic and hydraulic analysis was performed for a possible bridge replacement for the 8th street bridge over Happy Creek, a FEMA Zone AE floodplain. The Town's civil engineering consultant, RK&K, requested the effective flood analysis from FEMA for Happy Creek observed a number of items in the effective study which highlights a need to revisit the floodplain analysis in the Town. The first item of concern is the hydrology used for flood study on Happy Creek was derived from a statistical analysis of a gauge along Happy Creek, which no longer exists. Secondly, the gauge record for this former gauge was only for 28 years (1949 to 1977). Generally, good engineering practice indicates statistical based analysis of gauges should use closer to 50 years of gauge record to accurately derive the correct flow values to be used to establish the 100-year flood event, or 1% return interval. RK&K also highlighted to the Town that a comparison of the gauge record for Happy Creek versus the historical gauge record of the South Fork of Shenandoah River, an active USGS gauge (01631000), would indicate the Happy Creek gauge missed the top five flood events recorded on the SF Shenandoah River (1943, 1996, 1986, 1936, and 1902).

2. Scope of Work Narrative - Studies

The hydrologic and hydraulic analyses for the Flood Insurance Study (FIS), dated July 15 1988, was prepared by the USGS for the Federal Emergency Management Agency (FEMA) under Inter-Agency Agreement No. EMW-84-1548. This work was completed in June 1986. The hydraulic analyses for the streams were conducted by approximate methods in the Town of Front Royal which were determined through using the USGS WSPRO computer program.

1. *<u>Specific type of study proposed including whether the study is new or updates a prior study:</u>*
   New spatially distributed hydrological and hydraulic models will be developed for the watersheds and main streams within the Town of Front Royal. Specifically, the study will utilize HEC-HMS using NOAA Atlas 14 rainfall distribution curves applicable to the Town's zone and associated rainfall depths published in NOAA Atlas 14. The hydraulic model will be a 1-D HEC RAS model. The model will include the river structure and geometry allowing an analysis of the historical behavior of the watershed-river system. Furthermore, the model will continuously map the flood extent for the river floodplain during the past events as well as for specific scenarios (e.g., 25-yr event). This tool will then be used to provide recommendations on flood mitigation and planning. The project will be a steppingstone for a real time forecasting tool, which not only predicts the stage levels at selected locations, but also the areas that are predicted to be inundated and accordingly all the FIRMs will be updated. Successful fulfilment of the proposed project will also enable the community to apply for indexing in CRS, which will allow for lower flood insurance premiums to be made available to properties located within the regulated floodplains.

2. *Relationship of Study to the local Government's needs for flood prevention and protection, equity, community improvement, identification of nature-based solutions or other priorities contained in this manual:*

   The proposed study will investigate the highly flood prone areas in the Town through various flooding scenarios using the developed hydrology and hydraulic models. It will re-establish floodplain limits and magnitudes within the Town's study limits. We will then propose site appropriate rainwater management solutions which will built into sites, corridors, or neighborhoods without requiring significant space. Any rainwater capture and treatment facilities will enable predicted flood flows to be maintained or decreased over time, especially with any in-fill and re-development projects. Thereby reducing future damage related to flooding, especially properties located in flood prone areas of the Town. **Fig. 6** depicts examples of nature-based rainwater management solutions which will be considered in this study.

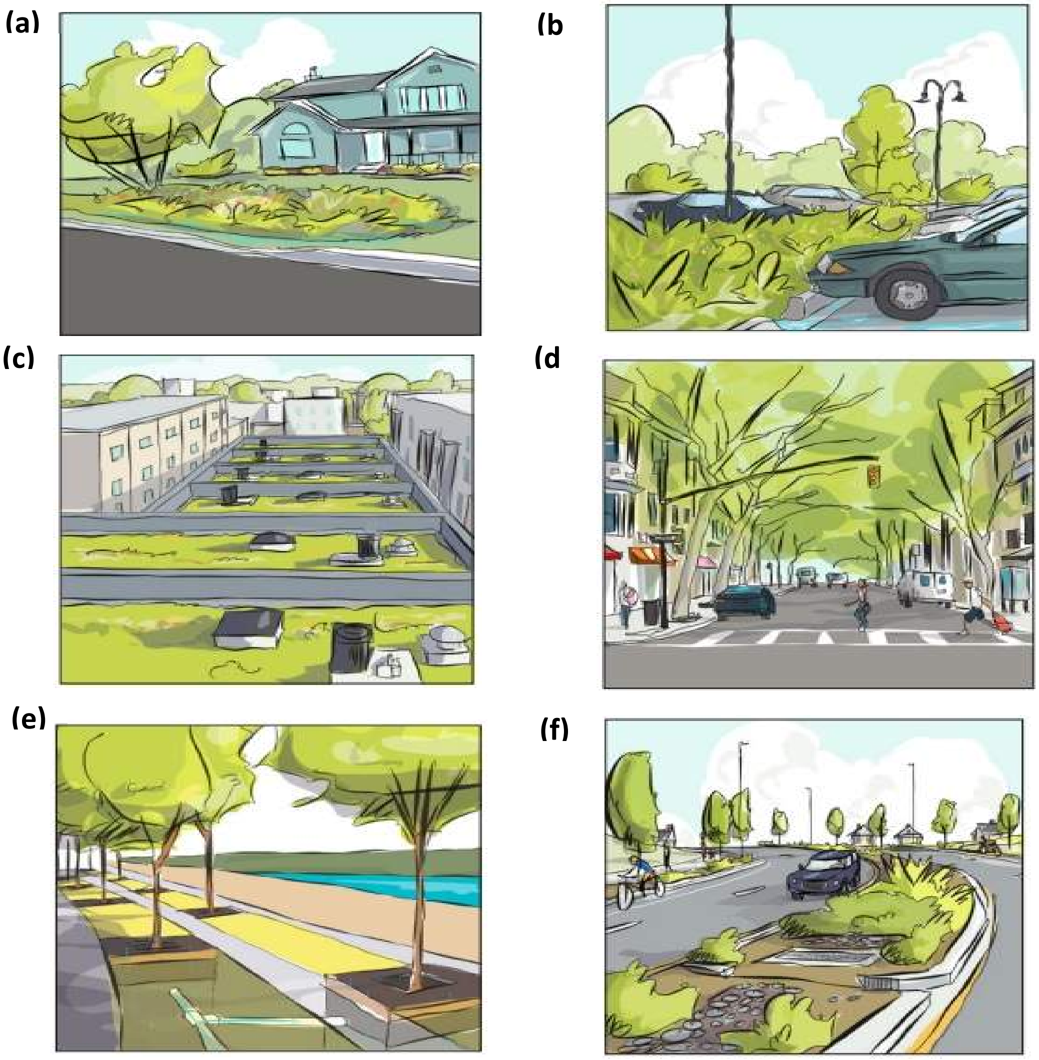

Fig. 6*(a) Rain Gardens, (b) Vegetated Swales, (c) Green Roofs, (d) Tree Canopy, (e) Tree Trenches and (f) Garden Streets.*

3. *Qualifications of the individuals or organizations charged with conducting the study or the elements of any request for proposal that define those qualifications:*
   The Town of Front Royal Manager, Steven Hicks, oversees all the Town's operations and employees. Some of the more specific responsibilities of this office include but are not limited to: Preparation of the annual budget; Preparation of Town Council agendas; Authorization of notices; Authorization of specific permits; Updating the Front Royal website; Updating the Town Code; and preparing a Quarterly Newsletter to Citizens. He also oversees the Planning Department, which is responsible for updating, administering, and enforcing the floodplain ordinance within the Town. The planning department will utilize an engineering consultant with specialized experience in conducting FEMA Letters of Map Revision (LOMR), utilizing HEC HMS and HEC RAS, with interfacing in the GIS environment for floodplain and floodway mapping to FEMA standards.

4. *The expected use of the study results in the context of the local resilience plan or, in the case of regional plans, how the study improves any regional approach:*
   Currently, there is no available local flood protection resilience plan. The proposed restudy will provide a complete hydrology and hydraulic model of the special hazard areas. The output data set can be used by Warren County for upstream and downstream portions of Shenandoah River, Happy Creek, and Leach Run. Moreover, the updated flood data can be utilized by neighboring upstream and downstream communities, which also have outdated studies.

5. *If applicable, how the study may improve Virginia's flood protection and prevention abilities in a statewide context:*
   The modeling methodology and application procedures in this study will revise and re-establish the floodplain based on updated FIRMs to maintain compliance with the NFIP and to incorporate higher standards that may reduce the risk of flood damage. This also enables the community to join a voluntary incentive CRS program that recognizes and encourages community floodplain management practices exceeding the minimum requirements of the NFIP. Currently, over 1,500 communities participate nationwide in the program. In CRS communities, flood insurance premium rates are discounted reflecting the reduced flood risk resulting from the community's efforts. The efforts seek to address the three goals of the program: reduce and avoid flood damage to insurable property, strengthen and support the insurance aspects of the National Flood Insurance Program, and foster comprehensive floodplain management.

2.1 Deliverables and outcomes

1. ***A validated GIS-based watershed/*****river** ***model for the Town of Front Royal***: This model will be used for further flood impact studies and sensitivity analysis related to planned development encroachments near floodplains.

2. ***Assessment of the watershed issues using the developed model***
We will investigate the updated flood zones and effect of the nearby structures on heavily affected regions, as vulnerability assessments and propose action-oriented approaches, to bolster flood preparedness and nature-based resilience solutions.

3. ***Final report***: It will summarize the application, calibration, and validation of the hydrological/hydraulic model to the Town of Front Royal and discuss the implications of the model results and recommendations for flood mitigation and nature-based solutions. All the FEMA Flood Insurance Rate Maps, Flood Profiles, Discharge Tables, and FIS narratives within the Town will need to be updated. The modeling methodology and application procedures will utilize industry standard models and techniques, future engineers and planners can continue to utilize for the foreseeable future.

Application in real-time forecasting and emergency management

The validated model will be able to predict the extent of the flood for any rainfall scenario in the past or future. In this study, we will simulate historical events and floods with different return periods (2-yr, 10-yr, 25-yr, 50-yr, 100-yr and 500-yr), however, the development and maintenance of a real-time web-based forecasting model needs additional analysis and study. Accordingly, for the next phase, this can be done based on the work that will be developed in this study.

Stakeholder process, coordination, and management plan

With the development of new flood mapping and studies, a public notice and public hearing regarding the new flood maps will be anticipated.

3. Approach, Milestones, and Deliverables

The expected duration of the project is 20 months with the following schedule:

1. ***Start* (July 1, 2022)**

2. ***Integrated watershed/river model development* (October 2022):** The US Army Corp of Engineers, Hydrological Engineering Center, Hydrological Modeling System and River Analysis System, integrated to ArcGIS, will be used for this task.

3. ***Incorporation of hydraulic structures in the models* (December 2022):** An advantage of the modeling systems is its ability to include river and watershed structures. The detail geometry of each structure is necessary for this step. During this task, hydraulic structures will be incorporated in the model.

4. ***Validations against historical events*** **(January 2023):** Using historical rainfall and runoff data at gauging stations, the models will be first calibrated for a portion of the data and then will be validated against the rest of the data.

5. ***Simulation of extreme events and sensitivity analysis*** **(February 2023):** By employing the validated model, predictions of the top ranked extreme events and 10/25/50/100/500-yr water levels will be provided at selected gauging stations. Other scenarios which might be of interest of stakeholders will be also modeled.

6. ***Writing the report and delivery of the final model*** **(February 2023):** For the development and validation of watershed and river models, many types of data are required including watershed Digital Elevation Model, land use, soil type, rainfall data, river geometry (Cross Sections), geometry of river/watershed structures, and stream flow data. This project will use the most recent available data; no surveying or field data will be included in this effort.

7. ***Coordination with FEMA for Approval of FIRMS (*****March 2023*****):*** Submit to FEMA LOMR package for updated hydrology and hydraulic modeling, mapping, floodway analysis.

8. ***Public Outreach (*****May 2023):** Conduct a public hearing regarding the update FEMA maps for final approval. This will include a public notice in the local newspaper to review the updated maps.

9. ***Obtain official FEMA Approval of update mapping and hydrology (*****December 2023):** With approval of the updated mapping and study, the project close out will be conducted with supporting documentation archived by the Town of Front Royal Planning Department.

8.Budget

The anticipated budget for this study is $100,000. The use of these funds will be used to procure the professional services of the Town’s engineering consultant to perform the hydrologic and hydraulic analysis, with updated flood insurance mapping, and GIS shapefiles of the revised floodplains.

- **Estimated Total Cost: $100,000**
- **Amount of Funds Requested from the Fund: $90,000**
- **Amount of cash funds available: $10,000**
    - **Authorization to request funding is attached in Appendix D-8- Authorization to request funding from the Fund from governing body of the local government**

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☒ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☒ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☒ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☒ Studies and Data Collection of Statewide and Regional Significance.

☒ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Town of Front Royal, VA- See Appendix D-1

NFIP Community Identification Number (CID#):(See appendix F 510167

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Zones A, AE, and X

Flood Insurance Rate Map Number(s) (If Applicable): 51187C0103C, 51187C0104C, 51187C0108C, 51187C0110C, 51187C0111C, 51187C0112C, 51187C0115C, 51187C0116C, 51187C0117C and 51187C0118C

Total Cost of Project: $100,000

Total Amount Requested $90,000

Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	30
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	15
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	35
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☒ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	45
○ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☒ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	45
☒ Flash flood studies and modeling in riverine regions of the state.	**45**	45
☒ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	45

☒ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	45
☒ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	50
☒ Regional hydrologic and hydraulic studies of floodplains.	**45**	45
☒ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	40
○ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on [ADAPT VA's Social Vulnerability Index Score.)](#)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	8
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	10
No	**0**	
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	
Total Points		468

NOTES TO USERS

nap is for use in administering the National Flood Insurance Program. It not necessarily identify all areas subject to flooding, particularly from local ge sources of small size. The **community map repository** should be lted for possible updated or additional flood hazard information.

tain more detailed information in areas where **Base Flood Elevations**) and/or **floodways** have been determined, users are encouraged to lt the Flood Profiles and Floodway Data and/or Summary of Stillwater ions tables contained within the Flood Insurance Study (FIS) report that npanies this FIRM. Users should be aware that BFEs shown on the FIRM ent rounded whole-foot elevations. These BFEs are intended for flood nce rating purposes only and should not be used as the sole source of elevation information. Accordingly, flood elevation data presented in the FIS should be utilized in conjunction with the FIRM for purposes of construction r floodplain management.

aries of the **floodways** were computed at cross sections and interpolated en cross sections. The floodways were based on hydraulic considerations gard to requirements of the National Flood Insurance Program. Floodway and other pertinent floodway data are provided in the Flood Insurance report for this jurisdiction.

n areas not in Special Flood Hazard Areas may be protected by **flood ol structures**. Refer to Section 2.4 "Flood Protection Measures" of the Insurance Study report for information on flood control structures for this ction.

rojection used in the preparation of this map was Universal Transverse tor (UTM) Zone 17. **Horizontal datum** was NAD 83, GRS80 spheroid. ences in datum, spheroid, projection or UTM zones used in the production IMs for adjacent jurisdictions may result in slight positional differences in eatures across jurisdiction boundaries. These differences do not affect the acy of this FIRM.

elevations on this map are referenced to the North American Vertical of 1988. These flood elevations must be compared to structure and d elevations referenced to the same **vertical datum**. For information ding conversion between the National Geodetic Vertical Datum of 1929 and orth American Vertical Datum of 1988, visit the National Geodetic Survey e at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at lowing address:

l Reference System Division
al Geodetic Survey, NOAA
Spring Metro Center
East-West Highway
Spring, Maryland 20910
713-3191

in current elevation, description, and/or location information for **bench** hown on this map, please contact the Information Services Branch of the l Geodetic Survey at **(301) 713-3242**, or visit its website at ww.ngs.noaa.gov/.

ap information was derived from multiple sources. Streamline files were ded from the National Hydrography Dataset. Political boundary files for Co. Unincorporated Areas were provided by Warren Co. Department of g and Zoning, VA. Political boundary and road files for Town of Front ere provided by Town of Front Royal Engineering Department, Warren . Road centerline files for Warren Co. Unincorporated Areas were ded from the 2000 TIGER/Line files. Park boundary files were provided ational Park Service and 2002 digital orthophotographs were provided by inia Geographic Network Division of its Department of Technology g (VGIN). Adjustments were made to specific base map features to align 1":200' and 1":400' scale VGIN orthophotos.

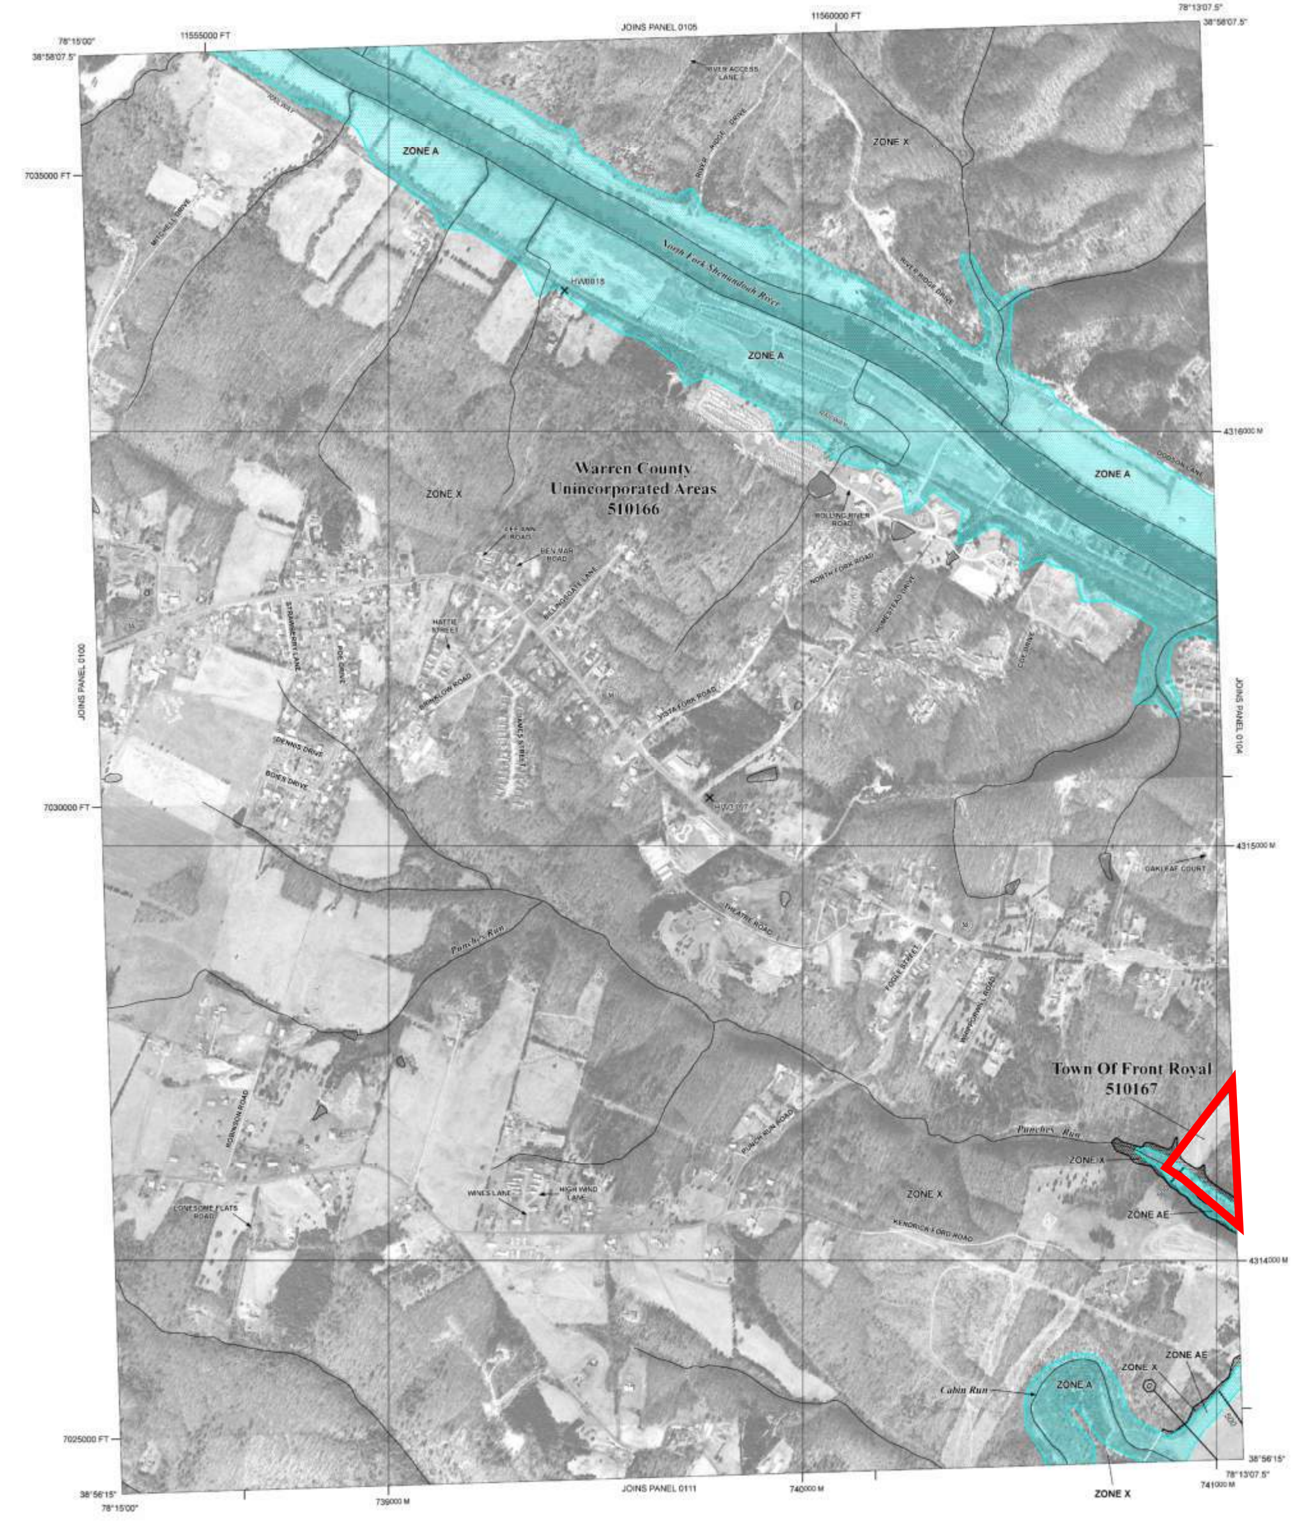
n the above mentioned digital orthophotographs, this map reflects more and up-to-date **stream channel configurations** than those shown on ious FIRM for this jurisdiction. As a result, the Flood Profiles may reflect channel distances that differ from what is shown on the map. Also, the floodplain relationships for unrevised streams may differ from what is n previous maps.

ate limits shown on this map are based on the best data available at the publication. Because changes due to annexations or de-annexations may ccurred after this map was published, map users should contact iate community officials to verify current corporate limit locations.

refer to the separately printed **Map Index** for an overview map of the howing the layout of map panels; community map repository addresses; isting of Communities table containing National Flood Insurance Program r each community as well as a listing of the panels on which each ity is located.

the **FEMA Map Service Center** at 1-800-358-9616 for information on products associated with this FIRM. Available products may include ly issued Letters of Map Change, a Flood Insurance Study report, and /or ersions of this map. The FEMA Map Service Center may also be reached t 1-800-358-9620 and its website at http://www.msc.fema.gov/.

ave **questions about this map** or questions concerning the National surance Program in general, please call **1-877-FEMA MAP** (1-877-336- visit the FEMA website at http://www.fema.gov/.



LEGEND

🟦 SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT T INUNDATION BY THE 1% ANNUAL CHANCE FLOO

The 1% annual chance flood (100-year flood), also known as the base flood, is the has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard area subject to flooding by the 1% annual chance flood. Areas of special Flood Haz Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the wa elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Ba Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain depths determined. For areas of alluvial fan flooding, veloc determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annu flood by a flood control system that was subsequently decertified. indicates that the former flood control system is being restored protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Fed protection system under construction; no Base Flood El determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Ba Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Ba Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be of encroachment so that the 1% annual chance flood can be carried without substantia in flood heights.

▒ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance average depths of less than 1 foot or with drainage areas le square mile; and areas protected by levees from 1% annual chanc

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodpla
ZONE D	Areas in which flood hazards are undetermined, but possible.

▧ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▧ OTHERWISE PROTECTED AREAS (OPAS)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard A

n current elevation, description, and/or location information for **bench** hown on this map, please contact the Information Services Branch of the Geodetic Survey at **(301) 713-3242**, or visit its website at ww.ngs.noaa.gov/.

ap information was derived from multiple sources. Streamline files were ded from the National Hydrography Dataset. Political boundary files for Co. Unincorporated Areas were provided by Warren Co. Department of g and Zoning, VA. Political boundary and road files for Town of Front ere provided by Town of Front Royal Engineering Department, Warren . Road centerline files for Warren Co. Unincorporated Areas were ded from the 2000 TIGER/Line files. Park boundary files were provided ational Park Service and 2002 digital orthophotographs were provided by ginia Geographic Network Division of its Department of Technology g (VGIN). Adjustments were made to specific base map features to align 1":200' and 1":400' scale VGIN orthophotos.

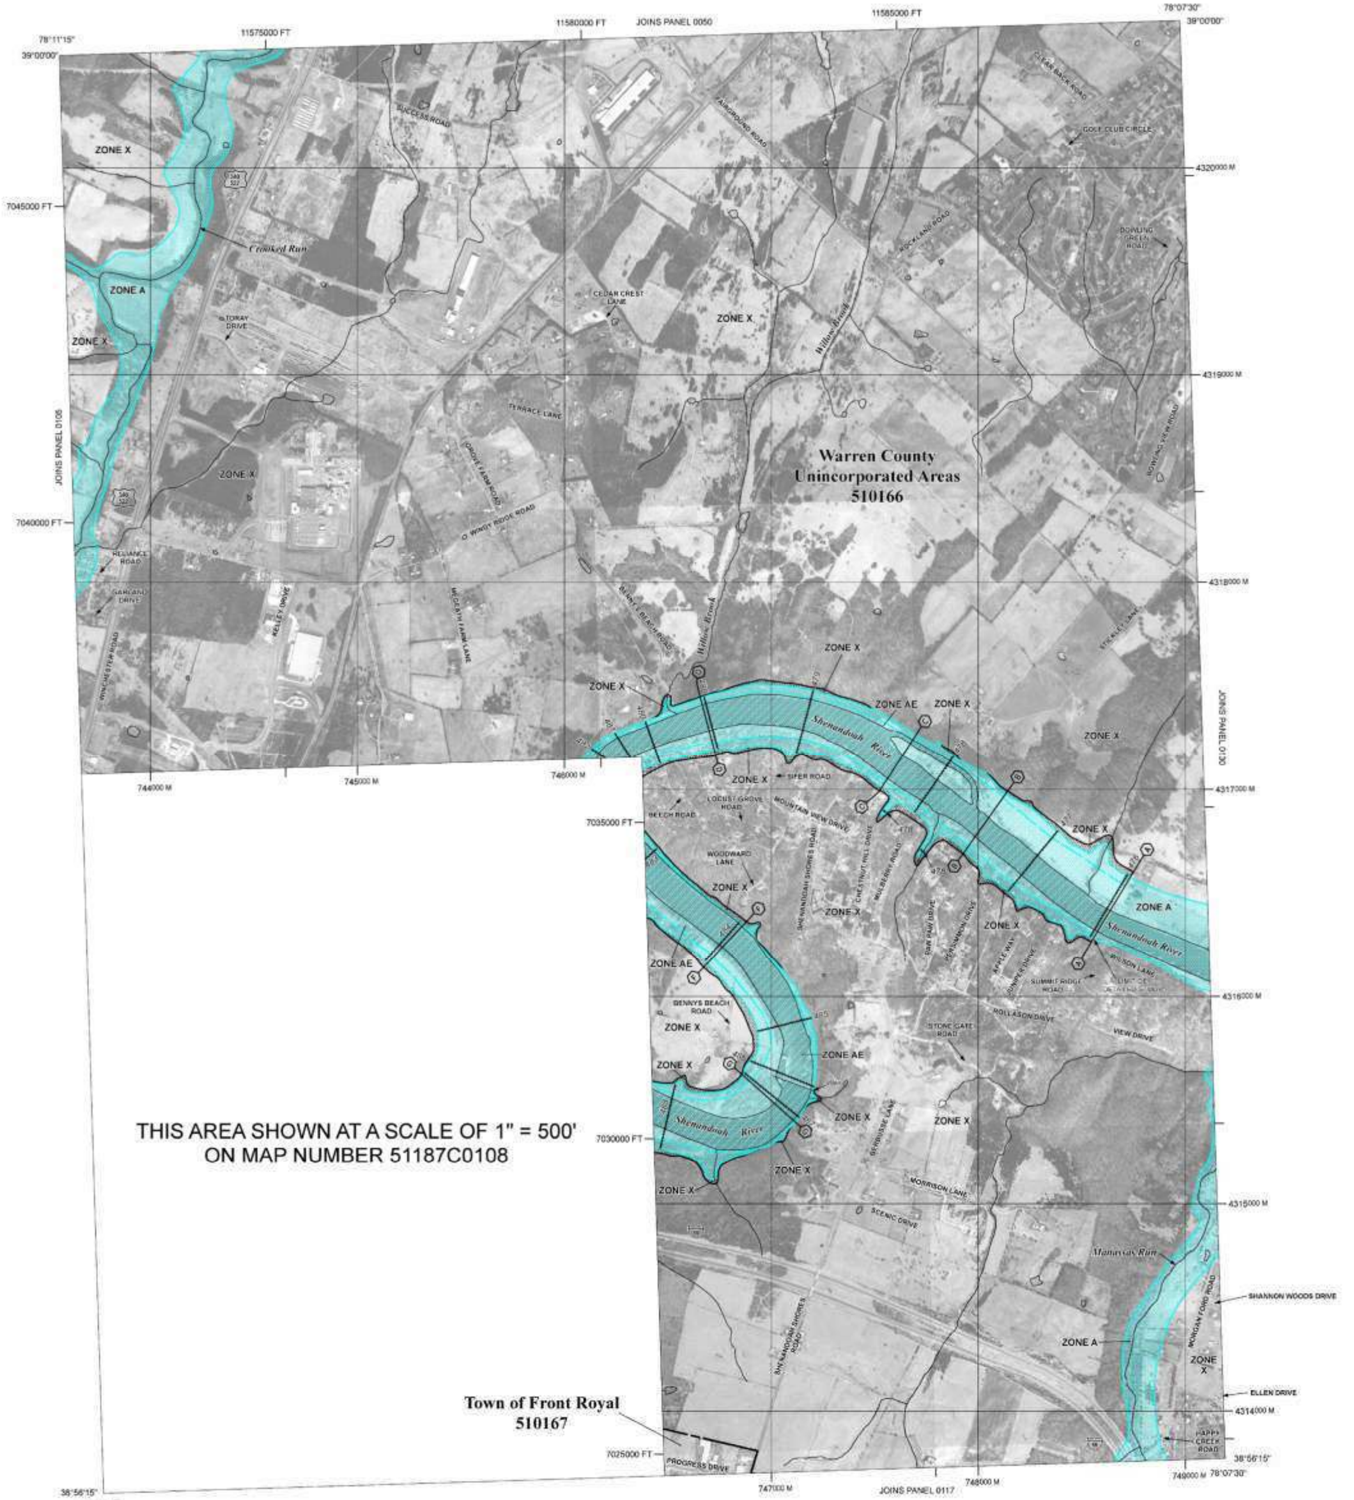
n the above mentioned digital orthophotographs, this map reflects more and up-to-date **stream channel configurations** than those shown on ious FIRM for this jurisdiction. As a result, the Flood Profiles may reflect channel distances that differ from what is shown on the map. Also, the floodplain relationships for unrevised streams may differ from what is n previous maps.

ate limits shown on this map are based on the best data available at the publication. Because changes due to annexations or de-annexations may ccurred after this map was published, map users should contact ate community officials to verify current corporate limit locations.

refer to the separately printed **Map Index** for an overview map of the howing the layout of map panels; community map repository addresses; sting of Communities table containing National Flood Insurance Program r each community as well as a listing of the panels on which each ity is located.

the **FEMA Map Service Center** at 1-800-358-9616 for information on products associated with this FIRM. Available products may include ly issued Letters of Map Change, a Flood Insurance Study report, and /or ersions of this map. The FEMA Map Service Center may also be reached t 1-800-358-9620 and its website at http://www.msc.fema.gov/.

ave **questions about this map** or questions concerning the National surance Program in general, please call **1-877-FEMA MAP** (1-877-336- visit the FEMA website at http://www.fema.gov/.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT T INUNDATION BY THE 1% ANNUAL CHANCE FLOO

The 1% annual chance flood (100-year flood), also known as the base flood, is the has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard area subject to flooding by the 1% annual chance flood. Areas of special Flood Haz Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the w elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Ba Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain) depths determined. For areas of alluvial fan flooding, veloc determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annu flood by a flood control system that was subsequently decertified. indicates that the former flood control system is being restored protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Fed protection system under construction; no Base Flood El determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no B Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Ba Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be of encroachment so that the 1% annual chance flood can be carried without substantial in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance average depths of less than 1 foot or with drainage areas le square mile; and areas protected by levees from 1% annual chan

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodpla
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAS)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard A

	1% annual chance floodplain boundary

NOTES TO USERS

ap is for use in administering the National Flood Insurance Program. It
ot necessarily identify all areas subject to flooding, particularly from local
e sources of small size. The **community map repository** should be
ed for possible updated or additional flood hazard information.

ain more detailed information in areas where **Base Flood Elevations**
and/or **floodways** have been determined, users are encouraged to
the Flood Profiles and Floodway Data and/or Summary of Stillwater
ons tables contained within the Flood Insurance Study (FIS) report that
anies this FIRM. Users should be aware that BFEs shown on the FIRM
nt rounded whole-foot elevations. These BFEs are intended for flood
ce rating purposes only and should not be used as the sole source of
evation information. Accordingly, flood elevation data presented in the FIS
hould be utilized in conjunction with the FIRM for purposes of construction
loodplain management.

ries of the **floodways** were computed at cross sections and interpolated
n cross sections. The floodways were based on hydraulic considerations
gard to requirements of the National Flood Insurance Program. Floodway
and other pertinent floodway data are provided in the Flood Insurance
eport for this jurisdiction.

areas not in Special Flood Hazard Areas may be protected by **flood**
structures. Refer to Section 2.4 "Flood Protection Measures" of the
nsurance Study report for information on flood control structures for this
ion.

ojection used in the preparation of this map was Universal Transverse
or (UTM) Zone 17. **Horizontal datum** was NAD 83, GRS80 spheroid.
ces in datum, spheroid, projection or UTM zones used in the production
Ms for adjacent jurisdictions may result in slight positional differences in
atures across jurisdiction boundaries. These differences do not affect the
cy of this FIRM.

elevations on this map are referenced to the North American Vertical
of 1988. These flood elevations must be compared to structure and
elevations referenced to the same **vertical datum**. For information
ng conversion between the National Geodetic Vertical Datum of 1929 and
th American Vertical Datum of 1988, visit the National Geodetic Survey
at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at

NOTES TO USERS

ap is for use in administering the National Flood Insurance Program. It t necessarily identify all areas subject to flooding, particularly from local e sources of small size. The **community map repository** should be d for possible updated or additional flood hazard information.

in more detailed information in areas where **Base Flood Elevations** and/or **floodways** have been determined, users are encouraged to the Flood Profiles and Floodway Data and/or Summary of Stillwater ns tables contained within the Flood Insurance Study (FIS) report that anies this FIRM. Users should be aware that BFEs shown on the FIRM nt rounded whole-foot elevations. These BFEs are intended for flood ce rating purposes only and should not be used as the sole source of evation information. Accordingly, flood elevation data presented in the FIS hould be utilized in conjunction with the FIRM for purposes of construction loodplain management.

ries of the **floodways** were computed at cross sections and interpolated n cross sections. The floodways were based on hydraulic considerations ard to requirements of the National Flood Insurance Program. Floodway and other pertinent floodway data are provided in the Flood Insurance eport for this jurisdiction.

areas not in Special Flood Hazard Areas may be protected by **flood structures**. Refer to Section 2.4 "Flood Protection Measures" of the nsurance Study report for information on flood control structures for this ion.

ojection used in the preparation of this map was Universal Transverse r (UTM) Zone 17. **Horizontal datum** was NAD 83, GRS80 spheroid. ces in datum, spheroid, projection or UTM zones used in the production ls for adjacent jurisdictions may result in slight positional differences in atures across jurisdiction boundaries. These differences do not affect the y of this FIRM.

levations on this map are referenced to the North American Vertical of 1988. These flood elevations must be compared to structure and elevations referenced to the same **vertical datum**. For information g conversion between the National Geodetic Vertical Datum of 1929 and th American Vertical Datum of 1988, visit the National Geodetic Survey at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at wing address:

Reference System Division
l Geodetic Survey, NOAA
pring Metro Center
ast-West Highway
pring, Maryland 20910
13-3191

in current elevation, description, and/or location information for **bench** hown on this map, please contact the Information Services Branch of the l Geodetic Survey at **(301) 713-3242**, or visit its website at ww.ngs.noaa.gov/.

ap information was derived from multiple sources. Streamline files were ded from the National Hydrography Dataset. Political boundary files for Co. Unincorporated Areas were provided by Warren Co. Department of g and Zoning, VA. Political boundary and road files for Town of Front ere provided by Town of Front Royal Engineering Department, Warren . Road centerline files for Warren Co. Unincorporated Areas were ded from the 2000 TIGER/Line files. Park boundary files were provided lational Park Service and 2002 digital orthophotographs were provided by ginia Geographic Network Division of its Department of Technology g (VGIN). Adjustments were made to specific base map features to align 1":200' and 1":400' scale VGIN orthophotos.

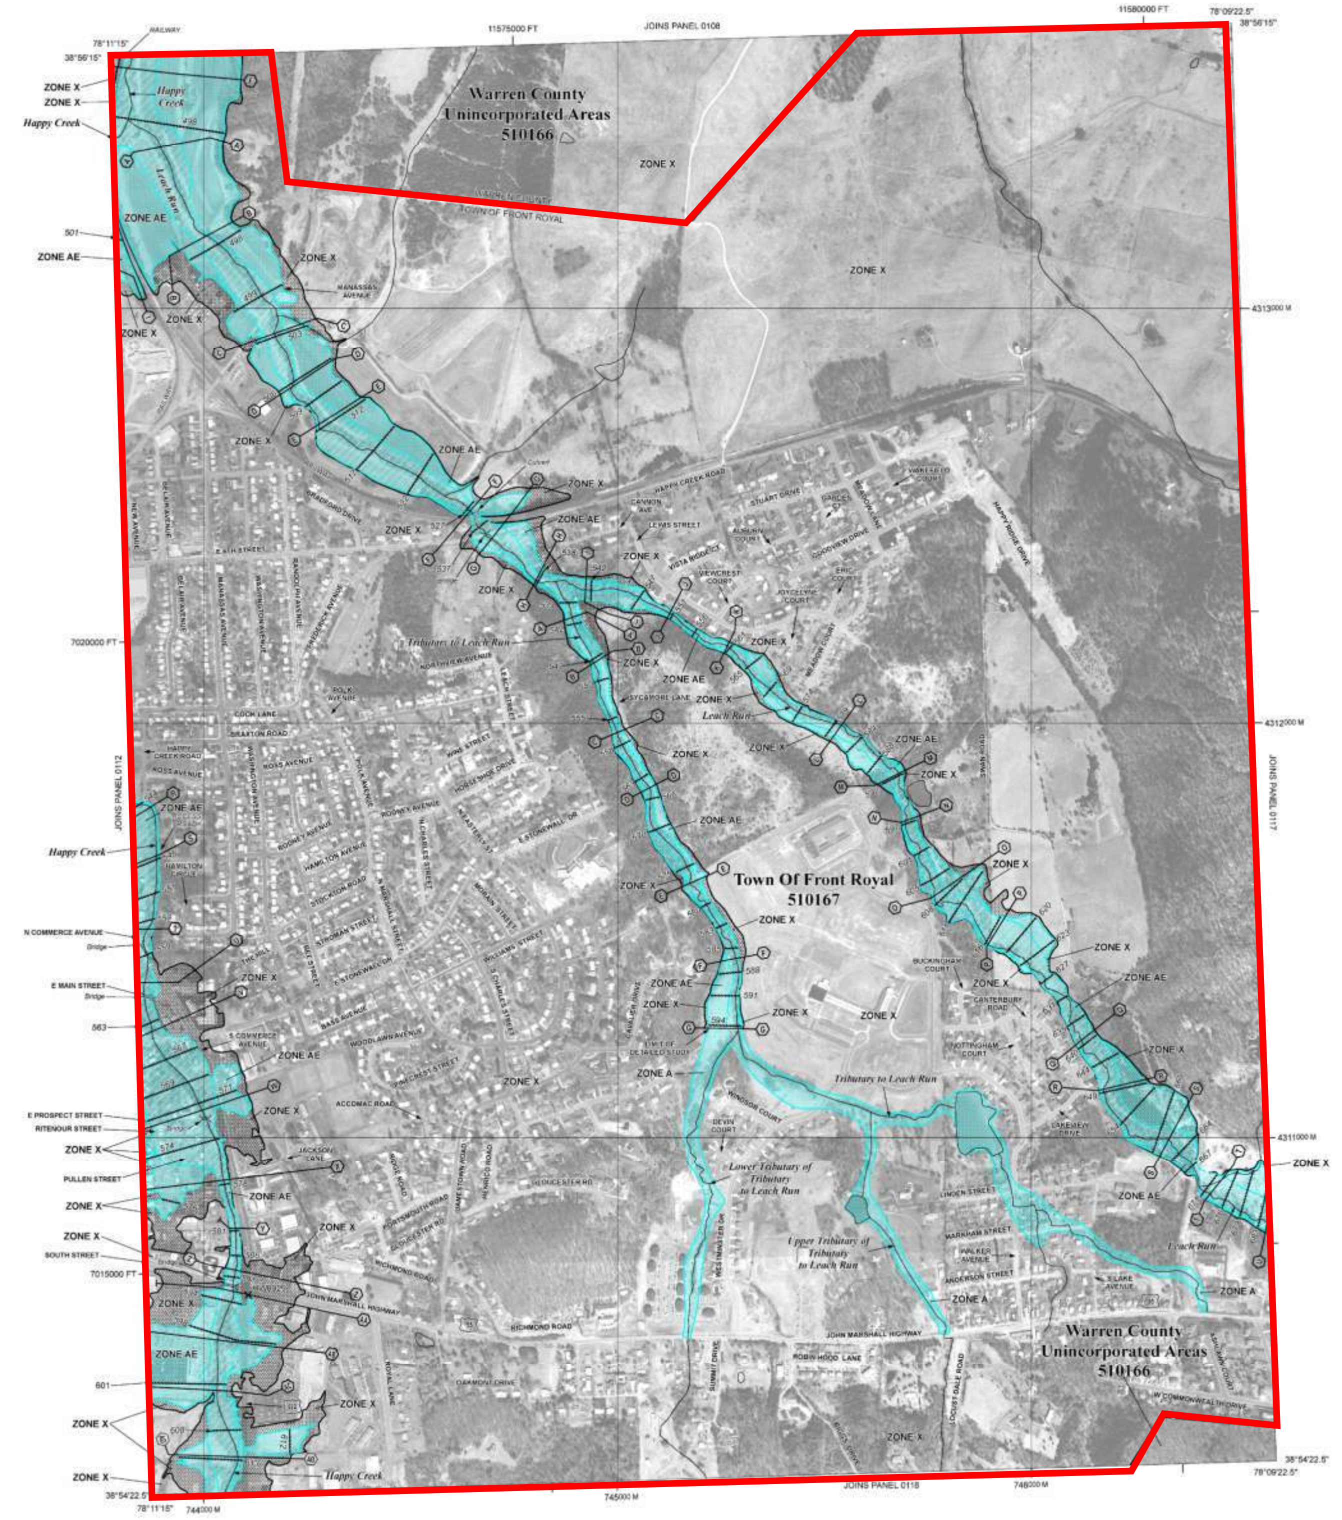
n the above mentioned digital orthophotographs, this map reflects more and up-to-date **stream channel configurations** than those shown on ious FIRM for this jurisdiction. As a result, the Flood Profiles may reflect channel distances that differ from what is shown on the map. Also, the floodplain relationships for unrevised streams may differ from what is n previous maps.

ate limits shown on this map are based on the best data available at the publication. Because changes due to annexations or de-annexations may ccurred after this map was published, map users should contact iate community officials to verify current corporate limit locations.

refer to the separately printed **Map Index** for an overview map of the showing the layout of map panels; community map repository addresses; isting of Communities table containing National Flood Insurance Program r each community as well as a listing of the panels on which each ity is located.

the **FEMA Map Service Center** at 1-800-358-9616 for information on products associated with this FIRM. Available products may include ly issued Letters of Map Change, a Flood Insurance Study report, and /or ersions of this map. The FEMA Map Service Center may also be reached t 1-800-358-9620 and its website at http://www.msc.fema.gov/.

ave **questions about this map** or questions concerning the National surance Program in general, please call **1-877-FEMA MAP** (1-877-336- visit the FEMA website at http://www.fema.gov/.



LEGEND

▨	SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT T INUNDATION BY THE 1% ANNUAL CHANCE FLOO

The 1% annual chance flood (100-year flood), also known as the base flood, is the has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard area subject to flooding by the 1% annual chance flood. Areas of special Flood Haz Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the wa elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Ba Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain) depths determined. For areas of alluvial fan flooding, veloc determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annu flood by a flood control system that was subsequently decertified. indicates that the former flood control system is being restored t protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Fed protection system under construction; no Base Flood El determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Ba Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Ba Elevations determined.
▨	FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be of encroachment so that the 1% annual chance flood can be carried without substantia in flood heights.

1987	1987-04-18	18.51	49,400

Peak Stream Flow since 1900 of SF Shenandoah River

Town of Front Royal

The principal flood problem on the South and North Fork Shenandoah Rivers in the town is that the floodplains are subject to periodic, disastrous flooding, and yet are the most amenable areas for development. Flow records for the period 1900 to the present are available for USGS gaging station (No. 01631000) located on the South Fork Shenandoah River at Front Royal. Historic floods, recorded at this gage, occurred in September 1996, November 1985, October 1942 and March 1936.

The September 1996 and the November 1985 flood had a peak discharge of 121,000 cubic feet per second (cfs). The recurrence interval for these storms is not available. The October 1942 flood had an estimated recurrence interval of 53 years with a peak discharge of 130,000 (cfs). The March 1936 flood had a recurrence interval of 25 years with a peak discharge of 98,000 cfs.

Another USGS gaging station (No. 01634000) is located on the North Fork Shenandoah River at Strasburg, approximately 10 miles upstream from Front Royal. Flow records are available at this site for the period 1926 to the present. Historic floods and their estimated recurrence intervals as recorded by this gage occurred in September 1996 (114,000 cfs, recurrence interval not availible) and October 1942 (100,000 cfs, greater than 100 years) and March 1936 (89,000 cfs, greater than 100 years).

Another major flood occurred on the Shenandoah River in October 1870. The stage of this flood was estimated to be the same as the flood of 1936 (Reference 1). Damage figures for the June 1972 flood of Tropical Storm Agnes are available for the drainage basins of the South and North Fork Shenandoah Rivers (Reference 2). Most serious conditions developed along mountain streams that received heavy runoff resulting in flash flooding. Total damage in both basins was estimated at $9,411,000. Most damage was to residential property ($3,564,000) and business ($2,227,000) in the South Fork Shenandoah River basin. Damage to transportation ($311,000) and agriculture ($298,000) accounted for most of the total in the North Fork Shenandoah River basin. The peak discharge at the gage on the South Fork Shenandoah River at Front Royal was 71,200 cfs with an estimated recurrence interval of 13 years; while the peak at the North Fork Shenandoah River gage at Strasburg was 25,100 cfs with an estimated recurrence interval of less than 10 years.

Most damage in the town from the flood of November 1985 occurred on the banks of the South and North Fork Shenandoah Rivers. Most permanent residences in the floodplain received water damage. Floodwaters were several feet above the first flood level in some instances. A number of vacation homes and mobile homes were completely submerged. Some structures came loose from their foundations and were carried downstream. A peak discharge of 120,000 cfs was recorded at the South Fork Shenandoah River gage at Front Royal, and its estimated recurrence interval is 47 years. The North Fork Shenandoah River gage at Strasburg recorded a peak discharge of 62,300 cfs with an estimated recurrence interval of 33 years.

Flood problems on Happy Creek are the result of the inadequate capacity of the Happy Creek channel, a number of restricted bridge openings, abrupt changes in the course of the stream at two places, and encroachments on the floodplain. Major floods occurred in March 1936 and October 1942. Much of the downtown area and the surrounding residences were inundated by these floods. A detailed account of the 1942 flood and estimates of the resulting damages are available (Reference 3). Total damages, adjusted to 1950 dollars, were estimated to be $145,600. Business and residential damages were $73,000 and $26,500, respectively. A USGS gaging station was located on Happy Creek near the southern corporate limits. Flow records are available for the period 1948 to 1977. Peak discharge estimates for the 1942 and 1936 floods are 7,100 cfs and 5,600 cfs, respectively. By comparing these estimates to the 29 years of flow record at the Happy Creek gage, the estimated recurrence intervals for the 1942 and 1936 floods are greater than 100 years and 60 years, respectively.

No historic flood information was available for Leach Run and its tributaries.

4. Copy of current floodplain ordinance

Current Floodplain Ordinance

FLOODPLAIN ZONING

(Amended Entirely 7-11-88, 10-14-08)

175-74 GENERAL PROVISIONS (Floodplain)

A. Statutory Authority: This ordinance is adopted pursuant to the authority granted to localities by Virginia Code § 15.2-2280.

(Amended 3-28-16-Effective Upon Passage)

B. Purpose: The purpose of these provisions is to prevent: the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

1. Regulating uses, activities, and development which, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

Chapter 175 TOWN OF FRONT ROYAL MUNICIPAL CODE Chapter 175

175-132

2. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;

3. Requiring all those uses, activities, and developments that do occur in flood-prone districts to be protected and/or flood-proofed against flooding and flood damage; and,

4. Protecting individuals from buying land and structures which are unsuited for intended purposes because of flood hazards.

C. Applicability: These provisions shall apply to all lands within the jurisdiction of the Town of Front Royal and identified as a being in the 1% annual chance of a flood (Special Flood Hazard Area), by the Federal Insurance Administration.

D. Compliance and Liability:

1. No land shall hereafter be developed and no structure shall be located, relocated, constructed, reconstructed, enlarged, or structurally altered except in full compliance with the terms and provisions of this ordinance and any other applicable ordinances and regulations which apply to uses within the jurisdiction of this ordinance.

2. The degree of flood protection sought by the provisions of this ordinance is considered reasonable for regulatory purposes and is based on acceptable engineering methods of study. Larger floods may occur on rare occasions. Flood heights may be increased by man-made or natural causes, such as ice jams and bridge openings restricted by debris. This ordinance does not imply that districts outside the Floodplain District or that land uses permitted within such district will be free from flooding or flood damages.

3. Records of actions associated with administering this ordinance shall be kept on file and maintained by the Zoning Administrator.

4. This ordinance shall not create liability on the part of the Town of Front Royal or any officer or employee thereof for any flood damages that result from reliance on this ordinance or any administrative decision lawfully made there under.

E. Abrogation and Greater Restrictions: This ordinance supersedes any ordinance currently in effect in flood-prone districts. However, any underlying ordinance shall remain in full force and effect to the extent that its provisions are more restrictive than this ordinance.

F. Severability: If any section, subsection, paragraph, sentence, clause, or phrase of this ordinance shall be declared invalid for any reason whatever, such decision shall not affect the remaining portions of this ordinance. The remaining portions shall remain in full force and effect; and for this purpose, the provisions of this ordinance are hereby declared to be severable.

G. Administration:

1. Designation of the Floodplain Administrator. The Floodplain Administrator is hereby appointed to administer and implement these regulations and is referred to herein as the Floodplain Administrator. The Zoning Administrator is hereby designated as the Floodplain Administrator for the Town of Front Royal. The Floodplain Administrator may:

a. Do the work themselves. In the absence of a designated Floodplain Administrator, the duties are conducted by the Town of Front Royal chief executive officer.

b. Delegate duties and responsibilities set forth in these regulations to qualified technical personnel, plan examiners, inspectors, and other employees.

c. Enter into a written agreement or written contract with another community or private sector entity to administer specific provisions of these regulations. Administration of any part of these regulations by another entity shall not relieve the community of its responsibilities pursuant to the participation requirements of the National Flood Insurance Program as set forth in the Code of Federal Regulations at 44 C.F.R. Section 59.22.

2. Duties and Responsibilities of the Floodplain Administrator: The duties and responsibilities of the Floodplain Administrator shall include but are not limited to:

a. Review applications for permits to determine whether proposed activities will be located in the Special Flood Hazard Area (SFHA).

b. Interpret floodplain boundaries and provide available base flood elevation and flood hazard information.

c. Review applications to determine whether proposed activities will be reasonably safe from flooding and require new construction and substantial improvements to meet the requirements of these regulations.

d. Review applications to determine whether all necessary permits have been obtained from the Federal, State or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the 100-year frequency floodplain of free-flowing non-tidal waters of the State.

e. Verify that applicants proposing an alteration of a watercourse have notified adjacent communities, the Department of Conservation and Recreation (Division of Dam Safety and Floodplain Management), and other appropriate agencies (VADEQ, USACE) and have submitted copies of such notifications to FEMA.

f. Advise applicants for new construction or substantial improvement of structures that are located within an area of the Coastal Barrier Resources System established by the Coastal Barrier Resources Act that Federal flood insurance is not available on such structures;

areas subject to this limitation are shown on Flood Insurance Rate Maps as Coastal Barrier Resource System Areas (CBRS) or Otherwise Protected Areas (OPA).

g. Approve applications and issue permits to develop in flood hazard areas if the provisions of these regulations have been met, or disapprove applications if the provisions of these regulations have not been met.

h. Inspect or cause to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with these regulations or to determine if non-compliance has occurred or violations have been committed.

i. Review Elevation Certificates and require incomplete or deficient certificates to be corrected.

j. Submit to FEMA, or require applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the Town of Front Royal within six months after such data and information becomes available if the analyses indicate changes in base flood elevations.

k. Maintain and permanently keep records that are necessary for the administration of these regulations, including:

[1] Flood Insurance Studies, Flood Insurance Rate Maps (including historic studies and maps and current effective studies and maps) and Letters of Map Change; and

[2] Documentation supporting issuance and denial of permits, Elevation Certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, inspection records, other required design certifications, variances, and records of enforcement actions taken to correct violations of these regulations.

l. Enforce the provisions of these regulations, investigate violations, issue notices of violations or stop work orders, and require permit holders to take corrective action.

m.Advise the Board of Zoning Appeals regarding the intent of these regulations and, for each application for a variance, prepare a staff report and recommendation.

n. Administer the requirements related to proposed work on existing buildings:

[1] Make determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged.

[2] Make reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct. Prohibit the non compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.

o. Undertake, as determined appropriate by the Floodplain Administrator due to the circumstances, other actions which may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other Federal, State, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in special flood hazard areas; and assisting property owners with documentation necessary to file claims for Increased Cost of Compliance coverage under NFIP flood insurance policies.

p. Notify the Federal Emergency Management Agency when the corporate boundaries of the Town of Front Royal have been modified and:

[1] Provide a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to these regulations has either been assumed or relinquished through annexation; and

[2] If the FIRM for any annexed area includes special flood hazard areas that have flood zones that have regulatory requirements that are not set forth in these regulations, prepare amendments to these regulations to adopt the FIRM and appropriate requirements, and submit the amendments to the governing body for adoption; such

adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended regulations shall be provided to Department of Conservation and Recreation (Division of Dam Safety and Floodplain Management) and FEMA.

q. Upon the request of FEMA, complete and submit a report concerning participation in the NFIP which may request information regarding the number of buildings in the SFHA, number of permits issued for development in the SFHA, and number of variances issued for development in the SFHA.

r. It is the duty of the Community Floodplain Administrator to take into account flood, mudslide and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the Community, whether or not those hazards have been specifically delineated geographically (e.g. via mapping or surveying).

3. Use and Interpretation of FIRMs. The Floodplain Administrator shall make interpretations, where needed, as to the exact location of special flood hazard areas, floodplain boundaries, and floodway boundaries. The following shall apply to the use and interpretation of FIRMs and data:

a. Where field surveyed topography indicates that adjacent ground elevations:

[1] Are below the base flood elevation, even in areas not delineated as a special flood hazard area on a FIRM, the area shall be considered as special flood hazard area and subject to the requirements of these regulations;

[2] Are above the base flood elevation, the area shall be regulated as special flood hazard area unless the applicant obtains a Letter of Map Change that removes the area from the SFHA.

b. In FEMA-identified special flood hazard areas where base flood elevation and floodway data have not been identified and in areas where FEMA has not identified SFHAs, any other flood hazard data available from a Federal, State, or other source shall be reviewed and reasonably used.

c. Base flood elevations and designated floodway boundaries on FIRMs and in FISs shall take precedence over base flood elevations and floodway boundaries by any other sources if such sources show reduced floodway widths and/or lower base flood elevations.

d. Other sources of data shall be reasonably used if such sources show increased base flood elevations and/or larger floodway areas than are shown on FIRMs and in FISs.

e. If a Preliminary Flood Insurance Rate Map and/or a Preliminary Flood Insurance Study has been provided by FEMA:

[1] Upon the issuance of a Letter of Final Determination by FEMA, the preliminary flood hazard data shall be used and shall replace the flood hazard data previously provided from FEMA for the purposes of administering these regulations.

[2] Prior to the issuance of a Letter of Final Determination by FEMA, the use of preliminary flood hazard data shall be deemed the best available data pursuant to Section 3.1.A.3. and used where no base flood elevations and/or floodway areas are provided on the effective FIRM.

[3] Prior to issuance of a Letter of Final Determination by FEMA, the use of preliminary flood hazard data is permitted where the preliminary base flood elevations or floodway areas exceed the base flood elevations and/or designated floodway widths in existing flood hazard data provided by FEMA. Such preliminary data may be subject to change and/or appeal to FEMA.

4. Jurisdictional Boundary Changes. In accordance with the Code of Federal Regulations, Title 44 Subpart (B) Section 59.22 (a) (9) (v), the Town will notify the Federal Insurance Administration and optionally the State Coordinating Office in writing whenever the boundaries of the Town have been modified by annexation or the Town has otherwise assumed or no longer has authority to adopt and enforce floodplain management regulations for a particular area. A copy of a map of the Town, suitable for reproduction, and clearly delineating the new corporate limits or new area for which the Town has assumed or relinquished floodplain management regulatory authority must be included with

the notification.

5. District Boundary Changes. The delineation of any of the Floodplain Districts may be revised by the Town where natural or man-made changes have occurred and/or where more detailed studies have been conducted or undertaken by the U. S. Army Corps of Engineers or other qualified agency, or an individual documents the need for such change. However, prior to any such change, approval must be obtained from the Federal Emergency Management Agency. A completed Letter of Map Revision (LOMR) is a record of this approval.

6. Interpretation of District Boundaries. Initial interpretations of the boundaries of the Floodplain Districts shall be made by the Zoning Officer. Should a dispute arise concerning the boundaries of any of the Districts, the Board of Zoning Appeals shall make the necessary determination. The person questioning or contesting the location of the District boundary shall be given a reasonable opportunity to present his case to the Board and to submit his own technical evidence if he so desires.

7. Submitting Model Backed Technical Data. A community's base flood elevations may increase or decrease resulting from physical changes affecting flooding conditions. As soon as practicable, but not later than six months after the date such information becomes available, a community shall notify the Federal Emergency Management Agency of the changes by submitting technical or scientific data. The community may submit data via a LOMR. Such a submission is necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and flood plain management requirements will be based upon current data.

8. Letters of Map Revision. When development in the floodplain will cause or causes a change in the base flood elevation, the Town shall require the applicant of the development to notify FEMA by applying for a Conditional Letter of Map Revision and then a Letter of Map Revision.

9. Penalty for Violations. Any person who fails to comply with any of the requirements or provisions of this article or directions of the director of planning or any authorized employee of the Town shall be guilty of the appropriate violation and subject to the penalties thereof.

Violations and associated penalties related to the floodplain provisions are found under Section 175-145 of this Chapter. In addition to the above penalties, all other actions are hereby reserved, including an action in equity for the proper enforcement of Sections 175-74 through 175-81.3. The imposition of a fine or penalty for any violation of, or noncompliance with, the provisions of Sections 175-74 through 175-81.3, shall not excuse the violation or noncompliance or permit it to continue; and all such persons shall be required to correct or remedy such violations within a reasonable time. Any structure constructed, reconstructed, enlarged, altered or relocated in noncompliance with this article may be declared by the Town to be a public nuisance and abatable as such. Flood insurance may be withheld from structures constructed in violation of this article.

(Added Entire “G – Administration” 3-28-16-Effective Upon Passage)

175-75 DEFINITIONS (Floodplain)

The following definitions apply to the floodplain regulations found within this chapter, specifically Sections 175-74 through 175-81.3:

(Added 3-28-16-Effective Upon Passage)

A. ACCESSORY STRUCTURE or APPURTENANT STRUCTURE – For purposes of the floodplain regulations of this chapter, shall mean an accessory building not in excess of 200 square feet. (Added 3-28-16-Effective Upon Passage)

B. BASE FLOOD - The flood having a one percent chance of being equaled or exceeded in any given year.

C. BASE FLOOD ELEVATION – The water surface elevations of the base flood, that is, the flood level that has a one percent or greater chance of occurrence in any given year. The water surface elevation of the base flood in relation to the datum specified on the community’s Flood Insurance Rate map. For the purposes of this ordinance, the base flood is the 1% annual chance flood.

(Amended 3-28-16-Effective Upon Passage)

D. BASEMENT - Any area of the building having its floor sub-grade (below ground level) on all sides.

E. BOARD OF ZONING APPEALS - The Board appointed to review appeals made by individuals with regard to decisions of the Zoning Administrator in the interpretation of this ordinance.

F. BREAKAWAY WALL - A wall that is not part of the structural support of the building and is intended through its design and construction to collapse under specific lateral loading forces, without causing damage to the elevated portion of the building or supporting foundation system.

G. DEVELOPMENT - Any man-made change to improved or unimproved real estate, including, but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.

H. ELEVATED BUILDING - A non-basement building built to have the lowest floor elevated above the ground level by means of fill, solid foundation perimeter walls, pilings, or columns (posts and piers).

I. ENCROACHMENT - The advance or infringement of uses, plant growth, fills, excavation, buildings, permanent structures or development into a floodplain, which may impede or alter the flow capacity of a floodplain.

J. EXISTING CONSTRUCTION – Structures for which the “start of construction” commenced before the effective date of the FIRM or before January 1, 1975 for FIRMs effective before that date “existing construction” may also be referred to as “existing structures”.

(Added 3-28-16-Effective Upon Passage)

K. FLOOD OR FLOODING -

1. A general or temporary condition of partial or complete inundation of normally dry land areas from:

a. The overflow of inland or tidal waters; or,

b. The unusual and rapid accumulation or run-off of surface waters from any source.

c. Mudflows which are proximately caused by flooding as defined in paragraph (1)(b) of this definition and are akin to a river of liquid and flowing mud on the surfaces of normally dry land areas, as when earth is carried by current of water and deposited along the path of the current.

(Added “c” 3-28-16-Effective Upon Passage)

2. The collapse or subsistence of land along the shore of a lake or other body of water as a result of erosion or undermining caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusually high water level in a natural body of water, accompanied by a severe storm, or by an unanticipated force of nature such as flash flood or an abnormal tidal surge, or by some similarly unusual and unforeseeable event which results in flooding as defined in paragraph (1) (a) of this definition.

L. FLOOD INSURANCE RATE MAP (FIRM) – An official map of a community, on which the Federal Emergency Management Agency has delineated both the special hazard areas and the risk premium zones applicable to the community. A FIRM that has been made available digitally is called a Digital Flood Insurance Rate Map (DFIRM).

(Added 3-28-16-Effective Upon Passage)

M. FLOOD INSURANCE STUDY (FIS) – A report by FEMA that examines, evaluates and determines flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation and determination of mudflow and/or flood-related erosion hazards.

(Added 3-28-16-Effective Upon Passage)

N. FLOODPLAIN OR FLOOD-PRONE AREA - Any land area susceptible to being inundated by water from any source.

O. FLOODWAY - The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height.

P. FREEBOARD - A factor of safety usually expressed in feet above a flood level for purposes of floodplain management. “Freeboard” tends to compensate for the many unknown factors that could contribute to flood heights greater than the height calculated for a selected size flood and floodway conditions, such as wave action, bridge openings, and the hydrological effect of urbanization in the watershed.

Q. FLOOD-PROOFING - Any combination of structural and non-structural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

R. HIGHEST ADJACENT GRADE – The highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

(Added 3-28-16-Effective Upon Passage)

S. HISTORIC STRUCTURE – Any structure that is:

1. Listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register;
2. Certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a register historic district;
3. Individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of the Interior; or,
4. Individually listed on a local inventory of history places in communities with historic preservation programs that have been certified either

a. by an approved state program as determined by the Secretary of the Interior; or,

b. directly by the Secretary of the Interior in states without approved programs.

(Added “S” 3-28-16-Effective Upon Passage)

T. HYDRAULIC AND HYDRAULIC ENGINEERING ANALYSIS – Analyses performed by a licensed profession engineer, in accordance with standard engineering practices that are accepted by the Virginia Department of Conservation and Recreation and FEMA, used to determine the base flood, other frequency floods, flood elevations, floodway information and boundaries, and flood profiles.

(Added 3-28-16-Effective Upon Passage)

U. LETTERS OF MAP CHANGES (LOMC) – A letter of Map Change is an official FEMA determination, by letter, that amends or revises an effective Flood Insurance Rate Map or Flood Insurance Study. Letters of Map Change include:

1. LETTER OF MAP AMENDMENT (LOMA) – An amendment based on technical data showing that a property was incorrectly included in a designated special flood hazard area. A LOMA amends the current effective Flood Insurance Rate Map and establishes that a land as defined by meets and bounds or structure is not located in a special flood hazard area.

2. LETTER OF MAP REVISION (LOMR) – A revision based on technical data that may show changes to flood zones, flood elevations, floodplain and floodway delineations, and planimetric features. A Letter of Map Revision based on Fill (LOMR-F), is a determination that a structure or parcel of land has been elevated by fill above the base flood elevation and is, therefore, no longer exposed to flooding associated with the base flood. In order to qualify for this determination, the fill must have been permitted and placed in accordance with the community's floodplain management regulations.

(Added "U" 3-28-16-Effective Upon Passage)

V. LOWEST ADJACENT GRADE – The lowest natural elevation of the ground surface next to the walls of structure.

(Added 3-28-16-Effective Upon Passage)

W. LOWEST FLOOR – The lowest floor of the lowest enclosed area (including basement). An unfinished or flood-resistant enclosure, usable solely for parking of vehicles, building access or storage in an area other than a basement area is not considered a building's lowest floor provided, that such enclosure is not built so as to render the structure in violation of the applicable non elevation design requirements of Federal Code 44CFR §60.3.

X. MANUFACTURED HOME – A structure, transportable in one or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when connected to the required utilities. For floodplain management purposes the term "manufactured homes" also include park trailers, travel trailers and other similar vehicles placed on a site for greater than 180 consecutive days.

(Added 3-28-16-Effective Upon Passage)

Y. MANUFACTURED HOME PARK OR SUBDIVISION – A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

(Added 3-28-16-Effective Upon Passage)

Z. MEAN SEA LEVEL – Is an elevation point that represents the average height of the ocean's surface (such as the halfway point between the mean high tide and the mean low tide) which is used as a standard in reckoning land elevation.

(Added 3-28-16-Effective Upon Passage)

aa. NEW CONSTRUCTION - For the purposes of determining insurance rates, structures for which the "start of construction" commenced on or after the effective date of an initial Flood Insurance Rate Map July 15, 1988, whichever is later, and includes any subsequent improvements to such structures. For floodplain management purposes, new construction means structures for which start of construction commenced on or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures.

bb. POST-FIRM STRUCTURES – A structure for which construction or substantial improvement occurred after July 15, 1988. (Added 3-28-16-Effective Upon Passage)

cc. PRE-FIRM STRUCTURES – A structure for which construction or substantial improvement occurred on or before July 15, 1988.

(Added 3-28-16-Effective Upon Passage)

dd. RECREATIONAL VEHICLE - A vehicle which is:

1. Built on a single chassis;
2. 400 square feet or less when measured at the largest horizontal projection;
3. Designed to be self-propelled or permanently towable by a light-duty truck; and,

4. Designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

ee. REPETITIVE LOSS STRUCTURE – A building covered by a contract for flood insurance that has incurred flood-related damages on two occasions, in which the cost of the repair, on the average, equaled or exceeded 25 percent of the market value of the structure at the time of each such flood event; and at the time of the second incidence of flood-related damage, the contract for flood insurance contains increased cost of compliance coverage.

(Added 3-28-16-Effective Upon Passage)

ff. SEVERE REPETITIVE LOSS STRUCTURE – A structure that: (a) is covered under a contract for flood insurance made available under the NFIP; and (b) has incurred flood related damage – (i) for which 4 or more separate claims payments have been made under flood insurance coverage whit the amount of each such claim exceeding $5,000, and with the cumulative amount of such claims payments exceeding $20,000; or (ii) for which at least 2 separate claims payments have been made under such coverage, with the cumulative amount of such claims exceeding the market value of the insured structure.

(Added 3-28-16-Effective Upon Passage)

gg. SPECIAL FLOOD HAZARD AREA - The land in the floodplain subject to a one (1%) percent or greater chance of being flooded in any given year, commonly known as the one-hundred (100) year floodplain.

hh. START OF CONSTRUCTION - The date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, substantial improvement or other improvement was within 180 days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation. Permanent construction does not include land preparation, such as clearing, grading and filling; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of the construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

ii. STRUCTURE – For floodplain management purposes, a walled and roofed building, including a gas or liquid storage tank, that is principally above ground, as well as a manufactured home.

(Added 3-28-16-Effective Upon Passage)

jj. SUBSTANTIAL DAMAGE - Damage of any origin sustained by a structure whereby the cost of restoring the structure to it's before damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

kk. SUBSTANTIAL IMPROVEMENT - Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the start of construction of the improvement. This term includes structures which have incurred substantial damage regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions, or

2. Any alteration of a historic structure, provided that the alteration will not preclude the structure's continued designation as a historic structure, or

3. Historic structures undergoing repair or rehabilitation that would constitute a substantial improvement as defined above, must comply with all ordinance requirements that do not preclude the structure's continued designation as a historic structure. Documentation that a specific ordinance requirement will cause removal of the structure from the National Register of Historic Places or the State Inventory of Historic Places must be obtained from the Secretary of the Interior or the State Historic Preservation Officer. Any exemption from ordinance requirements will be the minimum necessary to preserve the historic character and design of the structure.

(Added "kk" 3-28-16-Effective Upon Passage) ll VIOLATION – The failure of a structure or other development to be fully compliant with the community's floodplain management regulations. A structure or other development without the elevation certificate, other certifications, or other evidence of compliance required in Sections 175-74 through 175-81.3 of this Chapter is presumed to be in violation until such time as that documentation is provided.

(Added 3-28-16-Effective Upon Passage)

mm. WATERCOURSE - A lake, river, creek, stream, wash, channel or other topographic feature on or over which waters flow at least periodically. Watercourse includes specifically designated areas in which substantial flood damage may occur.

175-76 ESTABLISHMENT OF FLOODPLAIN DISTRICTS

A. Basis of Districts - The various floodplain districts shall include special flood hazard areas. The basis for the delineation of these districts shall be the Flood Insurance Study (FIS) for the Town of Front Royal prepared by the Federal Emergency Management Agency, Federal Insurance Administration, dated June 3, 2008, as amended.

(Amended "A" 5-12-08-Effective Upon Passage)

B. The Floodway District, also referred to as the AE zone, is delineated, for purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the Special Flood Hazard Area without increasing the water surface elevation of that flood more than one (1) foot at any point. The areas included in this District are specifically defined in Table 4 of the above-referenced Flood Insurance Study and shown on the accompanying Flood Boundary and Floodway Map or Flood Insurance Rate Map. The following provisions shall apply within the Floodway District of an AE zone:

1. Within any floodway area, no encroachments, including fill, new construction, substantial improvements, or other development shall be permitted unless it has been demonstrated through hydrologic and hydraulic analysis performed in accordance with standard engineering practice that the proposed encroachment will not result in any increase in flood levels within the community during the occurrence of the base flood discharge. Hydrologic

and hydraulic analyses shall be undertaken only by professional engineers or others of demonstrated qualifications, who shall certify that the technical methods used correctly reflect currently-accepted technical concepts. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the Floodplain Administrator. Development activities which increase the water surface elevation of the base flood may be allowed, provided that the applicant first applies – with the Town's endorsement – for a Conditional Letter of Map Revision (CLOMR), and receives the approval of the Federal Emergency Management Agency. If the requirements of this section are satisfied, all new construction and substantial improvements shall comply with all applicable flood hazard reduction standards.

2. The placement of manufactured homes (mobile homes) is prohibited, except when replacing an existing manufactured home in an existing manufactured home park or subdivision. A replacement manufactured home may be placed on a lot in an existing manufactured home park or subdivision provided the anchoring, elevation and encroachment standards are met.

(Amended "B" 6-23-08-Effective Upon Passage)

(Amended "B" and Added (1-2) 3-28-16-Effective Upon Passage)

C. The Flood-Fringe District shall be that area of the Special Flood Hazard Area not included in the Floodway District. The basis for the outermost boundary of the District shall be the Special Flood Hazard Area elevations contained in the flood profiles of the above-referenced Flood Insurance Study and as shown on the accompanying Flood Boundary and Floodway Map or Flood Insurance Rate Map.

D. The Approximated Floodplain District, also referred to as the A Zone, as illustrated on the FIRM accompanying the Flood Insurance Study (FIS) shall be those areas for which no detailed flood profiles or elevations are provided, but the one percent annual chance floodplain boundary has been approximated. For these areas, the following provisions shall apply:

1. The Approximated Floodplain District shall be that floodplain area for which no detailed

flood profiles or elevations are provided, but where a one percent annual chance floodplain boundary has been approximated. Such areas are shown as Zone A on the maps accompanying the FIS. For these areas, the base flood elevations and floodway information from federal, state, and other acceptable sources shall be used, when available. Where the specific one percent annual chance flood elevation cannot be determined for this area using other sources of data, such as the U. S. Army Corps of Engineers Floodplain Information Reports, U. S. Geological Survey Flood-Prone Quadrangles, etc., then the applicant for the proposed use, development and/or activity shall determine this base flood elevation. For development proposed in the approximate floodplain the applicant must use technical methods that correctly reflect currently accepted practices, such as point on boundary, high water marks, or detailed methodologies hydrologic and hydraulic analyses. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the Floodplain Administrator.

2. The Floodplain Administrator reserves the right to require a hydrologic and hydraulic analysis for any development. When such base flood elevation data is utilized, the lowest floorshall be elevated to or above the base flood plus twelve (12) inches. Additional elevation above 12 inches over the base flood is recommended if possible because it may reduce the cost of flood insurance.

3. During the permitting process, the Floodplain Administrator shall obtain:

a. The elevation of the lowest floor (in relation to mean sea level),including the basement, of all new and substantially improved structures; and,

b. If the structure has been flood-proofed in accordance with the requirements of this article, the elevation (in relation to mean sea level) to which the structure has been flood-proofed.

4. Base flood elevation data shall be obtained from other sources or developed using detailed methodologies comparable to those contained in a FIS for subdivision proposals and other proposed development proposals (including manufactured home parks and subdivisions)

that exceed fifty lots or five acres, whichever is the lesser.

(Amended “D” and Added (1-4) 3-28-16-Effective Upon Passage)

175-77 OVERLAY CONCEPT (Floodplain)

A. The Floodplain Districts described above shall be overlays to the existing underlying districts as shown on the Official Zoning Ordinance Map, and as such, the provisions for the floodplain districts shall serve as a supplement to the underlying district provisions.

B. If there is any conflict between the provisions or requirements of the Floodplain Districts and those of any underlying district, the more restrictive provisions and/or those pertaining to the floodplain districts shall apply.

C. In the event any provision concerning a Floodplain District is declared inapplicable as a result of any legislative or administrative actions or judicial decision, the basic underlying provisions shall remain applicable.

175-78 FLOODPLAIN DISTRICT BOUNDARIES

A. The boundaries of the Special Flood Hazard Area and Floodplain Districts are established as shown on the Flood Boundary and Floodway Map and/or Flood Insurance Rate Map which is declared to be a part of this Ordinance and which shall be kept on file at the Town of Front Royal Planning Offices.

(Amended “A” 6-23-08-Effective Upon Passage)

B. District Boundary Changes: The delineation of any of the Floodplain Districts may be revised by the Town of Front Royal where natural or man-made changes have occurred and/or where more detailed studies have been conducted or undertaken by the U. S. Army Corps of Engineers or other qualified agency, or an individual documents the need for such change. However, prior to any such change, approval must be obtained from the Federal Insurance Administration.

C. Interpretation of District Boundaries: Interpretations of the boundaries of the Floodplain Districts shall be made by the Zoning Administrator. Should a dispute arise concerning the boundaries of any of the Districts, the Board of Zoning Appeals shall make the necessary determination. The person questioning or contesting the location of the District boundary shall be given a reasonable opportunity to present his case to the Board and to submit his own technical evidence if he so desires.

175-79 DISTRICT PROVISIONS (Floodplain)

A. Permit Requirement: All uses, activities, and development occurring within any floodplain district shall be undertaken only upon the issuance of a Zoning Permit. Such development shall be undertaken only in strict compliance with the provisions of the Ordinance and with all other applicable codes and ordinances, as amended, and the Town of Front Royal Subdivision Regulations. Prior to the issuance of any such permit, the Zoning Administrator shall require all applications to include compliance with all applicable state and federal laws.

(Amended “A” 11-23-98-Effective Upon Passage)

(Amended “A” 6-23-08-Effective Upon Passage)

B. Site Plans and Permit Applications: All applications for development within any floodplain district and all building permits issued for the floodplain shall incorporate the following information:

1. For structures to be elevated, the elevation of the lowest floor (including basement).
2. For structures to be flood-proofed (non-residential only), the elevation to which the structure will be flood-proofed.
3. The elevation of the Base Flood at the site.
4. Topographic information showing existing and proposed ground elevations.

(Amended former “F’ 4-19-99-Effective Upon Passage)

(Amended “B” 5-12-08-Effective Upon Passage)

(Added “B” (3 & 4) 3-28-16-Effective Upon Passage)

175-80 GENERAL STANDARDS (Floodplain)

In all special flood hazard areas the property owner is ultimately responsible for insuring the following provisions have been considered:

A. New construction and substantial improvements shall be anchored to prevent floatation, collapse or lateral movement of the structure.

B. New construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.

C. New construction or substantial improvements shall be constructed by methods and practices that minimize flood damage.

D. Electrical, heating, ventilation, plumbing, air conditioning equipment and other service facilities, including duct work, shall be designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

E. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of flood waters into the system.

F. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of flood waters into the systems and discharges from the systems into flood waters.

G. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

H. Any alteration, repair, reconstruction or improvements to a building that is in compliance with the provisions of this ordinance shall meet the requirements of “new construction” as contained in this ordinance.

I. Any alteration, repair, reconstruction or improvements to a building that is not in compliance with the provisions of this ordinance, shall be undertaken only if said non-conformity is not furthered, extended, or replaced.

J. Prior to any proposed alteration or relocation of any channels or of any watercourse, stream, etc., within this jurisdiction a permit shall be obtained from the U. S. Corps of Engineers, the Virginia Department of Environmental Quality, and the Virginia Marine Resources Commission (a joint permit application is available from any of these organizations). Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the Department of Conservation and Recreation (Division of Dam Safety and Floodplain Management) and the Federal Insurance Administration.

K. The flood carrying capacity within an altered or relocated portion of any watercourse shall be maintained.

L. Manufactured homes shall be anchored to prevent flotation, collapse or lateral movement.

Methods of anchoring may include, but are not limited to, use of over-the-top or frame ties to ground anchors. This standard shall be in addition to and consistent with applicable state anchoring requirements for resisting wind forces.

(Added “L” 3-28-16-Effective Upon Passage)

(Added Entire Section 10-14-08-Effective Upon Passage)

175-81 SPECIFIC STANDARDS (Floodplain)

In all special flood hazard areas where base flood elevations have been provided in the Flood Insurance Study or generated according to Section 175-81.1(A), the following provisions shall apply:

A. Residential Construction: New construction or substantial improvement of any residential structure shall have the lowest floor, including basement, elevated no lower than one (1) foot above the base flood elevation.

B. Non-Residential Construction: New construction or substantial improvement of any commercial, industrial, or non-residential building shall have the lowest floor, including basement, elevated to no lower than one (1) foot above the base flood elevation. Buildings located in all AE and AH zones may be flood-proofed in lieu of being elevated provided that all areas of the building components below the elevation corresponding to the Base Flood Elevation (BFE) plus one foot are water tight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A registered professional engineer or architect shall certify that the standards of this subsection are satisfied. Such certification, including the specific elevation (in relation to mean sea level) to which such structures are floodproofed, shall be maintained by the Floodplain Administrator.

(Amended “B” 3-28-16-Effective Upon Passage)

C. The Space Below the Lowest Floor: Enclosed areas, of new construction or substantially improved structures, which are below the regulatory flood protection elevation shall:

(Amended Title of “C” from Elevated Floor 3-28-16-Effective Upon Passage

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door) or limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator). The interior portion of such enclosed area shall not be partitioned or finished into separate rooms, except to enclose storage areas;

2. Be constructed entirely of flood resistant materials below the regulatory flood protection elevation;

3. Include, in Zones A and AE measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings must either be certified by a professional engineer or architect or meet the following minimum design criteria:

a. Provide a minimum of two openings on different sides of each enclosed area subject to flooding.

b. The total net area of all openings must be at least one (1) square inch for each square foot of enclosed area subject to flooding.

c. If a building has more than one enclosed area, each area must have openings to allow floodwaters to automatically enter and exit.

d. The bottom of all required openings shall be no higher than one (1) foot above the adjacent grade.

e. Openings may be equipped with screens, louvers, or other opening coverings or devices, provided they permit the automatic flow of floodwaters in both directions.

f. Foundation enclosures made of flexible skirting are not considered enclosures for regulatory purposes, and, therefore, do not require openings. Masonry or wood underpinning, regardless of structural status, is considered an enclosure and requires openings as outlined above.

D. Standards for Recreational Vehicle: All recreational vehicles placed on sites must be either:

1. In all designated Special Flood Hazard Areas, all manufactured homes placed, or substantially improved, on individual lots or parcels, must meet all the requirements for the zone in which they are located for new construction, including the elevation and anchoring requirements in this ordinance; or,

2. All recreational vehicles placed on sites must either

a. Be on the site for fewer than 180 consecutive days, be fully licensed and ready for highway use (a recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utilities and security devices and has no permanently attached additions); or

b. Where allowed under the general zoning regulations of this Chapter, may be kept on the site for 180 days or more when all applicable floodplain standards for manufactured homes are complied with.

(Amended “D” and Added (1-2) 3-28-16-Effective Upon Passage)

(Added Entire Section 10-14-08-Effective Upon Passage)

175-81.1 STANDARDS FOR APPROXIMATED FLOODPLAIN

A. When base flood elevation data or floodway data have not been provided, the Zoning Administrator shall obtain, review, and reasonably utilize any base flood elevation and floodway data available from a federal, state, or any other source, in order to administer the provisions of Section. When such base flood elevation data is utilized, the Zoning Administrator shall obtain:

1. The elevation (in relation to the mean sea level) of the lowest floor (including the basement) of all new and substantially improved structures; and,

2. If the structure has been flood-proofed in accordance with the requirements of Section 175-81(B) of this ordinance, the elevation in relation to the mean sea level to which the structure has been flood-proofed.

B. When the data is not available from any source as in Section 175-81.1(A), the lowest floor of the structure shall be elevated to no lower than one (1) foot above the highest adjacent grade.

C. Base flood elevation data shall be provided for subdivision proposals and other proposed development proposals that exceed fifty lots or five acres, whichever is the lesser.

D. Standards for Subdivision Proposals.

1. All subdivision proposals shall be consistent with the need to minimize flood damage;

2. All subdivision proposals shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage;

3. All subdivision proposals shall have adequate drainage provided to reduce exposure to flood hazards, and

4. Base flood elevation data shall be obtained from other sources or developed using detailed methodologies, hydraulic and hydrologic analysis, comparable to those contained in a Flood Insurance Study for all major subdivision proposals and major site development plans, as defined under Chapter 148 of the Town Code.

(Added “D” 3-28-16-Effective Upon Passage)

E. Existing Structures in the Floodplain Areas. Any structure or use of a structure or premises must be brought into conformity with these provisions when it is changed, repaired, or improved, unless one of the following exceptions is established before the change is made:

1. The floodplain manager has determined that

a. change is not a substantial repair or substantial improvement; and,

b. no new square footage is being built in the floodplain that is not complaint; and,

c. no new square footage is being built in the floodway; and,

d. the change complies with this ordinance and the VA USBC; and,

e. the change, when added to all the changes made during a rolling 5 year period does not constitute 50% of the structure’s value.

2. The changes are required to comply with a citation for a health or safety violation.

3. The structure is a historic structure and the change required would impair the historic nature of the structure.

(Added “E” 3-28-16-Effective Upon Passage)

(Added Entire Section 10-14-08-Effective Upon Passage)

175-81.2 STANDARDS FOR THE FLOODWAY DISTRICT

The following provisions shall apply within the Floodway District:

Encroachments, including fill, new construction, substantial improvements and other developments are prohibited unless certification (with supporting technical data) by a registered professional engineer is provided demonstrating that encroachments shall not result in any increase in flood levels during occurrence of the base flood discharge. The preceding uses, activities and development occurring within any floodway district shall be undertaken only upon the issuance of a Special Use Permit. Development activities in which an increase in the water surface elevation of the base flood may be allowed, provided that the applicant first applies – with the Town of Front Royal endorsement – for a conditional Flood Insurance Rate Map and floodway revision, and receives the approval of the Federal Emergency Management Agency. However, other activities such as demolition in which there is not an increase in the water surface elevation, will require a zoning permit in lieu of a special use permit.

175-81.3 FLOODPLAIN VARIANCES: FACTORS TO BE CONSIDERED

A. Variances shall be issued only upon (i) a showing of good and sufficient cause, (ii) after the Board of Zoning Appeals has determined that failure to grant the variance would result in exceptional hardship to the applicant, and (iii) after the Board of Zoning Appeals has determined that the granting of such variance will not result in (a) unacceptable or prohibited increases in flood heights, (b) additional threats to public safety, (c) extraordinary public expense; and will not (d) create nuisances, (e) cause fraud or victimization of the public, or (f) conflict with local laws or ordinances.

B. While the granting of variances generally is limited to a lot size less than one-half acre, deviations from that limitation may occur. However, as the lot size increases beyond one- half acre, the technical justification required for issuing a variance increases. Variances may be issued by the Board of Zoning Appeals for new construction and substantial improvements to be erected on a lot of one-half acre or less in size contiguous to and surrounded by lots with existing structures constructed below the base flood level, in conformance with the provisions of this section.

C. Variances may be issued for new construction and substantial improvements and for other development necessary for the conduct of a functionally dependent use provided that the criteria of this section are met, and the structure or other development is protected by methods that minimize flood damages during the base flood and create no additional threats to public safety.

D. In passing upon applications for variances, the Board of Zoning Appeals shall satisfy all relevant factors and procedures specified in other sections of the zoning ordinance and consider the following additional factors:

(Added (A-D) 3-28-16-Effective Upon Passage)

1. The showing of good and sufficient cause.
2. The danger to life and property due to increased flood heights or velocities caused by encroachments. No variance shall be granted for any proposed use, development, or activity within any Floodway District that will cause any increase in the Special Flood Hazard Area elevation.
3. The danger that materials may be swept on to other lands or downstream to the injury of others.

4. The proposed water supply and sanitation systems and the ability of these systems to prevent disease, contamination, and unsanitary conditions.
5. The susceptibility of the proposed facility and its contents to flood damage and the effect of such damage on the individual owners.
6. The importance of the services provided by the proposed facility to the community.
7. The requirements of the facility for a waterfront location.
8. The availability of alternative locations not subject to flooding for the proposed use.
9. The compatibility of the proposed use with existing development and development anticipated in the foreseeable future.
10. The relationship of the proposed use to the comprehensive plan and floodplain management program for the area.
11. The safety of access by ordinary and emergency vehicles to the property in time of flood.

12. The expected heights, velocity, duration, rate of rise, and sediment transport of the flood waters expected at the site.

13. The historic nature of a structure. Variances for repair or rehabilitation of historic structures may be granted upon a determination that the proposed repair or rehabilitation will not preclude the structure’s continued designation as a historic structure and the variance is the minimum necessary to preserve the historic character and design of the structure.

(Added (13) 3-28-16-Effective Upon Passage)

14. Such other factors which are relevant to the purposes of this ordinance.

E. The Board of Zoning Appeals may refer any application and accompanying documentation pertaining to any request for a variance to any engineer or other qualified person or agency for technical assistance in evaluating the proposed project in relation to flood heights and velocities, and the adequacy of the plans for flood protection and other related matters.

(Amended 3-28-16-Effective Upon Passage)

F. Variances shall be issued only after the Board of Zoning Appeals has determined that the variance will be the minimum required to provide relief from exceptional hardship to the applicant.

G. The Board of Zoning Appeals shall notify the applicant for a variance, in writing, that the issuance of a variance to construct a structure below the Special Flood Hazard Area elevation (a) increases the risks to life and property and (b) will result in increased premium rates for flood insurance.

H. A record shall be maintained of the above notification as well as all variance actions, including justification for the issuance of the variances. Any variances that are issued shall be noted in the annual or biennial report submitted to the Federal Insurance Administrator.

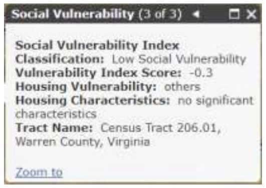
Virginia Vulnerability Index- Front Royal, VA

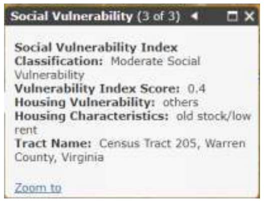
Source: http://cmap2.vims.edu/SocialVulnerability/SocioVul_SS.html

NOTES: Town of Front Royal Corporate Limits are comprised of Census Tracts 206.01, 205, 204, & 203. Vulnerability Index Scores shown below:

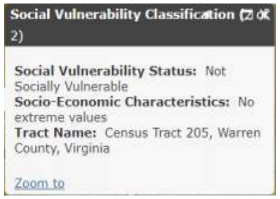


Social Vulnerability Index Classification: Low Social Vulnerability
Vulnerability Index Score: -0.3
Housing Vulnerability: others
Housing Characteristics: no significant characteristics
Tract Name: Census Tract 206.01, Warren County, Virginia

Social Vulnerability Status: Not Socially Vulnerable
Socio-Economic Characteristics: No extreme values
Tract Name: Census Tract 206.01, Warren County, Virginia

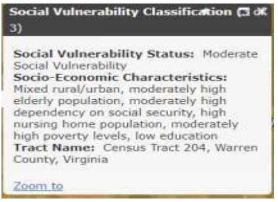


Social Vulnerability Index Classification: Moderate Social Vulnerability
Vulnerability Index Score: 0.4
Housing Vulnerability: others
Housing Characteristics: old stock/low rent
Tract Name: Census Tract 205, Warren County, Virginia

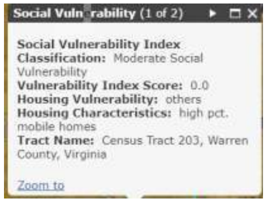


Social Vulnerability Status: Not Socially Vulnerable
Socio-Economic Characteristics: No extreme values
Tract Name: Census Tract 205, Warren County, Virginia

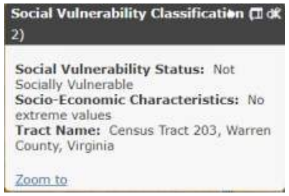
Social Vulnerability Index Classification: Moderate Social Vulnerability
Vulnerability Index Score: 0.7
Housing Vulnerability: others
Housing Characteristics: old stock/low rent
Tract Name: Census Tract 204, Warren County, Virginia



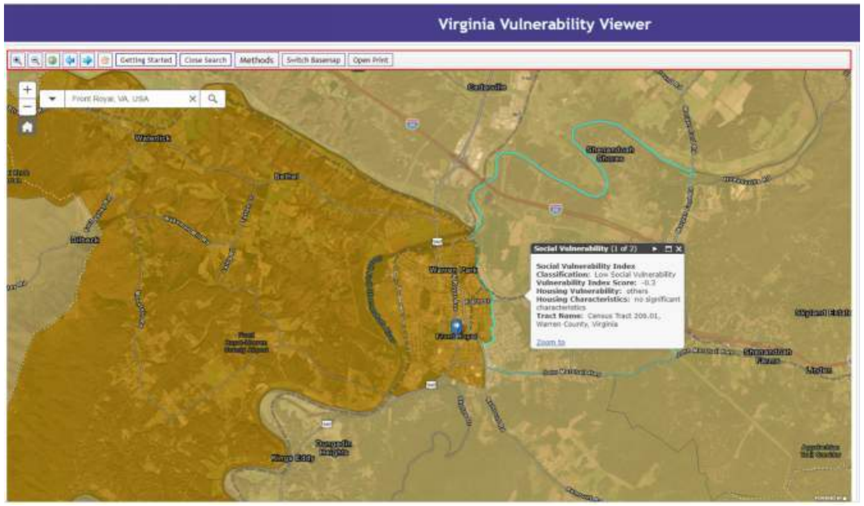
Social Vulnerability Status: Moderate Social Vulnerability
Socio-Economic Characteristics: Mixed rural/urban, moderately high elderly population, moderately high dependency on social security, high nursing home population, moderately high poverty levels, low education
Tract Name: Census Tract 204, Warren County, Virginia



Social Vulnerability Index Classification: Moderate Social Vulnerability
Vulnerability Index Score: 0.0
Housing Vulnerability: others
Housing Characteristics: high pct. mobile homes
Tract Name: Census Tract 203, Warren County, Virginia



Social Vulnerability Status: Not Socially Vulnerable
Socio-Economic Characteristics: No extreme values
Tract Name: Census Tract 203, Warren County, Virginia



Social Vulnerability Index Classification: Low Social Vulnerability
Vulnerability Index Score: -0.3
Housing Vulnerability: others
Housing Characteristics: no significant characteristics
Tract Name: Census Tract 206.01, Warren County, Virginia

Census Tract Number	Social Vulnerability Index Score
206.01	**-0.3**
205	**0.4**
204	**0.7**
203	**0.0**
Average Score in Project Area	0.2

RE: Floodplain Study

The Town of Front Royal is requesting ninety thousand dollars ($90,000) for a one hundred thousand dollar ($100,000) Community Flood Preparedness Fund Grant. The Town of Front Royal will contribute ten thousand dollars ($10,000) from the general fund and agree to pay the cash contribution during the agreement period. The grant will pay for the Flood Plain Study for the Town of Front Royal.

Sincerely,

Steven W. Hicks

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No ____

*The proposed Resilience Plan is for the entire City of Salem which includes some low-income geographic areas

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

- ☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.
- ☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.
- ☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.
- ☐ Studies and Data Collection of Statewide and Regional Significance.
- ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.
- ☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

- ☐ Floodplain Staff Capacity.
- ✔ Resilience Plan Development
  - ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  - ✔ Resource assessments, planning, strategies and development.
    - ☑ Policy management and/or development.
    - ☑ Stakeholder engagement and strategies.

Location of Project (Include Maps): City of Salem

NFIP Community Identification Number (CID#):(See appendix F 510141

Is Project Located in an NFIP Participating Community? ☑ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☑ Yes ☐ No

Flood Zone(s) (If Applicable): Floodway, AE-100yr., 500yr.

Flood Insurance Rate Map Number(s) (If Applicable): See Attachment C

Total Cost of Project: 78,962

Total Amount Requested 59,221

Scope of Work Narrative - Capacity Building and Planning

Introduction

The City of Salem is pleased to apply for funding through the 2022 Virginia Community Flood Preparedness Fund Grant (CFPF). The City of Salem's application is for the capacity building/planning category, and with the assistance of Wetland Studies and Solutions, Inc. the city plans to develop a resilience plan.

Capacity Needs and Assets

Resource Needs

-The City of Salem is applying for funding to assist in establishing a Resiliency Plan. The city is to contract a consultant to establish a plan that will help identify future flood control projects as well as studies, assessments, and program adjustments needed to meet resiliency goals. The city will coordinate with multiple departments but is reliant on the assistance of a consulting agency to aid in developing this plan as it is not something the city has the capacity to do on its own.

Scope of Work: see attachment "A"

Plan Development

-The City of Salem plans to contract with a consultant to assist with developing a Resilience Plan. This will include but is not limited to collecting and analyzing data, reviewing flood plains, stormwater controls, public outreach, and social vulnerability. A Resilience Plan will help the city identify future projects and prioritize areas of need.

See WSSI proposal – attachment "B"

SALEM VA

Charles E. VanAllman, Jr., PE, LS
Director

William L. Simpson, Jr., PE
City Engineer

City of Salem Community Development Department
Engineering, Inspections, GIS, Stormwater, Planning & Zoning

Goals and Objectives

-The goal of the Resilience Plan for the City of Salem is to apply nature-based solutions to the maximum extent possible to address increased flooding within the entire city. The goal of this planning level document will be to assist in reducing impacts to properties and community assets.

Stakeholders

-The Community Development Department with the City of Salem will be the primary stakeholder; but as projects and other items are identified through the Resilience Plan, this will assist in recognizing other stakeholders such as citizens, businesses, places of worship, government entities, and educational institutions.

Implementation

-The City of Salem would like to apply for funding in the earliest funding cycle possible. If awarded funding, the city will sign the proposal from our consultant and provide an estimated timeline for the completion of the plan; and once complete, the city would submit the Resilience Plan.

Responsible Parties

-The Community Development Department with the City of Salem would be the primary party responsible. Community Development is reliant on their consultant to acquire and analyze data to develop the Resilience Plan.

Performance Outputs and Measures

-The final product will be a comprehensive Resilience Plan that assists in identifying future projects, flood preparedness, and strategies to help protect properties city-wide. Another goal is to aid in additional measures to help the city meet its MS-4 permit requirements.

Maintaining Capacity

-The City of Salem plans to maintain and update the Resilience Plan as needed. Either through city staff or by a consultant, the Resilience plan can be updated as new information becomes available as well as other variables that necessitate changes.

Supporting Documentation

- City of Salem Comprehensive Plan
- Regional Hazard Mitigation Plan
- City of Salem Floodplain Overlay District code
- City of Salem Floodplain Map (Attachment C)
- City of Salem Social Vulnerability Map (Attachment C)
- Scoring Sheet (appendix D)

Budget

-Fees for services to develop the Resilience Plan are as follows:

Project Management	$ 11,210
City of Salem GIS Desktop Analysis	$ 16,036
Literature Review	$ 16,200
Community Outreach	$ 11,616
Resilience Plan Development	$ 23,400
Direct Expense Budget	$ 500
Total Fixed Cost	**$ 78,962**

Funds Requested

The City of Salem is requesting funds of $59,221 (75% CFPF) to aid in the development of a Resilience Plan. The city will be responsible for providing $19,741 (25% match) and these funds will be drawn from the City of Salem General Fund. This will provide the necessary funds to hire Wetland Studies and Solutions, Inc. to develop a plan.

Attachment "A"

Scope of Work Narrative

The following narrative is in support of the City of Salem's grant application for the Virginia Department of Conservation and Recreation's 2022 Community Flood Preparedness Fund Grant Program (CFPF). The City of Salem is requesting funds to assist in developing a Resilience Plan that will aid in the discovery and implementation of future flood mitigation and stormwater projects.

The city acknowledges that CFPF funds are to be used under the following principles:

1.) Acknowledge climate change and its consequences, and base decision making on the best available science.

2.) Identify and address socioeconomic inequities and work to enhance equity through adaptation and protection efforts.

3.) Utilize community and regional scale planning to the maximum extent possible, seeking region-specific approaches tailored to the needs of individual communities.

4.) Understand fiscal realities and focus on the most cost-effective solutions for the protection and adaptation of our communities, businesses, and critical infrastructure. The solutions will, to the extent possible, prioritize effective natural solutions.

5.) Recognize the importance of protecting and enhancing nature-based solutions in all regions, natural coastal barriers, and fish and wildlife habitat by prioritizing nature-based solutions.

The City of Salem is to work closely with a consultant (WSSI) to develop a framework document that will assist in establishing future projects, aid in flood preparedness and resilience, and provide data for better stormwater management as well as flood mitigation. For more details on the Resiliency Plan, please see the proposal from WSSI (attachment B)

Per the definition in the 2022 CFPF grant manual. The final Resiliency Plan will include:

1. It is project-based with projects focused on flood control and resilience.
2. It incorporates nature-based infrastructure to the maximum extent possible.
3. It includes considerations of all parts of a local government regardless of socioeconomics or race.
4. It includes coordination with other local and inter-jurisdictional projects, plans, and activities and has a clearly articulated timeline or phasing for plan implementation.
5. Is based on the best available science, and incorporates climate change, sea level rise, and storm surge (where appropriate), and current flood maps.

Attatchment B - WSSI Proposal

SHORT FORM CONTRACT
PROFESSIONAL SERVICES AGREEMENT

CLIENT:	City of Salem	**DATE:**	January 31, 2022 rev February 4, 2022
ADDRESS:	Community Development	**VIA EMAIL:**	wsimpson@salemva.gov
	21 S Bruffey St, Salem, VA 24153	**PROJECT NAME:**	Salem Resilience Plan
ATTN:	Will Simpson	**WSSI PROPOSAL #:**	P19163A

Wetland Studies and Solutions Inc. (WSSI) is pleased to provide this proposal pursuant to our Term Contract Agreement for Miscellaneous Professional Services. It is WSSI's understanding the City wants to develop a Resilience Plan (Plan) to prepare for the increase in urban flooding due to higher frequency storm events caused by climate and environmental changes. The Plan is intended to serve as a planning level document aimed at reducing impacts to properties and community assets. The Plan will include the five Commonwealth Planning Principles established by the Virginia Coastal Resiliency Master Planning framework and the following elements required by Appendix G of the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund:

1) The Plan will be project-based with projects focused on flood control and resilience.

2) The Plan will incorporate nature-based infrastructure to the maximum extent possible.

3) The Plan will include considerations of all parts of the City regardless of socioeconomics or race.

4) The Plan will include coordination with other local inter-jurisdictional projects, plans and activities and will clearly articulate a timeline and phasing for plan implementation.

5) The Plan will be based on the best available science and will incorporate climate change and current flood maps.

6) The Plan may also identify additional studies, assessments, regulatory or programmatic adjustments that may be needed for the City to reach its identified resiliency goals.

SCOPE AND FEE

The focus of this project is to work closely with the City to develop a Resilience Plan to act as a framework document for future efforts related to repetitive flooding, flood preparedness and resilience with a focus on the City's floodplains, current and planned gray and green infrastructure, and stormwater management. This planning effort will be guided by social equity data and principles. The total fixed fee for the services below is **$78,962.**

<u>Task A – Project Management</u> **Fixed Fee of $11,210.00**

Project Management will include the following:

1) Project meeting set up will be conducted by WSSI in coordination with City staff.

2) It is anticipated that one (1) hour virtual monthly steering committee meetings will be held during the duration of the project which is anticipated to be approximately six (6) months. WSSI will take meeting minutes and provide progress updates at the steering committee meetings.

3) Strategic partners identified in steering committee meetings will be engaged as necessary throughout the plan development process.

4) General project support will be provided throughout the plan development process.

Task B – City of Salem GIS Desktop Analysis — Fixed Fee of $16,036.00

WSSI will use the available City of Salem GIS shapefile data and aerial imagery to develop City-wide base mapping that will be used to help the City identify high priority areas. The GIS Desktop Analysis may include, but are not limited to the following:

- Social/Economical Vulnerable Areas
- High Risk Flooding Areas and FEMA Flood Insurance Rate Maps
- Critical Infrastructure Location
- Existing Historical Resources
- Environmentally Critical Areas
- Other Environmental Data: Soils, Hydrology, Slope, Watershed Delineation, Imperviousness and Existing Land Cover
- Existing and Approved Resilience Efforts
- Utility Easements and Right-of-Ways
- Property Ownership

Task C – Literature Review/Gap Analysis — Fixed Fee of $16,200.00

The literature review and gap analysis will proceed as follows:

1) Review existing City documents regarding stormwater, floodplains, resilience, and comprehensive planning; and identify elements that can be incorporated into the City's Resilience Plan. Documents that shall be collected and analyzed may include, but are not limited to the following:
   - Historical Flood Data
   - Historical Watershed Studies
   - Masterplans
   - Floodplain Ordinances
   - Historical and Proposed Drainage Projects
   - Site Specific Drainage Studies
   - TMDL Action Plans

2) Review the literature regarding the best climate change science available and social equity literature with a focus on flooding policies, strategies, and solutions.

3) Analyze flood resilience plans from other similar municipalities and identify concepts and elements that can be considered for the City's Resilience Plan.

4) Conduct a gap analysis to determine areas to focus the development of the City's Resilience Plan and identify potential studies and projects that would increase the City's resilience.

Task D – Community Education and Engagement — Fixed Fee of $11,616.00

WSSI will work with the City to garner community feedback through a two-phase effort. Phase I will consist of posting resilience information online to educate the public and solicit feedback to be incorporated into the draft resilience plan. WSSI will document feedback from the community and incorporate pertinent feedback into the Plan. The second phase will focus on placing the draft Plan on the City's website to solicit additional community feedback. The feedback will be used to drive resilience priorities in the Plan aimed at reducing flood impacts.

Task E – Resilience Plan Development — Fixed Fee of $23,400.00

The Resilience Plan will include the following:

1) WSSI will work with the steering committee and results of the first phase of community engagement to determine workable options for flood resilience and understand community needs.

2) WSSI will identify climate change impacts/resilience issues facing the City based on concerns identified from the public and available data. The Plan will identify needs for additional data and future studies.

3) WSSI will assess current City programs as they relate to identified resilience issues (e.g., development regulations, floodplain management program). WSSI will recommend programmatic changes to position the City to achieve resilience goals.

4) WSSI will work with the City to assess types of projects and studies to pursue to enhance flood control and resilience. Both green/grey infrastructure and nature-based projects will be considered and presented in the Plan.

5) A draft Plan and overall summary map will be prepared for City review. This draft will be placed on the City's website during the second phase of community engagement to garner feedback from the community.

6) A final Plan will be prepared and delivered to the City based on community feedback.

Task F – Reimbursable Expenses **Fixed Fee of $500.00**

ASSUMPTIONS

- The City will provide input throughout the Plan development process to include information during the literature review, community engagement support, Plan development support and participation on the steering committee.
- Specialty engineering support services such as field work, site survey, geotechnical, and modeling (e.g., floodplain) will not be included in the Plan.
- The City will provide any necessary advertising related to Task 4.
- The City will coordinate the placement of the draft Plan on the City's website. In addition, the City will provide the means to announce the availability of the Plan to the public and devise the means for the public to provide comments.

SCHEDULE & DELIVERABLES

This phase of work will begin upon a written notice to proceed and extend for a duration of approximately six (6) months. An initial kick-off meeting with the City will begin within two (2) weeks of notice to proceed. Community engagement preparation will begin within one (1) month. The draft Plan will be available within five (5) months of notice to proceed and placed on the City's website within two (2) weeks of the draft submission to the City. The final Plan will be developed within six (6) months of the notice to proceed.

The following items are project deliverables for this scope of work:

- Resilience information to post on the website to educate the community and garner feedback.
- Draft and Final City of Salem Resilience Plan.
- All background data, analyses, calculations, and project files.

The price is only fixed for thirty (30) days from the date of this proposal. Our fee for services will be invoiced as outlined above Plus Reimbursables (with 20 percent Administrative Fee).

If this short form contract outlines your understanding of the scope of services, please sign below and return a copy to our office.

Thank you for the opportunity to present this proposal.

Sincerely,
Wetland Studies and Solutions, Inc.

Appendix D: Scoring Criteria for Capacity Building & Planning

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Salem

Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	N/A
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration		☒ **Yes** ☐ **No**
Applicant Name:	City of Salem	
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	**55**	
Development of a new resilience plan.	**55**	55
Resource assessments, planning, strategies and development.	**45**	45
Policy management and/or development.	**40**	40
Stakeholder engagement and strategies.	**25**	25
Goal planning, implementation and evaluation.	**25**	25

Mount Vernon Dual Corrugated Metal Pipe Culvert Replacement and Optimization

Grant Application

CITY OF ALEXANDRIA, VIRGINIA

Community Flood Preparedness Fund Round 3

April 8, 2022

Image: Mount Vernon Avenue, August 15, 2021

Mount Vernon Dual Corrugated Metal Pipe Culvert Replacement and Optimization

The City of Alexandria (City) is applying for grant assistance under the Virginia Department of Conservation and Recreation (DCR) Community Flood Preparedness Fund (CFPF) Round 3 'Project' category to help mitigate flooding in the Arlandria neighborhood in northeast Alexandria, Virginia. The project, *Mount Vernon and Edison Dual Corrugated Metal Pipe (CMP) Culvert Replacement and Optimization*, will help to contain bigger storm events within the pipes, eliminating the surcharging occurring on Mount Vernon Avenue and greatly improve the health and safety of the community in this equity area. The project will replace existing, deteriorating, undersized dual corrugated metal pipe (CMP) leading from a Mount Vernon Avenue, under the Potomac West Apartments, and leading to the outfall east of Edison Street with a larger dual CMP to convey large flows of water. This work will include the relocation of the existing sanitary sewer line and replacement and upsizing four inlets on Edison Street.

Virginia DCR approved the City of Alexandria's Resilience Plan September 10, 2021. The City has integrated flood mitigation and resilience goals across areas of the local government, with flood resilience a priority addressed holistically through master planning, environmental planning, small area planning, waterfront planning, and capital project planning and implementation, and this project will advance the priorities identified in these various plans. The City has established requirements for development controls in the floodplain through zoning and the local floodplain ordinance. The City's Transportation and Environmental Services Department (T&ES) is implementing resilient stormwater system upgrades informed by the City of Alexandria Storm Sewer Capacity Analysis (CASSCA), neighborhood investigations, and making spot improvements to high priority flood risk areas, along with accelerated frequent operations and maintenance under the Flood Action Alexandria program. Additionally, the City understands the importance of engaging with communities in high-risk areas impacted by frequent urban flooding events. The City performed neighborhood investigations and meeting with residents following a series of intense storm events driven by climate change that caused urban flooding in 2019, 2020, and 2021. The City launched a flood mitigation grant program in August 2021 for property owners to make improvements to, and protect, their private property through flood barrier implementation and structural adaptations. In 2019, the City released an update to the Environmental Action Plan with a roadmap for climate mitigation and resilience activities, accompanied by the Energy and Climate Change Task Force. These initiatives are grounded by the City's new Equity ordinance, which commits to addressing racial, social, and economic disparities in all areas of local government. The project proposed in this application fulfil the requirements and support the goals of each of these resilience planning efforts and accelerate the City's efforts to deliver flood mitigation measures for the Arlandria area of Alexandria.

1. Project Information

In addition to the three severe storms that occurred within a 14-month period (July 2019 to September 2020), the City experienced more severe flash flooding events in 2021 on August 15 (see Figure 1) and September 16. Based on the City's rain gauge network, during the August 15th event, between three to five inches of rain fell in an hour, with very heavy rainfall rates for 30 minutes. The storm caused widespread flooding, as well as power outages, sanitary backups, road closures, displaced manhole covers, traffic light outages, sink holes, and other impacts on City infrastructure. In the neighborhood of Arlandria, one property was particularly hard hit with water entering into at least three basement dwelling units from water breaking through windows, water also rushed into the property from the first floor as it broke through the glass entry way door. This event occurred around midnight, and residents were able to evacuate safely, with reported injuries. The highest rain gauge reading in the City recorded 3.19 inches in

30-minutes, 4.43 inches in one hour, and 5.19 inches in two hours. The August 15 event corresponded to a 200 – 500-year storm event.

Figure 1. August 15, 2021, Edison Street

Arlandria is located within the City's portion of the Four Mile Run watershed. The watershed includes a nine-mile-long stream (Four Mile Run) located in a highly urbanized area in Northern Virginia. It's 19.6 square mile watershed covers portions of Arlington and Fairfax Counties and the Cities of Alexandria and Falls Church. The lower portion of Four Mile Run, from I-395 at the upstream end to National Airport at the mouth, is contained in a hardened flood control channel and marks a rough boundary between Arlington County and the City of Alexandria. Due to the highly urbanized nature of the Four Mile Run watershed, the neighborhoods and businesses adjacent to this portion of the run were subjected to repeated flooding, beginning in the 1940s.

The *Mount Vernon and Edison Dual CMP Culvert Replacement and Optimization* project will achieve the following activities as shown in the Project Vicinity Map, Figure 2:

- Relocate the Edison Street storm drain inlets (four) further north to the low point in the road.
- Relocate the Mount Vernon storm drain pipes so they are more central between the two existing buildings to allow for safer installation and future maintenance access.

- Upsize the Mount Vernon CMP storm drain pipes from 38-inch x 60-inch horizontal ellipses to 48-inch x 76-inch horizontal ellipses.
- Upsize the Mount Vernon storm drain outfall pipes from 51-inch x 66-inch corrugated metal arches to 48-inch x 76-inch horizontal reinforced concrete ellipses.
- Adjust the Mount Vernon storm drain pipes to a uniform two percent (2%) slope.
- Relocation the sanitary sewer line, between Mount Vernon Avenue and Edison Street, to allow for improved hydraulic alignment of the twin culverts.

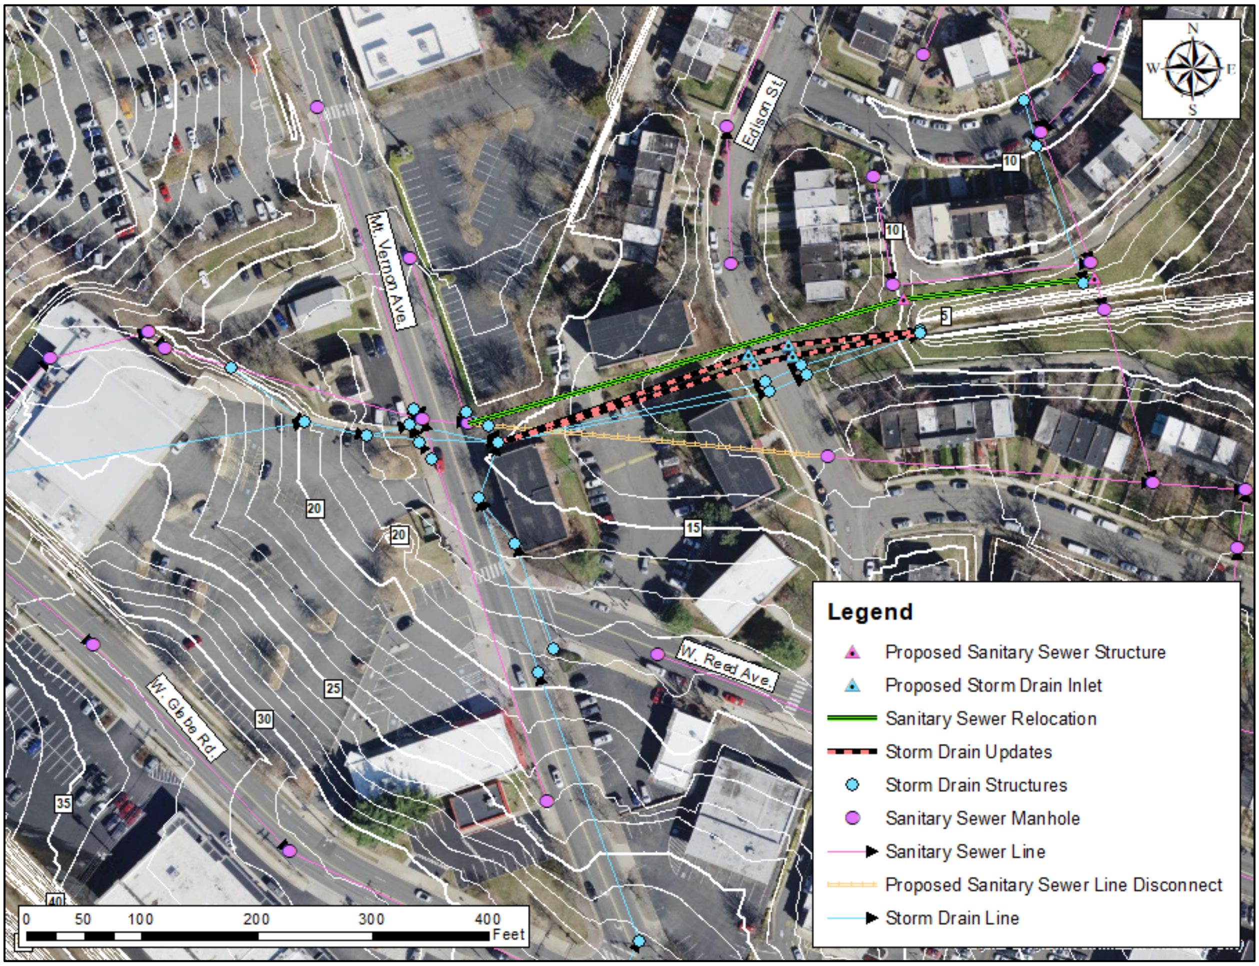

Figure 2. Project Vicinity Map

Arlandria is located within the northern portion of the Four Mile Run watershed model. The proposed optimization of the storm drain line was modeled in the XP-SWMM model by incorporating the *Mount Vernon and Edison Dual CMP Culvert Replacement and Optimization* project conceptual work. The 3-inch, 3-hour synthetic storm and 10-year, 24-hour storm event was used for the analysis. The 3-inch, 3-hour synthetic storm was created to account for the more frequent and high intensity storm events that the City is experiencing. The synthetic storm event was created by the City using Autodesk Storm & Sanitary Analysis (SSA). The program includes a Rainfall Designer, which utilizes site-specific storm information from a database with over 3,500 up-to-date rainfall recording stationing across North America. A comparison between the optimized and existing conditions, shows a decrease in the hydraulic grade line (HGL). The proposed solution would contain the design storm event within the pipes, eliminating the surcharging occurring on Mount Vernon Avenue for the design and greatly improve the health and safety of the community. Furthermore, the *Mount Vernon and Edison Dual CMP Culvert Replacement and*

Optimization project will have a positive impact on the immediate area of Mount Vernon Avenue and Edison Street, the neighborhood of Arlandria, and improve the overall conveyance upstream in Four Mile Run watershed and help create a more resilient City.

a) Population and Equity

Alexandria has a population of 159,467 (U.S. Census Bureau, 2020) and is the densest city in Virginia with a population density of about 9,460 people per square mile. The median household income in Alexandria in 2019 was $100,939. Arlandria is in Census Tract 2012.03 that has a median household income of $60,756, which is less than 80% of the median income of the City, meaning this area meets the grant definition of a “Low-Income Geographic Area”. This Census Tract, 2012.03, also has a High Social Vulnerability Index score of 1.1. This 0.4 square mile census tract has a population of approximately 7,800 and is one of four Opportunity Zones in the city. Figure 4 provides an overview of Arlandria’ s cultural themes as presented in A Cultural History of Arlandria, September 2021. This Cultural History was collected in coordination with the community’s Arlandria-Chirilagua Small Area Plan Process.

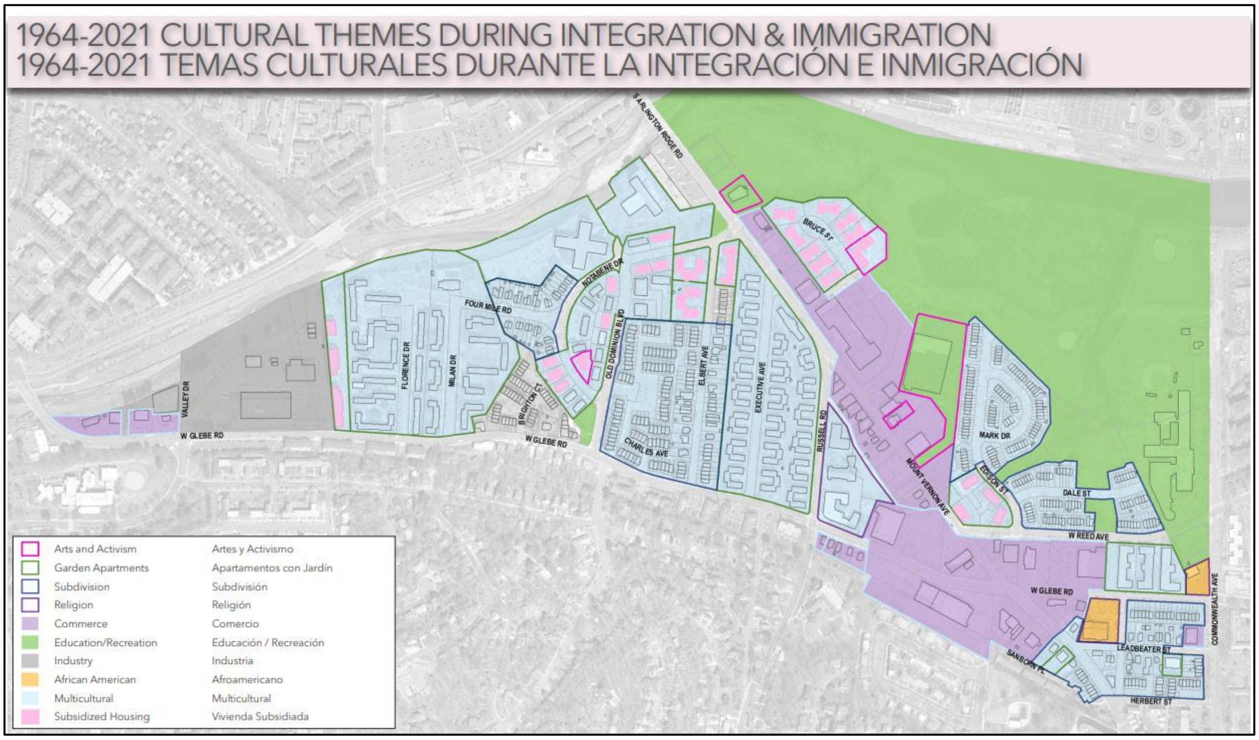

Figure 3. Arlandria Cultural Themes

b) Historic Flooding Data and Hydrologic Studies Projecting Flood Frequency

The City is experiencing more frequent and severe flash flooding from extreme precipitation events which have occurred more frequently in the last few years. These flash flood events damage residential and commercial properties, impact critical assets, and cause day-to-day disruptions and economic losses. The City has experienced several major flooding events since 2019, including July 8, 2019, July 23, 2020, September 10, 2020, and most recently August 15, 2021 and September 16, 2021. These events are characterized between 50 to 500-year level rainstorm events. The City's Intensity-Duration-Frequency (IDF) curves developed in the 1980's were compared to other localities in the region and available climate predictions during the CASSCA study, completed in 2016, and were found to be more conservative than many surrounding localities' design storms, more conservative than the National Atmospheric and Oceanic Administration (NOAA) Atlas-14, and were found to compare favorable to climate predictions available in 2016. The City is currently planning to further analyze these local IDF curves in comparison to regional efforts and more recent climate predictions.

The August and September 2021 storms were recorded by recently installed rain gauges that expand the City's gauge network to gather more localized storm information. Actual accumulation of over 5-inches in two hours, to be between 100 and 500-year level rain when compared to the statistical expectations derived for the City's curves developed in the 1980's for the City, which are more conservative than NOAA's predictions for the region. Meaning, what NOAA would call a 12-hour 25-year rainfall, Alexandria would call it closer to a 15-year rainfall.

c) Ability of Alexandria to Provide its Share of the Project Cost

In response to these recurring flooding events, in May 2021 the City Council unanimously adopted an ordinance to double our Stormwater Utility Fee with a 50% increase in the rate for the May 2021 billing and an additional 50% increase in the rate for the October billing to significantly increase local resources available for investments in our storm sewer infrastructure. The development of the FY 2022 – FY 2031 Stormwater Management Utility Ten Year Plan for funding of operating and capital improvement program (CIP) costs, included the identification and funding schedule for 11 top priority flooding mitigation capacity projects that include a mix of storage, conveyance, and green infrastructure. The 10-Year Plan also includes annually increasing funding for spot improvement projects and increased maintenance activities citywide. The Stormwater Utility Fee, paid by all property owners in the City (including non-taxable properties), will enable an acceleration of major capacity projects and spot improvement projects, an increase in channel maintenance, new state-of-good repair investments, property owner grants, and new staffing in support of these projects. The City confirms that it can cover the Cost Share required for this project with funding identified in the FY 2022 – FY 2031 Stormwater Management CIP under the Storm Sewer Spot Improvement program.

d) Alexandria is an Active Participant in the National Flood Insurance Program

The City began participating in the regular phase of Federal Emergency Management Agency (FEMA) National Flood Insurance Program (NFIP) on May 8, 1970, and is recognized for exceeding the goals of the NFIP Community Rating System (CRS) program. Alexandria is one of two Virginia localities to achieve a Class 6 rating. As a result, residents and businesses purchasing flood insurance for properties in Alexandria are eligible to receive up to a 20% discount on flood insurance premiums. The City also has established a Floodplain Ordinance to regulate development and redevelopment in the floodplain. The FEMA Flood Insurance Rate Map (FIRM) for Arlandria and the *Mount Vernon Dual CMP Culvert Replacement and Optimization* project area is included as Figure 4.

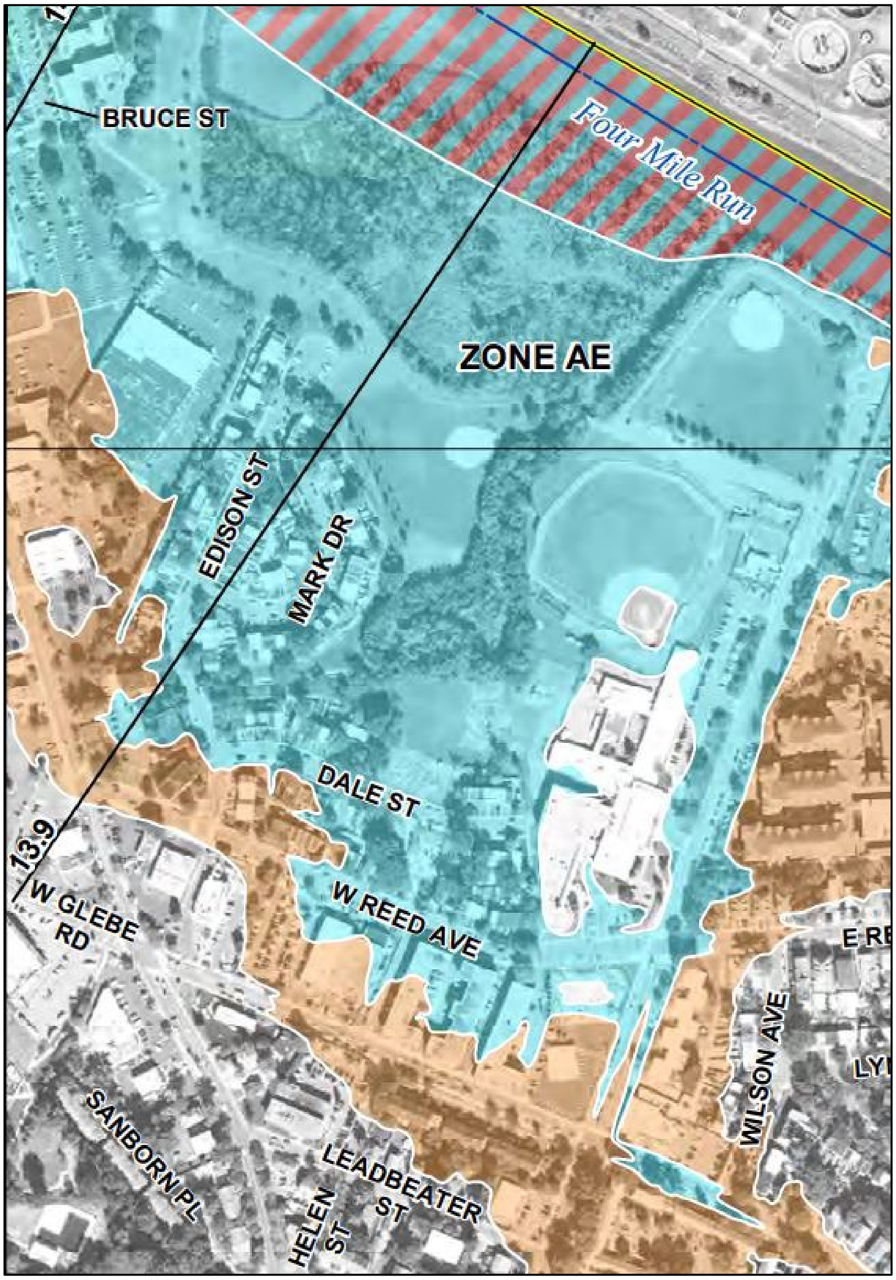

Figure 4. FIRM Map 5155190033F

Repetitive loss is defined by any insurable building for which two or more claims of more than $1,000 were paid by the NFIP within any rolling 10-year period, since 1978. A severe repetitive loss is defined by a family residence that has had four or more claims of more than $5,000 or at least two claims that cumulatively exceed the building value as defined by the Flood Insurance Reform Act of 2004. There were 12 repetitive loss sites in Alexandria as of 2015, of which six are residential and six are non-residential. These 12 repetitive loss sites have experienced a collective 30 losses, with a total payment of $1,871,287 as described in the 2017 Northern Virginia Hazard Mitigation Plan. A more updated list of repetitive losses across the City is forthcoming but preliminary assessment indicates more than 35 properties, more than triple that of 2015.

e) Other Necessary Information to Establish Project Priority

The Northern Virginia Hazard Mitigation Plan identified flooding as one of Alexandria's predominant hazards due to riverine, precipitation, tidal, and storm surge flooding. The Hazard Mitigation Plan ranked natural hazards for Alexandria using historical weather-related events based on the Storm Event Database by the NOAA National Centers for Environmental Information, formerly the National Climatic Data Center (NCDC). Hazards were ranked using a semi-quantitative scoring system that involved grouping the data values (normalized to account for inflation) based on statistical methods (see Figure 5). This method prioritizes hazard risk based on a blend of quantitative factors extracted from NCDC and other available data sources. The parameters considered include:

- Historical occurrences;
- Vulnerability of population in the hazard area; and
- Historical impact, in terms of human lives and property and crop damage.

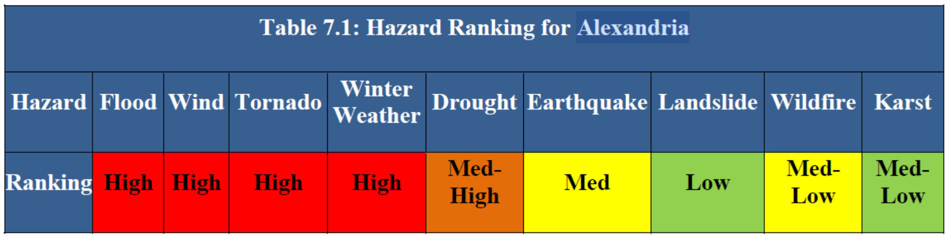

Table 7.1: Hazard Ranking for Alexandria

Hazard	Flood	Wind	Tornado	Winter Weather	Drought	Earthquake	Landslide	Wildfire	Karst
Ranking	High	High	High	High	Med-High	Med	Low	Med-Low	Med-Low

Figure 5. Hazard Ranking, Northern Virginia Hazard Mitigation Plan, 2017

Alexandria's watersheds have a significant percentage of impervious surfaces. Forty-three percent of the City's surface area is comprised of roads, buildings, parking lots, and sidewalks. Impervious surface contributes to the accumulation of stormwater because water is not able to convey and recharge. This type of flooding threatens the continuous operation of roads, emergency access, and property during precipitation events.

No critical facilities are located within the immediate vicinity of the project area.

2. Need for Assistance

The City has the staff and resources (SWM/SWU CIP), BSEGS 5 rating, CRS Class 6, to implement this project as soon as funding becomes available. DCR's financial support will help create a more resilient Alexandria while enhancing and improving the City's built infrastructure in the Arlandria neighborhood located within Four Mile Run.

a) Goals and Objectives

The purpose of this project is to help mitigate flooding in the Arlandria neighborhood by providing enhanced conveyance along a major storm sewer to its downstream outfall. This project will not only address local area flooding, but also facilitate upstream improvements in the drainage area by ensuring adequate conveyance to support future upgrades. The City cost-share for the project will be funded through the FY 2022 – FY 2031 Stormwater Management CIP under the Storm Sewer Spot Improvement program.

b) Approach, Milestones, and Deliverables

The *Mount Vernon Dual CMP Culvert Replacement and Optimization* project is a multi-faceted project that includes relocation of an existing sanitary sewer and replacement of two deteriorated storm sewer pipes. As such, the project team will include experts from the City of Alexandria's Transportation and Environmental Services Stormwater and Sanitary division. The City's Department of Project Implementation will be responsible for managing and delivering the project. Additional details on the project delivery approach and project teaming will be detailed in a project management plan developed by the City.

The City's project management plan is a living document specific to the project that is continually updated through the design and construction process. Input from the design contractor and construction manager will be included in the document as the project progresses. At a minimum, the project management plan will clearly identify the projects scope, team member roles and responsibilities, critical stakeholders, project risks and the project procurement plan.

The City's Engineer of Record Contract or an equivalent existing procured agreement will be utilized to develop contract documents including design plans, construction specifications costs estimates, a basis of design report and public rendering of impacts and improvements. Staff expect that construction of the project may require an open-bid procurement process.

Project deliverables will undergo a multiphase review at 30% Design, 60% Design and 90% Design before being accepted by the City as the Final Contract Documents.

c) Project Milestones and Deliverables

Table 1 summarizes project milestones for the *Mount Vernon Dual CMP Culvert Replacement and Optimization* project. The deliverables associated with each Milestone are included in Table 2.

Table 1. Project Milestones

Milestone	Fiscal Year (FY)
Project Planning	2023
Design Services Procurement	2023
Design Phase	2023 / 2024
Construction Procurement	2024
Construction	2025
Post-Construction	2025

Table 2. Deliverables by Milestone

Milestone	Deliverable
Project Planning	• Project Charter • Project Management Plan • Project Work Breakdown Structure • Project Schedule
Design Services Procurement	• Task Order Request based on existing contract • Task Order approval • Purchase Order and Notice To Proceed
Design Phase	• Design Plans at 30% and Final Design • Construction Specifications at Final Design • Basis of Design including Hydraulic Calculations at 30% and Final Design • Cost Estimate at 30% and Final Design
Construction Procurement	• Invitation to Bid at contract award • Contractor Proposal at contract award • Purchase Order at contract award
Construction/Post Construction	• Sign & Sealed As-builts following project close out • Site photographs following project close out

3. Relationship to Other Projects

The City has experienced repeated and increasingly frequent flooding from storm events, with several large severe storm event occurring in 2019 and 2020. These events lead to the development of the Flood Action Alexandria initiative. Information gathered via the City's 311 response center regarding flooding complaints and inquiries in addition to the 2016 City of Alexandria Storm Sewer Capacity Analysis (CASSCA) study, provided a roadmap for City staff to undertake neighborhood investigations. Located in the Four Mile Run watershed, with a large footprint within the 100-year and 500-year floodplain, the neighborhood of Arlandria, specifically the Edison Street, Dale Street, and West Reed Avenue, located off of Mount Vernon Avenue, a main throughfare, experienced significant flooding from the storms during 2019 and 2020. The City undertook neighborhood investigations and further engineering assessment and analysis of the storm sewer network in this area beginning in early 2021. However, it was the large storm event that occurred on August 15, 2021, after the launch of the Flood Action Alexandria, that brought the most significant flooding to this area, as described in Section 1, Project Information. Figure 6 provides a snapshot of the 311 requests for services that focused on reporting flooding issues across the City on August 15th.

The *Mount Vernon Dual CMP Culvert Replacement and Optimization* project falls within the City's Flood Action Alexandria initiative which includes a 10-year, $170 million capital improvement plan focused on 11 large capacity projects in addition to numerous spot improvement projects that are currently underway at the neighborhood scale across the City. The proposed project for funding will increase the resiliency of the Arlandria neighborhood, Four Mile Run watershed, and the City of Alexandria. This is a critical need given the City's sensitivity to climate change-induced severe storm events caused by rising global temperatures and increasing humidity.

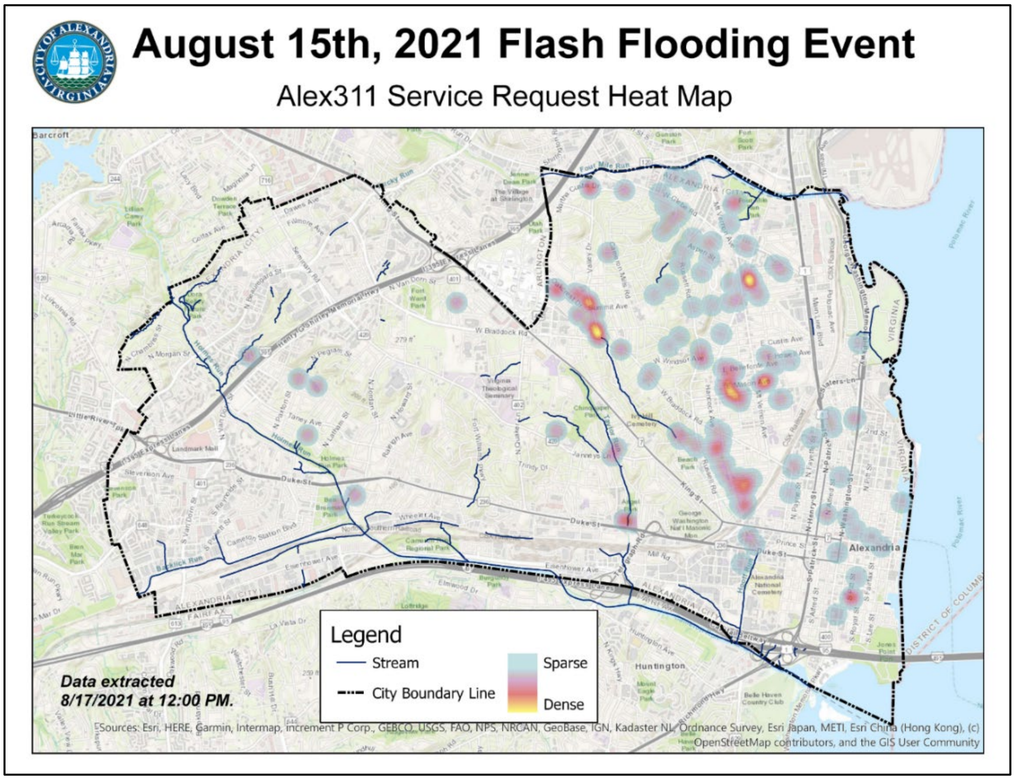

Figure 6. Alex311 Heat Map, August 15, 2021

4. Maintenance Plan

City sewer infrastructure 'state of good repair' program maintenance objectives includes inspection and maintenance on a rotating 3-5 year service schedule. The City also performs inspection and maintenance in response to Alex311 service requests an in advance of forecasted storm events. The initial installation will be inspected early on to ensure proper functioning prior to the routine, rotating schedule being implemented. More information is available on the City's Sewer Maintenance webpage.

5. Criteria

This project scoring criteria is found in Appendix B.

Budget Narrative

The *Mount Vernon Dual CMP Culvert Replacement and Optimization* is budgeted for design and construction for a total cost of $2,500,000. The City respectfully requests 50% of the total project cost to be covered by this grant: $1,250,000. All costs are categorized as Contractual. It is anticipated that 25% of the total Contractual costs will be spent on Project Design ($625,000) and 75% of the total Contractual costs will be spent on Project Construction ($1,875,000)

These projects will help to mitigate flooding and help increase the resiliency of the Arlandria neighborhood, the Four Mile Run watershed, and the City at-large. Project matching funds will come from the CIP section of the City's Stormwater Management Utility 10-Year Plan..

Cost Category	City of Alexandria Match	DCR CFPF Request	Total
Personnel	$0	$0	$0

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes __X__ No ____

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.

X Storm water system upgrades.

- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.
  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): Mt. Vernon Avenue, Edison Street, Arlandria Neighborhood, Alexandria, VA

NFIP Community Identification Number (CID#):(See appendix F CID515519

Is Project Located in an NFIP Participating Community? **X Yes** □ No

Is Project Located in a Special Flood Hazard Area? **X Yes** □ No

Flood Zone(s) (If Applicable): **AE**

Flood Insurance Rate Map Number(s) (If Applicable): **5155190033F**

Total Cost of Project: **$2,500,000**

Total Amount Requested **$1,250,000**

Appendix B – Scoring Criteria

Appendix B: Scoring Criteria for Flood Prevention and Protection Projects

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	**City of Alexandria, VA**	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	X
No	Eligible for consideration for studies, capacity building, and planning only	
3. If the applicant is not a town, city, or county, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Project Eligible for Consideration		**X Yes** **☐ No**
Applicant Name:	**City of Alexandria, VA**	
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Projects (Select all that apply)		
Projects may have components of both 1.a. and 1.b. below; however, only one category may be chosen. The category chosen must be the primary project in the application.		
1.a. Acquisition of property consistent with an overall comprehensive local or regional plan for purposes of allowing inundation, retreat, or acquisition of structures.	**50**	
☐ Wetland restoration, floodplain restoration ☐ Living shorelines and vegetated buffers. ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool ☐ Dam removal ☐ Stream bank restoration or stabilization. ☐ Restoration of floodplains to natural and beneficial function. ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.	**45**	
1.b. any other nature-based approach	**40**	
All hybrid approaches whose end result is a nature-based solution	**35**	
All other projects	**25**	**25**
7. Is the project area socially vulnerable? (Based on ADAPT VA’s Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	12
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	
Very Low Social Vulnerability (Less than -1.0)	**0**	

8. Is the proposed project part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	0
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	10
No	**0**	
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	0
11. Does this project provide "community scale" benefits?		
Yes	**20**	20
No	**0**	
Total Points		67

Good morning –

Attached, please find the City of Alexandria CFPF Round 3 grant application. We plan to submit a second application today for review under a separate email.

Thank you so much for allowing the City the opportunity to apply to this highly valuable program to help enhance our community resilience and mitigate the impacts of flooding.

Sincerely,

Jessica

City of Fairfax

Mosby Woods Floodplain Improvements Study Grant Request

2022 Virginia Community Flood Preparedness Fund (Round 3) Application Package

Introduction

The City of Fairfax (City) has prepared this 2022 Virginia Community Flood Preparedness Fund (CFPF) Application Package to request matching funds for the preparation of the Mosby Woods Floodplain Improvements Study. The City intends to apply for matching funds in the Study category. The City of Fairfax is a 6.27 square mile independent city located within Fairfax County in northern Virginia. The City is highly developed and is mainly compromised of residential and commercial lots. The City and study location have a low social vulnerability index score based on the ADAPT VA Social Vulnerability Index.

Background

The City of Fairfax is bisected by a multitude of stream reaches and acts as the headwater of Accotink Creek. As the City has evolved, it has naturally experienced large-scale development with the majority of its land draining to the north fork or the mainstem of Accotink Creek. This situation has led to locations of increased localized urban flooding. The City is now looking to conduct a study to evaluate the effects of the north fork of the Accotink Creek floodplain on the Mosby Woods condominiums, as well as develop strategies to prevent and mitigate damages from the riverine flooding. It is currently anticipated that the culvert system below Stafford Drive does not provide sufficient capacity and causes large storm events to back up, spilling onto neighboring properties. The drainage area and location of the Stafford Drive culvert system can be seen in Attachment 1.1.

The study will look to analyze the existing condition of 6,000 linear feet of Accotink Creek and the effects of the stream on floodplain on the adjoining infrastructure. The hydrology to the point of interest will be derived from a compilation of the most readily available aerial landcover data, survey data, GIS shapefile data, and soils data. The study will utilize the full build out condition from the City's 2035 Comprehensive Plan to increase resilience of future events. Additionally, the study will model the historic flows related to the rainfall and runoff from Tropical Storm Lee, a known flooding event at the Mosby Woods condominiums.

The study will then perform a floodplain sensitivity modeling analysis for infrastructure changes at the major culvert systems, stream, and the use of floodplain grading techniques within the study area. Evaluation of the overall stream corridor will be prioritized as to model the effect of the changes wholistically on the floodplain system, as to not potentially transfer any flooding downstream. Utilizing the study results, the City will have a comprehensive evaluation of the localized flooding within the study area and the impacts that different potential solutions could have on the floodplain.

Scope of Work Narrative

Capacity Needs

The City, in conjunction with an engineering consulting firm, will develop the Mosby Woods Floodplain Improvements Study. The City currently lacks the capacity or in house expertise to undertake this effort singularly and thus outside resources are required for the completion of this task.

Goals and Objectives

The goal of the Mosby Woods Floodplain Improvements Study is to provide a corridor-wide approach to better understand the flooding within the Accotink Creek. This planning level document will provide the City with the ability to better assess and develop an action-oriented approach to flooding and resiliency within the Mosby Woods community.

Stakeholders

Initially, the stakeholders associated with the Mosby Woods Floodplain Improvements Study will primarily be the City Department of Public Works. As items and projects identified in the study come to fruition, an expansion of the stakeholders will include citizens, businesses, and residents within the Mosby Woods community.

Implementation Plan and Timeline

The implementation of this plan will start once the grant has been awarded to the City and when the new fiscal year begins in July 2022. The City would like to note this is an anticipated timeline and could be subject to change.

Outputs and Measures

The output of this task is a comprehensive evaluation of the localized flooding within the study area and the impacts that different potential solutions could have on the floodplain. No other outputs are expected from this task.

Maintaining Capacity

At this time, the City does not anticipate the need for continuing support for development of the Mosby Woods Floodplain Improvements Study.

Budget Narrative

Estimated Total Project Cost

The estimated total project cost for the development of the Mosby Woods Floodplain Improvements Study is $48,570.66. The City has coordinated with a consultant to provide an estimated summary of proposed services and associated cost. This document has been included in Attachment 1.2 and includes an hourly breakdown based on anticipated tasks to be conducted by a consultant in the development of the Mosby Woods Floodplain Improvements Study.

Amount of Funds Requested

Per the 2022 CFPF Manual, the Mosby Woods Floodplain Improvements Study development is categorized as a Study activity. According to the latest U.S census data, the City of Fairfax has a median household income of $116,979. This is 58% higher than the Virginia median household income of $74,222 thus not qualifying as a low-income geographic area. The U.S census data can be seen in Attachment 3.7 of this application package.

Per the 2022 CFPF Manual, the City is requesting a 50% City match and a 50% CFPF match of the total project cost. Based on the Estimated Total Project cost highlighted above, the City is requesting $24,285.33 with this grant application package. This match will be utilized to assist with the overall cost of developing the Mosby Woods Floodplain Improvements Study. As mentioned above, an estimated summary of proposed services and associated cost has been included in Attachment 1.2. This includes an hourly breakdown based on anticipated tasks to be conducted by a consultant in the development of the Mosby Woods Floodplain Improvements Study.

Amount of Cash Funds Available

The City intends to allocate a portion of the City of Fairfax Stormwater Utility Fund for this study. The study has been included within the approved 2023 proposed budget as “Flood Mitigation Planning & Resilience”, which has an available budget of $225,000. The City has reserved $24,285.33 of available matching funds from the City of Fairfax Stormwater Utility Fund as part of this application package. The Flood Mitigation Planning & Resilience project sheet from the 2023 proposed Stormwater Utility Fund can be seen in Appendix 1.3. The Stormwater Utility Fund is available to the City’s Public Works division to complete engineering functions and manage capital improvement projects for stormwater related needs within the City.

Authorization To Request Funding

A signed authorization to request for funding has been included below:

> “I certify that I am requesting matching grant funds from the Virginia Community Flood Preparedness Fund on behave of the City of Fairfax in the Study category for the development of the Mosby Woods Floodplain Improvement Study.”

Fairfax, Virginia 22030

Re: Mosby Woods Floodplain Improvement Study

Dear Mr. Eto:

Kimley-Horn and Associates, Inc. (Kimley-Horn) is pleased to submit this task order proposal to the City of Fairfax (City) to provide professional consulting services related to the development of a Mosby Woods Floodplain Improvement Study. The language outlined below identifies our project understanding, scope of requested services, and accompanying fees related to the overall project.

PROJECT UNDERSTANDING

This proposal summarizes the phases and tasks necessary to prepare a Study to evaluate the effects of the North Fork of the Accotink Creek floodplain on the Mosby Woods Condominiums, as well as develop strategies to prevent and mitigate damages from the riverine flooding. This Scope of Services will focus on 6,600 linear feet of stream channel (Study Area) depicted in Attachment 1 of this Scope of Services.

SCOPE OF SERVICES

This proposal has been divided into six (6) tasks. Each task is outlined below with a brief summary defining the Scope of Services for each task. A time and materials not-to-exceed cost to perform this work is provided (Attachment 2) and includes Kimley-Horn project management and coordination time.

1. Site Base Mapping, Project Due Diligence, and Site Visit
2. Full Buildout Hydrologic Analysis of the Study Area
3. Stream Corridor Hydraulics Study
4. Development of a Mosby Woods Floods Improvement Concept Plan
5. Mosby Woods Floodplain Improvements Study Report
6. Meetings & Coordination

Task 100 - Site Base Mapping, Project Due Diligence, and Site Visit

Kimley-Horn will develop a Geographic Information Systems (GIS) base-map illustrating the existing site conditions from Plantation Parkway through Stafford Drive to the culvert system at Fairfax Boulevard (Route 50) / Lee Highway (Route 29). The base mapping will depict the 6,600 linear feet of stream along the Study Area and will illustrate existing City of Fairfax and FEMA GIS floodplain features, as well as depict the impacts of the existing floodplain on pertinent infrastructure. The base mapping will be derived using the most readily available City and FEMA GIS shapefile data, aerial imagery, and previously developed Study Limit data provided by the City. The base mapping will be used by Kimley-Horn to assist in site reconnaissance efforts and to supplement all meetings, efforts, and study deliverables outlined in this Scope of Services.

Kimley-Horn will a perform project due diligence for the Study Area by compiling pertinent information from the following reports and data sets:

- City of Fairfax - Flood Insurance Study (FIS)
- FEMA relevant Flood Insurance Rate Maps (FIRMs)
- Previous studies performed within the project study area (to be provided by the City)
- Available City of Fairfax existing HEC-HMS (Hydrologic Models) and HEC-RAS (Hydraulic / Floodplain Models)
- Available VDOT / City of Fairfax Bridge and Culvert Plans for the project Study Area
- Best available FEMA, State, and City GIS Shapefile Data and Aerial Imagery

Kimley-Horn will compile all relevant Study Area floodplain and site data in a Technical Support Data Memo (TSDM) and submit to the City.

Kimley-Horn will utilize the site base mapping and background data obtained through this task to perform a site visit to photo-document the current conditions along the Study Area. Kimley-Horn will compile the base mapping and site photos to create a composite GIS base-map depicting the photo locations captured in the field that identify potential Study Area opportunities and constraints.

Task 200 – Full Buildout Hydrologic Analysis of the Study Area

Kimley-Horn will perform a full buildout hydrologic evaluation of the Study Area watershed utilizing aerial imagery, as well as the City's 2035 Comprehensive Plan. As part of this analysis, Kimley-Horn will evaluate the major drainage area sub-basins within the following watersheds.

- Plantation Parkway Culvert System
- Stafford Drive Culvert System
- Ranger Road Culvert System
- Fairfax Boulevard (Rt.50) / Lee Highway (Rt.29) Culvert System

Kimley-Horn will use the United States Department of Agriculture's (USDA) Technical Release-55 (TR-55) Urban Hydrology for Small Watersheds SCS Methodology to determine the existing basin hydrologic parameters such as Runoff Curve Numbers (RCNs) and Times of Concentrations (Tc) / Lag Times (Tlag). The hydrology will be derived from a compilation of the most readily available aerial landcover data, survey data, GIS Shapefile data, and soils data. The derived drainage basin hydrologic conditions will be utilized as model input parameters in subsequent tasks to determine the Study Area's basin and stream corridor runoff inflows for the 1-yr, 2-yr, 10-yr, and 100-yr storm events. As part of this task, Kimley-Horn will also model the historical flows related to the rainfall and runoff from Tropical Storm Lee, a known flooding event at the Mosby Woods Condominiums.

The hydrologic data generated will be utilized in conjunction with the Army Corp of Engineer's HEC-HMS (Hydrologic Modeling System) software to simulate the hydrologic stream processes at junctions and specific locations within the 6,600 linear foot stream corridor that traverses the Study Area. The model input parameters for the Mosby Woods Study Area HEC-HMS model will be developed based on the following information:

- City of Fairfax and (potentially) Fairfax County supplemental GIS topography.
- NOAA Atlas 14 Precipitation Data and City Specific Precipitation data
- SCS curve numbers based on ArcGIS orthogonal imagery and NRCS Soil information within the Study Area watershed.
- Time of Concentration / Lag time values developed based on ArcGIS orthogonal imagery and City of Fairfax / Fairfax County topography.

A comprehensive basin routing comparison will be performed to determine the effects of different runoff producing events on the existing Study Area. In developing this model, Kimley-Horn will be able to determine the volumetric discharge (flow rate) for multiple storm events which will be utilized as inputs in the HEC-RAS stream corridor hydraulics study (Task 300).

As part of this task, Kimley-Horn will compare our modeled hydrologic results with the published flows outlined in the City of Fairfax – Flood Insurance Study (FIS) for the North Fork of Accotink Creek, as well as the published flows at the Confluence of the North Fork of Accotink Creek with the Main Stem of Accotink Creek. Both sets of stream flows (KH derived / FIS) will be utilized in the hydraulic models developed in Task 300 (Stream Corridor Hydraulics Study).

All information derived and modeled in this task will be documented within the Mosby Woods Floodplain Improvements Study Final Report (Task 500).

Task 300 – Stream Corridor Hydraulics Study

Existing Conditions Modeling

Kimley-Horn will build an existing conditions floodplain hydraulics model of the 6,600 linear foot stream system within the Study Area utilizing previously derived topographic survey information for portions of the stream reach, and readily available City GIS shapefile data as supplemental information (contour, road, structure, etc.). Kimley-Horn will generate representative cross-sections for the 6,600 linear foot stream reach from available survey information and supplemental GIS contours, to input into the Army Corp of Engineer's HEC-RAS (River Analysis System) modeling software. The existing conditions floodplain hydraulics model will be developed to reflect channel and cross-sectional geometry indicative of the stream reach as well as any pertinent site characteristics (obstructions, structures, residences etc.), present throughout the stream reach / floodplain area.

Kimley-Horn will route the flows derived in the Full Buildout hydrologic analyses (Task 200) through the existing conditions floodplain hydraulic model to determine the existing stream/floodplain cross-sectional hydraulic characteristics along the Study Area. The hydraulic data generated in this task will be used to determine water surface elevations along the existing stream reach, specifically around the Mosby Woods Community and downstream from the Stafford Drive culvert system. This analysis will also quantify the effect of the Plantation Parkway, Stafford Drive, Ranger Road, and the Route 50/Route 29 Culvert System on the stream corridor and floodplain. Existing flood inundation depths, stream and floodplain velocities, cross-sectional top widths, and energy and hydraulic grade line calculations will be derived as part of this analysis.

Once the existing conditions model is developed, Kimley-Horn will create a separate HEC-RAS geometry file that will nest the Kimley-Horn derived exiting conditions model into the preliminary revised HEC-

RAS model developed for the revised Flood Insurance Study for the City of Fairfax (Stantec – September 2020). It is assumed that this model will be provided by the City to Kimley-Horn for this task.

Kimley-Horn will document the results for both the existing conditions floodplain hydraulics model, as well as the nested existing conditions hydraulics model in the overall preliminary 2020 FEMA floodplain model. These values will provide a baseline comparison for all future modeling analysis.

Floodplain Improvements Sensitivity Modeling

Kimley-Horn will modify the Existing Conditions Hydraulics Model(s) to evaluate proposed changes that may help abate the flooding at the Mosby Woods Condominium complex. Floodplain sensitivity modeling will focus on infrastructure changes at the major culvert systems, stream, and floodplain grading techniques, and pairing of the two within the Study Area. Evaluation of the overall stream corridor will be prioritized as to model the effect of the changes wholistically on the floodplain system, as to not potentially transfer any flooding downstream.

Kimley-Horn will route the flow data derived in Task 200 to analyze the viability and success of potential changes along the Study Area stream corridor. Revised Water Surface Elevations for all modeled storm events will be compared to existing conditions as to quantify the effect of the proposed improvements on the inundation depths and horizontal spread of the floodplain limits.

All relevant model cross sections and stream profiles will be updated to reflect any conceptual proposed infrastructure changes, grading, structure placement or channel realignment techniques, if applicable, within the Study Area limits. This information will be included in the Mosby Woods Floodplain Improvements Study Report (Task 500)

Task 400 - Development of a Mosby Woods Flood Improvement Concept Plan

Based on the results determined in the Floodplain Improvements Sensitivity modeling, Kimley-Horn will derive a 24x36 AutoCAD developed conceptual plan that will graphically depict locations of potential improvements among the 6,600 linear foot stream reach. Proposed conceptual improvements will include, but are not limited to the following:

- Infrastructure based improvements
- Natural based solutions
- Preservation and creation of open space and focus on permanent conservation of lands having flood resilience value

Due to the conceptual nature of this plan all proposed structural improvements, grading and riparian enhancements, and proposed future project implementation locations will have limited engineering design and will focus on project layout and location.

Task 500 - Mosby Woods Floodplain Improvements Study Report

Kimley-Horn will develop a Mosby Woods Floodplain Improvement Study report outlining the information derived in tasks 100 - 400. Study graphics, tabular summaries, numerical analysis, and conceptual level designs created in all previous tasks will be included in the final report. Recommendations on future drainage basin stormwater management improvements, future storm sewer designs, as well as comprehensive drainage and floodplain improvement implementation scenarios for the Study Area will be included with the report.

Task 600 – Meetings & Coordination

Kimley-Horn staff will be available for up to two (2) project coordination meetings, in person (if requested), to discuss the project. In addition, Kimley-Horn staff will participate in calls to discuss the project with City staff. If additional meetings and coordination activities are requested, Kimley-Horn will prepare a separate Scope of Services and cost estimate for client approval prior to proceeding with the additional work.

DELIVERABLES

The following items are anticipated as project deliverables for this Scope of Services.

- Site specific floodplain data compilation outlined in a Technical Support Data Memo (TSDM)
- HEC-HMS Hydrologic / HEC-RAS Stream Hydraulic Models(s)
- Mosby Woods Floodplain Improvements Study – 24 x 36 AutoCAD Derived Conceptual Plan
- Mosby Woods Floodplain Improvements Study – Final Report
- All maps, models, analyses, spreadsheets, and base data utilized for the design (if requested).

OVERALL PROJECT ASSUMPTIONS

For the purposes of developing this proposed Scope of Services and the accompanying cost estimate, we have made the following assumptions:

- All previous project information developed by others will be provided by the City to Kimley-Horn in a timely manner to accommodate anticipated project schedule.
- The flood studies and analyses proposed in this Scope of Services are intended as a planning level and will not constitute a formal FEMA floodplain study. As such this information and data will not be stamped and sealed by a Virginia Professional Engineer (PE).
- All analyses and studies developed in this Scope of Services will be based on limited survey information, and as such, the information derived will be considered “for information purposes only”
- The Conceptual Design Plan referenced in this Scope of Services will be limited in terms of engineering design and analysis. As such, they will be not stamped by a licensed Virginia Professional Engineer and labeled as “Not for Construction Purposes”.
- The City will provide site access permission to Kimley-Horn, for conducting all necessary fieldwork related tasks in a timely manner to facilitate the project schedule.
- Accuracy and precision of data and previous studies provided by others is solely on the consulting firm that derived the studies. Kimley-Horn will review all data provided by the City with regards to the Study Area but assumes no responsibility for information outlined in the studies developed by others.
- Readily available City GIS shapefile and geodatabase information will be used to supplement this study, as needed.

- The City will provide all coordination with inter-city departments with regards to this project.
- This proposal and the accompanying cost estimate are valid for a period of 60 days and will expire if not accepted within that timeframe.

OVERALL PROJECT EXCLUSIONS

Services that are not currently anticipated as part of this project and are therefore outside the scope of this task order proposal include the following:

- Phase I, II, III Archaeological Investigations
- Environmental Site Assessments
- Perennial Stream Assessments and/or Flow Determinations
- Wetland Permit Compliance
- Project Renderings
- VSMP Compliance
- Floodplain Studies and Submittals
- FEMA CLOMR or LOMR Applications
- Dam Safety Compliance
- Dam Break Inundation Zone (DBIZ) Modeling / Mapping
- Engineering Design Plan Submittals
- Utility Design
- VDOT Design or Permitting
- Right of Way Permitting or Dedication associated with planned or future development
- Development/Delivery of Presentations, Board of Supervisors, Committees, or the Public
- Notifications to impacted Property Owners
- All other services not explicitly stated in this Scope of Services

SCHEDULE

The tasks referenced in this scope will be coordinated with City Staff. Meetings, action items, and deliverables will be tracked on a monthly basis and reported to the City with a monthly progress report for documentation of services provided. Assuming Kimley-Horn receives a notice to proceed by July 1, 2022, Kimley-Horn anticipates completion of the Scope of Services outlined above by October 31, 2022. A detailed schedule will be developed for the City outlining project workflow and deliverables after contract execution.

FEE AND BILLING

Kimley-Horn will provide the following scope of services under our term contract #17007-2017-KHA. The following tasks will be provided on a time and materials basis not to exceed a total project cost of **$48,570.66.** A detailed breakdown (by task) of Kimley-Horn Horn's fee estimate is provided in Attachment 1 and utilizes the rate schedule as provided for in the City of Fairfax Task Order Contract #17007-2017-KHA, Year 5. Please note that hourly fees will be invoiced monthly based upon hours expended for services performed and payment will be due within 25 days of receipt of invoices related to this project.

CLOSURE

The work described with this proposal will be completed in accordance with the terms and conditions of Contract #17007-2017-KHA between the City of Fairfax and Kimley-Horn. We appreciate the opportunity to provide these services to you. Please contact either of us if you have any questions.

Very truly yours,
KIMLEY-HORN AND ASSOCIATES, INC.

City of Fairfax – 2023 Stormwater Utility Fund Project Information Sheet

PROJECT INFORMATION

Name:	**Flood Mitigation Planning & Resiliency**	**Project #**	**--**
2035 Comprehensive Plan Reference:	**NE2.1 pg 108**	**2035 Comprehensive Plan Timeframe:**	**Long-Term**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project supports the development of two flood mitigation initiatives. The first is a Flood Resilience Plan for the city. This plan provides project-based improvements for flood control and resilience, leverages nature-based infrastructure, considers all parts of a locality, includes coordination with other local and inter-jurisdictional activities, and is based on best available science. The plan will be developed to also provide credits towards FEMA's Community Rating System.

During the design of the Stafford Drive Stream Restoration Project, the effects to the floodplain were reviewed through hydraulic modeling. It was found that the culvert under Stafford Drive is a contributing factor in the floodplain impacts to the Mosby Woods condominium community. A flood study is proposed to evaluate the current condition of the Stafford Drive culvert and investigate options to improve the flood conditions in this area.
.
The city intends to apply for Community Flood Preparedness Fund grants for two projects which can, if approved, provide up to 75% funding for the flood preparedness plan, and 50% for the flood mitigation study. Development of a Flood Resilience Plan is a prerequisite to applying for any future grant funding for construction of a mitigation project, which can fund 50-70% of the project costs.

FUNCTION:	**Stormwater Utility Fund**
DEPARTMENT:	**Public Works**
DIVISION OR ACTIVITY:	**Storm Drainage Operations & Maintenance**

PROGRAM:

The Storm Drainage division maintains the city's stormwater collection systems, which consist of 300,000 linear feet of storm pipe, 1,840 catch basins, 145 outfalls, 28 box culverts, 324 driveway culverts, 7 bridges, and 37 bridge culverts. Crews replace deteriorated storm lines, perform preventative maintenance tasks biannually, clear blocked streams, repair box culverts, and repair damaged driveway pipe and ditch lines.

OBJECTIVES:

- Clean ditch lines, storm pipes, and catch basins
- Repair and replace storm pipes and catch basins.
- Clean and clear stream beds of brush/obstacles to improve flow without affecting downstream properties.
- Repair box culverts.

SERVICES AND PRODUCTS:

- Catch basin repair
- Creek and stream maintenance
- Drainage ditch maintenance
- Storm sewer pipe maintenance, repair, and replacement
- Culvert repairs
- Bridge repairs
- Install lining to storm pipe and culverts
- Concrete lid/top replacement and repair
- Perform emergency drainage repairs and projects
- Provide sandbags and emergency response to flooding

FUNCTION:	**Stormwater Utility Fund**
DEPARTMENT:	**Public Works**
DIVISION OR ACTIVITY:	**Stormwater Utility Administration & Engineering**

Budget Comments:

The FY2023 budget creates the Stormwater Utility Fund. The stormwater related costs from Public Works Administration and Engineering will be transferred from the General Fund to the Stormwater Utility Fund.

FUNCTION:	**Stormwater Utility Fund**
DEPARTMENT:	**Public Works**
DIVISION OR ACTIVITY:	**Stormwater Utility Administration & Engineering**

PROGRAM:

The office of the director manages seven public works divisions, including Stormwater Management, and provides professional engineering services for constructing and maintaining stormwater infrastructure, environmental projects, and drainage improvements.

OBJECTIVES:

- Maintain compliance with the city's Municipal Separate Storm Sewer System (MS4) permit.
- Meet the city's Total Maximum Daily Load (TMDL) goals for the Chesapeake Bay and local waterways.
- Administrate erosion and sediment control and stormwater pollution prevention programs for public and private development projects.
- Maintain records of the layout and condition of the city's storm sewer infrastructure.
- Deliver adopted capital drainage improvement projects that provide direct benefit to affected property owners.
- Provide public outreach and education on stormwater management and pollution prevention topics.
- Encourage the public to engage in stormwater-positive actions and activities.
- Administrate Stormwater Utility capital programming.
- Assist city residents and businesses with finding solutions to drainage problems.

SERVICES and PRODUCTS:

- Administrative services for the Stormwater Utility.
- Drainage improvement projects.
- Environmental projects; stream restoration, stormwater facility upgrades and retrofits.
- Evaluation of drainage concerns, both public and private.
- Printed and electronic outreach and education materials on stormwater topics.
- Administration of Virginia Erosion & Sediment Control and Virginia Stormwater Management Program laws through inspections and enforcement.

PROJECT INFORMATION

Name:	**Replacement of Failing Galvanized Storm Drainage Systems**	**Project #**	**340-644411-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project provides for the replacement of the City's galvanized storm drain systems located within the city's right-of-ways and citizen properties. Failed storm sewer mains create sinkholes and hazards. The failing systems would be replaced with HDPE pipe and new structures.

PROJECT INFORMATION

Name:	**Storm Pipe Lining Rehabilitation**	**Project #**	**340-644410-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project is necessary to extend the life of the storm pipe lines. As concrete storm pipe linings age and deteriorate, sections can collapse and lose capacity. A plastic liner is installed on the inside wall of the pipe to maintain pipe integrity and stormwater flow.

Project includes mobilization, pre TV inspection, heavy cleaning, post TV inspection, and linear installation.

PROJECT INFORMATION

Name:	**Mosby Road Drainage Improvements**	**Project #**	**340-344429-580330**
2035 Comprehensive Plan Reference:	**IU1.3.2 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is needed to reduce flooding on Mosby Road. During heavy rain storms stormwater from Burke Station Road and floods the road. This project will fund the design and construct curb and gutter, curb inlets and stormwater pipes to collect and direct the stormwater from Burke Station Road to an existing stormwater sewer main on Mosby Road. Design will be completed in FY23 with construction scheduled for FY24.

PROJECT INFORMATION

Name:	**Reline Bridge Culvert Storm Structures**	**Project #**	**320-631318-580330**

2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project is necessary to extend the life of the storm structures that bridge vehicular traffic over the creek systems. The existing galvanized pipe has deteriorated and will not support the road bed if a new system is not installed. There are approximately 37 bridge culverts throughout the city with diameters exceeding 24”.

PROJECT INFORMATION

Name:	**Ashby Pond Dredging & Retrofit**	**Project #**	**340-644430-580330**
2035 Comprehensive Plan Reference:	**IU1.3.2 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Short-Term**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

When the Ashby Pond project was completed in 2011, the project did not include the complete removal of silt. Instead, only a portion was removed. Since then the City has taken steps to help the water quality through the installation of aeration bubblers and native plantings along the pond banks. 30% design plans for restoration of the channel that feeds the east side of the pond, and restoration of the inflow channel on the south side of the pond, as well as the pond dredging and retrofit were completed in FY21 & FY22. Stormwater Local Assistance Fund grants were applied for in FY22. This project will contribute to the TMDL pollutant load reduction for the City. All available grant funding opportunities will be pursued.

Statement of Need:

This project will replace the erosion/scour slab, riprap and repair the wing walls on the upstream and downstream ends of this double 10' diameter corrugated metal pipe culvert across two phases. FY23 funding will provide for repair of the eastern/outlet side headwall and wingwall, and outlet apron/plunge pool area. The wingwalls and headwalls will also be sealed with graffiti resistant paint.

PROJECT INFORMATION

Name:	**Flood Mitigation Planning & Resiliency**	**Project #**	**--**
2035 Comprehensive Plan Reference:	**NE2.1 pg 108**	**2035 Comprehensive Plan Timeframe:**	**Long-Term**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project supports the development of two flood mitigation initiatives. The first is a Flood Resilience Plan for the city. This plan provides project-based improvements for flood control and resilience, leverages nature-based infrastructure, considers all parts of a locality, includes coordination with other local and inter-jurisdictional activities, and is based on best available science. The plan will be developed to also provide credits towards FEMA's Community Rating System.

During the design of the Stafford Drive Stream Restoration Project, the effects to the floodplain were reviewed through hydraulic modeling. It was found that the culvert under Stafford Drive is a contributing factor in the floodplain impacts to the Mosby Woods condominium community. A flood study is proposed to evaluate the current condition of the Stafford Drive culvert and investigate options to improve the flood conditions in this area.
.
The city intends to apply for Community Flood Preparedness Fund grants for two projects which can, if approved, provide up to 75% funding for the flood preparedness plan, and 50% for the flood mitigation study. Development of a Flood Resilience Plan is a prerequisite to applying for any future grant funding for construction of a mitigation project, which can fund 50-70% of the project costs.

PROJECT INFORMATION

Name:	**Northfax Linear Park Design**	**Project #**	**--**

2035 Comprehensive Plan Reference:	**CCAC 2.3.5**	**p.52**		**2035 Comprehensive Plan Timeframe:**	**Immediate**

Comprehensive Plan Element

✓	**Land Use**		✓	**Environment and Sustainability**
✓	**Multimodal Transportation**		✓	**Economic Vitality**
	Community Services			**Other City Plan/Policy**

Statement of Need:

Funding is requested for consultant services to develop a unified stormwater strategy, landscape design and standards for the Northfax Linear Park as recommended in the Northfax Small Area Plan adopted in June 2020. This project will establish a phasable conceptual plan to be implemented across multiple properties and timelines. Final design and construction will occur incrementally as development proceeds on impacted parcels. A unified stormwater strategy and landscape plan are specifically recommended as implementation items to precede development of impacted parcels in the plan.

PROJECT INFORMATION

Name:	**Stormwater & Wastewater Plan Review**	**Project #**	**340-644439-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p.144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

Stormwater quality and quantity designs for larger development projects are becoming more complex due to the increasingly urban nature of the City. Wastewater contributions to the City's system also increase through development projects. This project will allow for an additional layer of plan review assistance by specialized storm/waste water engineering firms to ensure that regulatory requirements are met, no adverse stormwater impacts to the proposed development or surrounding properties will occur, and wastewater capacities are adequate.

PROJECT INFORMATION

Name:	**Municipal Separate Storm Sewer System (MS4)**	**Project #**	**340-644424-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is required to comply with the 2018-2023 Municipal Separate Storm Sewer System (MS4) permit requirements. The new permit has new significant milestones that the City must meet each year of the 5 year permit term. The permit requirements include updating GIS files for DEQ, updating the City's website, revising the 5 year program plan, updating and implementing nutrient management plans, conducting outfall screening, conducting public outreach & education, and compiling our MS4 annual report. Funding will also provide for inspections, materials/equipment/signage, and staff training necessary to maintain Stormwater Pollution Prevention Plan compliance at the City's Property Yard facility. This permit will be active from 2018-2023, with this fiscal year being permit year 5.

PROJECT INFORMATION

Name:	**Private BMP/SWM Inspection**	**Project #**	**340-644432-580330**

2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project provides for the annual inspection of all the private Best Management Practice/Storm Water Management (BMP/SWM) systems throughout the City. Currently there are 440 privately owned facilities in inventory. Annual inspection of these facilities is required under the Virginia Pollution Discharge Elimination System (VPDES) and Phase II-Municipal Separate Storm Sewer System (MS4) permit. While BMP facilities are engineered to meet state requirements for pollutant load reduction and water quantity, their continued performance is dependent upon inspections and maintenance. The number of facilities in inventory will continue to increase with future development / redevelopment of properties.

PROJECT INFORMATION

Name:	**Public BMP/SWM Inspection and Maintenance**	**Project #** **340-644415-580330**

2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**		**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project provides for the annual inspection and maintenance of all the public Best Management Practice/Storm Water Management (BMP/SWM) systems throughout the City, including prior stream restoration project areas. There are currently 38 City owned and maintained facilities, plus two stream restoration areas that are inspected annually. Annual inspection of these facilities is required under the Virginia Pollution Discharge Elimination System (VPDES), Phase II-Municipal Separate Storm Sewer System (MS4) permit, and grant funding agreements with Virginia Department of Environmental Quality. Maintenance of BMP facilities is necessary to ensure that they continue to function as designed to provide water quality and quantity control. Implementation of Best Management Practices is required to offset the impacts of development activity, and the number of facilities in inventory will increase with future development/redevelopment of City properties, and roadway / transportation projects.

PROJECT INFORMATION

Name:	**Stream Evaluation and Restoration**	**Project #**	**340-644422-580330**

2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**	✓	**Other City Plan/Policy**

Statement of Need:

The Accotink Creek Stream Stability Assessment and Prioritization Plan was developed in October 2007 and has been used as a guide to select future stream restoration project areas. This report is now 15-years old and an update is needed. A comprehensive stream condition assessment is proposed for FY23 which will document improvements made through completed environmental projects and help prioritize stream segments for future restoration projects. All grant opportunities will be explored for this project.

PROJECT INFORMATION

Name: **TMDL Action Plans**	**Project #** **340-644426-580330**

2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**	**2035 Comprehensive Plan Timeframe:** **Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is needed to comply with the annual milestone requirements of the Municipal Separate Storm Sewer System (MS4) permit and state mandated TMDL allocations for waterways located within the regional watershed. A Chesapeake Bay Total Maximum Daily Load (TMDL) action plan was completed in 2015 and updated in 2019, as well as nine additional local TMDLs allocated to the City. Each action plan outlines what the pollutant of concern (POC) loads and required reductions are for the City to meet the permit requirements, and how the City will achieve them. The City met the Chesapeake Bay TMDL 5% reduction requirements for 2018. The Chesapeake Bay TMDL requires that the City achieve a 40% pollutant reduction goal by 2023, and 100% pollutant reduction goal by 2028. This project will provide for design and construction of stormwater outfall channel retrofits, and BMP retrofits. Both types of projects will provide for TMDL credit towards the City's pollutant reduction goals. Alternative compliance methods will be explored, including nutrient credit purchases. This project will also provide for development of a required chloride TMDL Action Plan. All grant opportunities will be explored.

Statement of Need:

A multi-phase evaluation program to prioritize areas for CCTV camera inspection of pipes and manholes was developed in FY22. This project will continue inspections to provide asset condition data and guide future maintenance and upgrade priorities. This project will also allow for collection of updated storm sewer inventory data that will be accessible through GIS. Data to be collected will include coordinate location, pipe size, material, depth, inlet/manhole type, and pipe connectivity layout.

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☒ Other relevant flood prevention and protection project or study.

Capacity Building and Planning Grants

☐ Floodplain Staff Capacity.

☐ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
    - Policy management and/or development.
    - Stakeholder engagement and strategies.

Location of Project (Include Maps): City of Fairfax: Mosby Woods

NFIP Community Identification Number (CID#):(See appendix F 515524

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Zone AE, Zone X

Flood Insurance Rate Map Number(s) (If Applicable): 5155240002D

Total Cost of Project: $48,570.66

Total Amount Requested $24,285.33

Virginia Department of Conservation and Recreation
Virginia Community Flood Preparedness Fund Grant Program

Applicant Name: City of Fairfax

Eligibility Information

Criterion	Description	Check One
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Studies Eligible for Consideration		☒ **Yes** ☐ **No**
Applicant Name:		
Scoring Information		
Criterion	**Point Value**	**Points Awarded**
6. Eligible Studies (Select all that apply)		
Revising floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.	**30**	
Creating tools or applications to identify, aggregate, or display information on flood risk or creating a crowd-sourced mapping platform that gathers data points about real-time flooding. This could include a locally or regionally based web-based mapping product that allows local residents to better understand their flood risk.	**15**	
Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA).	**35**	
Studies and Data Collection of Statewide and Regional Significance. Funding of studies of statewide and regional significance and proposals will be considered for the following types of studies:		
☐ Updating precipitation data and IDF information (rain intensity, duration, frequency estimates) including such data at a sub-state or regional scale on a periodic basis.	**45**	
☐ Regional relative sea level rise projections for use in determining future impacts.	**45**	
☐ Vulnerability analysis either statewide or regionally to state transportation, water supply, water treatment, impounding structures, or other significant and vital infrastructure from flooding.	**45**	
☐ Flash flood studies and modeling in riverine regions of the state.	**45**	
☐ Statewide or regional stream gauge monitoring to include expansion of existing gauge networks.	**45**	

☐ New or updated delineations of areas of recurrent flooding, stormwater flooding, and storm surge vulnerability in coastal areas that include projections for future conditions based on sea level rise, more intense rainfall events, or other relevant flood risk factors.	**45**	
☐ Regional flood studies in riverine communities that may include watershed-scale evaluation, updated estimates of rainfall intensity, or other information.	**50**	X
☐ Regional hydrologic and hydraulic studies of floodplains.	**45**	
☐ Studies of potential land use strategies that could be implemented by a local government to reduce or mitigate damage from coastal or riverine flooding.	**40**	
☐ Other proposals that will significantly improve protection from flooding on a statewide or regional basis	**35**	
7. Is the study area socially vulnerable? (Based on ADAPT VA's Social Vulnerability Index Score.)		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	X
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed study part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	X
9. Is the proposed study in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	X
10. Projects eligible for funding may also reduce nutrient and sediment pollution to local waters and the Chesapeake Bay and assist the Commonwealth in achieving local and/or Chesapeake Bay TMDLs. Does the proposed project include implementation of one or more best management practices with a nitrogen, phosphorus, or sediment reduction efficiency established by the Virginia Department of Environmental Quality or the Chesapeake Bay Program Partnership in support of the Chesapeake Bay TMDL Phase III Watershed Implementation Plan?		
Yes	**5**	
No	**0**	X
Total Points		50

Mosby Woods Floodplain Improvements Study Area FIRM Map

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles, Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' National Geodetic Vertical Datum of 1929 (NGVD 29). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures in this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 18. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the National Geodetic Vertical Datum of 1929. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

Spatial Reference System Division
National Geodetic Survey, NOAA
Silver Spring Metro Center
1315 East-West Highway
Silver Spring, Maryland 20910
(301) 713-3191

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit their website at www.ngs.noaa.gov.

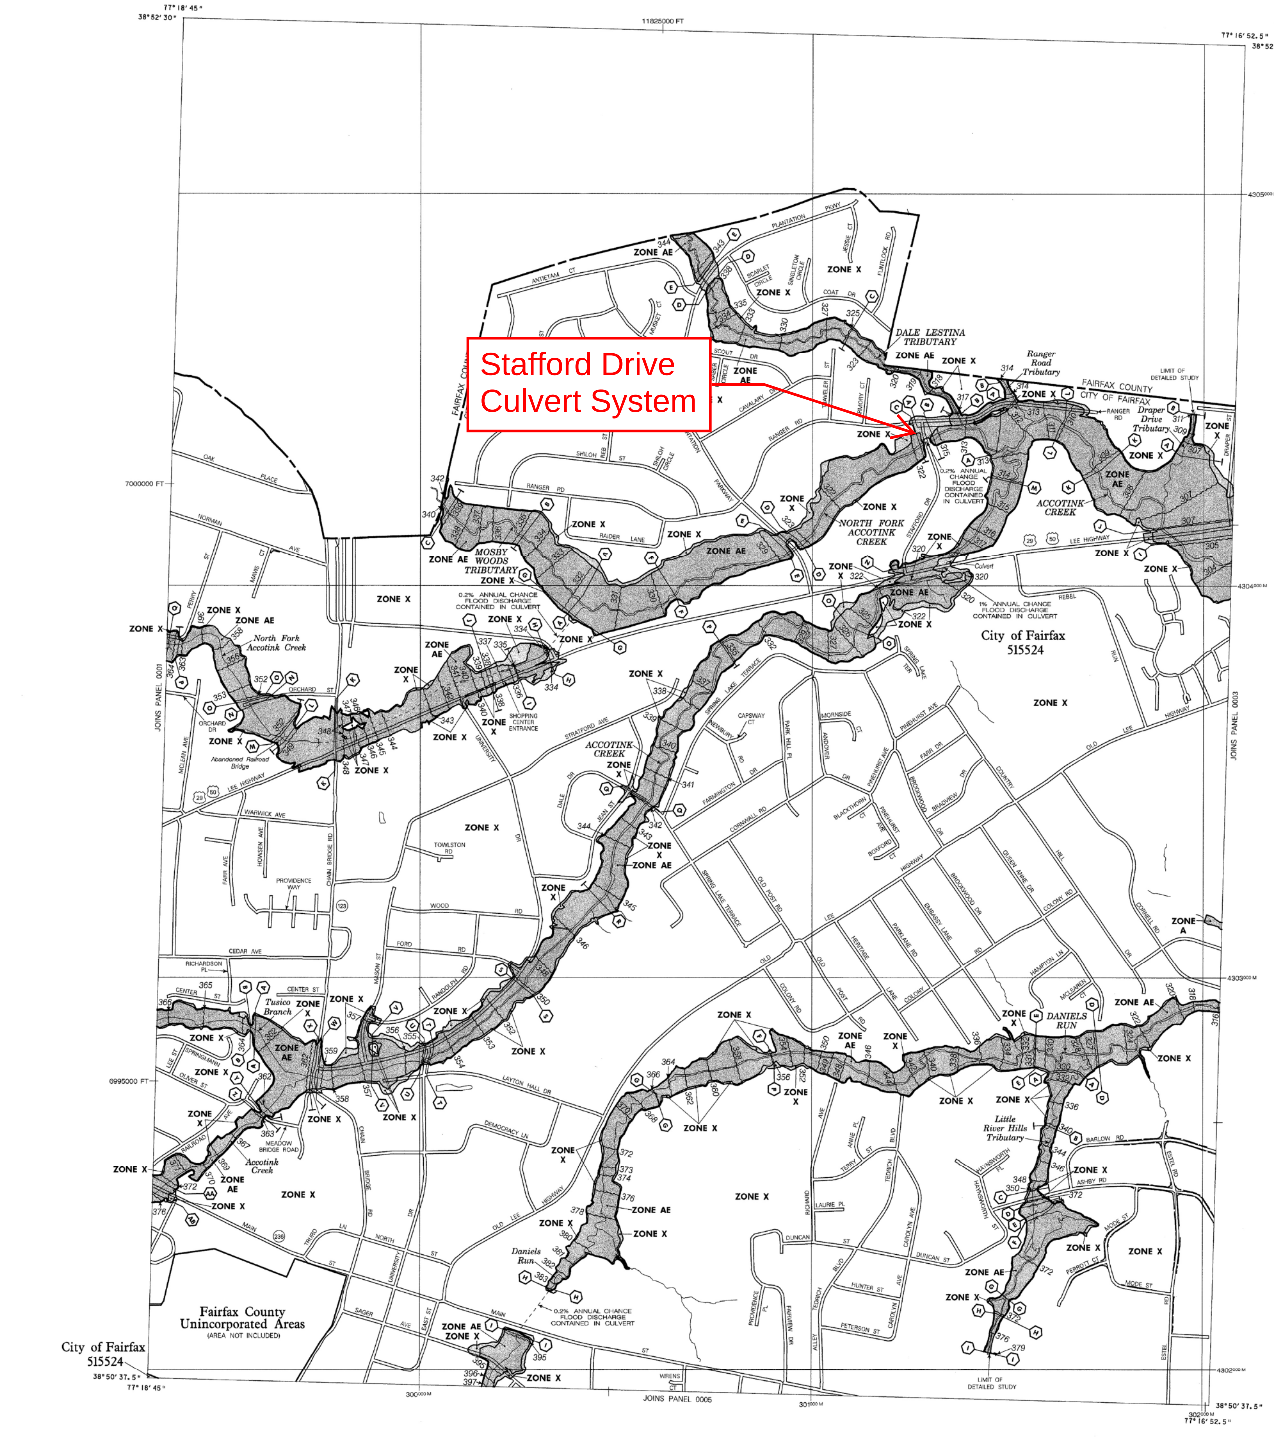
Base map information shown on this FIRM was provided in digital format by the City of Fairfax, Virginia. This information was photogrammetrically compiled at a scale of 1:1,200 from aerial photography dated March 1997.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map showing the layout of map panels for this jurisdiction.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and their website at http://www.msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.



LEGEND

▨ SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

▨ FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

▨ OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

☐ OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

▨ COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

▨ OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

———————	1% annual chance floodplain boundary
———————	0.2% annual chance floodplain boundary
—— —— ——	Floodway boundary
- ——— ——— -	Zone D boundary
••••••••••••••••••••	CBRS and OPA boundary
▨ ←	Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities
~~513~~~~~	Base Flood Elevation line and value; elevation in feet*
(EL 987)	Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the National Geodetic Vertical Datum of 1929

Federal Emergency Management Agency

Attachment 3.4

City of Fairfax – Current Floodplain Ordinance (4.15 Floodplain Regulations)

§4.14.6. Radioactivity

There shall be no radioactive emission that would be dangerous to health.

§4.14.7. Electrical interference

There shall be no electrical disturbance adversely affecting the operation of any equipment other than that of the creator of such disturbance.

§4.14.8. Liquid or solid wastes

There shall be no discharge of any liquid or solid wastes into any stream, except as authorized by a public agency.

§4.14.9. Glare and heat

There shall be no direct or reflected glare, whether from floodlights or from high-temperature processes (for example, combustion or welding) so as to be visible from within any residential district. There shall be no discharge of heat or heated air from any source so as to be detectable beyond the lot line.

§4.15. FLOODPLAIN REGULATIONS

§4.15.1. Authority

These regulations are adopted pursuant to the authority granted to localities by Code of Virginia, §15.2 - 2280.

§4.15.2. Purpose

The purpose of these provisions is to prevent: the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

A. Regulating uses, activities, and development which, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

B. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;

C. Requiring all those uses, activities, and developments that do occur in flood-prone districts to be protected and/or floodproofed against flooding and flood damage; and

D. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards.

§4.15.3. General Provisions

A. Applicability

These regulations shall apply to all privately and publicly owned lands within the city and identified as areas of special flood hazard according to the flood insurance rate map (FIRM) that is provided to the city by the Federal Emergency Management Agency (FEMA)

B. Compliance and liability

1. No land shall hereafter be developed and no structure shall be located, relocated, constructed, reconstructed, enlarged, or structurally altered except in full compliance

with the terms and provisions of these regulations and any other applicable ordinances and regulations, which apply to uses within the city.

2. The degree of flood protection sought by the provisions of these regulations is considered reasonable for regulatory purposes and is based on acceptable engineering methods of study, but does not imply total flood protection. Larger floods may occur on rare occasions. Flood heights may be increased by man-made or natural causes, such as ice jams and bridge openings restricted by debris. These regulations do not imply that districts outside the floodplain district or land uses permitted within such district will be free from flooding or flood damages.

3. These regulations shall not create liability on the part of the city or any officer or employee thereof for any flood damages that result from reliance on these regulations or any administrative decision lawfully made thereunder.

C. Records

Records of actions associated with administering these regulations shall be kept on file and maintained by the floodplain administrator.

D. Abrogation and greater restrictions

These regulations supersede any regulations currently in effect in flood-prone districts. Any existing regulation, however, shall remain in full force and effect to the extent that its provisions are more restrictive than the provisions of these regulations.

§4.15.4. Administration

A. Designation of the floodplain administrator

The zoning administrator shall serve as the floodplain administrator and is hereby appointed to administer and implement the regulations of this section and is referred to herein as the floodplain administrator. The floodplain administrator may:

1. Administer and implement floodplain regulations himself or delegate duties and responsibilities set forth in these regulations to qualified technical personnel, plan examiners, inspectors, and other employees.

2. Enter into a written agreement or written contract with another community or private sector entity to administer specific provisions of these regulations. Administration of any part of these regulations by another entity shall not relieve the city of its responsibilities pursuant to the participation requirements of the National Flood Insurance Program (NFIP) as set forth in the Code of Federal Regulations at 44 CFR 59.22.

B. Duties and responsibilities of the floodplain administrator

The duties and responsibilities of the floodplain administrator shall include but are not limited to:

1. Review applications for floodplain permits to determine whether proposed activities will be located in the special flood hazard area.

2. Interpret floodplain boundaries and provide available base flood elevation and flood hazard information.

3. Review applications to determine whether proposed activities will be reasonably safe from flooding and require new construction and substantial improvements to meet the requirements of these regulations.
4. Review applications to determine whether all necessary permits have been obtained from the federal, state or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the 100-year frequency floodplain of free-flowing nontidal waters of the state.
5. Verify that applicants proposing an alteration of a watercourse have notified adjacent communities, the Department of Conservation and Recreation (DCR) Division of Dam Safety and Floodplain Management, and other appropriate agencies (Virginia Department of Environmental Quality [VADEQ], United States Army Corps of Engineers [USACE]) and have submitted copies of such notifications to FEMA.
6. Approve applications and issue floodplain permits to develop in flood hazard areas if the provisions of these regulations have been met, or disapprove applications if the provisions of these regulations have not been met.
7. Inspect or cause to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with these regulations or to determine if non-compliance has occurred or violations have been committed.
8. Review elevation certificates and require incomplete or deficient certificates to be corrected.
9. Submit to FEMA, or require applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six months after such data and information becomes available if the analyses indicate changes in base flood elevations.
10. Maintain and permanently keep records that are necessary for the administration of these regulations, including:
    - **(a)** Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and
    - **(b)** Documentation supporting issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, other required design certifications, special exceptions and special use permits, and records of enforcement actions taken to correct violations of these regulation
11. Enforce the provisions of these regulations, investigate violations, issue notices of violations or stop work orders, and require permit holders to take corrective action.
12. Advise the board of zoning appeals, or the city council, as appropriate, regarding the intent of these regulations and, for each application for special exceptions and special use permits, prepare a staff report and recommendation.

13. Administer the requirements related to proposed work on existing buildings:
    - **(a)** Make determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged.
    - **(b)** Make reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.
14. Undertake other actions which may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other Federal, State, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in special flood hazard areas; and assisting property owners with documentation necessary to file claims for Increased Cost of Compliance coverage under NFIP flood insurance policies.
15. Notify FEMA when the corporate boundaries of the city have been modified and:
    - **(a)** Provide a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to these regulations has either been assumed or relinquished through annexation; and
    - **(b)** If the FIRM for any annexed area includes special flood hazard areas that have flood zones that have regulatory requirements that are not set forth in these regulations, prepare amendments to these regulations to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended regulations shall be provided to DCR Division of Dam Safety and Floodplain Management and FEMA.
16. Upon the request of FEMA, complete and submit a report concerning participation in the NFIP which may request information regarding the number of buildings in the special flood hazard area, number of permits issued for development in the special flood hazard area, and number of special exceptions and special use permits issued for development in the special flood hazard area.
17. Take into account flood, mudslide and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g. via mapping or surveying).

C. Use and interpretation of FIRMs

The floodplain administrator shall make interpretations, where needed, as to the exact location of special flood hazard areas, floodplain boundaries, and floodway boundaries. The following shall apply to the use and interpretation of FIRMs and data:

1. Where field surveyed topography indicates that adjacent ground elevations:

(a) Are below the base flood elevation, even in areas not delineated as a special flood hazard area on a FIRM, the area shall be considered as special flood hazard area and subject to the requirements of these regulations;

(b) Are above the base flood elevation, the area shall be regulated as special flood hazard area unless the applicant obtains a letter of map change that removes the area from the special flood hazard area.

2. In FEMA-identified special flood hazard areas where base flood elevation and floodway data have not been identified and in areas where FEMA has not identified special flood hazard areas, any other flood hazard data available from a federal, state, or other source shall be reviewed and reasonably used.

3. Base flood elevations and designated floodway boundaries on FIRMs and in flood insurance studies shall take precedence over base flood elevations and floodway boundaries by any other sources if such sources show reduced floodway widths and/or lower base flood elevations.

4. Other sources of data shall be reasonably used if such sources show increased base flood elevations and/or larger floodways than are shown on FIRMs and in flood insurance studies.

5. If a Preliminary FIRM and/or a Preliminary Flood Insurance Study has been provided by FEMA:

(a) Upon the issuance of a letter of final determination by FEMA, the preliminary flood hazard data shall be used and shall replace the flood hazard data previously provided from FEMA for the purposes of administering these regulations.

(b) Prior to the issuance of a letter of final determination by FEMA, the use of preliminary flood hazard data shall be deemed the best available data pursuant to §4.15.6.C regarding A Zones, and used where no base flood elevations and/or floodways are provided on the effective FIRM.

(c) Prior to issuance of a letter of final determination by FEMA, the use of preliminary flood hazard data is permitted where the preliminary base flood elevations or floodways exceed the base flood elevations and/or designated floodway widths in existing flood hazard data provided by FEMA. Such preliminary data may be subject to change and/or appeal to FEMA.

D. Jurisdictional boundary changes

1. The city floodplain regulations then in effect on the date of annexation or agreed upon boundary line adjustment shall remain in effect and shall be enforced by the city for all annexed areas until the city adopts and enforces an ordinance which meets the requirements for participation in the NFIP. It is a requirement that municipalities with existing floodplain ordinances shall pass a resolution acknowledging and accepting responsibility for enforcing floodplain ordinance standards prior to annexation of any area containing identified flood hazards. If the FIRM for any annexed area includes special flood hazard areas that have flood zones that have regulatory requirements that are not set forth in these regulations, the city shall prepare amendments to these regulations to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the

same time as or prior to the date of annexation and a copy of the amended regulations shall be provided to the DCR Division of Dam Safety and Floodplain Management and FEMA.

2. In accordance with the Code of Federal Regulations, Title 44 Subpart (B) Section 59.22 (a) (9) (v) all NFIP participating communities must notify the Federal Emergency Management Agency and optionally the State Coordinating Office (Virginia Department of Conservation and Recreation – Division of Dam Safety and Floodplain Management) in writing whenever the boundaries of the community have been modified by annexation or the community has otherwise assumed or no longer has authority to adopt and enforce floodplain management regulations for a particular area.
3. In order that all FIRMs accurately represent the city's boundaries, a copy of a map of the city suitable for reproduction, clearly delineating the new corporate limits or new area for which the community has assumed or relinquished floodplain management regulatory authority must be included with the notification.

E. District boundary changes

The city council may modify the boundaries of the floodplain in accordance with the procedures established for zoning map amendments contained in §6.4. Any such modification shall be based upon hydrologic and hydraulic analyses performed by an engineer who shall certify that the technical methods used correctly reflect accepted engineering design methods. Prior to any such modification, approval shall be obtained from FEMA.

F. Interpretation of district boundaries

The zoning administrator shall be responsible for the interpretation of floodplain boundaries and may approve minor refinements after consulting with the city engineer to more accurately determine the true location of such boundaries. Such approval shall be based on hydrologic and hydraulic analyses performed by an engineer, who shall certify that the technical methods used correctly reflect accepted engineering design methods. The determination of the floodplain boundary by the zoning administrator may be appealed by an aggrieved party to the board of zoning appeals pursuant to §6.21.

G. Submitting technical data

The city's base flood elevations may increase or decrease resulting from physical changes affecting flooding conditions. As soon as practicable, but not later than six months after the date such information becomes available, the city shall notify FEMA of the changes by submitting technical or scientific data. Such a submission is necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and flood plain management requirements will be based upon current data.

H. Letters of map revision

When development in the floodplain causes a change in the base flood elevation, the applicant, including state agencies, must notify FEMA by applying for a conditional letter of map revision prior to construction, and a letter of map revision after construction. For example:

1. Any development that causes a rise in the base flood elevations within the floodway.

2. Any development occurring in Zones A1-30 and AE without a designated floodway, which will cause a rise of more than one foot in the base flood elevation.

§4.15.5. Alteration or relocation of a stream

Alteration or relocation of a stream, including but not limited to installing culverts and bridges. [44 CFR 65.3 and 65.6(a)(12)]

§4.15.6. Establishment of special flood hazard districts

A. Description of special flood hazard districts

The various special flood hazard districts shall include the special flood hazard areas. The basis for the delineation of these districts shall be the flood insurance study and the FIRM for the city prepared by FEMA, dated June 2, 2006, and any subsequent revisions or amendments thereto. The city may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas may be delineated on a local flood hazard map using best available topographic data and locally derived information such as flood of record, historic high water marks or approximate study methodologies. The boundaries of the special flood hazard areas are established as shown on the FIRM which is declared to be a part of these regulations and which shall be kept on file at the city.

1. The floodway district is in an AE Zone and is delineated, for purposes of These regulations, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one percent annual chance flood without increasing the water surface elevation of that flood more than one foot at any point. The following provisions shall apply within the floodway district of an AE Zone [44 CFR 60.3(d)]:

   (a) Within any floodway, no encroachments, including fill, new construction, substantial improvements, or other development shall be permitted unless it has been demonstrated through hydrologic and hydraulic analysis performed in accordance with standard engineering practice that the proposed encroachment will not result in any increase in flood levels within the community during the occurrence of the base flood discharge. Hydrologic and hydraulic analyses shall be undertaken only by professional engineers or others of demonstrated qualifications, who shall certify that the technical methods used correctly reflect currently-accepted technical concepts. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the floodplain administrator.

   (b) Development activities which increase the water surface elevation of the base flood may be allowed, provided that the applicant first applies – with the city's endorsement – for a conditional letter of map revision (CLOMR), and receives the approval of FEMA.

   (c) If §4.15.6.A.1(a) is satisfied, all new construction and substantial improvements shall comply with all applicable flood hazard reduction provisions of §4.15.7, §4.15.8, §4.15.9, §4.15.10, and §4.15.11.

B. The AE, or AH Zones on the FIRM accompanying the Flood Insurance Study shall be those areas for which one-percent annual chance flood elevations have been provided and the floodway has not been delineated. The following provisions shall apply within an AE or AH Zone [44 CFR 60.3(c)]:

1. Until a regulatory floodway is designated, no new construction, substantial improvements, or other development (including fill) shall be permitted within the areas of special flood hazard, designated as Zones A1-30 and AE or AH on the FIRM, unless it is demonstrated that the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood more than one foot at any point within the city.

2. Development activities in Zones Al-30 and AE or AH, on the city FIRM which increase the water surface elevation of the base flood by more than one foot may be allowed, provided that the applicant first applies – with the city's endorsement – for a conditional letter of map revision, and receives the approval of FEMA

C. The A Zone on the FIRM accompanying the Flood Insurance Study shall be those areas for which no detailed flood profiles or elevations are provided, but the one percent annual chance floodplain boundary has been approximated. For these areas, the following provisions shall apply [44 CFR 60.3(b)]:

1. The approximated floodplain district shall be that floodplain area for which no detailed flood profiles or elevations are provided, but where a 100-year floodplain boundary has been approximated. Such areas are shown as Zone A on the maps accompanying the Flood Insurance Study. For these areas, the base flood elevations and floodway information from federal, state, and other acceptable sources shall be used, when available. Where the specific one percent annual chance flood elevation cannot be determined for this area using other sources of data, such as the USACE Floodplain Information Reports, U. S. Geological Survey Flood-Prone Quadrangles, etc., then the applicant for the proposed use, development and/or activity shall determine this base flood elevation. For development proposed in the approximate floodplain the applicant must use technical methods that correctly reflect currently accepted non-detailed technical concepts, such as point on boundary, high water marks, or detailed methodologies hydrologic and hydraulic analyses. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the floodplain administrator.

2. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development. When such base flood elevation data is utilized, the lowest floor shall be elevated at least 18 inches above the base flood level.

3. During the permitting process, the floodplain administrator shall obtain:

   (a) The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and,

   (b) If the structure has been floodproofed in accordance with the requirements of this article, the elevation (in relation to mean sea level) to which the structure has been floodproofed.

4. The AO Zone on the FIRM accompanying the Flood Insurance Study shall be those areas of shallow flooding identified as AO on the FIRM. For these areas, the following provisions shall apply [44 CFR 60.3(c).

   (a) All new construction and substantial improvements of residential structures shall have the lowest floor, including basement, elevated above the highest adjacent grade at least as high as the depth number specified in feet on the FIRM plus 18 inches. If no flood depth number is specified, the lowest floor, including basement, shall be elevated no less than three and one-half feet above the highest adjacent grade.

(b) All new construction and substantial improvements of nonresidential structures shall:

(1) Have the lowest floor, including basement, elevated above the highest adjacent grade at least as high as the depth number specified in feet on the FIRM plus 18 inches. If no flood depth number is specified, the lowest floor, including basement, shall be elevated at least three and one-half feet above the highest adjacent grade; or,

(2) Together with attendant utility and sanitary facilities be completely floodproofed to the specified flood level so that any space below that level is watertight with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.

(c) Adequate drainage paths around structures on slopes shall be provided to guide floodwaters around and away from proposed structures.

D. Overlay Concept

The floodplain districts described above shall be overlays to the existing underlying districts as shown on the city’s zoning map, and as such, the provisions for the floodplain districts shall serve as a supplement to the underlying district provisions.

1. If there is any conflict between the provisions or requirements of the floodplain districts and those of any underlying district, the more restrictive provisions and/or those pertaining to the floodplain districts shall apply.

2. In the event any provision concerning a floodplain district is declared inapplicable as a result of any legislative or administrative actions or judicial decision, the basic underlying provisions shall remain applicable.

§4.15.7. Permit and application requirements

A. Permit requirement

All uses, activities, and development occurring within any floodplain district shall be undertaken only upon the issuance of a zoning permit. Such development shall be undertaken only in strict compliance with the provisions of these regulations and with all other applicable codes and ordinances, as amended, such as the Virginia Uniform Statewide Building Code (USBC) and the city’s subdivision ordinance and regulations appertaining thereto. Prior to the issuance of any such permit, the floodplain administrator shall require all applications to include compliance with all applicable state and federal laws and shall review all sites to assure they are reasonably safe from flooding. Under no circumstances shall any use, activity, and/or development adversely affect the capacity of the channels or floodways of any watercourse, drainage ditch, or any other drainage facility or system. A floodplain permit shall be issued by the zoning administrator after an application has been submitted along with any documentation required by the zoning administrator and a fee in accordance with §6.2.4.

B. Site plans and permit applications

All applications for development within any floodplain district and all building permits issued for the floodplain shall incorporate the following information:

1. The elevation of the base flood at the site.
2. The elevation of the lowest floor (including basement).
3. For structures to be floodproofed (nonresidential only), the elevation to which the structure will be floodproofed.
4. Topographic information showing existing and proposed ground elevations.

C. Allowed uses

The following uses shall be permitted within the floodplain by right or with a special use permit, as specified; provided, that such uses are permitted in the zoning district within which they are located, the review criteria contained in §4.15.7 are met, and a floodplain permit is obtained as specified in §4.15.4.C.

1. Permitted uses

(a) Utilities and public facilities and improvements such as streets, channel improvements, bridges, utility pipes, utility transmission lines and stormwater management facilities shall be permitted.

(b) The following uses and improvements shall be permitted, provided that the development or use is otherwise permitted in this chapter and that the area of impervious surface shall not exceed 2,500 square feet and such uses or improvements shall not contain areas of fill in excess of 12 inches in depth:

(1) Agricultural uses such as farming, gardening, grazing and similar uses.

(2) Outdoor recreational uses such as parks, trails, picnic grounds, athletic fields, play grounds, golf courses, tennis courts and archery ranges.

2. Special uses

The following uses and improvements shall be permitted with a special use permit issued by the city council in accordance with the provisions of §6.7, provided that such use is permitted in the zoning district in which the proposed use or improvement is located:

(a) Area specified

The uses permitted and specified in §4.15.7.C.1 where the area of impervious surface will exceed 2,500 square feet or such uses or improvements will contain areas of fill in excess of 12 inches in depth.

(b) Redevelopment of property

(1) For the purposes of §4.15, redevelopment shall be any reconstruction, conversion, structural alteration, relocation or enlargement of any structure or any extension of the use of the land. No redevelopment shall be permitted in any floodplain until the developer submits to the zoning administrator a study performed by an engineer, which addresses the review criteria contained in §4.15.8.

(2) Redevelopment shall only be permitted if construction techniques are employed which floodproof each structure located within the floodplain in accordance with the NFIP, USBC floodproofing standards and all other applicable requirements. Within Zone AO the underside of the lowest floor (including basement) of any structure shall be a minimum of three and one-half feet above the highest adjacent grade. In addition, the underside of the lowest floor (including basement) of any structure shall be a minimum of 18 inches above the floodplain elevation.

§4.15.8. Approval criteria

A. Permitted uses, activities or developments (including redevelopments) within the floodplain shall be permitted only when all available alternative locations not within the floodplain have been properly considered and it is not possible to accommodate reasonable development outside the floodplain boundaries. Each application for a floodplain permit, together with required supporting documentation, shall clearly demonstrate that the proposed use, activity or development:

1. Shall minimize grading to the maximum possible extent.
2. Shall minimize the amount of impervious surface to the maximum possible extent through site design, the use of porous construction materials, grid or modular pavement, and other reasonable methods.
3. Shall minimize the loss of natural vegetation and natural stormwater characteristics.
4. Shall minimize the susceptibility of structures and their contents to flood damage.
5. Shall not negatively affect water quality.
6. Shall not increase the intensity or extent of flooding of lands above or below the property or jeopardize property or human life.
7. Shall not adversely affect the capacity of the floodplain channel or increase erosion within or adjacent to the floodplain. Prior to any proposed alteration or relocation of any channels or of any watercourse, stream, etc., within the city all applicable permits shall be obtained from the USACE, the VADEQ, and the Virginia Marine Resources Commission. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the DCR, and the Federal Insurance Administration.
8. Shall minimize negative impacts upon wildlife habitat.
9. Shall have its design incorporate base (100-year) flood elevation data for any proposed new activity or development greater than 50 lots or five acres, whichever is the lesser, if located within Zone A. In addition, the best available floodway information from federal, state, or other sources acceptable to the zoning administrator shall be used.
10. Shall not result in more than a one-foot increase in the base (100-year) flood elevation. This shall include the cumulative effect of the proposed use, activity, or development when combined with all other existing and anticipated uses, activities, or development.
11. Shall not negatively affect drainage.

§4.15.9. General standards

A. New construction and substantial improvements shall be according to the Virginia USBC, and anchored to prevent flotation, collapse or lateral movement of the structure.

B. New construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.

C. New construction or substantial improvements shall be constructed by methods and practices that minimize flood damage.

D. Electrical, heating, ventilation, plumbing, air conditioning equipment and other service facilities, including duct work, shall be designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

E. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of floodwaters into the system.

F. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

G. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

§4.15.10. Elevation and construction standards

In all identified flood hazard areas where base flood elevations have been provided in the Flood Insurance Study or generated by a certified professional in accordance with §4.15.6.C, the following provisions shall apply:

A. Residential Construction

New construction or substantial improvement of any residential structure in Zones A1-30, AE, AH and A with detailed base flood elevations shall have the lowest floor, including basement, elevated at least 18 inches above the base flood level.

B. Non-Residential Construction

New construction or substantial improvement of any commercial, industrial, or nonresidential building shall have the lowest floor, including basement, elevated at least 18 inches above the base flood level. Buildings located in all A1-30, AE, and AH Zones may be floodproofed in lieu of being elevated provided that all areas of the building components below the elevation corresponding to the base flood elevation plus one foot are water tight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A registered professional engineer or architect shall certify that the standards of this §4.15.10 are satisfied. Such certification, including the specific elevation (in relation to mean sea level) to which such structures are floodproofed, shall be maintained by the zoning administrator).

C. Space Below the Lowest Floor

In Zones A, AE, AH, AO, and A1-A30, fully enclosed areas, of new construction or substantially improved structures, which are below the regulatory flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door) or limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the regulatory flood protection elevation;

3. Include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings must either be certified by a professional engineer or architect or meet the following minimum design criteria:

  (a) Provide a minimum of two openings on different sides of each enclosed area subject to flooding.

  (b) The total net area of all openings must be at least one square inch for each square foot of enclosed area subject to flooding.

  (c) If a building has more than one enclosed area, each area must have openings to allow floodwaters to automatically enter and exit.

  (d) The bottom of all required openings shall be no higher than one foot above the adjacent grade.

  (e) Openings may be equipped with screens, louvers, or other opening coverings or devices, provided they permit the automatic flow of floodwaters in both directions.

  (f) Foundation enclosures made of flexible skirting are not considered enclosures for regulatory purposes, and, therefore, do not require openings. Masonry or wood underpinning, regardless of structural status, is considered an enclosure and requires openings as outlined above.

D. Manufactured homes

All manufactured homes shall be prohibited within the city. No special exceptions or variances will be granted.

E. Recreational vehicles

All recreational vehicles shall be prohibited within any special flood hazard area. No special exceptions or variances will be granted.

§4.15.11. Subdivision standards

A. All subdivisions shall minimize flood damage;

B. All subdivisions proposals shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage;

C. All subdivisions shall have adequate drainage provided to reduce exposure to flood hazards, and

D. Base flood elevation data shall be obtained from other sources or developed using detailed methodologies, hydraulic and hydrologic analysis, comparable to those contained in a Flood

Insurance Study for subdivision proposals and other proposed development proposals (including subdivisions) that exceed 50 lots or five acres, whichever is the lesser.

§4.15.12. Existing structures in floodplain areas

A structure or use of a structure or premises which lawfully existed before the enactment of these provisions, but which is not in conformity with these provisions, may be continued subject to the following conditions:

A. Existing structures in the floodway shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain areas to an extent or amount of less than 50 percent of its market value shall conform to the Virginia USBC and the appropriate provisions of these regulations.

C. The modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, regardless of its location in a floodplain area to an extent or amount of 50 percent or more of its market value shall be undertaken only in full compliance with these regulations and shall require the entire structure to conform to the Virginia USBC.

§4.15.13. Special exceptions

A. The board of zoning appeals may, by special exception, permit within the floodplain additional uses where such uses are not permitted uses specified in §4.15.6, provided that:

1. Such additional use is permitted in the underlying zoning district;
2. Special exceptions shall be granted only in accordance with the procedures and limitations established for special use permits in §6.7; and
3. The special exception granted represents the minimum variation necessary to afford relief.

B. In reviewing a special exception request, the board of zoning appeals shall consider the following additional factors:

1. The danger to life and property due to increased flood heights or velocities caused by encroachments. No special exception shall be granted for any proposed use, development, or activity within any floodway that would cause any increase in the 100-year flood elevation.
2. The compatibility of the proposed use with existing development and nearby development anticipated in the foreseeable future.
3. The relationship of the proposed use to the comprehensive plan and floodplain management program for the area.
4. For historic structures, a determination that the exception is the minimum necessary to preserve the historic character and design of the structure and would not preclude the structures continued designation as a historic structure.
5. The danger that materials may be swept on to other lands or downstream to the injury of others.

6. The proposed water supply and sanitation systems and the ability of these systems to prevent disease, contamination, and unsanitary conditions.
7. The susceptibility of the proposed facility and its contents to flood damage and the effect of such damage on the individual owners.
8. The importance of the services provided by the proposed facility to the community.
9. The requirements of the facility for a waterfront location.
10. The availability of alternative locations not subject to flooding for the proposed use.
11. The safety of access by ordinary and emergency vehicles to the property in time of flood.
12. The expected heights, velocity, duration, rate of rise, and sediment transport of the floodwaters expected at the site.

C. A special exception shall be granted only after the board of zoning appeals has determined that the granting of such would not (i) result in unacceptable or prohibited increases in flood heights, (ii) pose additional threats to public safety, (iii) require extraordinary public expense, (iv) create any nuisances, (v) cause fraud or victimization of the public, and (vi) conflict with local laws or ordinances. Special exceptions shall be granted only after the board of zoning appeals has determined that a special exception would be the minimum required to provide relief from any hardship to the applicant.

D. The board of zoning appeals shall notify, in writing, the applicant for a special exception request that the issuance of a special exception to construct a structure below the 100-year flood elevation (i) increases the risks to life and property and (ii) may result in increased premium rates for flood insurance.

E. A record shall be maintained of the above notification as well as all special exception actions, including justification for the issuance of the special exceptions. The annual or biennial report submitted to the FEMA shall note any special exceptions, which are issued during the period covered by the report.

F. A special exception shall meet the elevation and construction standards established in §4.15.10.

§4.15.14. Variances

A. Applications for a variance, pursuant to the requirements of §6.18, will be subject to the same considerations as a special exception, as set forth in §4.15.13.

B. The board of zoning appeals shall notify, in writing, the applicant for a variance request that the issuance of a variance to construct a structure below the 100-year flood elevation (i) increases the risks to life and property and (ii) may result in increased premium rates for flood insurance.

§4.15.15. Definitions

For the purposes of 4.15, the following words and phrases shall have the meanings respectively ascribed to them by 4.15 unless the context clearly indicates otherwise:

100-YEAR FLOODPLAIN: The Federal Emergency Management Agency designated one percent annual chance water surface elevation. For the purposes of this ordinance, the 100-year flood is the base flood.

§4.15.15 Definitions

A, A1-30, AND AE ZONES: Areas subject to inundation by the 1-percent-annual-chance flood event determined by detailed methods. Base flood elevations are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.

AH ZONE: Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually areas of ponding) where average depths are between one and three feet. Base flood elevations derived from detailed hydraulic analyses are shown in this zone. Mandatory flood insurance purchase requirements and floodplain management standards apply.

AO ZONE: Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet. Average flood depths derived from detailed hydraulic analyses are shown in this zone. Mandatory flood insurance purchase requirements and floodplain management standards apply. Some AO Zones have been designated in areas with high flood velocities such as alluvial fans and washes. Communities are encouraged to adopt more restrictive requirements for these areas.

APPROXIMATED FLOODPLAIN DISTRICT: The floodplain area for which no detailed flood profiles or elevations are provided, but where a 100-year floodplain boundary has been approximated.

BASE FLOOD: The flood having a one percent chance of being equaled or exceeded in any given year.

BASE FLOOD ELEVATION (BFE): The FEMA designated one percent annual chance water surface elevation and the elevation determined per §4.15.10. The water surface elevation of the base flood in relation to the datum specified on the city’s FIRM. For the purposes of these regulations, the base flood is the 100-year flood or 1 percent annual chance flood.

BASEMENT: Any area of the building having its floor sub-grade (below ground level) on all sides.

CONDITIONAL LETTER OF MAP REVISION (CLOMR): A formal review and comment as to whether a proposed flood protection project or other project complies with the minimum NFIP requirements for such projects with respect to delineation of special flood hazard areas. A CLOMR does not revise the effective Flood Insurance Rate Map or Flood Insurance Study.

DCR: Virginia Department of Conservation and Recreation.

DEVELOPMENT: Any man-made change to improved or unimproved real estate, including, but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.

ELEVATION CERTIFICATE: An administrative tool of the National Flood Insurance Program which is to be used to provide elevation information necessary to ensure compliance with to community floodplain management ordinances, to determine the proper insurance premium rate, or support a request for a Letter of Map Amendment.

ENCROACHMENT: The advance or infringement of uses, plant growth, fill, excavation, buildings, permanent structures or development into a floodplain, which may impede or alter the flow capacity of a floodplain.

FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA): The federal agency under which the NFIP is administered. In March 2003, FEMA became part of the newly created U.S. Department of Homeland Security.

FLOOD OR FLOODING: A general or temporary condition of partial or complete inundation of normally dry land areas from the overflow of inland or tidal waters; the unusual and rapid accumulation or runoff of surface waters from any source. Mudflows which are proximately caused by such accumulation or runoff of surface waters and are akin to a river of liquid and flowing mud on the surfaces of normally dry land areas, as when earth is carried by a current of water and deposited along the path of the current. The collapse or subsidence of land along the shore of a lake or other body of water as a result of erosion or undermining caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusually high water level in a natural body of water, accompanied by a severe storm, or by an unanticipated force of nature such as flash flood or an abnormal tidal surge, or by some similarly unusual and unforeseeable event which results in the overflow of inland or tidal waters. .

FLOOD INSURANCE RATE MAP (FIRM): an official map of a community, on which FEMA has delineated both the special hazard areas and the risk premium zones applicable to the community. A FIRM that has been made available digitally is called a Digital Flood Insurance Rate Map (DFIRM).

FLOOD INSURANCE STUDY (FIS): A report by FEMA that examines, evaluates and determines flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation and determination of mudflow and/or flood-related erosion hazards.

FLOODPLAIN AREA: Any land area susceptible to being inundated by water from any source.

FLOODPLAIN DISTRICT: District designated as a special flood hazard area.

FLOODPLAIN ADMINISTRATOR: the individual appointed to administer and implement these regulations. The zoning administrator has been appointed as the floodplain administrator.

FLOODPROOFING: any combination of structural and non-structural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

FLOODWAY: The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one foot.

FLOODWAY DISTRICT: The area within an AE Zone that is delineated, for purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one percent annual chance flood without increasing the water surface elevation of that flood more than one foot at any point. See §4.15.6.A.

HIGHEST ADJACENT GRADE: the highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

HISTORIC STRUCTURE: Any structure that is: (a) listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register; (b) certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district; (c) individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of the Interior; or, (c) individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either; (d) by an approved state program as determined by the Secretary of the Interior; or (e) directly by the Secretary of the Interior in states without approved programs.

LETTER OF FINAL DETERMINATION (LFD): A letter FEMA sends to the chief executive officer of a community stating that a new or updated FIRM or DFIRM will become effective in six months.

LETTER OF MAP CHANGE (LOMC): A letter of map change is an official FEMA determination, by letter, that amends or revises an effective Flood Insurance Rate Map or Flood Insurance Study. Letters of map change include:

LETTER OF MAP AMENDMENT (LOMA): An amendment based on technical data showing that a property was incorrectly included in a designated special flood hazard area. A LOMA amends the current effective Flood Insurance Rate Map and establishes that land as defined by meets and bounds or structure is not located in a special flood hazard area.

LETTER OF MAP REVISION (LOMR): A revision based on technical data that may show changes to flood zones, flood elevations, floodplain and floodway delineations, and planimetric features. A letter of map revision based on fill (LOMR-F), is a determination that a structure or parcel of land has been elevated by fill above the base flood elevation and is, therefore, no longer exposed to flooding associated with the base flood. In order to qualify for this determination, the fill must have been permitted and placed in accordance with the community’s floodplain management regulations.

LOCAL FLOOD HAZARD MAP – A map created by the city of Fairfax to identify and regulate local flood hazard or ponding areas that are not delineated on the Flood Insurance Rate Map.

LOWEST ADJACENT GRADE: the lowest natural elevation of the ground surface next to the walls of it structure.

LOWEST FLOOR: The lowest floor of the lowest enclosed area (including basement). An unfinished or flood-resistant enclosure, usable solely for parking of vehicles, building access or storage in an area other than a basement area is not considered a building’s lowest floor; provided, that such enclosure is not built so as to render the structure in violation of the applicable non-elevation design requirements of 44 CFR 60.3.

MANUFACTURED HOME: A structure, transportable in one or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when connected to the required utilities. For floodplain management purposes the term “manufactured home” also includes park trailers, travel trailers, and other similar vehicles placed on a site for greater than 180 consecutive days, but does not include a recreational vehicle.

NEW CONSTRUCTION: For the purposes of determining insurance rates, structures for which the “start of construction” commenced on or after December 23, 1971, or after December 31, 1974, whichever is later, and includes any subsequent improvements to such structures. For floodplain management purposes, new construction means structures for which the start of construction commenced on or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures.

POST-FIRM STRUCTURES: A structure for which construction or substantial improvement occurred after December 31, 1974 or on or after December 23, 1971, whichever is later.

PRE-FIRM STRUCTURES: A structure for which construction or substantial improvement occurred on or before December 31, 1974 or before December 23, 1971.

RECREATIONAL VEHICLE: A vehicle which is: (a) built on a single chassis; (b) 400 square feet or less when measured at the largest horizontal projection; (c) designed to be self-propelled or permanently towable by a light duty truck; and (d) designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

REGULATORY FLOOD PROTECTION ELEVATION: See “base flood elevation”.

SHALLOW FLOODING AREA: A special flood hazard area with base flood depths from one to three feet where a clearly defined channel does not exist, where the path of flooding is unpredictable and indeterminate, and where velocity flow may be evident. Such flooding is characterized by ponding or sheet flow.

SPECIAL FLOOD HAZARD AREA: The land in the floodplain subject to a one percent or greater chance of being flooded in any given year as determined in §4.15.6.

START OF CONSTRUCTION: The date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, substantial improvement or other improvement was within 180 days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation; or the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers, or foundations or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of the construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

STRUCTURE: A walled and roofed building, including a gas or liquid storage tank that is principally above ground, as well as a manufactured home.

SUBSTANTIAL DAMAGE: Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

SUBSTANTIAL IMPROVEMENT: Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the start of construction of the improvement. This term includes structures that have incurred substantial damage regardless of the actual repair work performed. The term does not, however, include either: (a) any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions, or (b) any alteration of a historic structure, provided that the alteration will not preclude the structure’s continued designation as a historic structure. Historic structures undergoing repair or rehabilitation that would constitute a substantial improvement as defined above, must comply with all ordinance requirements that do not preclude the structure’s continued designation as a historic structure. Documentation that a specific ordinance requirement will cause removal of the structure from the National Register of Historic Places or the State Inventory of Historic places must be obtained from the Secretary of the Interior or the State Historic Preservation Officer. Any exemption from ordinance requirements will be the minimum necessary to preserve the historic character and design of the structure.

USACE: United States Army Corps of Engineers.

USBC: Virginia Uniform Statewide Building Code.

VADEQ: Virginia Department of Environmental Quality.

VIOLATION: the failure of a structure or other development to be fully compliant with the community's floodplain management regulations. A structure or other development without the elevation certificate, other certifications, or other evidence of compliance required in these regulations is presumed to be in violation until such time as that documentation is provided.

WATERCOURSE: A lake, river, creek, stream, wash, channel or other topographic feature on or over which waters flow at least periodically. Watercourse includes specifically designated areas in which substantial flood damage may occur.

§4.16. STORM DRAINAGE FACILITIES

§4.16.1. Purpose

A. The purpose of §4.16 to define those storm drainage facilities which must be provided by landowners to control rainfall runoff from and across their property in a manner not detrimental to other inhabitants of the city and to preserve, where possible, presently existing natural creek channels. It is the further purpose of §4.16 to minimize the adverse effects of stormwater runoff on downstream drainageways within the city.

B. Article 2.3 (§62.1-44.15:27) of Chapter 3.1 of Title 62.1 of the Code of Virginia establishes the requirement for localities to establish a stormwater management program. §4.16 is adopted pursuant to Chapter 3.1 of Title 62.1 of the Code of Virginia (§62.1-44.15:25 and §62.1-44.15:28 et seq.).

§4.16.2. Performance standards for facilities

Stormwater BMPs, on-site detention facilities, and on-site drainage facilities shall be designed and maintained in such a manner as to minimize economic and environmental costs to the city and its inhabitants in accordance with §4.16.7.

§4.16.3. Performance requirements

Performance requirements for stormwater BMPs, on-site detention facilities, and on-site drainage facilities shall be as specified in §4.16.8.

§4.16.4. Design, construction, inspection and maintenance requirements

Design, construction, inspection and maintenance requirements shall be as defined in the city storm drainage facility specifications as they may be hereafter promulgated by the city engineer and approved by the city council from time to time.

§4.16.5. Usage, improvement and preservation of creeks and channels

A. Natural creeks and drainage channels may be used where available to route stormwater runoff from the city.

B. Natural drainage systems will be improved where necessary in accordance with 9VAC25-870-66 of the Regulations. To the maximum degree possible, these improvements shall be made in such a manner as to preserve, enhance or restore the vegetation, including trees, along the creek line so that the aesthetic, environmental and ecological values of the vegetation are not lost to the community.

C. Land disturbances within resource protection areas or resource management areas may require a water quality impact assessment in accordance with §4.18.8.

Attachment 3.5

City of Fairfax – 2035 Comprehensive Plan

1805

City of Fairfax
2035 Comprehensive Plan

Adopted February 12, 2019
Last Amended June 23, 2020

City of Fairfax, Virginia
10455 Armstrong Street · Fairfax, VA 22030-3630
www.fairfaxva.gov

This is an exciting time for the City's Comprehensive Plan to be significantly revised — not only because it has been 15 years since such an extensive effort has been taken, but also because of the many opportunities happening right now that will impact our future.

Our region is undergoing a major economic shift. Federal spending as a portion of the overall regional economy continues to diminish. This greatly impacts the demand for federal workforce and contractors. Meanwhile, technology-based businesses are flourishing and have made numerous high-profile investments in the region.

The City and George Mason University, at our southern border, have the opportunity to work together to take advantage of this shift and be critical players in the new regional economy. In addition, there are many other opportunities in this plan to leverage the regional economy to benefit the community.

Commercial Redevelopment: Many of the City's commercial properties date to the 1950s and are no longer competitive to attract top-tier tenants. The land use plan provides new flexibility and clarity to encourage property owners to revitalize their properties to meet modern demands and remain competitive in the commercial market.

Housing and Neighborhoods: The City's older housing stock is increasingly being renovated and expanded to keep up with current trends in design and amenities to attract employees in the new economy. The Comprehensive Plan encourages new housing types to attract a wider array of residents and to create and maintain a supply of units that is more affordable.

Historic Resources: The long history of the City provides a unique identity that separates the City from the bulk of Northern Virginia, making it an ideal place to invest. This history will continue to be communicated through preservation of the numerous historic structures and landscapes and celebrated through events and festivals.

Multimodal Transportation: This Comprehensive Plan is supported by the City's recently completed Multimodal Transportation Plan. It envisions a more accessible City for cars, bikes, pedestrians and public transit alike, and accommodates anticipated innovative technologies in transportation. A number of new funding sources also make implementing these initiatives much more feasible than in the past.

Environment: The City will embrace new technologies and promote policies and regulations for a more sustainable future, both locally and globally. New measures will improve the quality of our streams through better stormwater management. The City will vigorously pursue best practices to reduce the volume of waste generated from commercial and residential properties.

Community Services: The City has always prided itself on providing the highest quality public services. Maintaining this stature requires continued investment and monitoring public service facilities for needed improvements, particularly as new technologies and innovations emerge.

The City Council, the Planning Commission, and all of the stakeholders who participated in the development of this plan look forward to seizing the opportunities that will influence the City during the next 15 to 20 years — from an advancing regional economy to new technologies and innovations to support services and environmental sustainability. Together, these opportunities will support a strong, sustainable economy for our vibrant 21st-century community.

Sincerely,

Mayor David L. Meyer

Councilmember Michael Demarco

Councilmember Jennifer Passey

Councilmember So Lim

Councilmember Jonathan Stehle

Councilmember Janice Miller

1 Introduction

The City of Fairfax ("the City") is unique in boasting the benefits of a closely knit community that is hard to find in the Metropolitan Washington region and the access and proximity to large-city amenities and activities. Residents enjoy neighborhoods with distinct character, an active arts scene, high-quality educational institutions for all ages, easy access to natural amenities, and exceptional City services and facilities. Employees and business owners appreciate its central location within Northern Virginia; ease of access and adjacency to major thoroughfares, and its proximity to major regional employers in the health, education, government, and legal sectors.

Nonetheless, the City is not immune to the internal and external elements that place considerable pressure on its identity and future. Its commercial and retail properties are aging and growing less competitive with nearby jurisdictions, raising questions about future development and tax burdens on City residents. Nearby localities feature newer, more in-demand housing stock to attract and retain residents. Region-wide issues of affordable housing, aging and stressed utility infrastructure, traffic congestion, and environmental concerns similarly impact the City and those who live and work here.

As the City's official policy guide for future development-related decisions, the 2035 Comprehensive Plan ("the Comprehensive Plan") provides direction to enhance the City's function, appearance, and livability based on its current conditions. It also seeks to provide the opportunity to examine the various forces affecting the City – such as redevelopment opportunities, economic competitiveness, and an increasingly strained transportation network – and propose innovative solutions that benefit City residents, workers, and visitors alike. As changes occur in and around the City, the Comprehensive Plan provides a framework for responding to and thriving as a result of these changes. Those who contributed to the Comprehensive Plan hope that readers find it a thoughtfully-crafted document that lends itself to enhancing quality of life and making the City a great place for everyone.

Background

The City was established as the Town of Providence in 1805 following the construction of the Fairfax County Courthouse at the rural crossroads of Little River Turnpike and Ox Road. The Town became a hub of commerce within a predominantly agricultural area removed from the growing City of Washington. In 1874, the Town adopted the name Fairfax.

The Town emerged as a more significant regional crossroads when US 50 and US 29 were created in 1926 as part of the original U.S. Highway System. These roadways supported the City's economic growth as businesses expended around the needs of travelers, and the industries serving the surrounding dairy farms. Federal housing programs following World War II catalyzed suburban development in the City, attracting veterans and their families and spurring rapid population growth. The Town was incorporated as the City of Fairfax in 1961. Further economic growth was fueled by the establishment of George Mason University along the City's southern border in 1964, the opening of Interstate 66 along the northern border in 1982, the extension of the Metrorail Orange Line from Washington to the nearby Vienna/Fairfax-GMU station in 1986, and continued overall growth of the region.

Today, the City is an independent jurisdiction of just over six square miles and a current population of around 24,000, located in the heart of Northern Virginia. The Metropolitan Washington Council of Governments (MWCOG) forecasts an increase of 3,400 households in the City by 2035, as shown in Figure 1. The City strives to strike a balance between maintaining the charm that residents currently enjoy and that makes it unique from surrounding communities while also guiding the growth and development projected for this metropolitan area.

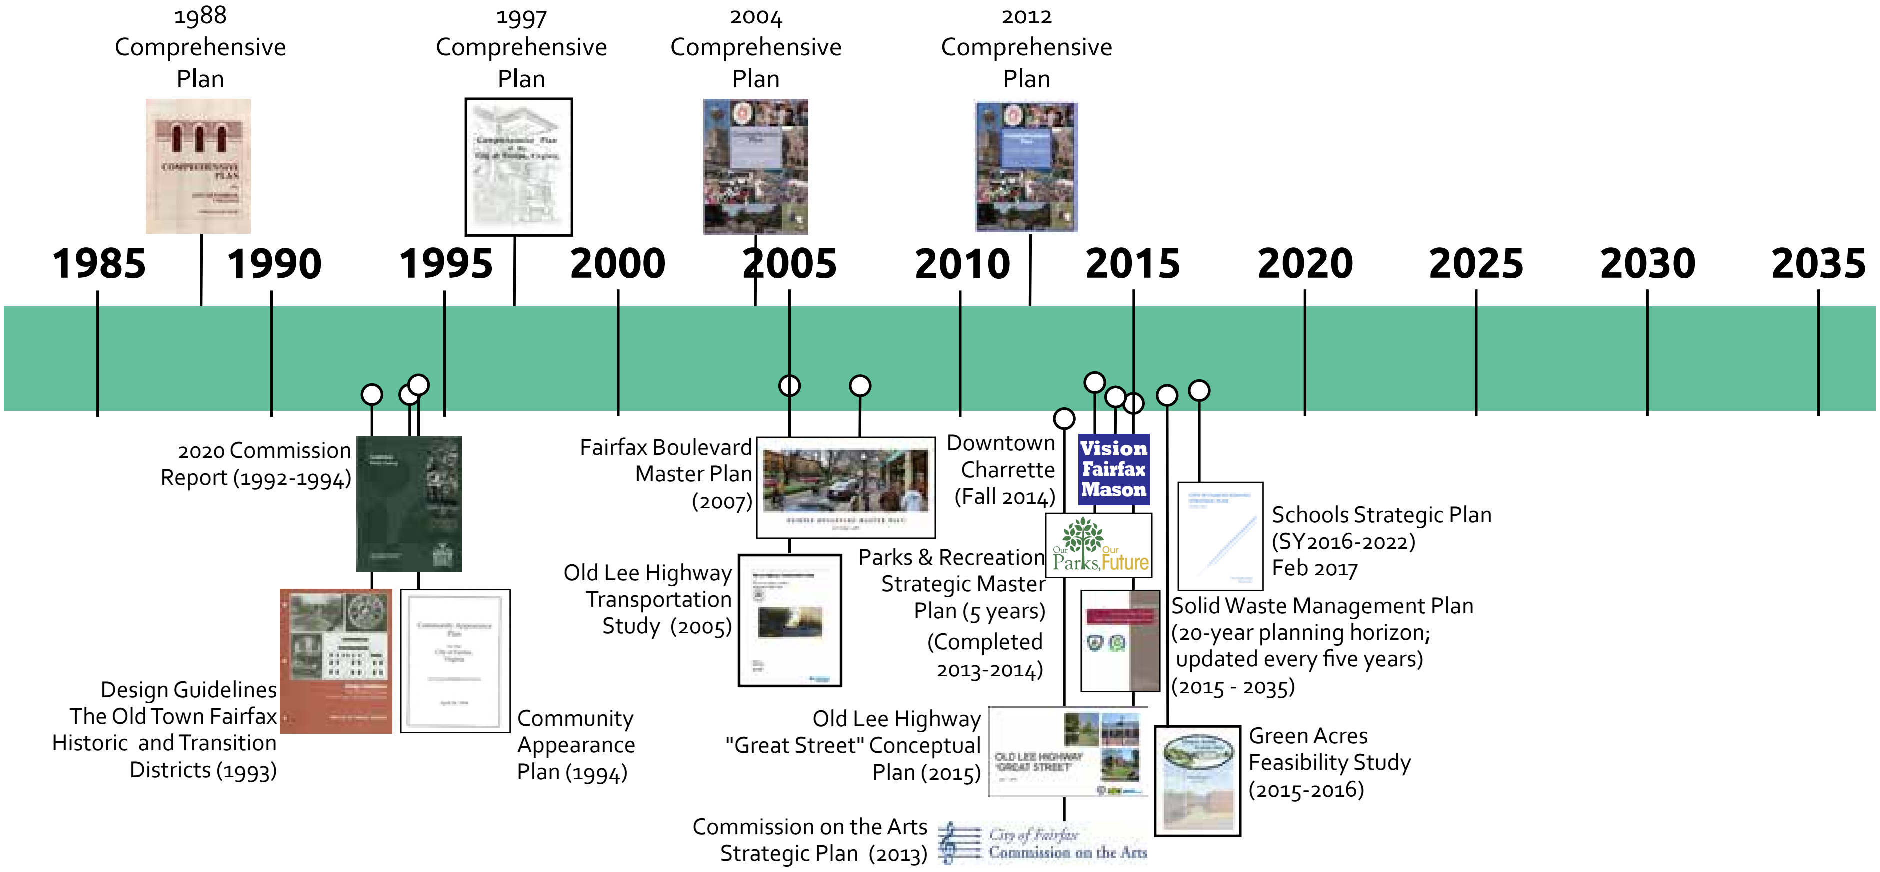
City of Fairfax
2035 Comprehensive Plan
FACT BOOK

November 2016
REVISED February 2017
REVISED April 2017
REVISED July 2017
REVISED April 2018

-DRAFT-

For more information about the City's population, check out the City of Fairfax Fact Book.

The first comprehensive development plan for the City was adopted in June 1968, with amendments in 1971 and 1973. New plans were adopted in 1975, 1982, and 1988, with amendments in 1983, 1991, 1993, and 1997. City Council adopted the Comprehensive Plan's last major rewrite in July 2004. During the Comprehensive Plan's 2008-2011 review, the Planning Commission amended the existing plan, which was adopted in 2012. In addition to the Comprehensive Plan updates, many individual studies and plans have been completed over the years as shown in the diagram below. This Comprehensive Plan incorporates and builds on many of the goals and strategies found in those studies as well as other plans and City policies not identified below.



Structure of the Comprehensive Plan

The Comprehensive Plan is a guide for the future growth of the City, focusing on community needs through 2035. Guidance and policy recommendations are provided through a vision, guiding principles, goals, outcomes, and actions, as described below.

- The **Vision** is the aspirational statement for the City in 2035;
- **Guiding Principles** are content-specific statements;
- **Goals** are general statements of the ideals toward which the City strives;
- **Outcomes** define what success looks like for each Goal; and
- **Actions** are the specific steps necessary to realize each Goal and Outcome.

The 14 Guiding Principles, as provided on pages 6-8, are categorized into five chapters: **Land Use, Multimodal Transportation, Environment and Sustainability, Economic Vitality, and Community Services**. Each topic is presented in a chapter of the Comprehensive Plan. Each chapter includes an introduction that provides background on the topic and a description of existing conditions, as well as opportunities and challenges facing the City that inform some of the policies suggested through the Comprehensive Plan. Additional background information, Goals, Outcomes, and Actions are then provided for each Guiding Principle. Goals, Outcomes, and Actions, can also be found in the stand-alone Implementation Guide, which will be revised on a regular basis to track the City's progress on meeting its Goals.

This Comprehensive Plan is supported by two appendices:

- **Appendix A – Chesapeake Bay Preservation Plan** identifies and characterizes the City's water resources and addresses the effects of land use planning and development on water quality in accordance with the Chesapeake Bay Preservation Act.
- **Appendix B - Transportation Practices and Policy** provides additional information on some of the more innovative practices discussed in the Multimodal Transportation Chapter.

Supporting maps, graphs and figures are provided throughout this document.

What is a Comprehensive Plan?

- Document describing a community's vision for how it wants to physically grow and develop in the near future (10 to 20 years)
- Provides guidance on land use, transportation, housing, economic development, environment, public facilities, parks, arts, and historic preservation
- Policy document for decision-making that informs zoning and budget decisions, i.e., the Capital Improvement Program (the five-year plan for physical improvements in the City – facilities, infrastructure, etc.)

VISION

In 2035, the City of Fairfax
has a strong, sustainable economy
that supports a vibrant 21st century community.

GUIDING PRINCIPLES

In 2035, Fairfax is a city with...

Land Use

...a close-knit community and a population that is diverse in its culture, demographics, and lifestyles, that capitalizes on its location in the center of the growing region and with easy access to the nation's capital.

...inviting neighborhoods, each with its own unique character.

Neighborhoods

Housing

...a choice of housing types that meet the needs of our community.

Economic Vitality

...an economy that cultivates and promotes business success and entrepreneurial opportunities for large, small, and independent businesses and capitalizes on national, regional and intellectual partnerships.

Commercial Corridors and Activity Centers

Photo Credit: Hord Coplan Macht

...flourishing centers of commercial and mixed-use activity that include an assortment of grocery stores, restaurants, cafes, entertainment venues, retail stores, offices, and housing.

Cultural Arts

...a thriving cultural arts program that supports a variety of special events, art spaces and performance venues.

Multimodal Transportation

...options for residents to easily, safely, and efficiently move within and between neighborhoods either by walking, bicycling, taking public transportation or driving.

Community Design and Historic Preservation

...architecture that contributes to a vibrant, creative place and complements our historic character.

Parks and Recreation

...inviting, well-maintained parks, trails, open spaces and multi-generational community centers.

Education

...world-class community schools and a best-in-class education from preschool to post-high school that prepares students to be productive, responsible members of society, capable of competing in the global economy and motivated to pursue life-long learning.

Sustainability Initiatives

...sustainable practices that preserve, conserve, reuse and recycle resources.

Natural Environment

...a healthy ecosystem of naturally flowing streams, native plants, wildlife, contiguous natural habitat areas, and a healthy tree population.

Government and Public Safety

...exceptional governmental, police and fire safety services.

Infrastructure and Utilities

...safe, well-maintained infrastructure and use of advanced technology.

Planning Process

Development of the Comprehensive Plan was based on a three-phase process beginning with information collection, followed by analysis and recommendations. Information collection included references to previous plans and studies that helped inform the Comprehensive Plan and input provided by members of the community, including residents, business owners, City Council, City boards and commissions, other stakeholders (George Mason University, Fairfax County, etc.), and City staff. During the information collection period, staff also developed the Fact Book, a summary of data on the City, from physical conditions to demographics and service analysis.

Based on the previous plans and studies referenced, input collected from the community, and data from the Fact Book, a series of goals and outcomes were developed for each of the content areas. These goals and outcomes were reviewed with the Planning Commission and City boards and commissions. The same process was followed to develop actions and metrics for the content areas. Goals, outcomes, actions and metrics for each content area encompass the recommendations of the Comprehensive Plan and provide the foundation for the overall document.

More specific data analysis was provided for the Land Use Strategies Guiding Principle, including a scenario analysis using Envision Tomorrow software. This provided a way to illustrate – with graphics and numbers – what the future could look like, given different development contexts, culminating in a public survey on potential development scenarios based on the results of the analysis. Along with the Scenario Analysis, survey results helped guide development of the Future Land Use Map.

Final revisions to the Comprehensive Plan were based on review by members of the community through public open houses, online forums, and Planning Commission and City Council meetings. The Comprehensive Plan was adopted by City Council on February 12, 2019 (R-19-03) after recommendation by the Planning Commission (PC-19-02).

The Multimodal Transportation Plan was prepared through a separate planning process parallel to this one, but with the intention of incorporating it into the Comprehensive Plan, with connections to land use, open space, housing, and economic development.

Community Outreach

Community outreach played a vital role in the development of the Comprehensive Plan. Early public involvement guided all aspects of the Comprehensive Plan including issue and opportunity identification, as well as development of the vision, goals, and objectives. Providing the opportunity for public input encourages citizens to be invested in the future of their community and helps ensure that recommendations developed as part of the Comprehensive Plan are implemented and sustained over time.

Staff employed a diverse set of traditional and non-traditional outreach tools and strategies to ensure all stakeholders had an opportunity to contribute throughout the process.

Community Surveys

The Center for Social Science Research (CSSR) at George Mason University worked with City staff to develop and administer a Community Survey to ask members of the community for feedback on issues of interest to formulate a vision, goals, and objectives for the Comprehensive Plan.

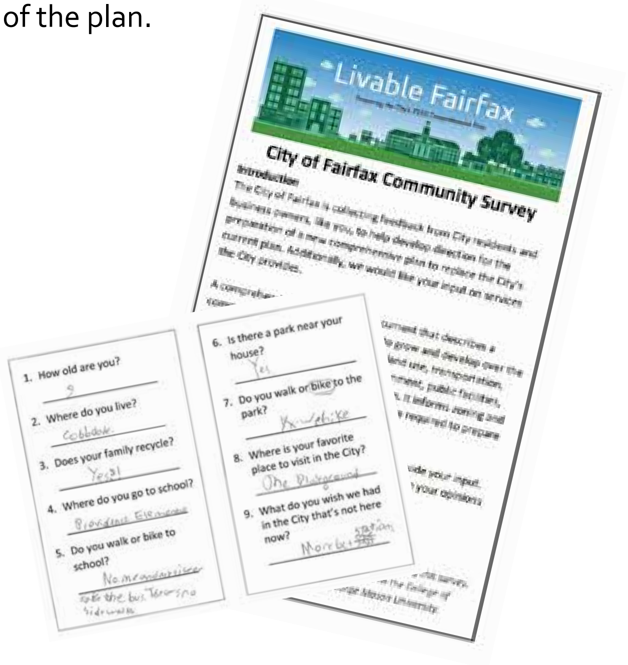
City residents and business owners were notified of the survey via postcards sent out in March 2016, which provided directions on how to take an online survey. Paper copies were also made available to those that requested them.

An overview of the results was presented at a public meeting on June 6 at the Sherwood Community Center, as well as at meetings of the City Council on June 14 and the Planning Commission on June 27, which were televised on Cityscreen-12. The full document detailing the process and analyzing the results was released on June 30, 2016.

CSSR sent out 9,943 postcards to City residences and businesses, and followed up with reminder calls. A total of 863 surveys were completed.

City staff also prepared a ten-question Kids' Survey that was distributed at Parks and Recreation events and to students at Daniels Run Elementary School, Providence Elementary School, Lanier Middle School, and Saint Leo the Great Catholic School. A total of 620 Kids' Surveys were completed. The ages of the students that completed the survey ranged from seven to thirteen.

Online Google surveys were also used to collect feedback on proposed future development scenarios, the future land use map, and drafts of the plan.



Livable Fairfax

City of Fairfax Community Survey

Introduction

The City of Fairfax is collecting feedback from City residents and business owners, like you, to help develop direction for the preparation of a new comprehensive plan to replace the City's current plan. Additionally, we would like your input on services the City provides.

1. How old are you?
9
2. Where do you live?
[illegible]
3. Does your family recycle?
Yes!
4. Where do you go to school?
Providence Elementary
5. Do you walk or bike to school?
[illegible]

6. Is there a park near your house?
Yes
7. Do you walk or bike to the park?
Walk/bike
8. Where is your favorite place to visit in the City?
The Playground
9. What do you wish we had in the City that's not here now?
[illegible]

Website and Social Media

Information about the Comprehensive Plan process, meetings, technical information, and opportunities to provide feedback were made available on the City's website. City staff created a page within the website devoted to the Comprehensive Plan, www.fairfaxva.gov/livablefairfax.

In addition to the website, City staff promoted meetings and information about the Comprehensive Plan through Facebook and Twitter. One of the many benefits of using social media for outreach is that it allowed staff to track how many people viewed what was shared and which posts performed the best.

Several of the presentations were shared live on Facebook and posted on the City's YouTube channel. Staff also created YouTube videos to advertise the community survey, which were shown on the City's government access television station, Cityscreen-12. Staff also created a welcome video for an open house to explain the comprehensive plan process.

Printed Media

To ensure all members of the community were aware of the comprehensive plan process and opportunities to participate, articles were regularly included in the CityScene, the City's newsletter published monthly and mailed to all City businesses and residents. Seventeen articles related to the Comprehensive Plan have been posted in the CityScene since April 2016.

To reach an even broader audience for targeted events, ads were purchased in regional newspapers, The Fairfax Times and Fairfax Connection.

Other printed communications include postcards mailed to all residents and businesses and informational fliers handed out at City events and displayed at City facilities.

CityScene Article

City Seeks Input on Vision for 2035 *Comprehensive Plan*

The City of Fairfax seeks community feedback on the draft vision statement for the 2035 *Comprehensive Plan*, culminating with a public comment period during the September 26 Planning Commission meeting. The *Comprehensive Plan* vision statement will provide guidance on how the city should grow and develop during the next 20 years. Information: 703-385-7930.

The draft vision statement is a series of statements related to each of the proposed content areas in the 2035 *Comprehensive Plan*: Land Use; Neighborhoods; Commercial Centers and Redevelopment Areas; Housing; Community Design and Historic Preservation; Transportation, Mobility and Connectivity; Natural Environment; Sustainability Initiatives; Business Attraction, Retention and Promotion; Education; Parks, Recreation and Cultural Arts; Public Safety; Infrastructure and Utilities; and Implementation Strategy and Performance Metrics.

The vision statement is intended to describe Fairfax's values, aspirations and shared image of what the community as a whole

continued on page [illegible]

Public Meetings

The Planning Commission began discussions on preparing the Comprehensive Plan on Monday, October 26, 2015. Members of the public were encouraged to attend any of the regularly scheduled Planning Commission meetings to share thoughts or concerns about the Comprehensive Plan, even if it was not explicitly being discussed as part of the agenda.

In addition to presentations to the Planning Commission, staff presented briefings and solicited feedback at the regular meetings of other boards and commissions including the City of Fairfax School Board, Board of Architectural Review, Community Appearance Committee, Commission on the Arts, Fairfax Renaissance Housing Corporation, Parks and Recreation Advisory Board, Historic Fairfax City Inc., Economic Development Authority, Commission for Women, and the Environmental Sustainability Committee. The Planning Commission also hosted joint work sessions at The Civil War Interpretive Center at Historic Blenheim with the various boards and commissions to discuss specific topics of interest, and joint work sessions with the City Council.

Community Events

Open Houses

In addition to regularly scheduled public meetings, staff hosted many open houses at locations throughout the City, including the Stacy C. Sherwood Community Center, Old Town Hall, Lanier Middle School, and City Hall.

Panel Discussion: Emerging Trends Shaping our Community

The City gathered a panel of experts and a moderator to talk about trends in housing, economic vitality, and community development as part of the effort to prepare the Comprehensive Plan. The discussion took place on Saturday, September 16, 2017 at the Sherwood Community Center.

The expert panel included Thomas Maskey, Jr., Principal of Potomac Development Group, who has dedicated 35 years to the development of retail shopping centers and is responsible for over 8 million square feet of development in the Washington, D.C. region, including landmark projects at Downtown Silver Spring, Washingtonian Center, Milestone Center, Fair Lakes Center, Fairfax Corner, Virginia Gateway, and National Harbor; Donald W. Knutson, President of the Knutson Companies, whose development projects include Downtown Brambleton and Crescent Place in Leesburg; and Michelle Krocker, Executive Director of the Northern Virginia Affordable Housing Alliance. The discussion was moderated by Lisa Nisenson, an affiliated researcher with George Mason University's Center for Real Estate Entrepreneurship who leads Alta Planning + Design's New Mobility Group.

City Events

City staff attended other events to engage and inform the public about the comprehensive planning process. Those events included:

- Chocolate Lovers Festival
- Scavenger Hunt on July 4
- Fall Festival
- Easter Egg Hunt
- Community Farmers Market
- Rock the Block
- Bike to Work Day

Schools

Staff worked with the City of Fairfax School Board, Superintendent, and School principals to involve the City's students in the comprehensive planning process early and often. In addition to the Kids' Survey that was covered previously, staff made several presentations and had discussions with the students at Daniels Run Elementary School, Providence Elementary School, Lanier Middle School, Fairfax High School, and George Mason University. At the end of the 2017-2018 school year, representatives from the City's schools and from George Mason University presented their thoughts on the draft goals to the Planning Commission at public meetings. All City school students grades K through 12 were also encouraged to share their vision of Fairfax in 2035 through an art contest.

Statutory Requirements

The comprehensive plan serves as a locality's primary decision-making document for land use and development. It establishes the intent and goals of the community to influence development in both the private and public sectors and should be relied upon as an initial source that directs users to appropriate reports or strategic plans where necessary.

State law governing the development of a comprehensive plan (Section 15.2-2223 of the Code of Virginia) requires every county, city, and town to adopt a plan for the physical development of the territory within its jurisdiction. The Code further requires that comprehensive plans be reviewed every five years to ensure that the plan is responsive to current circumstances and that its goals continue to be supported by the citizenry; however, the City should consistently be prepared to make interim changes to the plan because necessary changes can result from the completion of strategic plans or changes to other City policies. The Planning Commission is tasked with preparing the plan and recommending it to the City Council for adoption.

The Code of Virginia includes both required and optional content for comprehensive plans. Required provisions relate to issues that are fundamental to the plan itself, such as long-range recommendations for development and methods of implementation. In order to address what are perceived as critical issues statewide, the Code of Virginia specifically requires that all comprehensive plans address both affordable housing and transportation infrastructure.

Authority

While the Comprehensive Plan communicates a vision for future land use and development in the City, the zoning ordinance provides the regulatory mechanism to ensure that new development and changes in land uses are consistent with this vision. Section 15.2-2232 of the Virginia Code states that a comprehensive plan "shall control the general or approximate location, character and extent of each feature shown on the plan." Consistency with the Comprehensive Plan is one of the approval considerations for zoning text amendments, zoning map amendments, special use permits, and special exceptions to the zoning ordinance.

Where any new development is proposed that requires a land use action not consistent with the Comprehensive Plan, the applicant should request a modification to the Comprehensive Plan as well, in order to keep the two documents consistent. Such modifications must be reviewed by the Planning Commission and approved by City Council. This provides flexibility for the Comprehensive Plan to adjust to market conditions and design trends, but ensures that any such changes are reviewed and considered within the greater context of the City's vision.

In addition to guiding decisions on land use and development, the Comprehensive Plan includes guidance on investment for transportation and infrastructure. Section 15.2-2232 of the Code of Virginia requires that no public facilities – such as streets, parks, utilities, or public buildings – shall be approved or constructed unless deemed to be in accordance with the Comprehensive Plan by the Planning Commission. The Comprehensive Plan should be used as a reference for all land use and budget decisions. Any budget item in the Capital Improvement Plan should support at least one of the goals of the Comprehensive Plan.

Implementation

In addition to providing guidance on land use and budget decisions, the Comprehensive Plan includes numerous actions to be taken by the City or its affiliates in order to achieve the vision of the plan. A separate Implementation Guide has been developed in support of the Comprehensive Plan to track progress on implementation of these actions. This is accomplished through an implementation matrix that provides the lead responsibility, timeframe for initiation and timeframe for completion of each action. Where appropriate, performance metrics are listed for goals to provide a mechanism for determining whether the implemented actions are achieving the desired result.

The Implementation Guide is a separate document from the Comprehensive Plan because it is expected to be updated regularly as progress is made toward achieving each action. The lead responsibilities, timeframes and performance metrics are also subject to change as more information is obtained in support of specific actions.

City of Fairfax

2035 Comprehensive Plan

IMPLEMENTATION GUIDE

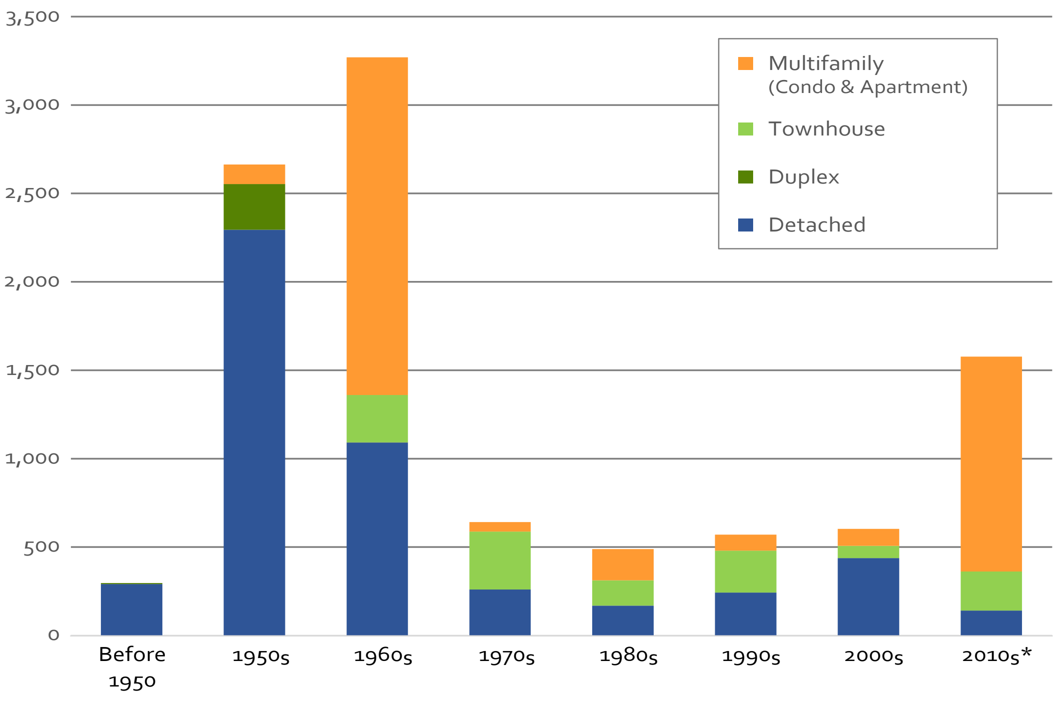
November 2018

2 Land Use

The City's residential neighborhoods are distinct in housing types, age, and character. While much of the land area of the City is encompassed by single-family neighborhoods initially developed in the 1950s and 1960s, there is also a significant amount of multifamily neighborhoods built primarily during the 1960s. Since then, the City has continued to accommodate residential development on smaller sites, including single-family homes, townhomes, and multifamily residences.

As developable land has become scarcer, new residential development has been more dependent on infill and redevelopment sites. Developers are offering higher-end products and seeking greater densities to offset the higher land values and development costs associated with redevelopment sites. In addition, some homes in existing single-family neighborhoods are being significantly renovated, expanded, or redeveloped.

FIGURE 2 HOUSING UNITS BY TYPE AND DECADE BUILT



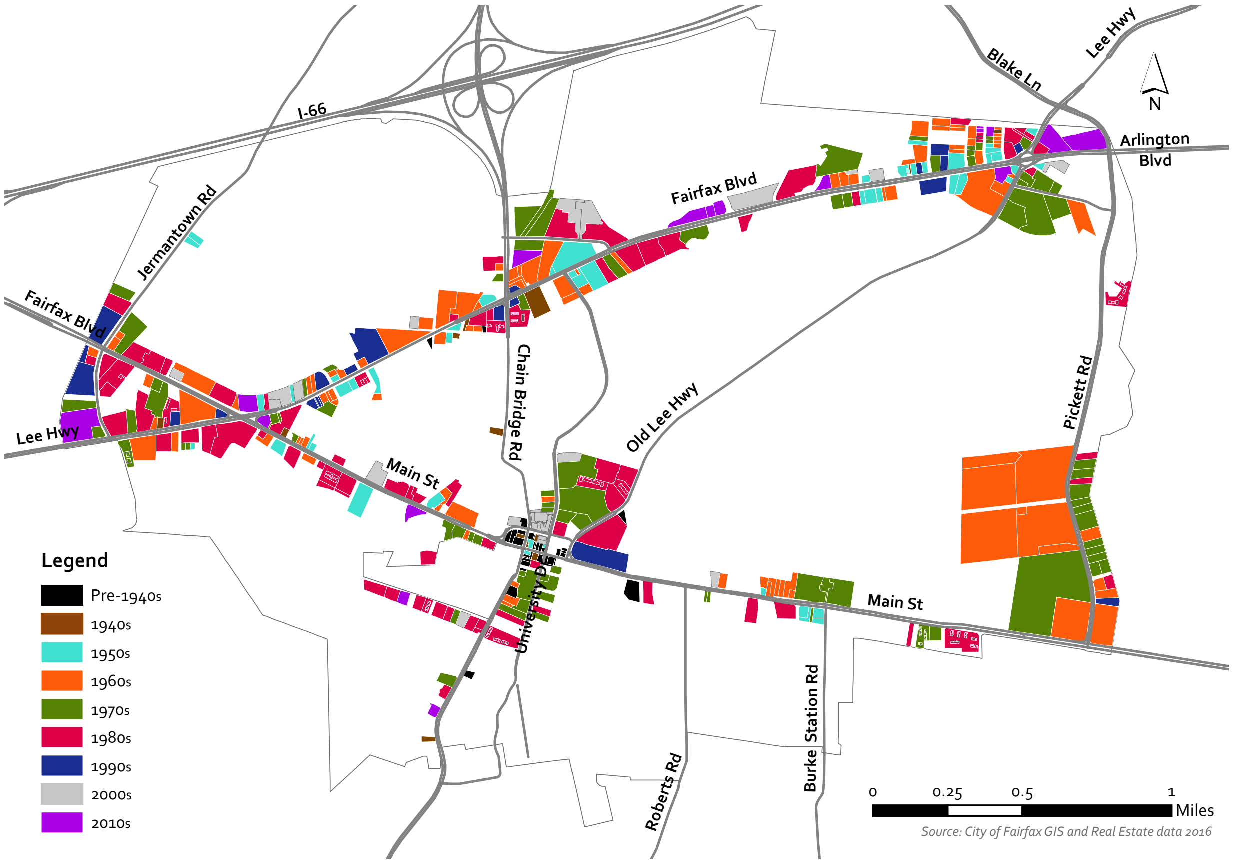
Note: Includes housing units existing and approved as of January, 2018. "2010s" includes housing units under construction, as well as projects that have been approved by City Council, but for which construction has not begun.

Source: Fairfax City Real Estate Assessments

Commercial uses in the City have historically benefited from its location at a crossroads of several regional transportation routes. While most neighborhoods in the City were established in the 1950s and 1960s, heavy commercial growth continued through the 1980s. This was fueled by continuing regional population growth and by general market trends that supported extensive office and retail growth. There has been less commercial growth in recent years as the commercial real estate market has changed and new development in surrounding areas of Fairfax County has added competition to the local market. Despite this, the City has experienced some redevelopment of older commercial properties, and recently approved mixed-use projects indicate that unsubsidized redevelopment remains feasible.

The Land Use Chapter encompasses the following Guiding Principles: Land Use Strategies, Neighborhoods, Commercial Corridors and Activity Centers, Housing, and Community Design and Historic Preservation.

FIGURE 3 COMMERCIAL AND INDUSTRIAL BUILDING AGE BY DECADE BUILT



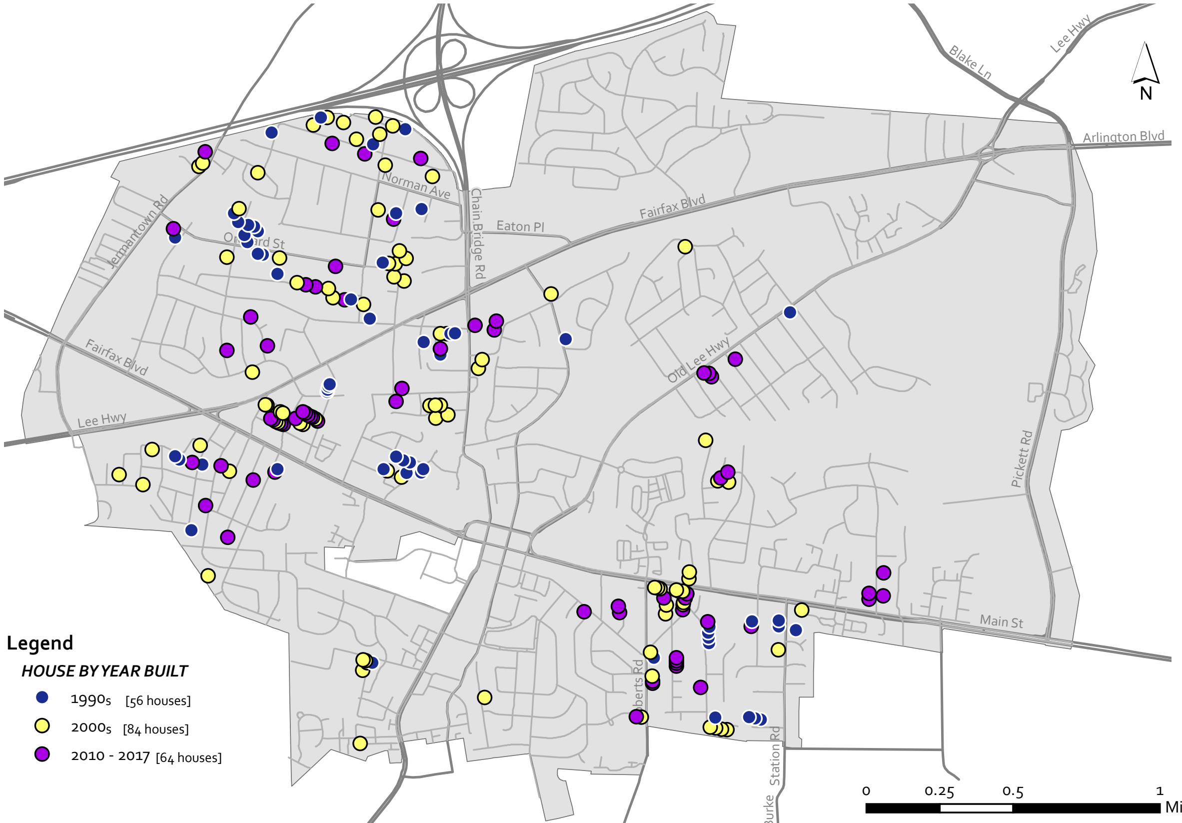
Source: City of Fairfax GIS and Real Estate data 2016

Opportunities and Challenges

Residential improvements

With an aging housing stock, there is consistent pressure for upgrading or replacing existing homes. While this can help keep neighborhoods current with consumer desires and housing preferences, it can also impact the character of existing neighborhoods.

FIGURE 4 INFILL HOUSING BY DECADE BUILT



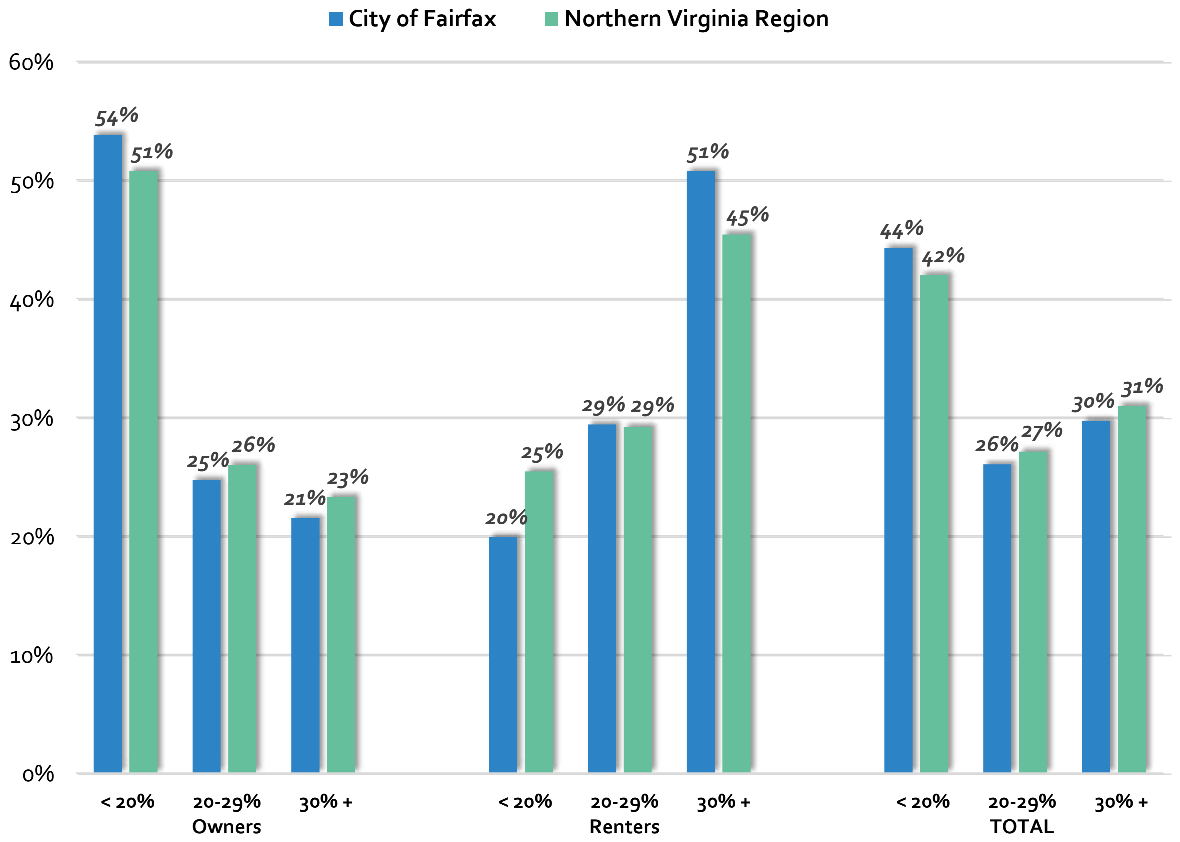
Source: City of Fairfax GIS and Real Estate data 2017

Housing affordability

As the regional economy has grown, increases in housing values have outpaced increases in income. As a result, there are few residential units in the City that are affordable to lower income households. About one-third of City households spend more than 30% of their income on housing costs, as shown in Figure 5 , which also highlights that almost half of renters reside in units that are potentially cost-burdensome.

While many of the apartments that were built in the 1960s are more affordable than newer apartments in the surrounding areas of Fairfax County, their asking rents are not achievable to a full range of incomes. There is also no guarantee that these apartment complexes will remain as "naturally occurring affordable housing." Redevelopments of two complexes have been approved since 2013, and there has been communicated interest in redevelopment of additional complexes.

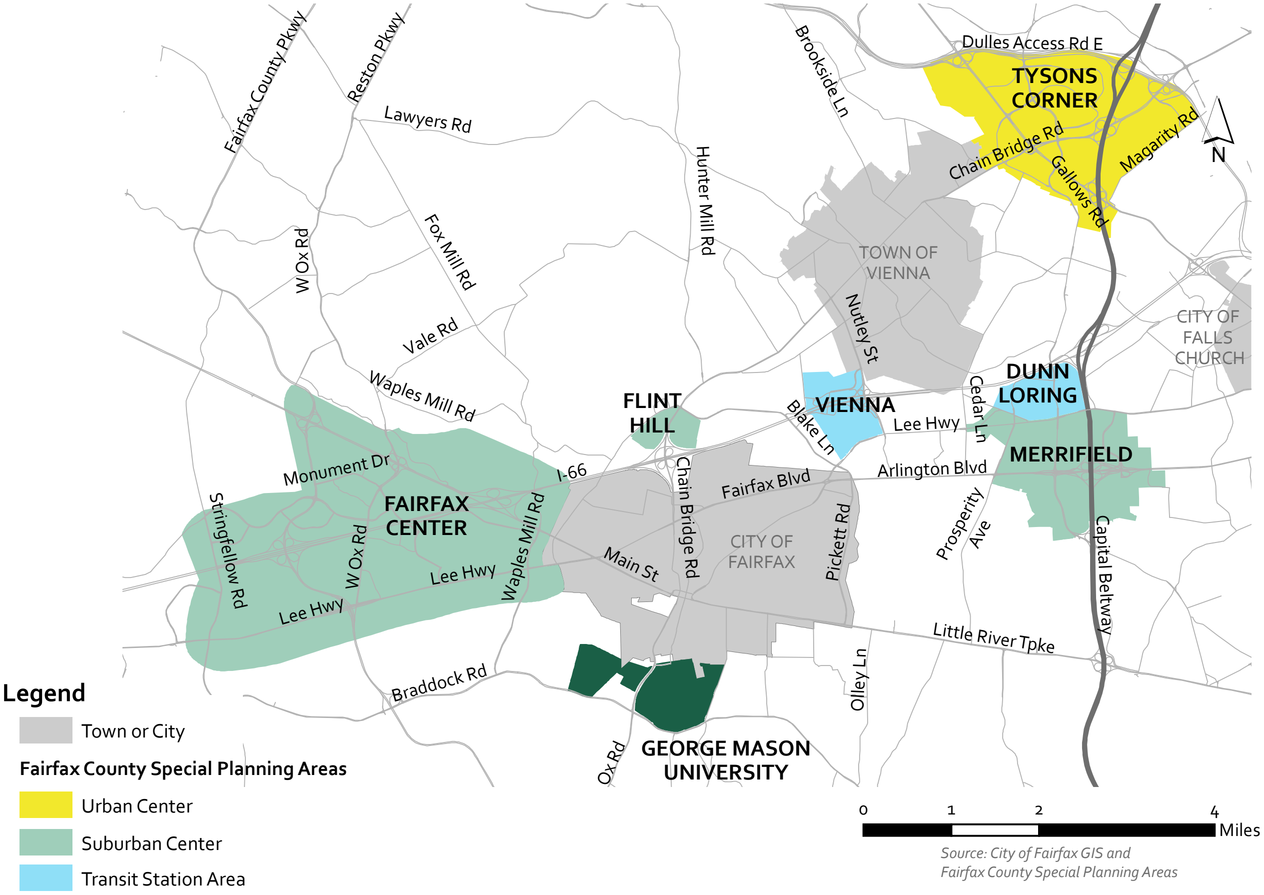
FIGURE 5 HOUSING COSTS AS A PERCENTAGE OF HOUSEHOLD INCOME BY TENURE AND IN TOTAL



Source: US Census ACS, 2012-16

Note: The Department of Housing and Urban Development defines cost-burdened families as those who pay more than 30% of their income for housing and may have difficulty affording necessities such as food, clothing, transportation, and medical care.

FIGURE 6 NEARBY MAJOR MIXED-USE CENTERS

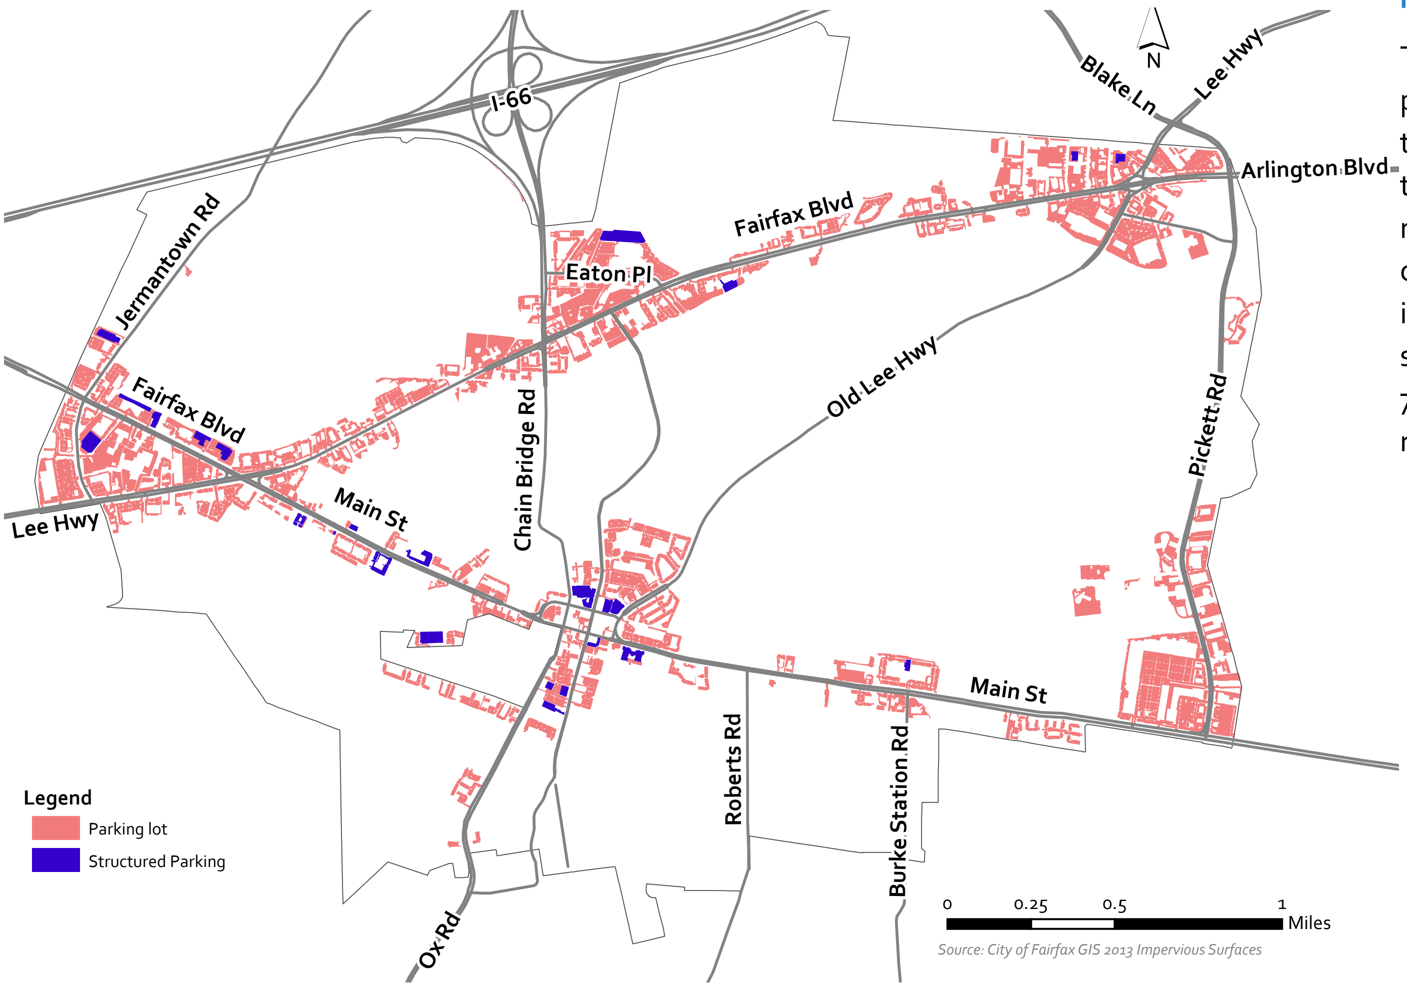


Source: City of Fairfax GIS and Fairfax County Special Planning Areas

Commercial market changes

Long-term shifts in retail and office markets have added uncertainty to the continued marketability of some commercial properties in the City. In addition, new development to the east and west of the City absorbs potential demand for destination commercial offerings, and the City's Commercial Corridors and Activity Centers currently lack many popular types of retail and entertainment establishments. This trend could continue with the Fairfax County Comprehensive Plan encouraging new commercial and mixed-use development in designated Special Planning Areas proximate to the City, as shown in Figure 6.

FIGURE 7 COMMERCIAL AND INDUSTRIAL SURFACE AND STRUCTURED PARKING



Source: City of Fairfax GIS 2013 Impervious Surfaces

Commercial redevelopment potential

There are numerous commercial properties throughout the City with the potential for redevelopment or to reposition themselves for current market demands. Characteristics of potential redevelopment sites include significant amounts of surface parking, as shown in Figure 7, and low building-to-land value ratios.

Land Use Strategies

Guiding Principle:

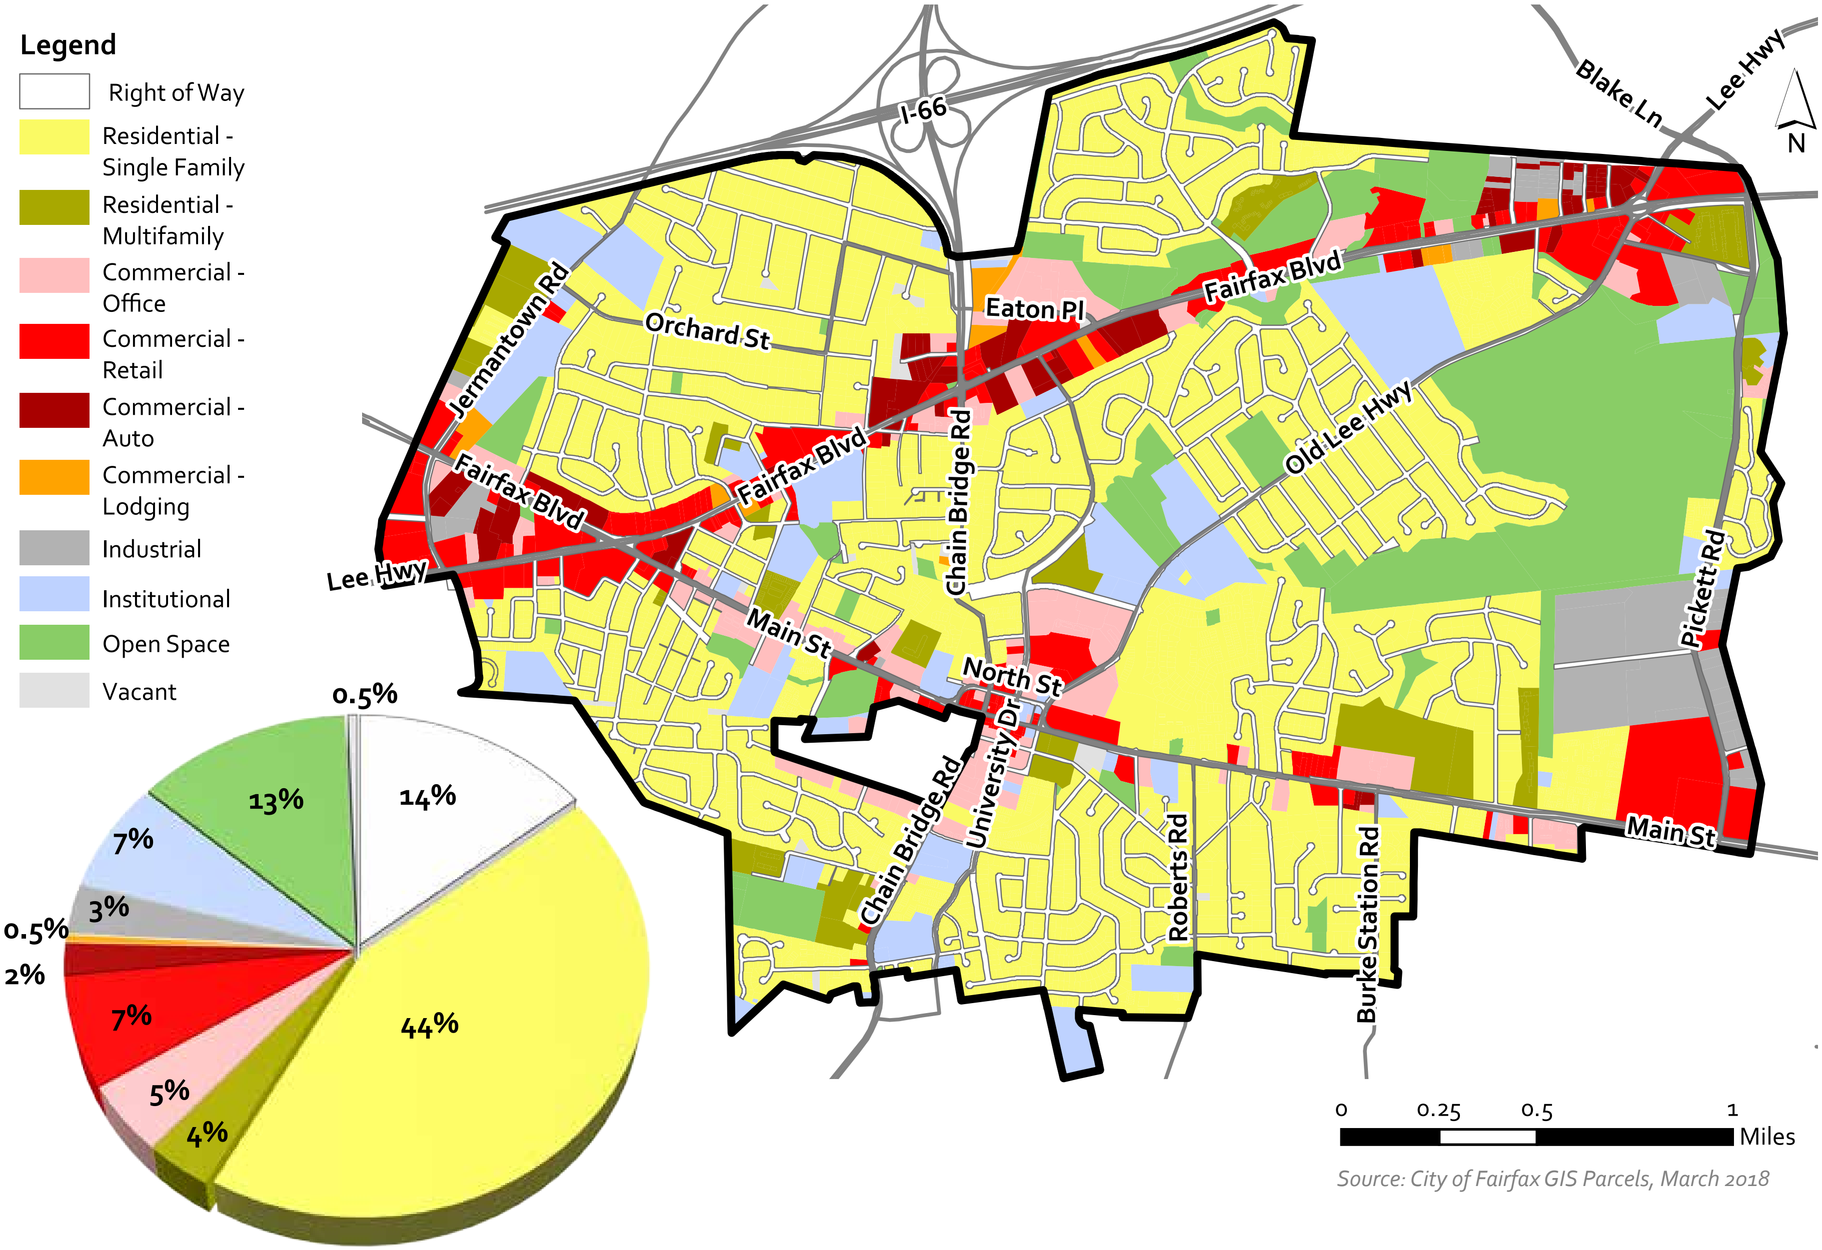
In 2035, Fairfax is a city with...
a close-knit community and a
population that is diverse in its
culture, demographics, and lifestyles,
that capitalizes on its location in the
center of the growing region and with
easy access to the nation's capital.

More than 200 years of growth and development have formed Fairfax into a unique small city with development patterns and building styles that span multiple eras. A variety of land uses are distributed throughout the City to complement and support each other. Existing land uses and a summary of land use coverage areas in the City are shown in Figure 8. The City, however, continues to evolve to accommodate changing needs of residents and businesses. The Land Use Strategies Guiding Principle supports measures to manage growth in such a way to allow the City to evolve while maintaining the unique character that has taken decades to build.

Managing development depends heavily on the Comprehensive Plan Future Land Use Map (shown on p. 27). This map, which is supported by Goal 1 of this Guiding Principle, illustrates the desired land uses in the City organized by Place Types, which are locations within the City that are intended to share similar physical characteristics and have both zoning and "Link + Place" street types (as defined under Multimodal Transportation Goal 2) that are consistent with these characteristics.

Rather than show land uses as they exist today, the Future Land Use Map shows how the Comprehensive Plan foresees appropriate development over the next 15 to 20 years. The Place Types shown on the map communicate the types of uses and character of development envisioned throughout the City.

FIGURE 8   EXISTING LAND USE MAP



Source: City of Fairfax GIS Parcels, March 2018

Land Use Strategies

Goal 1

Ensure development is complementary.

OUTCOME LU1.1:	The Future Land Use Map is used in conjunction with other recommendations from the Comprehensive Plan to guide development throughout the City.
ACTION LU1.1.1	Maintain and update, as necessary, a Future Land Use Map that provides for a balanced mix of development types and addresses current and future needs of the City.
ACTION LU1.1.2	Use the Future Land Use Map (Figure 9), Place Types, and general text from the Comprehensive Plan as a guide when considering new development throughout the City.
ACTION LU1.1.3	Refer to Parcel Specific Recommendation, as detailed on pages 39-44 for potential alternative uses. Amend the Comprehensive Plan to provide additional Parcel Specific Recommendations as appropriate.
OUTCOME LU1.2:	Zoning regulations that accommodate high-quality design and development practices.
ACTION LU1.2.1	Consistently review the Zoning and Subdivision Ordinances and the Zoning Map to ensure they are able to support the Future Land Use Map and other guidance of the Comprehensive Plan.

While the 6.3 square mile City is primarily built out, leaving few opportunities for large new development, there is consistent pressure for the City's variety of land use types to adapt to environmental, economic and cultural demands. This means that some flexibility must be provided with a balanced mix of development types that accommodate adaptations without negatively impacting the existing community. New development and redevelopment should be complementary to surrounding areas and contribute to an attractive, accessible, and economically viable place.

This can be managed by using the Future Land Use Map in conjunction with recommendations of this Comprehensive Plan and the requirements of the Zoning and Subdivision Ordinances to guide development within the City. While the Future Land Use Map communicates the most appropriate types of uses and character of development, the Zoning and Subdivision Ordinances provide the regulatory measures to accommodate such development. The Ordinances may occasionally be amended to furnish necessary changes for various land uses.

Future Land Use Map

The Future Land Use Map is provided in Figure 9, with specific guidance on development for each of the Place Types identified on the map provided on the following pages. Additional guidance is provided for certain specific sites beginning on page 38. When using the Future Land Use Map, consideration should also be given to the other Guiding Principles of this chapter, depending on site location and types of uses.

The following information is provided for each of the Place Types:

1. Definition: A brief description of the types of uses and structures the Place Type applies to.
2. Zoning Districts: A list of Zoning Districts that are most likely to accommodate the uses and structures provided in the definition for the Place Types.
3. Link + Place Street Types: A list of the types of streets (as provided in the Multimodal Transportation Chapter) where the Place Type is most appropriate.
4. Physical Characteristics: A description of general preferences for site design and building placement.
5. Concept diagrams and photos: Provided to show typical development patterns for each Place Type.

Most new development is anticipated to occur in areas designated as an Activity Center Place Type. There are five areas of the City that have this Place Type designation: Old Town Fairfax, Northfax, Kamp Washington, Fairfax Circle, and Pickett & Main. The following additional guidance is provided for the Activity Center Place Type:

6. Use Characteristics: Since multiple uses can be accommodated in the Activity Center Place Type, separate physical characteristics are provided for various uses to ensure that new development provides a consistent character in spite of varying uses.
7. Residential Limitations: As a more detailed analysis of specific development scenarios is not included in this plan, limitations on the number of residential units that can be absorbed in each Activity Center are provided. This is intended to communicate to developers and the general public that unrestrained increases in residential development will not be considered in these areas of the City.

Small Area Plans

Small Area Plans are an opportunity to conduct detailed analyses of concentrated geographic areas of the City and provide more specific recommendations on issues such as land use and transportation than that provided in the Comprehensive Plan. Once approved, Small Area Plans serve as the primary source for guidance on development in the respective Activity Centers. As supported by Land Use Action CCAC2.3.5, Small Area Plans are proposed for each of the five Activity Centers. As each of the Small Area Plans is completed and adopted, the recommendations from that plan will supersede the Activity Center Place Type recommendations from the Future Land Use Map. This may include the guidance provided for Physical Characteristics, appropriate Street Types, Use Characteristics, and Residential Limitations.

In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. While a brief description of these two Activity Centers is provided in the Activity Center Place Type description, please refer to the respective Small Area Plans for specific guidance in those two areas. The general guidance in the Activity Center Place Type description applies to Kamp Washington, Fairfax Circle, and Pickett & Main until Small Area Plans are adopted for those Activity Centers.

Adopted February 12, 2019
Revised June 9, 2020

SINGLE-FAMILY DETACHED NEIGHBORHOOD

Definition

The Single-Family Detached Neighborhood Place Type, identified in yellow on the Future Land Use Map, applies to neighborhoods that are primarily developed with single-family detached homes. Accessory uses associated with these residences are permitted, such as home-based businesses and accessory dwelling units.

Physical Characteristics

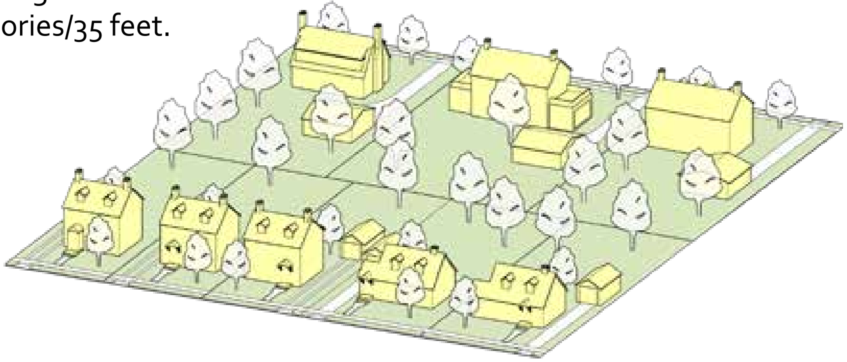
New development of single-family detached homes in an existing residential neighborhood should reflect the character of that neighborhood by providing similar lot widths and building setbacks as surrounding properties. In order to support shared stormwater management facilities and usable open space, narrower lot widths and building setbacks may be considered where a new development provides a similar overall density to the surrounding neighborhood. New development is considered to be within an existing neighborhood where any vehicular access is taken from an existing Limited Connection Residential street or a Neighborhood Circulator. New residential units on all lots that are adjacent to those streets should be oriented with the front of the structure facing that street, even where vehicular access is taken from a new public or private street. Predicated on the underlying zoning district, the Single-Family Detached Neighborhood Place Type supports up to 7 dwelling units per acre and a maximum height of 3 stories/35 feet.

Zoning Districts

- RL, Residential Low
- RM, Residential Medium
- RH, Residential High
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Some existing Single-Family Detached Neighborhoods are present along Avenues and Boulevards, such as portions of Chain Bridge Road, Old Lee Highway, and Main Street.



TOWNHOUSE/SINGLE-FAMILY ATTACHED NEIGHBORHOOD

Definition

The Townhouse/Single-Family Attached Neighborhood Place Type, identified in orange on the Future Land Use Map, applies to neighborhoods that are primarily developed with townhouses and single-family attached or duplex housing. Single-family detached uses may be considered in the Townhouse/Single-Family Attached Neighborhood Place Type when developed in conjunction with Townhouse/Single-Family Attached Neighborhood uses.

Physical Characteristics

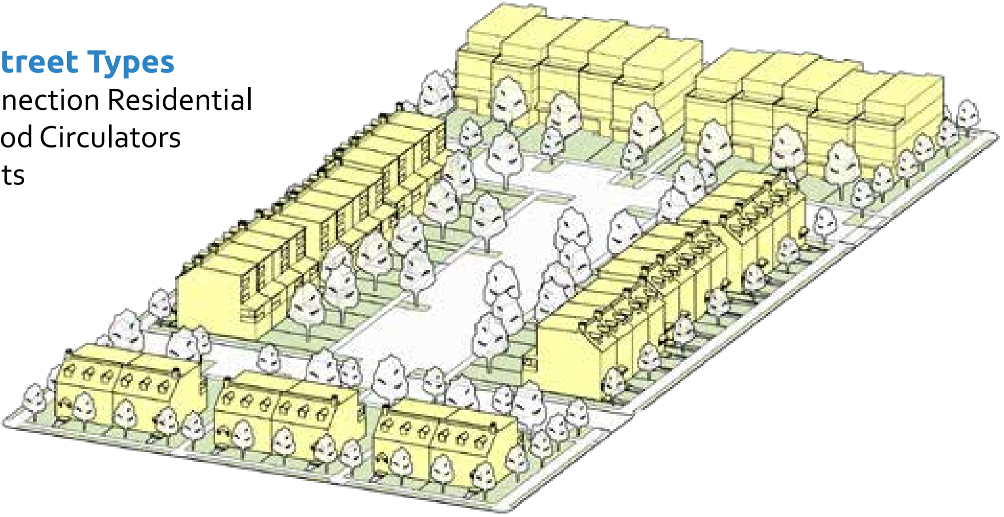
The design and layout of new Townhouse and Single-Family Attached Neighborhood developments should reflect the location of the development within the City. In particular, development that is adjacent to Single-Family Detached Neighborhoods within City limits, or to neighborhoods zoned primarily for single-family detached residences within adjacent jurisdictions, should have a maximum of three floors and provide landscaped setbacks for that portion of the site that is adjacent to any such neighborhood. Otherwise, a building height of up to four stories or 45 feet may be considered. Predicated on the underlying zoning district, the Townhouse/Single-Family Attached Neighborhood Place Type supports up to 12 dwelling units per acre.

Zoning Districts

- RT, Residential Townhouse
- RT-6, Residential Townhouse
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Active Streets
- Avenues
- Boulevards



MULTIFAMILY NEIGHBORHOOD

Definition

The Multifamily Neighborhood Place Type, identified in brown in the Future Land Use Map, applies to neighborhoods that are primarily developed with multifamily apartment or multifamily condominium housing. Townhouse/Single-Family Attached Neighborhood uses and Single-Family Detached Neighborhood uses may be considered in the Multifamily Neighborhood Place Type when developed in conjunction with Multifamily Neighborhood uses.

Physical Characteristics

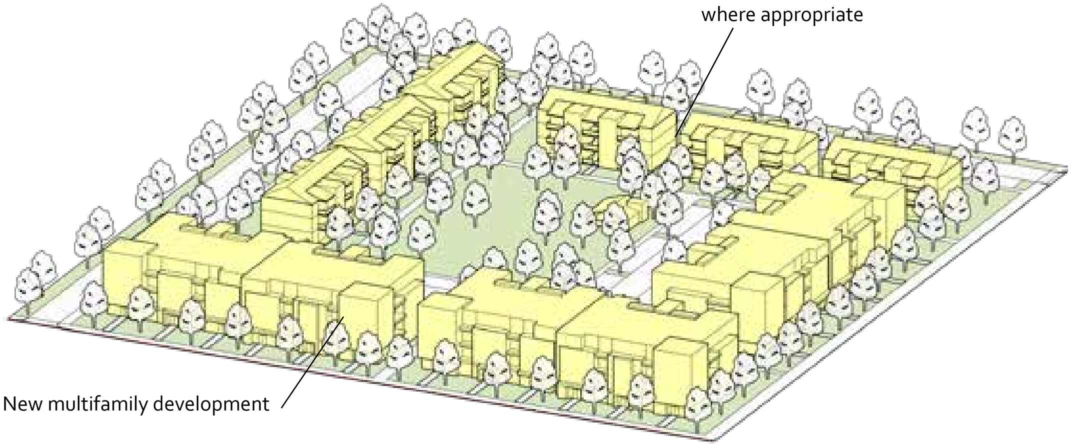
The design and layout of new Multifamily Neighborhood developments should reflect the location of the development within the City. Development that is adjacent to Single-Family Detached or Townhouse/Single-Family Attached neighborhoods within City limits, or to neighborhoods zoned primarily for single-family detached or single-family attached residences within adjacent jurisdictions, should have a maximum of three floors and provide landscaped setbacks for portions of the site that are adjacent to any such uses. Otherwise, a building height of up to four stories or 45 feet may be considered. In order to retain the relative affordability available in many existing multifamily structures, redevelopment of existing multifamily sites within Multifamily Neighborhood land use areas, where additional density is permitted by the Zoning Ordinance, should consider accommodating existing multifamily structures. Predicated on the underlying zoning district, the Multifamily Neighborhood Place Type supports up to 20 dwelling units per acre and a maximum height of 4 stories/45 feet.

Zoning Districts

- RMF, Multifamily
- PD-R, Planned Development Residential

Link + Place Street Types

- Limited Connection Residential
- Neighborhood Circulators
- Active Streets
- Avenues
- Boulevards



COMMERCIAL CORRIDOR

Definition

The Commercial Corridor Place Type, identified in red on the Future Land Use Map, includes a mix of retail, restaurant, service, medical, office, and other commercial uses. Limited manufacturing and other light industrial uses may also be considered. Heavy industrial uses should not be added or expanded beyond areas where they currently exist (such as the tank farm on Pickett Road). Residential uses are not recommended in Commercial Corridors. Commercial areas should accommodate access via a variety of transportation modes and be accessible to adjacent neighborhoods via pedestrian and bicycling facilities.

Physical Characteristics

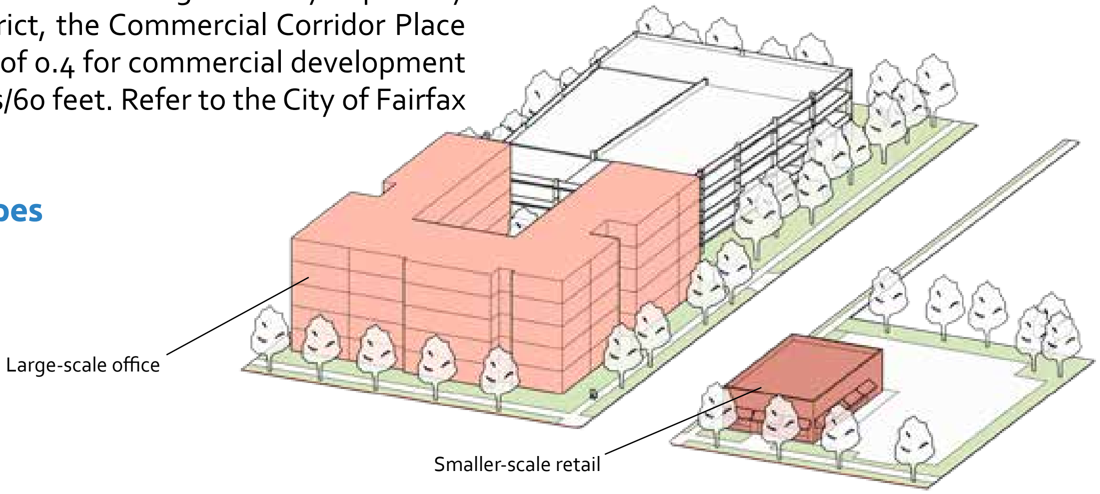
Commercial Corridor Place Types can accommodate a variety of buildings from small footprint retail buildings to multi-story office buildings. The desired orientation and placement of buildings on a Commercial Corridor site is primarily dependent on the adjacent Street Type. For sites located along Commercial Mains, buildings should have similar setbacks and building orientation as recommended for the nearby Activity Centers. Parking is encouraged in above-ground structures or underground, should be provided to the side or rear of buildings, and should be screened from view from the right-of-way by building mass or landscaping. For sites located along Boulevards or other street types, buildings should be located near front property lines with parking provided to the side or rear. Direct pedestrian access should be provided from the sidewalk in the right-of-way to primary building entrances. Predicated on the underlying zoning district, the Commercial Corridor Place Type supports a density of a minimum Floor Area Ratio (FAR) of 0.4 for commercial development and a maximum building height of 3 stories/35 feet to 5 stories/60 feet. Refer to the City of Fairfax Design Guidelines for more specific guidance on site design.

Zoning Districts

- CL, Commercial Limited
- CO, Commercial Office
- CR, Commercial Retail
- CG, Commercial General
- IL, Industrial Light
- IH, Industrial Heavy
- PD-C, Planned Development Commercial
- PD-I, Planned Development Industrial

Link + Place Street Types

- Boulevards
- Commercial Mains



ACTIVITY CENTER

Definition

The Activity Center Place Type, identified in purple on the Future Land Use Map, applies to locations in the City where pedestrian-oriented, mixed-use development is strongly encouraged. (Mixed-use development is pedestrian-oriented development that allows multiple activities to take place by layering compatible land uses, public amenities, and active streets accommodating multimodal transportation, and community-serving commercial.) Uses should be integrated as a mix of commercial uses, multifamily housing, and townhouses, either in the same building (i.e., vertical mixed-use) or as a combination of single-use buildings featuring a range of complementary uses within the Activity Center (i.e., horizontal mixed-use).

Physical Characteristics

Activity Centers can accommodate a variety of building types based on the different uses permitted and varying characteristics among individual Activity Centers. Recommended physical characteristics for specific uses are provided under Use Characteristics (p. 33) and more specific recommendations are provided for the Old Town Fairfax and Northfax Activity Centers on the following pages. The Comprehensive Plan also recommends Small Area Plans be developed for each of the City's five Activity Centers. As each of these plans is completed and adopted, the recommendations will supersede the pre-existing guidance of this Comprehensive Plan.

In general, new development in Activity Centers should support a connected street network as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan; provide an improved streetscape and pedestrian connections to surrounding uses, including links to the existing pedestrian network; and include inviting public and/or private open spaces. Parking should be provided in structured or below-grade facilities where reasonable.

Development in Activity Centers must meet the Code of Virginia definition for an Urban Development Area (Virginia Code § 15.2-2223.1) and follow the recommendations for Private Site Design and Elements in the applicable district of the City of Fairfax Design Guidelines. Predicated on the underlying zoning district, the Activity Center Place Type supports a density of a minimum FAR of 0.4; at least six townhouses or at least 12 multifamily dwelling units per acre; or any proportional combination of residential and commercial densities with building heights predominantly five stories or less, unless otherwise specified in an adopted Small Area Plan.

Photo Credit: Hord Coplan Macht

ACTIVITY CENTER (con't)

Use Characteristics

Office: Office uses are acceptable as components of mixed-use buildings or as stand-alone buildings.

Retail: Retail uses may be provided on the ground floor of mixed-use buildings, as stand-alone buildings, or on upper floors of buildings where larger tenant floor area requirements would detract from an active presence on the first floor. Retail uses are preferred along Commercial Mains, except where indicated otherwise in adopted Small Area Plans, but may be provided at other locations within an Activity Center.

Hotel: Hotels are acceptable as components of mixed-use buildings or as stand-alone buildings. Hotels are particularly encouraged in high visibility locations along Commercial Mains and at key intersections, or as may otherwise be identified in adopted Small Area Plans.

Public, Civic, and Institutional: Public, civic and institutional uses that are allowed by special use permit in commercial districts in the Zoning Ordinance may be provided as components of mixed-use buildings or as stand-alone buildings.

Residential Multifamily: Residential multifamily uses are acceptable as components of mixed-use buildings or as stand-alone buildings. Ground floor residential uses in multifamily or residential mixed-use buildings, including accessory spaces and amenities but not including residential lobby areas, should not be provided along Commercial Mains, unless such uses are identified in adopted Small Area Plans. Where ground-floor residential units are located adjacent to Active Streets or Commercial Mains, direct exterior access should be provided to individual units.

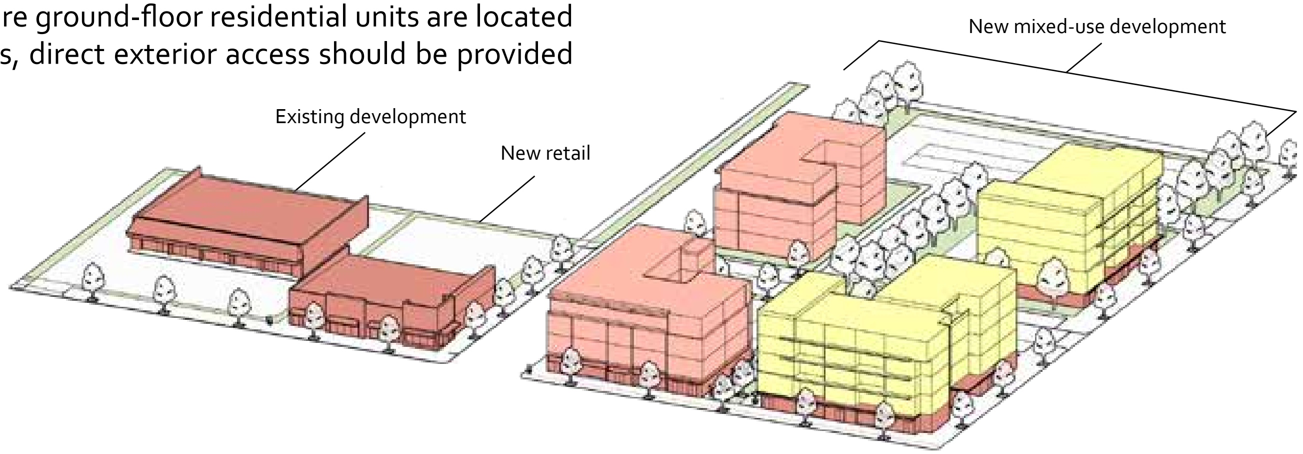
Townhouse: Residential townhouses should only be considered to serve as a transitional use to existing development outside of the Activity Center.

Zoning Districts

- CU, Commercial Urban
- PD-R, Planned Development Residential
- PD-C, Planned Development Commercial
- PD-M, Planned Development Mixed Use

Link + Place Street Types

- Active Streets
- Commercial Mains



ACTIVITY CENTER (con't)

Residential Limitations

The majority of future residential growth is anticipated to occur within the five Activity Centers identified in the Future Land Use Map. Refer to adopted Small Area Plans for specific recommendations on growth in each Activity Center. For Activity Centers for which a Small Area Plan has not yet been adopted, any unified development application within an Activity Center that contains a residential component should have a density of no more than 48 dwelling units per acre. Such developments must offer benefits that support the vision of the Comprehensive Plan for the Activity Center. Such benefits should include the following:

1. A mix of uses within the development site;

2. Contributions toward a connected street grid;

3. Usable open space, and;

4. High quality design.

Should a unified development application fail to offer these benefits, that development may contain no more than 20 dwelling units per acre.

Direct fiscal benefits to the City from residential developments are not typically as strong as those from commercial properties. In order to avoid significant displacement of commercial uses in Activity Centers, new residential development should first focus on lower value commercial or industrial sites unless a significant commercial component is included. Conversion of commercial space in existing buildings into residential space is not generally supported.

ACTIVITY CENTER - OLD TOWN FAIRFAX

The Old Town Fairfax Activity Center ("Old Town Fairfax") encompasses a cultural hub for the City, with a concentration of historic buildings, public services, active open space, and commercial buildings. Old Town Fairfax can also capitalize on its proximity to George Mason University to attract university supported businesses and arts and entertainment venues. The entirety of Old Town Fairfax is within the Old Town Fairfax Historic Overlay District (HOD) or the Old Town Fairfax Transition Overlay District (TOD) and is subject to those provisions of the Zoning Ordinance and the City of Fairfax Design Guidelines.

Refer to the Old Town Fairfax Small Area Plan, dated June 2020, for specific recommendations within Old Town Fairfax, including locations for future streets and open spaces, opportunities for pedestrian connections across Commercial Mains, building form (including appropriate locations for more or less restrictive building heights from the Activity Center standards), and general land use and development limitations. The overall concept plan for Old Town Fairfax, as provided in the Small Area Plan, is shown to the right.

ACTIVITY CENTER - NORTHFAX

The Northfax Activity Center ("Northfax") is considered the most appropriate location in the City to accommodate a regional mixed-use destination. Its location at the intersection of Fairfax Boulevard and Chain Bridge Road, with immediate access to Interstate 66 and a potential future Metro station, is more accessible than other Activity Centers. It is also equidistant from existing regional mixed-use destinations at Merrifield and Fairfax Corner. In order to leverage these characteristics, the City should strive to market Northfax to a wide range of commercial tenants and retail uses in order to take advantage of these benefits. New residential uses and amenities such as open spaces and a pedestrian-friendly multimodal transportation network, should also be leveraged to improve the commercial marketability of the Activity Center.

Refer to the Northfax Small Area Plan, dated June 2020, for specific recommendations within the Northfax Activity Center, including locations for future streets and open spaces, pedestrian connections, building height and form, general land use, and development limitations. The overall concept plan for Northfax, as provided in the Small Area Plan, is shown to the right.

SOCIAL AND CIVIC NETWORK

Definition

The Social and Civic Network Place Type, identified in blue on the Future Land Use Map, includes public and private schools, libraries, places of worship, post offices, and other public facilities There are no specific corresponding Link + Place Street Types for this category because the varying types of Social and Civic Network land uses are appropriate in a variety of conditions. There is no zoning district specifically related to this Place Type. More information on the zoning districts for which uses in this Place Type are permitted, or constitute a special use, is provided in the Principal Use Table in the Zoning Ordinance. In order to support the recommendations of the Housing Guiding Principle in this chapter, residential uses may be considered in conjunction with other uses in the Social and Civic Network Place Type, provided such residential uses are considered affordable.

Physical Characteristics

New development of, or modifications to existing, social and civic uses located in any Residential Neighborhood should complement the character of the surrounding properties and provide transitional screening where necessary. Any new, or modifications to, existing social and civic uses located in an Activity Center should reflect the typical context of the center. New buildings should be oriented towards the street network and provide additional pedestrian connections to surrounding uses as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan.

GREEN NETWORK

Definition

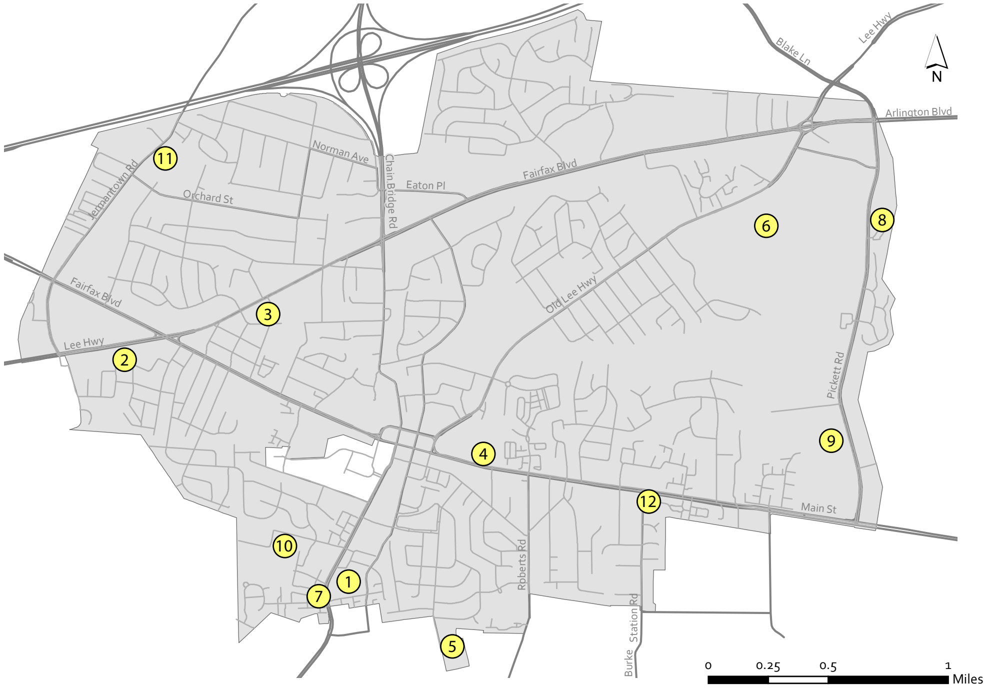
The Green Network Place Type includes public spaces, such as active and passive parks, trails, playing fields, public recreation facilities, cemeteries, open space, and private facilities such as golf courses and private open space. There are currently no zoning districts specifically related to this Place Type. Green Network uses are permitted in the CR, Commercial Retail; CU, Commercial Urban; and CG, Commercial General zoning districts and constitute a special use in all of the residential zoning districts. Outdoor recreational uses, such as tennis courts and golf courses, are permitted as a special use in all of the nonresidential zoning districts except for CL, Commercial Limited.

Physical Characteristics

New recreational facilities shall provide connections to the pedestrian and street network as recommended in the Multimodal Transportation Chapter of the Comprehensive Plan. Proposed connections to other green spaces to complete the network should be prioritized for recreation and transportation purposes as well as ecological benefits. Properties in the network also include natural areas for conservation and protection. Parking facilities for specific recreational uses shall be integrated into the site so as not to prioritize vehicular access over pedestrian connections.

Parcel Specific Considerations

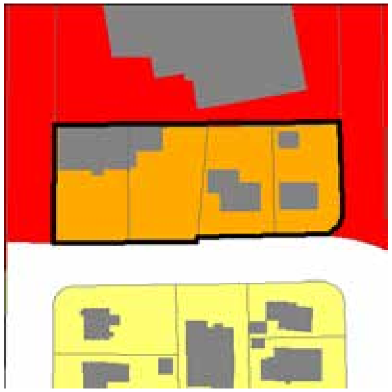
In some cases, the appropriate Place Type for a parcel or group of parcels can vary based on the specifics of design, changes in market demand and variations in surrounding conditions. Several sites in the City have been identified for further consideration of their Place Type designation based on these factors. These sites are identified on the map to the right and described below. While alternatives may be considered, the existing Place Type designation on the Future Land Use Map is the primary recommendation for each site. This list may be expanded in future modifications of this in plan. In particular, potential alternative Place Type designations should be considered for privately-owned sites with a Social and Civic Network designation.



1. Inova and Sunrise Assisted Living

The Inova Emergency Care site, located on Chain Bridge Road, School Street, and George Mason Boulevard, encompasses 9.6 acres and is currently occupied by the Inova Fairfax Emergency Care Center, Sunrise Assisted Living, and the PACE senior medical care center. This site is likely to become available for redevelopment within the next few years. Its unique location makes it suitable for different uses to include commercial, multifamily, and/or townhouse uses. Commercial uses are appropriate along Chain Bridge Road. Any multifamily development should provide substantial buffering to abutting residential uses to the north. Building heights should be no more than three floors along the north, east, and south property lines. Additionally, townhouse uses may be considered as a transition to adjacent, lower-density residential uses.

2. Park Road Properties



Four properties located along Park Road, totaling 0.89 acres, are located within the Westmore Neighborhood but are commercially zoned. Two of the parcels contain a commercial building. The other two parcels contain single-family residential buildings, though one is occupied by a commercial business. Given the location of these lots and their dependence on access from within the neighborhood, alternative uses may be more appropriate than a commercial zoning designation.

Single-family attached residential uses would provide a logical transition between the single-family detached neighborhood to the south and commercial uses to the north. Single-family detached residential uses may also be appropriate. Commercial uses may be appropriate if the properties are consolidated with commercial properties to the north so vehicular access is not dependent on Park Road.

3. Oak Street Properties

Five parcels (059 through 063 on the attached map) located along the west side of Oak Street between Fairfax Boulevard and Cedar Avenue are designated as Single-Family Attached and Single-Family Detached though they are surrounded by higher intensity uses, including the potential Fairfax Garden redevelopment to the west and commercial uses to the north and east. While the Place Type designation supports the current uses, these properties may be appropriate for a Multifamily Neighborhood Place Type designation if they are all included in a parcel consolidation. Alternatively, parcel 063 may be appropriate for a Commercial Corridor designation if it is consolidated with properties with that Place Type designation to the north.

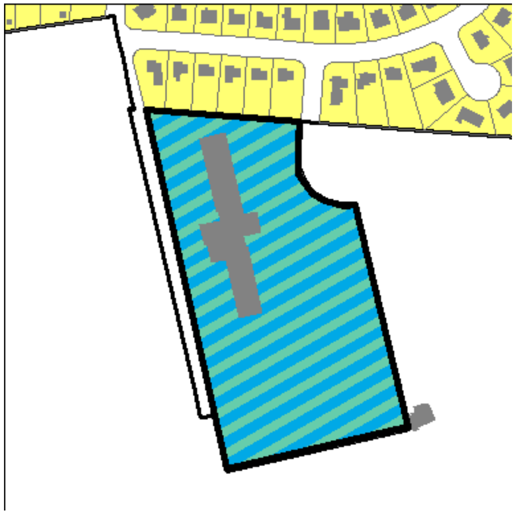
4. Farr Homeplace

This 9.4-acre property located along Main Street between Farrcroft and Main Street Marketplace is privately-owned and the location of the "Farr Homeplace," also known as "Five Chimneys." There is a Resource Protection Area in the rear of the property. Although no historic designation exists, it should be explored for inclusion within a Historic Overlay District. An alternate use may include Single-Family Attached Neighborhood. Any development should retain the existing house, minimize disturbance in the Resource Protection Area, and consider appropriate relationships with the Farrcroft neighborhood to the east.

5. Green Acres

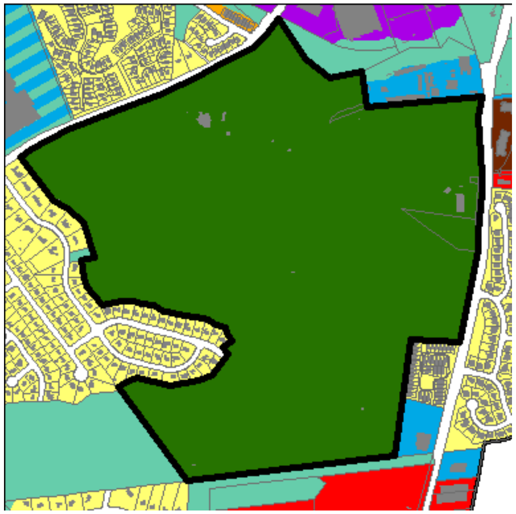
The Green Acres site encompasses 10 acres of land surrounded by George Mason University with one street leading to it through a residential neighborhood. The 2016 Green Acres Feasibility Study found that it is not best suited for the community center use it currently serves and recommended a new community center be constructed elsewhere in the City. The study proposed three alternatives for the future use of the Green Acres site; retaining the entire site for future community uses, selling the entire site, or retaining a portion of the site for community use and selling a portion of the site. The study does not recommend specific uses.

The City of Fairfax School Board reserves the right to retain the site for construction for a future school if necessitated by enrollment demands. This is governed through a covenant on the property. For this reason, the Social and Civic Network Place Type designation should remain. If this covenant is transferred to another property in the City, it would no longer be needed at Green Acres, and the site would become available for other uses.



6. Army Navy Country Club

Covering approximately 234 acres, the Army Navy Country Club is the largest individual property in the City and the largest area of open space. While there are no known plans for the Country Club to vacate or for the property to be developed, and this plan supports continued use of the property for open space, priorities for the future of the site should be considered. Given the wide array of potential implications development of this site could have on the various Guiding Principles for the City, an advisory committee should be formed to conduct a comprehensive analysis and provide recommendations on key priorities if development becomes likely.

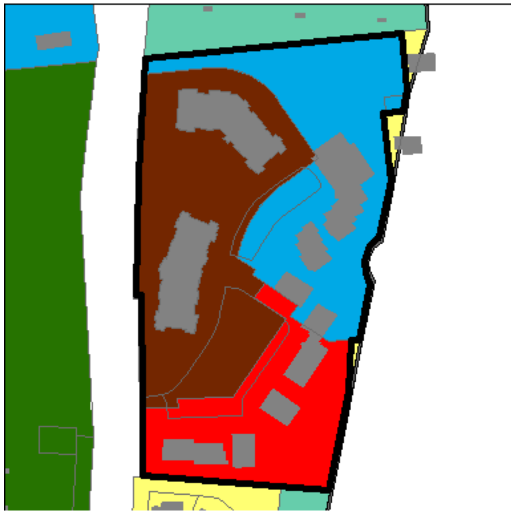


7. 4328 Chain Bridge Road

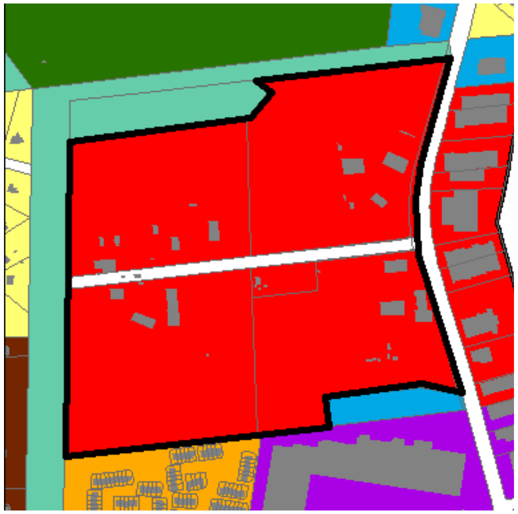
Encompassing just over half an acre, this site is located on the northwest corner of Chain Bridge Road and School Street. Adjacent properties to the north, west and south are occupied by fairly new townhomes and single-family homes that are not expected to be redeveloped within the timeframe of this plan. Redevelopment on this site should be limited to three stories to integrate with surrounding development. An alternative use for the site could include townhomes for which partial fourth stories could be considered for portions of the site that are not directly adjacent to shorter buildings.

8. Mantua Professional Center

The Mantua Professional Center was originally approved as an office development in 1975, though only a portion of the approved development was ever constructed. Since that time, the original approved plan has been amended several times, including separate amendments that converted portions of the site to be used as a private school and multifamily condominiums. As a result, the current complex is now occupied by three distinct uses. Alternative uses could include multifamily residential or townhomes in the portions of the site currently designated as Commercial Corridor and Social/Civic Network. Any expansion of residential uses in the complex should be cognizant of existing neighborhoods to the south and east and should provide adequate transitions in these areas.



9. Tank Farm

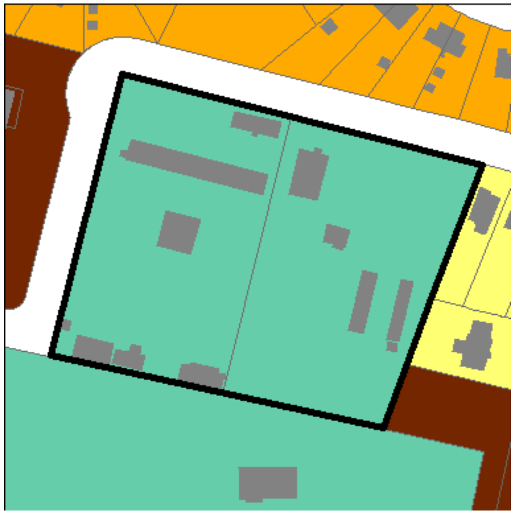


The Pickett Road tank farm comprises above-ground storage for four commercial gasoline and fuel oil facilities and an underground pipeline station on approximately 71 acres. No expansion of the existing heavy industrial uses at this site would be appropriate, and the Commercial Corridor place type is recommended for future development. While there are no known plans for the tank farm to be redeveloped, guidance on development priorities and alternative uses that complement recommendations for the Pickett & Main Activity Center should be established for the site.

Fairfax County Property Yards

Fairfax County currently owns and manages three property yards within the City, located on West Drive, Jermantown Road, and Main Street. Fairfax County may consider some of these locations for closure in order to provide more efficient services from a consolidated, centralized location. Should Fairfax County choose to vacate any of these locations and dispose of the properties, the City should consider pursuing acquisition. These properties have been identified as potential locations for park uses, open space, affordable housing partnerships between the City and non-profit entities, school sites, property yard functions, or other uses.

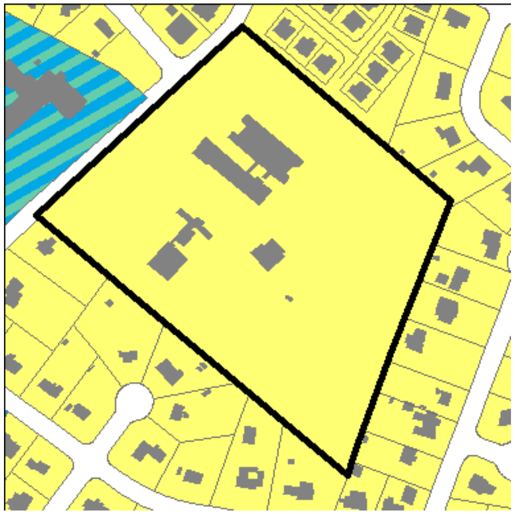
10. West Drive



The two properties that make up the West Drive property yard site encompass 4.2 acres and present a logical extension of the adjacent Providence Park. Their inclusion in the park area would also make Providence Park large enough to host a potential future elementary school in place of the Green Acres site, should that site be desired for other uses. If the City does not acquire this site, it is most suitable for residential development, including single-family detached, single-family attached, or multifamily units. Residential development should provide logical transitions to adjacent uses, particularly along the eastern property line where it abuts existing single-family uses.

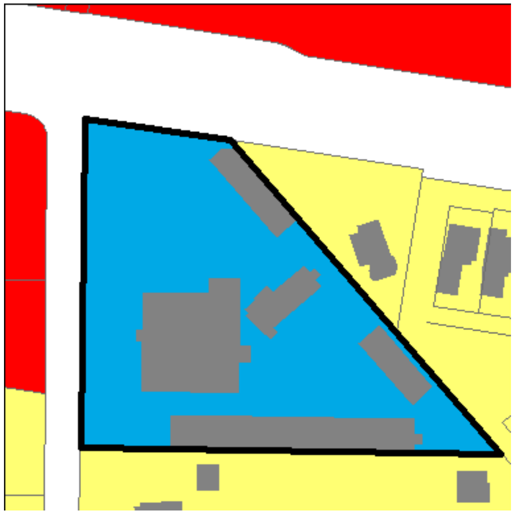
11. Jermantown Road

If this 15-acre property discontinues its function as a property yard and the City does not acquire it, single-family detached residential uses are an appropriate use, consistent with surrounding uses. The cemetery on this parcel should not be impacted by any redevelopment.



12. Main Street

This 2.45-acre parcel is bounded on two sides by roads, Main Street and Burke Station Road. If the City obtains this site, one potential reuse would be a relocation of some of the City's public works services, currently located at the Property Yard on Pickett Road. The existing property yard has flooding issues and diminishing space. The Parks and Recreation Strategic Plan also recommends identification of new potential park sites in the southeast portion of the City. While this site is relatively small, open space uses would provide an amenity in a portion of the City in which open space is not abundant. If the City does not purchase this property, appropriate uses include single-family detached, single-family attached, or commercial uses.



Neighborhoods

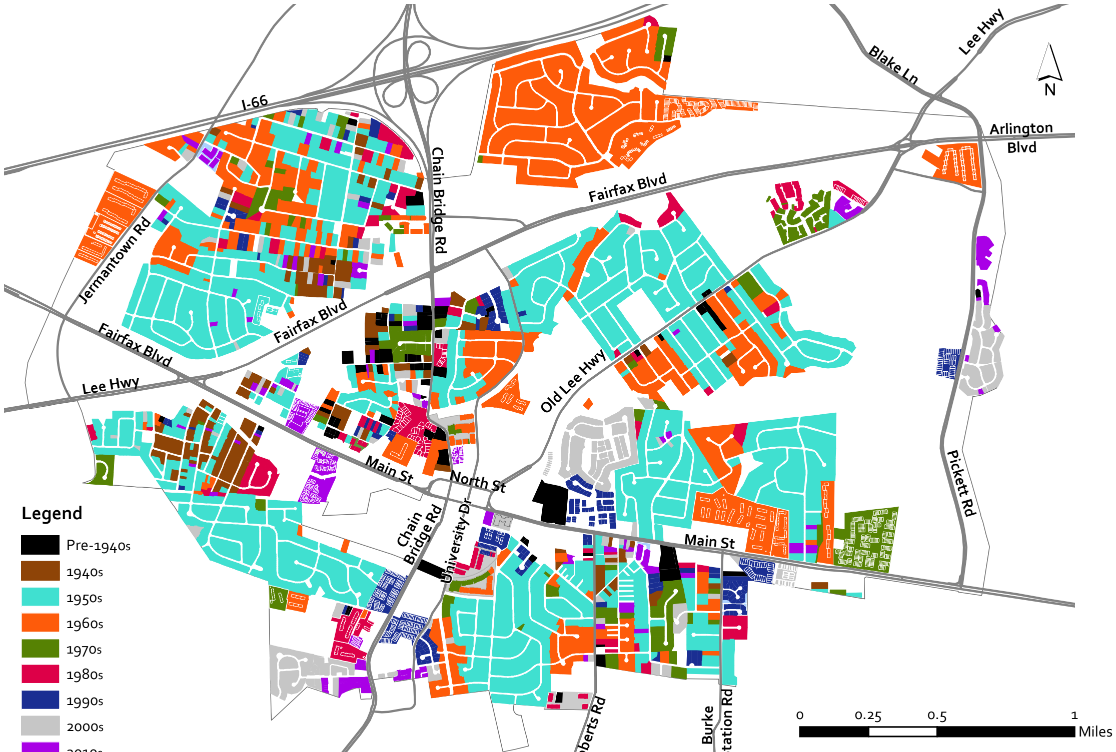
Neighborhoods – the places where we live, learn, play, and increasingly work – constitute the largest geographical use of land in the City, though physical boundaries are not the only defining character trait of a neighborhood. Numerous characteristics define neighborhoods, including the period of building and development (Figure 10), subdivision patterns, architectural style, location of public amenities and services, and presence of social or civic organizations. The City's neighborhoods each have their own unique character and offer a variety of housing and lifestyle opportunities.

Neighborhoods are supported by a separate Guiding Principle in this Plan due to their importance to residents. City growth and development policies must both preserve the quality of neighborhoods and protect neighborhoods from adverse consequences of growth. However, this should not imply that Fairfax's neighborhoods should remain static. Well-designed and properly scaled infill can be an appropriate strategy to foster walkability, better amenities, and housing affordability. This section's goals strive to balance these concerns and take advantage of opportunities through improved policies and regulations, and increased communication with and within the community.

Guiding Principle:

In 2035, Fairfax is a city with...
inviting neighborhoods, each
with its own unique character.

FIGURE 10 HOUSING AGE BY DECADE BUILT



Source: City of Fairfax GIS and Real Estate data 2016

Neighborhoods Goal 1

Enhance neighborhood character.

There is relatively little undeveloped land available in the City for new residential neighborhoods. As the City's housing stock ages, replacements for, or additions to, existing structures will be the prevalent methods of updating housing to meet current market demands. The City should use this as an opportunity to enhance the character and inclusiveness of the City's neighborhoods. Any modification or new construction on residential lots located in established neighborhoods should be compatible with the character of that neighborhood. In order to encourage reinvestment in neighborhoods, the City and civic associations should educate residents about programs available to them (such as Fairfax Renaissance Housing Corporation loans) and the processes involved in updating their homes.

OUTCOME N1.1:	Infill housing that complements the character of surrounding homes in existing neighborhoods.
ACTION N1.1.1	Maintain regulatory standards to ensure infill housing fits in with the surrounding neighborhood context.
OUTCOME N1.2:	Residents have regular communication and positive interactions with other members of their neighborhood as well as the larger City community.
ACTION N1.2.1	Encourage and support community engagement through homeowner, condominium, and civic associations.
ACTION N1.2.2	Establish regular communication with homeowner, condominium, and civic associations and residential property managers as a means to keep individual citizens informed about City business.

Neighborhoods

Goal 2

Provide neighborhood pedestrian connections.

Walkability was frequently cited as a desired attribute of the City during the Comprehensive Plan's public outreach process. Ensuring our neighborhoods are designed to both encourage pedestrian activity and to provide various transportation alternatives will enable people of all abilities to get around the City efficiently and reduce traffic congestion. Improving walkability is not just about adding more sidewalks and trails, but also looking at destinations residents can walk to – such as parks, schools, Commercial Corridors, Activity Centers, and other local destinations – and identifying the condition of the transportation network that can get them there. The strength of a network to get someone from point A to point B is only as good as its weakest link.

OUTCOME N2.1: Residents of all abilities safely and easily move about the community.

ACTION N2.1.1 Identify opportunities for future open space and trails in neighborhoods that are currently deficient in offering these amenities.

ACTION N2.1.2 Expand existing pedestrian network to increase connectivity within neighborhoods and to other destinations.

Commercial Corridors and Activity Centers

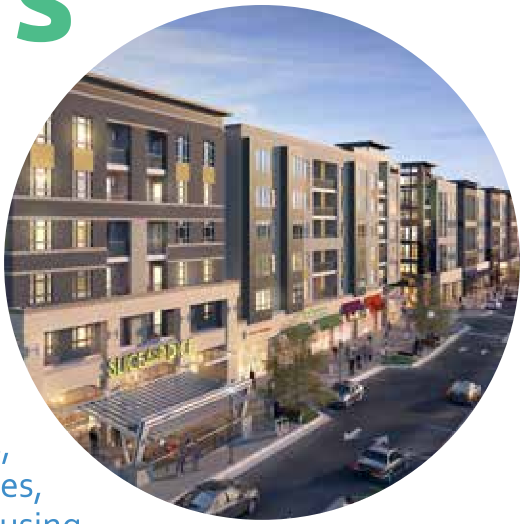


Photo Credit: Hord Coplan Macht

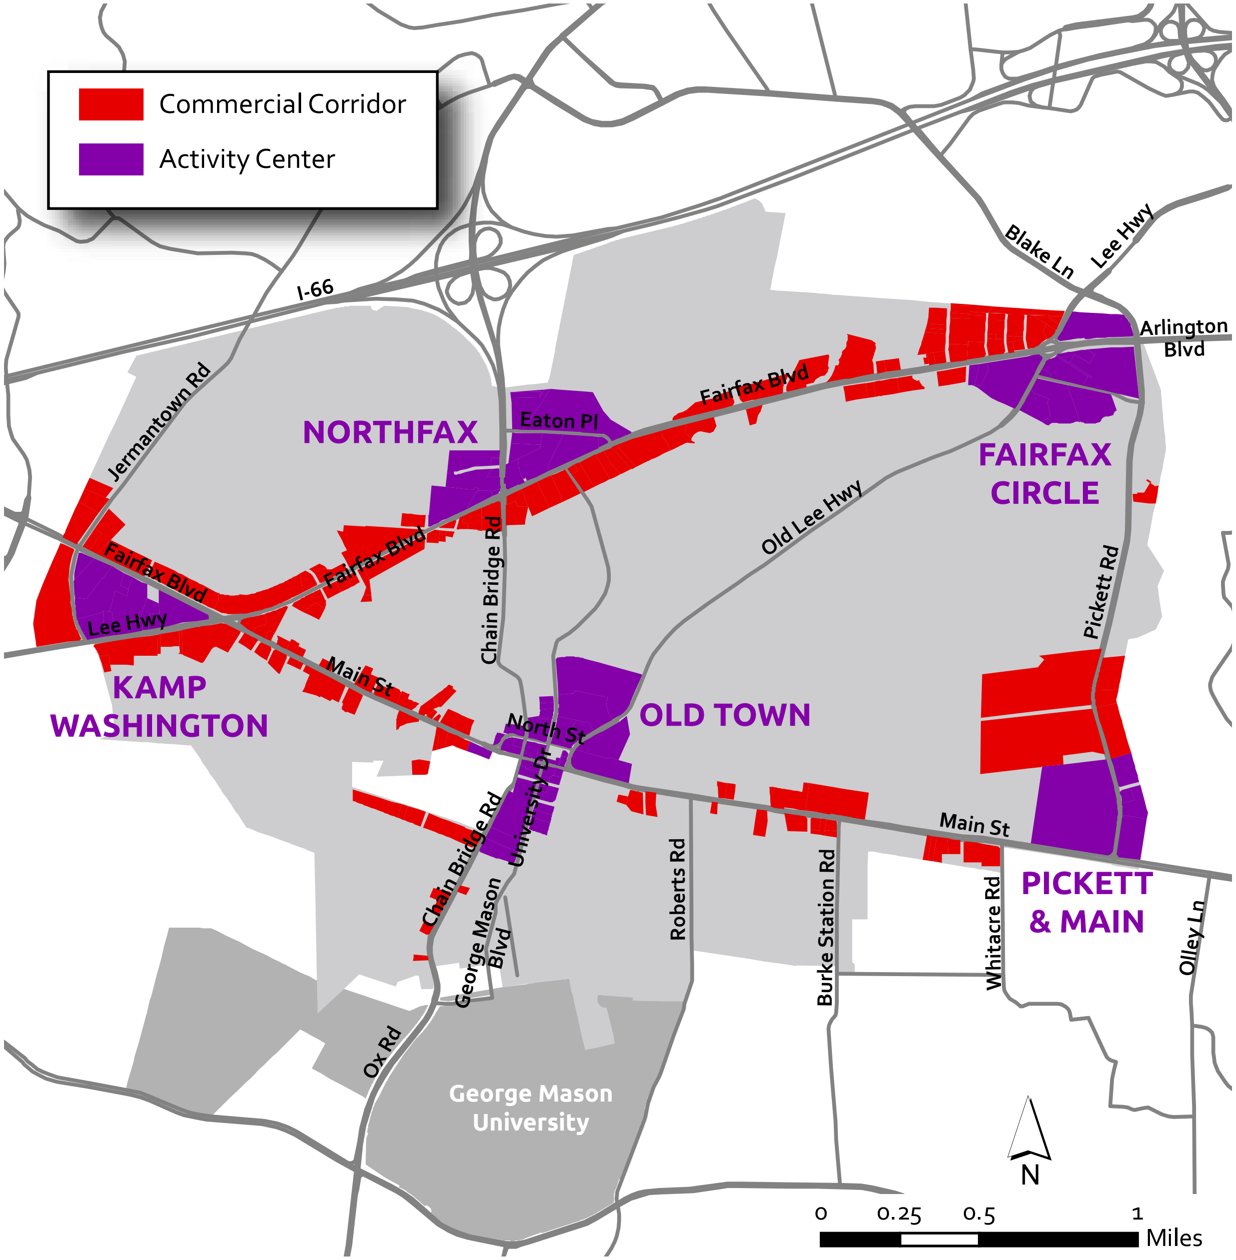
Guiding Principle:

In 2035, Fairfax is a city with...
flourishing centers of commercial and mixed-use activity that include an assortment of grocery stores, restaurants, cafes, entertainment venues, retail stores, offices, and housing.

Fairfax's success in achieving the community's vision for future development hinges upon effective growth strategies for the City's areas of highest redevelopment potential. These areas will accommodate the majority of new commercial activity, higher density residential neighborhoods, and transportation improvements. Success in achieving this vision will be measured not by the magnitude of new investment, but rather by the attributes that can transform a disjointed pattern of development into an attractive and welcoming neighborhood. If the City's Commercial Corridors and Activity Centers can be transformed into areas with attractive physical characteristics and a mix of uses, then the City will realize a major aspect of its goal to be a vibrant 21st century community.

While higher intensity mixed-use redevelopment of older commercial properties can provide economic and social benefits to the community, these benefits would be most realized if concentrated in key areas to allow new developments to complement each other, avoid oversaturating the market, and minimize impacts to existing neighborhoods. These types of uses are primarily envisioned in Activity Centers, as indicated on the Future Land Use Map. While a mix of uses and connected street grids are envisioned in all Activity Centers, such development is always encouraged in the Old Town Fairfax and Northfax Activity Centers. More specific guidance is provided for these two areas in the Activity Center Place Type (pages 35-36) and through the goals of this Guiding Principle.

FIGURE 11 ACTIVITY CENTERS AND COMMERCIAL CORRIDORS



While reinvestment and redevelopment of properties in Commercial Corridors is encouraged, incorporation of residential mixed uses is not recommended. Stronger pedestrian orientation and improved aesthetics are encouraged in Commercial Corridors through the physical attributes of the Place Type and recommendations of the City of Fairfax Design Guidelines.

Commercial Corridors and Activity Centers

Goal 1

Enhance Commercial Corridors.

Many commercial properties in the City are underutilized with an overabundance of surface parking. These properties are often suitable for redevelopment, whether to achieve greater use of the land or to make the properties more market competitive. New development and redevelopment must enhance commercial activities along the City's major corridors with a mix of retail, office, and service offerings in an attractive and welcoming setting. Recently-approved projects indicate that there is demand for additional investment in many of these properties.

OUTCOME CCAC1.1:	Commercial Corridors with attractive physical characteristics that provide shopping, dining, services, and other businesses.
ACTION CCAC1.1.1	Encourage commercial redevelopment that offers amenities and atmosphere to attract top-tier commercial tenants.
ACTION CCAC1.1.2	Identify underutilized properties (i.e., buildings assessed at considerably less than the total property value) and, working with the City's Economic Development Authority, encourage redevelopment.
ACTION CCAC1.1.3	Encourage creativity and architectural excellence in new commercial developments.
ACTION CCAC1.1.4	Develop urban design concept diagrams for small block and multi-block areas along the City's Commercial Corridors outside the Activity Centers.
ACTION CCAC1.1.5	Encourage tree-lined and heavily-landscaped property edges, particularly where surface parking is adjacent to the public rights-of-way.
ACTION CCAC1.1.6	Provide pedestrian and bicycle connections to nearby neighborhoods.
OUTCOME CCAC1.2:	Tenants representing diverse business sectors that meet current and emerging trends in neighborhood-serving retail, service, and other business demands.
ACTION CCAC1.2.1	Strengthen existing retail businesses and expand choices to capture retail spending by residents.
ACTION CCAC1.2.2	Create a marketing plan to generate excitement about the current retail and service offerings.

Commercial Corridors and Activity Centers

Goal 2

Promote redevelopment in the City's Activity Centers.

While actions throughout the City will contribute to fulfill the community's vision for the City's future, those pertaining to land use planning in these specific areas carry an outsized importance. The City will promote redevelopment in Activity Centers to strengthen economic vitality; provide retail, office, and residential opportunities for sustained demand; and reinforce the City's regional appeal. Given the potential scope of redevelopment opportunities, new construction in these areas to accommodate various types of housing units and commercial tenants could accomplish many of the goals set forth elsewhere in this Plan's Land Use Chapter.

OUTCOME CCAC2.1:	Old Town Fairfax, including an expanded downtown area to its north and south, is a lively, economically viable, walkable cultural hub for the City.
ACTION CCAC2.1.1	Capitalize on the authenticity and appeal of Old Town Fairfax as an historic place and a shopping, dining, and tourist destination.
ACTION CCAC2.1.2	Attract and retain businesses along Main Street and market it as a primary retail street for Old Town Fairfax.
ACTION CCAC2.1.3	Maximize the use of publicly-owned properties to contribute to the economic and cultural vibrancy of Old Town Fairfax.
ACTION CCAC2.1.4	Encourage redevelopment of privately-owned, underutilized sites north and south of Old Town Fairfax, such as the Courthouse Plaza shopping center and the area west of University Drive between Sager Avenue and Armstrong Street, as mixed-use developments.
ACTION CCAC2.1.5	Market the connection to Old Town Fairfax from George Mason University and emphasize Old Town Fairfax as a desirable place for students and faculty to shop, dine, and live.
ACTION CCAC2.1.6	Support efforts by Fairfax County to develop a Master Plan for the County Courthouse Complex including encouraging improved connections between the complex and surrounding areas, as well as uses that contribute toward, rather than compete with the vibrancy of the Old Town Activity Center.
OUTCOME CCAC2.2:	A pedestrian-oriented, mixed-use destination at Northfax that capitalizes on its location to successfully compete with other regional centers.
ACTION CCAC2.2.1	Pursue feasibility of a public-private partnership to develop parking structures.
ACTION CCAC2.2.2	Consistently articulate expectations for unified developments and support measures that facilitate property consolidation.
ACTION CCAC2.2.3	Encourage the redevelopment of Northfax as a major commercial center and transit-oriented development that capitalizes on a potential future Metrorail station along I-66.

Commercial Corridors and Activity Centers

Goal 2

OUTCOME CCAC2.3:	Old Town Fairfax, Northfax, and the other Activity Centers are well-designed and desirable places to live, work, shop, and dine.
ACTION CCAC2.3.1	Encourage structured parking and minimize surface parking, particularly adjacent to public rights-of-way.
ACTION CCAC2.3.2	Promote the orientation of buildings facing toward streets with architecture that engages street-level activity.
ACTION CCAC2.3.3	Promote active streetscapes with minimal building setbacks, pedestrian amenities, street furniture, on-street parking, landscaping, and other features.
ACTION CCAC2.3.4	Support land planning that balances connectivity for pedestrians, bicyclists, and motorists.
ACTION CCAC2.3.5	Prepare individual Small Area Plans, as defined in Section 15.2-2303.4 of the Code of Virginia, for each of the Activity Centers that clearly demonstrate the desired mix of uses, residential density, building intensity, design aesthetic, specific street locations and multimodal connections, infrastructure improvements, parking, and open space.
ACTION CCAC2.3.6	Target and coordinate public infrastructure improvements with desired infill, reinvestment, and redevelopment areas to encourage and stimulate private development.

Housing

Guiding Principle:

In 2035, Fairfax is a city with... a choice of housing types that meet the needs of our community.

In order to function equitably and inclusively, the City must prioritize the availability of housing units for people of widely varying income levels, ages, and lifestyle choices. While there is great variety among the approximately 9,000 housing units in the City, several types or characteristics of housing may be underrepresented among the current housing mix, especially as other nearby communities undergo redevelopment and expand their offerings.

Although the City is primarily built out, a variety of new housing types can be accommodated through redevelopment on a relatively limited basis to broaden the current offerings and accommodate changing demands. Accordingly, housing that is affordable, housing that is designed for older adults and people with disabilities to accommodate the City's relatively high proportion of older adults, and housing for growing younger families seeking modern single-family housing without leaving the City should be prioritized.

Existing housing units can also accommodate changing demands through renovations and retrofits. Prioritizing additional housing units in underrepresented market segments, improving the functionality of existing housing units, and accommodating in-demand housing types would help to ensure that the City is as welcoming as possible to current and potential residents, regardless of socioeconomic status, age, or other circumstances.

In addition to expanding housing choices, proactive strategies should be taken to ensure that existing housing units that are affordable are preserved and that new units that are affordable are added to the City's overall housing unit mix.

Housing

Goal 1

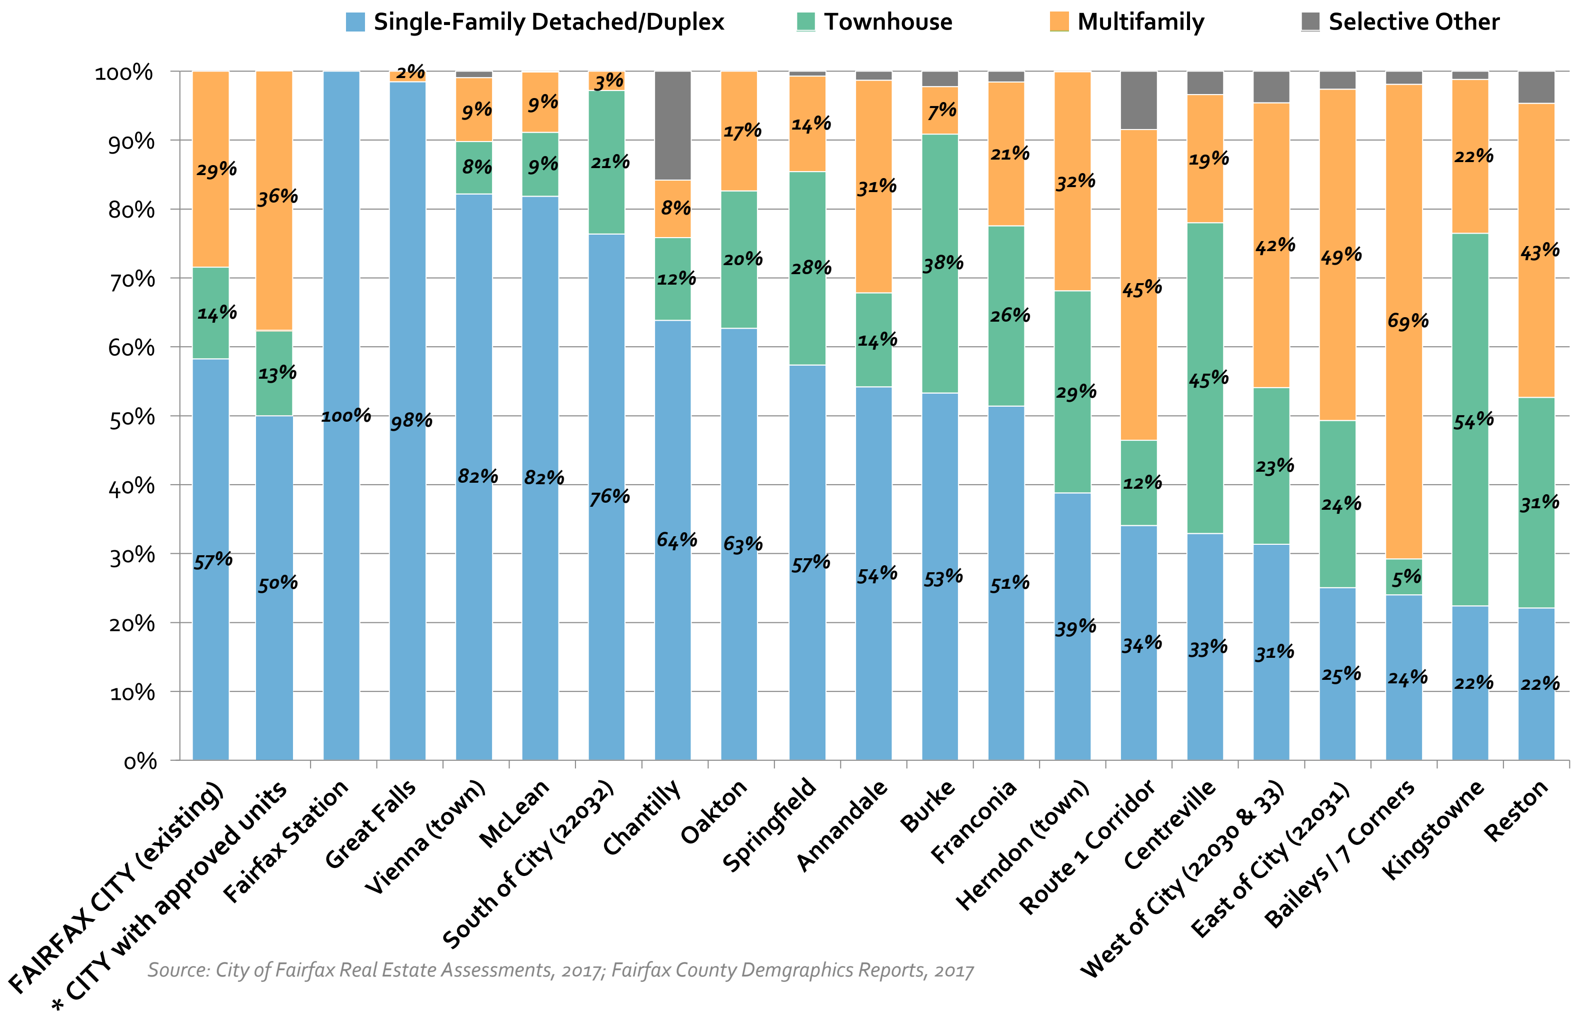
Support a wide range of housing types.

It is vital that a variety of high-quality, attractive housing choices continue to be available in the City to support differing needs and demands of residents. Housing needs and demands are reflective of the existing housing stock and fluctuating market trends, making them subject to change over time. Specific housing types are identified in the Land Use Strategies Section of the Comprehensive Plan. Current shortages could include multifamily rentals and condominiums, of which the majority of the City's stock was built in the 1960s, and townhomes, of which the City currently has a lower ratio than many surrounding communities in Fairfax County. Although significant single-family development is not anticipated as the City is primarily built-out, potential redevelopment and infill housing that keep up with modern expectations and meet demand are encouraged, provided they comply with the Zoning Ordinance.

OUTCOME H1.1:	Continued development of housing types that are underrepresented in the City's existing stock of housing units.
ACTION H1.1.1	Create a housing policy that can best provide for the types of housing units that are most in demand.
1.1.1.1	Conduct a housing assessment to examine the types of housing that are most in demand in the City for a full income range of households, or are most supportive of growing sectors of the local economy.
1.1.1.2	Support development of housing types that are not heavily represented in the City's housing stock, as identified in the housing assessment, where reasonable.
1.1.1.3	Consider efforts to market new and existing housing stock in the City to growing sectors of the regional economy.
ACTION H1.1.2	Research changes to the zoning regulations to expand opportunities for accessory dwelling units, while ensuring they do not negatively impact the surrounding neighborhood.

Figure 12 on the following page provides a comparison of housing type percentages between the City (both current and approved) and other parts of Fairfax County.

FIGURE 12 HOUSING UNITS BY TYPE



Source: City of Fairfax Real Estate Assessments, 2017; Fairfax County Demgraphics Reports, 2017

* City with approved units = Approved and unbuilt units as of the adoption of this Comprehensive Plan.

Housing
Goal 2

Ensure availability of housing that is affordable.

During the Comprehensive Plan outreach process, affordable housing was the primary issue that rose to the forefront of the housing discussion. (Code of Virginia Section 15.2-2201 defines affordable housing as housing that is affordable to households with incomes at or below the area median income, provided that the occupant pays no more than thirty percent of his gross income for gross housing costs, including utilities. However, the actions associated with this goal could target households with incomes below the median.) In addition, Code of Virginia Section 15.2-2223 states that the Comprehensive Plan "shall include the designation of areas and implementation of measures for the construction, rehabilitation and maintenance of affordable housing, which is sufficient to meet the current and future needs of residents of all levels of income in the locality." There are a number of tools available to encourage the establishment of new affordable residential units as well as to preserve existing "naturally occurring affordable housing" that is affordable to families earning below the region's median household income. Affordable housing should be encouraged in higher-density areas of the City, particularly in the Activity Centers.

OUTCOME H2.1:	Affordable housing units have been added to the City's housing stock through redevelopment and strategic investments.
ACTION H2.1.1	Maintain a robust housing affordability program and dedicated housing trust fund that could be used to rehabilitate and preserve existing housing that is affordable or to help leverage other funding streams for new construction.
ACTION H2.1.2	Provide regulatory and financial incentives to increase the supply of affordable housing, including amending the City's Zoning Ordinance to include an Affordable Dwelling Unit ordinance.
ACTION H2.1.3	Pursue a contractual partnership with the Fairfax County Department of Housing and Community Development to administer elements of a housing affordability program for the City.
ACTION H2.1.4	Provide alternative means of accommodating new dedicated affordable housing units, such as leveraging vacant or underutilized public land; supporting or partnering with private, non-profit, or faith-based organizations; and co-locating affordable housing with public construction.
OUTCOME H2.2:	Preservation of and reinvestment in the City's existing supply of affordable multifamily rental housing units.
ACTION H2.2.1	Facilitate partnerships between existing property owners and nonprofit organizations to preserve and ensure long-term affordability of existing multifamily complexes.
ACTION H2.2.2	Promote the use of the Low Income Housing Tax Credits, tax abatements, low-interest loans, the PACE (Property Assessed Clean Energy) Program, and other funding sources available to reinvest in and upgrade existing multifamily complexes.

Housing
Goal 3

Provide housing options for older adults and persons with disabilities.

Housing that is designed for older residents and persons with disabilities was another issue that rose to the forefront of the housing discussion during the Comprehensive Plan's public outreach sessions. Given the relatively high concentration of older adults in the City as compared to surrounding jurisdictions, demand for such units from existing City residents could be strong. Housing should be suitable for a range of choices, such as aging in place, accessory dwelling units, dedicated senior housing, and assisted living/nursing care. In addition, options should be available for people with a variety of disabilities and incorporate features of universal design - the design of buildings, products, or environments to make them accessible to all people, regardless of age, disability, or other factors.

OUTCOME H3.1:	A range of accessible housing types with appropriate levels of support and care is available for older adults and persons with disabilities that incorporate the concept of universal design.
ACTION H3.1.1	Express preferences regarding housing units that are appropriate and/or in demand for seniors and those with disabilities and incorporate features of universal design at a range of price points.
ACTION H3.1.2	Encourage development of congregate living facilities - a group of independent dwelling units that have common kitchen and dining areas - to support older adults and persons with disabilities.
ACTION H3.1.3	Review provisions within the City's Zoning Ordinance to identify and amend provisions that impede the ability to construct or modify housing containing minimal physical barriers for people of all ages and abilities, including but not limited to standards of universal design.

Housing

Goal 4

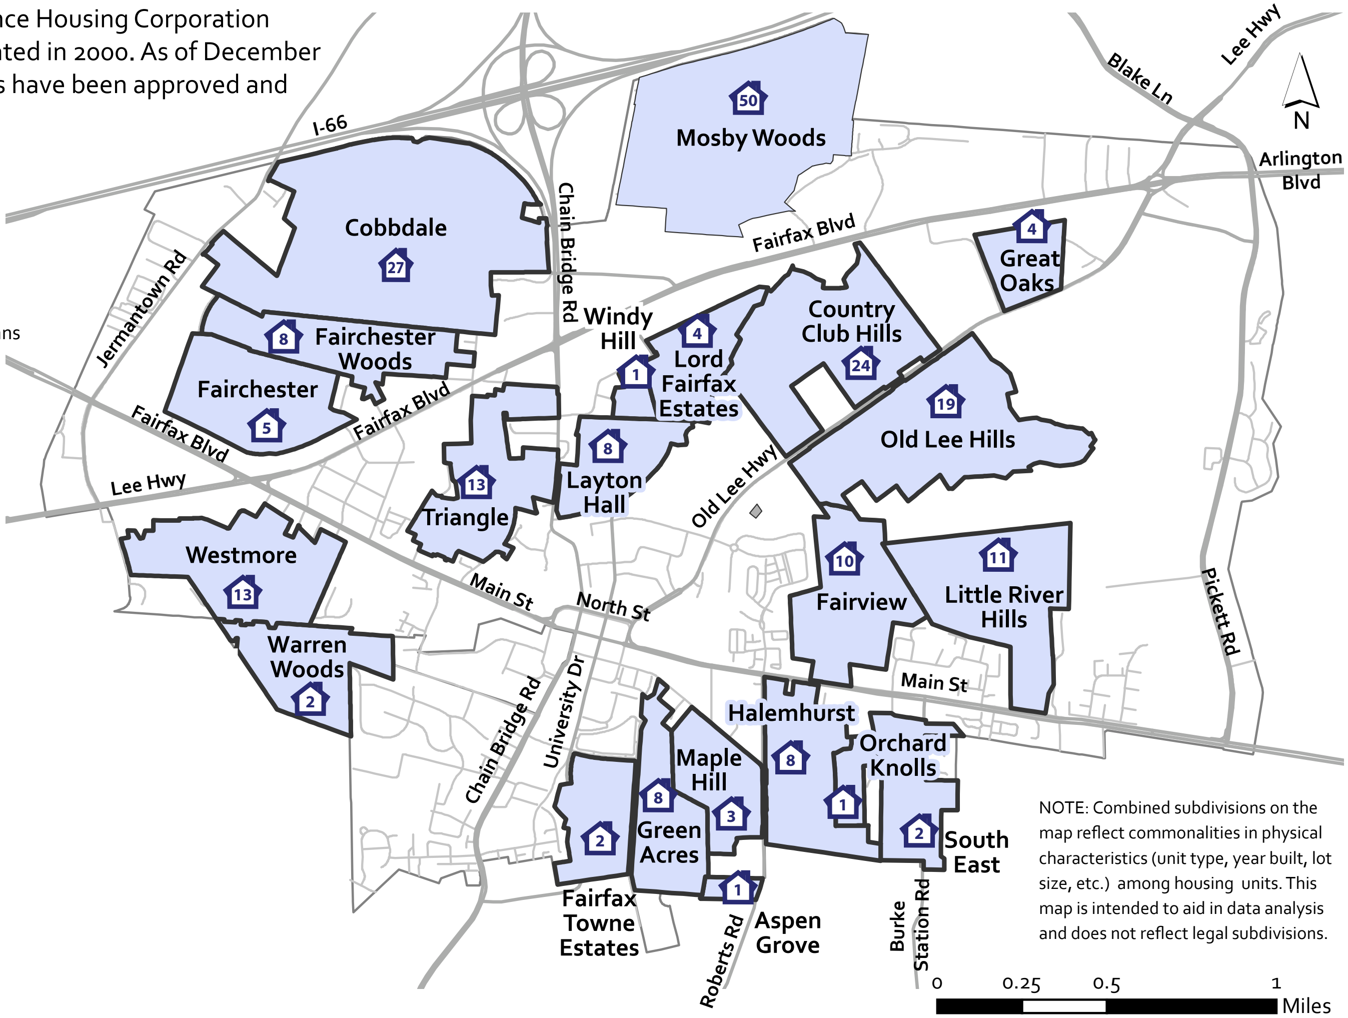
Support residential improvements of existing housing units.

Home renovations and expansions allow existing housing units in the City to keep up with modern expectations, including characteristics such as floor area, layout, style, technological amenities, and sustainable infrastructure. The Fairfax Renaissance Housing Corporation has assisted in such housing improvement projects throughout the City since 2000, as shown in Figure 13. In addition, the City has engaged in other programs, such as Solarize NOVA, to encourage residents to consider sustainable elements in home renovations.

OUTCOME H4.1:	A greater number of renovated housing units.
ACTION H4.1.1	Continue to encourage property owners to undertake residential reinvestment projects that can collectively modernize the City's housing stock.
ACTION H4.1.2	Encourage energy-efficient retrofits that reduce water use and heating and cooling costs.
ACTION H4.1.3	Continue to enforce compliance with building and property maintenance codes to prevent deteriorated, unsafe, and unhealthy housing conditions.
ACTION H4.1.4	Incentivize reinvestment in existing multifamily complexes.
OUTCOME H4.2:	Expanded City-sponsored residential improvement programs.
ACTION H4.2.1	Continue to explore modifications to the FRHC program to encourage greater participation.
ACTION H4.2.2	Encourage further engagement of programs to promote sustainable retrofits and incorporation of sustainable elements in residential renovations.

FIGURE 13 RESIDENTIAL IMPROVEMENT PROJECTS WITH FAIRFAX RENAISSANCE HOUSING CORPORATION (FRHC) LOANS

The Fairfax Renaissance Housing Corporation (FRHC) was incorporated in 2000. As of December 2017, 224 applications have been approved and completed.



NOTE: Combined subdivisions on the map reflect commonalities in physical characteristics (unit type, year built, lot size, etc.) among housing units. This map is intended to aid in data analysis and does not reflect legal subdivisions.

Community Design and Historic Preservation

Guiding Principle:

In 2035, Fairfax is a city with...
architecture that contributes
to a vibrant, creative place and
complements our historic character.

An attractive, well-designed City instills civic pride; improves the visual character of the community; creates a strong, positive image; and attracts quality developments. Community Design relates not just to what buildings look like, but to the spaces between buildings, as well as to the street and public realm. While accommodating new growth and change, consideration must be given to preserving significant elements of the community that contribute to the City's unique character.

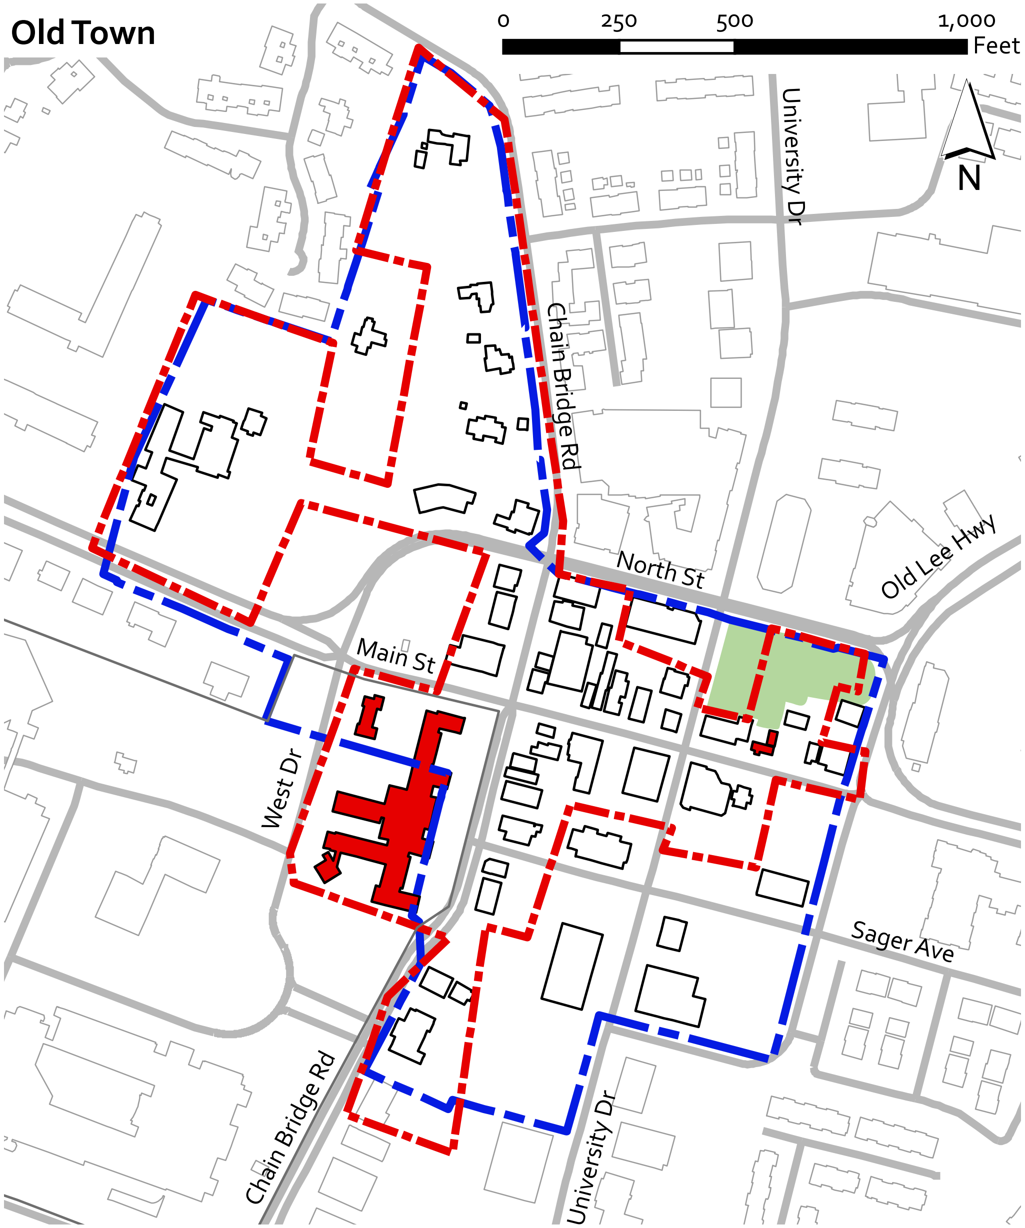
The intent of the Community Design and Historic Preservation Guiding Principle is to capitalize on unique features of the City in a manner reflecting the community's values and its connection to the history and traditions that distinguish it from other communities in the region. This can be accomplished through review and adjustment of planning, regulatory and incentive tools, and by improving coordination among stakeholders who impact the future development of the City, without unreasonably burdening the review process.

The primary resource on design elements for new construction, expansions and renovations is the City of Fairfax Design Guidelines. Separate design characteristics are described in the guidelines for the Old Town Fairfax Historic Overlay District, the Old Town Fairfax Transition Overlay District (both described on the following pages), and the Architectural Control Overlay District (which encompasses all properties within the City except for single-family residential properties and those properties located within one of the other overlay districts). The Board of Architectural Review, along with City staff, reviews development applications to determine if proposals meet the intent of the design guidelines.

Historic Overlay Districts

The majority of the City's historic architectural resources are concentrated in Old Town, the City's traditional core. Old Town is recognized and preserved both nationally as a National Register of Historic Places district as well as through a City preservation district zoning overlay (Figure 14). There are 52 buildings, 10 "other structures," and a monument within the National Register of Historic Places' "City of Fairfax Historic District," many of which are considered "contributing elements." Six of the buildings predate 1850 while others are from the turn of the 20th century to the early 1930s. The City's locally-designated Old Town Fairfax Historic Overlay District is larger in area than the National Register district.

FIGURE 14 HISTORIC DISTRICTS AND BUILDINGS



Source: City of Fairfax GIS 2016 Impervious Surfaces, Zoning Overlays, National Register Districts

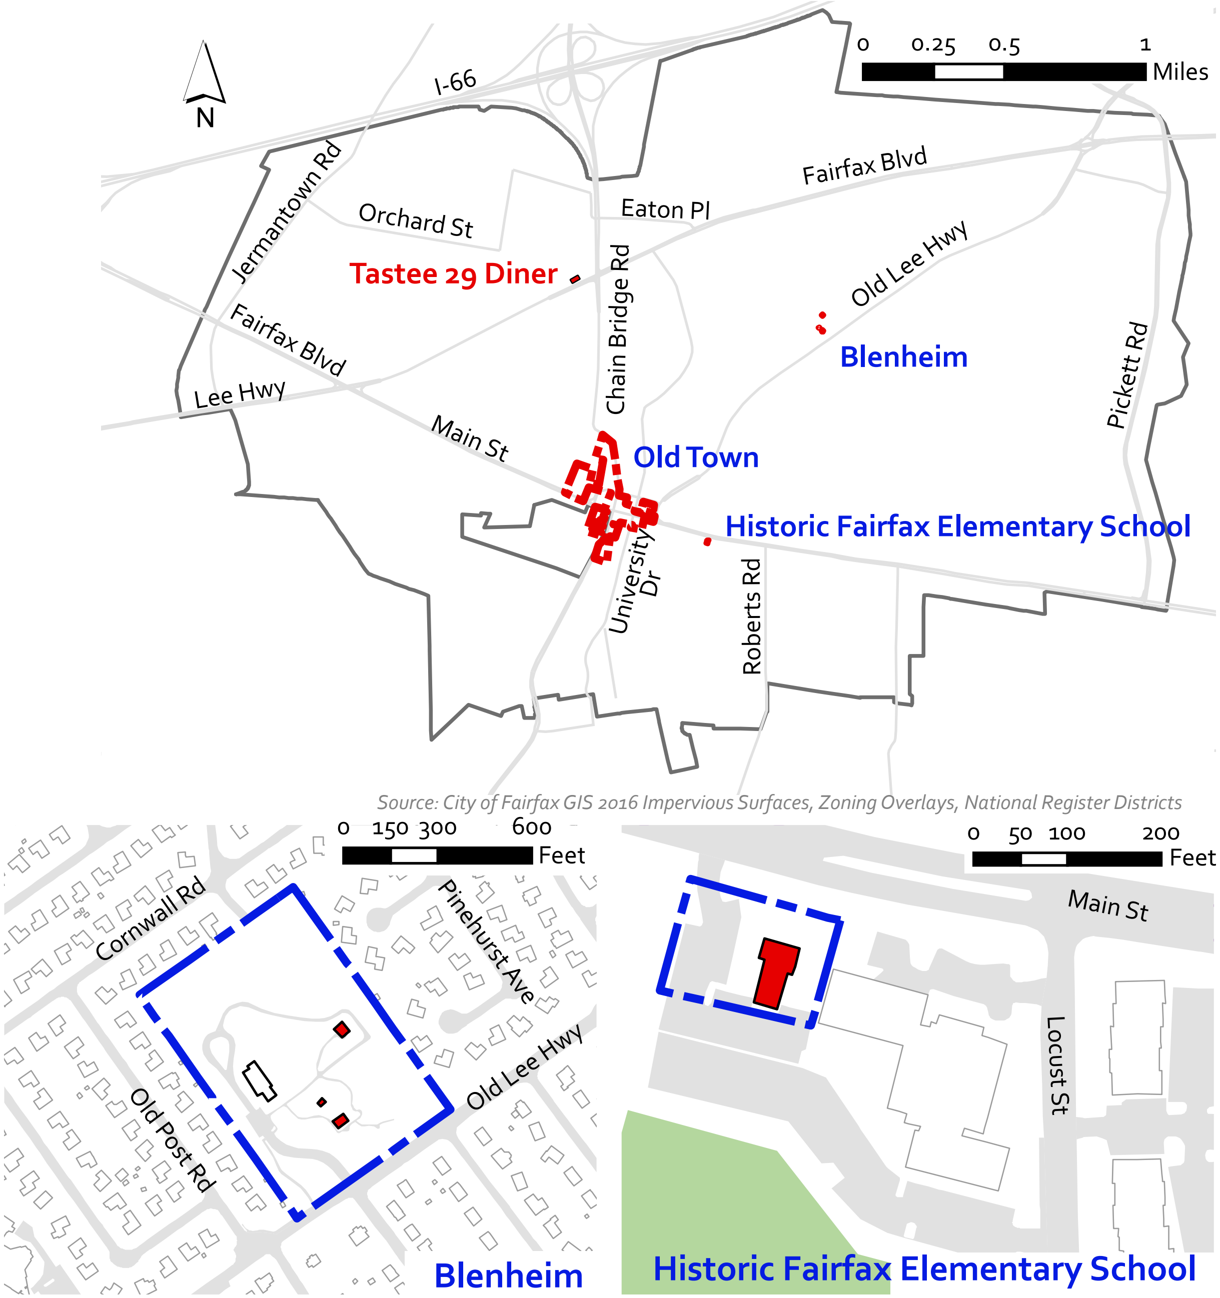
Legend

- ▭ National Register Historic District
- 🟥 National Register Historic Building
- ▭ City Historic District
- □ Building
- — Centerline of Road
- 🟩 Park

In addition to Old Town, the City has historic zoning overlay districts for two other properties, the Fairfax Public School and Blenheim (Figure 15).

Additionally, there are many properties and structures with historic characteristics that have not been designated at the local, state, or national levels. Over 4,800 structures in the City are 50 years of age or older, one of the criteria to determine eligibility of historic designation. The significance of a given property or structure to architectural history, landscape history, events or activities in the past, or to lives of important people are other criteria for preservation. Remaining large estates such as the Farr Homeplace and the Sisson House may also be considered for preservation, as well as landforms such the Manassas Gap Railroad Bed.

FIGURE 15 HISTORIC DISTRICTS AND BUILDINGS



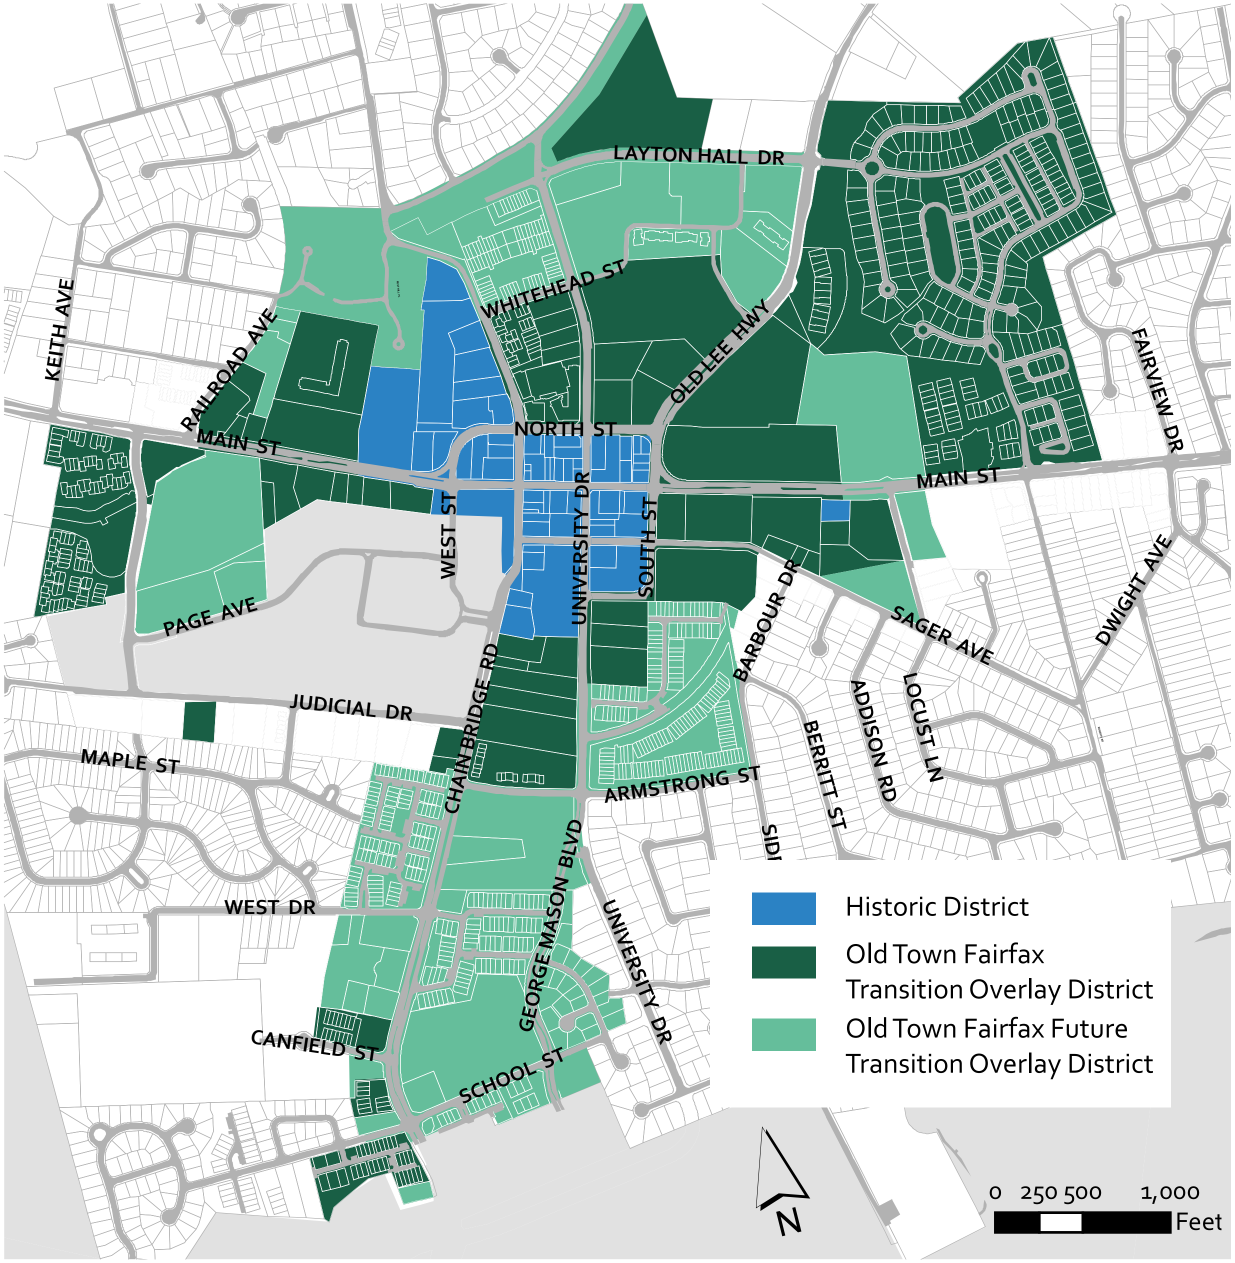
Source: City of Fairfax GIS 2016 Impervious Surfaces, Zoning Overlays, National Register Districts

Old Town Fairfax Transition Overlay District (Transition District)

The Transition District is established in areas surrounding Old Town Fairfax as a means to ensure the character of those areas complements that of the historic districts. This is accomplished through regulations in the Zoning Ordinance limiting the height of new construction, encouraging buildings to be oriented toward the street, and requiring more extensive streetscape improvements than the base standards. The current extent of the Transition District and potential Future Transition Overlay District are provided in Figure 16.

Properties located in the Future Transition Overlay District may be added to the Transition District either upon application from the property owner (typically in conjunction with an individual property rezoning) or as part of a larger City-initiated rezoning. The extent of the potential expansion area for the Transition District stretches farther away from the historic district in order to continue these characteristics along corridors leading into Old Town Fairfax.

FIGURE 16 HISTORIC DISTRICTS AND TRANSITION OVERLAY DISTRICTS



Community Design and Historic Preservation

Goal 1

Require high-quality, sustainable design.

Beyond residential neighborhoods, there is a wide variety of building uses in the City, from office and retail buildings to industrial and institutional buildings. These buildings were constructed over several decades and encompass an array of design styles and architectural influences. The City requires high-quality, sustainable design and construction of new buildings and public spaces along with similarly high-quality modifications and additions to existing buildings and open spaces. The intent of the design review process in areas of the City outside the historic districts is to continue to allow architectural variety while encouraging higher quality materials and design rather than designating specific design styles. The City can further support aesthetic quality through public investment in visible infrastructure, such as streetscapes and signage, and through public-private partnerships to promote desired types of development.

OUTCOME CDHP1.1:	Clear expectations for the required design elements and building materials for the City's historic districts and commercial centers.
ACTION CDHP1.1.1	Determine design aesthetic of Fairfax Boulevard and Main Street with input from City boards and commissions and convey through design documents such as the City of Fairfax Design Guidelines and other documents that may be prepared.
OUTCOME CDHP1.2:	Attractive buildings, inviting public spaces, and welcoming gateways that contribute to our economic vitality and unique character.
ACTION CDHP1.2.1	Identify commercial economic investment areas and provide financial support through the Economic Development Authority.
ACTION CDHP1.2.2	Continue to develop and refine design standards with a menu of options to encourage variety, visual interest, and durability in the design of new development.
ACTION CDHP1.2.3	Explore public-private partnerships to create neighborhood centers inclusive of gathering places.
ACTION CDHP1.2.4	Create attractive gateway features at key City entry points.

Community Design and Historic Preservation

Goal 2

Protect and enhance historic resources.

Inclusion of properties or structures in a local historic district should be based on the criteria described on p. 61. Local protections give the City the ability to designate specific characteristics of a property or district that are intended to be preserved, as well as provide regulatory measures that protect those properties. Local districts can be applied to individual properties or a group of properties, such as a neighborhood. Establishment of any new historic districts should be contingent upon support from owners of the affected properties.

OUTCOME CDHP2.1:	Protection of eligible structures, properties, and neighborhoods through local historic designation and strategic investments.
ACTION CDHP2.1.1	Develop an inventory of historic and archaeological resources readily available on the City's website that is reviewed and updated at least every 10 years.
ACTION CDHP2.1.2	Work with neighborhoods to gain support for new locally-designated historic districts and landmarks, where appropriate.
ACTION CDHP2.1.3	Encourage the preservation of existing buildings of historic or architectural significance whenever feasible.
OUTCOME CDHP2.2:	Redevelopment that respects nearby historic structures and the established architectural pattern.
ACTION CDHP2.2.1	Ensure all new development subject to the requirements of the City of Fairfax Design Guidelines is compliant, and continue to monitor the review process for Certificates of Appropriateness to ensure it is effective.
ACTION CDHP2.2.2	Rezone all properties in the Old Town Fairfax Future Transition Overlay District to the Old Town Fairfax Transition Overlay District, either proactively or as each property seeks land use amendments.
OUTCOME CDHP2.3:	The City's historic resources are utilized to provide educational programs to the community and promote preservation of historic properties.
ACTION CDHP2.3.1	Promote greater awareness of the City's historic resources and the history of the City and surrounding area, identifying educational, economic, and recreational benefits of historic structures, properties, and districts.
ACTION CDHP2.3.2	Evaluate the need to expand the Fairfax Museum and Visitor Center, currently located in the Historic Fairfax Elementary School building.

Preservation and appreciation of historic properties and other historic resources in the City can be supported through events and programs that highlight the history of the City and the importance of the historic properties in historic events. City historic resources, such as the Fairfax Museum and Visitor Center, Blenheim Civil War Interpretive Center, and the Ratcliffe-Allison-Pozer House can be utilized to engage the public through special programs, tours, events, exhibitions, and outreach efforts.

3

Multimodal Transportation

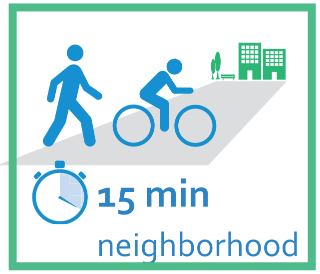
Transportation is about more than mere movement – transportation grants us access to the needs of everyday life. Sustainable, connected, and integrated transportation is fundamental to the success and livability of the City. The intent of the Multimodal Transportation Chapter is to recommend strategies that will improve the operation and safety of the City's transportation system in order to achieve the larger community objectives for a vital, vibrant, and livable City.

This Chapter is based on the Multimodal Transportation Plan, the first comprehensive, multimodal transportation plan completed by the City. ("Multimodal" refers to the multiple ways people use to get around – car, bus, train, bike, walking, etc. – and a multimodal plan incorporates these various transportation modes into an efficient and connected system.) The Multimodal Transportation Plan was developed as a separate effort, but in coordination with the Comprehensive Plan. The four key aspirations shown to the right helped ensure the multimodal aspect of the plan inform many of the recommendations.

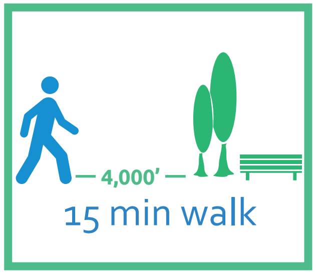
Guiding Principle:

In 2035, Fairfax is a city with...
options for residents to easily, safely, and efficiently move within and between neighborhoods either by walking, bicycling, taking public transportation or driving.

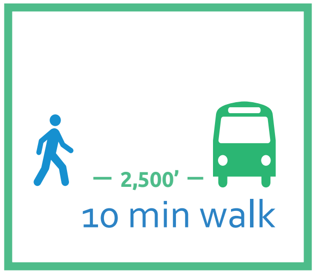
Create a city of **"15-minute neighborhoods"** – ensure that 100% of residents can access a local activity center via a safe 15-minute walk from home (currently 44%).



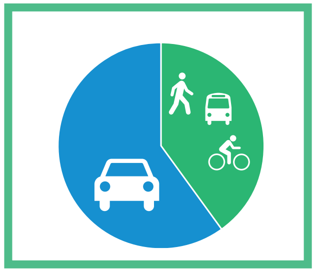
Ensure 100% of residents are connected to green space, trails, or open space via a safe 15-minute walk of home (currently 88%).



Ensure 100% of residents have access to transit by providing a transit stop within a safe 10-minute walk of each residence (currently 79%).



Increase choice, reliability, and efficiency in travel by achieving at least a 40% non-drive alone mode share for commute to work trips (currently 28%).



Fairfax Transportation Facts

The City of Fairfax is centrally located

A **20-minute** drive to Tysons, Falls Church, and Dulles International Airport

Taking transit to these same destinations can take **three times as long**

27% Of households have at least **one child at home**

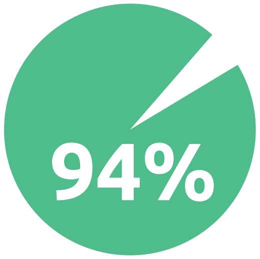
36% Of households include at least **one senior**

68,000 Daily trips are made through the city **without stopping**

In 2015, there were

837

Automobile crashes in the city



Of city residents have access to **one or more** cars

6% Of city residents must get by without an automobile

72% Of City of Fairfax commuters **drive alone to work**

66% Of residents surveyed would prefer to travel by a means **other than driving alone** to work or errands

CONGESTION + Safety

are the two most frequently cited threats to livability in the City of Fairfax

Most transit routes in the city operate from **early morning through evening**

However, most transit routes only operate **once or twice per hour**

1/3 of all household trips are less than one mile in distance

1/2 Of these short distance trips **are driven**

SOURCE: City of Fairfax Multimodal Transportation Survey, 2015; US Census National Household Travel Survey, 2009; MWCOG; City of Fairfax

Opportunities and Challenges

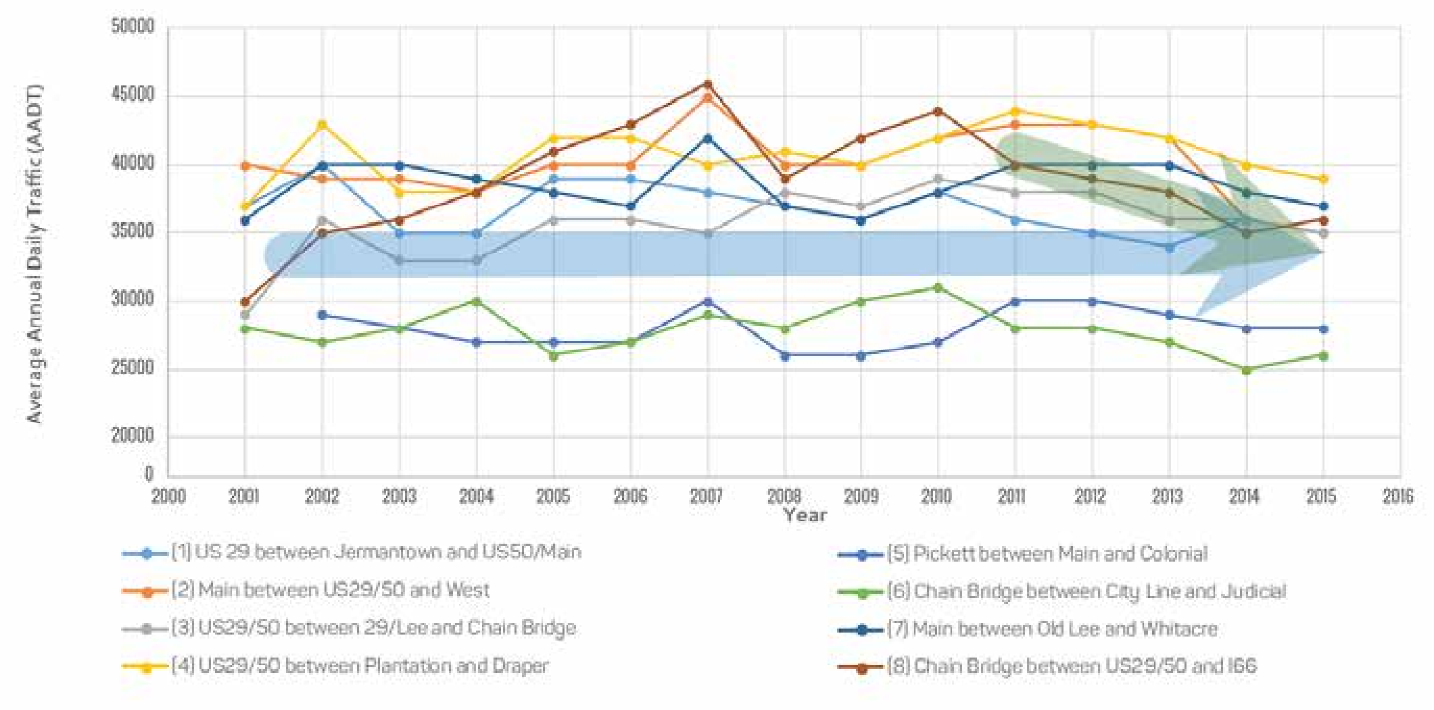
Traffic volumes and peak period congestion

Despite growth in population in the area, daily traffic volumes on the City's 16 miles of arterial roads have remained relatively stable over the past 15 years. However, while traffic volume on several segments has decreased since 2010-2011, vehicular congestion during peak hours continues to present challenges to residents and commuters.

Travel patterns

Currently, the vast majority (72%) of City residents who are employed drive alone to work while 8% carpool, 11% use transit (bus or rail), and 5% work from home. Most households (94%) have at least one automobile. However, 6% of City households make do without owning a personal vehicle. The average City resident who is employed travels 12.6 miles to work — a trip that takes 35 minutes on average. Within the Washington region, approximately one third of all trips are less than a mile, but more than 50% are driven. Many of the short trips in the City could be completed on foot, on transit, or by bike rather than driving.

FIGURE 17 AVERAGE ANNUAL DAILY TRAFFIC



SOURCE: Virginia Department of Transportation, 2001 - 2015

Transportation safety

Traffic congestion is significant along most of the major corridors in the City and concentrated where arterials intersect. These areas also experience high rates of vehicle crashes, with the highest rates concentrated at major intersections.

FIGURE 18 2015 VEHICLE CRASHES BY LOCATION

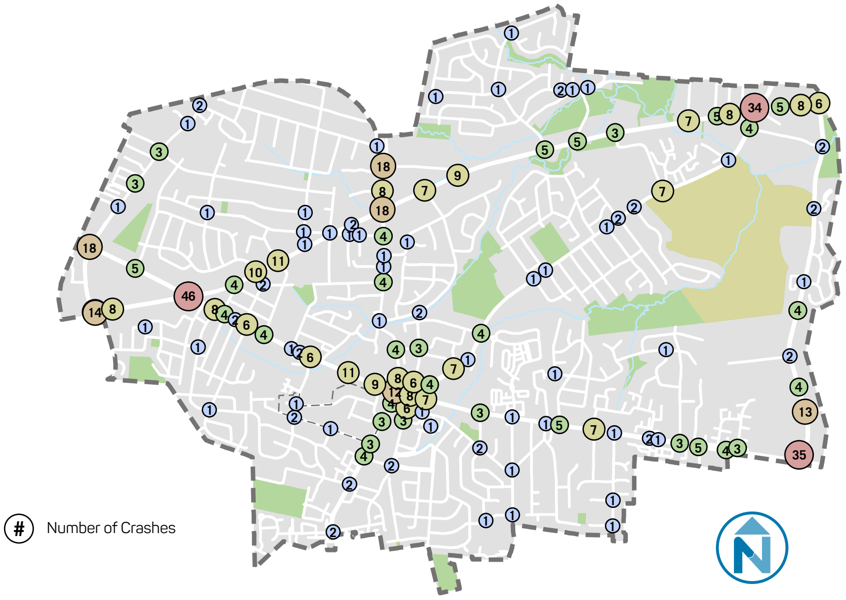


FIGURE 19 2015 VEHICLE CRASH RATES

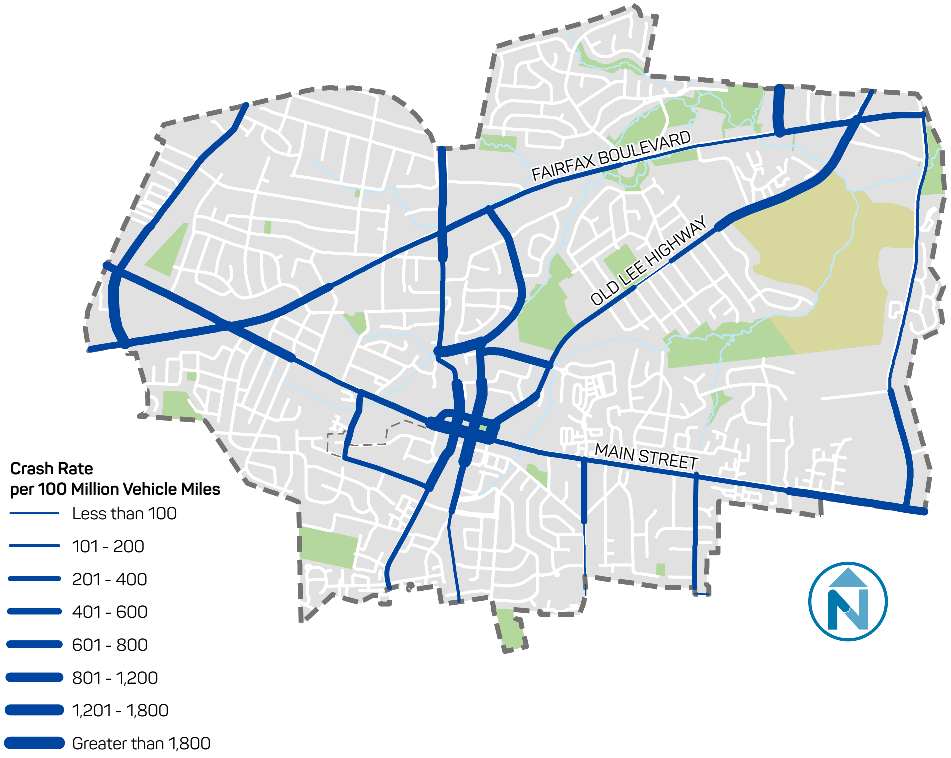
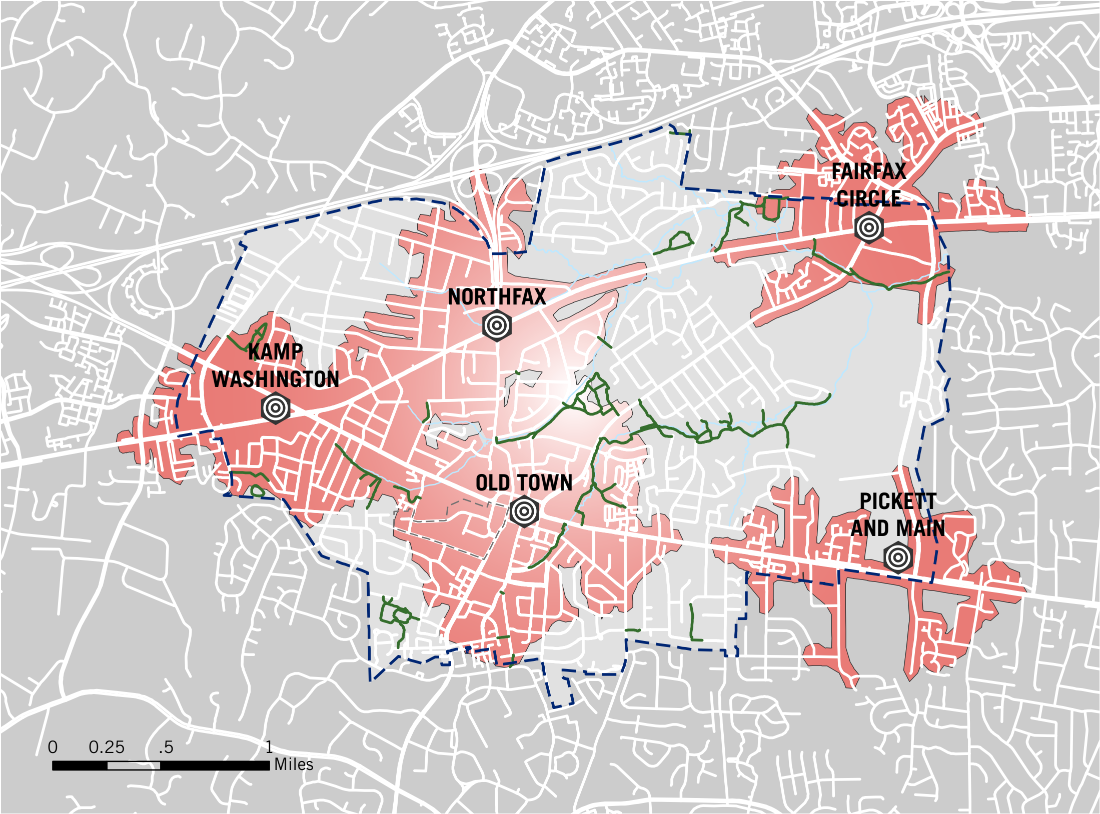


SOURCE: City of Fairfax, 2015

Pedestrian and bicycle access to amenities

Forty-four percent of City housing units are within a 20-minute walk of basic amenities such as shopping, dining, groceries, open space, schools, and other community facilities. Many of these amenities are concentrated within the City's five Activity Centers. Except for Old Town, these centers are generally separated from adjacent residential communities by larger block sizes, busy roadways, and missing or discontinuous pedestrian networks. High-volume roadways are often dangerous for pedestrians to navigate and complicate access to local amenities. While many neighborhoods have relatively complete sidewalk networks, and while the City has a number of bicycle and pedestrian trails, the bicycle and pedestrian network is not well-connected or accessible for all users.

FIGURE 20 ACTIVITY CENTER WALKSHEDS (15 MINUTES)

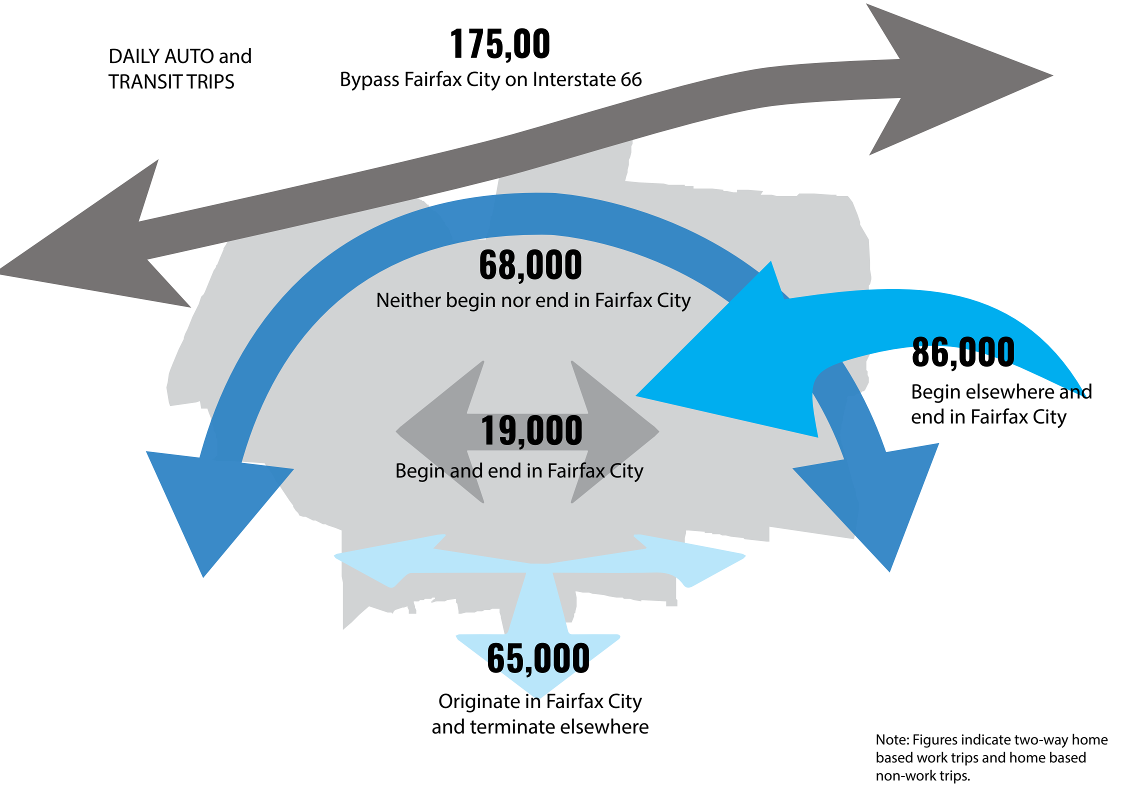


SOURCE: Census Data Set H1, 2010

Regional transportation demand

Every day, 68,000 regional travelers, primarily motorists, travel through the City without making a stop. As traffic congestion continues to increase on major regional corridors such as I-66 and Braddock Road, this regional traffic threatens to similarly increase congestion on City corridors.

FIGURE 21 DAILY TRIPS TO, FROM, AND THROUGH THE CITY

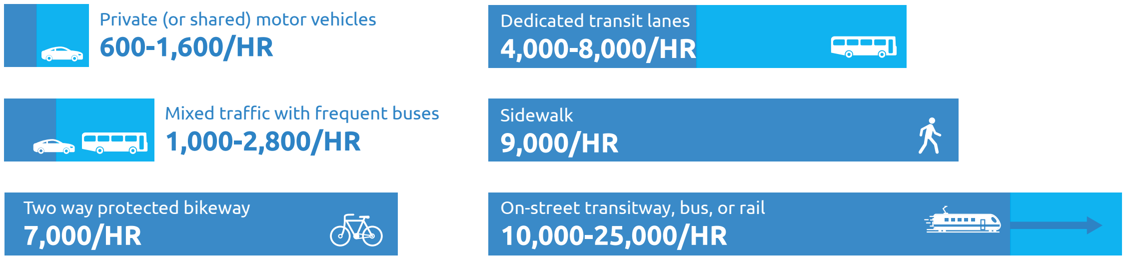


SOURCE: MWCOG 2.3 v57a Model, 2015

Roadway expansion limitations

While the City may continue to add local minor streets to enhance connectivity and access, few opportunities remain to add substantially more vehicle capacity on City streets. As such, the City will need to focus on ways to efficiently move more people within the existing street network. This can be done by encouraging higher occupancy in both private and mass transit vehicles, satisfying more short distance trips with walking and bicycle options, and encouraging people to shift their time of travel away from peak hours to less congested times of the day.

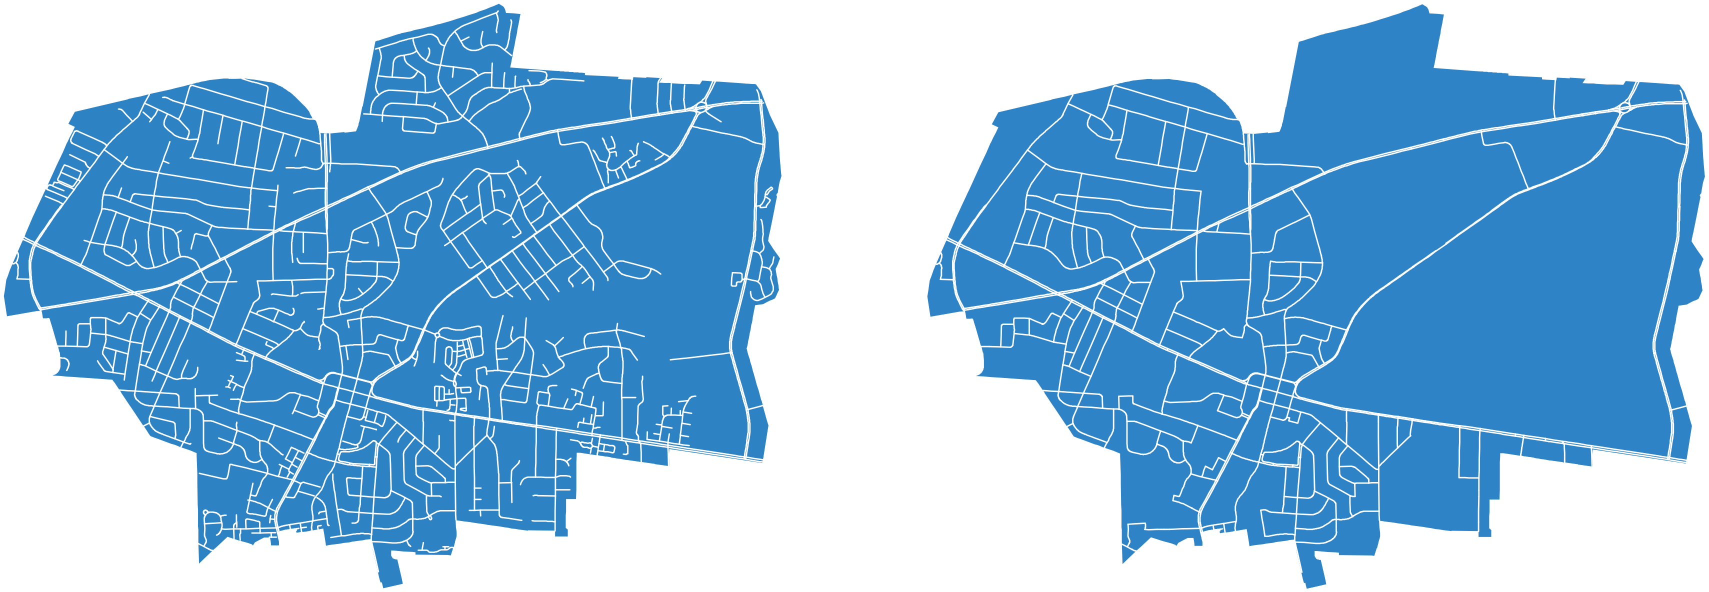
FIGURE 22 PEOPLE MOVING CAPABILITY OF VARIOUS TRANSPORTATION MODES



Street connectivity

The City has 104 centerline miles of streets. However, only 61% of them can connect users to other parts of the City without depending on major corridors. While limited connectivity discourages through traffic on local streets, it also constrains resident access in and out of their neighborhood. Oftentimes bicycle and pedestrian access is equally constrained, causing further conflict, congestion, and potential safety concerns among all road users.

FIGURE 23 TOTAL AND FUNCTIONAL VEHICULAR NETWORKS



TOTAL STREET GRID

A comparison of the entire City street grid to a functional grid paints a stark picture. The east side of the City consists almost entirely of neighborhoods isolated by physical barriers.

FUNCTIONAL STREET GRID

The functional grid is made up of roads that can be used to travel by vehicle to another neighborhood or part of the City. The west side of the City is far more integrated with Old Town and areas immediately northwest, southwest, and south of City boundaries.

Transportation infrastructure, services, and other assets

Among individuals responding to the 2015 City of Fairfax Multimodal Transportation Survey, about two-thirds of residents who currently drive alone to work expressed a desire to have the option to travel by some other means. Current constraints to non-auto travel include limited transit frequency, missing or discontinuous bicycle and pedestrian networks, and general concerns about safety when traveling by non-auto modes.

TRAILS

The City has a 28 mile trail network that provides safe, attractive, and convenient non-motorized access while concurrently promoting physical health and well-being.

CUE

The CUE bus system is well respected and generally well used, and buses generally operate over 16 hours a day on weekdays (with somewhat shorter hours on weekends). Frequency of service is limited, however. Real-time bus tracking and arrival information helps augment the system's usability. Combining transit applications with multimodal trip planning services provides riders with greater choice and convenience to weigh their travel decisions depending on time, cost, or other considerations.

DEVELOPMENT OPPORTUNITIES

The strong Northern Virginia economy continues to make the City an attractive place to live and invest. Following guidance in the Land Use Chapter of this plan, well-designed, concentrated development in Activity Centers can assist in reducing the growth of traffic and congestion. By locating many origins and destinations within a compact, accessible, and walkable area, more residents can fulfill daily needs without depending on driving. Those who drive may take just one vehicle trip and accomplish a number of other errands on foot within the same area. Urban-style development is better able to support more frequent transit service, benefiting travelers across the area.

Evolving shared mobility and technology options

Shared travel options such as carpooling, ride hailing services, or bicycle sharing systems offer opportunities to meet local travel needs conveniently and cost-effectively while reducing single-occupant vehicle travel. Real-time information, intelligent transportation, and other information and technology innovations can also make travel more efficient. Examples of best practices and future trends are shown in Appendix B. Some of these examples may be appropriate components of a sustainable mobility system in the City.

Multimodal Transportation

Goal 1

Connect with the region.

The City is a relatively small jurisdiction within a much larger region. Although regional traffic can congest City streets, City residents rely on the larger region for significant employment, entertainment, and cultural destinations; and City businesses rely on regional patrons and attract employees from the larger area. The City must enhance facilities that connect to the larger region, but do so in a way that supports safety, connection, and robust choices in travel options.

OUTCOME MM1.1:	Corridors for regional travel and better connections to regional networks and destinations are enhanced and improved.
ACTION MM1.1.1	Continue to participate in regional planning efforts to increase connectivity in the regional road, transit, and trail networks.
ACTION MM1.1.2	Collaborate with WMATA and regional partners to support a western extension of Metro's Orange Line, including a station location at I-66 and Route 123 (near Northfax) to benefit City of Fairfax stakeholders with improved access to the Metrorail system.
ACTION MM1.1.3	Increase connectivity to the existing Vienna/Fairfax-GMU Metrorail station including:
1.1.3.1	Improve pedestrian connections from the Fairfax Circle area to the Metro station area.
1.1.3.2	Improve bicycle facility connections and crossings across Fairfax Boulevard from the City to the Metro station.
1.1.3.3	Continue collaboration with George Mason University to enhance bicycle and transit connections between the University and the Metrorail system.
1.1.3.4	Implement the recommendations of the Old Lee Highway "Great Street" conceptual plan.
ACTION MM1.1.4	Expand trail and bicycle networks to connect to regional facilities and destinations, including:
1.1.4.1	Improve connections and logical links to the Cross-County Trail and beyond to the Washington & Old Dominion (W&OD) trail.
1.1.4.2	Improve trail connections south along Route 123 to connect to the Braddock Road Sidepath and on to Lorton.
1.1.4.3	Connect local trails to the planned I-66 trail facility.
1.1.4.4	Coordinate with Fairfax County on the construction of the Main Street/ Little River Turnpike bicycle facility.

Multimodal Transportation

Goal 1

Photo Credit: Virginia Department of Transportation

Photo Credit: Ben Schumin

ACTION MM1.1.5	Improve the Blake Lane-Jermantown Road corridor.
1.1.5.1	Complete a transportation study to determine necessary facility improvements and operational plans.
1.1.5.2	Coordinate with Fairfax County and VDOT on improvements to the Jermantown Road bridge over I-66, including additional capacity for vehicles, bicycles, and pedestrians.
1.1.5.3	Pursue a connection from Jermantown Road to Waples Mill Road north of Fairfax Boulevard.
ACTION MM1.1.6	Support Fairfax County in pursuing improvements to Braddock Road to facilitate its operation as a critical regional corridor.
ACTION MM1.1.7	Complete the Government Center Parkway connection.
ACTION MM1.1.8	Improve safety and ensure continued efficiency of Pickett Road as a regional north-south corridor and important truck route.
OUTCOME MM1.2:	Safety and operations in the regional network are improved.
ACTION MM1.2.1	Conduct a detailed study of Fairfax Circle to improve safety and operations, potentially including geometric changes to the existing circle configuration.
ACTION MM1.2.2	Simplify multi-leg and offset intersections, such as the intersection of McLean Avenue, Warwick Avenue, and Fairfax Boulevard.
ACTION MM1.2.3	Address safety and operational deficiencies at major intersections, such as the intersection of Eaton Place and Chain Bridge Road.
ACTION MM1.2.4	Continue City participation on regional transportation boards.
ACTION MM1.2.5	Promote a regional approach to public transportation planning.
ACTION MM1.2.6	Participate in the regional process for evaluation and recommendation of projects to be applied for state and federal funding.

Multimodal Transportation

Goal 2

Provide viable and attractive mobility choices.

At present, the City is heavily dominated by vehicle traffic. Many surveyed residents expressed a desire to make the City more walkable and bikeable, but walking or bicycling on busy streets can be uncomfortable or even dangerous. The City's bus system is well-used and highly regarded, but is often caught in the same traffic as other vehicles. Improving mobility requires providing a balanced system where people can choose the best travel option for them depending on their needs.

OUTCOME MM2.1:	Pedestrian safety is improved.
ACTION MM2.1.1	Fill critical gaps in the pedestrian network. Develop and act on a prioritized list of sidewalk improvements in the commercial areas and provide sidewalks on at least one side of every residential street in neighborhoods that are in agreement.
ACTION MM2.1.2	Ensure the pedestrian network is accessible to all and meets the requirements of the Americans with Disabilities Act (ADA).
ACTION MM2.1.3	Enhance safe routes to school, safe routes to transit, and safe routes to community facilities, completing specific planning efforts as required.
ACTION MM2.1.4	Improve pedestrian crosswalks. Crosswalks should be provided across all legs of all intersections.
ACTION MM2.1.5	Expand the sidewalk network. Sidewalks should be provided with any significant street maintenance, rehabilitation, or reconstruction project and may be constructed independent of a street project.
ACTION MM2.1.6	Increase pedestrian connectivity to the existing Vienna/Fairfax-GMU Metro station, such as through the Fairfax Circle area.
ACTION MM2.1.7	Expand safety education efforts to educate all road users on pedestrian awareness and safety. Educate residents on proper procedures for traveling as a pedestrian, interacting with pedestrians as a driver, and locating and using pedestrian facilities to increase comfort and safety and encourage more walking.
OUTCOME MM2.2:	The City's existing trail system, including the "Green Ribbon" parks and trail network, is connected and expanded.
ACTION MM2.2.1	Identify and fill gaps in the trail network. Find opportunities for future trails, complete connections to existing segments, implement projects proposed by the Parks and Recreation Master Plan, and pursue new trail connections to create a more functional trail network.
ACTION MM2.2.2	Connect the George Snyder Trail to the planned I-66 trail facility.
ACTION MM2.2.3	Improve trail crossings across arterial streets, including Fairfax Boulevard at Pickett Road and Main Street at Main Street Square and Railroad Avenue.

Multimodal Transportation Goal 2

ACTION MM2.2.4	Provide wayfinding, trailblazing, traffic calming/safety, and non-motorized facility improvements to provide connections between parks and trails.
ACTION MM2.2.5	Increase resident awareness of trail networks and connections.
OUTCOME MM2.3	Bicycle network, facilities, and programs are improved.
ACTION MM2.3.1	Develop and adopt a bicycle network plan linking major destinations including George Mason University, Old Town, Metrorail, and the regional trail system.
ACTION MM2.3.2	Review bicycle facility design standards to ensure best practices in design and delivery of facilities.
ACTION MM2.3.3	Expand the provision of bicycle racks for short-term bicycle parking.
ACTION MM2.3.4	Adopt bicycle-supportive policies for development projects where applicable, including expanded provision of short- and long-term bicycle parking, showers, and changing facilities.
ACTION MM2.3.5	Complete a bikeshare feasibility study including definition of necessary station density, recommended "starter system," operating and management structure, and funding program, preferably in partnership with George Mason University.
ACTION MM2.3.6	Provide initial support to establish bikeshare in the City.
ACTION MM2.3.7	Expand safety education efforts to educate all road users on bicycle awareness and safety. Educate casual cyclists on proper procedures to encourage more cycling through an increased comfort level.
ACTION MM2.3.8	Increase connectivity to the existing Vienna/Fairfax-GMU Metrorail station by improving bicycle facility connections and crossings across Fairfax Boulevard north to the Metro station.

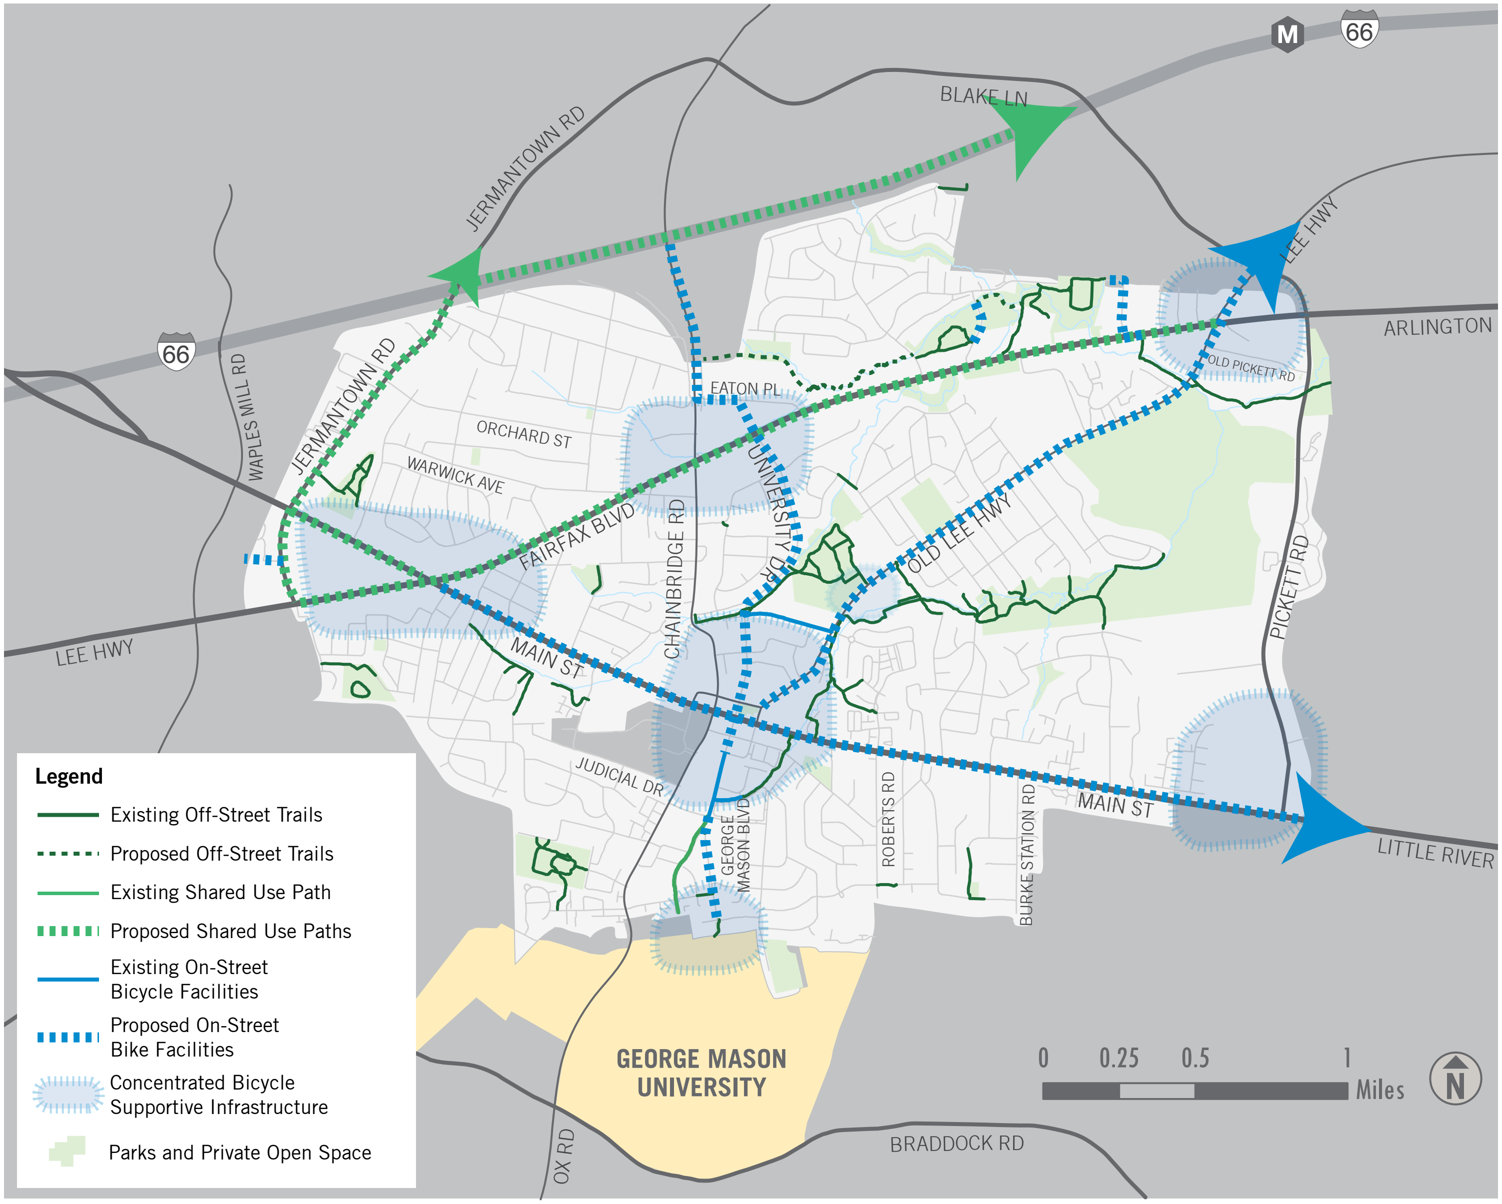
Multimodal Transportation Goal 2

OUTCOME MM2.4	Transit continues to be an effective non-driving alternative.
ACTION MM2.4.1	Improve transit services and facilities.
2.4.1.1	Identify a priority transit network providing enhanced transit operations and more frequent services along key corridors including Main Street, Old Lee Highway, and Fairfax Boulevard.
2.4.1.2	Enhance passenger accommodations to improve comfort and convenience.
2.4.1.3	Improve major transfer locations with quality passenger amenities, expanded information, and improved pedestrian facilities. Significant transfer locations include the Kamp Washington area, Fairfax Circle, Old Town, and Pickett and Main.
2.4.1.4	Implement recommendations of the CUE Transit Development Plan to maintain the highly-valued service of the CUE system.
2.4.1.5	Achieve and maintain 90% on-time performance for the CUE system.
2.4.1.6	Improve connections to other transit routes and facilities through enhancements at significant transfer locations.
2.4.1.7	Promote transit-friendly design features in development projects.
2.4.1.8	Expand ADA-accessible sidewalks and crosswalks serving bus stops.
OUTCOME MM2.5:	Vehicular travel and facilities are effectively managed and maintained.
ACTION MM2.5.1	Design all new facilities and upgrade existing facilities to comply with all federal, state, and local safety standards.
ACTION MM2.5.2	Pursue new technologies that would improve safety on City streets.
ACTION MM2.5.3	Ensure the safety of City streets by incorporating traffic calming measures as needed.
ACTION MM2.5.4	Evaluate opportunities to increase street grid connectivity to distribute traffic and to improve network resiliency. Opportunities for additional connections may be identified at any time but particularly as redevelopment occurs.

FIGURE 24 PROPOSED GREEN RIBBON OF RECREATIONAL TRAILS AND ENVISIONED CONNECTIONS

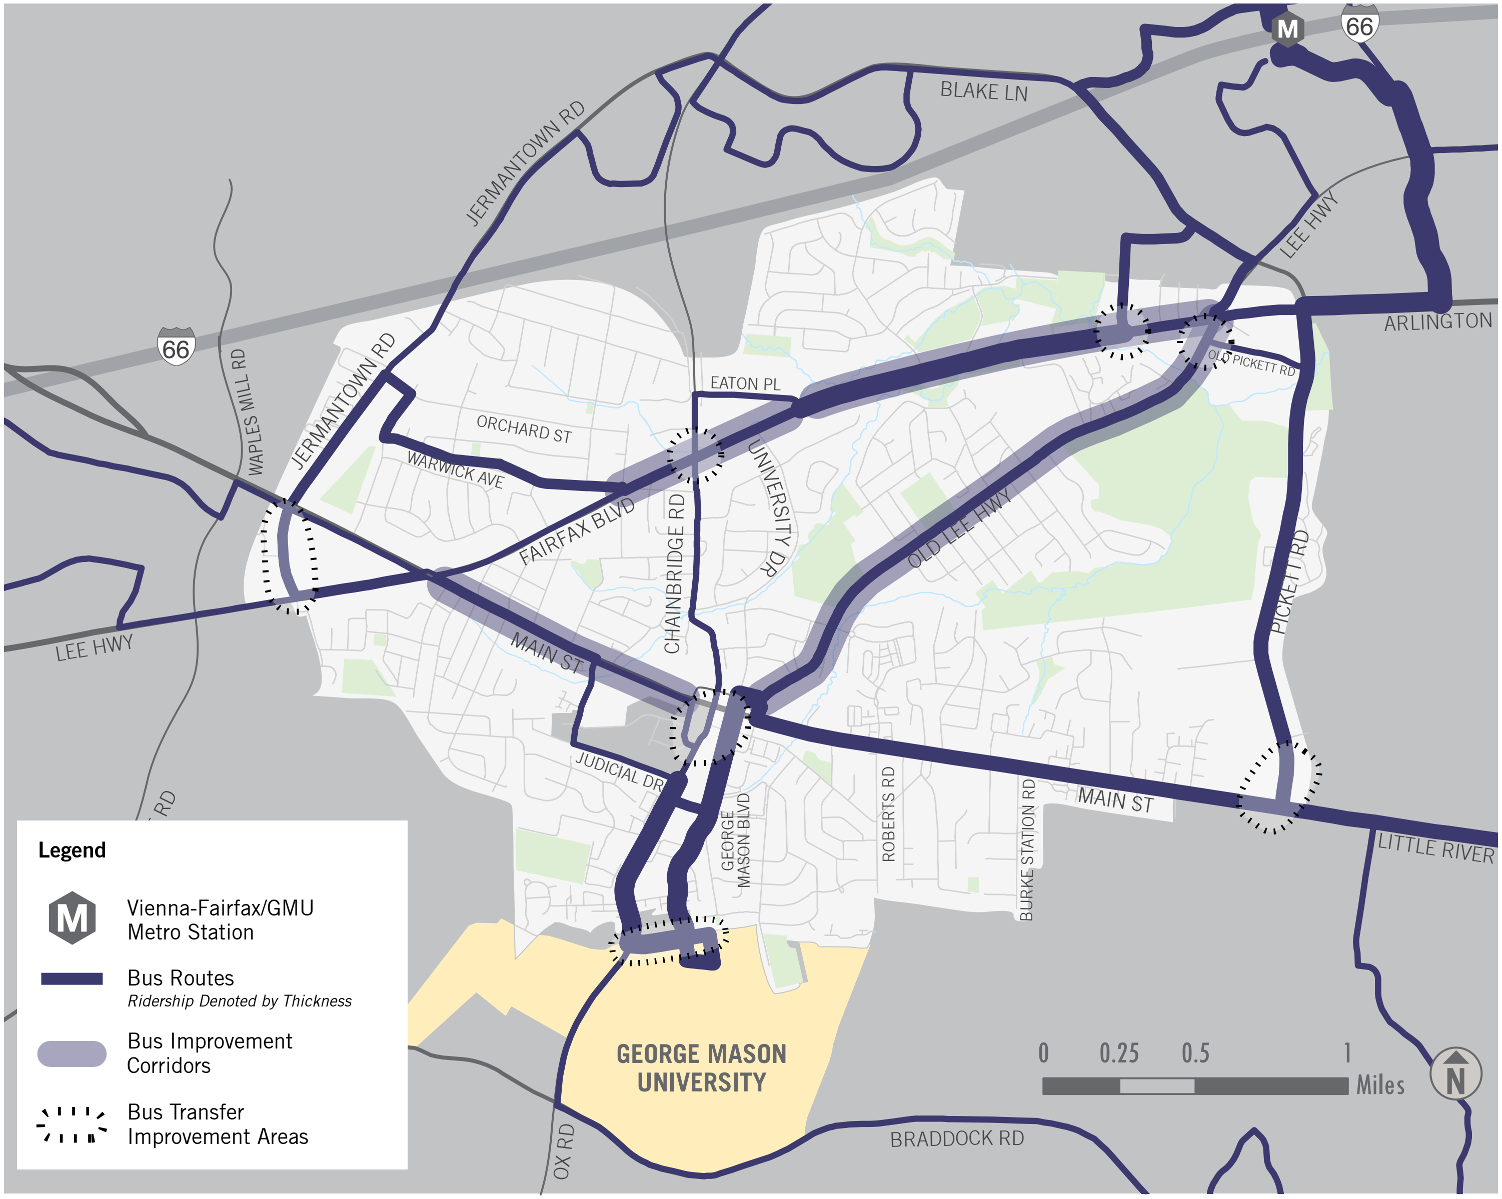
(See Outcome MM2.2)

FIGURE 25 PROPOSED NETWORK FOR BICYCLE TRAVEL



(See Outcome MM2.3)

FIGURE 26 PROPOSED TRANSIT NETWORK ENHANCEMENTS



(See Outcome MM2.4)

Multimodal Transportation Goal 3

Integrate transportation with land use.

Land use and transportation are inextricably linked and must be planned and designed concurrently – the purpose of transportation is to improve access to land use, and development patterns impact the feasibility and attractiveness of mobility choices. Mixing uses in a compact, walkable area – building housing, schools, parks, employment, shops and dining close together – can reduce the need for vehicle trips that contribute to increased congestion and other negative impacts such as eroded air quality and public health. Designing connected street networks increases the accessibility of these areas to surrounding areas. Managing parking and encouraging the use of non-driving modes can further reduce the growth of vehicle traffic while allowing for new development.

OUTCOME MM3.1:	On- and off-street parking and curbside uses are effectively managed.
ACTION MM3.1.1	Effectively locate, design, and manage parking facilities to provide context-appropriate parking availability and accessibility to the surrounding destinations.
ACTION MM3.1.2	Enhance wayfinding and information, with an initial focus on Old Town.
ACTION MM3.1.3	Explore parking pricing and other parking management strategies for public parking spaces and facilities throughout the City.
ACTION MM3.1.4	Explore the creation of parking management districts in Old Town and other Activity Centers to maximize parking resources while minimizing excess parking supply.
ACTION MM3.1.5	Consider policy measures to allow developers to fund public parking or other forms of access infrastructure in lieu of meeting parking requirements on site.
ACTION MM3.1.6	Develop travel marketing material to reduce the demand for long-term commuter/employee parking in the City.
ACTION MM3.1.7	Revise the Residential Parking Permit District Policy to consistently manage on-street public parking in residential neighborhoods.
OUTCOME MM3.2:	Walkability to and within Activity Centers and between neighborhoods is increased.
ACTION MM3.2.1	Whenever possible, increase connections – particularly non-motorized connections – between neighborhoods, community facilities, and Activity Centers.
ACTION MM3.2.2	With development projects, break up large blocks to a more walkable scale. Pursue additional secondary and tertiary street network opportunities. Streets should be well-designed as complete streets and align at regular intersections for a continuous street grid.

Multimodal Transportation Goal 3

The City will improve street design and better guide street management decisions through adoption of a "Link + Place" street typology appropriate to the City's streets and development patterns. The typology provides planners, engineers, and designers with an understanding of the typical and desired users of the street, features to consider for inclusion, and the transportation demands that require accommodation based on the street's size and uses. Link + Place street type designations for all streets in the City are provided in Figure 28, with each street type defined on the following pages.

ACTION MM3.2.3	Increase the number, safety, and frequency of pedestrian crossings, including across major streets. Provide crosswalks at all approaches of all signalized intersections at minimum intervals of 500 feet within Activity Centers. An exception exists in the case where the implementation of a crosswalk would result in operational failure of the corridor.
ACTION MM3.2.4	Improve the overall pedestrian environment, including pedestrian crossings, street trees, and furnishing zones; buffering sidewalk from vehicle travel lanes; improved pedestrian scale lighting; and active ground floor uses along primary street edges.
OUTCOME MM3.3:	Streets are designed to accommodate context and function.
ACTION MM3.3.1	Develop and adopt a "Link + Place" street typology to guide street design and management for public and private streets.
ACTION MM3.3.2	Through community consultation, develop specific design objectives, desired outcomes, and performance metrics for each street type. Link design objectives to the street design and project development process, guidelines, and reference documents.
ACTION MM3.3.3	Ensure quality street design in both the pedestrian zone and travel zone of the street.
ACTION MM3.3.4	Improve access, circulation, walkability, and transportation management in Activity Centers.

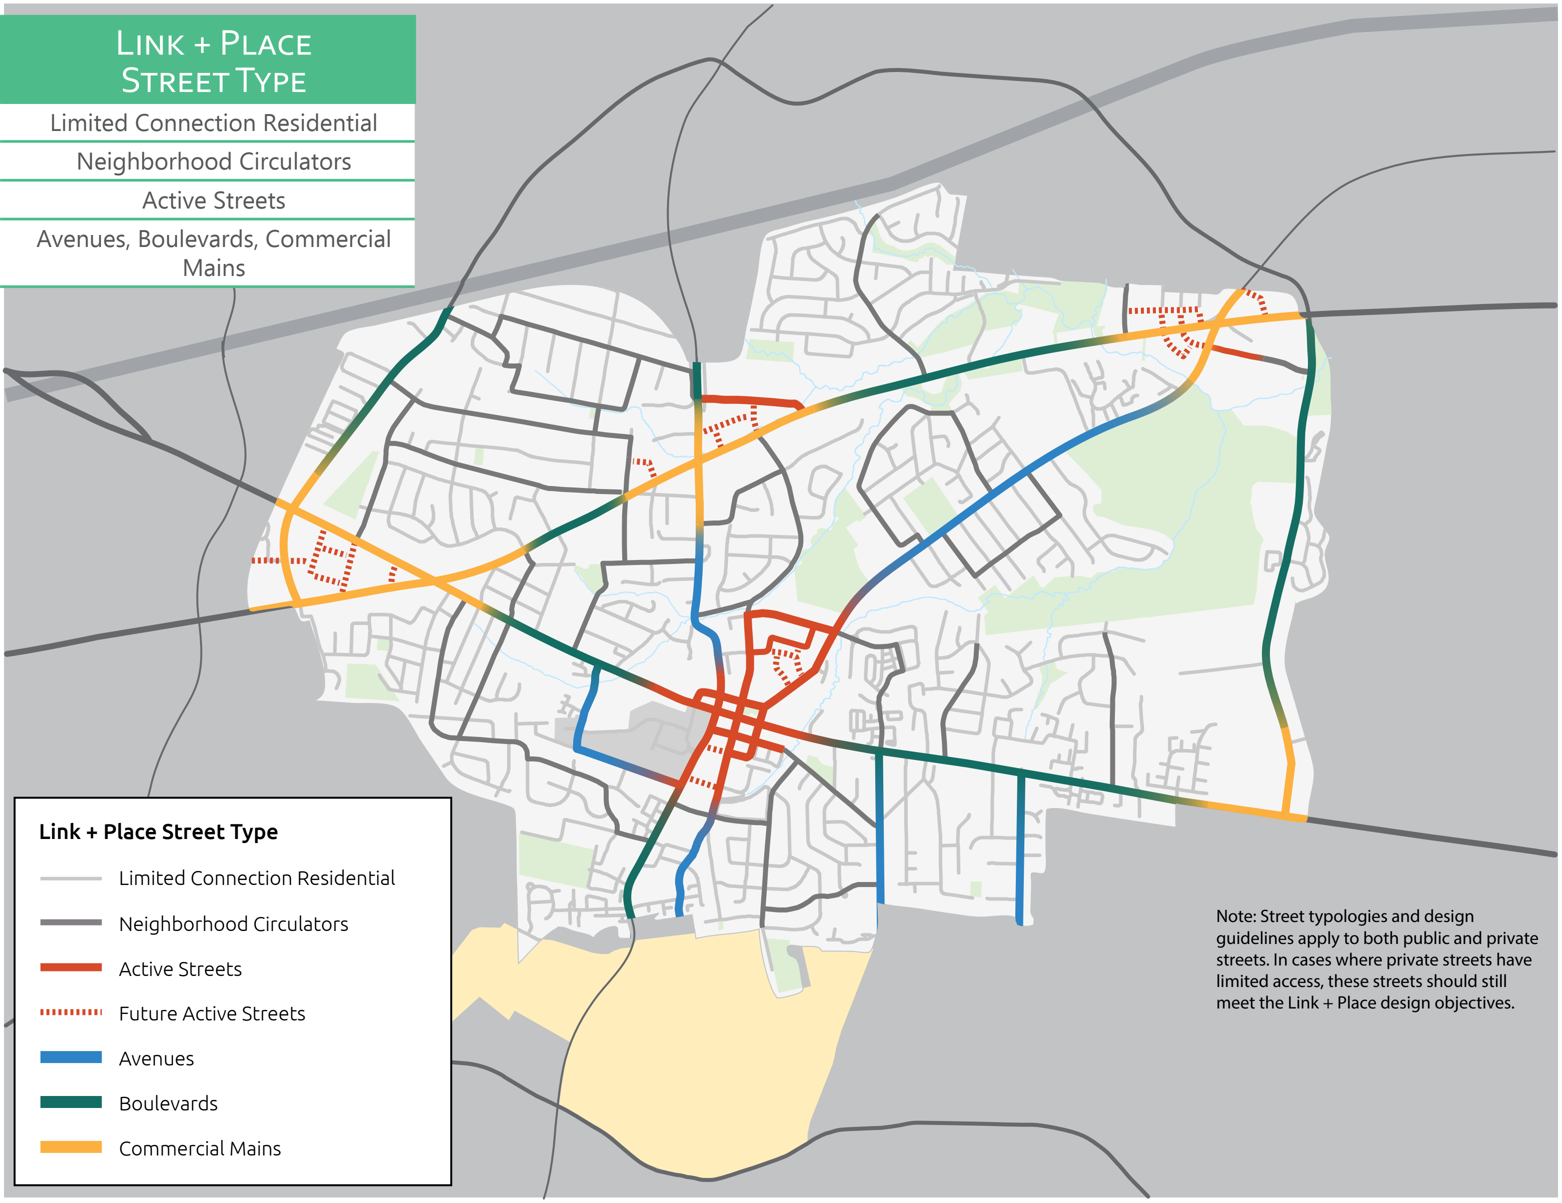
FIGURE 27 PROPOSED ACTIVITY CENTER ENHANCEMENTS

(See Outcome MM3.2)

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

FIGURE 28 PROPOSED STREET TYPOLOGY DESIGNATIONS

VDOT CLASSIFICATION	LINK + PLACE STREET TYPE
Local	Limited Connection Residential
Minor Collector	Neighborhood Circulators
Major Collector	Active Streets
Minor + Major Arterial	Avenues, Boulevards, Commercial Mains



Note: Street typologies and design guidelines apply to both public and private streets. In cases where private streets have limited access, these streets should still meet the Link + Place design objectives.

(See Outcome MM3.23

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

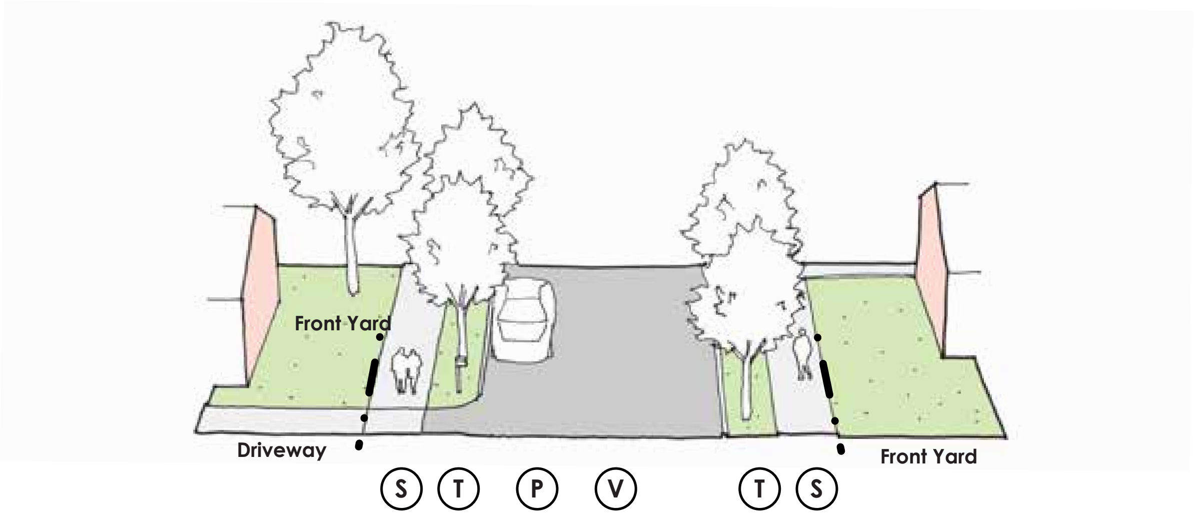
LIMITED CONNECTION RESIDENTIAL STREETS

These are interior neighborhood residential streets that generally do not connect to other streets in the network. These streets are lined with residential front yards and a robust tree canopy, and generally self-regulate both vehicle speeds and volumes.

Typical Transportation Uses

- Local traffic only – typically the home segment of the journey
- Non-motorized trips within the neighborhood
- Bicycles typically share the street with vehicles
- Very low traffic speeds

LIMITED CONNECTION RESIDENTIAL STREETS



TYPICAL ELEMENTS MAY INCLUDE:

- NARROW AND DESIGNED FOR SLOWER SPEEDS
- SINGLE-FAMILY RESIDENTIAL SET BACK WITH DRIVEWAYS
- ON-STREET PARKING (UNMARKED) - WHERE APPLICABLE
- SIDEWALKS

DIAGRAM KEY

Ⓥ	Travel Lanes -10' to 11' Each
Ⓟ	On-Street Parking
Ⓣ	Street Tree Zone - 5'
Ⓢ	Sidewalks - 5'
¦	City Right-of-Way

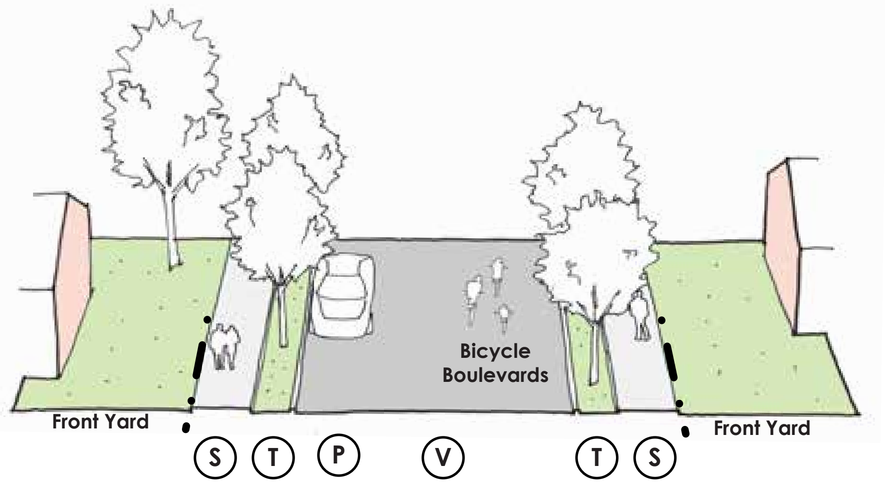
NEIGHBORHOOD CIRCULATORS

Neighborhood Circulators are residential streets that contribute to community connectivity and may include the presence of parks, community centers, schools, or places of worship. Neighborhood Circulators have abundant street trees and open space along them. These streets may need design techniques that reduce travel speeds and traffic volumes.

Typical Transportation Uses

- Mostly local traffic; vehicles from throughout the neighborhood may filter onto these streets
- Some may have transit service
- Non-motorized trips connecting to local destinations (e.g., schools, parks or retail)
- Bicycles typically share the street with vehicles; marked facilities recommended
- Vehicle speeds should be low; speed management may be required

NEIGHBORHOOD CIRCULATORS



Note: Similar to Limited Connection Residential, though provide more connectivity to City street network

TYPICAL ELEMENTS MAY INCLUDE:

- NARROW AND DESIGNED FOR SLOWER SPEEDS
- SINGLE-FAMILY RESIDENTIAL SET BACK WITH DRIVEWAYS
- ON-STREET PARKING (UNMARKED) - WHERE APPLICABLE
- SIDEWALKS
- BICYCLE BOULEVARDS (SEE DEFINITION BELOW)
- STREET LIGHTING

DIAGRAM KEY

Ⓥ	Travel Lanes -10′ to 11′ Each
Ⓟ	On-Street Parking - 8′
Ⓣ	Street Tree Zone - 5′
Ⓢ	Sidewalks - 5′
i	City Right-of-Way

Bicycle Boulevards are streets with low traffic volumes and speeds, designated and designed to give bicycle travel priority within the travel lane.

-National Association of City Transportation Officials

ACTIVE STREETS

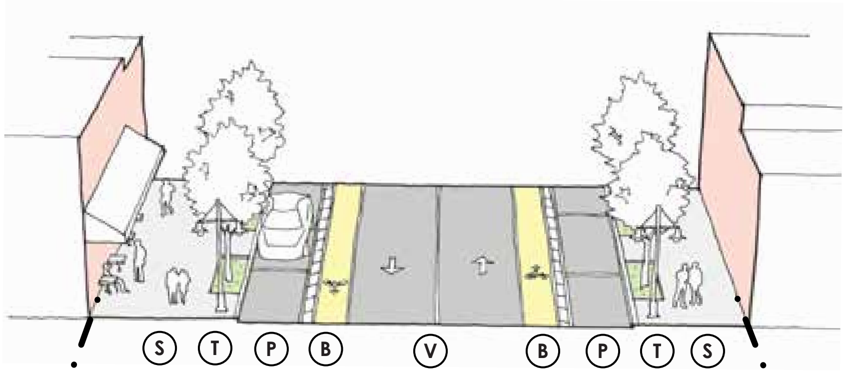
Active Streets connect multiple destinations and are more mixed-use or commercial in nature than residential streets. They are generally the street type for new streets within Activity Centers and are the primary location for commercial property access. Active Streets should be designed to create a comfortable environment for walking while at the same time accommodating circulation by bicyclists, cars, and trucks, and in some cases transit vehicles.

Typical Transportation Uses

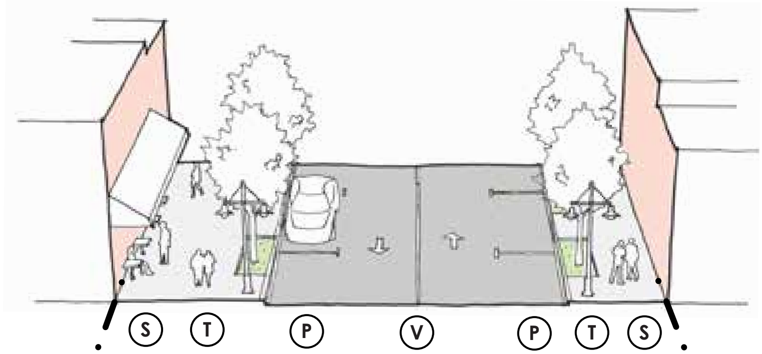
- Mostly local traffic accessing destinations, though some active streets may accommodate regional traffic
- Some may have transit service
- High concentrations of pedestrians
- Bicycles in-street only, preferably on dedicated facilities
- Loading and delivery vehicles need to be accommodated
- Traffic speeds should be low

ACTIVE STREETS

Option 1



Option 2



TYPICAL ELEMENTS MAY INCLUDE:

- NARROW STREETS (TYPICALLY TWO LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- ON-STREET PARKING
- SIDEWALKS
- BICYCLE BOULEVARDS
- STREET LIGHTING
- TREES IN PITS, PLANTERS, OR GRATES

DIAGRAM KEY

Ⓥ Travel Lanes -10' to 11' Each
Ⓟ On-Street Parking - 8'
Ⓣ Street Tree Zone - Min. 5'
Ⓢ Sidewalks - Varies 6' to 12'
Ⓑ Bicycle Lanes - Min. 5'
i City Right-of-Way

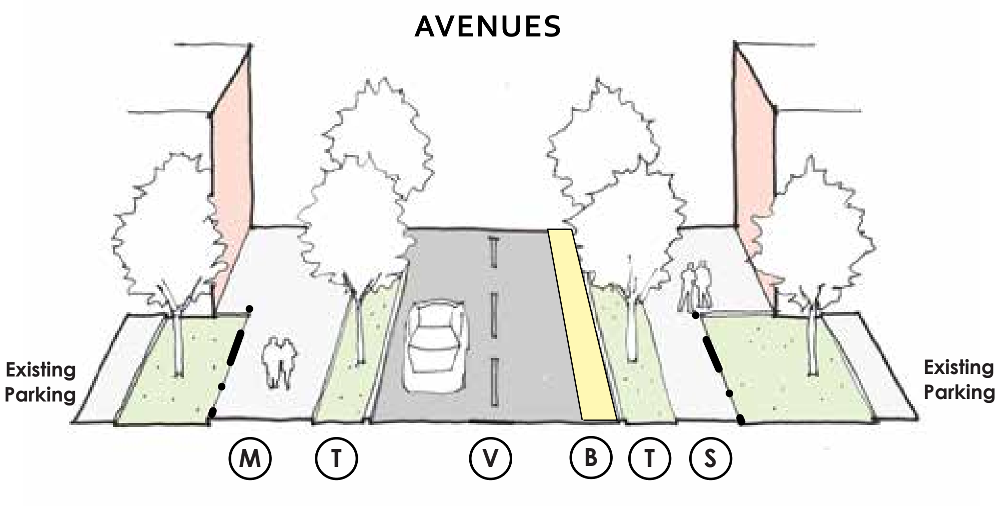
AVENUES

Avenues carry moderate traffic volumes using one travel lane in each direction. As a result, these corridors are more comfortable for transportation users. They include sections of arterial corridors between certain Activity Centers such as Old Lee Highway and Chain Bridge Road. Medians or planted median islands are less common while curb cuts and access drives are numerous. Vehicle throughput can be controlled through these areas due to high volume, naturally lowering traffic speeds to a level consistent with the non-commercial context.

Typical Transportation Uses

- Can be moderate volumes of traffic. Most vehicles are passing through to other local or area destinations
- Transit service is likely
- Moderate concentrations of pedestrians
- Bicycles accommodated on protected or off-street facilities such as shared use paths
- Traffic speeds lower, limited by volume

Image Credit: Google



TYPICAL ELEMENTS MAY INCLUDE:

- LOWER CAPACITY THAN BOULEVARDS (TWO LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- LIMITED OR NO ON-STREET PARKING
- SIDEWALKS OR SHARED USE PATHS
- BICYCLE LANES AND/OR SHARED USE PATHS
- VEGETATED BUFFERS FOR TREE ZONE

DIAGRAM KEY

Ⓥ	Travel Lanes -11' to 12' Each
Ⓣ	Street Tree Zone - Min. 5'
Ⓢ	Sidewalks - Varies 6' to 12'
Ⓜ	Shared Use Paths - Min. 10'
Ⓑ	Bicycle Lanes - Min. 5'
┆	City Right-of-Way

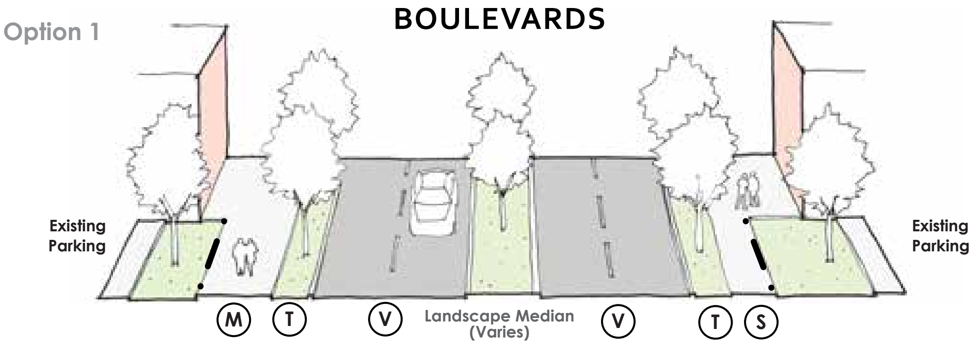
BOULEVARDS

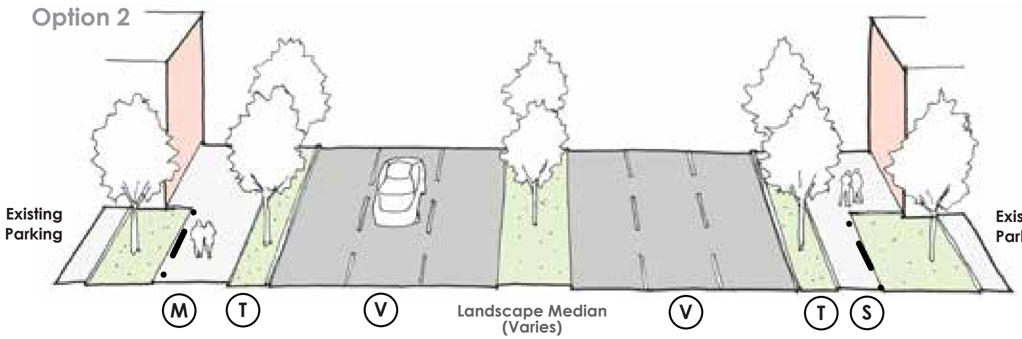
Boulevards carry moderate to high volumes of traffic, but do so through a parkway like setting. They include sections of arterial corridors between the Activity Centers that may be designated as Boulevards, as well as minor arterials such as Pickett Road and Jermantown Road. Medians or planted median islands are common and curb cuts and access drives should be few and far between. While vehicle throughput is generally smooth through these areas, traffic speeds should remain consistent with the residential or park-like setting the streets travel through.

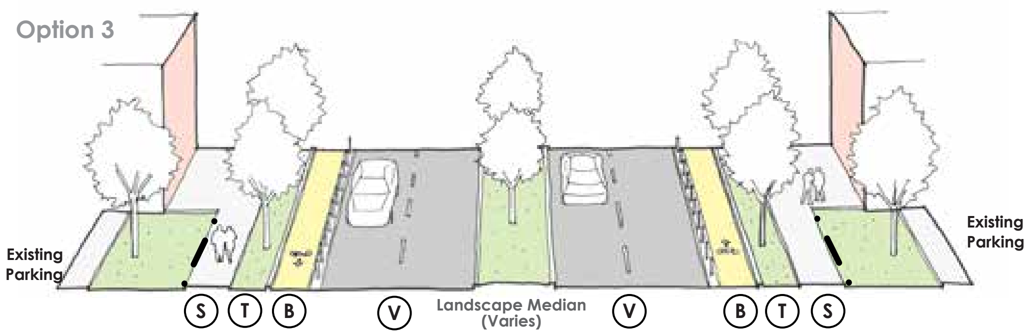
Typical Transportation Uses

- Can be high volumes of traffic. Most vehicles are passing through to other local or area destinations
- Transit service is likely
- Low concentrations of pedestrians
- Bicycles accommodated on protected or off-street facilities such as shared use paths
- Traffic speeds likely higher, but still managed

BOULEVARDS







TYPICAL ELEMENTS MAY INCLUDE:

- MULTI-LANE (TYPICALLY FOUR OR MORE LANES)
- GROUND FLOOR USES ORIENTED TOWARD THE STREET
- NO ON-STREET PARKING
- SIDEWALKS OR SHARED USE PATHS
- BICYCLE LANES OR SHARED USE PATHS
- VEGETATED BUFFERS FOR TREE ZONE

DIAGRAM KEY

Ⓥ Travel Lanes -11′ to 12′ Each
Ⓣ Street Tree Zone - Min. 5′
Ⓢ Sidewalks - Varies 6′ to 12′
Ⓜ Shared Use Paths - Min. 10′
Ⓑ Bicycle Lanes - Min. 5′
/ City Right-of-Way

COMMERCIAL MAINS

Commercial Mains are where commercial activity is concentrated, such as Fairfax Boulevard through Northfax or Main Street around Kamp Washington. Commercial Mains feature high volumes of vehicle traffic that mixes with bicycles, transit vehicles, and pedestrian crossings. Streets should be designed to slow traffic speeds while facilitating traffic flow. The pedestrian zone of the street should buffer pedestrians from the adjacent traffic. Access management on Commercial Mains improves vehicle flow while reducing conflicts with pedestrians or bicyclists.

Typical Transportation Uses

- Can be high volumes of traffic. Many vehicles are passing through to other local or regional destinations
- Transit service is likely
- High concentrations of pedestrians
- Bicycles accommodated in dedicated facilities either in-street or in well-designed shared use paths
- Traffic speeds likely higher, but still managed

Multimodal Transportation

Goal 4

Adopt policies and procedures for strategic transportation decision making.

The City will work with civic leaders, community members, and other stakeholders to develop and adopt clear and consistent policies and processes based on the community's fundamental values and advance the overall vision for sustainable transportation. These policies are aimed at ensuring the safety of all travelers, enhancing the person-trip efficiency of the system, and preserving the characteristics that make the City unique.

OUTCOME MM4.1:	The City's sidewalk policy is updated.
ACTION MM4.1.1	Adopt a formal sidewalk policy, beginning with the best practices and policy recommendations for Pedestrian Accessibility Policy in Appendix B (Section 4), requiring sidewalks on all new, reconstructed, or substantially rehabilitated streets that respond to local needs and community context.
OUTCOME MM4.2:	A Complete Streets policy is adopted and implemented.
ACTION MM4.2.1	Develop and adopt a Complete Streets policy, beginning with the best practices and policy recommendations for Complete Streets Policy in Appendix B (Section 5).
4.2.1.1	Develop an appropriate policy for the City and adopt as formal policy.
4.2.1.2	Examine existing design practices and processes and adjust to ensure implementation of the adopted policy.
4.2.1.3	Set and track evaluation measures for Complete Streets improvements.
ACTION MM4.2.2	Implement Complete Streets improvements on major corridors including Fairfax Boulevard, Chain Bridge Road, University Drive, Old Lee Highway and Main Street.
OUTCOME MM4.3:	A Transportation Demand Management (TDM) Program is adopted and implemented.
ACTION MM4.3.1	Based on best practices (as defined in Appendix B Section 3), establish a Citywide TDM policy and program framework that can be utilized by the City and adapted by businesses and developers.
ACTION MM4.3.2	Require TDM for all large development projects. Require bi-annual monitoring to assess resident/employee travel patterns.

Multimodal Transportation Goal 4

ACTION MM4.3.3	Create a City TDM brand and website to centralize all available travel option information including transit schedules, bicycle maps, ridesharing opportunities, and education tools.
ACTION MM4.3.4	Increase outreach and education to George Mason University, the Central Fairfax Chamber of Commerce, City of Fairfax Schools, and other markets that can provide strong partnerships with the TDM program.
ACTION MM4.3.5	Evaluate a linked TDM fund for in-lieu developer fees related to parking requirements to enhance the transit system and Citywide TDM programs.
ACTION MM4.3.6	Improve access to ridesourcing programs through enhanced coordination with Fairfax County RideSource, Commuter Connections, or initiate a City-based program.
ACTION MM4.3.7	Explore opportunities for carshare services within the City to address "last mile" connections.
ACTION MM4.3.8	Partner with employer-sponsored wellness programs to highlight and market travel options and associated costs.
OUTCOME MM4.4:	Mobility best practices and emerging technologies, including those described in Appendix B, are considered in transportation policies and projects.
ACTION MM4.4.1	Consider methods of implementing and evaluating new transportation concepts, including trial or pilot programs.
ACTION MM4.4.2	Provide real-time information through both apps and visual displays for transit arrivals, parking availability, and shared bicycles and vehicles.
ACTION MM4.4.3	Promote multimodal travel planning applications and services.
ACTION MM4.4.4	Pursue Intelligent Transportation Systems (ITS) such as transit or emergency vehicle priority, dynamic signal timing, and other strategies.

Multimodal Transportation
Goal 4

ACTION MM4.4.5	Participate with state and regional partners to ensure autonomous vehicle policies protect vulnerable street users and reduce overall vehicle miles traveled.
ACTION MM4.4.6	Consider curbside policies and street design to manage curbside carsharing/ridesourcing activities while preserving the safe and efficient flow of travel.
ACTION MM4.4.7	Consider policies to promote technologies and innovations that reduce environmental impacts from transportation.
OUTCOME MM4.5:	A short-term prioritized transportation project list is developed.
ACTION MM4.5.1	Develop a two-year project list that reflects City Council and community priorities.
ACTION MM4.5.2	Provide opportunities for public input on transportation improvements.
ACTION MM4.5.3	Use all available media to provide transportation information to the public.

Recommended Transportation Policies, And Projects And Cost Estimates

The plan's goals are achieved through accomplishing the policies and projects highlighted in Figure 30. Additionally, in accordance with Virginia Code Section 15.2-2223 relating to Comprehensive Plans, the map is accompanied by cost estimates for the specific projects, as shown below in Figure 29. The map and table include only key recommended projects; all projects under consideration to meet the long-term goals of the Multimodal Plan will be considered annually as part of the development of the City's Two-Year Transportation Program.

FIGURE 29 CITY OF FAIRFAX MULTIMODAL TRANSPORTATION PLAN – COST ESTIMATE

PROJECT #	NAME	PROJECT TOTAL COST ESTIMATE
1	Implement multimodal improvements at Warwick Ave and Fairfax Blvd	$ 7,900,000
2	Improve Jermantown Rd corridor	$ 21,000,000
3	Add sidewalk connection on Chain Bridge Rd between Old Town and Fairfax Blvd	$ 4,580,000
4	Implement Old Lee Hwy multimodal improvements	$ 15,000,000
5	Study Main St bicycle facility feasibility	$ 11,200,000
6	Extend trail along Pickett Rd from Fairfax Blvd to the Cross County Trail	$ 3,500,000
7	Complete the George Snyder Trail	$ 14,000,000
8	Support the study of a Metrorail extension	$ 15,260,000
9	Improve intersection at Eaton Place and Chain Bridge Rd	$ 26,000,000
10	Improve vehicular and pedestrian safety at Fairfax Circle	$ 5,760,000
11	Expand the roadway network in Northfax West	$ 5,000,000
12	Extend South St between University Dr and Chain Bridge Rd	$ 19,750,000
13	Complete the Judicial Drive Trail	$ 350,000
14	Implement University Drive traffic calming measures	$ 500,000
15	Complete the Government Center Parkway connection	$ 5,000,000
Citywide, not location specific	Implement pedestrian spot improvements Citywide	$ 400,000
	Conduct a bikeshare feasibility study	$ 60,000
	Improve Transit facilities	$ 965,000
	Implement roadbed improvements	$ 1,000,000
	Develop a Transportation Demand Management Program	$ 60,000
	Maintain pavement condition of primary extension roadways	$ 970,000
		$ 158,255,000

FIGURE 30 TRANSPORTATION POLICIES AND PROJECTS

Regional Corridors

Continue to participate in regional planning efforts to improve vehicle and freight operations and pedestrian, bicyclist and vehicle safety in regional corridors, such as Blake Lane-Jermantown Road, Braddock Road, Government Center Parkway, and Pickett Road.

City Major Corridors

Implement complete streets improvements to safely accommodate all roadway users in the City on all roads, and in particular on arterials including Fairfax Boulevard, Chain Bridge Road, Old Lee Highway and Main Street.

Local Activity Centers

Within Local Activity Centers:

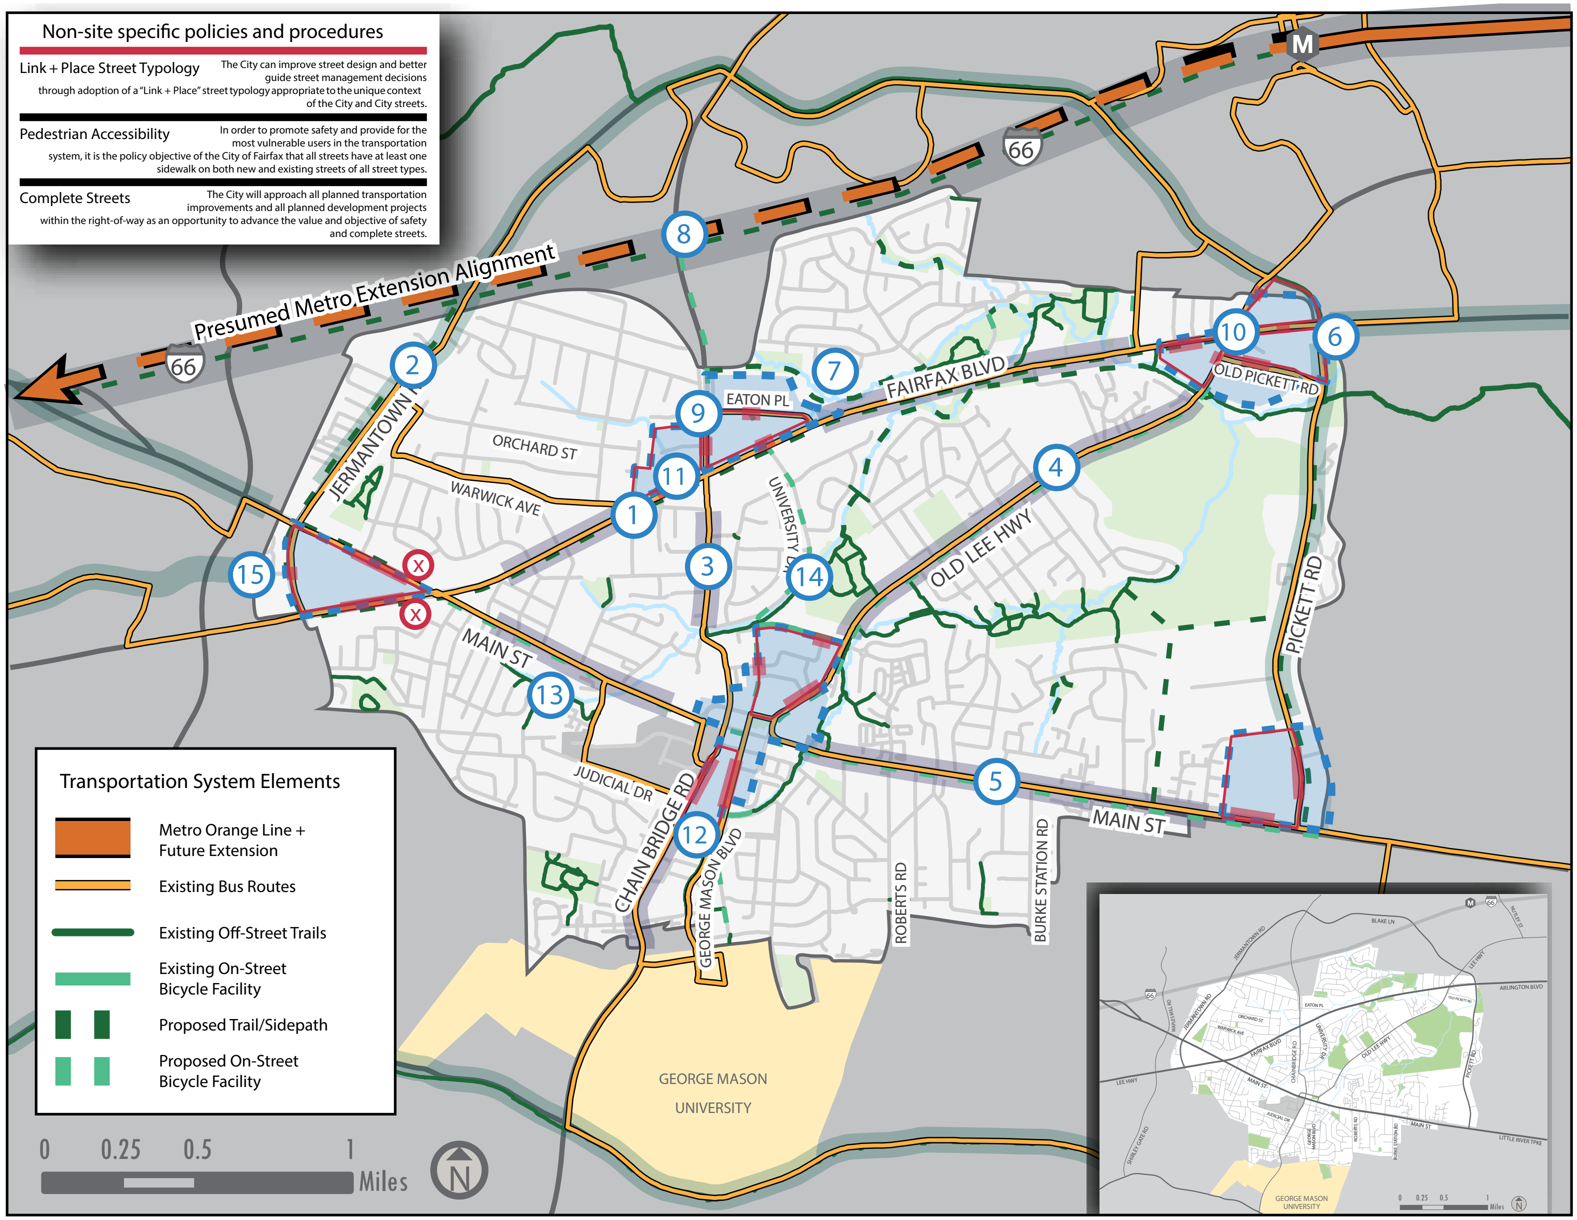
- Break up large blocks to a more walkable scale. Pursue expanded secondary, tertiary, and non-motorized network opportunities.
- Consolidate vehicular access points
- Provide new pedestrian-only connections

Specific Projects

1. Improve Warwick Ave and Fairfax Blvd
2. Improve Jermantown Rd corridor
3. Add sidewalk on Chain Bridge Rd
4. Add Old Lee Hwy multimodal improvements
5. Study Main St bicycle facility feasibility
6. Add Pickett Rd trail connection
7. Complete the George T. Snyder Trail
8. Support the study of a Metrorail extension
9. Improve intersection at Eaton Place and Chain Bridge Rd
10. Improve safety for all users at Fairfax Circle
11. Expand the roadway network in Northfax West
12. Expand the roadway network at South Street
13. Complete the Judicial Drive Trail
14. Implement University Drive traffic calming measures
15. Connect Government Center Parkway

Citywide Projects (Locations TBD)

- Implement pedestrian spot improvements
- Conduct a bikeshare feasibility study
- Improve transit facilities
- Implement roadbed improvements
- Develop a Transportation Demand Management Program
- Maintain pavement condition of primary extension roadways



Non-site specific policies and procedures

Link + Place Street Typology The City can improve street design and better guide street management decisions through adoption of a "Link + Place" street typology appropriate to the unique context of the City and City streets.

Pedestrian Accessibility In order to promote safety and provide for the most vulnerable users in the transportation system, it is the policy objective of the City of Fairfax that all streets have at least one sidewalk on both new and existing streets of all street types.

Complete Streets The City will approach all planned transportation improvements and all planned development projects within the right-of-way as an opportunity to advance the value and objective of safety and complete streets.

Transportation System Elements

- Metro Orange Line + Future Extension
- Existing Bus Routes
- Existing Off-Street Trails
- Existing On-Street Bicycle Facility
- Proposed Trail/Sidepath
- Proposed On-Street Bicycle Facility

Note: In June 2020, Small Area Plans were adopted for the Old Town Fairfax and Northfax Activity Centers. Refer to the respective Small Area Plan for specific guidance in each of these Activity Centers.

4 Environment and Sustainability

This Chapter is supported by two Guiding Principles: Natural Environment and Sustainability Initiatives. The Natural Environment Guiding Principle focuses on the physical and geographic context of the City and the impact on local and regional environmental resources. The City has several types of environmental resources that are easily impaired by urban land uses. Encompassing the headwaters of Accotink Creek, measures taken by the City to protect water quality, riparian and floodplain areas, open space, and the urban forest are critical to support regional efforts to improve environmental health. Located within the Chesapeake Bay Watershed, the City is committed to reducing stormwater runoff in order to protect the Bay through the adoption of the Chesapeake Bay Preservation Act (Appendix A) and enforcement of other federal, state, and local stormwater regulations.

The Sustainability Initiatives Guiding Principle focuses on City practices with a more global interest. This includes specific actions that support sustainable practices that can decrease greenhouse gas emissions from both building energy use and transportation; increase energy efficiency; increase utilization of renewable energy; increase waste reduction and recycling; conserve water; and support healthy lifestyles. It is important to recognize that sustainability practices address a broad range of social, economic, and environmental issues, and therefore are incorporated throughout the Comprehensive Plan.

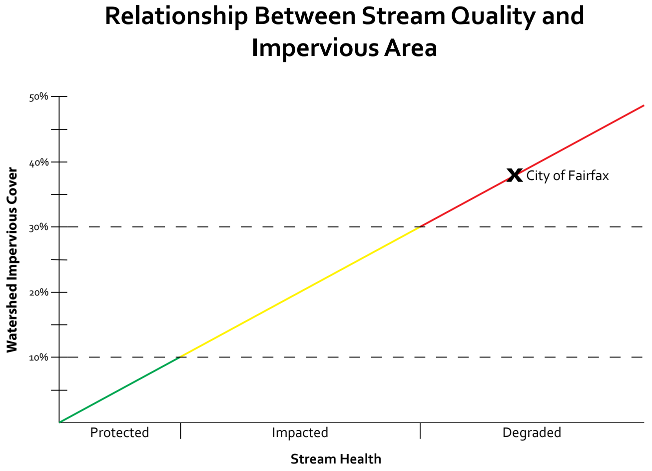
Opportunities and Challenges

Impervious surface

Previous land development has resulted in a large percentage of impervious areas, as shown in Figure 31. Impervious areas have structures such as pavement and buildings that do not allow rainwater to pass through into the ground, and increase the speed and amount of stormwater runoff resulting in negative impacts to streams. As shown in the chart "Relationship Between Stream Quality and Impervious Area," as the percentage of impervious cover in a watershed increases, stream quality declines. At 42.7% impervious cover, the City's streams are classified as "non-supporting streams." Streams in this category are usually so degraded they become a conduit for conveying stormwater and have poor stream quality. As is typical in urban areas, maintaining the health of streams in the City is a continual challenge. The City has an opportunity to increase the amount of pervious areas with redevelopment and to improve the stormwater management system in order to adequately manage stormwater runoff.

FIGURE 31 PERVIOUS AND IMPERVIOUS AREAS

Source: City of Fairfax GIS 2013 Impervious Surfaces

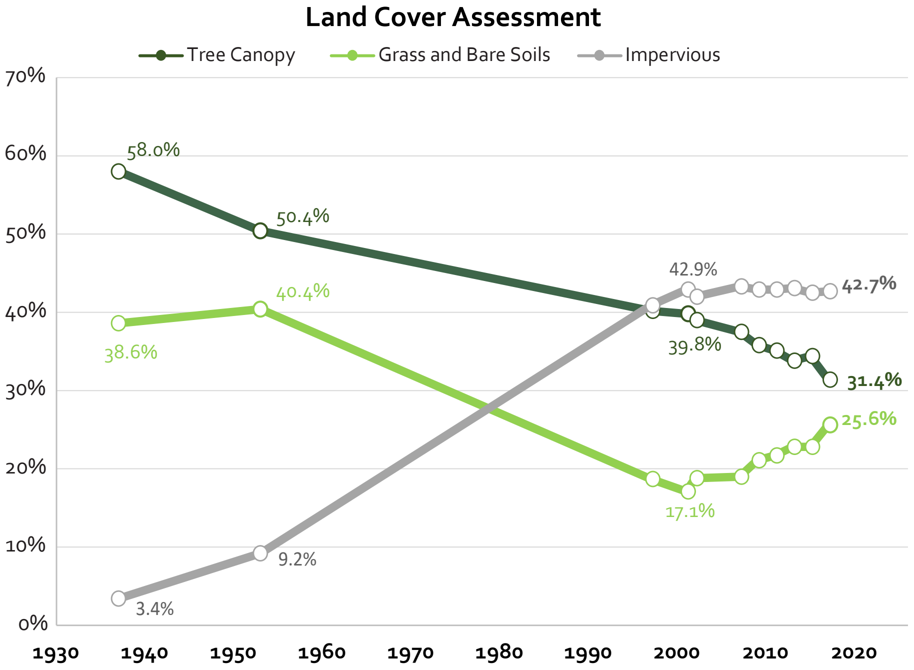


As impervious ground cover increases, stream health and quality declines. With 42.% of its ground area covered by impervious surfaces, the City's streams are considered degraded with poor quality.

Tree cover

Due to urbanization, much of which occurred during rapid post World War II development around Washington, D.C., the City's tree canopy decreased from 58% in 1937 to 31.4% in 2017, while impervious areas have increased from 3.4% to 42.7% as shown in Figure 32. Tree canopy coverage offers many benefits, such as conserving energy due to the reduction of temperatures from shading, improving air quality, reducing stormwater run-off, improving property values, and beautifying our community. Because the City is almost entirely developed, few significant forested areas remain. Those that still exist, whether public or private, deserve specific attention so that their aesthetic and ecological benefits to the City are not lost.

FIGURE 32 TREE CANOPY



Source: City of Fairfax conducted a tree canopy assessment using the i-Tree Canopy software developed by the US Forest Service. The i-Tree land cover assessment results were estimated using random sampling statistics and have standard deviations ranging from ± .14 to ±1.53.

Source: Individual municipal websites

Greenhouse gas emissions

Scientific consensus accepts the reality of climate change and recognizes that human activity, especially the combustion of fossil fuels that creates greenhouse gases, is an important driver of climate change. The City, along with the entire Mid-Atlantic region, can anticipate changes in temperature, precipitation, water supply, and air quality as a result of the changing climate. Local governments are responding to new demands on infrastructure as well as impacts to natural resources related to weather instability and changing, uncertain climatic conditions. The City is committed to exploring the potential benefits and costs of adopting policies and participating in programs that promote the long-term goal of greenhouse gas emissions reduction while maximizing economic and social benefits. A summary of greenhouse gas emissions from community activities in the City is provided in Figure 33. The City will explore and prioritize strategies that could best aid in reducing greenhouse gas emissions.

FIGURE 33 GREENHOUSE GAS EMISSIONS

Green building practices

With new public and private development projects, the City has ample opportunity to encourage the use of green building practices (Figure 34). In addition to the environmental benefits of green buildings (e.g., reducing energy use, greenhouse gas emissions, construction waste, etc.), they can also enhance the economics of local development. Recent trends show that office space meeting green building standards generally experiences higher demand and can be a catalyst for bringing new businesses to a community.

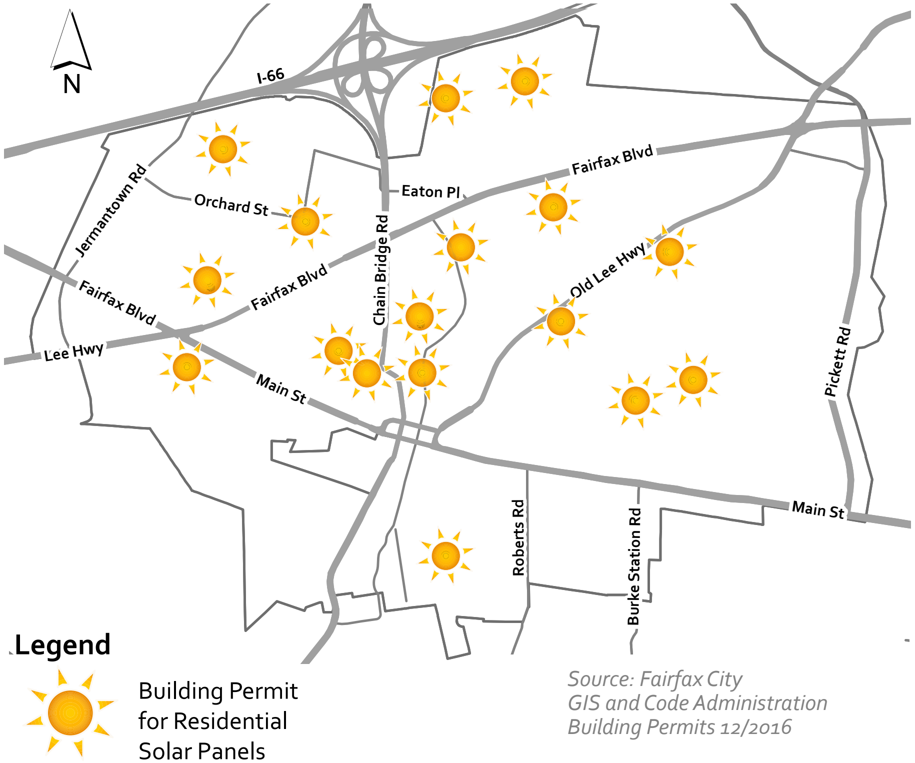
Solar installations

In recent years, the City has seen an increase in the number of solar energy installations (Figure 35). Increasing the use of renewable energy sources will benefit the resilience and economic competitiveness of our community. Since 2014, the City has participated in the Solarize NOVA campaign, a yearly effort to encourage incorporation of solar power into individual homes and businesses in Fairfax and several peer jurisdictions. This is accomplished through incentives such as free solar assessments. In 2017, the City received a "Bronze" designation from the national program SolSmart for encouraging solar energy growth and removing obstacles to solar development.

FIGURE 35 BUILDING PERMITS FOR RESIDENTIAL SOLAR PANELS



Source: Fairfax City GIS and Code Administration Building Permits 12/2016

Natural Environment

One of the characteristics of the City that makes it a desirable and healthy place in which to live is the extent, diversity, and quality of its environmental resources. The City's main environmental resources include wetlands, ponds, streams, public parks, open space, and urban forests. As the City continues to grow and redevelop, these resources are at risk of being impaired. Growth and development often cause pollution to the water, air, and soil; degradation to ecosystems; and loss of natural areas that contribute to residents' quality of life. Continuing to preserve and restore our environmental resources ensures a healthy environment by providing access to clean air, clean water, healthy ecosystems, and high quality recreation areas. The City is also at risk from impacts caused by natural and man-made hazards. Reducing threats to the community and environment from these hazards will foster a safer and healthier community.

Guiding Principle:

In 2035, Fairfax is a city with... a healthy ecosystem of naturally flowing streams, native plants, wildlife, contiguous natural habitat areas, and a healthy tree population.

Natural Environment Goal 1

Preserve, promote, and enhance a healthy environment.

The local environment will be preserved and protected through insightful policies and programs that improve the quality of the City's natural resources. Managing the stormwater that runs off land surfaces is a fundamental practice to mitigate the adverse effects of urban development by reducing flow velocities and enhancing water quality. Several federal, state, and local regulations and the City's adoption of the Chesapeake Bay Preservation Ordinance are enacted to protect the region's water resources.

The City has the opportunity to protect and increase the tree canopy by identifying the greatest challenges facing the urban forest (e.g. development, disease, etc.) and developing and implementing an urban forest management plan that includes detailed strategies for attaining a diverse, well-managed urban forest.

OUTCOME NE1.1:	Clean and protected water resources and watersheds in the City.
ACTION NE1.1.1	Reaffirm and implement the City's Chesapeake Bay Preservation Plan (Appendix A) and zoning regulations.
ACTION NE1.1.2	Enhance zoning regulations and support initiatives that encourage the use of green stormwater infrastructure on private and public property.
ACTION NE1.1.3	Retain and acquire riparian areas as open space or parkland.
OUTCOME NE1.2:	Clean, healthy air that supports plant, animal, aquatic, and human life.
ACTION NE1.2.1	Develop and implement a Climate and Energy Action Plan to achieve regional greenhouse gas emissions reduction goals (20% reduction from 2005 level by 2020, 80% reduction from 2005 level by 2050) as committed to in the Greater Washington 2050 Compact.
ACTION NE1.2.2	Identify and implement strategies to reduce airborne pollutants known to cause health problems.
OUTCOME NE1.3:	A diverse, well-managed urban forest dominated by native species.
ACTION NE1.3.1	Develop and implement an urban forest management plan to protect the City's urban forest and increase the quantity, density, and diversity of trees on public and private land.
ACTION NE1.3.2	Support incentives, provide education, and partner with public and private groups to encourage native tree planting and preservation by private property owners.

Natural Environment

Goal 1

ACTION NE1.3.3	Update zoning regulations and public facilities manual for tree preservation, removal, and planting of preferred species of trees located along streets, parking lots, and riparian areas.
OUTCOME NE1.4:	A diverse population of native vegetation protected from invasive plants.
ACTION NE1.4.1	Develop a strategy to control invasive species including identifying and mapping areas impacted by invasive plants.
ACTION NE1.4.2	Support the development of community and habitat gardens on underutilized parcels and public lands.
ACTION NE1.4.3	Provide education and partner with public and private groups to promote the preservation and planting of native plants, sustainable landscaping techniques, and management of invasive plants.
OUTCOME NE1.5:	Restored and preserved natural open spaces and contiguous greenway corridors that provide natural habitats for plants and wildlife.
ACTION NE1.5.1	Restore disturbed areas along streams and in conservation easements with native species.
ACTION NE1.5.2	Pursue opportunities to purchase and preserve in perpetuity privately-owned open space.
ACTION NE1.5.3	Encourage new development that protects and preserves environmentally-sensitive areas and natural features, such as tree cover (especially significant stands of trees and healthy, mature trees), native vegetation, streams, wildlife habitat, and natural topography.

Natural Environment
Goal 2

Prepare for the impacts from natural and man-made hazards.

Extreme weather events such as prolonged heat, hurricanes, and flash flooding have contributed to negative health impacts, damaged homes and businesses, destroyed critical infrastructure, and to interruptions in the region's economic activity. These types of weather events are projected to increase in frequency and magnitude. There is also a risk that the community could be exposed to a variety of pollutants and hazardous chemicals, which may have negative effects on human health and the environment. The City should take steps to prepare for and mitigate these hazards.

OUTCOME NE2.1:	Reduced risk and improved preparedness to meet the challenges associated with natural and man-made hazards.
ACTION NE2.1.1	Participate in the National Flood Insurance Program's (NFIP) Community Rating System, a voluntary incentive program that recognizes and encourages community floodplain management activities that exceed the minimum NFIP requirements.
ACTION NE2.1.2	Develop a resiliency plan to set priorities and allocate resources to manage risks associated with natural and man-made hazards.
ACTION NE2.1.3	Continue to work with the Northern Virginia Hazard Mitigation Advisory Committee to regularly update the Northern Virginia Hazard Mitigation Plan.
OUTCOME NE2.2:	Reduced exposure to pollutants and hazardous chemicals in the environment.
ACTION NE2.2.1	Enhance exterior lighting standards and pursue certification as an International Dark Sky Community to reduce light pollution and protect nighttime skies.
ACTION NE2.2.2	Continue to enforce noise standards.
ACTION NE2.2.3	Promote the proper disposal or recycling of household hazardous waste.
ACTION NE2.2.4	Educate on the identification, risks, and remediation of hazardous materials in buildings, including but not limited to radon, asbestos and volatile organic compounds.
ACTION NE2.2.5	Develop integrated pest management and nutrient management plans.
ACTION NE2.2.6	Promote the responsible use of pesticides and fertilizers.

Sustainability Initiatives

Sustainability can be defined in many ways. In relation to urban planning, sustainability is often defined as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (World Commission on Environment and Development, 1987). The City has a responsibility to future generations to develop sustainably. In 2013, the City executed an energy performance contract to implement energy retrofits at fourteen City-owned buildings. The City pays back the upfront costs of the retrofits using the annual energy cost savings over time.

Sustainability issues extend well beyond City boundaries, so local decisions can impact the region and beyond. The City collaborates with regional partners, such as MWCOG and the Northern Virginia Regional Commission (NVRC) in formulating solutions to sustainability challenges and taking actions to achieve regional goals. In 2010, the Mayor and City Council adopted a resolution endorsing the voluntary Greater Washington 2050 Compact in which the City committed to following the principles and goals set within The Region Forward report, a vision for a more accessible, sustainable, prosperous, and livable metropolitan Washington.

Guiding Principle:

In 2035, Fairfax is a city with...
sustainable practices that
preserve, conserve, reuse and
recycle resources.

Sustainability Initiatives

Goal 1

Increase the use of sustainable practices, technology, design, and materials.

This City should seize the opportunity to promote energy efficient and sustainable redevelopments and retrofits of aging buildings while also encouraging designs that fit within the context of the existing community. This can involve incentives for privately-owned buildings as well as City investment in public facilities. Education about financing options (such as the Fairfax Renaissance Housing Corporation loans) should be provided to property owners. By improving energy efficiency and sustainable design of civic operations and in the greater community, the City will harmonize resources, investments and technology, help reduce utility costs, support "green collar" jobs, and institutionalize change.

OUTCOME SI1.1:	Minimized energy demand with the application of energy efficient design features, technologies, and best practices.
ACTION SI1.1.1	Promote the efficient use of energy by residents, business owners and government facilities and operations to achieve a 30% reduction in energy use from 2018 baseline levels by 2035; a 40% reduction from 2018 baseline levels by 2040; and a 55% reduction from 2018 baseline levels by 2050.
SI1.1.1.1	Use a data-driven assessment process to deploy energy efficiency technologies throughout all government facilities and operations, and promote energy efficiency best practices among government employees.
SI1.1.1.2	Support incentives, provide education, and partner with public and private groups to promote energy efficiency and sustainability improvements by private property owners.
SI1.1.1.3	Promote voluntary benchmarking for commercial buildings.
SI1.1.1.4	Implement programs that offer clean energy financing solutions for residential and commercial sectors, such as the Solarize NOVA campaign, Property Assessed Clean Energy (PACE) program, and Fairfax Renaissance Housing Corporation (FRHC) Loans.
ACTION SI1.1.2	Develop a green building policy that establishes green building standards and incentives for both private and public sector construction and major renovations.
OUTCOME SI1.2:	Increased use of renewable energy sources and advanced sustainable technologies.
ACTION SI1.2.1	Conduct feasibility studies and subsequent plans for government operations to achieve 100% renewable electricity by 2035 and community-wide 100% renewable electricity by 2050.
ACTION SI1.2.2	Revise applicable codes, zoning regulations, policies, and design guidelines to help facilitate local renewable energy deployment and adoption of sustainable technologies.
ACTION SI1.2.3	Provide education and incentives for residents and businesses to install renewable energy systems and sustainable technologies.
ACTION SI1.2.4	Partner with other local governments, organizations, and individuals on renewable energy planning and implementation.

Sustainability Initiatives Goal 1

OUTCOME SI1.3:	Reduced waste and increased reuse and recycling of materials.
ACTION SI1.3.1	Implement the Solid Waste Management Plan, which establishes waste reduction goals and outlines how the City manages solid waste and recycling.
OUTCOME SI1.4:	Minimized potable water demand in the community.
ACTION SI1.4.1	Develop and provide water conservation education and incentive programs for residents and businesses to promote the use of water efficient practices and products.
ACTION SI1.4.2	Support incentives and revise applicable codes, policies, and design guidelines to encourage water efficiency in new construction and landscaping.

Sustainability Initiatives Goal 2

Support physical activity and healthy lifestyles.

Since the City is mostly built out and infrastructure is already in place, it is an ideal location to provide access to healthy food, community facilities, and recreational opportunities. Smart growth concepts should be incorporated in new development and redevelopment to further enhance the ability of residents to take advantage of public transportation, parks, open space, and trails. The City also strives to improve access to healthy, affordable, and regionally-grown foods to promote public health, reduce environmental impacts, and support economic development (Figure 36).

OUTCOME SI2.1:	Access to healthy, regionally-grown foods.
ACTION SI2.1.1	Evaluate regulations that permit urban agriculture on publicly-owned property and/or space for community gardens in new multifamily and mixed-use developments.
ACTION SI2.1.2	Work with Fairfax County to develop a healthy food access plan.
OUTCOME SI2.2:	Access to parks, recreation, community facilities, trails, and open space.
ACTION SI2.2.1	Promote walking and trail use as part of a healthy community initiative.
ACTION SI2.2.2	Partner with Fairfax County and NOVA Parks to improve and expand the local and regional park system.

5 Economic Vitality

Guiding Principle:

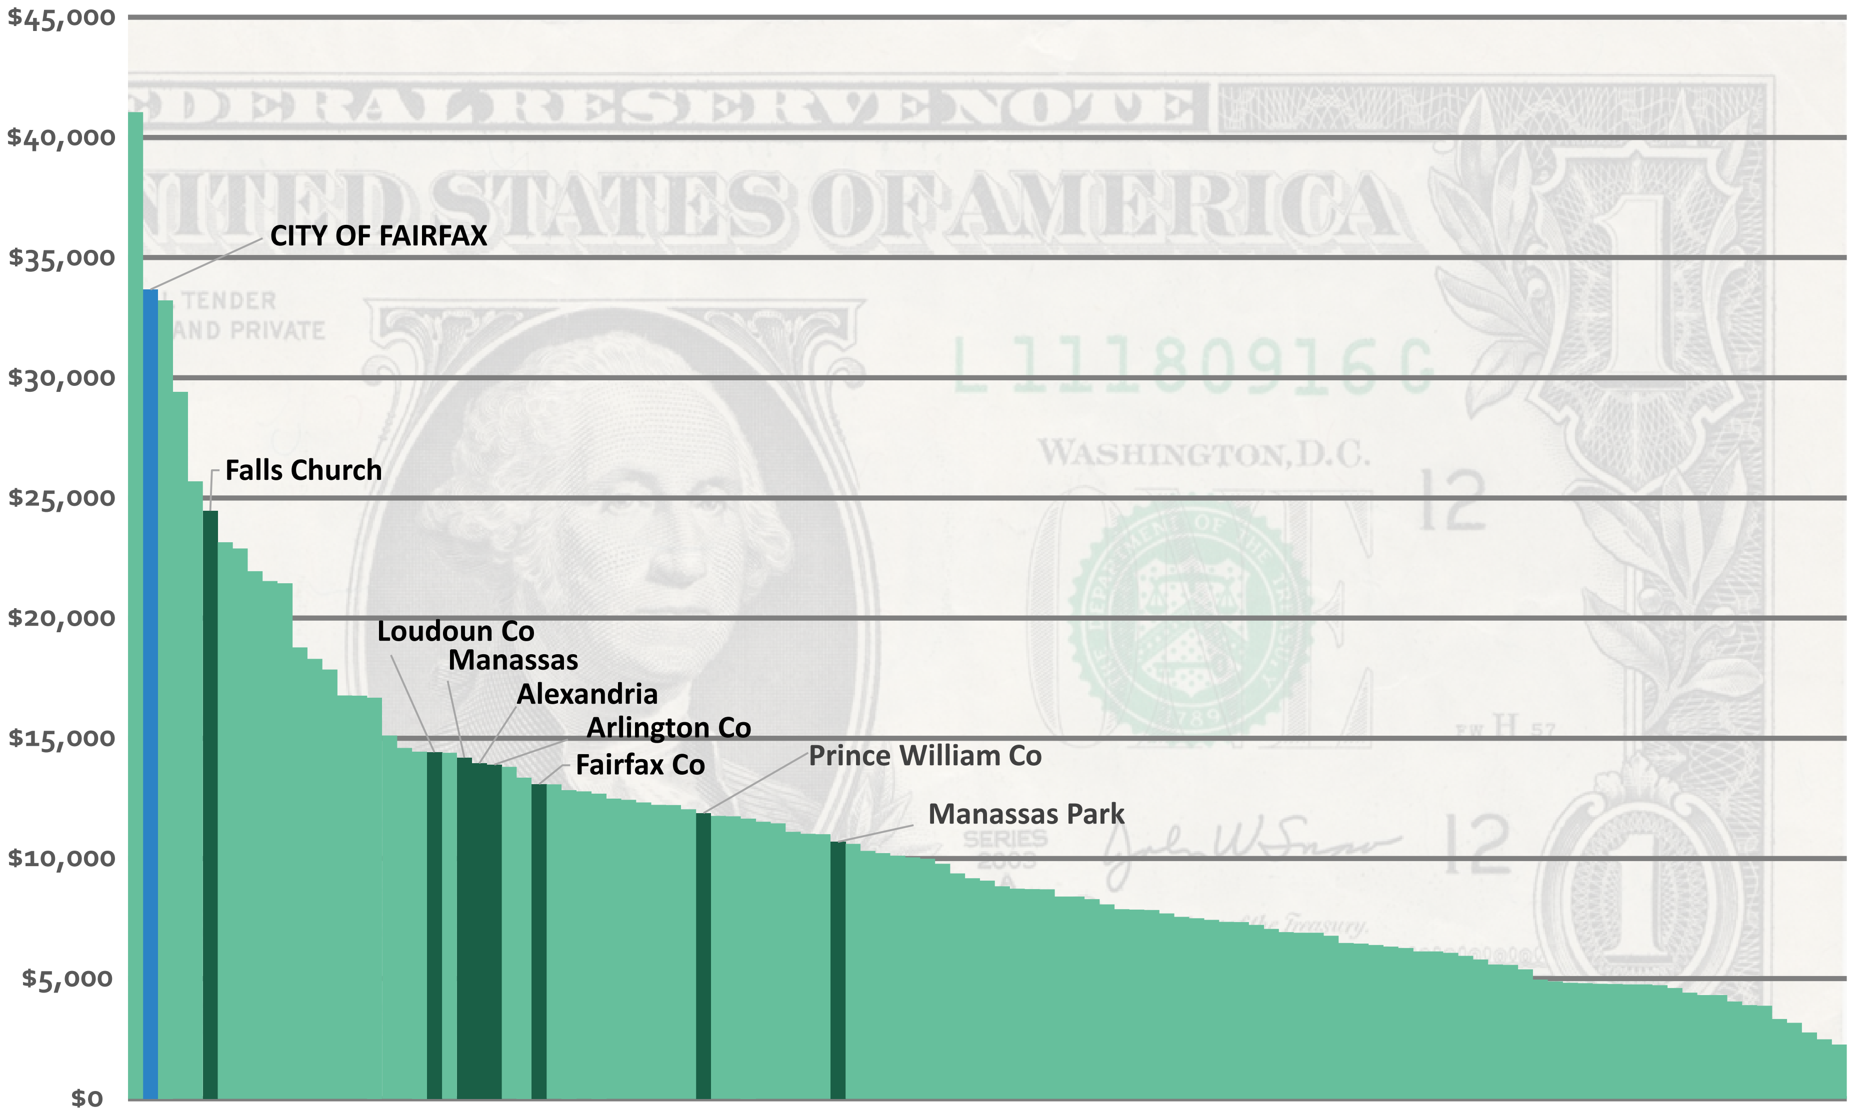
In 2035, Fairfax is a city with... an economy that cultivates and promotes business success and entrepreneurial opportunities for large, small, and independent businesses and capitalizes on national, regional and intellectual partnerships.

The City has long been a hub for economic activity within Northern Virginia. Due to its central location; proximity to regional destinations such as George Mason University, the Fairfax Courts Complex and Inova Fairfax Hospital; and its setting among transportation crossroads, the City has traditionally boasted a larger proportional share of the region's office and retail activity than its relatively small size and population would suggest. This longstanding concentration of economic activity still holds true, with the City achieving the second-highest amount of retail sales per capita of any Virginia jurisdiction (as shown in Figure 37), and a regional share of office space nearly five times the City's share of Northern Virginia's land area.

This cluster of economic vitality provides Fairfax with many benefits, such as a diversified revenue stream that enables the City to rely less on residential tax revenue than do most nearby jurisdictions. Furthermore, a high concentration of office and retail activity enables City residents to have varied employment and shopping opportunities relatively close to home.

Throughout the Comprehensive Planning process, sustaining this historical advantage has emerged as a priority. However, ensuring that the City remains as an economic hub for the region requires both a commitment to maintaining existing commercial infrastructure and positioning the City to be at the forefront of emerging marketplace trends.

FIGURE 37 2016 TAXABLE SALES PER CAPITA FOR VIRGINIA JURISDICTIONS WITH POPULATION OVER 10,000



Source: Virginia Department of Taxation

Opportunities and Challenges

Shifts in the office market

While the City has seen significant increases in office vacancies over the past decade, this trend is present in Fairfax County and Northern Virginia as well. In fact, the City has generally kept a lower office vacancy rate than the region as a whole. With previous regional overbuilding, increases in teleworking and more efficient office space utilization, however, an overall downward trend in office demand is expected to continue for the foreseeable future. The 2013 Fairfax Boulevard Market Analysis only forecasted a net absorption of 50,000 square feet of office space along the corridor over the ten-year study period.

The City office market, while large in size, is overwhelmingly comprised of Class B structures that offer few modern amenities. Given the increasing interdependence and fluidity of Northern Virginia's office market, this can make office space in the City less competitive and less desirable to prospective tenants than Class A office space in surrounding areas, particularly in more rapidly expanding sectors of the economy.

FIGURE 38 OFFICE VACANCY RATE

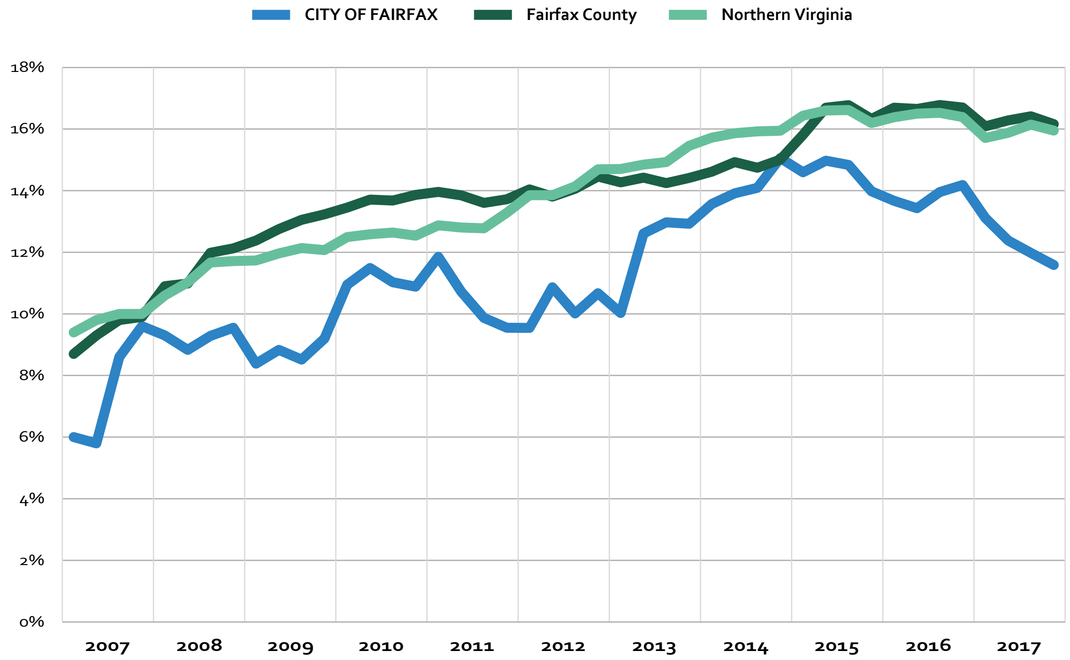


FIGURE 39 OFFICE MARKET BY CLASS, 2017

Source: CoStar, Dec 2017

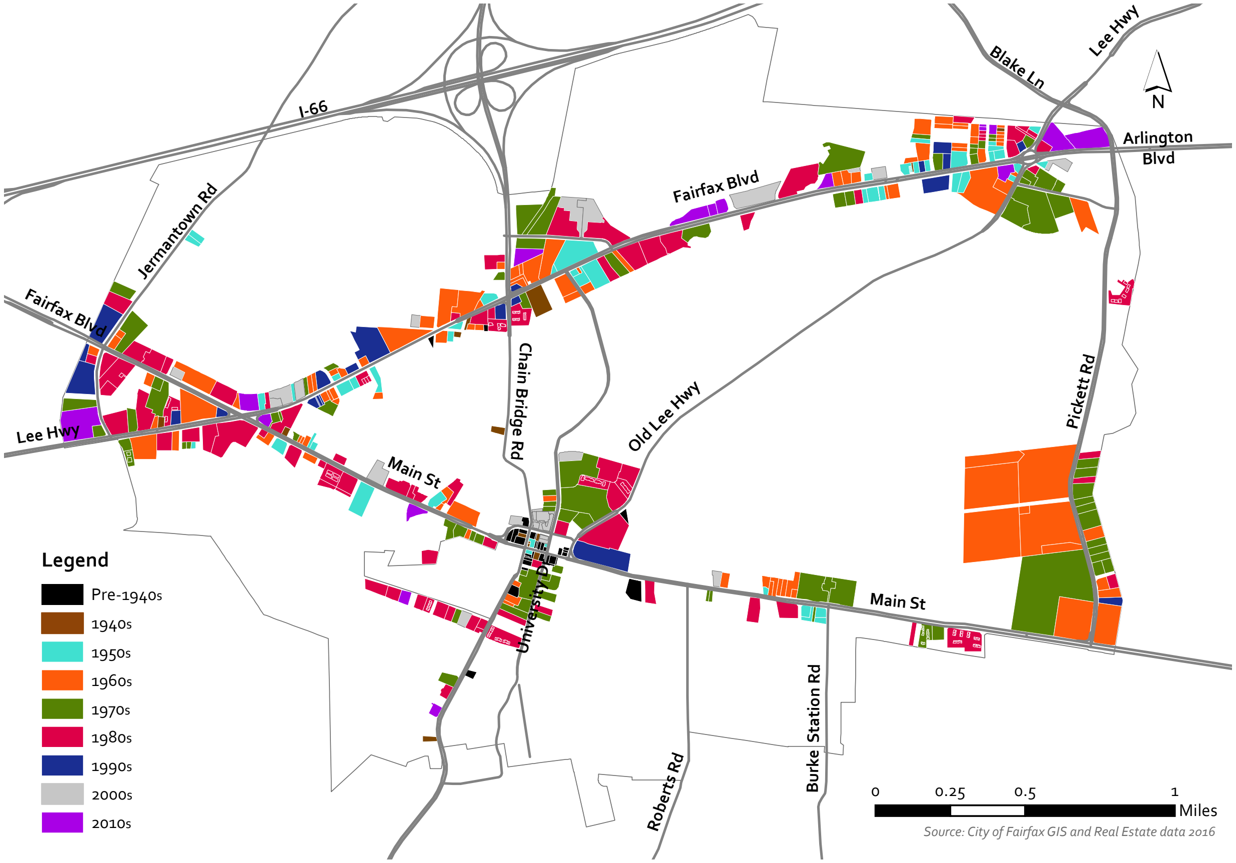
Shifts in the retail market

With consumers gravitating to online purchases and larger format retailers, demand for retail space has been decreasing region-wide in recent years. This has been especially true for older retail spaces that lack modern design requirements. The reduction in demand for traditional retail has been partially offset by increases in demands for food and drink and service type establishments.

These trends have combined to create vigorous regional competition for high-value retailers. As shown in Figure 6 (p. 21), numerous mixed-use centers have been built, or are being planned, within 10 miles of the City. All of these centers use retail as a linchpin to their fiscal success. In order to thrive in this competitive and interdependent retail market, the City must both be mindful of the pragmatic limits of regional retail demand, and must also offer high-quality retail spaces for prospective tenants.

With the vast majority of the City's existing commercial space constructed in the 1960s and 1970s, ensuring that both area consumers and retailers have updated commercial space will greatly enhance the City's retail sector's appeal in this increasingly competitive retail marketplace.

FIGURE 40 COMMERCIAL AND INDUSTRIAL BUILDING AGE BY DECADE BUILT



Source: City of Fairfax GIS and Real Estate data 2016

Economic Vitality

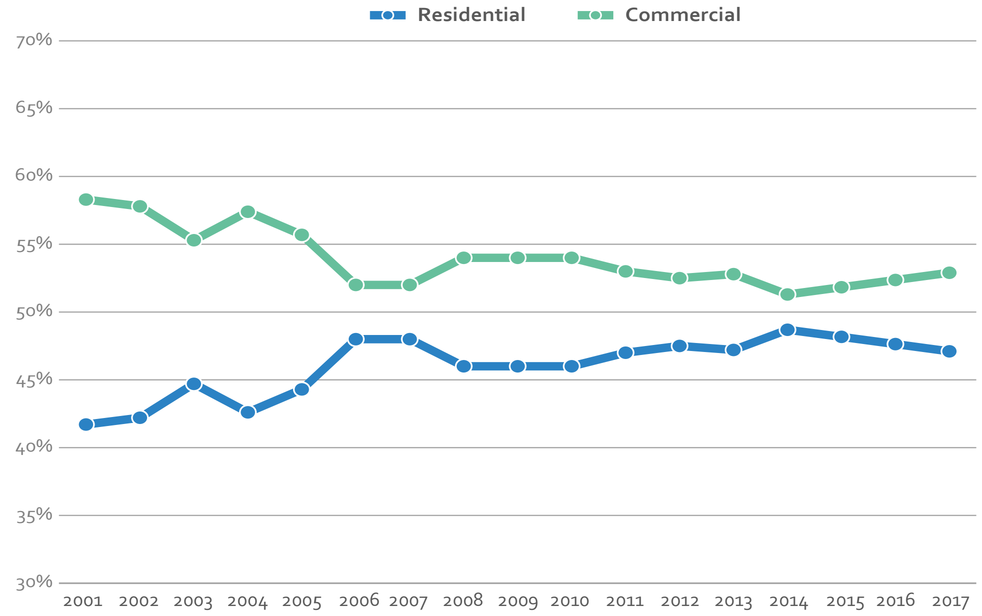
Goal 1

Increase the City's ratio of commercial to residential real estate.

Commercial properties tend to contribute more to the tax base than they consume in public expenditures because of relatively high real estate values and lower dependence on public services. The City has historically benefited from having a high ratio of commercial to residential development, resulting in a lesser tax burden on residences. As commercial properties have aged and new commercial development has slowed, this ratio has begun to shift. The City can offset this shift by supporting measures to increase values of existing commercial properties and encouraging new commercial development so that the value of nonresidential properties continues to comprise a greater proportion of the City's taxable properties.

OUTCOME EV1.1:	New development and redevelopment that maximize revenue generation from nonresidential buildings and uses.
ACTION EV1.1.1	Attract new commercial businesses while supporting and retaining existing businesses.
ACTION EV1.1.2	Leverage proximity to George Mason University to attract university spin-outs and startups.
ACTION EV1.1.3	Capitalize on proximity to Inova Fairfax Hospital to attract health- and wellness-related businesses.
ACTION EV1.1.4	Capitalize on regional growth in the technology-based, creative, and innovative sectors and encourage related businesses to establish in the City.
ACTION EV1.1.5	Pursue corporate headquarters to locate in the City.

FIGURE 41 ESTIMATED REVENUES GENERATED BY COMMERCIAL AND RESIDENTIAL SECTORS



NOTE: 2001-2014 data from City budgets. 2015-2017 data estimated based on revenue allocation assumptions from the City of Fairfax Finance and Accounting Department.

Source: City of Fairfax Budget.

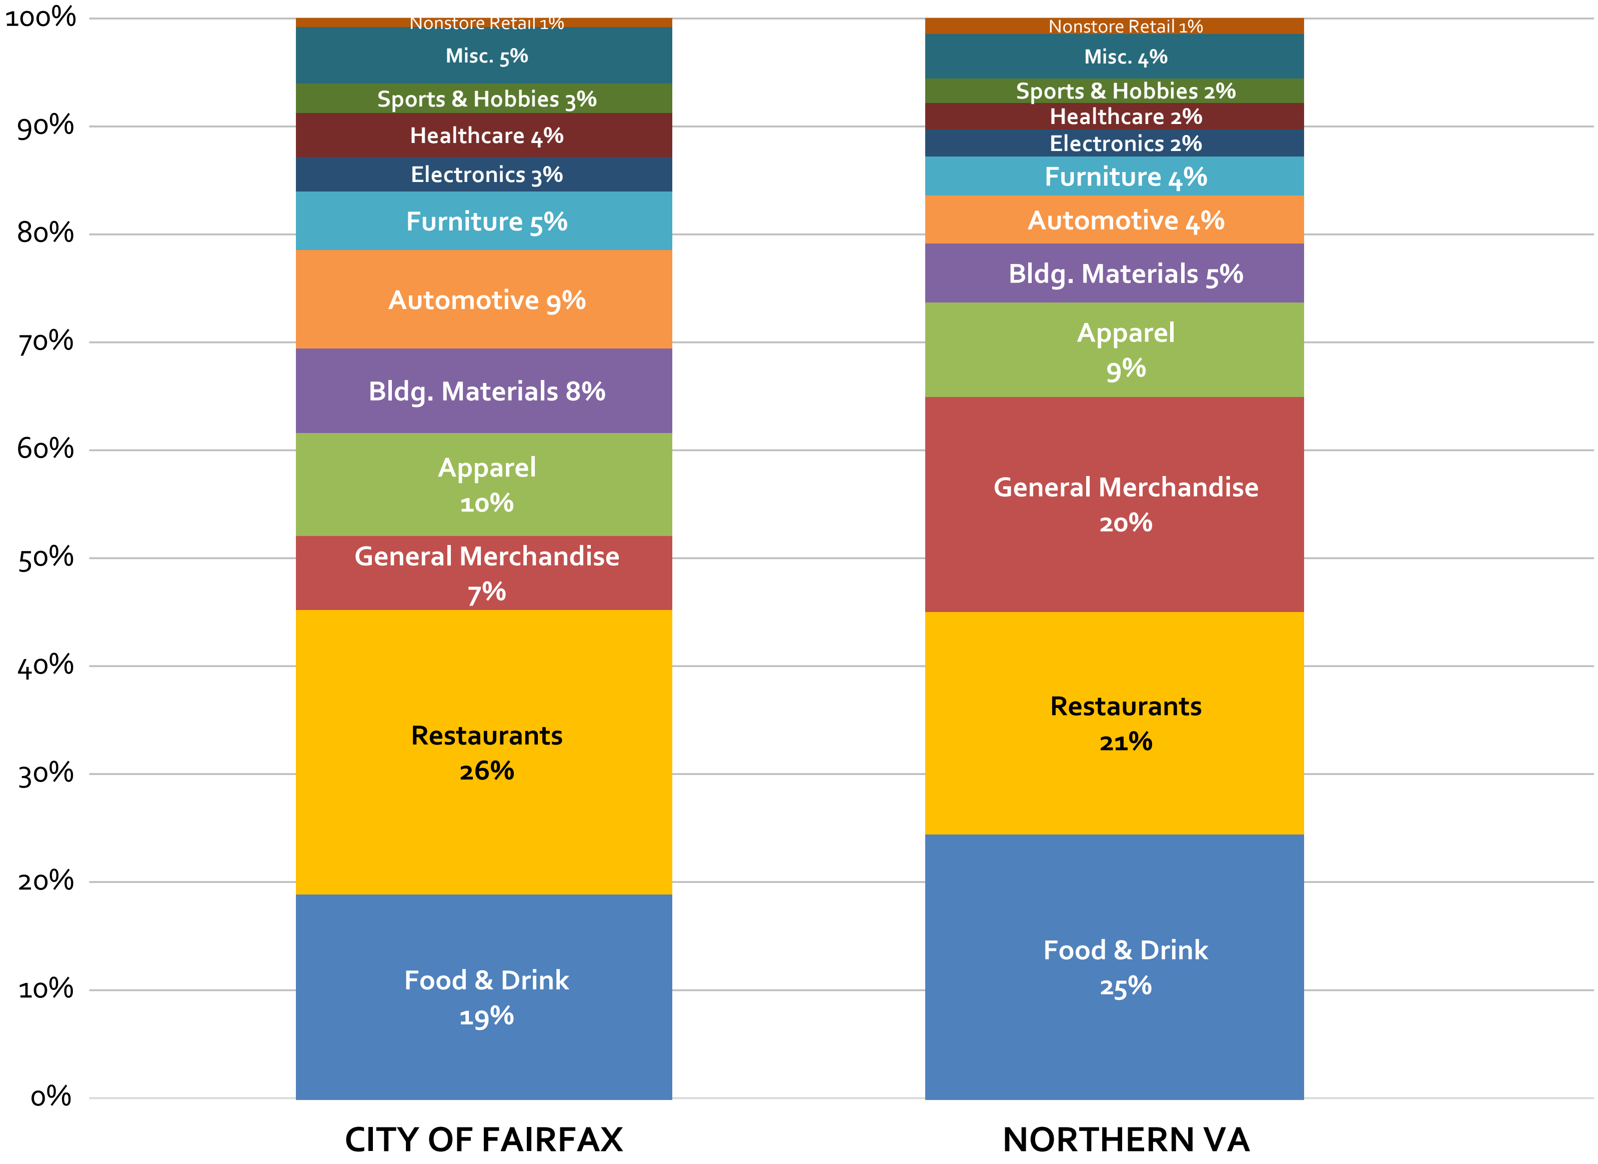
Economic Vitality
Goal 2

Support diversification of the retail, service, and office sectors.

While the City has strong current levels of retail and restaurant sales, some critical sectors are underrepresented in Fairfax's current retail inventory, as shown in Figure 42. This lack of retail diversity – coupled with an inventory of buildings heavily composed of 1960s-70s structures – points to a potential loss of market share to nearby retail areas that are more reflective of current tastes and consumer demand. With a high percentage of Class B office space, the office market in the City may also be less competitive than surrounding office development in Fairfax County. The City will strive to support existing and attract new businesses that fill market or growth opportunities and support an improved office space inventory.

OUTCOME EV2.1:	The retail and service sectors more effectively compete with other regional commercial sectors, resulting in increased desirability as a destination.
ACTION EV2.1.1	Attract new retail and service businesses representing sectors that have the ability to become regional destinations.
ACTION EV2.1.2	Create new commercial areas that contain the amenities and atmosphere necessary to attract top-tier commercial tenants.
OUTCOME EV2.2:	An improved office space inventory attracts high-value tenants.
ACTION EV2.2.1	Work with owners and operators of existing office buildings to encourage property renovations and upgrades needed to bring properties to Class A status.
ACTION EV2.2.2	Encourage the provision of Class A office space in new commercial development projects and renovations.
OUTCOME EV2.3:	A strong relationship with George Mason University is leveraged to support new development and investment that capitalizes on the needs of the University and supports the Comprehensive Plan Vision for the City.
ACTION EV2.3.1	Use the newly-created position of MEC Business Incubator Director to graduate a consistent pipeline of at least one tenant per year to a permanent location within the City.
ACTION EV2.3.2	Explore the establishment of a local development corporation or other formal partnership between the City and George Mason University.

FIGURE 42 PERCENTAGE OF TAXABLE RETAIL SALES BY STORE CLASSIFICATION



Source: Virginia Department of Taxation

Economic Vitality

Goal 3

Transform the Commercial Corridors and Activity Centers.

Being within the economically robust Northern Virginia region presents great opportunity for the City to leverage its many advantages to create and strengthen further economic vitality. The City's varied Commercial Corridors and downtown area provide excellent opportunities to capitalize on the region's growing economy, and to continue being an economic hub for future generations. The City will strive to transform these areas into distinctive regional destinations that can compete effectively with other development and mixed-use centers in Northern Virginia.

OUTCOME EV3.1:	Redevelopment projects in the Commercial Corridors and Activity Centers create destinations that attract tenants, customers, and residents.
ACTION EV3.1.1	Develop a branding and marking strategy for individual Activity Centers.
ACTION EV3.1.2	Create a commercial targeting strategy to focus the City's efforts on attracting businesses that would have the greatest impact in competing with other regional commercial sectors.
ACTION EV3.1.3	Prepare conceptual designs for the Activity Centers and present in dynamic marketing materials that clearly demonstrate the desired mix of uses, residential density, building intensity, design aesthetic, multimodal connections, and parking.

Economic Vitality

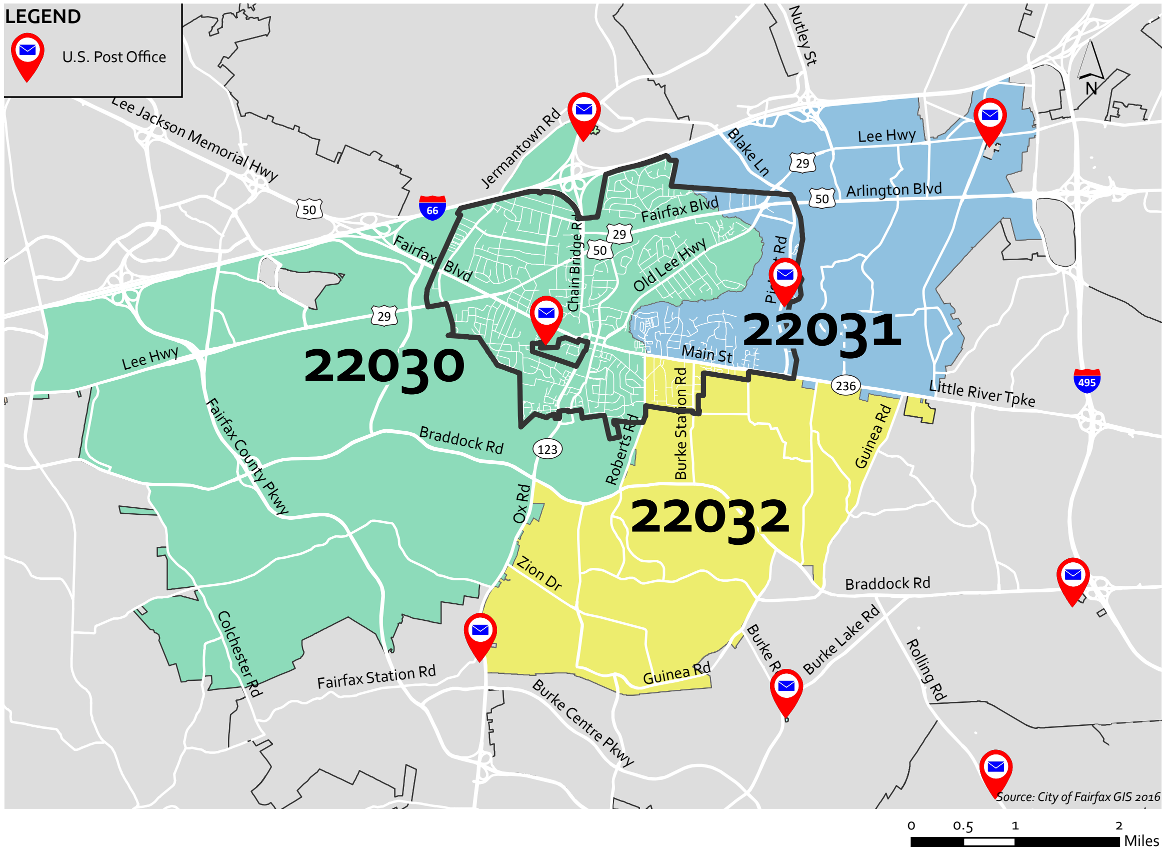
Goal 4

Create a single ZIP Code for the City.

The City currently contains portions of three ZIP Codes, all of which contain large portions of Fairfax County in addition to City addresses. This creates a complicated web of addresses, which leads to confusion among residents and businesses regarding which areas are located within the City or Fairfax County. Significantly, this has also led to difficulties in revenue collection, since some businesses have reported their addresses in the incorrect jurisdiction – and with e-commerce based revenue becoming more common, this may become a more noteworthy problem in the future. Creating a common ZIP Code for City addresses mitigates these revenue-related problems with an exclusive way of identifying City addresses and allowing business revenue to be more accurately collected. This would also serve a unifying function to easily distinguish the City from the surrounding portions of Fairfax County in terms of economic competitiveness.

OUTCOME EV4.1:	The U.S. Postal Service designates a ZIP Code that is unique to addresses within City limits.
ACTION EV4.1.1	Conduct a cost-benefit analysis.
ACTION EV4.1.2	If supported by the cost-benefit analysis, request a ZIP Code Boundary Review from the U.S. Postal Service.

FIGURE 43 CITY OF FAIRFAX ZIP CODES



Source: City of Fairfax GIS 2016

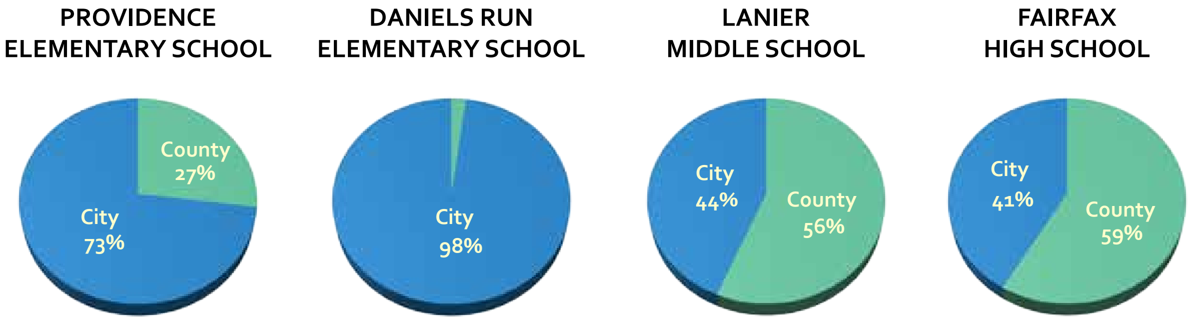
6 Community Services

One of the most crucial elements in the long term desirability of the City is maintaining and improving the high-quality services that residents and businesses have come to expect. This Chapter examines health, safety and welfare issues for which the City provides or facilitates services to its citizens, businesses and visitors. As an independent jurisdiction, Fairfax emphasizes providing quality public facilities and services. Public facilities are the institutions and land intended for the community's general use and benefit. Some of the primary services provided by the City addressed in this Chapter are Education, Parks and Recreation, Cultural Arts, Public Safety, and Utilities and Infrastructure as described below.

Education

Over 3,100 children who are City residents are enrolled in Fairfax County Public Schools (FCPS), with the vast majority of those students attending one of Fairfax's four schools. Through a School Services Agreement with FCPS, the City of Fairfax School Board manages the school buildings, while FCPS hires staff and develops curricula. The agreement also accommodates students from Fairfax County in the City school facilities where capacity allows. The percentage of City and Fairfax County students who attend each of the City's four public schools is provided below.

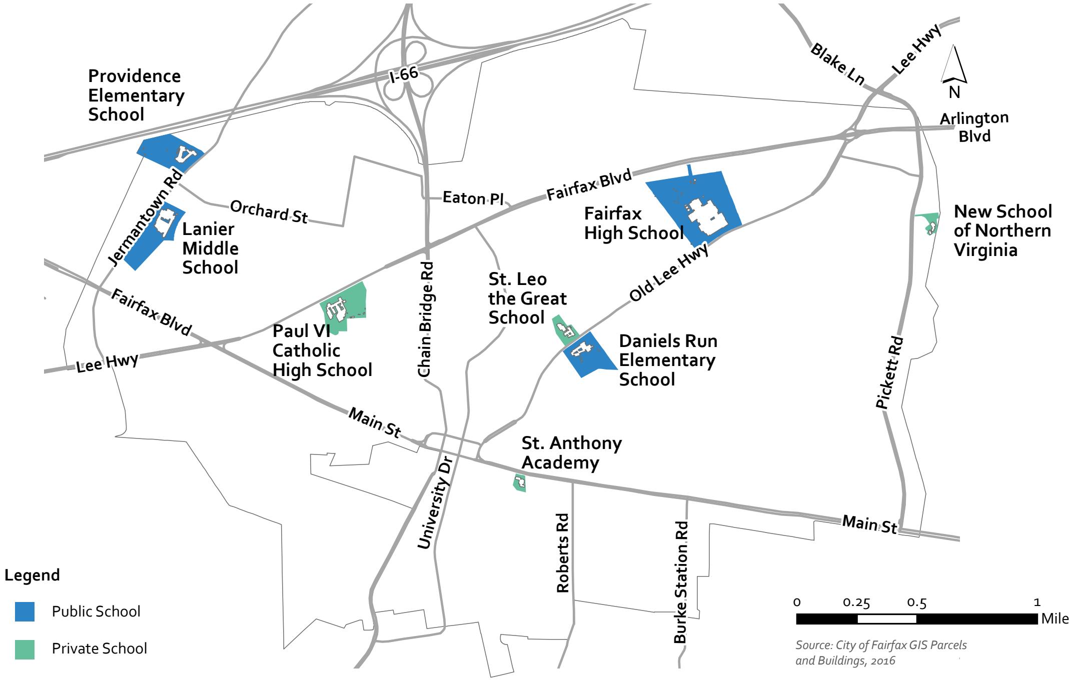
FIGURE 44 SCHOOL ENROLLMENT BY STUDENTS' PLACE OF RESIDENCE



There are also four private schools currently located in the City. Paul VI Catholic High School serves grades 9-12 with just over 1,000 students currently enrolled. A new location for this school is under construction outside the City, and the current location is anticipated to close once the new location is operable. Saint Leo the Great Catholic School serves grades Pre-K-8 with a current enrollment of 410 students. The New School of Northern Virginia is a private liberal arts and science school serving grades 6-12 with a current enrollment of approximately 150 students. Saint Anthony Academy serves grades K-12 with a current enrollment of over 30 students. All public and private schools currently located in the City are shown in Figure 45.

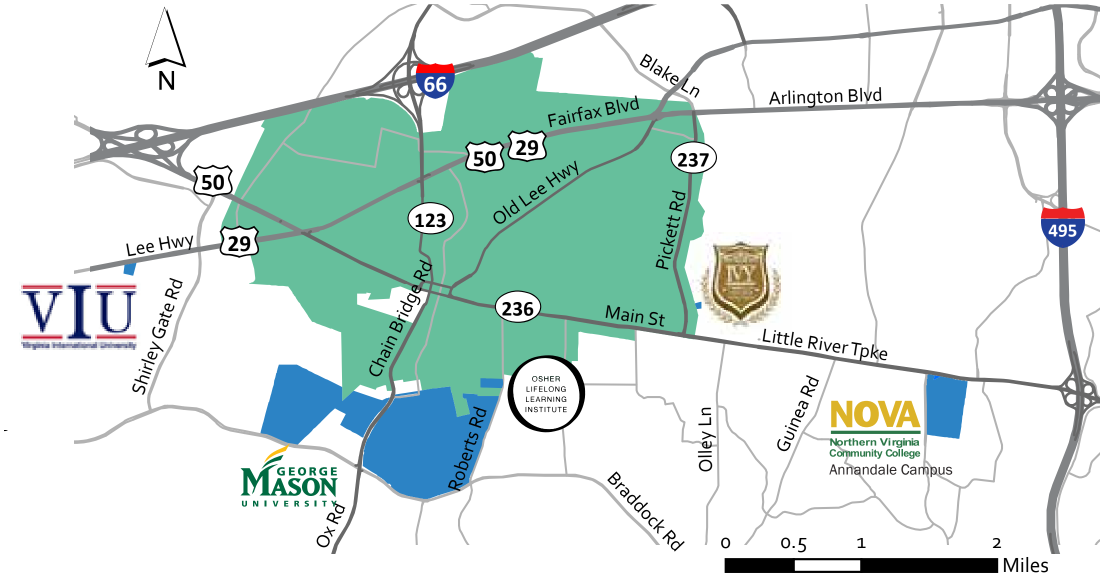
The City is also surrounded by several higher education facilities. George Mason University's Fairfax Campus began with 356 students in 1964, after the completion of construction of the first four buildings. Today, 21,442 full-time equivalent students come to the Fairfax Campus, which includes 80% of the enrollment of all Mason's campuses. The Annandale campus of Northern Virginia Community College opened in 1967 and is now the largest of all NOVA campuses. The 2014-2015 enrollment for all campuses was 34,586 full-time equivalent students. Virginia International University was founded in 1988 and had 1,876 students enrolled as of the July 2015 - June 2016 semester. Ivy Christian College was founded in March 2006 and received accreditation in May 2014. The reported enrollment for 2013 was 319 students. Osher Lifelong Learning Institute (OLLI) offers classes to Northern Virginia residents in their retirement years.

FIGURE 45 PUBLIC AND PRIVATE SCHOOLS, K-12



Source: City of Fairfax GIS Parcels and Buildings, 2016

FIGURE 46 LOCAL HIGHER EDUCATION AND LIFELONG LEARNING



Parks and Recreation

A diverse network of public parks and open space areas, including recreation fields, natural areas, informal open spaces, and a trail system is provided throughout the City. Containing approximately 200 acres of land, the City's parks fall into four categories: regional parks, community parks, neighborhood parks, and vest pocket parks as shown in Figure 47. Most trails in the City are multipurpose recreational trails serving the needs of pedestrians, joggers, and bicyclists.

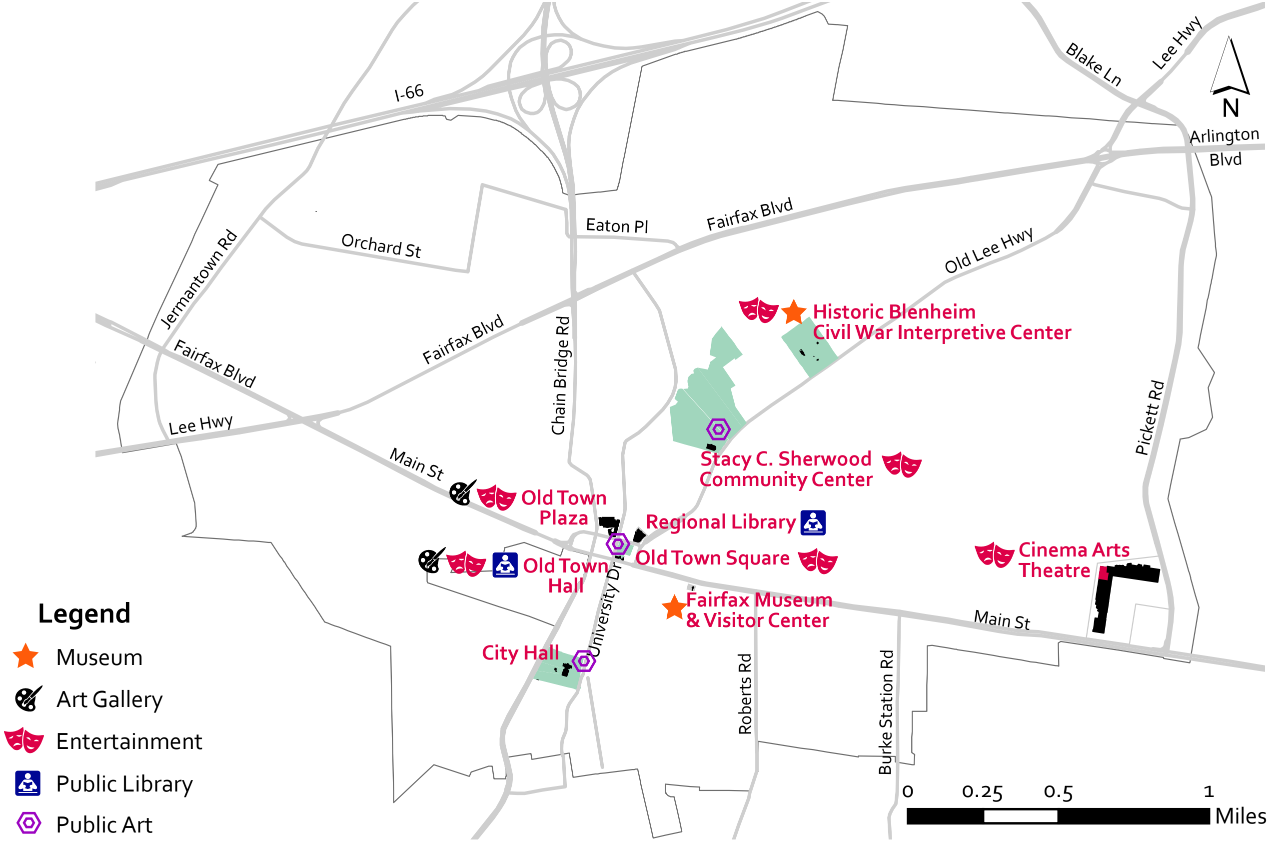
FIGURE 48   CULTURAL FACILITIES AND PUBLIC ART



Source: City of Fairfax GIS and Cultural Arts information

Cultural Arts

The City's cultural arts activities and special events draw people to the City and contribute to the unique sense of place and close-knit community, offering distinctive venues to unite members of the community. Currently, public art and cultural facilities are focused mainly in and around Old Town, as shown in Figure 48. The City has a museum, art galleries, and other performance venues; however, there is a lack of performing arts venues for theater and other performance groups.

Police

The Police Department, the City's primary law enforcement agency, is responsible for protecting life and property, preventing crime, detecting and apprehending criminal suspects, and maintaining order. The ability to anticipate, prevent, and manage crime; minimize threats to property; and minimize damage from environmental hazards all contribute to public safety.

Fire

The Fire Department furnishes fire suppression, rescue, emergency medical services, and emergency medical transportation both within the City and in an approximately 14-square mile area of Fairfax County. In return, Fairfax County provides a computer-aided dispatch (CAD) service for all fire and rescue vehicles as well as "first due" engines and rescue response in the areas along Pickett Road near the tank farm and along Jermantown Road near the schools, as well as backup response in the remainder of the City.

Emergency Management

The Office of Emergency Management (OEM) acts as liaison to all emergency response agencies, monitors for and alerts of any impending natural or man-made safety issues, and develops training schedules for emergency personnel. OEM also ensures that safety documents are kept current, such as the state-mandated Comprehensive Emergency Management Plan and the Northern Virginia Hazard Mitigation Plan.

Utilities

The City sold its water system to Fairfax Water on January 2, 2014. Since that sale, Fairfax Water has been providing water services to the City as shown in Figure 49. The City operates its own wastewater collection system as shown in Figure 50. Wastewater originating in the City's wastewater system is treated by Fairfax County at its Noman M. Cole, Jr., Pollution Control Plant by a contractual agreement that provides a guaranteed treatment capacity for the City. The City manages, maintains, and repairs its stormwater system, which consists of approximately 60 miles of storm drain pipe and 3,650 storm sewer structures throughout the City.

The City does not own or operate any electric, telephone or cable utilities. It does, however, own the rights-of-way where transmission lines are located. Approximately 67 miles of City streets contain utility poles supporting overhead electric, telephone, and cable television wires.

PIPES BY FLOW TYPE

- Gravity/Trunk *Larger underground trunk mains which use gravity to transport the wastewater to the treatment facility.*
- Gravity *Gravity pipes rely on gravity to move wastewater*
- Force *When gravity flow is not sufficient, force mains are used to move wastewater under pressure by using pumps or compressors located in pumping stations.*

Source: City of Fairfax GIS sewer network 2016

The City provides weekly refuse and recycling collection for residents in detached homes, duplexes, and townhouses. Curbside collection service is shown in Figure 51. City businesses and multifamily complexes use private refuse and recycling services. In 2015, the City adopted a Solid Waste Management Plan that outlines how solid waste and recycling will be managed over the next twenty years.

Opportunities and Challenges

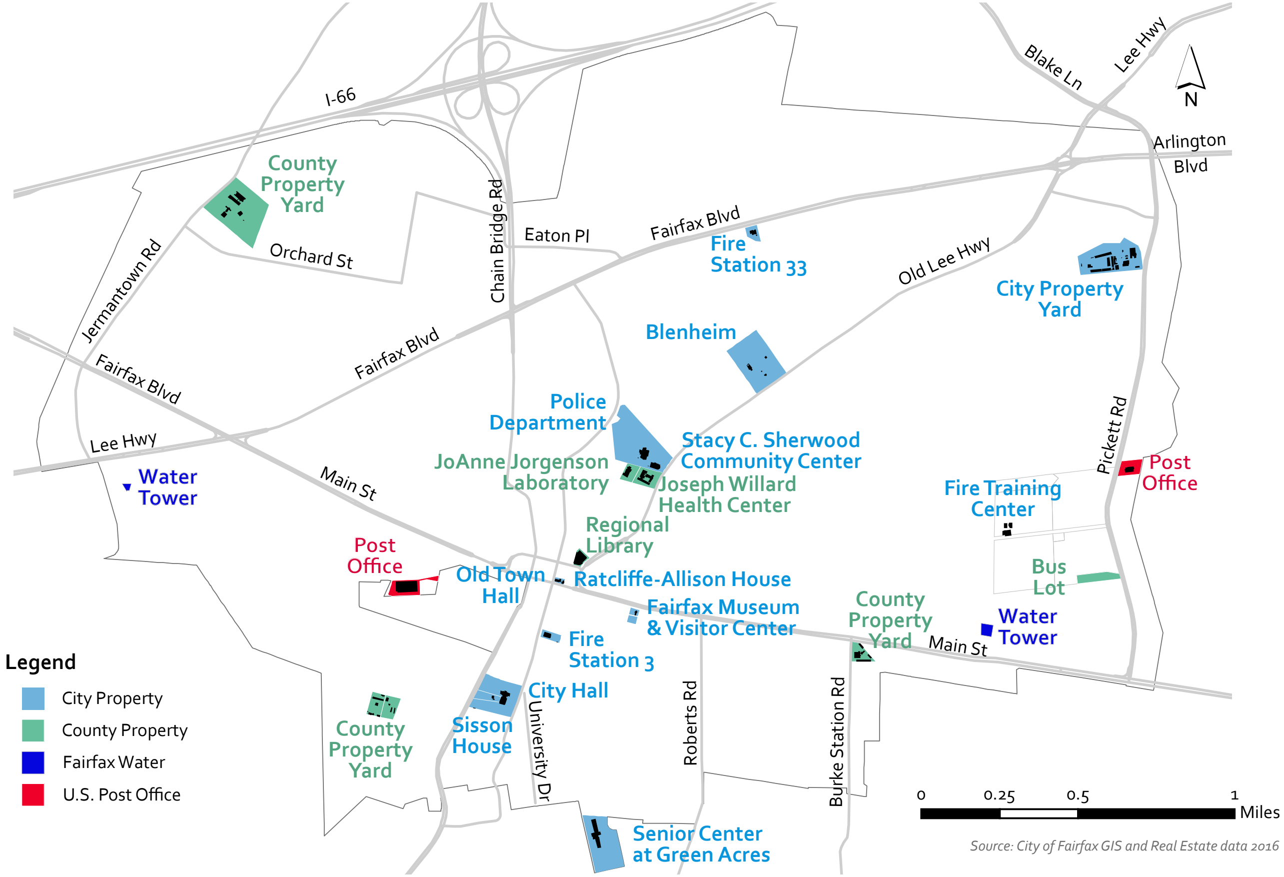
Ongoing maintenance of public facilities

Public facility locations are shown in Figure 52. Several of these facilities in the City are historic structures that have withstood years of service. Ensuring that community services and facilities are phased with changing demand is a major component of facility management, since the quality of public facilities contributes to the City's quality of life.

Service agreements

The relatively small size of the City makes provisions for some public services inefficient. The City provides many services to its citizens through contractual agreements with Fairfax County and regional agencies. This provides for more efficient service delivery while allowing the City to retain some control. Aside from the School Services Agreement with FCPS, City residents may use any of eight regional and fourteen community libraries that compose the Fairfax County library system. Fairfax County also provides health and human services assistance, including environmental health, communicable disease programs, and public health services.

FIGURE 52 PUBLIC FACILITIES



Source: City of Fairfax GIS and Real Estate data 2016

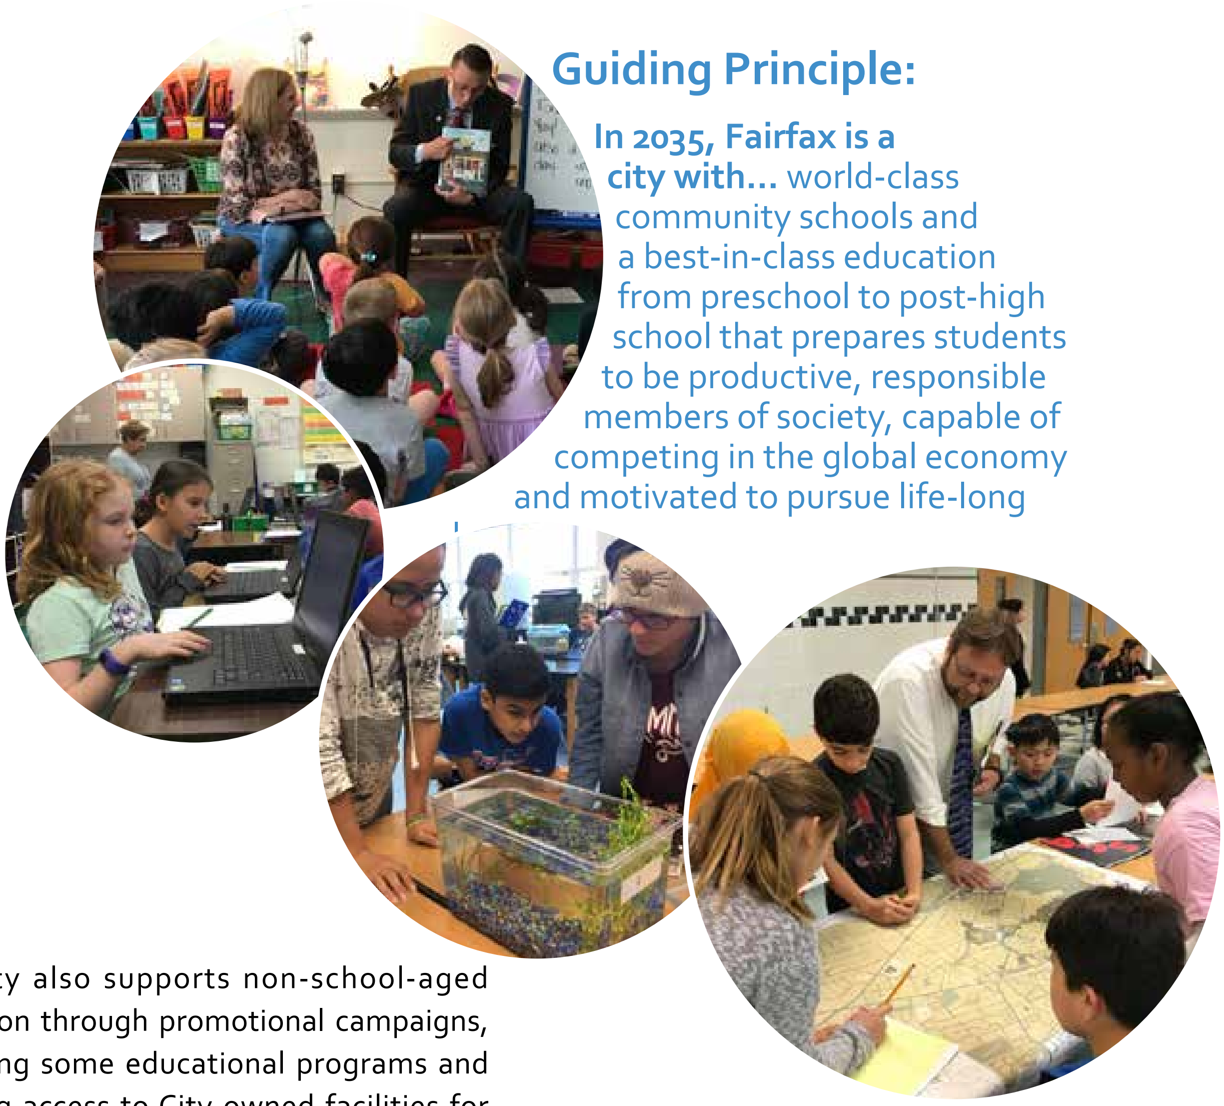
Growth and development

Population growth and new development can impact demands on public facilities and services. Demands, however, can be monitored to ensure that the resulting impacts are realized in advance and factored into the decision-making process for accommodating new development.

Education

Between the City's public schools, its proximity to higher education institutions, and its accessibility to lifelong learning offerings, education factors heavily into the City's quality of life. Excellent public education is not just a priority for current residents, but is also an investment in the City's future, and City policies should continue to ensure that educational opportunities are prioritized for future generations. The City will strive to provide excellent instructional services and superior facilities, geared to the needs of our evolving and diverse population. The City of Fairfax School Board maintains its own Strategic Plan and is responsible for the School Services Agreement with FCPS, through which the City is able to ensure outstanding facilities and instructional accommodations for the 3,100 public school students who reside within City limits. As the City grows and student needs evolve, both the City government and the City of Fairfax School Board should continue to prioritize educational services in order to provide the highest possible levels of service for the future needs of the City's school-aged population.

The City also supports non-school-aged education through promotional campaigns, operating some educational programs and allowing access to City owned facilities for educational programs provided by other entities.



Guiding Principle:

In 2035, Fairfax is a city with... world-class community schools and a best-in-class education from preschool to post-high school that prepares students to be productive, responsible members of society, capable of competing in the global economy and motivated to pursue life-long

Education
Goal 1

Ensure the City's public education needs are met.

The school services agreement with FCPS has provided outstanding instructional programs for City students, combined with an impressive amount of local control. While all four of the City's public schools have been renovated since 2000, changes in student needs, technology and enrollment must continually be monitored to ensure facilities remain exceptional.

The City School board possesses a deed of covenant on the existing Green Acres site at the south end of the City to accommodate a third elementary school should enrollment increase to a point where Daniels Run and Providence Elementary Schools could not reasonably be expanded to accommodate the growth. The School Board has selected Providence Park as an alternative site for a future school, which would be particularly more appropriate if it is consolidated with the adjacent West Drive Property Yard. Further discussion on this site is provided in the Parcel Specific Recommendations in the Land Use Chapter of this plan.

OUTCOME E1.1:	The School Services Agreement with FCPS, guided by the City of Fairfax School Board, continues to provide City students with the highest quality education.
ACTION E1.1.1	Continue to follow the established guidelines of the School Services Agreement and to monitor its implementation.
ACTION E1.1.2	Maintain a close working relationship with the Mayor, City Council and City staff regarding school needs and continue to provide information to the elected officials and staff.
OUTCOME E1.2:	Public school facilities and grounds meet the current and future needs of the school-aged population.
ACTION E1.2.1	Continue cooperation between City government and the City of Fairfax School Board to assess and plan for impacts from future residential development.
ACTION E1.2.2	Monitor potential Fairfax County school boundary adjustments to anticipate impacts on City school enrollment.
ACTION E1.2.3	Continue to examine potential need for additional school facilities and the best use for the City of Fairfax School Board's Deed of Covenant on Green Acres.
ACTION E1.2.4	Continue to ensure a safe learning environment, proper program capacities, and the availability of the latest technology and functional accommodations.
ACTION E1.2.5	Promote environmentally friendly practices for school facilities and grounds.

Education
Goal 2

Ensure access to educational and training opportunities for all generations.

City residents place a high priority on education at all stages of life – from early childhood education up to continuing education and adult lifelong learning. Prioritizing the continued growth and development of the City's educational offerings and linkages by collaborating with local education providers and institutions will help enhance the City's livability for future generations.

OUTCOME E2.1:	All children will be well-prepared to begin elementary school.
ACTION E2.1.1	Continue to promote Pre-K instructional opportunities for all City Pre-K children.
ACTION E2.1.2	Increase access to early childhood literacy and after school care at the City's community facilities, City of Fairfax Regional Library, and other institutions.
OUTCOME E2.2:	The City's residents will have access to facilities and programs that foster an informed community.
ACTION E2.2.1	Maintain access to the City's community facilities, City of Fairfax Regional Library, and other institutions for ongoing dialogue in educational events and discussions.
ACTION E2.2.2	Continue to provide residents and businesses with access to timely information on City government programs and initiatives via the monthly CityScene newsletter, Cityscreen-12 television station, City website, and email alerts.
OUTCOME E2.3:	Partnerships and community resources provide opportunities for training and continuing education.
ACTION E2.3.1	Continue to foster good relations with nearby education providers such as George Mason University and Osher Lifelong Learning Institute (OLLI).

Parks and Recreation

Recreation and open space make an essential contribution to a healthier population and a greener city. They are integral to the City's quality of life and provide beauty, respite, and opportunity to enjoy the outdoors. In addition, City staff takes pride in providing quality experiences for the community through services and programs that enrich people's lives and contribute to total development of the individual, family, and the community.

In June 2014, the Parks and Recreation Advisory Board (PRAB) presented the City of Fairfax Strategic Master Plan for Parks, Recreation, Trails, Open Space, Events and Cultural Arts to the City Council. Referred to as the Strategic Master Plan, it contains measurable goals, objectives and policies that the City Council, PRAB and the Commission on the Arts use as guidance when determining program and facility needs. The Strategic Master Plan should be referenced for specific contributions toward the actions listed for this Guiding Principle.

Guiding Principle:

In 2035, Fairfax is a city with... inviting, well-maintained parks, trails, open spaces and multi-generational community centers.

Parks and Recreation Goal 1

Develop high-quality park infrastructure.

A high-quality park system should serve the community's needs with a range of services and facilities for all age groups and abilities provided in a safe environment. As the City's population grows, new interests and demand for a variety of activities will require periodic evaluation of the facilities the City offers. It is also important to look at the locations of facilities to ensure all neighborhoods are provided with equitable access to parks and recreation amenities and programs. High-quality, accessible parks, facilities, recreation, and open space should be acquired, preserved, developed, and redeveloped throughout the City for public health, enjoyment and environmental purposes. (Actions specifically relating to the City's trail network may be found under Multimodal Transportation Outcomes MM2.2 and MM2.3.)

OUTCOME PR1.1:	A well-connected system of parks that provides citizens with healthy choices for recreation.
ACTION PR1.1.1	Identify and address gaps in the connections between the City's parks and open space.
ACTION PR1.1.2	Identify opportunities for future open space in neighborhoods that are undersupplied in public recreation and open space opportunities.
ACTION PR1.1.3	Enhance public access to parks and recreational facilities by making necessary infrastructure improvements.
ACTION PR1.1.4	Partner with the Department of Public Works on efforts to improve pedestrian and bicycle networks throughout the City.
OUTCOME PR1.2:	A greater awareness of the City's natural resources and commitment to protect and enhance them.
ACTION PR1.2.1	Implement measures to preserve privately-owned land adjacent to parks and trails in perpetuity, e.g., utilizing conservation easements, deed restrictions, etc.
ACTION PR1.2.2	Adopt tree preservation guidelines for parks, open space, and trails.

Parks and Recreation

Goal 2

Provide programs and services that meet the needs of the community.

High-quality programs, facilities, and services – including large-scale community events that draw significant attendance – can improve the tax base, increase property values, attract businesses, produce revenue to offset operating costs, and provide indirect benefits to our economy, contributing to the City's continued growth and development.

OUTCOME PR2.1:	Robust programming of the City's parks and public facilities that provides opportunities for individuals of all ages and abilities to participate.
ACTION PR2.1.1	Conduct a study to determine how the City's long-term needs for a community center and senior center can be best met, and implement the recommendations of this study, including construction of recommended facilities.
ACTION PR2.1.2	Update Parks and Recreation facilities to ensure they are accessible to individuals of all abilities.
ACTION PR2.1.3	Expand and enhance facility, program, and service offerings through innovative funding, management best practices, and cost recovery efforts.
ACTION PR2.1.4	Enhance Old Town Square as a destination and community gathering place by providing a venue for arts, recreation, and green space.
OUTCOME PR2.2:	Expanded and enhanced partnerships with City businesses and other organizations such as City of Fairfax Schools, Fairfax County Park Authority, NOVA Parks, FCPS, George Mason University, Fairfax County Neighborhood and Community Services, and others to complement the services provided by the City.
ACTION PR2.2.1	Identify opportunities to expand partnerships with institutional and business communities.
ACTION PR2.2.2	Establish relationships and partnerships with various underrepresented, underserved, or diverse demographic groups in the City to assist with developing programs and services to meet the needs of these communities.
OUTCOME PR2.3:	Rehabilitation or construction of public facilities to meet the programmatic and recreational needs of the community.
ACTION PR2.3.1	Enhance safety, accessibility, quality of service, and cost effectiveness through comprehensive operations and maintenance programs and services.
ACTION PR2.3.2	Inventory the condition of existing public facilities and identify any necessary updates and repairs.

Parks and Recreation Goal 3

Market programs, special events, facilities, and services.

A broad range of marketing and public relations techniques are necessary to develop public awareness, strengthen community relations, bring a larger audience from outside of the City to our events, and further invigorate the local economy. The City will use innovative promotional and marketing initiatives to increase awareness, participation and support of programs, special events, facilities and services.

OUTCOME PR3.1:	A well-informed community that utilizes the City's quality programs and attends events.
ACTION PR3.1.1	Conduct public opinion surveys of Parks and Recreation customers to identify desired changes in facilities and programming.
ACTION PR3.1.2	Utilize a variety of communications platforms to publicize facilities, programs and events to the community.
OUTCOME PR3.2:	City facilities and events are a regional draw, resulting in increased economic vitality for local businesses.
ACTION PR3.2.1	Increase awareness, participation, and support of programs, facilities, and services using innovative promotional and marketing initiatives.

Cultural Arts

Guiding Principle:

In 2035, Fairfax is a city with...
a thriving cultural arts program that supports a variety of special events, art spaces and performance venues.

The City takes pride in the wide variety of cultural events, programs, and facilities it provides to enhance the quality of life for its residents. The City is committed to preserving and protecting its heritage, recognizing evolving socioeconomic and cultural patterns, and promoting the arts as an integral part of our spirit and vitality with wide ranging economic benefits.

In January 2013, the Commission on the Arts (COA) prepared a Strategic Plan with near-term (one to three years) and long-range objectives for cultural arts in the City. The plan "envisions an economically and culturally booming City with a vibrant arts community serving as a leading arts destination," supporting the Comprehensive Plan Vision. The goals of this Guiding Principle seek to support and build upon the COA Strategic Plan, exploring opportunities for inclusion of the arts as the City develops.

Historically, the arts organizations in our community have been the City of Fairfax Band and the Fairfax Art League. Over the past two decades, four theater companies have emerged, as well as several smaller performance groups. The range of performances is constrained by the lack of theater spaces.

Public art has also sprouted in the last decade with art at the Library, in front of City Hall, and in front of the Sherwood Center. More is planned for Old Town Square.

Cultural Arts
Goal 1

Integrate cultural facilities into the City.

The City currently lacks adequate facilities for performing arts, including a community theater that could provide space for the larger audiences that regional and national artists could bring to the City. Although Fairfax High School and Lanier Middle School have auditorium/theater spaces, theater groups are severely challenged to obtain time in these facilities and are concerned about rental fees. The City must continue to evaluate and expand its cultural venues and to cater to the increasing entertainment expectations of its residents and promote the character and economic vitality of the City, making it a regional arts destination. This should be supported through expanded public art facilities.

OUTCOME CA1.1:	Cultural facilities that provide opportunities for local, regional and national artists to perform for audiences of all sizes.
ACTION CA1.1.1	Create a broad-based special commission charged with the mission of identifying short- and long-term needs for performance spaces and other facilities to support a robust City arts program.
ACTION CA1.1.2	Based on conclusion of CA1.1.1, create a capital program for arts facilities, including a priority for a performing arts facility. This may include upgrading of school arts-related facilities.
ACTION CA1.1.3	Support the creation of Arts and Entertainment Districts with priority to Old Town Fairfax.
ACTION CA1.1.4	Identify underutilized or vacant private facilities that can function as temporary performance spaces.
OUTCOME CA1.2:	Public art such as murals and sculptures displayed to identify, enhance, and promote the cultural nature of the City.
ACTION CA1.2.1	Promote the City's cultural arts identity through public art.
ACTION CA1.2.2	Implement the City of Fairfax Public Art Policy and consider additional policies and practices that promote cultural vitality.
ACTION CA1.2.3	Create a cultural arts bike and pedestrian trail (e.g. Indianapolis Cultural Trail).

Cultural Arts
Goal 2

Encourage a broad representation of arts.

There are a wide variety of interests in arts programs and events resulting from the ever-changing demographics of the City. Strategic partnerships with local institutions, such as George Mason University's Center for the Arts and Northern Virginia Community College's Fine Arts Program should be constantly sought and promoted to expand opportunities for City residents of all ages, ethnicities and abilities. Alternative means of providing and promoting programs must continually be explored as well.

OUTCOME CA2.1:	Collaboration and partnership with local schools, colleges, and universities to provide performance, rehearsal and educational opportunities for artists.
ACTION CA2.1.1	Collaboration and partnerships support establishment of performance, rehearsal and educational opportunities for artists.
ACTION CA2.1.2	Establish a mechanism for continuous collaboration with local schools, colleges, universities and arts organizations on education for artists, and for arts programming.
ACTION CA2.1.3	Explore public-private partnerships to develop performance and rehearsal spaces.
OUTCOME CA2.2:	Cultural programming in the City increases opportunities for a wide range of cultural experiences.
ACTION CA2.2.1	Consider creating a Cultural Affairs office with a full-time director.
ACTION CA2.2.2	Identify and create plan to optimize use of existing and future public facilities for cultural arts programs.
ACTION CA2.2.3	Enhance awareness of current and future programs and facilities.
ACTION CA2.2.4	Develop and execute strategies to increase funds by charging admission to selected events and to increase sponsorships, contributions, and grants.
OUTCOME CA2.3:	Expanded and enhanced partnerships with city businesses and other organizations such as City of Fairfax Schools, Northern Virginia Community College, George Mason University, Virginia Commission for the Arts and other local arts agencies.
ACTION CA2.3.1	Expand partnerships with institutional and business communities for funding and facilities usage.

Government and Public Safety

Guiding Principle:

In 2035, Fairfax is a city with… exceptional governmental, police and fire safety services.

Municipal government services directly affect daily life for residents and businesses including trash pick-up, dog licensing, sign permits, facility rentals, or emergency services. These services not only allow a community to function, but also impact its overall quality of life.

Public safety services include law enforcement, fire protection, emergency medical services and emergency management. The continuity of governmental services offers reassurance that essential services are in place to respond to basic community concerns and needs.

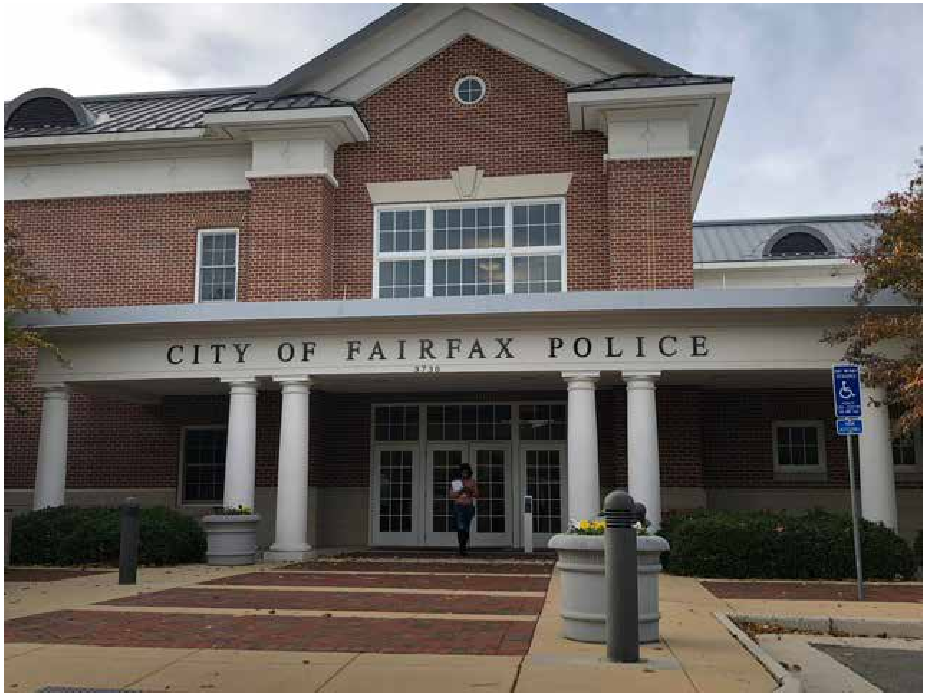
Government and Public Safety

Goal 1

Provide state-of-the-art-facilities for local government and public safety operations.

Anticipating future growth patterns and planning for infrastructure and services to meet the needs of such growth are critical elements in determining the future of the City and its development framework. The City's location in the metropolitan Washington, D.C. area promises to provide the stimulus for continued growth. This growth will affect the resources required to provide the desired level of public services, safety response, and protection. The City must continually monitor demands on government and public safety resources in order to determine needs for facility and service enhancements.

OUTCOME GPS1.1:	Public facilities and equipment that properly support the efficient functioning of City staff to provide valued services to City residents and businesses.
ACTION GPS1.1.1	Maintain and update City facilities to ensure all are safe, accessible to individuals of all abilities, energy efficient, and modernized to meet the changing needs of the community and operations.
ACTION GPS1.1.2	Construct new buildings, when warranted, that are accessible, sustainable, and properly located, including co-locating multiple uses to meet the needs of the community and operations.
ACTION GPS1.1.3	Pursue right of first refusal agreement with Fairfax County on County-owned property located within the City.



Government and Public Safety

Goal 2

Provide high-quality community services.

The City must balance fiscal challenges with the need to maintain public facilities and equipment. Improper maintenance and inadequate facilities can result in disruptive needs for repair and costly replacements. The City will provide high-quality, efficient and cost-effective community services with optimal levels of service to meet public needs on a daily basis, as well as during times of stress.

OUTCOME GPS2.1:	User-friendly and convenient customer service tools using the latest technology available.
ACTION GPS2.1.1	Monitor trends and advancements in technology as they become available to determine if they would benefit City staff's ability to deliver services.
OUTCOME GPS2.2:	Police protection and service that maintain a safe environment for residents, workers and visitors.
ACTION GPS2.2.1	Prevent crime through safe environmental design.
ACTION GPS2.2.2	Support the implementation of the Police Department's long-range plans.
OUTCOME GPS2.3:	Responsive fire and rescue services that protect lives and property.
ACTION GPS2.3.1	Support the implementation of the Fire Department's long-range plans.
ACTION GPS2.3.2	Maintain and update City fire facilities and equipment to ensure all are safe, accessible to individuals of all abilities, energy efficient, and modernized to meet the changing needs of the community and staff.
OUTCOME GPS2.4:	Continued coordination and collaboration with appropriate jurisdictions, agencies and groups for emergency preparedness and response.
ACTION GPS2.4.1	Survey assets and expand upon them to best capitalize on investment in preparedness.
ACTION GPS2.4.2	Continue education programs focused on establishing survivable spaces and promoting emergency preparedness.
OUTCOME GPS2.5:	Essential health and human services are readily available for all community members.
ACTION GPS2.5.1	Improve access and availability to health and human services, amenities, and products.
ACTION GPS2.5.2	Increase transit service options available to destinations where healthy food is sold or distributed such as food banks, farmers markets and grocery stores.
ACTION GPS2.5.3	Recognizing many human services are provided by outside agencies and are not directly marketed for the City, develop a marketing strategy targeting individuals in the City who could benefit from those services.

Infrastructure and Utilities

Guiding Principle:

In 2035, Fairfax is a city with... safe, well-maintained infrastructure and use of advanced technology.

Well-maintained infrastructure and utility systems are critical to the City's continued growth and development. The services covered under this Guiding Principle include water, wastewater, stormwater, energy, telecommunications, and solid waste and recycling. These services support existing and future development and contribute to the health, safety and welfare of the community's residents, businesses and visitors. As technology advances, the City will have greater opportunity to expand the use of information and communications technologies to enhance livability, economic growth, public safety and sustainability.

The proper functioning of infrastructure systems can have major environmental implications. Water, wastewater, and stormwater systems are embedded in the region's hydrology, and the quality of our watersheds is heavily influenced by the operation of these systems. Overhead utility wires are a distracting visual element within the streetscape and present a maintenance concern. Trees must be trimmed away from the overhead lines on a regular basis, resulting in odd-shaped and unnatural-looking trees unable to grow to their fullest potential. Undergrounding utilities can enhance safety, improve aesthetics, reduce maintenance, and improve street tree health.

Infrastructure and Utilities

Goal 1

Provide quality utility services and infrastructure systems.

Utilities and infrastructure will be compliant with applicable federal and state standards and requirements to meet anticipated growth and development needs. The City should continue to ensure its infrastructure and utility systems meet the demand of projected growth and the community's needs. Significant investments in infrastructure (such as stormwater management facilities) will be needed to keep pace with maintenance, regulatory requirements and advancing technology.

OUTCOME IU1.1:	Access to a clean, safe and reliable potable water supply.
ACTION IU1.1.1	Continue to work with Fairfax Water to ensure the City has access to safe and reliable drinking water.
ACTION IU1.1.2	Encourage residents and businesses to conserve water in an effort to protect and preserve the water supply.
OUTCOME IU1.2:	A reliable and efficient wastewater system that collects, conveys and treats wastewater.
ACTION IU1.2.1	Maintain the ability to collect and transmit wastewater.
ACTION IU1.2.2	Continue to perform regular testing, maintenance and improvements to the City's wastewater collection system to ensure compliance with federal and state environmental regulations.
OUTCOME IU1.3:	A sustainable and efficient stormwater system.
ACTION IU1.3.1	Continue to implement the Virginia Stormwater Management Program (VSMP) and the City's stormwater management program to ensure compliance with federal and state regulations.
ACTION IU1.3.2	Continue to maintain and improve the City's stormwater system, utilizing green stormwater infrastructure where practical.
OUTCOME IU1.4:	Access to reliable energy and telecommunications infrastructure.
ACTION IU1.4.1	Partner with utility providers, local municipalities, and regional groups to improve access to utility data and service outage data.
ACTION IU1.4.2	Coordinate upgrades and replacement of non-City provided utilities, including electricity, water, natural gas and communications networks.
ACTION IU1.4.3	Work with utilities, developers, and state agencies to relocate above-ground utility lines underground, where feasible, with an emphasis on major corridors.

Infrastructure and Utilities

Goal 1

ACTION IU1.4.4	Encourage the placement and appearance of utility infrastructure (e.g. substations, transmission towers and lines, and switching boxes) to minimize visual disruption and negative effects on quality of life, and to enhance streetscapes.
ACTION IU1.4.5	Work with utility companies to ensure the reliability and availability of electricity, water, natural gas, and communications services during both normal times and times of stress (e.g. storm events, flooding, extreme heat, etc.).
OUTCOME IU1.5:	A safe and well-connected right-of-way system that provides a functional surface transportation system and utility infrastructure services throughout the City.
ACTION IU1.5.1	Evaluate and ensure that there is adequate lighting along all major streets.
ACTION IU1.5.2	Convert light fixtures and street lights to light emitting diodes (LEDs) and down-cast lighting.
ACTION IU1.5.3	Develop an inventory of existing public right-of-way infrastructure assets (e.g., street lights), current infrastructure conditions, and priorities for maintenance or rehabilitation.
ACTION IU1.5.4	Provide rights-of-way that will permit the expansion of tree planting strips and tree wells to provide more suitable growing conditions for street trees.
OUTCOME IU1.6:	Access to reliable and efficient solid waste and recycling services and infrastructure.
ACTION IU1.6.1	Maintain and enhance solid waste and recycling infrastructure in City parks, trails, sidewalks, and public facilities, and at events.

Infrastructure and Utilities

Goal 2

Expand the use of advanced technology.

Advanced technology infrastructure helps support economic growth and public safety, improve access to information, and ensure a broad range of communications services. Technology is rapidly progressing while the price of these advanced technologies is decreasing. The City will monitor, evaluate, and utilize advances in technology to improve efficiency, connectivity and quality of life.

OUTCOME IU2.1:	All City residences, businesses and institutions have access to reliable and affordable advanced technology and telecommunications infrastructure and services.
ACTION IU2.1.1	Periodically update policies and regulations for the design and siting of telecommunications facilities to ensure they remain applicable with fast-changing technologies.
ACTION IU2.1.2	Explore public-private partnerships as a way to enhance the City's telecommunications infrastructure.
ACTION IU2.1.3	Consider implementing innovative pilot initiatives that advance new technologies (e.g., regenerative power, solar-powered charging stations, etc.).

Appendices

Appendix A: Chesapeake Bay Preservation Plan

Appendix B: Transportation Practices and Policy

A Chesapeake Bay Preservation Plan

The City recognizes the importance of preserving its valuable water resources for future generations and the need to protect them from the adverse effects of pollution generated by urban land uses. The City also recognizes that land use activities adversely affecting City streams also impact the health and viability of downstream resources, the most important of which is the Chesapeake Bay. The Chesapeake Bay is an economic, social, and ecological resource whose continued health is of benefit to all citizens of the Commonwealth.

The City of Fairfax has a vested interest and a responsibility to maintain and promote a healthy environment, including the protection of local waterways from further degradation as a result of development. In addition, steps must be taken to improve currently degraded resources to ensure the long-term health of both the City's resources and the Chesapeake Bay. The City has risen to the challenge of natural resources and water quality protection and is committed to implementing the Chesapeake Bay Preservation Area Designation and Management Regulations as manifest by the Chesapeake Bay Preservation Act of 1988. These regulations apply to all localities within Tidewater Virginia; however, the individual jurisdictions are responsible for identifying and implementing Chesapeake Bay preservation strategies.

The City has made progress towards maintaining and promoting a healthy environment; nonetheless, significant environmental issues still need to be addressed. This Chesapeake Bay Preservation component to the City's Comprehensive Plan serves as a planning tool for the City Council, the Planning Commission, City agencies, and citizens to help guide the City in its protection of the Chesapeake Bay and the City's natural resources.

Contents

Section 1. Introduction, Purpose, and Legal Authority

Recognizing the economic and social importance of long-term viability of State waters, and in particular the Chesapeake Bay and its tributaries, the Virginia General Assembly enacted the Chesapeake Bay Preservation Act of 1988. The Chesapeake Bay Preservation Area Designation and Management Regulations as adopted in 1989 and amended in 1991, 2001, and in 2012, state that local programs shall contain "a comprehensive plan or revision that incorporates the protection of Chesapeake Bay Preservation Areas and of the quality of state waters, in accordance with criteria set forth in Part V (9VAC25-830-160 et seq.)."

The waters of the Chesapeake Bay have been degraded significantly by many sources of pollution, including nonpoint source pollution from land uses and development. Existing high-quality waters are worthy of protection from degradation to guard against further pollution. Certain lands that are proximate to shorelines have intrinsic water quality value due to the ecological and biological processes that they perform. Other lands have severe development constraints as a result of flooding, erosion, and soil limitations. With proper management, they offer significant ecological benefits by providing water quality maintenance and pollution control, as well as flood and shoreline erosion control.

To achieve these ends, the City Council and the Planning Commission have, in accordance with the Chesapeake Bay Preservation Area Designation and Management Regulations (9VAC25-830), developed a Chesapeake Bay preservation program which is centered around the City's Chesapeake Bay Preservation regulation of the Zoning Ordinance. This Chesapeake Bay Preservation component to the City's Comprehensive Plan builds upon the City's regulation and is designed to protect those qualities of life held important by the citizens of the Commonwealth and the City and to encourage future development that enhances and compliments the growth of the City as well as protects it natural resources.

Section 2. Water Resources Protection Programs and Regulations

The City has made substantial progress towards ensuring the protection and balanced management of its natural resources through the implementation of various City regulations and water quality protection and pollution prevention programs. While the Chesapeake Bay Preservation regulation is the City's primary tool for protecting water resources within the City, water quality and natural resources protection requires an integrated approach.

This involves not only regulation but also citizen participation through the use of public education and volunteer programs. Enforcement of the City's Chesapeake Bay Preservation regulation must be coupled with a comprehensive examination of how the City's various land use regulations, including its Zoning and Subdivision ordinances, may be better utilized to protect the natural environment.

The following is an overview of the City's existing regulations and programs related to water quality and natural resources protection. These regulations and programs are then reexamined and options are presented for their improvement in light of an analysis of the City's water resources (Section 3), existing and potential sources of pollution (Section 4), and constraints to development (Section 5).

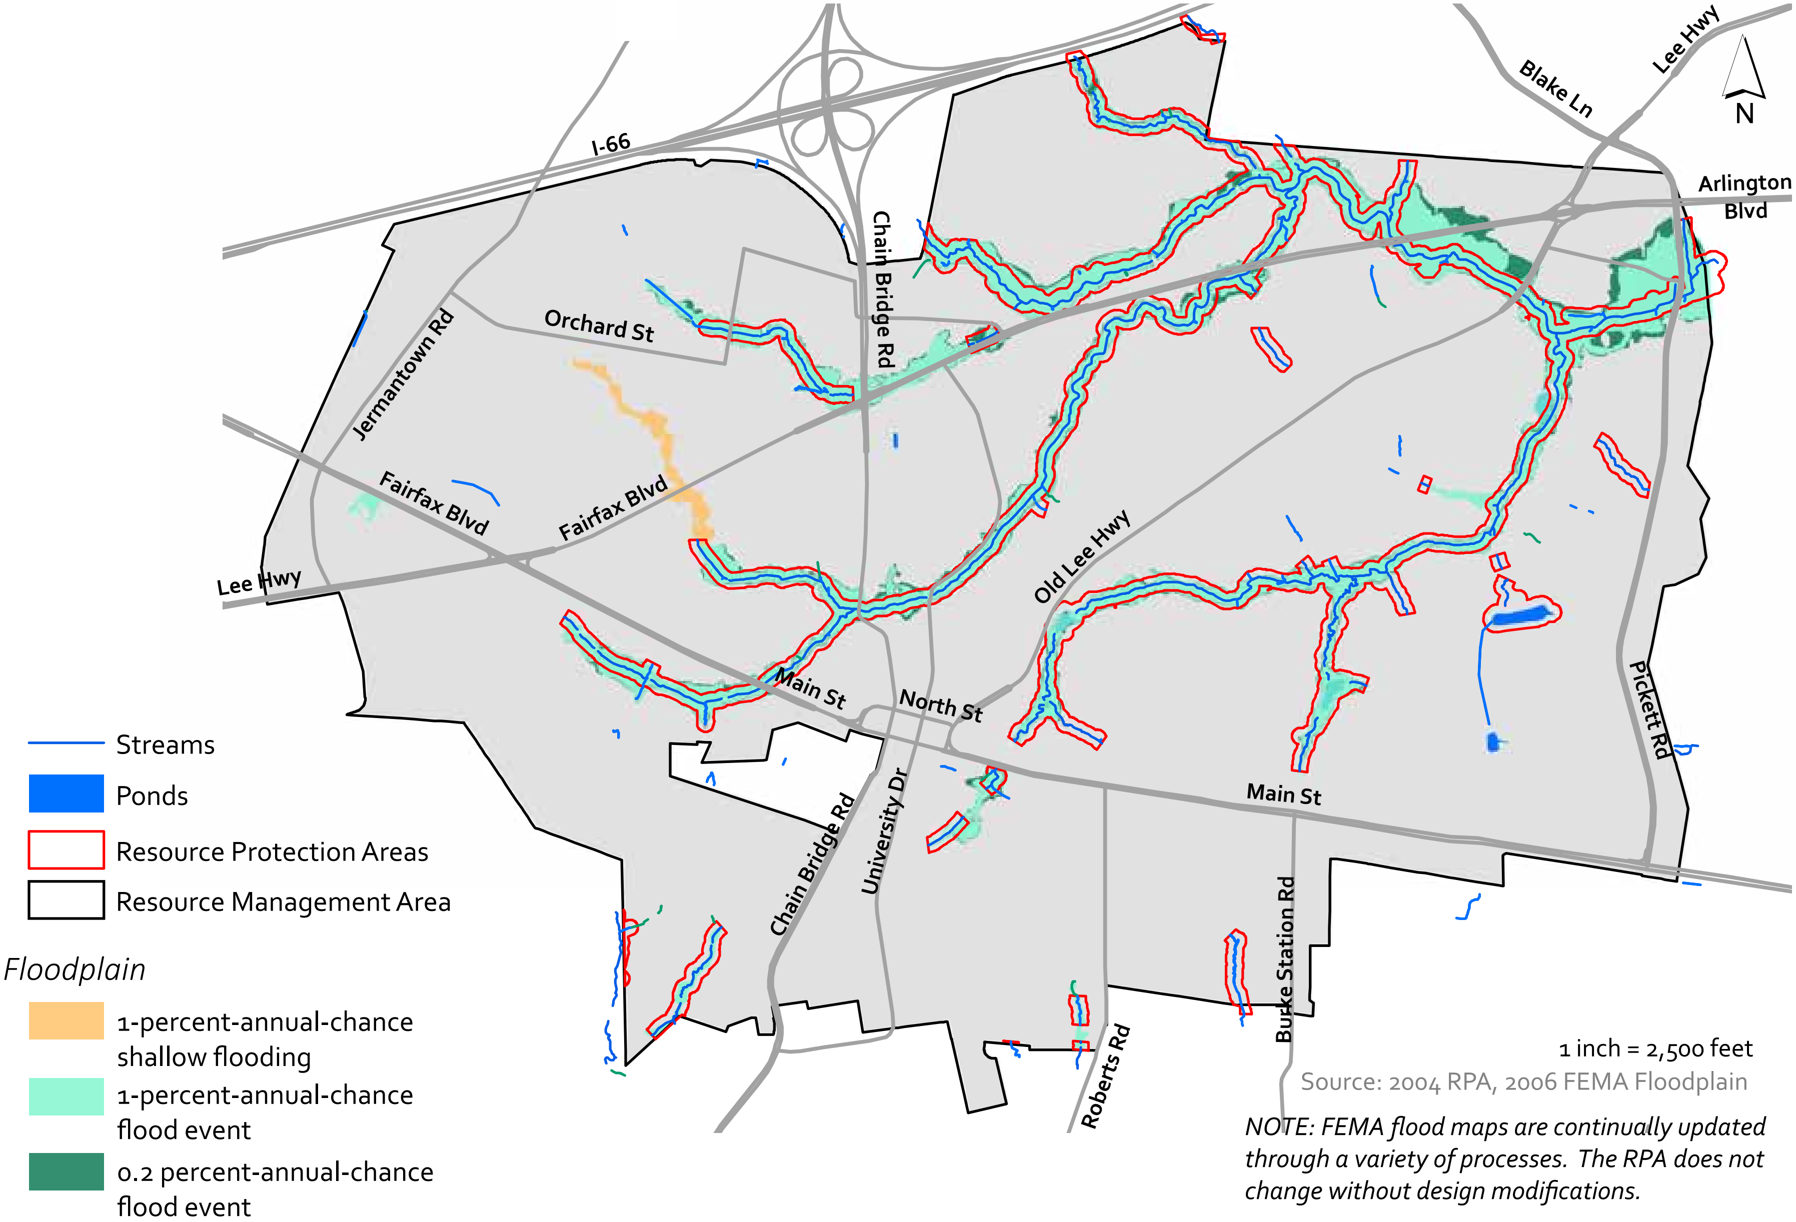
2.1. Chesapeake Bay Preservation Regulation

The Chesapeake Bay Preservation Act (Chapter 3.1 of Title 62.1 of the Code of Virginia) establishes a program to protect environmentally sensitive features which, when disturbed or developed incorrectly, lead to reductions in water quality in the Chesapeake Bay. The Act provides a framework for local government to identify these sensitive areas and to enact regulations to better plan land use activities on and around them. Under the regulations, the City of Fairfax is called to promote the following:

- Protection of existing high quality State waters and restoration of all other State waters to a condition or quality that will permit all reasonable public uses, and will support the propagation and growth of all aquatic life which might reasonably be expected to inhabit them;
- Safeguarding the clean waters of the Commonwealth from pollution;
- Prevention of any increase in pollution;
- Reduction of existing pollution; and,
- Promotion of water resource conservation in order to provide for the health, safety, and welfare of the present and future citizens of the Commonwealth.

In accordance with State guidelines, Chesapeake Bay Preservation Areas (CBPAs) were mapped for the City and the City adopted a Chesapeake Bay preservation area map as part of the City's Zoning Ordinance in October, 1990 and was most recently amended in March, 2015 (§4.18. et seq.). The Chesapeake Bay Preservation Areas were delineated for the city according to criteria established by the State Department of Conservation and Recreation. Figure A1 presents the City's Floodplain and Chesapeake Bay Preservation Area Map.

FIGURE A1 FLOODPLAIN AND CHESAPEAKE BAY PRESERVATION AREA MAP



1 inch = 2,500 feet

Source: 2004 RPA, 2006 FEMA Floodplain

NOTE: FEMA flood maps are continually updated through a variety of processes. The RPA does not change without design modifications.

The resource protection area (RPA) includes (1) tidal wetlands; (2) nontidal wetlands connected by surface flow and contiguous to tidal wetlands or water bodies with perennial flow; (3) tidal shores; (4) intermittent streams that remain largely in a natural condition and that have not been significantly impacted by adjacent development; (5) water bodies with perennial flow; and (6) a 100-foot vegetated buffer area located adjacent to and landward of the components listed above, and expanded to include noncontiguous wetlands within the floodplain that are partially located within the buffer, along both sides of any water body with perennial flow.

In general, development within the RPA is limited to water dependent uses, passive recreational uses, utilities and public facilities, and certain types of redevelopment so long as the proposed land use is carried out in accordance with the provisions of the City's Zoning Ordinance.

The resource management area (RMA) includes all lands in the city that are not designated as an RPA. All development or redevelopment within a Chesapeake Bay preservation area exceeding 2,500 square feet of disturbed land area shall be subject to the general performance standards in §4.18.7 of the Zoning Ordinance as well as the development review procedures of §6.13 of the Zoning Ordinance.

The performance standards establish the means to minimize erosion and sedimentation potential, reduce land application of nutrients and toxics, and maximize rainwater infiltration. Natural ground cover, especially woody vegetation, is most effective in holding soil in place and preventing site erosion. Indigenous vegetation, with its adaptability to local conditions without the use of harmful fertilizers or pesticides, filters stormwater runoff. Minimizing impervious cover enhances rainwater infiltration and effectively reduces stormwater runoff potential.

The performance standards are intended to prevent a net increase in nonpoint source pollution from new development and to achieve a 10 percent reduction in nonpoint source pollution from redevelopment.

2.2. Erosion and Sediment Control Regulation

The purpose of the City's Erosion and Sediment Control Regulation is to prevent the degradation of properties, stream channels, waters, and other natural resources by providing that adequate soil erosion and sediment control measures are taken before, during, and after the period of site clearance, development, and construction. The Erosion and Sediment Control Ordinance implements the Virginia Erosion and Sediment Control Law (§ 62.1-44.15:51 et seq of the Code of Virginia (2013)) as well as the Chesapeake Bay Preservation Act.

Under this ordinance, land owners proposing a nonexempt regulated land disturbing activity of greater than 2,500 square feet must first submit an erosion and sediment control plan to the City Department of Public Works. The City's erosion and sediment control requirements are detailed in Erosion and Sediment Control section of the Zoning Ordinance (§4.17).

2.3. Landscaping Regulation

The City's landscaping regulations are intended to encourage the planting and proper care of vegetation and trees throughout the City, to enhance tree canopy, and to provide for appropriate screening. These actions are intended to contribute to the health, safety, and welfare of the city by enhancing pedestrian facilities, decreasing flooding, soil erosion, air pollution and noise, and improving aesthetics.

The regulation controls the removal of trees from public and private property and establishes standards limiting tree removal and ensuring the replacement of trees sufficient to safeguard the ecological and aesthetic integrity of the community's environment. In addition, the regulation was enacted: to prevent the unnecessary clearing and disturbing of land so as to preserve, insofar as is practicable, the natural and existing growth of vegetation; to replace the removed trees with new trees or large shrubs on the same property and in the same general location; to provide protective regulations against hazardous trees and diseased trees or shrubs; to control activities related to trees and plantings upon the streets or public properties of the City; and to establish a permit procedure for tree contractors. The City's landscaping requirements are detailed in the landscape section of the Zoning Ordinance (§4.5).

Tree cover has long been recognized as serving to protect water quality. Tree canopy provides a buffer between precipitation and the soil by slowing the rate and velocity of rainfall.

Tree roots serve to keep soil particles in place and from washing away due to rainfall. Vegetation of all types also extract nutrients from water for use in plant tissues. In addition, tree cover in riparian areas serves to protect aquatic habitat by lowering and stabilizing stream temperature.

2.4. Floodplain Regulation

In 1981, the Federal Emergency Management Agency (FEMA) investigated the existence and severity of flood hazards in the City of Fairfax to aid in the administration of the National Flood Insurance Act of 1968 and the Flood Disaster Protection Act of 1973. The study was also meant to be used by local and regional planners in their efforts to promote sound floodplain management. To these ends, the City established a floodplain district as part of the City's Zoning Ordinance in 1982, which has been continually updated. The current Floodplain regulation was adopted by the City in March 2015.

The purpose of the City's floodplain regulation is to prevent the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services and the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

- Regulating uses, activities, and development which, alone or in combination with their existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies.
- Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding.
- Requiring all those uses, activities, and developments that do occur in flood-prone districts to be protected and/or flood proofed against flooding and flood damage.
- Protecting individuals from buying land and structures which are unsuited for intended purposes because of flood hazards.

In addition to protecting life and property, the floodplain regulation serves to protect water quality by decreasing the potential for stream bank erosion and by providing, in many instances, vegetated stream buffer areas which filter runoff from surrounding impervious areas. Figure A1 on page 3 depicts areas of Fairfax that have been designated as flood prone (the one-hundred year floodplain) for which the City's regulation applies. The City's floodplain regulations are detailed in §4.15 of the Zoning Ordinance.

2.5. Zoning and Subdivision Ordinances

The City's Zoning and Subdivision ordinances provide the City with valuable tools for natural resources protection through better development and redevelopment practices. Many of the City's water quality protection regulations, including the City's Chesapeake Bay Preservation regulation and Floodplain regulation are contained within the City's Zoning Ordinance as overlay districts. Protection of water resources may be accomplished through the application of Zoning Ordinance provisions which relate to impervious coverage requirements, land use densities, etc. For instance, creative parking requirements to minimize impervious areas, including cooperative parking arrangements between businesses, may be used to minimize impervious cover.

2.6. City Source Control Programs

The control of pollutants before they enter stormwater or groundwater is recognized as the most cost effective and environmentally sound method of environmental protection. While the effectiveness of source control programs are difficult to ascertain due to their heavy reliance on human behavior modification, they are nevertheless integral components of the Commonwealth's Chesapeake Bay preservation effort. The City has addressed source control on a number of fronts, many of which are specifically geared at water quality protection and some of which have water quality protection as direct benefit. Among the City's source control programs which benefit water quality are its street sweeping program, curbside leaf and brush pickup service, and recycling program.

Street sweeping is effective in removing harmful pollutants, particularly litter and sand from deicing and snow removal activities. Under the City's street sweeping program, main streets are swept once a week from mid-March through mid-November and subdivision streets are swept three times a year. In order for the City's program to have a more substantial effect on water quality, more frequent and concentrated street sweeping would need to be implemented. Specifically, more intense street sweeping efforts in downtown areas, where nutrients and other pollutants tend to accumulate at higher rates, may be of direct benefit to water quality.

In addition to street sweeping, the City conducts a curbside leaf and brush pickup service which discourages those whose properties lie within a RPA from dumping yard waste near streams where it can kill vegetation. This practice can result in erosion and the leaching of excess nutrients into the local stream. In conducting its program, the City should take care to make sure that leaves are not placed directly in the gutter where they can be washed into the local stream course.

The City has an extensive recycling program which has collections for most recycling materials including plastics, glass, metals, etc. The City also collects potentially hazardous substances such as used oil, oil filters, rechargeable batteries, and car batteries at the Property Yard Recycling Center. The City advertises its recycling program in the Public Works Department's insert to the City's monthly newsletter several times a year. New homeowners are provided with a packet of information on recycling requirements and facilities within the City.

In addition to City source control efforts, the Department of Environmental Quality (DEQ), Water Division, works directly with owners of underground storage tanks (USTs) to ensure that these tanks do not impact on groundwater quality. The DEQ, Water Division, has an extensive monitoring program to detect and mitigate any leaking USTs before substantial groundwater quality degradation can occur.

2.7. Local and Regional Watershed Management Efforts

For many years, the City's stormwater drainage system has been under considerable stress as the result of a rapid increase in the City's jurisdiction-wide imperviousness. Several types of stormwater system problems have been identified within the Accotink Creek watershed including streambank and streambed erosion, sedimentation, localized flooding, deteriorated drainage facilities, limited capacity of the drainage system as originally designed, and finally, pollutants affecting water quality.

In the last few decades, several water quality related regulations, as summarized below, have been enacted that has made it necessary for the City to investigate and address these problems on a watershed-wide basis.

- **National Pollution Discharge Elimination System:** Established by the United States Environmental Protection Agency (EPA) in 1987 as an amendment to the Clean Water Act, the National Pollution Discharge Elimination System requires permits for discharges from municipal separate storm sewer systems to limit pollutant discharges into streams, rivers, and bays. The DEQ administers the program as the Virginia Pollutant Discharge Elimination System.

- **Chesapeake Bay Preservation Act:** Established by the DEQ in 1988 to improve water quality in the Chesapeake Bay. Localities are required to adopt programs to protect water quality in the Chesapeake Bay from excessive nutrients caused by stormwater runoff from impervious surfaces.

- **Virginia Stormwater Management Program:** These regulations were established by the DEQ and include requirements for erosion and sediment control during the construction process and for the installation of BMPs to address stormwater runoff post-construction.

- **MS4 Permits:** Issued by the DEQ and EPA, these regulatory permits require local governments to implement a variety of programs (ranging from detection and correction of illicit discharges to public outreach and education) to lessen the volume of pollutants carried by their municipal stormwater conveyance systems. These permits require consistency with the pollution budgets of applicable total maximum daily loads (TMDLs); and have been issued over time.

- **Local TMDL:** Established by the DEQ and EPA, these TMDLs set target reductions for pollutants (nutrients, sediment, bacteria, trash, and PCBs) in a number of waters in the region that have been designated as 'impaired'.

- **Chesapeake Bay TMDL:** Established by the EPA in December 2010, this historic and comprehensive "pollution diet" requires reductions in nutrient (nitrogen and phosphorus) and sediment pollution throughout the Chesapeake Bay watershed and for major tributaries such as the Potomac River.

To determine how the City will face its watershed challenges, the City completed a Watershed Management Plan in July 2005. The plan evaluated watershed conditions and included recommendations on how to improve watershed health. The City also completed an Accotink Creek Stream Stability Assessment and Prioritization Plan in October 2007 and a supplement report for Daniels Run in October 2008. These reports captured the scale and extent of stream bank erosion in the Accotink Creek watershed and included a prioritization plan for future restoration activities based upon observed conditions.

The City has been continually implementing the recommendations identified in these reports. For example, the City has made significant efforts to stabilize the stream banks to handle the urban stormwater runoff and flows by implementing stream restoration and stabilization improvements at numerous locations on Accotink Creek.

The City also participates in regional efforts by being a member of the Chesapeake Bay Policy Committee, which was established by the MWCOG Board of Directors. Elected officials and staff from MWCOG's member governments, and water and wastewater utilities comprise the committee's membership. The Committee tracks developments under the federal-state Chesapeake Bay Program for implications to local governments and recommends Bay-related policies to the Board.

On June 16, 2014, the Chesapeake Bay Watershed Agreement was signed. Signatories include representatives from the entire watershed, including the Commonwealth of Virginia, committing for the first time the Chesapeake Bay's headwater states to full partnership in the Chesapeake Bay Program. This plan for collaboration across the Bay's political boundaries establishes goals and outcomes for the restoration of the Bay, its tributaries and the lands that surround them.

Section 3. Inventory of Existing Water Resources

The City contains a wealth of natural resources which benefit both residents and businesses within the City. Of its natural resources, the City's water resources are among the most important from an economic, social, and ecological point of view, as well as the most sensitive. Land uses and development, air pollution, and human carelessness all contribute to the degradation of water resources.

The City has been able to protect many stream corridors through the expansion of its public park system and the preservation of vegetative buffers. However, as the population grew from only 1,946 in 1950 to 24,097 in 2017, development pressures resulted in a dramatic increase in the City's impervious acreage and a loss of natural vegetation. While past responses to the pressures of development have resulted in the implementation of erosion and sediment control measures, stormwater quantity measures to control flooding, and floodplain protection, only recently have the post-development effects of urbanization on water quality been fully appreciated and addressed.

With the adoption of the City's Chesapeake Bay Preservation regulation in 1990, the City committed itself to a comprehensive and integrated approach to water quality protection. In order to better plan for future development and redevelopment within the City and to identify ways to enhance the quality of life through the preservation and restoration of the City's water resources, it is important to understand the resources which exist within the City. The following section presents an inventory of the water resources within the City including watersheds and streams, water supplies, water supply protection, and groundwater.

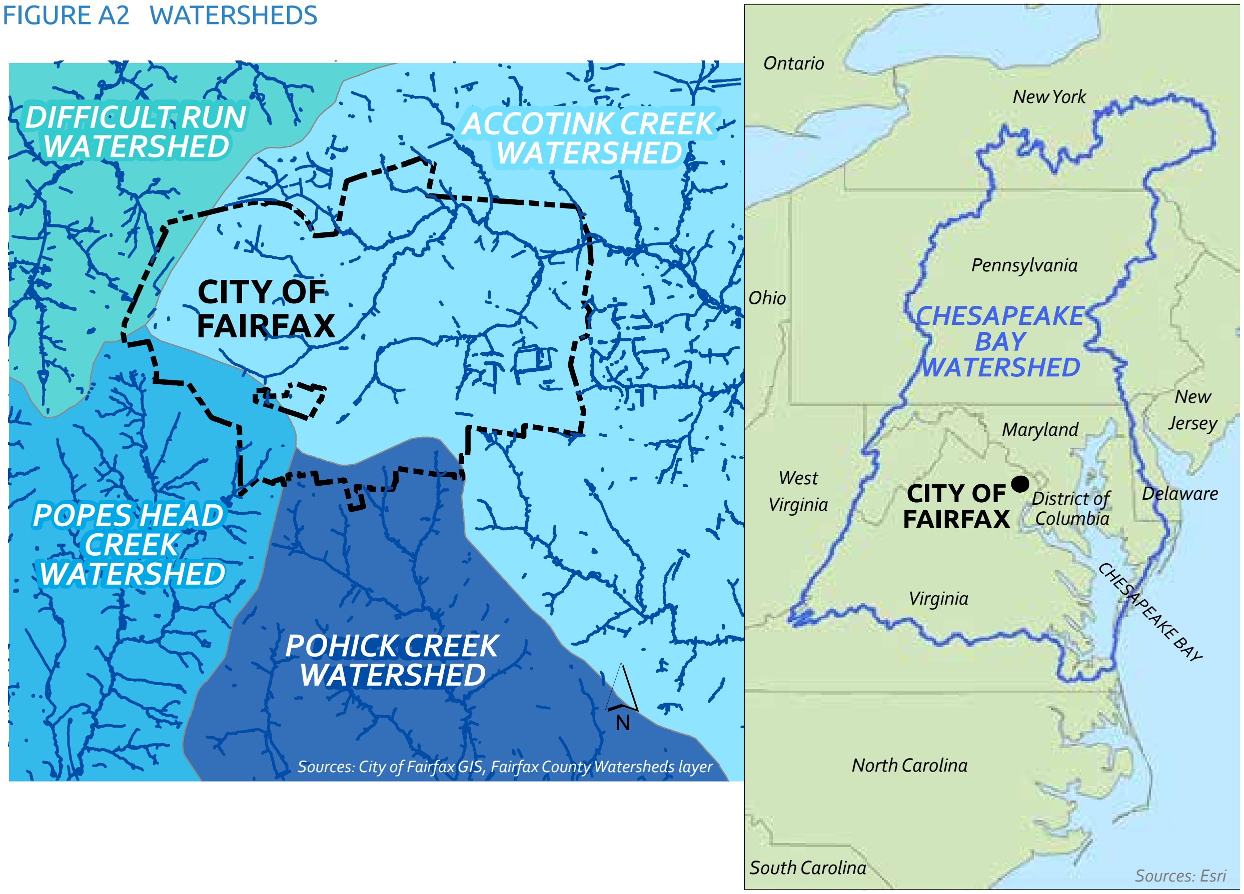
3.1. Streams and Watersheds

The City is located at the confluence of four major drainage divides and includes portions of the Accotink Creek, Pohick Creek, Popes Head Creek, and Difficult Run watersheds. As a unique consequence, practically all watercourses within the City (with the exception of a few tributaries to Accotink Creek in the northeastern portion of the City) originate within its boundaries and are not directly affected by activities from neighboring jurisdictions. This provides a considerable level of control to the City over the water quality of its streams. Major perennial streams which flow through the City include Accotink Creek (north and central forks) and Daniels Run (also known as the south fork of Accotink Creek), which drains to Accotink Creek within the City. Many smaller tributaries drain to Accotink Creek and Daniels Run in a roughly dendritic (branched) pattern which has been substantially modified by development and channelization.

The City contains the headwaters of Accotink Creek, which flows through southern Fairfax County and empties into Accotink Bay and Gunston Cove and then into the Potomac River. Within the City, Accotink Creek is primarily a gravelly bottomed fast flowing stream. However, in some wide, shallow, or slower moving areas, particularly in areas upstream of culverts, thick layers of sediments have been deposited over the gravel as a result of excessive erosion and both natural and man-made stream course blockage. Throughout much of the City, Accotink Creek is only five to ten feet wide and relatively shallow. However, the creek widens to ten to twenty-five feet and is several feet deep where it exits the northeastern edge of the City near the intersection of Pickett Road and Old Pickett Road in Thaiss Park.

According to the Division of Soil and Water Conservation's Hydrologic Units Map of Northern Virginia, the City lies primarily within the Accotink Creek watershed (HUC Code: 020700100402) which drains approximately 90% of the City. The Pohick Creek watershed (HUC Code: 020700100401), which drains the southeastern portion of the City covers approximately 3% of the City. The Difficult Run watershed (HUC Code: 02070081004), which drains the area west of Jermantown Road, covers approximately 3% of the City while the Popes Head Creek watershed (HUC Code: 020700100705), which drains the southwestern portion of the City, covers approximately 4% of the City. Popes Head Creek flows through south-central Fairfax County, bisecting the Town of Clifton, and eventually empties into the Occoquan Reservoir. This is significant due to the fact that the Occoquan serves as a primary drinking water supply for a large percentage Northern Virginians. Figure A2 presents a schematic of the City's major watersheds. Figure A3 presents a schematic of the major streams within the City.

FIGURE A2 WATERSHEDS



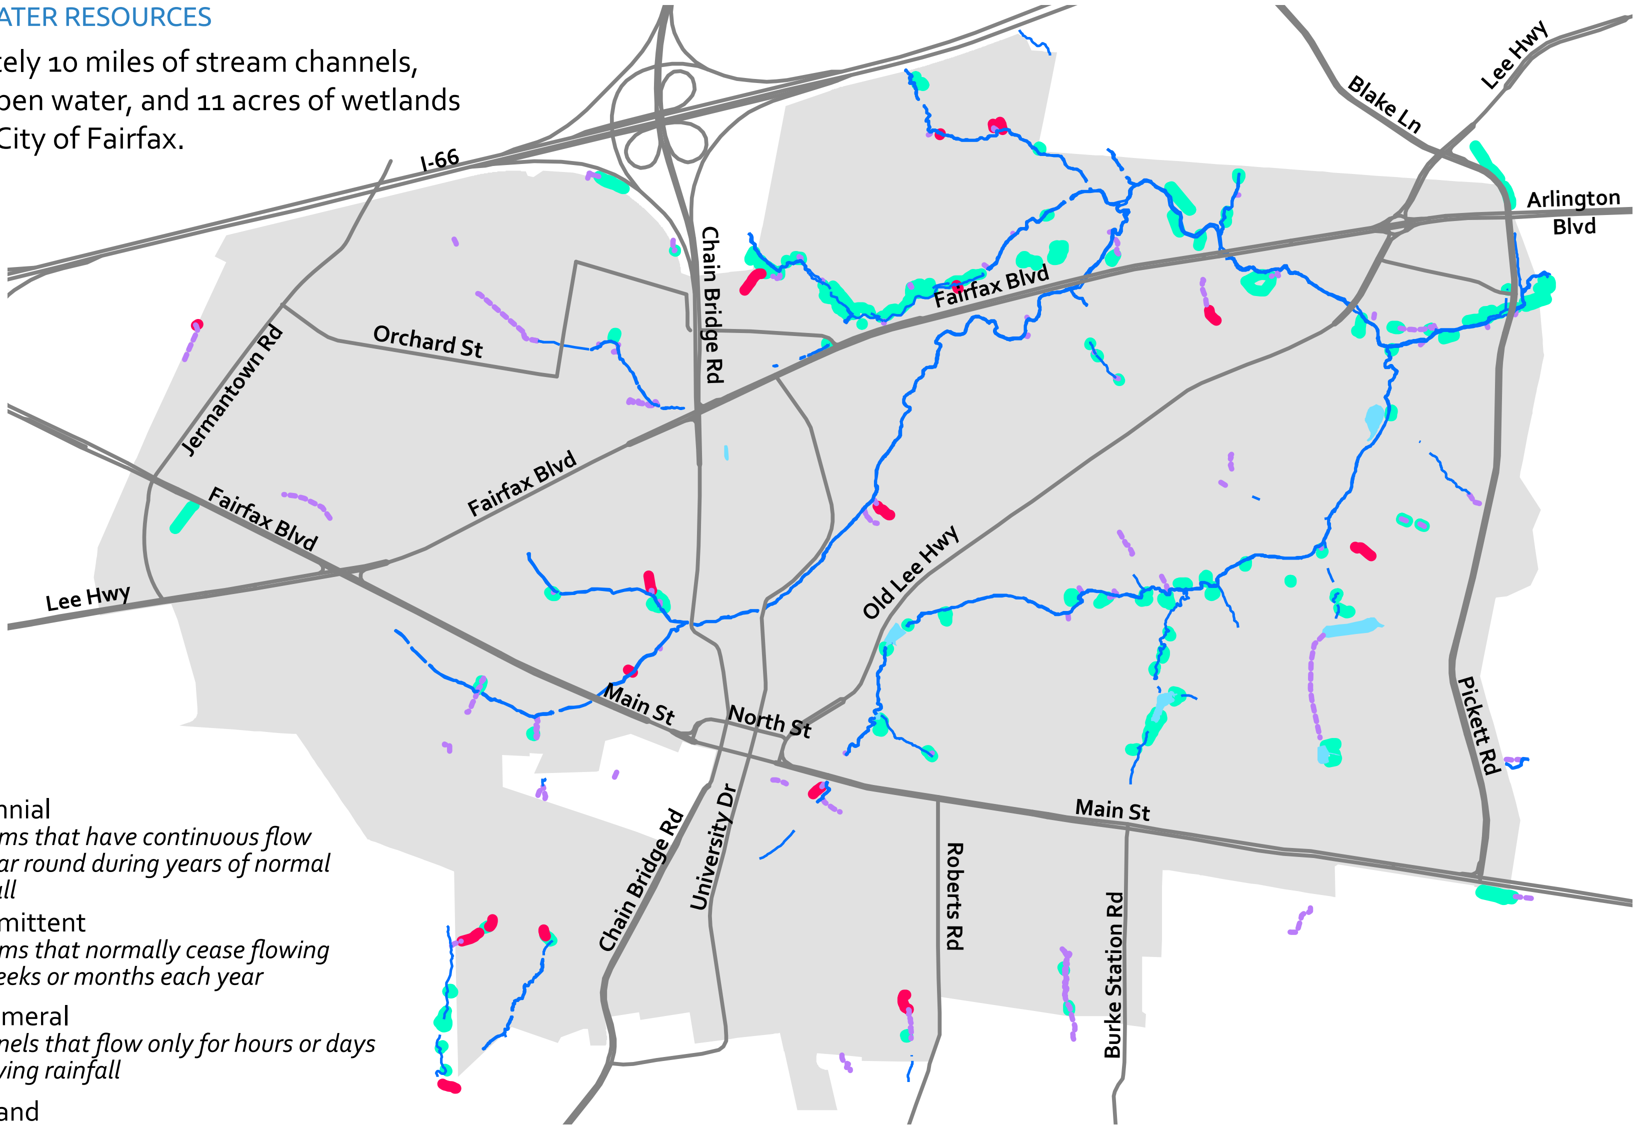
Sources: City of Fairfax GIS, Fairfax County Watersheds layer

Sources: Esri

Tributary streams within the City are subject to runoff from shopping centers, garages, parking lots, and other potentially high pollution areas. Storm drains feed the majority of the streams passing through the City and have been implicated as sources of pollution from improperly disposed petroleum products. Although many tributaries have been cleared to their banks, or have been modified to enhance drainage capacity, only a relatively small proportion of the City's perennial streams have actually been piped or channelized with concrete. The implications that the City's land uses, impervious cover, and human activities have on water quality are further detailed in Section 4.

FIGURE A3   WATER RESOURCES

Approximately 10 miles of stream channels, 9 acres of open water, and 11 acres of wetlands exist in the City of Fairfax.



— Perennial
Streams that have continuous flow all year round during years of normal rainfall

┅ Intermittent
Streams that normally cease flowing for weeks or months each year

▬ Ephemeral
Channels that flow only for hours or days following rainfall

▬ Wetland
Land area that is saturated with water, either permanently or seasonally

🟦 Pond
A body of standing water (either natural or artificial)

1 inch = 2,500 feet

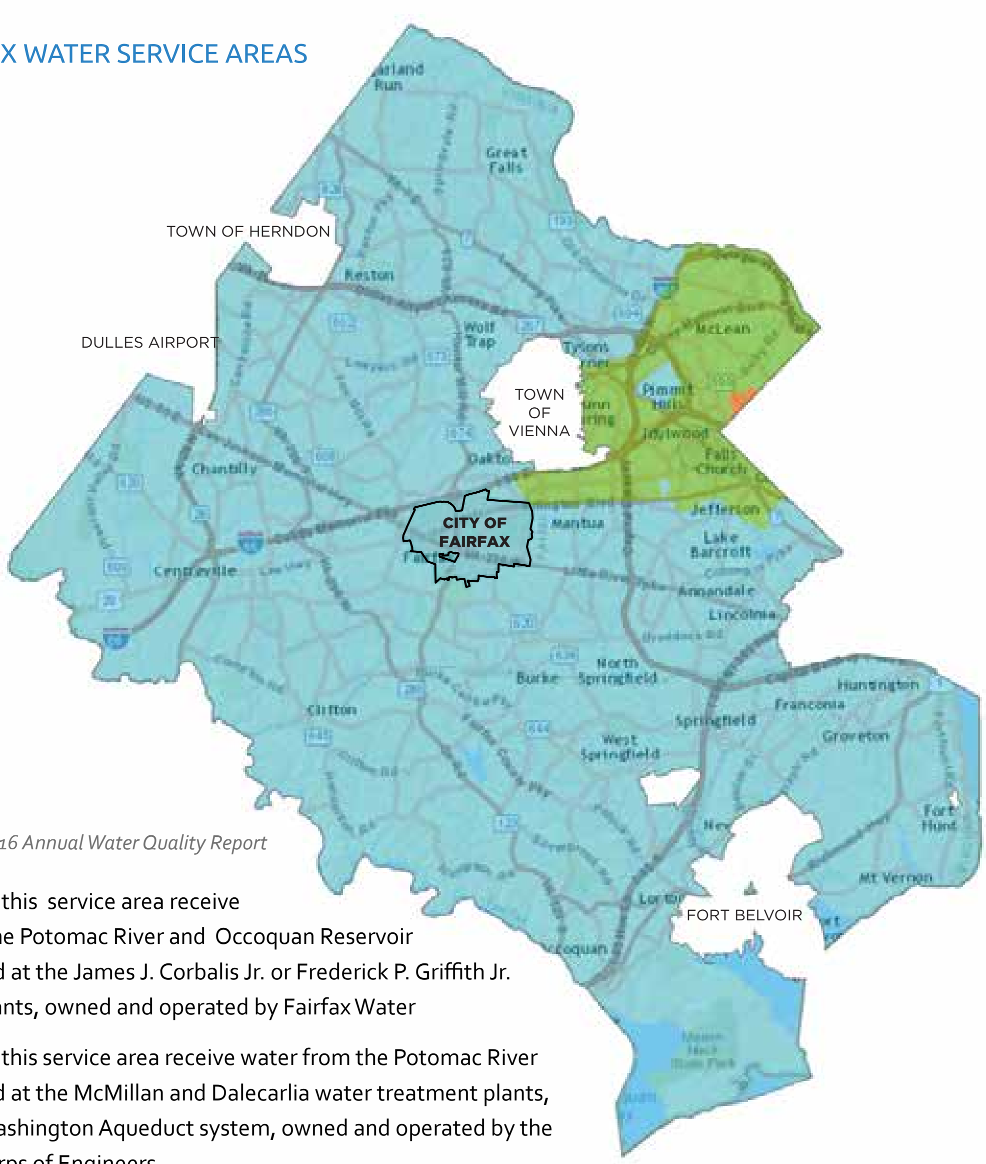
3.2. Water Supply

The City sold its water system to Fairfax Water on January 2, 2014. Since that sale, Fairfax Water has been providing water services to the City as presented on Figure A4.

Per the Fairfax Water Strategic Plan 2020, "Fairfax Water owns and operates the two largest water treatment facilities in Virginia with an average daily water production of 163 million gallons and combined maximum capacity of 376 million gallons per day. The James J. Corbalis Jr. treatment plant is at the northern tip of Fairfax County and the Frederick P. Griffith Jr. treatment plant is on the southern border of Fairfax County. Fairfax Water also purchases water from the McMillan and Dalecarlia treatment plants in Washington DC. They are part of the Washington Aqueduct, owned and operated by the U.S. Army Corps of Engineers. Fairfax Water draws raw water from two primary sources: the Potomac River and the Occoquan Reservoir, which is fed by the Occoquan River."

The principal source of potable water for the City is the Potomac River and Occoquan Reservoir that is treated at the James J. Corbalis Jr. or Frederick P. Griffith Jr. treatment plants. Fairfax Water continually works to reliably meet the needs of present and future

FIGURE A4 FAIRFAX WATER SERVICE AREAS



Source: Fairfax Water 2016 Annual Water Quality Report

🟦 Customers in this service area receive water from the Potomac River and Occoquan Reservoir that is treated at the James J. Corbalis Jr. or Frederick P. Griffith Jr. treatment plants, owned and operated by Fairfax Water

🟩 Customers in this service area receive water from the Potomac River that is treated at the McMillan and Dalecarlia water treatment plants, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers

🟧 Customers in this service area receive water from the Potomac River that is treated at the Dalecarlia water treatment plant, part of the Washington Aqueduct system, owned and operated by the U.S. Army Corps of Engineers customers. The City will continue to work with Fairfax Water to ensure the City has access to safe and reliable drinking water.

In compliance with federal Safe Drinking Water Act, the Virginia Department of Health (VDH) conducts source-water assessments, which consist of figures of the evaluated watershed area, an inventory of known land-use activities, and documentation of known source-water contamination. The Potomac River and the Occoquan Reservoir were determined to be of high susceptibility to contamination.

In addition to protecting the City's water supply from pollution, water conservation practices help conserve and protect it from depletion. Conservation also reduces the amount of potable water that reaches the City's sanitary sewer system and reduces the potential that landscape irrigation and car washing will result in water pollution. The City should develop a program to encourage City residents on a more regular basis to practice water conservation, including the voluntary replacement of water-intensive (or leaky) fixtures in the home with new low consumption fixtures. Incorporation of water conservation into the school curriculum is also an effective approach and has been used elsewhere in Northern Virginia, including Arlington County.

3.3. Water Quality Monitoring

Protecting the quality of surface water resources is a concern for many urban jurisdictions. The removal of tree canopy cover, which serves to stabilize and cool stream temperatures, as well as increased imperviousness of surrounding areas, which increases the volume and velocity of stormwater runoff into local streams, have a generally negative effect on stream water quality. Water quality may be decreased as a result of pesticide and fertilizer-laden runoff from adjacent lawns or by runoff from parking lots which may contain nutrients, heavy metals, and hydrocarbons. Eroding stream banks contribute to urban water quality problems by choking local streams with sediment. Illegal dumping into storm sewers, trash and litter, animal and pet wastes, and leaking above ground and underground storage tanks also take their toll on urban water quality.

The City's established Water Quality Monitoring Program (WQMP) helps the City meet the requirements contained in Section I.B.2.e of the City's Municipal Separate Storm Sewer System (MS4) permit, and Item 9 in the City of Fairfax's DEQ approved TMDL Action Plans. It was designed to assist in assessing the effectiveness of all the City's Local TMDL Action Plans. Under the program, the City collects water quality samples which are analyzed for water quality parameters including Total Suspended Solids (TSS), Bacteria (E. coli), temperature, specific conductance, Dissolved Oxygen (DO), pH, turbidity, nitrate + nitrite, total phosphorus, and volatile suspended solids. Samples are collected twice a year from six representative MS4 outfalls located within the drainage sheds of the impaired reaches of Difficult Run, Accotink Creek, and Popes Head Creek.

The City utilizes the water quality sampling data to address multiple objectives including: screening for potential sources of the pollutants of concern discharging into the City's MS4; targeting locations within the MS4 permit area for implementation of BMPs; educating the public on the potential water quality impacts of their actions and behavior within the MS4 drainage area; and ultimately to aid in assessing the overall effectiveness of the Action Plan in reducing the discharge of the pollutants of concern from the City's MS4.

At the end of each MS4 permit reporting period, the City prepares annual Water Quality Monitoring Reports, which are included with the City's MS4 Annual Report. Once appropriate amounts of sampling data have been collected under the WQMP, the City will analyze the results to determine the next steps to take with the MS4 Permit Program and local TMDL Action Plans.

3.4. Groundwater Resources

While the City no longer relies on groundwater resources for its potable water supply, groundwater is nonetheless an important water resource. An investigation of the groundwater resources of the City is important because groundwater is intimately connected with the ecosystem as it provides the base flow to many rivers, streams, ponds, lakes, and wetlands. Groundwater is also an issue of regional importance due to its dynamic nature, as was shown when a leaking oil storage tank at the Fairfax Tank Farm formed a plume which spread from the eastern edge of the City into the Mantua neighborhood of Fairfax County. Because the City no longer relies on groundwater for its potable water supply, recent data on City-wide groundwater dynamics and quality is not available.

Section 4. Existing and Potential Sources of Water Pollution

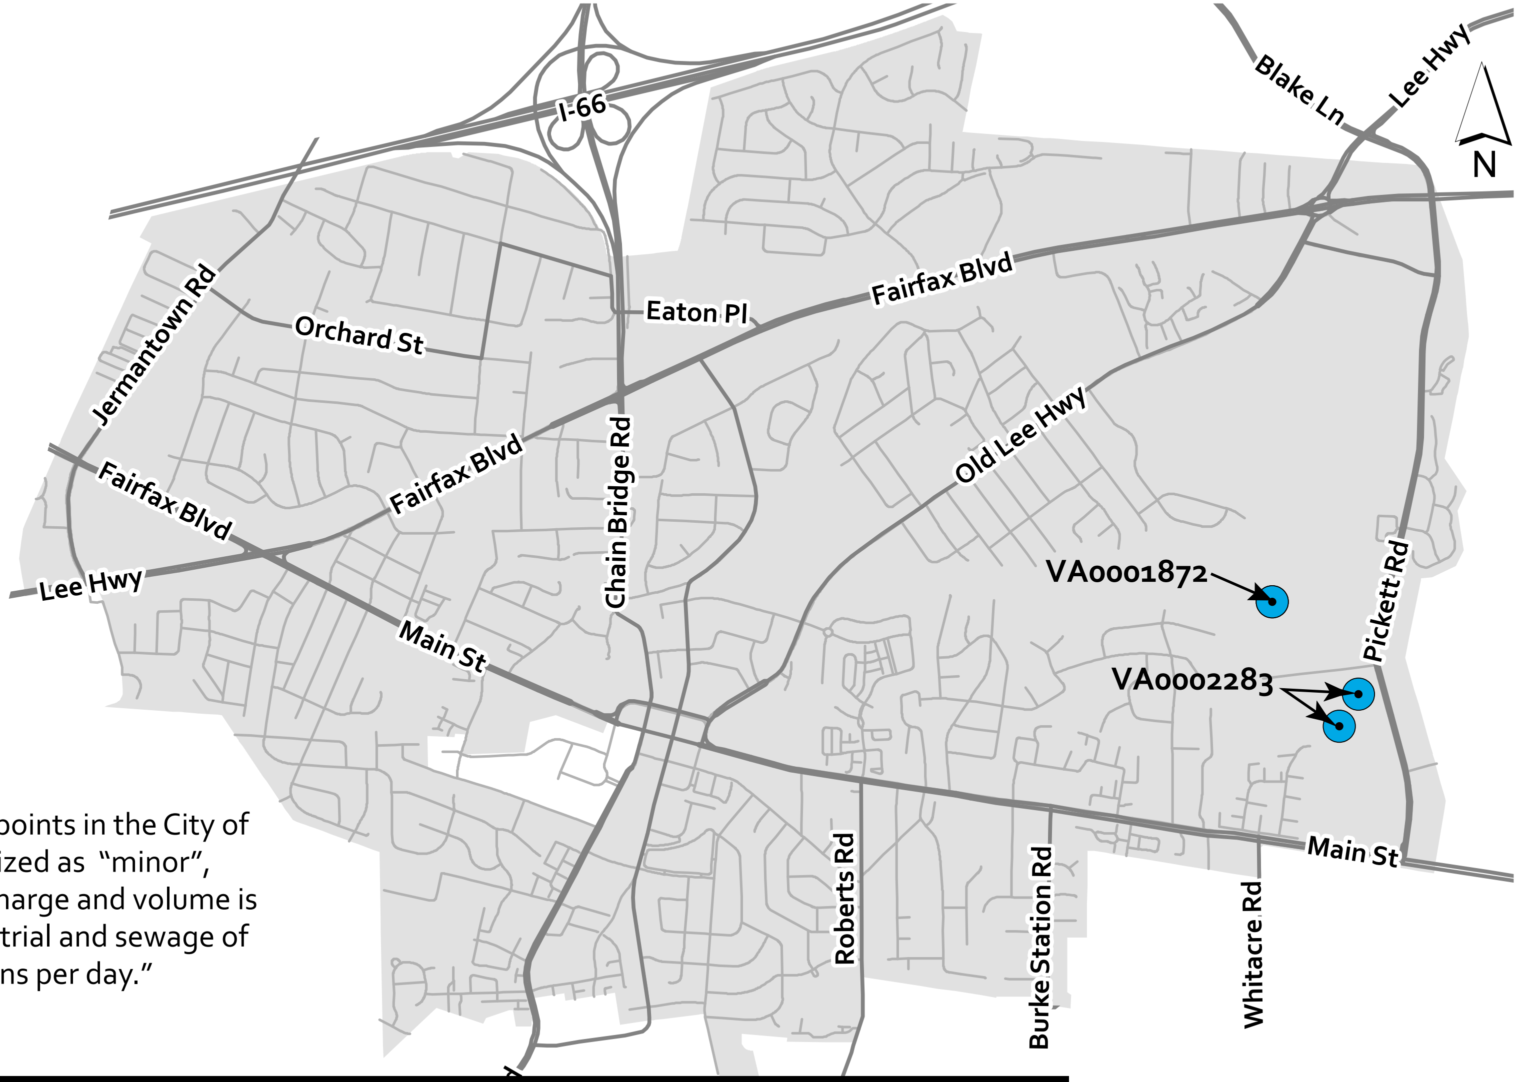
While some level of environmental pollution resulting from human activity may be inevitable, the cost of pollution and its effects on quality of life should not be ignored. Unmanaged pollution can result in surface and groundwater contamination, poor air quality, aesthetic degradation of the landscape, and the destruction of important ecological habitats, all of which detract from the City's basic character. The most cost-effective approach to the problem of pollution is to prevent it at its source. A number of tools are available to the City to aid in pollution prevention, including public education and awareness programs, water conservation, lawn care programs, and recycling efforts, to name only a few. The cost to the City once environmental damage is done includes not only short term clean-up costs, but long-term costs including decreased property values and loss of tax base. The following section describes the City's existing sources of pollution as well as potential sources of pollution which the City may face as it grows and develops.

4.1. Point Source Pollution

Point source pollution is pollution which can be attributed to a specific outfall and is therefore often the most easily recognizable and regulatable form of pollution. Industries and municipalities, under the federal Clean Water Act, National Pollution Discharge Elimination System, are required to report pollution discharges to water courses above a certain threshold, and to the maximum extent practicable, mitigate the effects of the pollution on the environment. The DEQ, Water Division, maintains records on these sources of pollution and is charged with ensuring that environmental regulations are enforced.

There are two National Pollution Discharge Elimination System discharge points located within the City (VA0001872 and VA0002283), both of which drain to tributaries of Accotink Creek (see Figure A5). The discharge points are associated with ongoing activities at the Fairfax Tank Farm Terminal Complex located on Colonial Avenue. The City's water quality is not affected by any upstream point source discharges from surrounding Fairfax County or other jurisdictions. There are currently no municipal discharge points on property owned by the City which fall under the National Pollution Discharge Elimination System

FIGURE A5 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) DISCHARGE POINTS



● VPDES Outfall Individual Permit

There are two discharge points in the City of Fairfax. Both are categorized as "minor", meaning the type of discharge and volume is "commercial, small industrial and sewage of less than 1.0 million gallons per day."

regulations. Stormwater runoff, which is considered nonpoint source pollution, unless piped, is further discussed under Section 4.2.

4.2. Nonpoint Source Pollution

Nonpoint source pollution is pollution which cannot be attributed to a single source but is the result of many diffuse sources. Considered singularly, each small source would not constitute a problem, but together these nonpoint sources constitute a substantial threat to water quality. Most commonly, nonpoint source pollution is caused by rainfall running off roadways, parking lots, roof tops, and other urban land uses. Urbanization increases the imperviousness of a land area, thereby increasing the amount and velocity of stormwater runoff delivered to nearby streams. Pollutants which would normally settle out or infiltrate through the soil are carried directly to local waterways. On a per acre basis, urban land use including residential development generally produces higher annual nonpoint source pollutant loadings of nutrients, heavy metals, and oxygen-depleting substances than do rural agricultural uses. Oil contamination, sediments, pesticides, metals, and other toxic substances can kill fish and destroy bottom life. In addition to transporting pollution, increased runoff also increases instream flow during and immediately after periods of precipitation. This results in increased soil erosion and the destruction of wildlife habitat.

The effect on local waterways is a general degradation of water quality and a phenomenon known as eutrophication. Eutrophic conditions, caused by excessive nutrients in the water, are characterized by low dissolved oxygen levels and high algal growth. The primary detrimental effect on water resources, particularly on large bodies of water such as the Potomac River and the Chesapeake Bay, is algal blooms, which block sunlight from aquatic life and deplete the dissolved oxygen content during decay. Eutrophication also destroys the recreational use of water resources and results in strong odor and undesirable taste.

Because the City lies within the Tidewater area of Virginia, which has a significant impact on the health of the Chesapeake Bay, controlling nonpoint source pollution is an important aspect of the City's environmental protection efforts. The Virginia Division of Soil and Water Conservation has designated the control of nonpoint source pollution as a high priority for all watersheds within the City.

Nonpoint source pollution from urban areas can be controlled by minimizing impervious areas from new development, reducing impervious areas through redevelopment, utilizing open space and preserving indigenous vegetation, restoring denuded vegetative stream buffers, and by employing the use of structural or nonstructural best management practices (BMPs), which operate by trapping stormwater runoff and detaining it until unwanted nutrients, sediment, and other harmful pollutants are allowed to settle out or be filtered through the underlying soil. The City's Chesapeake Bay Preservation regulation requires the achievement of certain performance standards for any development which takes place in designated Chesapeake Bay Preservation Areas.

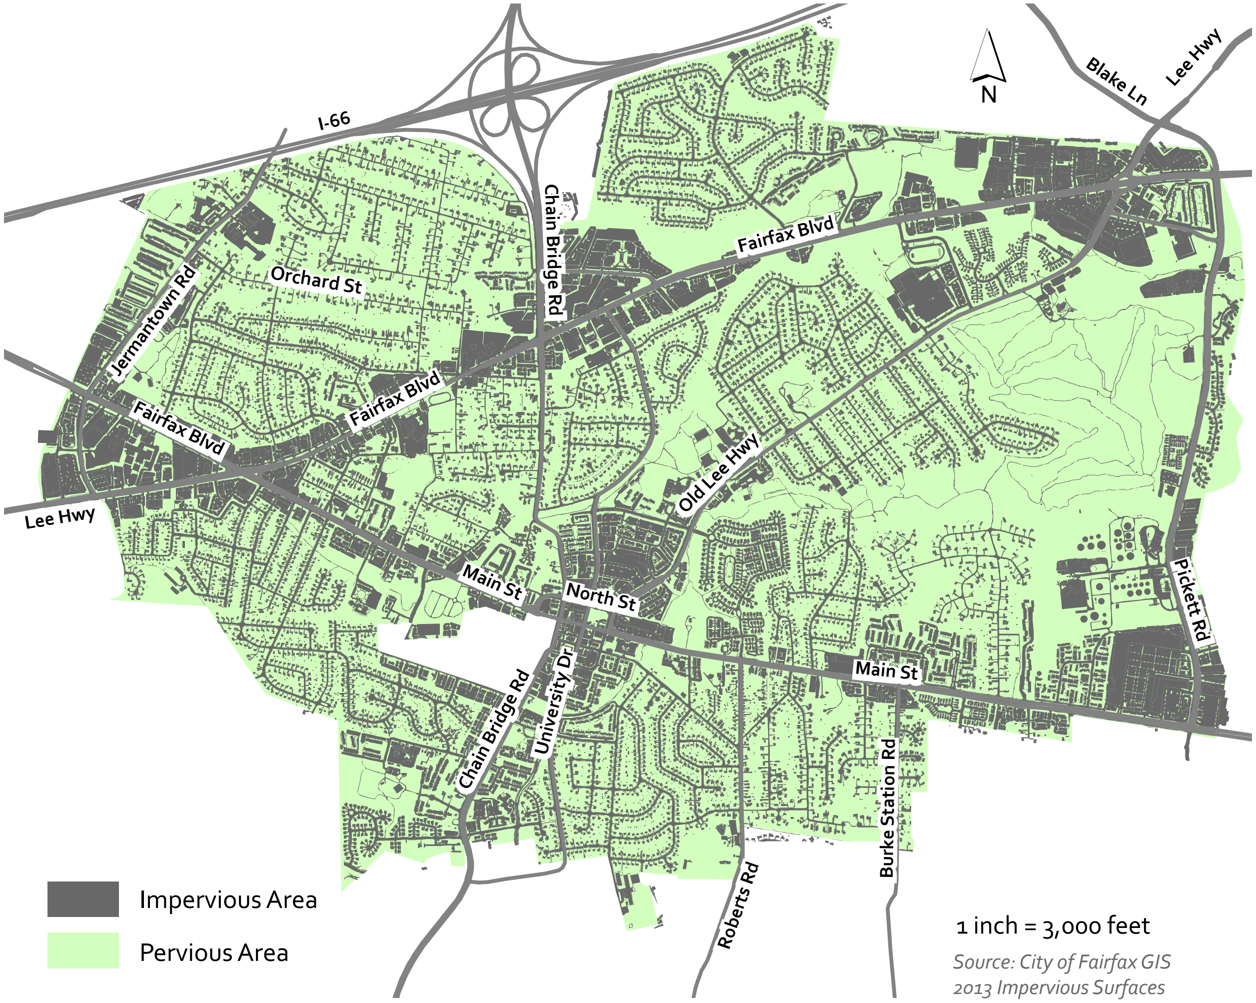
A useful analysis tool in nonpoint source pollution mitigation is to examine where highly impervious areas of the City are in relation to the City's water resources. In this way, various nonpoint source pollution control efforts, from educational programs to redevelopment, can be concentrated on those areas most likely to produce the greatest impact on the quality of City water. Since the City is largely built out, these figures are helpful when considering where to concentrate redevelopment or retrofit to improve water quality. It is also useful in deciding where and what types of public education programs may be beneficial. The City consists of approximately 42.7% impervious land areas and 57.3% pervious land areas (Figure A6).

The City's nonpoint source pollution control program also includes the City's Erosion and Sediment Control Ordinance. This ordinance requires that stormwater management facilities be installed during construction to help control increased stormwater runoff created by development thereby reducing the possibility of downstream flooding and erosion.

4.3. Streambank Erosion and Sedimentation

While streambank and land erosion is a natural process, land development has greatly accelerated this process. As large areas of once forested land have been replaced with impervious land cover, a greater quantity of stormwater is directly piped into local waterways at a much higher velocity. Signs of stormwater erosion include undercut streams and fallen banks, felled bushes and trees which once lined the banks, and exposed sewer and other utility pipes. Suspended sediments choke and muddy local waterways making them uninhabitable to local species of aquatic

FIGURE A6 PERVIOUS AND IMPERVIOUS AREAS



Source: City of Fairfax GIS
2013 Impervious Surfaces

life. In addition, nutrients and other pollutants attach themselves to sediment particles and contribute to eutrophic conditions in the Potomac River and the Chesapeake Bay. Eventually, suspended sediments are deposited in slower moving portions of the stream course, causing buildup, destruction of benthic life forms, and a decreased stream capacity for floodwaters, thus resulting in greater potential for further erosion and property damage.

Completed in 2005, the City's Watershed Management Plan found that overall stream health to be fair to poor in the majority of the City (Figure A7); erosion potential remains at a very high level; there is evidence of sediment deposition which can cause water quality degradation and have negative impacts on aquatic life; and down-cutting streams threaten City utilities and surrounding property.

A bank erosion hazard index (BEHI) assessment was conducted on Accotink Creek (Figure A8) and Daniels Run (Figure A9). The BEHI is a methodology used to assess and predict stream bank erosion potential. Based on the BEHI results, over 90% of studied stream reach length had at least a high potential for stream bank degradation and over half of all stream

Bank Erosion Hazard Index Assessment was conducted on Daniels Run on August 4-7, 2007.

reaches were found to be at a very high or extreme risk for stream bank degradation. It is evident from these results that stream bank erosion is a major impact on the stability and overall health of the City's streams

4.4. Malfunctioning Water Quality BMPs

In response to the water quality requirements of the Chesapeake Bay Preservation Act, many development sites within the City will be called upon to establish water quality best management practices (BMPs). These BMPs are designed to detain polluted stormwater runoff until harmful pollutants have had a chance to settle, at which time the stormwater is slowly released. However, BMPs, like most other structural facilities, will deteriorate over time and require regular maintenance. Adequate maintenance will prolong the expected lifespan of a facility, therefore saving considerable money in the long-run. Further, while a properly functioning facility enhances downstream environments by mitigating the environmental impacts of land development, pollutant removal efficiencies will decline over time if regular maintenance is not performed.

Pursuant to the BMP Maintenance and Monitoring Agreement, Erosion and Sediment Control Plan, or Site Plan governing the facilities throughout the City, it is responsibility of the owner(s) to maintain the BMP facility in good working order. The maintenance agreement, Erosion and Sediment Control plan or Site Plan, provides the City of Fairfax with authority to conduct inspections of BMPs and Stormwater Management Facilities.

The City conducts a Citywide assessment to ensure all facilities are in working order on an annual basis. A representative from the City or an authorized consultant visits the property (or HOA property) to conduct an inspection of the stormwater control measures and BMPs in place to ensure proper maintenance is being performed in accordance with the suggested maintenance schedule for each facility.

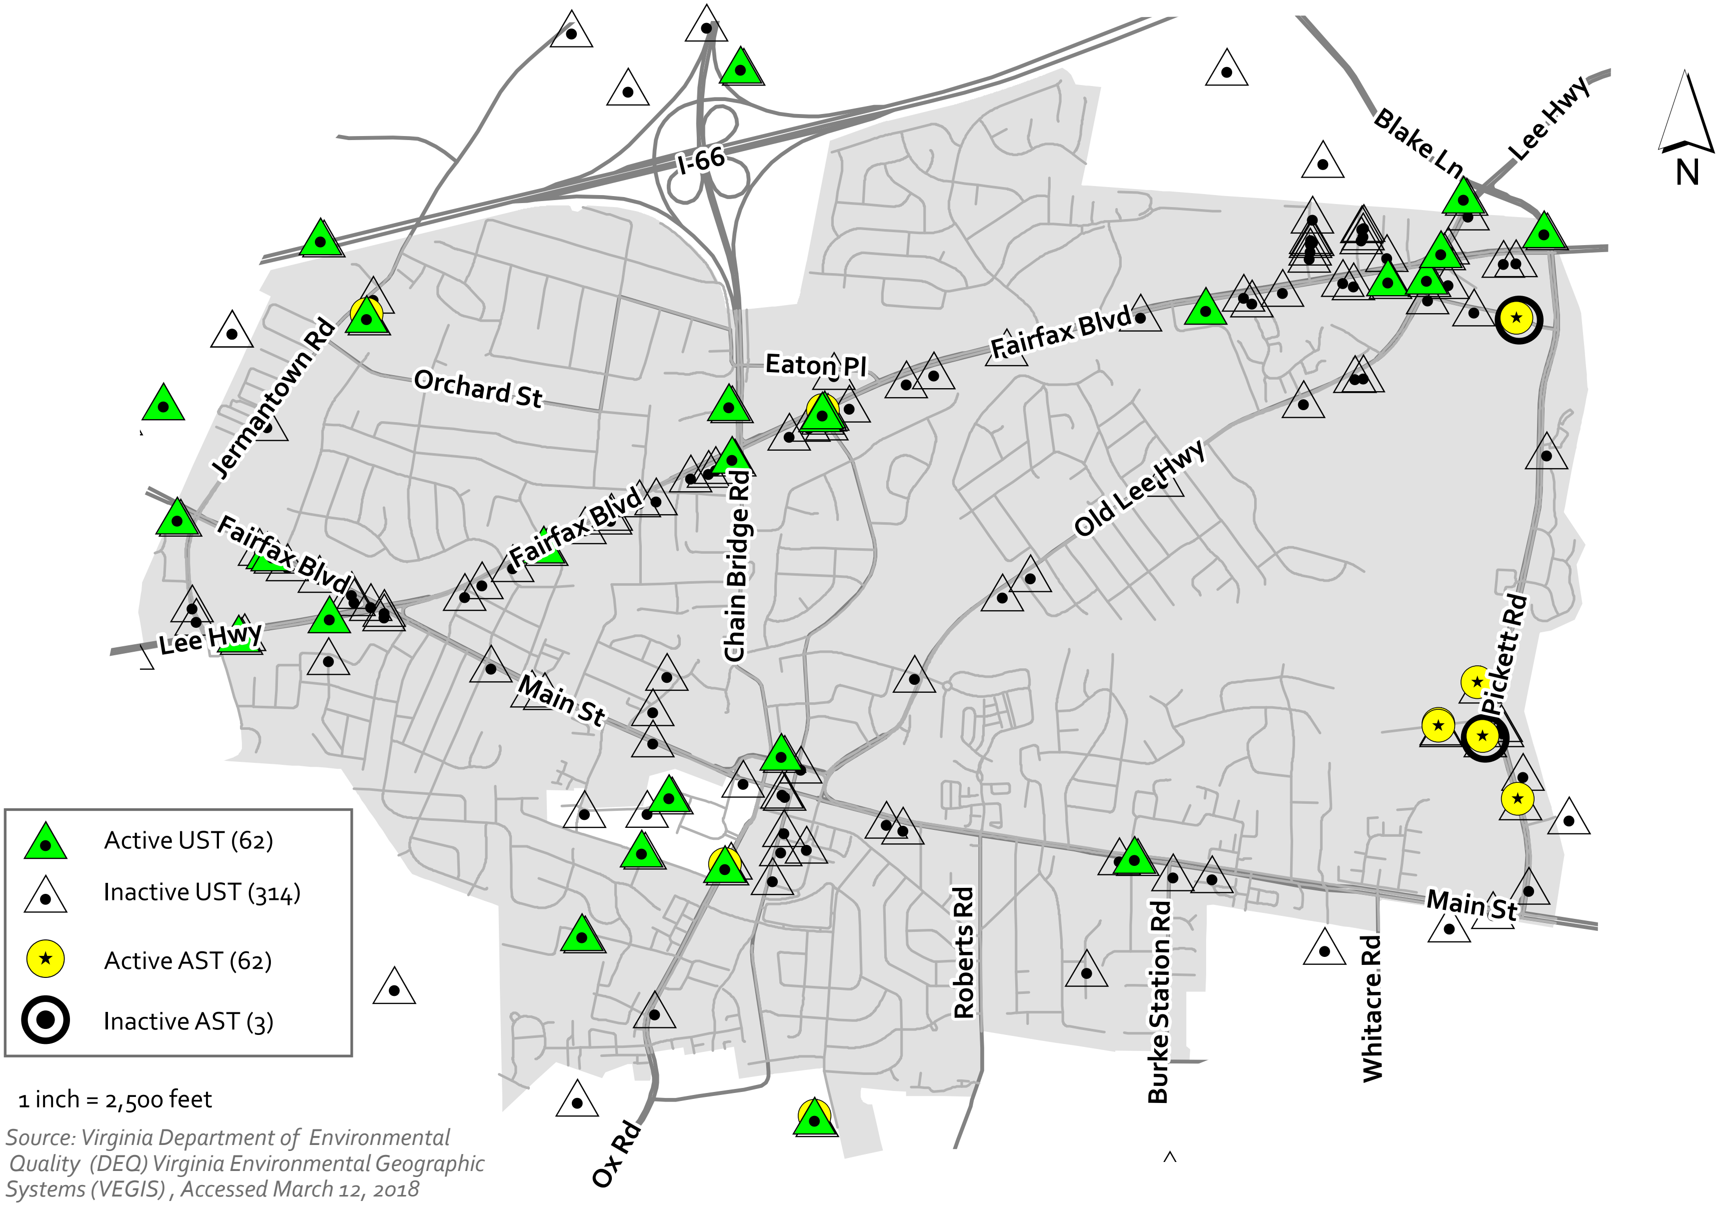
4.5. Underground Storage Tanks

The Virginia Department of Environmental Quality (DEQ), Water Division, is responsible for permitting and tracking underground storage tanks (USTs). Within the City limits, there are approximately 376 USTs of varying capacity at 118 street addresses. Of these USTs, only 62 are still active. The USTs are currently being used to store gasoline, diesel, used oil, heating oil, and other substances. Due to the fact that the City is a major commercial and transportation corridor, the City has a relatively high concentration of USTs for its land area. Underground storage tanks are concentrated along the City's commercial and industrial corridors including lower Pickett Road, Old Town Fairfax, the Kamp Washington area, the intersection of Chain Bridge Road and Fairfax Boulevard, and the Fairfax Circle area (Figure A8).

When properly maintained, underground storage tanks are safe, save space, and are a more aesthetically pleasing alternative than above ground storage tanks. However, leaking tanks are a major source of soil and groundwater contamination. Leaking USTs also have the potential to affect surface waters since many streams are fed by groundwater aquifers. Underground storage tanks often pose a greater threat than other sources of pollution because a leak or spill may not be detected until it has already created extensive damage. Further, there exist many underground storage tanks which were installed before more stringent regulations were applied. The location and condition of these tanks are often unknown.

Another important factor affecting the incidence of leaking tanks is the age of the tanks. Particularly in an area such as Fairfax where soils tend to be acid, older tanks are more likely to be subject to leakage than

FIGURE A10   LOCATION OF UNDERGROUND AND ABOVE GROUND STORAGE TANKS (USTS & ASTS)



1 inch = 2,500 feet

Source: Virginia Department of Environmental Quality (DEQ) Virginia Environmental Geographic Systems (VEGIS), Accessed March 12, 2018

newer tanks designed to counter acid soil. Areas where age may be a factor are scattered throughout the City which should be a consideration when targeting areas for further investigation or for public/business education. Another factor to consider is the proximity of USTs to stream sites. Streams which are located near USTs of above average age may be at particular risk to contamination. Most of the commercial areas of the City directly impact on at least one perennial stream.

The City has and will continue to work with the owners of leaking underground storage tanks and the DEQ to ensure that any existing or future contamination is properly addressed and corrected.

4.6. Above Ground Storage Tanks

The Virginia State Water Control Board in 1998 adopted the regulation, 9 VAC 25-91-10 et seq., which consolidated three repealed regulations, that is, (i) Oil Discharge Contingency Plans and Administrative Fees, 9 VAC 25-90-10 et seq. (ii) Facility and Aboveground Storage Tank Registration Requirements, 9 VAC 25-130-10 et seq., and (iii) Aboveground Storage Tanks Pollution Prevention Requirements, 9 VAC 25-140-10 et seq.

The AST regulations were revised primarily to incorporate new performance standards for certain aboveground storage tanks (1 million gallon or more AST facilities) located in the City as mandated by the 2011 General Assembly (CH 884 of the 2011 Acts of Assembly). By July 1, 2021, the impacted facilities must satisfy specific requirements for strength testing, and release prevention barriers.

Individual tanks with a capacity of less than 660 gallons or multiple tanks with an aggregate capacity of less than 1,320 gallons are not currently regulated by the State or the federal government. Within the City limits, there are 65 regulated ASTs of varying capacity at 9 street addresses (Figure A 8). Of these ASTs, 62 are currently active. Most home fuel oil tanks are only 200 to 660 gallons. It is therefore the responsibility of the individual owner to ensure that leaks and spills do not occur. While individual household tanks do not pose a significant risk to the environment, the aggregate of tanks may pose a serious threat if small problems are not taken seriously. Releases from individual tanks may occur as a result of overfill or the tipping over of the tank. To reduce the risk of accidental spill, the homeowner or fuel company should inspect a tank before filling to ensure that it is sturdy and does not exhibit signs of corrosion. An owner should also have the capacity of the tank clearly marked on the tank and specifically indicate the filling cap location.

4.7. Illegal Dumping of Petroleum and Litter

The reported presence of petroleum products in City streams is a major water quality concern. Petroleum can severely damage the ecosystem by destroying plant life and killing aquatic lifeforms. While some petroleum products in the water may be attributable to leaking automobiles on nearby parking areas or leaking underground storage tanks, the most common source of petroleum is illegal dumping by do-it-yourself (DIY) automotive maintenance activities. A DIY is an individual who removes used oil from a motor vehicle, utility engine, or other piece of equipment that he or she operates as opposed to someone who takes the equipment to a lube shop or auto mechanic.

There is a risk that DIYers may pour the oil down a storm drain or throw it out in the trash, resulting in a release of oil into the environment. For areas such as the City of Fairfax, where streams are primarily fed by residential storm drains, only a few careless instances can result in a significant degradation in water quality.

The City provides and advertises for the collection of used oil and oil filters at its Property Yard Recycling Center, implements a storm drain marking program, and works with local civic organizations and volunteers to install storm drain markers, which state "Only rain down the storm drain." These markers are used to educate residents that the storm drain eventually empties to the Chesapeake Bay watershed and to prevent the amount of pollution that reaches local creeks and rivers. The City may wish to consider the implementation of a public education program which not only informs residents what to do with used oil, but also tells them what to do if he/she witnesses a neighbor pouring oil down a storm drain.

4.8. Pet and Animal Wastes

Fecal coliform is a pollutant of concern in the City of Fairfax. While there are several potential sources of fecal coliforms, the most likely source is from pet waste, and particularly dog waste, which is not disposed of properly. City paths and walkways along streams (or near storm drains) provide for public access and scenic areas to walk, run, and bicycle. However, these public areas are also used by some pet owners who leave pet wastes which are then easily transported by the next storm directly into the water course.

Fecal coliform can severely impact on the viability of the City's water resources. Control mechanisms include enforcing local animal waste control provisions, BMPs, and natural stream buffers. While BMPs and natural buffers are established as part of the City's overall Chesapeake Bay Program, the most effective manner of control is through public education and better enforcement of the City's animal waste control regulation. Better enforcement and education can reduce the levels of fecal coliforms and nutrients in stormwater runoff.

The City will continue to promote and maintain the dog waste disposal stations along the park trail. The City will also add brochure holders to each waste station that contain public education / outreach materials related to the water quality impacts of dog waste.

4.9. Air Quality as it Relates to Water Quality

Recent evidence suggests that atmospheric deposition, as a result of poor air quality, has a greater impact on water quality than previously assumed. According to the EPA, air sources contribute about one-third of the total nitrogen loads to the Chesapeake Bay by depositing onto the tidal surface waters of the Bay and Bay watershed. Direct deposition to the Bay's tidal surface waters is estimated to be six to eight percent of the total (air and non-air) nitrogen load delivered to the Bay. Nitrogen deposited onto the land surface of the Bay's watershed and subsequently transported to the Bay is approximately 25 to 28 percent of the total nitrogen load delivered to the Bay.

The Clean Air Act requires significant air quality planning and implementation at local, State, and regional levels. The Clean Air Act regulations and programs are expected to achieve significant decreases in air deposition of nitrogen by 2020.

Nitrogen is the primary pollutant of concern for brackish waterbodies such as the Chesapeake Bay. While very little atmospheric deposition will fall directly into the City's streams, pollutants deposited on impervious surfaces, which make up approximately 42.7% of the City's land area, will be washed into local waterways via curbs, gutters, and storm drains during storm events. This has the potential to contribute significantly to water quality problems within the City and beyond.

The City has already contributed to improving air quality through the establishment of pedestrian and bicycle trails in accordance with the Comprehensive Plan and by keeping CUE bus fares low to encourage ridership. The City also continues to work with George Mason University and Fairfax County to encourage alternative forms of transportation.

Many approaches to improving air quality from mobile source emissions will be implemented at the State and regional levels through transportation control measures such as increased public transportation and high occupancy vehicle lanes. Technological advances such as alternative fuel vehicles and tighter tailpipe standards are other measures whose widespread application is expected. The City continues to contribute to these regional efforts through participation on the Metropolitan Washington Council of Government's Air Quality Committee and The Climate, Energy and Environment Policy Committee (CEEPC).

The City seeks to continue its commitment to clean air by expanding its efforts and adopting policies to increase public awareness of the environmental problems associated with air pollution.

Section 5. Environmentally Sensitive Features and Constraints on Development

Land use planning that takes into account sensitive natural features and water resources has the dual benefit of enhancing quality of life through protecting the environment from degradation as well as protecting businesses and homeowners from potentially harmful environmental hazards. Although land use patterns within much of the City are well established, a few vacant parcels still have development potential. These properties deserve special consideration and should be developed in a manner which integrates the man-made and natural environments.

Most development within the City, however, will take place as a result of redevelopment. Development prior to the late 1980s took place without the benefit of many environmental protection constraints; therefore some existing development is not sensitive to the potential for water quality degradation that development brings. With recent concern raised over environmental degradation, and particularly the effects of increased stormwater runoff on the City's streams, the City has begun to reevaluate past practices. Good planning now prescribes that when possible, development should avoid sensitive environmental features. The following section provides an overview of the sensitive natural resources within the City of Fairfax and an analysis of how these resources are currently being managed and additional management options.

5.1. Floodplains

The relatively flat or low land area adjoining a river, stream, or water course which is subject to partial or complete inundation is known as a floodplain. Encroachment on floodplains, such as artificial fill, reduces a stream's flood-carrying capacity, increases flood heights, and increases flood hazards in areas beyond the encroachment itself. In addition, floodplain soils are often unsuitable for development due to high water table, shrink-swell potential, and highly permeable and hydric soil conditions. Floodplains also provide important habitat for a range of vegetative and animal species.

In 1974, the Federal Emergency Management Agency (FEMA) conducted a study of flooding potential and hazards in the City as part of its national flood insurance program. The plan was also meant to be used as a tool to assist local governments in effective floodplain management. As a result of the study, the City adopted a Floodplain regulation which establishes an overlay as part of the Zoning Ordinance in 1993. As discussed in Section 2.4, the current Floodplain regulation was adopted by the City in March, 2015. The overlay district severely limits the type and location of any development in the floodplain district. The floodplain district includes areas subject to inundation by waters of the one-hundred year flood. The one-hundred year floodplain within the City is associated with areas along the north and central forks of Accotink Creek, Daniels Run, and some major tributaries. A denuded or improperly developed floodplain can result in erosion and a significant reduction in water quality and reduce the effectiveness of the RPA. Figure A1 delineates the approximate extent of the one-hundred year floodplain (1 percent annual chance flood event) in the City.

5.2. Geologic and Sensitive Soil Conditions

It is difficult to overemphasize the importance of geology and soils characteristics when planning for new development and redevelopment. Development should be guided away from sensitive or unstable areas in order to protect the safety of residents, the structural soundness of buildings, and the water quality of Accotink Creek, Pohick Creek, Popes Head Creek, Difficult Run, and eventually the Potomac River and the Chesapeake Bay.

Common constraints placed by geologic conditions or sensitive soils include but are not limited to hydric conditions, shrink-swell potential, wetness, flooding potential, depth to bedrock, and high water table. Proper management of soils will help maintain clean water and will provide areas to recharge groundwater. However, poor management of soils will choke local waterways with silt and sediments and result in the erosion of valuable topsoil as well as spoil the landscape.

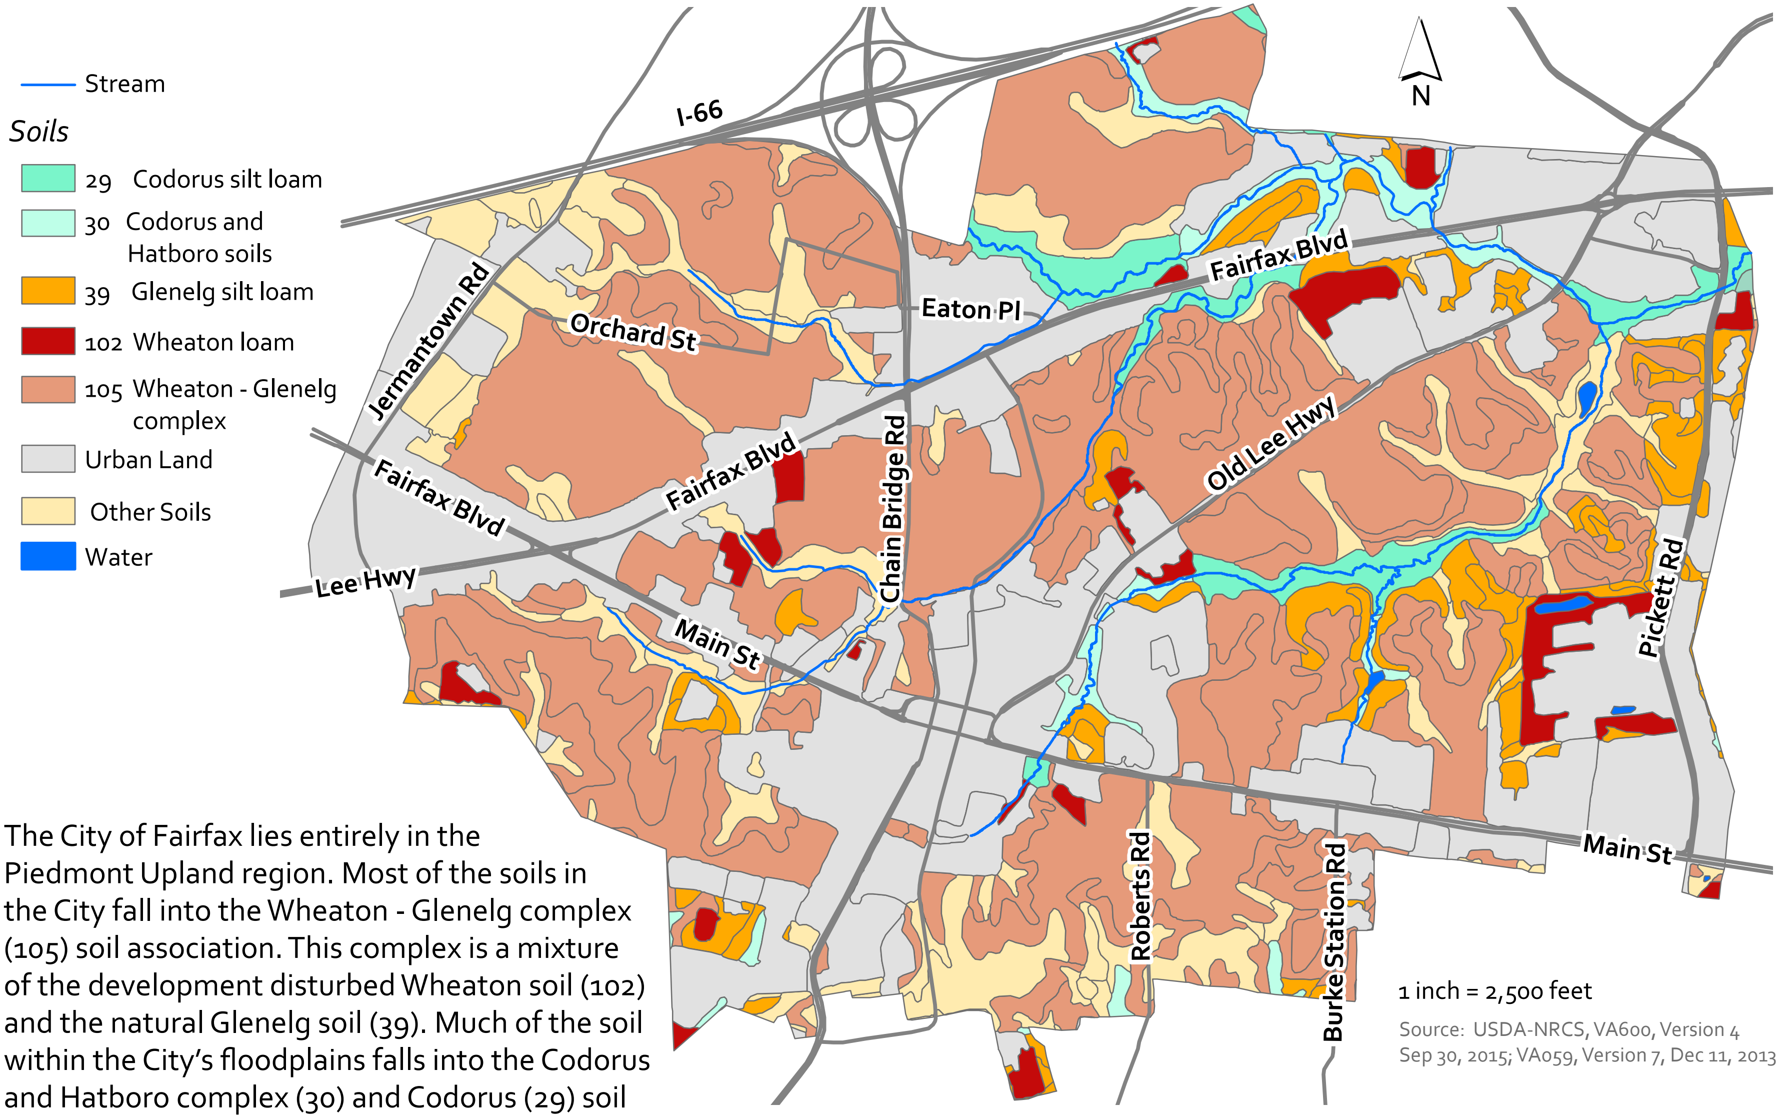
According to the USDA Natural Resources Conservation Service soil survey data (2015), most of the City falls into the Wheaton-Glenelg complex soil association. This complex is a mixture of the development disturbed Wheaton soil and the natural Glenelg soil which is well suited for development. Much of the soil within the City's floodplains falls into the Codorus and Hatboro complex and Codorus silt loam soil associations. These soils are poorly drained, subject to flooding, and not suitable for urban development. Figure A 9 presents the distribution of soil associations in the City.

The underlying geology of the City, along with climate, determines soils characteristics, which offers both constraints and opportunities for development. In order to promote soil conservation and protect water quality, as well as safeguard residents and businesses from potential hazards, including hazards such as radon, it is imperative that future development within the City takes geologic constraints into consideration. Most areas of the City are generally suitable for development purposes if a site is properly engineered. A discussion of the engineering capacity of underlying geology is inappropriate for this Plan due to its technical and detailed nature. Developers must refer to the City's Department of Public Works for more information and recommended resources.

5.3. Vegetative Buffers and Areas with Mature Tree Canopy Cover

To the maximum extent possible, the City wishes to maintain and enhance its urban tree cover. During development, provisions must be made to protect existing trees and replace trees when they are damaged or removed.

FIGURE A11 SOILS



Source: USDA-NRCS, VA600, Version 4 Sep 30, 2015; VA059, Version 7, Dec 11, 2013

The City of Fairfax lies entirely in the Piedmont Upland region. Most of the soils in the City fall into the Wheaton - Glenelg complex (105) soil association. This complex is a mixture of the development disturbed Wheaton soil (102) and the natural Glenelg soil (39). Much of the soil within the City's floodplains falls into the Codorus and Hatboro complex (30) and Codorus (29) soil associations.

The City's Chesapeake Bay Preservation regulation also requires that a 100-foot buffer area along perennial streams be maintained or established during development or redevelopment in order to protect streams from the adverse effects of increased impervious surfaces and resultant runoff.

Since the City is almost entirely developed, few significant vegetation stands remain. Those that still exist deserve special protection so that their aesthetic and ecological benefits to the City are not lost. The largest City-owned vegetation stand is located at Daniels Run Park. The park covers 48 acres, most of which is in a natural state. It contains deciduous vegetation with an oak canopy and a beech understory. Other tree types found there are hickory, sycamore, tulip poplar, and holly. The 20-acre Van Dyck Park is partially wooded as is the 10-acre Ranger Road Park. The 20-acre Providence Park is largely wooded, and contains many of these same tree types.

The City's concern for trees is reflected in its Arbor Day tree planting activities and its designation every year starting in 1987 as a Tree City by the National Arbor Day Foundation.

5.4. Non-Tidal Wetlands

Wetlands provide a variety of environmental and socio-economical benefits and also serve as important fish and wildlife habitat. Wetlands enhance water quality by filtering water as it passes through, thereby reducing sediments, nutrients, and chemical and organic pollutants flowing to open water. Wetlands also assist with flood control and serve as groundwater discharge and recharge areas. The U.S. Fish and Wildlife Service estimates that up to 43% of the threatened and endangered species rely directly or indirectly on wetlands for their survival.

The City has a total of 11 acres of wetlands. Figure A2 presents the City's water resources, including wetland areas. There are 8.6 acres of woody wetlands, which consist of areas where forest or shrubland vegetation accounts for 25-100 percent of the cover and the soil or substrate is periodically saturated with or covered with water. The remaining 2.4 acres of wetlands are classified as emergent herbaceous wetlands, which consist of areas where perennial herbaceous vegetation accounts for 75-100 percent of the cover and the soil or substrate is periodically saturated with or covered with water.

Pertinent law protecting non-tidal wetlands includes Section 404 of the federal Clean Water Act, which addresses dredge and fill operations and is administered through the Army Corps of Engineers, and the Virginia Water Protection Permit Act. Other programs, such as those under the Virginia Endangered Species Act and various floodplain management regulations, also serve to protect non-tidal wetlands.

Under the City's Chesapeake Bay Preservation regulation, non-tidal wetlands connected by surface flow and contiguous to tidal wetlands or water bodies with perennial flow are designated as RPAs. All other non-tidal wetlands are protected as part of the RMA. Most wetlands within the City are located contiguous to a tributary stream and within the confines of the floodplain.

5.5. Topography

Poorly designed and constructed developments on steep slopes frequently result in substantial costs to the public, either for repairs or for protective measures to prevent further damage. Increased runoff and sedimentation from denuded hillsides require increased public expenditures for flood control and stormwater management. Further, improperly planned development of hillsides affects the equilibrium of vegetation, geology, slope, and soil.

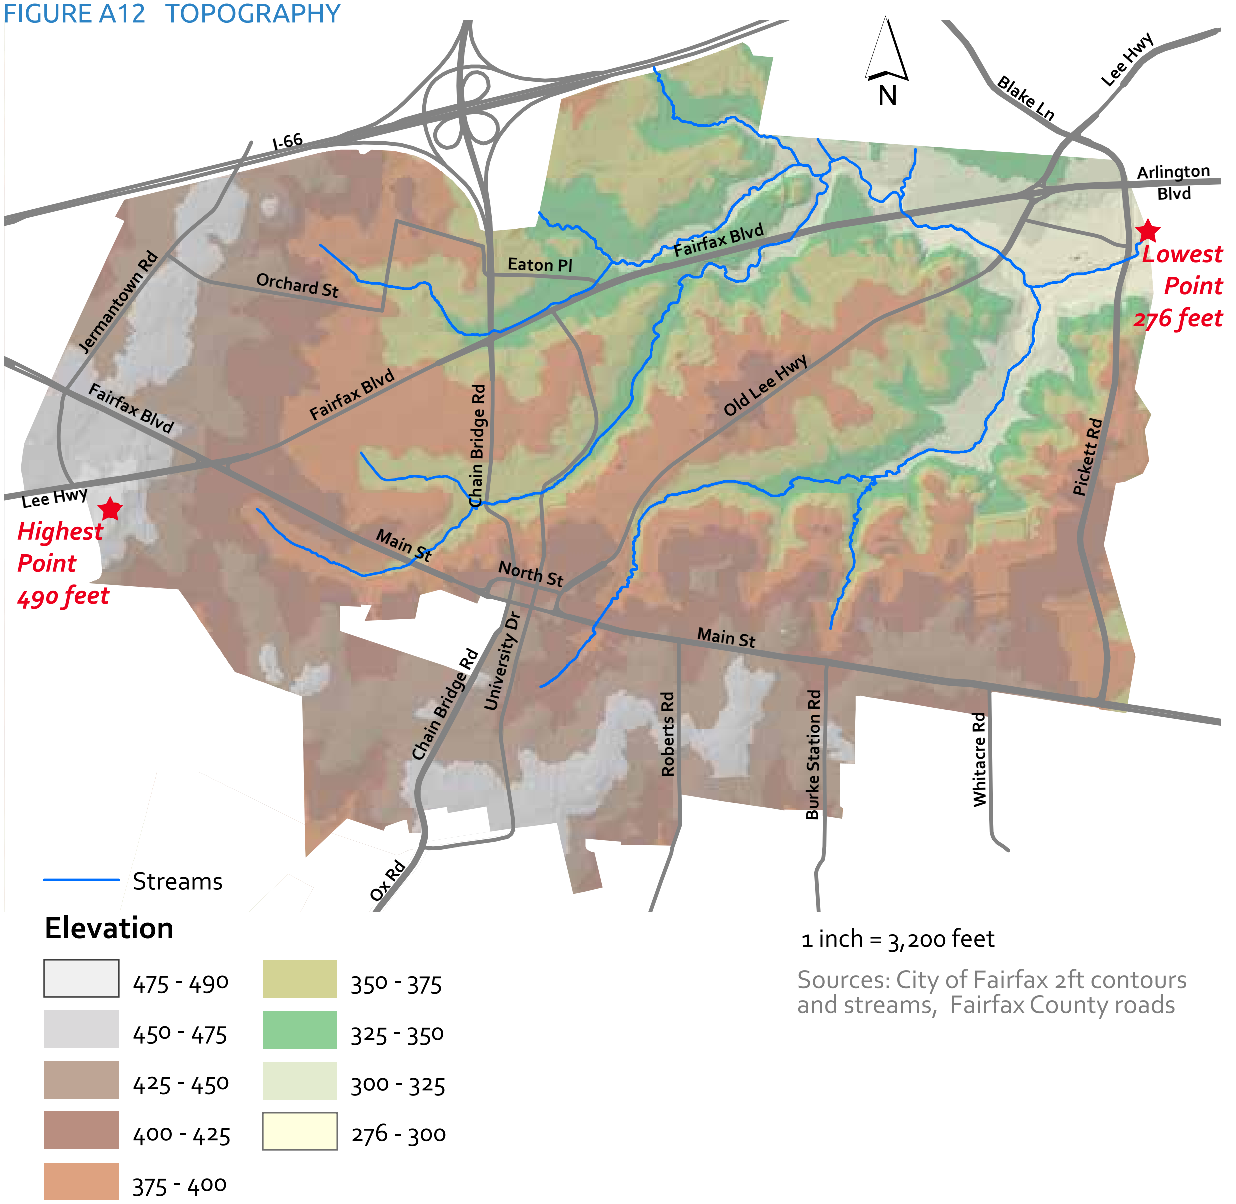
While the City is largely built out, any redevelopment within the City must take topographic constraints into consideration for the following reasons:

- Disturbance of hillsides can result in soil instability and increased erosion.
- Disturbances of hillside can increase runoff.
- Disturbance of hillsides can destroy a community's aesthetic resources.

Steep slopes in excess of 15 percent and slopes located along streams are susceptible to erosion; therefore, particular care must be taken when planning to develop a site with this characteristic. In some instances, special engineering may be required to stabilize slopes. Figure A10 presents a topographic map of the City.

Only a very small portion of the City's land area has slopes of over 15%. These areas are primarily associated with reaches of Accotink Creek and Daniels Run and lie within the City-owned Van Dyck and Daniels Run Parks and in the Army Navy Country Club Property.

FIGURE A12 TOPOGRAPHY



1 inch = 3,200 feet

Sources: City of Fairfax 2ft contours and streams, Fairfax County roads

5.6. Groundwater Protection

The importance of groundwater protection was recognized by the Commonwealth of Virginia when the General Assembly enacted the Groundwater Act of 1973 and the Groundwater Management Act of 1992. The Groundwater Management Act reads "... unrestricted usage of groundwater is contributing and will contribute to pollution and shortage of groundwater, thereby jeopardizing the public welfare, safety, and health."

Although the City now receives a treated water supply from the Potomac River and Occoquan Reservoir, protection of the City's groundwater must be a consideration during development and redevelopment. When development occurs, it affects the natural balance of the groundwater flow. Increased imperviousness as a result of development reduces the potential for groundwater recharge and should be taken into consideration when designing a site plan. Generally, high topographic areas are groundwater recharge areas and impervious surface areas in defined groundwater recharge areas should be minimized. By providing recharge areas for stormwater, groundwater equilibrium can be maintained. If recharge areas are not taken into consideration, wells may go dry, base flow to streams is reduced, and wetlands may shrink.

Once contaminated, the usefulness of an aquifer as a resource may be limited or destroyed depending on the toxicity of the contamination and the effort, time, and money involved in clean-up. In most cases it is impractical and sometimes impossible to restore a contaminated aquifer to its original level of purity. Common sources of groundwater contamination include but are not limited to leaking underground storage tanks, antiquated sewer lines, septic systems situated on improper soils, and improperly capped wells. In addition, improperly maintained water quality best management practices may present a groundwater threat. In the City, the most common source of groundwater contamination on record with the DEQ, Water Division, is from petroleum leaks and spills. More stringent underground tank standards enacted in recent years should reduce the level of contamination from these sources.

Recommendations

The City recognizes the importance of the Chesapeake Bay as an economic and social resource and is committed to its protection through the implementation of the Chesapeake Bay Preservation Area Designation and Management Regulations. The following provides the background information and analysis necessary for the City to arrive at informed and proactive policies and goals which address the issue of water quality protection in City streams and the Chesapeake Bay.

These recommendations approach water quality protection from the viewpoint that environmental regulations and healthy economic development are not mutually exclusive, but rather that both may be accomplished simultaneously, and that the result is a better quality of life for all City residents.

Recommendation 1: Protect the quality of the City's surface water resources, the Potomac Estuary, and the Chesapeake Bay from the avoidable impacts of land development.

- **Enforce the provisions of the City's Chesapeake Bay Preservation regulation.**

  The Chesapeake Bay Preservation regulation is the City's primary water quality protection tool. The regulation is designed to protect the overall quality of the City's water resources and the health of the Chesapeake Bay as it relates to impacts from existing and new development.

- **Enforce the City's Erosion and Sediment Control Ordinance.**

  The Erosion and Sediment Control Ordinance serves to protect City streams during site development by minimizing erosion and sedimentation.

- **Maintain strong City oversight of private BMP maintenance programs.**

  Review the effectiveness of the City's current BMP maintenance program and determine whether stronger inspection and maintenance measures are warranted. Make recommendations for how to improve the City's maintenance program, if necessary.

- **Continue implementation of stream restoration and improvement efforts.**

  Continue efforts to stabilize the physical conditions and restore the stream habitat to enable the natural restoration of the streams' biological integrity. The City should continue to prioritize the worst stream reaches, and coordinate improvements with overall watershed strategy.

- **Ensure that development avoids where possible, or minimizes, disturbance of sensitive environmental features, including problem soils.**

  Improper development of sensitive environmental features, and particularly soils, may result not only in structural damage to buildings, but also to a loss of soil to erosion, a decrease in local water quality, and the loss of important habitat and aesthetic resources.

- **Improve the City's ability to identify sensitive environmental features.**

  Readily available information concerning environmentally sensitive features will help the City to better plan for and avoid negative environmental impacts resulting from land disturbing activities. The development and redevelopment processes often result in the generation of substantial information on environmental features. During the development process, the City should take the opportunity to collect information, generated from site plans, reports, etc. on sensitive environmental areas, and particularly on soils.

  The City should arrange a protocol to compile this information to create an overlay map identifying environmentally sensitive features within the City including steep slopes, soils, wetlands, floodplains, undisturbed natural areas, and features that are unique or integral to the City's character.

Recommendation 2: Ensure the adequacy of the City's future stormwater management system while emphasizing the need to protect tributary streams and water quality.

- **Continue to conduct and implement watershed management plans to allow for a holistic approach to local water resource protection.**

  The City should continue to conduct watershed studies and planning to evaluate conditions and identify actions that would improve watershed health. The City should also continue to assess the effectiveness of capital projects and examine long-term trends in the City's water quality.

- **Minimize exposure of the City's natural floodplains to new development.**

  Natural floodplains are essential to the conveyance of stormwater in that they provide extra holding capacity during storms. Floodplains left in their natural condition form a filter for polluted runoff from surrounding land uses. Protection of the City's floodplain is achieved through enforcement of the City's Floodplain regulation.

- **Encourage the use of shared or regional stormwater control measures during development and redevelopment.**

  The implementation of a large number of small, site-specific stormwater quality/quantity management facilities increases maintenance costs and consumes valuable land. The City should seek to facilitate cooperative agreements among developers to encourage the establishment of shared or regional stormwater management facilities.

- **Continue to allocate dedicated and sustainable funding to guarantee the stormwater program's continued viability.**

  Provide the funds necessary to meet MS4 permit and TMDL requirements and to address other stormwater infrastructure needs, such as ensuring adequate capacity for flood control, replacing aging infrastructure, and performing preventive maintenance on all City stormwater management facilities.

  Reassess the Stormwater Fund on a regular basis to ensure that revenue generated adequately covers program needs.

Recommendation 3: Reduce existing sources and prevent potential sources of point and nonpoint source pollution resulting from residential, commercial, and industrial activities within the City.

- **Continue implementation of the City's Water Quality Monitoring Program.**

  At the end of each MS4 permit reporting period, the City prepares annual Water Quality Monitoring Reports, which are included with the City's MS4 Annual Report. Once appropriate amounts of sampling data have been collected under the Water Quality Monitoring Program, the City will analyze the results to determine the next steps (e.g. potentially pinpoint areas that could to be targeted for pollution prevention or source control programs).

- **Encourage the use of green stormwater infrastructure and low impact design on private and public property.**

  Enhance zoning regulations and support initiatives that encourage the use of green stormwater infrastructure and low impact design on private and public property. Consider providing incentives for developers to incorporate green infrastructure and low impact design in their plans.

- **Continue efforts to improve the region's air quality.**

  The City should continue to pursue measures to improve air quality through support of pedestrian access and mass transportation. Since air quality is a regional concern, continued participation on the Metropolitan Washington Air Quality Committee is necessary to achieve many air quality goals.

- **Improve the City's ability to respond to the potential hazards of leaking underground and above ground storage tanks and pipelines.**

  The City should continue to work closely with the DEQ, Water Division, to monitor and enforce clean-up of underground storage tanks.

  The City should support programs to educate residents on how to safely manage above ground storage tanks and should promote policies aimed at providing opportunities to reduce reliance on above ground storage tanks through conversion to alternative forms of fuel.

- **Expand public education and outreach programs.**

  Continue to develop and implement education and outreach programs to improve awareness and encourage the community to protect and improve the quality of area waters. The City will include appropriate public involvement and participation to meet MS4 requirements and satisfy other watershed objectives.

- **Continue to improve upon the City's strong recycling program.**

  A well-publicized recycling program will decrease illegal disposal of materials, and particularly of oil, into the City's storm sewer system.

Recommendation 4: Protect the quality of the City's potable water supply and safeguard the City's groundwater resources against contamination that may adversely affect the ecosystem.

- **Work with the Department of Environmental Quality's Water Division to protect groundwater from contamination from underground storage tanks.**

  The primary threat to the City's groundwater is contamination from underground storage tanks. While the City has no legal authority to regulate underground storage tanks, it should work closely with the DEQ's Water Division to identify areas with high contamination potential and to quickly remediate areas where contamination has already occurred.

B Transportation Practices and Policy

Contents

The Multimodal Transportation Chapter of the Comprehensive Plan references several innovative practices that can help the City achieve its goals in improving transportation infrastructure and services. Many of these practices require further study before the proper implementation strategy can be determined. This includes analyses of new advancements in technology as they occur, as well as policy priorities for the City.

Specific actions in the Comprehensive Plan refer to the Transportation Practices and Policy Appendix for more information. This appendix provides detailed information which should be used as an initial step in implementing the recommendations of the Comprehensive Plan that reference these innovative practices.

Section 1. Best Practices/Future Trends

BIKESHARE

The central jurisdictions of the region (Washington, D.C. and Arlington County) launched Capital Bikeshare (CaBi) in 2010 with 400 bikes and 50 stations. Since that time the system has expanded to 2,500 bikes at over 400 stations across a number of additional jurisdictions in the region, including Fairfax County. City stakeholders and partners expressed an interest in bringing bikeshare to the City, either expanding CaBi or establishing an independent system serving local travel needs.

CARSHARING

Carsharing has been operational in the region for over a decade. Zipcar is the largest operator in the region at the present time, offering round-trip as well as point-to-point or one-way rental options. Round-trip carsharing requires that users return the vehicle to the same designated spot when finished with their rental period.

One-way carshare allows a user to take the car from one point within a service area and leave it at a different legal parking space within the area. Car2go operates within the District of Columbia and Arlington County offering one-way service. The fee for round-trip carshare is typically on an hourly or daily basis while the cost for a one-way carshare trip is typically calculated on a minute and distance basis.

Peer-to-peer carsharing closely mimics the round-trip carshare service provided by carshare companies but is instead provided by individual auto owners listing their personal car available for use to other "members" via an electronic platform.

Photo Credit (all photos): Nelson\Nygaard

RIDESOURCING

Taxis are a traditional form of ridesourcing where a passenger calls into a central dispatch or hails a clearly branded vehicle to provide a one-way ride. Smartphones and app-based services have enabled the rise of Transportation Network Companies (TNCs) such as Uber and Lyft. TNCs use an online mobile platform to connect passengers to drivers, who use their personal vehicles. With less oversight and regulation, the cost of a TNC ride at present is generally lower than that of a taxi trip.

Image Credit: Lyft

AGGREGATED RIDE SOURCING

The platforms used for ridesourcing have become progressively more sophisticated. Several TNCs now offer riders the option of sharing a ride with others traveling along their general line of travel to further lower trip costs, concurrently increasing travel efficiency with higher vehicle occupancy within the same roadway space. Uber offers "Uber Pool" while Lyft supports "Lyft Line." These aggregated ridesourcing options pool riders, thus lowering travel costs.

Photo Credit: Nelson\Nygaard

PRE-ARRANGED OR DYNAMIC CARPOOLING

Multiple web or smartphone based applications facilitate carpooling both on a regular basis (pre-arranged) or sporadically. Apps like Zimride and RideAmigos match drivers with passengers along a pre-determined route and planned time of day. If desired, some applications permit drivers and riders to be matched across complementary characteristics such as employment or student status, gender, age, and even music preferences. Dynamic carpooling is the electronic equivalent of the traditional Washington region practice of "slugging" where drivers can spontaneously be matched with a rider in real time along their intended route. Under both models, drivers and passengers share costs and take advantage of high occupancy lanes by capitalizing on empty seats in their vehicles.

MICROTRANSIT

Microtransit follows the same principle as aggregated ride sourcing, but generally with more added efficiency. It uses online services to dynamically generate on-demand routes along an efficient travel path. Rather than picking each passenger up at their door of origin, passengers may need to walk a short distance to a collector road and arrive at the designated location shortly before the vehicle arrives. By reducing the amount of circling and the dwell time waiting for passengers, microtransit reduces travel time and delay, increases vehicle efficiency, and reduces individual travel costs.

Image Credit: Via

CONNECTED + AUTONOMOUS VEHICLES

Vehicular technology continues to progress at a rapid rate, and the time is soon coming when human drivers may no longer be needed to operate passenger vehicles. Connected vehicles have the ability to communicate with one another and with the surrounding infrastructure, provided the infrastructure has "smart" capabilities. Autonomous Vehicles can operate independently by observing cues in the built environment. Future vehicles will likely utilize the capabilities of both connected and autonomous technologies. Such vehicles may have the ability to dramatically increase the efficiency and capacity of existing roadway facilities and decrease the need to operate and store (e.g. park) private vehicles. Thus, autonomous vehicles, with the right policy guidance, may reduce vehicle ownership, reduce the need for long-term parking, and increase accessibility and mobility across the economic spectrum.

Section 2. Smart Infrastructure + Real-Time Information

Improved technology in both Intelligent Transportation Systems (ITS) and better information for users provides great promise for more efficiency in mobility systems and greater predictability and control for users. The following system elements have been implemented elsewhere in the greater Washington D.C. area. Some elements may be appropriate for managing traffic and improving trip making in the City.

SMART SIGNALS

These signals are connected to a central control center and may be adjusted either according to a programmed algorithm or by central control. Smart signals can adjust to changing demands in the roadway network and may be used to facilitate the advancement of transit vehicles (transit signal priority or TSP), passively detect pedestrians and bicyclists, and/or meter traffic volumes to even out the flow of traffic and mitigate congestion, improving the operation and efficiency of multiple modes.

DYNAMIC SIGNAGE

Dynamic signage includes variable message boards and variable speed signs such as those found along I-66, and also includes urban signage indicating the location and availability of parking spaces. These signs provide real-time information to motorists without requiring the use of a smartphone or app. Dynamic signage at transit stops can indicate the next bus anticipated to arrive and the time of arrival. Dynamic signage can help to better distribute traffic loads, minimize unnecessary circling of vehicles searching for parking, and increase user confidence with regard to transit. Dynamic signage can reduce traffic volumes by 10% to 30%, particularly in central business areas.

DEMAND-RESPONSIVE PRICING

Applying basic economic principles to encourage more efficient use of the transportation system, demand-responsive pricing uses real time and/or historical information on parking or travel demand to optimize supply and demand. When demand is high and available supply (or capacity) is low, mobility services are priced higher. During periods of low demand, the cost of travel or parking is correspondingly low. Such strategies reduce congestion, increase efficiency in the system, and ensure the availability of reliable capacity (for a price) for essential trips. When coupled with lower cost, higher capacity travel options such as transit, ridesharing/ride sourcing, and safe non-motorized options, demand-responsive pricing can appropriately meet travel needs without necessarily resulting in higher overall transportation costs to users.

TRAVEL PLANNING APPS

The best travel planning apps integrate a number of different travel options including driving (in a personal vehicle or ridesource vehicle), transit, bicycle, walking and/or a combination of multiple modes. These apps provide users with real time information on both travel time and cost, including the probability of travel delay, while some also provide information on personal and environmental health benefits or impacts of various choices. Smart applications link directly to other applications to help the traveler arrange the mode of travel they selected, such as hailing an Uber or reserving a carshare vehicle. Travel apps and mobility service payment systems are evolving such that in the near future, travelers will also be able to pay for their transit trip, bikeshare use, or high-occupancy tolls all from a single point of transaction. This should help to even the playing field of awareness and convenience across all travel options.

Section 3. Transportation Demand Management

Cities have traditionally approached transportation from the supply side of the equation, and this is a critical role for cities to play. Cities have significant control over how much vehicle capacity, bicycle accommodation, or parking is provided in their communities. But some economists advise cities that they must also consider and manage the demand side of the equation as well. Managing demand requires a more nuanced approach, but is, in many ways, more effective than supply-side management alone.

Transportation Demand Management (TDM) provides information and incentives to allow travelers to make the best choices for themselves. It is also a way for jurisdictions to make the most of transportation systems they have already built and optimize investments they have made by encouraging the use of excess capacity before adding additional capacity. Excess capacity exists in the form of empty seats on buses or in cars. It exists on sidewalks, trails, and bike lanes. It exists in the 20 hours of the day outside of the peak hours of traffic congestion. And it exists in the parking spaces that remain empty when the vehicle they are intended for is at another destination.

TDM serves cities, but it also brings benefit to users as well – often saving money on transportation costs, improving reliability and predictability in their travel, giving greater freedom of choice, lowering stress, and perhaps even improving personal health.

Section 4. Pedestrian Accessibility Policy

Best Practice

The best pedestrian-supportive infrastructure policies are applicable to the entire community and focus on safety and connectivity. Best practice policies are compliant with all applicable state and federal regulations, including the Americans with Disabilities Act (ADA) ,and establish a methodology for prioritization and performance evaluation.

The following are potential policies to improve pedestrian-supportive infrastructure.

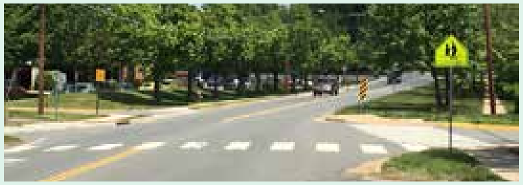
- Prioritize walking connections to transit stops, schools and parks. Implement first-last mile walking connection to transit and prioritize access to transit stops.
- Support projects that improve pedestrian connectivity.
- Improve pedestrian access to destination areas in the City.
- Improve pedestrian routes that connect students to schools.
- Maintain a sidewalk inventory.
- Establish a methodology for project prioritization and performance evaluation.
- Improve pedestrian access across major roadways that create barriers to connecting the network. Comply with all state and federal regulations including the ADA.

Policy Recommendation

The following is a draft recommended policy for the City.

In order to promote safety and provide for the most vulnerable users in the transportation system – children, seniors, and persons with disabilities – it is the policy objective of the City that all streets have at least one sidewalk on both new and existing streets of all street types.

- All new streets should provide sidewalks on both sides of the street irrespective of anticipated traffic volumes, unless explicitly designed as a shared street.
- Sidewalks should be considered with every major maintenance, restoration, or street reconstruction project. Sidewalks may be constructed independent of other street projects.
- Streets with moderate to high vehicle volumes (5,000 or more vehicles per day) should have sidewalks on both sides of the street. Moderate volume streets should have a continuous sidewalk at least along one side. Local streets (less than 5,000 vehicles per day) should have a sidewalk on at least one side of the street, unless specifically designed as a shared street.
- Sidewalks should be a minimum of five feet wide.
- The sidewalk network should be continuous and connected. Curb ramps must be provided at street crossings.



Section 5. Complete Streets Policy

Best Practice

A Complete Streets policy should include a community's vision for transportation, account for many types of uses and community needs, and allow for flexible implementation.

The following are potential policies by which to implement Complete Streets principles:

- Approach every planned transportation improvement as an opportunity to apply the Complete Streets principles.
- Apply Complete Streets policies to all public and private projects and developments that impact the right-of-way.
- Allow Complete Streets elements to be phased over time.
- Identify regional, state, and federal funding for Complete Streets improvements.
- Collaborate and coordinate between departments and transportation agencies to efficiently utilize funds.
- Identify performance measures and report progress annually.
- Maintain an inventory of bicycle and pedestrian infrastructure to identify gaps.
- Identify and prioritize projects based on infrastructure needs.
- Train staff and decision makers on the technical content and best practices of Complete Streets principles.

Policy Recommendation

The City will approach all planned transportation improvements and all development projects with right-of-way impacts as opportunities to advance the value and objective of safety and Complete Streets. It shall be the policy of the city that:

- Every street safely accommodate all users.
- Any street subject to major maintenance, rehabilitation or reconstruction will provide safe accommodation for all users of all abilities.
- The means of accommodation will be appropriate to the street context and developed in consultation with community stakeholders.
- The city will pursue regional, state, and federal funding opportunities to support Complete Streets improvements.
- City agencies and departments will collaborate and coordinate with one another and adjacent jurisdictions to apply Complete Streets principles and provide continuous networks.
- Progress on Complete Streets will be measured in concert with the adopted measures of the City of Fairfax Multimodal Transportation Plan.

City of Fairfax - CFPF Grant Application Submittals

1 message

Eto, Satoshi <Satoshi.Eto@fairfaxva.gov> Fri, Apr 8, 2022 at 7:04 AM
To: "cfpf@dcr.virginia.gov" <cfpf@dcr.virginia.gov>

Good morning,

Please follow this link to download two CFPF grant applications from the City of Fairfax.
https://www.dropbox.com/sh/blwg7yl4zo41nbr/AAAx6EfEfrMXYagxxz5REBgMa?dl=0

The applications could not be attached directly to this email due to file size (50MB/ea).

Please feel free to reach out to me if you have any questions. Thank you!

City of Fairfax

Resilience Plan Grant Request

2022 Virginia Community Flood Preparedness Fund (Round 3) Application Package

Introduction

The City of Fairfax (City) has prepared this 2022 Virginia Community Flood Preparedness Fund (CFPF) Application Package to request matching funds for the preparation of a City Resilience Plan. The City intends to apply for matching funds in the Planning and Capacity Building category. The City of Fairfax is a 6.27 square mile independent city located within Fairfax County in northern Virginia. The City is highly developed and is mainly compromised of residential and commercial lots. The City has a low social vulnerability index score based on the ADAPT VA Social Vulnerability Index.

Background

As rainfall intensity and frequency increase annually, the City's stormwater waterways have been unable to meet the flow demand. The increase in rainfall intensity coupled with the City's unique topographic and hydrologic features has led to local urbanized flooding that affects critical infrastructure and City residents. There are four (4) main watersheds throughout the City:

1. Accotink Creek,
2. Difficult Run Creek,
3. Lower Bull Run Creek, and
4. Pohick Creek

Attachment 1.1 included with this grant application package contains a City-Wide Floodplain Exhibit that illustrates the geographic location of the four (4) main watersheds along with a floodplain overlay. The City is the headwater of Accotink Creek with a majority of the City draining to the north fork or the mainstem. Additionally, small portions of the City drain to the south and west discharging to the remaining three (3) watersheds.

The stream reaches throughout the City cross residential, commercial, educational, and industrial properties. Due to the development within the watershed, the existing waterway have begun to experience increased flooding. Certain portions of the City infrastructure were developed within the 100 and 500 year floodplain. The City residents are aware of the impact that flooding has had in their community and are very vocal about the need to find a solution.

Utilizing the proposed Resilience Plan, the City will have an outline that will focus on upgrading, modifying, and installing new stormwater and flood control practices in strategic locations within the City. The Resilience Plan will aim to implement nature-based solutions to the maximum extent practicable in order to mitigate current flooding as well as increase Citywide resilience to future flooding situations.

Scope of Work Narrative

Capacity Needs

The City, in conjunction with an engineering consulting firm, will develop the Resilience Plan. The City currently lacks the capacity or in house expertise to undertake this effort singularly and thus outside resources are required for the completion of this task.

Goals and Objectives

The goal in development of the City of Fairfax Resilience Plan is to provide a City-wide approach to address the increased flooding within the community through nature-based solutions. This planning level document will provide the City with the ability to complete vulnerability assessments and develop an action-oriented approach to flood preparedness and resiliency.

Stakeholders

Initially, the stakeholders associated with the development of the Resilience Plan will primarily be the City Department of Public Works. As items and projects identified in the Resilience Plan come to fruition, an expansion of the stakeholders will include citizens, businesses, and ultimately the overarching City of Fairfax community.

Implementation Plan and Timeline

The implementation of this plan will start once the grant has been awarded to the City and when the new fiscal year begins in July 2022. The City would like to note this is an anticipated timeline and could be subject to change.

Outputs and Measures

The output of this task is a comprehensive approach to flood preparedness and resilience in the form of a City-wide Resilience Plan. No other outputs are expected from this task.

Maintaining Capacity

At this time, the City does not anticipate the need for continuing support for development of the Resilience Plan. Once the plan has been finalized and certified by the Virginia Department of Conservation & Recreation (DCR), the City will utilize the plan for subsequent grant requests for a period of three (3) years in accordance with the 2022 CFPF Grant Manual.

Budget Narrative

Estimated Total Project Cost

The estimated total project cost for the development of the City of Fairfax Resilience Plan is $159,672.58. The City has coordinated with a consultant to provide an estimated summary of proposed services and associated cost. This document has been included in Attachment 1.2 and includes an hourly breakdown based on anticipated tasks to be conducted by a consultant in the development of the Resilience Plan.

Amount of Funds Requested

Per the 2022 CFPF Manual, the Resilience Plan development is categorized as a Planning and Capacity Building activity. According to the latest U.S census data, the City of Fairfax has a median household income of $116,979. This is 58% higher than the Virginia median household income of $74,222 thus not qualifying as a low-income geographic area. The U.S census data can be seen in Attachment 3.6 of this application package.

Per the 2022 CFPF Manual, the City is requesting a 25% City match and a 75% CFPF match of the total project cost. Based on the Estimated Total Project cost highlighted above, the City is requesting $119,754.44 with this grant application package. This match will be utilized to assist with the overall cost of developing the Resilience Plan. As mentioned above, an estimated summary of proposed services and associated cost has been included in Attachment 1.2. This includes an hourly breakdown based on anticipated tasks to be conducted by a consultant in the development of the Resilience Plan.

Amount of Cash Funds Available

The City intends to allocate a portion of the City of Fairfax Stormwater Utility Fund for this project. The project has been included within the approved 2023 proposed budget as “Flood Mitigation Planning & Resilience”, which has an available budget of $225,000. The City has reserved $39,918.14 of available matching funds from the City of Fairfax Stormwater Utility Fund as part of this application package. The Flood Mitigation Planning & Resilience project sheet from the 2023 proposed Stormwater Utility Fund can be seen in Attachment 1.3. The Stormwater Utility Fund is available to the City’s Public Works division to complete engineering functions and manage capital improvement projects for stormwater related needs within the City.

Authorization To Request Funding

A signed authorization to request for funding has been included below:

> “I certify that I am requesting matching grant funds from the Virginia Community Flood Preparedness Fund on behave of the City of Fairfax in the Planning and Capacity Building category for the development of a Resilience Plan.”

Kimley-Horn – Summary of Proposed Services

Kimley»Horn

March 28, 2020

Satoshi Eto
Public Works Program Manager
City of Fairfax, Department of Public Works
10455 Armstrong Street, Room 200
Fairfax, Virginia 22030

Re: City of Fairfax – Stormwater and Flooding Resilience Plan Development

Dear Mr. Eto:

Kimley-Horn and Associates, Inc. (Kimley-Horn) is pleased to submit this summary of proposed services to the City of Fairfax (City) to provide professional consulting services related to the City of Fairfax – Stormwater and Flooding Resilience Plan Development (Resilience Plan). It is Kimley-Horn's understanding that the City wants to develop a Resilience Plan to prepare for the increase in urban flooding due to higher frequency storm events caused by climate and environmental changes. The Resilience Plan is intended to serve as a planning level document aimed at assisting the City and its citizens by outlining flood reduction methodologies that could potentially reduce impacts to properties and community assets, while providing equitable treatment for all communities. The language outlined below identifies our project understanding, summary of proposed services, and estimated fee related to the City of Fairfax – Stormwater and Flooding Resilience Plan Development.

PROJECT UNDERSTANDING

At the City's request, Kimley-Horn is providing this summary of proposed services outlining the development of a Resilience Plan. On October 22, 2020, Virginia's Governor Ralph S. Northam signed into effect the Virginia Coastal Resilience Master Planning Framework. This encouraged local jurisdictions to develop localized Resilience Plans in accordance with the following principles:

1. Acknowledge climate change and its consequences, and base decision making on the best available science.
2. Identify and address socioeconomic inequities, and work to enhance equity through adaptation and protection efforts.
3. Utilize community and regional scale planning to the maximum extent possible, seeking region-specific approaches tailored to the needs of individual communities.
4. Understand fiscal realities and focus on the most cost-effective solutions for the protection and adaptation of communities, businesses, and critical infrastructure. The solutions will, to the extent possible, prioritize effective natural solutions.
5. Recognize the importance of protecting and enhancing green infrastructure in all regions and in the coastal region, natural coastal barriers, and fish and wildlife habitat by prioritizing nature-based solutions.

It is the City's intent to develop a Resilience Plan to assist in management of increased flooding frequency. The Resilience Plan is also intended to serve as a guidance document for the City's involvement in the Virginia Department of Conservation & Recreation (VA DCR) Community Flood Preparedness Fund (CFPF)

Grant and the Federal Emergency Management Agency (FEMA) Community Rating System (CRS) program. Kimley-Horn will develop the Resilience Plan in accordance with the guidance provided in Appendix G of the 2022 Grant Manual for the Virginia Community Flood Preparedness Fund and Section 512 titled Floodplain Management Planning (FMP) of the FEMA Community Rating System Coordinator's Manual.

SCOPE OF SERVICES

This proposal has been divided into ten (10) tasks. Each task is outlined below with a brief summary defining the Scope of Services for each task. A time and materials not-to-exceed cost to perform this work is provided (Attachment 1) and includes Kimley-Horn project management and coordination time.

Task 100 – Organize to Prepare the Plan

Kimley-Horn will draft a document to establish the "office" that will be utilized in the development of the Resilience Plan. It is anticipated that the City of Fairfax Public Works Department and Kimley-Horn staff will be utilized to develop the Resilience Plan and will constitute as members of the "office". Relevant staff member roles will be identified and agreed upon prior to commencement of Resilience Plan development and shall be actively involved in the coordination, writing, and/or review of the Resilience Plan.

Task 200 - Involve the Public

Kimley-Horn will conduct six (6) in-person outreach activities to obtain public input related to City flooding. If outreach activities cannot be conducted in person, Kimley-Horn will attempt to conduct the meetings virtually. The outreach activities shall be conducted based on the minimum requirements for Resilience Plan preparation to receive input at different stages of the process. Kimley-Horn staff will prepare the necessary meeting materials, coordinate meeting location, and assist with public outreach. It is anticipated that City staff will assist and provide access to the City's existing public outreach channels (i.e Engage Fairfax, Cityscene, City of Fairfax News) to maximize outreach.

The first public meeting will be held within the first two months of the planning process to obtain public input on the localized natural hazards, community flooding problems, and solicit community opinions on possible solutions. This meeting will be held in one of the City's flood prone neighborhoods and will be utilized to gather citizen input. The meeting will consist of a brief presentation explaining the intent of the Resilience Plan but the main intent of the meeting will be to document citizens' concerns and comments.

Kimley-Horn will conduct up to four (4) additional outreach activities. These activities will be conducted to explain the planning process and encourage input from the constituents. The content and outreach method will be discussed and agreed upon with City staff prior to their development. Examples of anticipated outreach activities are: public webcasts, questionnaires, brochures, public information booths, presentations at civic organizations, and website/blog postings.

Lastly, Kimley-Horn staff will conduct a public meeting to obtain input on the draft Resilience Plan. This meeting will take place at the end of the planning process and be at least two weeks prior to submittal of the recommended Resilience Plan to the City's council. Kimley-Horn will work in conjunction with City staff to determine the necessary revisions to the Resilience Plan based on public input. All revisions to the Resilience Plan will be made prior to submittal to City Council.

Task 300 – Coordinate

Kimley-Horn will coordinate and contact agencies and communities outside of the City of Fairfax governmental structure to obtain readily available rainfall and flooding data and hazard mitigation input for the resilience planning process. In accordance with the guidance document, Kimley-Horn will prioritize attempts for meetings or telephone conference calls with agencies or organizations over written communication. For the purpose of this scope of service, "coordinate and contact" means to:

- Contact the agency or organization and keep a record of the contact
- Ask for data or information related to the hazard
- Ask if the agency or organization is doing anything that might affect flooding or properties in flood prone areas
- Offer the agency or organization an opportunity to be involved in the planning effort

Kimley-Horn will attempt to coordinate and contact up to thirty (30) different agencies and communities to gather relative information related to the City's resilience efforts. Special emphasis will be placed on data related to past flood studies, disaster damage reports, natural area plans, and existing floodplains. Once all the requisite data has been gathered, Kimley-Horn will review the existing studies, reports, and technical information. The review will focus on how the gathered data impacts the community's needs, goals, and plans for the area. The data gathered will be utilized as part of the assessment of Task 400 and Task 500. A summary of the data along with a conclusion of the review process will be included in Task 800.

Task 400 – Asses the Hazard

Kimley-Horn will compile and asses the data obtained in Task 300 into base maps and assessments that can be utilized in the development of the Resilience Plan. This scope of services does not include any new studies, engineering reports, construction documents, or analyses beyond what is exclusively stated in this proposal. If the City wishes to conduct further investigations, a separate of scope of services can be submitted for this work. The assessments of the existing data will be broken down into the following four (4) categories:

Known Flood Hazards

For known flood hazard areas, Kimley-Horn will identify the locations based on the Special Flood Hazard Areas (SFHA) as depicted in the Flood Insurance Rate Map (FIRM), areas of documented repetitive loss within City limits, areas not mapped on the FIRM that have recorded flood events in the past, and other surface flooding areas identified in previous studies. The flood hazard areas will be utilized to derive an ArcGIS map depicting the known flood hazards areas along with a description of the known flood hazards, the source of water, the depth of flooding, known velocities, warning times, and past flooding events.

Less Frequent Flood Hazard Areas

For the less-frequent flood hazard areas, Kimley-Horn will provide: an inventory of known levees, an inventory of dams that would result in flood of developed areas if failed, and identification of any flood-related special hazards. The assessment will utilize this information to derive an ArcGIS map depicting the affected areas. For the purpose of this task, Kimley-Horn will only assess existing information and any less-frequent flood hazards area shown is intended as an approximation for planning purposes only. A detailed review of any existing study is not included within this scope of services and previously approved information will assumed to be correct.

Future Areas of Increased Hazards

For the future areas of increased hazards, Kimley-Horn will identify areas likely to be flooded or experience flood problems in the future based on the following three (3) criteria: changes in floodplain development and demographics, development in the watershed, and climate change or sea level rise. This assessment will be based on the City of Fairfax Comprehensive Plan and is intended as a planning level exercise only. No future population trends or forecasting is included with this scope of services.

None Flood Hazards

For none-flood hazards, Kimley-Horn will provide descriptions of the magnitude or severity, history, and probability of future events for other natural hazards, such as earthquakes, wildfires, or tornados that may affect the City of Fairfax. Any analysis or projections will be based on the best available data and will include the source of the information.

Task 500 – Assess the Problem

Kimley-Horn will identify the impact of the hazards outlined in Task 400 onto City of Fairfax neighborhoods, infrastructure, natural floodplain, and discuss the impact of development on future flooding.

An overall summary of the City's vulnerability to each identified flood hazard will be incorporated within the Resilience Plan along with its associated impact on the community. Additionally, Kimley-Horn will provide an assessment on how each hazard identified in Task 400 impacts each of the following six (6) categories:

- Life safety and the need for warning and evacuating residents and visitors
- Public health, including health hazards to individuals from flood waters and mold
- Critical facilities and infrastructure
- Community's economy and major employers
- The quantity and types of affected building
- Historical damage to building to include repetitive loss properties and properties that have received flood insurance claims payments

Kimley-Horn will also provide a description of development, redevelopment, population trends, and include information about future development and redevelopment in the community, the watershed, and within the City's natural resource areas. All forward based projections will be derived on information outlined in the City of Fairfax Comprehensive Plan.

Task 600 – Set Goals

Kimley-Horn will prepare a statement of the goals of the resilience plan to address the community and City flooding concerns identified in Task 500. The goals will be identified in conjunction with City of Fairfax Public Works staff and will be based on the City's current and projected available resources.

Task 700 – Review Possible Activities

Kimley-Horn will review different activities that could prevent or reduce the severity of the problem(s) identified in Task 500 to achieve the Resilience Plan goals outlined in Task 600. All activities identified will include a pros/cons assessment, a narrative as to why the activity is appropriate for the community and will identify a potential funding mechanism available that could fund the activity.

As part of this task, Kimley-Horn will review preventive flood control activities, such as revisions to zoning ordinances, more stringent stormwater management regulations, building codes, subdivision ordinances, and preservation of open space, and as well as review the effectiveness of current regulatory and preventive standards and programs. The review will highlight how these activities can reduce future flood losses, a discussion on the current standards in the community's plan and regulations, and whether the community should adopt or revise such plans and regulations. The review will specifically highlight possible activities within the following four (4) sections:

1. Activities to protect the natural and beneficial functions of the floodplain, such as wetlands protection.
2. Emergency services activities, such as warning and sandbagging.
3. Existing and upcoming structural projects, such as levees, reservoirs, and channel modifications.
4. Public information activities, such as outreach projects and environmental education programs.

Task 800 – Draft A Resilience Plan

Kimley-Horn will compile information derived in task 100-700 into a preliminary Resilience Plan. The Resilience Plan will identify the departments responsible for implementing action items, an anticipated schedule to implement action items, and anticipated funding mechanisms. Action items listed within the Resilience Plan will be prioritized based on discussions with City of Fairfax Public Works staff. The Resilience Plan will provide action items for the four (4) sections identified in Task 700 and the areas identified as having none flood related hazards (Task 400). Additionally, Kimley-Horn will work with the City of Fairfax Office of Emergency Management (OEM) to obtain any existing documentation with regards to post-disaster redevelopment and mitigation policies, plans, and procedures. If available, the post-disaster policies, plans, and procedures will be incorporated into the Resilience Plan.

Kimley-Horn anticipates a total of two (2) submissions of the draft Resilience Plan to the City of Fairfax Public Works Department. Revisions to the draft Resilience Plan will be made after each submission based on comments received from City staff. If necessary, Kimley-Horn will conduct up to (2) meetings to review comments with City staff. If more than two (2) submissions and accompanying revisions are required, Kimley-Horn can provide a separate scope of services to address the required revisions.

Task 900 – Adopt the Resilience Plan

Kimley-Horn will submit the Resilience Plan to the City of Fairfax Public Works Department. It is anticipated the Resilience Plan will be presented to the City of Fairfax City Council for a vote on adoption of the plan. Kimley-Horn will assist and attend one (1) City Council meeting to provide technical support to the City staff. If the Resilience Plan is not approved by City Council, Kimley-Horn will meet with City staff to determine the next step. Revision to the Resilience Plan to address City Council comments or satisfy any requirements that may arise are not included within this scope of services. Kimley-Horn may provide additional support to the City under a separate scope of services, if requested.

Task 1000 – Implement, Evaluate, and Revise

Kimley-Horn will develop a document outlining procedures for monitoring, implementing, reviewing progress, and recommending revisions to the Resilience Plan. Once finalized, the document will be submitted to the City of Fairfax Public Works Department to assist in the future management of the Resilience Plan. Any task included with the process for monitoring, implanting, reviewing progress, or providing recommendations for revisions to the plan are excluded from this scope of services. In accordance with the guidance document, it is anticipated the Resilience Plan will be required to be updated at a minimum once every five (5) years. If requested, Kimley-Horn may provide a separate scope of services to assist in any required plan updates.

Task 1100 – Meetings & Coordination

Kimley-Horn staff will be available for up to three (3) project coordination meetings, in person (if requested), to discuss the project. Kimley-Horn anticipates meeting at the following stages:

1.) Completion of Task 400 to present the hazards identified.
2.) Prior to Task 500 to establish goals.
3.) Prior to Task 800 to discuss the outline of the Resilience Plan.

In addition, Kimley-Horn staff will participate in calls to discuss the project with City staff. If additional meetings and coordination activities are requested, Kimley-Horn will prepare a separate Scope of Services and cost estimate for client approval prior to proceeding with the additional work.

DELIVERABLES

The following items are anticipated as project deliverables for this Scope of Services.

- Six (6) public outreach presentations and accompanying presentation material.

- City-wide base maps for the following four (4) categories: areas of known flood hazards, areas of less frequent flood hazards, future areas of increased hazards, and areas of none flood hazards
- A Resilience Plan to be approved by the City of Fairfax City Council.
- Technical support for one (1) City Council meeting to assist in approval of the Resilience Plan
- A document outlining procedures revising the Resilience Plan in the future.
- Maps, models, presentation, calculations, and associated documentation utilized throughout the plan development process (if requested).

OVERALL PROJECT ASSUMPTIONS

For the purposes of developing this proposed scope of services and the accompanying cost estimate, we have made the following assumptions:

- This Resilience Plan is intended as a planning level document and will not be stamped and sealed by a Virginia Professional Engineer (PE).
- All previously approved studies, engineering reports, construction documents, or analyzes is assumed to be correct. This scope of services does not include a detailed review of previously approved documents. Kimley-Horn will not be held accountable for the accuracy of the data created by others and utilized in the development of the Resilience Plan.
- The Resilience Plan is intended to be an element in the City of Fairfax participation in the Community Rating System (CRS) program. This proposal does not include submission to the Federal Emergency Management Agency (FEMA) or revisions necessary for approval into the program.
- The Resilience Plan will utilize readily available existing data. This scope of services does not include new studies, engineering reports, construction documents, or any analyses beyond what is exclusively stated in this proposal. If the City wishes to conduct further investigations, a separate of scope of services can be submitted for this work.
- All previous project information developed by others will be provided by the City to Kimley-Horn in a timely manner to accommodate anticipated project schedule.
- The City will provide site and facility access permission to Kimley-Horn Horn for conducting all necessary fieldwork related tasks in a timely manner to facilitate the project schedule.
- Kimley-Horn will be able to utilize the City's public outreach channels to facilitate outreach activities announcements.
- Kimley-Horn will be able to schedule and conduct meetings within agreed-upon City of Fairfax government facilities. If facility rental is required, a separate scope of services can be submitted for these costs.
- The City will provide all coordination with inter-city departments with regards to this project. This scope of services is for the submittal of a Resilience Plan to the Public Works Department exclusively. If any other submission is required, a separate scope of services can be submitted.
- Any permit application fees, review fees, and/or data request fees required for the development of the Resilience Plan will be paid directly by the City of Fairfax.
- This proposal and the accompanying cost estimate are valid for a period of 60 days and will expire if not accepted within that timeframe.

OVERALL PROJECT EXCLUSIONS

Services that are not currently anticipated as part of this project and are therefore outside the scope of this task order proposal include the following:

- Environmental Site Assessments
- Perennial Stream Assessments and/or Flow Determinations
- Wetland Permit Compliance
- Project Renderings
- VSMP Compliance
- Floodplain Studies and Submittals
- Dam Safety Compliance
- Dam Break Inundation Zone (DBIZ) Modeling / Mapping
- FEMA CLOMR or LOMR Applications
- Design Plan Submittals
- All other services not explicitly stated in this Scope of Services

SCHEDULE

The tasks referenced in this scope will be coordinated with City of Fairfax Public Works Staff. Meetings, action items, and deliverables will be tracked on a monthly basis and reported to the City with a monthly progress report for documentation of services provided Kimley-Horn is aware that this summary of proposed services will be included as an attachment to the Virginia Community Flood Preparedness Fund (CFPF) grant request, and commencement of this work will be dependent on the funds award date. A detailed schedule will be developed for the City outlining project workflow and deliverables after contract execution.

FEE AND BILLING

Kimley-Horn will provide the following scope of services under our term contract #17007-2017-KHA. The following tasks will be provided on a time and materials basis not to exceed a total project cost of **$159,672.58**. A detailed breakdown (by task) of Kimley-Horn Horn's fee estimate is provided in Attachment 1 and utilizes the rate schedule as provided for in the City of Fairfax Task Order Contract #17007-2017-KHA, Year 5. Please note that hourly fees will be invoiced monthly based upon hours expended for services performed and payment will be due within 25 days of receipt of invoices related to this project.

CLOSURE

The work described with this proposal will be completed in accordance with the terms and conditions of Contract #17007-2017-KHA between the City of Fairfax and Kimley-Horn. We appreciate the opportunity to provide these services to you. Please contact either of us if you have any questions.

Very truly yours,
KIMLEY-HORN AND ASSOCIATES, INC.

City of Fairfax – 2023 Stormwater Utility Fund Project Information Sheet

PROJECT INFORMATION

Name:	**Flood Mitigation Planning & Resiliency**	**Project #**	**--**
2035 Comprehensive Plan Reference:	**NE2.1 pg 108**	**2035 Comprehensive Plan Timeframe:**	**Long-Term**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project supports the development of two flood mitigation initiatives. The first is a Flood Resilience Plan for the city. This plan provides project-based improvements for flood control and resilience, leverages nature-based infrastructure, considers all parts of a locality, includes coordination with other local and inter-jurisdictional activities, and is based on best available science. The plan will be developed to also provide credits towards FEMA's Community Rating System.

During the design of the Stafford Drive Stream Restoration Project, the effects to the floodplain were reviewed through hydraulic modeling. It was found that the culvert under Stafford Drive is a contributing factor in the floodplain impacts to the Mosby Woods condominium community. A flood study is proposed to evaluate the current condition of the Stafford Drive culvert and investigate options to improve the flood conditions in this area.
.
The city intends to apply for Community Flood Preparedness Fund grants for two projects which can, if approved, provide up to 75% funding for the flood preparedness plan, and 50% for the flood mitigation study. Development of a Flood Resilience Plan is a prerequisite to applying for any future grant funding for construction of a mitigation project, which can fund 50-70% of the project costs.

FUNCTION: **Stormwater Utility Fund**
DEPARTMENT: **Public Works**
DIVISION OR ACTIVITY: **Storm Drainage Operations & Maintenance**

PROGRAM:

The Storm Drainage division maintains the city's stormwater collection systems, which consist of 300,000 linear feet of storm pipe, 1,840 catch basins, 145 outfalls, 28 box culverts, 324 driveway culverts, 7 bridges, and 37 bridge culverts. Crews replace deteriorated storm lines, perform preventative maintenance tasks biannually, clear blocked streams, repair box culverts, and repair damaged driveway pipe and ditch lines.

OBJECTIVES:

- Clean ditch lines, storm pipes, and catch basins
- Repair and replace storm pipes and catch basins.
- Clean and clear stream beds of brush/obstacles to improve flow without affecting downstream properties.
- Repair box culverts.

SERVICES AND PRODUCTS:

- Catch basin repair
- Creek and stream maintenance
- Drainage ditch maintenance
- Storm sewer pipe maintenance, repair, and replacement
- Culvert repairs
- Bridge repairs
- Install lining to storm pipe and culverts
- Concrete lid/top replacement and repair
- Perform emergency drainage repairs and projects
- Provide sandbags and emergency response to flooding

FUNCTION: **Stormwater Utility Fund**
DEPARTMENT: **Public Works**
DIVISION OR ACTIVITY: **Stormwater Utility Administration & Engineering**

Budget Comments:

The FY2023 budget creates the Stormwater Utility Fund. The stormwater related costs from Public Works Administration and Engineering will be transferred from the General Fund to the Stormwater Utility Fund.

FUNCTION: **Stormwater Utility Fund**
DEPARTMENT: **Public Works**
DIVISION OR ACTIVITY: **Stormwater Utility Administration & Engineering**

PROGRAM:

The office of the director manages seven public works divisions, including Stormwater Management, and provides professional engineering services for constructing and maintaining stormwater infrastructure, environmental projects, and drainage improvements.

OBJECTIVES:

- Maintain compliance with the city’s Municipal Separate Storm Sewer System (MS4) permit.
- Meet the city’s Total Maximum Daily Load (TMDL) goals for the Chesapeake Bay and local waterways.
- Administrate erosion and sediment control and stormwater pollution prevention programs for public and private development projects.
- Maintain records of the layout and condition of the city’s storm sewer infrastructure.
- Deliver adopted capital drainage improvement projects that provide direct benefit to affected property owners.
- Provide public outreach and education on stormwater management and pollution prevention topics.
- Encourage the public to engage in stormwater-positive actions and activities.
- Administrate Stormwater Utility capital programming.
- Assist city residents and businesses with finding solutions to drainage problems.

SERVICES and PRODUCTS:

- Administrative services for the Stormwater Utility.
- Drainage improvement projects.
- Environmental projects; stream restoration, stormwater facility upgrades and retrofits.
- Evaluation of drainage concerns, both public and private.
- Printed and electronic outreach and education materials on stormwater topics.
- Administration of Virginia Erosion & Sediment Control and Virginia Stormwater Management Program laws through inspections and enforcement.

PROJECT INFORMATION

Name:	**Replacement of Failing Galvanized Storm Drainage Systems**	**Project #**	**340-644411-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project provides for the replacement of the City's galvanized storm drain systems located within the city's right-of-ways and citizen properties. Failed storm sewer mains create sinkholes and hazards. The failing systems would be replaced with HDPE pipe and new structures.

FY 2022 - Old Lee Highway

FY 2023 - Old Lee Highway

FY 2024 - Orchard Street & Burrows Avenue

FY 2025 - Maple Street

FY 2026 - Towlston, appx. 70' X12"

FY 2027 - TBD

PROJECT INFORMATION

Name:	**Storm Pipe Lining Rehabilitation**		**Project #**	**340-644410-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1**	**p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project is necessary to extend the life of the storm pipe lines. As concrete storm pipe linings age and deteriorate, sections can collapse and lose capacity. A plastic liner is installed on the inside wall of the pipe to maintain pipe integrity and stormwater flow.

Project includes mobilization, pre TV inspection, heavy cleaning, post TV inspection, and linear installation.

PROJECT INFORMATION

Name: **Mosby Road Drainage Improvements**	**Project #** **340-344429-580330**
2035 Comprehensive Plan Reference: **IU1.3.2** **p. 144**	**2035 Comprehensive Plan Timeframe:** **Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is needed to reduce flooding on Mosby Road. During heavy rain storms stormwater from Burke Station Road and floods the road. This project will fund the design and construct curb and gutter, curb inlets and stormwater pipes to collect and direct the stormwater from Burke Station Road to an existing stormwater sewer main on Mosby Road. Design will be completed in FY23 with construction scheduled for FY24.

PROJECT INFORMATION

Name:	**Reline Bridge Culvert Storm Structures**	**Project #**	**320-631318-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project is necessary to extend the life of the storm structures that bridge vehicular traffic over the creek systems. The existing galvanized pipe has deteriorated and will not support the road bed if a new system is not installed. There are approximately 37 bridge culverts throughout the city with diameters exceeding 24”.

PROJECT INFORMATION

Name:	**Ashby Pond Dredging & Retrofit**	**Project #**	**340-644430-580330**
2035 Comprehensive Plan Reference:	**IU1.3.2 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Short-Term**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

When the Ashby Pond project was completed in 2011, the project did not include the complete removal of silt. Instead, only a portion was removed. Since then the City has taken steps to help the water quality through the installation of aeration bubblers and native plantings along the pond banks. 30% design plans for restoration of the channel that feeds the east side of the pond, and restoration of the inflow channel on the south side of the pond, as well as the pond dredging and retrofit were completed in FY21 & FY22. Stormwater Local Assistance Fund grants were applied for in FY22. This project will contribute to the TMDL pollutant load reduction for the City. All available grant funding opportunities will be pursued.

Statement of Need:

This project will replace the erosion/scour slab, riprap and repair the wing walls on the upstream and downstream ends of this double 10' diameter corrugated metal pipe culvert across two phases. FY23 funding will provide for repair of the eastern/outlet side headwall and wingwall, and outlet apron/plunge pool area. The wingwalls and headwalls will also be sealed with graffiti resistant paint.

PROJECT INFORMATION

Name:	**Flood Mitigation Planning & Resiliency**		**Project #**	**--**
2035 Comprehensive Plan Reference:	**NE2.1**	**pg 108**	**2035 Comprehensive Plan Timeframe:**	**Long-Term**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

This project supports the development of two flood mitigation initiatives. The first is a Flood Resilience Plan for the city. This plan provides project-based improvements for flood control and resilience, leverages nature-based infrastructure, considers all parts of a locality, includes coordination with other local and inter-jurisdictional activities, and is based on best available science. The plan will be developed to also provide credits towards FEMA's Community Rating System.

During the design of the Stafford Drive Stream Restoration Project, the effects to the floodplain were reviewed through hydraulic modeling. It was found that the culvert under Stafford Drive is a contributing factor in the floodplain impacts to the Mosby Woods condominium community. A flood study is proposed to evaluate the current condition of the Stafford Drive culvert and investigate options to improve the flood conditions in this area.
.

The city intends to apply for Community Flood Preparedness Fund grants for two projects which can, if approved, provide up to 75% funding for the flood preparedness plan, and 50% for the flood mitigation study. Development of a Flood Resilience Plan is a prerequisite to applying for any future grant funding for construction of a mitigation project, which can fund 50-70% of the project costs.

PROJECT INFORMATION

Name:	**Northfax Linear Park Design**	**Project #**	**--**
2035 Comprehensive Plan Reference:	**CCAC 2.3.5 p.52**	**2035 Comprehensive Plan Timeframe:**	**Immediate**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
✓	**Multimodal Transportation**	✓	**Economic Vitality**
	Community Services		**Other City Plan/Policy**

Statement of Need:

Funding is requested for consultant services to develop a unified stormwater strategy, landscape design and standards for the Northfax Linear Park as recommended in the Northfax Small Area Plan adopted in June 2020. This project will establish a phasable conceptual plan to be implemented across multiple properties and timelines. Final design and construction will occur incrementally as development proceeds on impacted parcels. A unified stormwater strategy and landscape plan are specifically recommended as implementation items to precede development of impacted parcels in the plan.

PROJECT INFORMATION

Name:	**Stormwater & Wastewater Plan Review**	**Project #**	**340-644439-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p.144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

✓	**Land Use**	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

Stormwater quality and quantity designs for larger development projects are becoming more complex due to the increasingly urban nature of the City. Wastewater contributions to the City's system also increase through development projects. This project will allow for an additional layer of plan review assistance by specialized storm/waste water engineering firms to ensure that regulatory requirements are met, no adverse stormwater impacts to the proposed development or surrounding properties will occur, and wastewater capacities are adequate.

PROJECT INFORMATION

Name:	**Municipal Separate Storm Sewer System (MS4)**	**Project #**	**340-644424-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is required to comply with the 2018-2023 Municipal Separate Storm Sewer System (MS4) permit requirements. The new permit has new significant milestones that the City must meet each year of the 5 year permit term. The permit requirements include updating GIS files for DEQ, updating the City's website, revising the 5 year program plan, updating and implementing nutrient management plans, conducting outfall screening, conducting public outreach & education, and compiling our MS4 annual report. Funding will also provide for inspections, materials/equipment/signage, and staff training necessary to maintain Stormwater Pollution Prevention Plan compliance at the City's Property Yard facility. This permit will be active from 2018-2023, with this fiscal year being permit year 5.

PROJECT INFORMATION

Name:	**Private BMP/SWM Inspection**	**Project #**	**340-644432-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project provides for the annual inspection of all the private Best Management Practice/Storm Water Management (BMP/SWM) systems throughout the City. Currently there are 440 privately owned facilities in inventory. Annual inspection of these facilities is required under the Virginia Pollution Discharge Elimination System (VPDES) and Phase II-Municipal Separate Storm Sewer System (MS4) permit. While BMP facilities are engineered to meet state requirements for pollutant load reduction and water quantity, their continued performance is dependent upon inspections and maintenance. The number of facilities in inventory will continue to increase with future development / redevelopment of properties.

PROJECT INFORMATION

Name:	**Public BMP/SWM Inspection and Maintenance**	**Project #**	**340-644415-580330**
2035 Comprehensive Plan Reference:	**IU1.3.1 p. 144**	**2035 Comprehensive Plan Timeframe:**	**Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project provides for the annual inspection and maintenance of all the public Best Management Practice/Storm Water Management (BMP/SWM) systems throughout the City, including prior stream restoration project areas. There are currently 38 City owned and maintained facilities, plus two stream restoration areas that are inspected annually. Annual inspection of these facilities is required under the Virginia Pollution Discharge Elimination System (VPDES), Phase II-Municipal Separate Storm Sewer System (MS4) permit, and grant funding agreements with Virginia Department of Environmental Quality. Maintenance of BMP facilities is necessary to ensure that they continue to function as designed to provide water quality and quantity control. Implementation of Best Management Practices is required to offset the impacts of development activity, and the number of facilities in inventory will increase with future development/redevelopment of City properties, and roadway / transportation projects.

✓	**Community Services**	✓	**Other City Plan/Policy**

Statement of Need:

The Accotink Creek Stream Stability Assessment and Prioritization Plan was developed in October 2007 and has been used as a guide to select future stream restoration project areas. This report is now 15-years old and an update is needed. A comprehensive stream condition assessment is proposed for FY23 which will document improvements made through completed environmental projects and help prioritize stream segments for future restoration projects. All grant opportunities will be explored for this project.

PROJECT INFORMATION

Name: **TMDL Action Plans**

Project # **340-644426-580330**

2035 Comprehensive Plan Reference: **IU1.3.1** **p. 144**

2035 Comprehensive Plan Timeframe: **Ongoing**

Comprehensive Plan Element

	Land Use	✓	**Environment and Sustainability**
	Multimodal Transportation		**Economic Vitality**
✓	**Community Services**		**Other City Plan/Policy**

Statement of Need:

This project is needed to comply with the annual milestone requirements of the Municipal Separate Storm Sewer System (MS4) permit and state mandated TMDL allocations for waterways located within the regional watershed. A Chesapeake Bay Total Maximum Daily Load (TMDL) action plan was completed in 2015 and updated in 2019, as well as nine additional local TMDLs allocated to the City. Each action plan outlines what the pollutant of concern (POC) loads and required reductions are for the City to meet the permit requirements, and how the City will achieve them. The City met the Chesapeake Bay TMDL 5% reduction requirements for 2018. The Chesapeake Bay TMDL requires that the City achieve a 40% pollutant reduction goal by 2023, and 100% pollutant reduction goal by 2028. This project will provide for design and construction of stormwater outfall channel retrofits, and BMP retrofits. Both types of projects will provide for TMDL credit towards the City's pollutant reduction goals. Alternative compliance methods will be explored, including nutrient credit purchases. This project will also provide for development of a required chloride TMDL Action Plan. All grant opportunities will be explored.

Statement of Need:

A multi-phase evaluation program to prioritize areas for CCTV camera inspection of pipes and manholes was developed in FY22. This project will continue inspections to provide asset condition data and guide future maintenance and upgrade priorities. This project will also allow for collection of updated storm sewer inventory data that will be accessible through GIS. Data to be collected will include coordinate location, pipe size, material, depth, inlet/manhole type, and pipe connectivity layout.

Is the proposal in this application intended to benefit a low-income geographic area as defined in the Part 1 Definitions? Yes ____ No X

Categories (select applicable project):

Project Grants (Check All that Apply)

- ☐ Acquisition of property (or interests therein) and/or structures for purposes of allowing floodwater inundation, strategic retreat of existing land uses from areas vulnerable to flooding; the conservation or enhancement of natural flood resilience resources; or acquisition of structures, provided the acquired property will be protected in perpetuity from further development.
- ☐ Wetland restoration.
- ☐ Floodplain restoration.
- ☐ Construction of swales and settling ponds.
- ☐ Living shorelines and vegetated buffers.
- ☐ Structural floodwalls, levees, berms, flood gates, structural conveyances.
- ☐ Storm water system upgrades.
- ☐ Medium and large scale Low Impact Development (LID) in urban areas.
- ☐ Permanent conservation of undeveloped lands identified as having flood resilience value by *ConserveVirginia* Floodplain and Flooding Resilience layer or a similar data driven analytic tool.
- ☐ Dam restoration or removal.
- ☐ Stream bank restoration or stabilization.
- ☐ Restoration of floodplains to natural and beneficial function.
- ☐ Developing flood warning and response systems, which may include gauge installation, to notify residents of potential emergency flooding events.

Study Grants (Check All that Apply)

☐ Studies to aid in updating floodplain ordinances to maintain compliance with the NFIP or to incorporate higher standards that may reduce the risk of flood damage. This must include establishing processes for implementing the ordinance, including but not limited to, permitting, record retention, violations, and variances. This may include revising a floodplain ordinance when the community is getting new Flood Insurance Rate Maps (FIRMs), updating a floodplain ordinance to include floodplain setbacks or freeboard, or correcting issues identified in a Corrective Action Plan.

☐ Revising other land use ordinances to incorporate flood protection and mitigation goals, standards and practices.

☐ Conducting hydrologic and hydraulic studies of floodplains. Applicants who create new maps must apply for a Letter of Map Revision or a Physical Map Revision through the Federal Emergency Management Agency (FEMA). For example, a local government might conduct a hydrologic and hydraulic study for an area that had not been studied because the watershed is less than one square mile. Modeling the floodplain in an area that has numerous letters of map change that suggest the current map might not be fully accurate or doing a detailed flood study for an A Zone is another example.

☐ Studies and Data Collection of Statewide and Regional Significance.

☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard.

☐ Other relevant flood prevention and protection project or study.

<u>Capacity Building and Planning Grants</u>

☐ Floodplain Staff Capacity.

☒ Resilience Plan Development

  ☐ Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.

  ☐ Resource assessments, planning, strategies and development.
  - Policy management and/or development.
  - Stakeholder engagement and strategies.

Location of Project (Include Maps): City of Fairfax

NFIP Community Identification Number (CID#):(See appendix F 515524

Is Project Located in an NFIP Participating Community? ☒ Yes ☐ No

Is Project Located in a Special Flood Hazard Area? ☒ Yes ☐ No

Flood Zone(s) (If Applicable): Not Applicable

Flood Insurance Rate Map Number(s) (If Applicable): Not Applicable

Total Cost of Project: $159,672.58

Total Amount Requested $119,754.44

Virginia Community Flood Preparedness Fund Grant Program

Applicant Name:	City of Fairfax	
Eligibility Information		
Criterion	**Description**	**Check One**
1. Is the applicant a local government (including counties, cities, towns, municipal corporations, authorities, districts, commissions, or political subdivisions created by the General Assembly or pursuant to the Constitution or laws of the Commonwealth, or any combination of these)?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
2. Does the local government have an approved resilience plan and has provided a copy or link to the plan with this application?		
Yes	Eligible for consideration under all categories	
No	Eligible for consideration for studies, capacity building, and planning only	X
3. If the applicant is <u>not a town, city, or county</u>, are letters of support from all affected local governments included in this application?		
Yes	Eligible for consideration	
No	Not eligible for consideration	
4. Has this or any portion of this project been included in any application or program previously funded by the Department?		
Yes	Not eligible for consideration	
No	Eligible for consideration	X
5. Has the applicant provided evidence of an ability to provide the required matching funds?		
Yes	Eligible for consideration	X
No	Not eligible for consideration	
N/A	Match not required	

Capacity Building and Planning Eligible for Consideration	☒ **Yes** ☐ **No**
Applicant Name:	City of Fairfax

Scoring Information

Criterion	**Point Value**	**Points Awarded**
6. Eligible Capacity Building and Planning Activities (Select all that apply)		
Revisions to existing resilience plans and modifications to existing comprehensive and hazard mitigation plans.	**55**	
Development of a new resilience plan.	**55**	X
Resource assessments, planning, strategies and development.	**45**	
Policy management and/or development.	**40**	
Stakeholder engagement and strategies.	**25**	
Goal planning, implementation and evaluation.	**25**	
Long term maintenance strategy.	**25**	
Other proposals that will significantly improve protection from flooding on a statewide or regional basis.	**15**	
7. Is the area within the local government to which the grant is targeted socially vulnerable? (Based **on ADAPT VA's Social Vulnerability Index Score.)**		
Very High Social Vulnerability (More than 1.5)	**15**	
High Social Vulnerability (1.0 to 1.5)	**12**	
Moderate Social Vulnerability (0.0 to 1.0)	**8**	
Low Social Vulnerability (-1.0 to 0.0)	**0**	X
Very Low Social Vulnerability (Less than -1.0)	**0**	
8. Is the proposed activity part of an effort to join or remedy the community's probation or suspension from the NFIP?		
Yes	**10**	
No	**0**	X
9. Is the proposed project in a low-income geographic area as defined in this manual?		
Yes	**10**	
No	**0**	X
10. Does this project provide "community scale" benefits?		
Yes	**20**	X
No

Attachment 3.3

City of Fairfax – Current Floodplain Ordinance (4.15 Floodplain Regulations)

§4.14.6. Radioactivity

There shall be no radioactive emission that would be dangerous to health.

§4.14.7. Electrical interference

There shall be no electrical disturbance adversely affecting the operation of any equipment other than that of the creator of such disturbance.

§4.14.8. Liquid or solid wastes

There shall be no discharge of any liquid or solid wastes into any stream, except as authorized by a public agency.

§4.14.9. Glare and heat

There shall be no direct or reflected glare, whether from floodlights or from high-temperature processes (for example, combustion or welding) so as to be visible from within any residential district. There shall be no discharge of heat or heated air from any source so as to be detectable beyond the lot line.

§4.15. FLOODPLAIN REGULATIONS

§4.15.1. Authority

These regulations are adopted pursuant to the authority granted to localities by Code of Virginia, §15.2 - 2280.

§4.15.2. Purpose

The purpose of these provisions is to prevent: the loss of life and property, the creation of health and safety hazards, the disruption of commerce and governmental services, the extraordinary and unnecessary expenditure of public funds for flood protection and relief, and the impairment of the tax base by:

A. Regulating uses, activities, and development which, alone or in combination with other existing or future uses, activities, and development, will cause unacceptable increases in flood heights, velocities, and frequencies;

B. Restricting or prohibiting certain uses, activities, and development from locating within districts subject to flooding;

C. Requiring all those uses, activities, and developments that do occur in flood-prone districts to be protected and/or floodproofed against flooding and flood damage; and

D. Protecting individuals from buying land and structures that are unsuited for intended purposes because of flood hazards.

§4.15.3. General Provisions

A. Applicability

These regulations shall apply to all privately and publicly owned lands within the city and identified as areas of special flood hazard according to the flood insurance rate map (FIRM) that is provided to the city by the Federal Emergency Management Agency (FEMA)

B. Compliance and liability

1. No land shall hereafter be developed and no structure shall be located, relocated, constructed, reconstructed, enlarged, or structurally altered except in full compliance with the terms and provisions of these regulations and any other applicable ordinances and regulations, which apply to uses within the city.

2. The degree of flood protection sought by the provisions of these regulations is considered reasonable for regulatory purposes and is based on acceptable engineering methods of study, but does not imply total flood protection. Larger floods may occur on rare occasions. Flood heights may be increased by man-made or natural causes, such as ice jams and bridge openings restricted by debris. These regulations do not imply that districts outside the floodplain district or land uses permitted within such district will be free from flooding or flood damages.

3. These regulations shall not create liability on the part of the city or any officer or employee thereof for any flood damages that result from reliance on these regulations or any administrative decision lawfully made thereunder.

C. Records

Records of actions associated with administering these regulations shall be kept on file and maintained by the floodplain administrator.

D. Abrogation and greater restrictions

These regulations supersede any regulations currently in effect in flood-prone districts. Any existing regulation, however, shall remain in full force and effect to the extent that its provisions are more restrictive than the provisions of these regulations.

§4.15.4. Administration

A. Designation of the floodplain administrator

The zoning administrator shall serve as the floodplain administrator and is hereby appointed to administer and implement the regulations of this section and is referred to herein as the floodplain administrator. The floodplain administrator may:

1. Administer and implement floodplain regulations himself or delegate duties and responsibilities set forth in these regulations to qualified technical personnel, plan examiners, inspectors, and other employees.

2. Enter into a written agreement or written contract with another community or private sector entity to administer specific provisions of these regulations. Administration of any part of these regulations by another entity shall not relieve the city of its responsibilities pursuant to the participation requirements of the National Flood Insurance Program (NFIP) as set forth in the Code of Federal Regulations at 44 CFR 59.22.

B. Duties and responsibilities of the floodplain administrator

The duties and responsibilities of the floodplain administrator shall include but are not limited to:

1. Review applications for floodplain permits to determine whether proposed activities will be located in the special flood hazard area.

2. Interpret floodplain boundaries and provide available base flood elevation and flood hazard information.

3. Review applications to determine whether proposed activities will be reasonably safe from flooding and require new construction and substantial improvements to meet the requirements of these regulations.
4. Review applications to determine whether all necessary permits have been obtained from the federal, state or local agencies from which prior or concurrent approval is required; in particular, permits from state agencies for any construction, reconstruction, repair, or alteration of a dam, reservoir, or waterway obstruction (including bridges, culverts, structures), any alteration of a watercourse, or any change of the course, current, or cross section of a stream or body of water, including any change to the 100-year frequency floodplain of free-flowing nontidal waters of the state.
5. Verify that applicants proposing an alteration of a watercourse have notified adjacent communities, the Department of Conservation and Recreation (DCR) Division of Dam Safety and Floodplain Management, and other appropriate agencies (Virginia Department of Environmental Quality [VADEQ], United States Army Corps of Engineers [USACE]) and have submitted copies of such notifications to FEMA.
6. Approve applications and issue floodplain permits to develop in flood hazard areas if the provisions of these regulations have been met, or disapprove applications if the provisions of these regulations have not been met.
7. Inspect or cause to be inspected, buildings, structures, and other development for which permits have been issued to determine compliance with these regulations or to determine if non-compliance has occurred or violations have been committed.
8. Review elevation certificates and require incomplete or deficient certificates to be corrected.
9. Submit to FEMA, or require applicants to submit to FEMA, data and information necessary to maintain FIRMs, including hydrologic and hydraulic engineering analyses prepared by or for the city, within six months after such data and information becomes available if the analyses indicate changes in base flood elevations.
10. Maintain and permanently keep records that are necessary for the administration of these regulations, including:
    - **(a)** Flood insurance studies, FIRMs (including historic studies and maps and current effective studies and maps) and letters of map change; and
    - **(b)** Documentation supporting issuance and denial of permits, elevation certificates, documentation of the elevation (in relation to the datum on the FIRM) to which structures have been floodproofed, other required design certifications, special exceptions and special use permits, and records of enforcement actions taken to correct violations of these regulation
11. Enforce the provisions of these regulations, investigate violations, issue notices of violations or stop work orders, and require permit holders to take corrective action.
12. Advise the board of zoning appeals, or the city council, as appropriate, regarding the intent of these regulations and, for each application for special exceptions and special use permits, prepare a staff report and recommendation.

13. Administer the requirements related to proposed work on existing buildings:
    - **(a)** Make determinations as to whether buildings and structures that are located in flood hazard areas and that are damaged by any cause have been substantially damaged.
    - **(b)** Make reasonable efforts to notify owners of substantially damaged structures of the need to obtain a permit to repair, rehabilitate, or reconstruct, and prohibit the non-compliant repair of substantially damaged buildings except for temporary emergency protective measures necessary to secure a property or stabilize a building or structure to prevent additional damage.
14. Undertake other actions which may include but are not limited to: issuing press releases, public service announcements, and other public information materials related to permit requests and repair of damaged structures; coordinating with other Federal, State, and local agencies to assist with substantial damage determinations; providing owners of damaged structures information related to the proper repair of damaged structures in special flood hazard areas; and assisting property owners with documentation necessary to file claims for Increased Cost of Compliance coverage under NFIP flood insurance policies.
15. Notify FEMA when the corporate boundaries of the city have been modified and:
    - **(a)** Provide a map that clearly delineates the new corporate boundaries or the new area for which the authority to regulate pursuant to these regulations has either been assumed or relinquished through annexation; and
    - **(b)** If the FIRM for any annexed area includes special flood hazard areas that have flood zones that have regulatory requirements that are not set forth in these regulations, prepare amendments to these regulations to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended regulations shall be provided to DCR Division of Dam Safety and Floodplain Management and FEMA.
16. Upon the request of FEMA, complete and submit a report concerning participation in the NFIP which may request information regarding the number of buildings in the special flood hazard area, number of permits issued for development in the special flood hazard area, and number of special exceptions and special use permits issued for development in the special flood hazard area.
17. Take into account flood, mudslide and flood-related erosion hazards, to the extent that they are known, in all official actions relating to land management and use throughout the entire jurisdictional area of the city, whether or not those hazards have been specifically delineated geographically (e.g. via mapping or surveying).

C. Use and interpretation of FIRMs

The floodplain administrator shall make interpretations, where needed, as to the exact location of special flood hazard areas, floodplain boundaries, and floodway boundaries. The following shall apply to the use and interpretation of FIRMs and data:

1. Where field surveyed topography indicates that adjacent ground elevations:

- **(a)** Are below the base flood elevation, even in areas not delineated as a special flood hazard area on a FIRM, the area shall be considered as special flood hazard area and subject to the requirements of these regulations;
- **(b)** Are above the base flood elevation, the area shall be regulated as special flood hazard area unless the applicant obtains a letter of map change that removes the area from the special flood hazard area.

2. In FEMA-identified special flood hazard areas where base flood elevation and floodway data have not been identified and in areas where FEMA has not identified special flood hazard areas, any other flood hazard data available from a federal, state, or other source shall be reviewed and reasonably used.

3. Base flood elevations and designated floodway boundaries on FIRMs and in flood insurance studies shall take precedence over base flood elevations and floodway boundaries by any other sources if such sources show reduced floodway widths and/or lower base flood elevations.

4. Other sources of data shall be reasonably used if such sources show increased base flood elevations and/or larger floodways than are shown on FIRMs and in flood insurance studies.

5. If a Preliminary FIRM and/or a Preliminary Flood Insurance Study has been provided by FEMA:

- **(a)** Upon the issuance of a letter of final determination by FEMA, the preliminary flood hazard data shall be used and shall replace the flood hazard data previously provided from FEMA for the purposes of administering these regulations.
- **(b)** Prior to the issuance of a letter of final determination by FEMA, the use of preliminary flood hazard data shall be deemed the best available data pursuant to §4.15.6.C regarding A Zones, and used where no base flood elevations and/or floodways are provided on the effective FIRM.
- **(c)** Prior to issuance of a letter of final determination by FEMA, the use of preliminary flood hazard data is permitted where the preliminary base flood elevations or floodways exceed the base flood elevations and/or designated floodway widths in existing flood hazard data provided by FEMA. Such preliminary data may be subject to change and/or appeal to FEMA.

D. Jurisdictional boundary changes

1. The city floodplain regulations then in effect on the date of annexation or agreed upon boundary line adjustment shall remain in effect and shall be enforced by the city for all annexed areas until the city adopts and enforces an ordinance which meets the requirements for participation in the NFIP. It is a requirement that municipalities with existing floodplain ordinances shall pass a resolution acknowledging and accepting responsibility for enforcing floodplain ordinance standards prior to annexation of any area containing identified flood hazards. If the FIRM for any annexed area includes special flood hazard areas that have flood zones that have regulatory requirements that are not set forth in these regulations, the city shall prepare amendments to these regulations to adopt the FIRM and appropriate requirements, and submit the amendments to the city council for adoption; such adoption shall take place at the same time as or prior to the date of annexation and a copy of the amended regulations shall be provided to the DCR Division of Dam Safety and Floodplain Management and FEMA.

2. In accordance with the Code of Federal Regulations, Title 44 Subpart (B) Section 59.22 (a) (9) (v) all NFIP participating communities must notify the Federal Emergency Management Agency and optionally the State Coordinating Office (Virginia Department of Conservation and Recreation – Division of Dam Safety and Floodplain Management) in writing whenever the boundaries of the community have been modified by annexation or the community has otherwise assumed or no longer has authority to adopt and enforce floodplain management regulations for a particular area.
3. In order that all FIRMs accurately represent the city's boundaries, a copy of a map of the city suitable for reproduction, clearly delineating the new corporate limits or new area for which the community has assumed or relinquished floodplain management regulatory authority must be included with the notification.

E. District boundary changes

The city council may modify the boundaries of the floodplain in accordance with the procedures established for zoning map amendments contained in §6.4. Any such modification shall be based upon hydrologic and hydraulic analyses performed by an engineer who shall certify that the technical methods used correctly reflect accepted engineering design methods. Prior to any such modification, approval shall be obtained from FEMA.

F. Interpretation of district boundaries

The zoning administrator shall be responsible for the interpretation of floodplain boundaries and may approve minor refinements after consulting with the city engineer to more accurately determine the true location of such boundaries. Such approval shall be based on hydrologic and hydraulic analyses performed by an engineer, who shall certify that the technical methods used correctly reflect accepted engineering design methods. The determination of the floodplain boundary by the zoning administrator may be appealed by an aggrieved party to the board of zoning appeals pursuant to §6.21.

G. Submitting technical data

The city's base flood elevations may increase or decrease resulting from physical changes affecting flooding conditions. As soon as practicable, but not later than six months after the date such information becomes available, the city shall notify FEMA of the changes by submitting technical or scientific data. Such a submission is necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and flood plain management requirements will be based upon current data.

H. Letters of map revision

When development in the floodplain causes a change in the base flood elevation, the applicant, including state agencies, must notify FEMA by applying for a conditional letter of map revision prior to construction, and a letter of map revision after construction. For example:

1. Any development that causes a rise in the base flood elevations within the floodway.

2. Any development occurring in Zones A1-30 and AE without a designated floodway, which will cause a rise of more than one foot in the base flood elevation.

§4.15.5. Alteration or relocation of a stream

Alteration or relocation of a stream, including but not limited to installing culverts and bridges. [44 CFR 65.3 and 65.6(a)(12)]

§4.15.6. Establishment of special flood hazard districts

A. Description of special flood hazard districts

The various special flood hazard districts shall include the special flood hazard areas. The basis for the delineation of these districts shall be the flood insurance study and the FIRM for the city prepared by FEMA, dated June 2, 2006, and any subsequent revisions or amendments thereto. The city may identify and regulate local flood hazard or ponding areas that are not delineated on the FIRM. These areas may be delineated on a local flood hazard map using best available topographic data and locally derived information such as flood of record, historic high water marks or approximate study methodologies. The boundaries of the special flood hazard areas are established as shown on the FIRM which is declared to be a part of these regulations and which shall be kept on file at the city.

1. The floodway district is in an AE Zone and is delineated, for purposes of These regulations, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one percent annual chance flood without increasing the water surface elevation of that flood more than one foot at any point. The following provisions shall apply within the floodway district of an AE Zone [44 CFR 60.3(d)]:

   (a) Within any floodway, no encroachments, including fill, new construction, substantial improvements, or other development shall be permitted unless it has been demonstrated through hydrologic and hydraulic analysis performed in accordance with standard engineering practice that the proposed encroachment will not result in any increase in flood levels within the community during the occurrence of the base flood discharge. Hydrologic and hydraulic analyses shall be undertaken only by professional engineers or others of demonstrated qualifications, who shall certify that the technical methods used correctly reflect currently-accepted technical concepts. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the floodplain administrator.

   (b) Development activities which increase the water surface elevation of the base flood may be allowed, provided that the applicant first applies – with the city's endorsement – for a conditional letter of map revision (CLOMR), and receives the approval of FEMA.

   (c) If §4.15.6.A.1(a) is satisfied, all new construction and substantial improvements shall comply with all applicable flood hazard reduction provisions of §4.15.7, §4.15.8, §4.15.9, §4.15.10, and §4.15.11.

B. The AE, or AH Zones on the FIRM accompanying the Flood Insurance Study shall be those areas for which one-percent annual chance flood elevations have been provided and the floodway has not been delineated. The following provisions shall apply within an AE or AH Zone [44 CFR 60.3(c)]:

1. Until a regulatory floodway is designated, no new construction, substantial improvements, or other development (including fill) shall be permitted within the areas of special flood hazard, designated as Zones A1-30 and AE or AH on the FIRM, unless it is demonstrated that the cumulative effect of the proposed development, when combined with all other existing and anticipated development, will not increase the water surface elevation of the base flood more than one foot at any point within the city.

2. Development activities in Zones Al-30 and AE or AH, on the city FIRM which increase the water surface elevation of the base flood by more than one foot may be allowed, provided that the applicant first applies – with the city's endorsement – for a conditional letter of map revision, and receives the approval of FEMA

C. The A Zone on the FIRM accompanying the Flood Insurance Study shall be those areas for which no detailed flood profiles or elevations are provided, but the one percent annual chance floodplain boundary has been approximated. For these areas, the following provisions shall apply [44 CFR 60.3(b)]:

1. The approximated floodplain district shall be that floodplain area for which no detailed flood profiles or elevations are provided, but where a 100-year floodplain boundary has been approximated. Such areas are shown as Zone A on the maps accompanying the Flood Insurance Study. For these areas, the base flood elevations and floodway information from federal, state, and other acceptable sources shall be used, when available. Where the specific one percent annual chance flood elevation cannot be determined for this area using other sources of data, such as the USACE Floodplain Information Reports, U. S. Geological Survey Flood-Prone Quadrangles, etc., then the applicant for the proposed use, development and/or activity shall determine this base flood elevation. For development proposed in the approximate floodplain the applicant must use technical methods that correctly reflect currently accepted non-detailed technical concepts, such as point on boundary, high water marks, or detailed methodologies hydrologic and hydraulic analyses. Studies, analyses, computations, etc., shall be submitted in sufficient detail to allow a thorough review by the floodplain administrator.

2. The floodplain administrator reserves the right to require a hydrologic and hydraulic analysis for any development. When such base flood elevation data is utilized, the lowest floor shall be elevated at least 18 inches above the base flood level.

3. During the permitting process, the floodplain administrator shall obtain:

   (a) The elevation of the lowest floor (including the basement) of all new and substantially improved structures; and,

   (b) If the structure has been floodproofed in accordance with the requirements of this article, the elevation (in relation to mean sea level) to which the structure has been floodproofed.

4. The AO Zone on the FIRM accompanying the Flood Insurance Study shall be those areas of shallow flooding identified as AO on the FIRM. For these areas, the following provisions shall apply [44 CFR 60.3(c).

   (a) All new construction and substantial improvements of residential structures shall have the lowest floor, including basement, elevated above the highest adjacent grade at least as high as the depth number specified in feet on the FIRM plus 18 inches. If no flood depth number is specified, the lowest floor, including basement, shall be elevated no less than three and one-half feet above the highest adjacent grade.

(b) All new construction and substantial improvements of nonresidential structures shall:

(1) Have the lowest floor, including basement, elevated above the highest adjacent grade at least as high as the depth number specified in feet on the FIRM plus 18 inches. If no flood depth number is specified, the lowest floor, including basement, shall be elevated at least three and one-half feet above the highest adjacent grade; or,

(2) Together with attendant utility and sanitary facilities be completely floodproofed to the specified flood level so that any space below that level is watertight with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.

(c) Adequate drainage paths around structures on slopes shall be provided to guide floodwaters around and away from proposed structures.

D. Overlay Concept

The floodplain districts described above shall be overlays to the existing underlying districts as shown on the city’s zoning map, and as such, the provisions for the floodplain districts shall serve as a supplement to the underlying district provisions.

1. If there is any conflict between the provisions or requirements of the floodplain districts and those of any underlying district, the more restrictive provisions and/or those pertaining to the floodplain districts shall apply.
2. In the event any provision concerning a floodplain district is declared inapplicable as a result of any legislative or administrative actions or judicial decision, the basic underlying provisions shall remain applicable.

§4.15.7. Permit and application requirements

A. Permit requirement

All uses, activities, and development occurring within any floodplain district shall be undertaken only upon the issuance of a zoning permit. Such development shall be undertaken only in strict compliance with the provisions of these regulations and with all other applicable codes and ordinances, as amended, such as the Virginia Uniform Statewide Building Code (USBC) and the city’s subdivision ordinance and regulations appertaining thereto. Prior to the issuance of any such permit, the floodplain administrator shall require all applications to include compliance with all applicable state and federal laws and shall review all sites to assure they are reasonably safe from flooding. Under no circumstances shall any use, activity, and/or development adversely affect the capacity of the channels or floodways of any watercourse, drainage ditch, or any other drainage facility or system. A floodplain permit shall be issued by the zoning administrator after an application has been submitted along with any documentation required by the zoning administrator and a fee in accordance with §6.2.4.

B. Site plans and permit applications

All applications for development within any floodplain district and all building permits issued for the floodplain shall incorporate the following information:

1. The elevation of the base flood at the site.
2. The elevation of the lowest floor (including basement).
3. For structures to be floodproofed (nonresidential only), the elevation to which the structure will be floodproofed.
4. Topographic information showing existing and proposed ground elevations.

C. Allowed uses

The following uses shall be permitted within the floodplain by right or with a special use permit, as specified; provided, that such uses are permitted in the zoning district within which they are located, the review criteria contained in §4.15.7 are met, and a floodplain permit is obtained as specified in §4.15.4.C.

1. Permitted uses

(a) Utilities and public facilities and improvements such as streets, channel improvements, bridges, utility pipes, utility transmission lines and stormwater management facilities shall be permitted.

(b) The following uses and improvements shall be permitted, provided that the development or use is otherwise permitted in this chapter and that the area of impervious surface shall not exceed 2,500 square feet and such uses or improvements shall not contain areas of fill in excess of 12 inches in depth:

(1) Agricultural uses such as farming, gardening, grazing and similar uses.

(2) Outdoor recreational uses such as parks, trails, picnic grounds, athletic fields, play grounds, golf courses, tennis courts and archery ranges.

2. Special uses

The following uses and improvements shall be permitted with a special use permit issued by the city council in accordance with the provisions of §6.7, provided that such use is permitted in the zoning district in which the proposed use or improvement is located:

(a) Area specified

The uses permitted and specified in §4.15.7.C.1 where the area of impervious surface will exceed 2,500 square feet or such uses or improvements will contain areas of fill in excess of 12 inches in depth.

(b) Redevelopment of property

(1) For the purposes of §4.15, redevelopment shall be any reconstruction, conversion, structural alteration, relocation or enlargement of any structure or any extension of the use of the land. No redevelopment shall be permitted in any floodplain until the developer submits to the zoning administrator a study performed by an engineer, which addresses the review criteria contained in §4.15.8.

(2) Redevelopment shall only be permitted if construction techniques are employed which floodproof each structure located within the floodplain in accordance with the NFIP, USBC floodproofing standards and all other applicable requirements. Within Zone AO the underside of the lowest floor (including basement) of any structure shall be a minimum of three and one-half feet above the highest adjacent grade. In addition, the underside of the lowest floor (including basement) of any structure shall be a minimum of 18 inches above the floodplain elevation.

§4.15.8. Approval criteria

A. Permitted uses, activities or developments (including redevelopments) within the floodplain shall be permitted only when all available alternative locations not within the floodplain have been properly considered and it is not possible to accommodate reasonable development outside the floodplain boundaries. Each application for a floodplain permit, together with required supporting documentation, shall clearly demonstrate that the proposed use, activity or development:

1. Shall minimize grading to the maximum possible extent.
2. Shall minimize the amount of impervious surface to the maximum possible extent through site design, the use of porous construction materials, grid or modular pavement, and other reasonable methods.
3. Shall minimize the loss of natural vegetation and natural stormwater characteristics.
4. Shall minimize the susceptibility of structures and their contents to flood damage.
5. Shall not negatively affect water quality.
6. Shall not increase the intensity or extent of flooding of lands above or below the property or jeopardize property or human life.
7. Shall not adversely affect the capacity of the floodplain channel or increase erosion within or adjacent to the floodplain. Prior to any proposed alteration or relocation of any channels or of any watercourse, stream, etc., within the city all applicable permits shall be obtained from the USACE, the VADEQ, and the Virginia Marine Resources Commission. Furthermore, notification of the proposal shall be given by the applicant to all affected adjacent jurisdictions, the DCR, and the Federal Insurance Administration.
8. Shall minimize negative impacts upon wildlife habitat.
9. Shall have its design incorporate base (100-year) flood elevation data for any proposed new activity or development greater than 50 lots or five acres, whichever is the lesser, if located within Zone A. In addition, the best available floodway information from federal, state, or other sources acceptable to the zoning administrator shall be used.
10. Shall not result in more than a one-foot increase in the base (100-year) flood elevation. This shall include the cumulative effect of the proposed use, activity, or development when combined with all other existing and anticipated uses, activities, or development.
11. Shall not negatively affect drainage.

§4.15.9. General standards

A. New construction and substantial improvements shall be according to the Virginia USBC, and anchored to prevent flotation, collapse or lateral movement of the structure.

B. New construction and substantial improvements shall be constructed with materials and utility equipment resistant to flood damage.

C. New construction or substantial improvements shall be constructed by methods and practices that minimize flood damage.

D. Electrical, heating, ventilation, plumbing, air conditioning equipment and other service facilities, including duct work, shall be designed and/or located so as to prevent water from entering or accumulating within the components during conditions of flooding.

E. New and replacement water supply systems shall be designed to minimize or eliminate infiltration of floodwaters into the system.

F. New and replacement sanitary sewage systems shall be designed to minimize or eliminate infiltration of floodwaters into the systems and discharges from the systems into floodwaters.

G. On-site waste disposal systems shall be located and constructed to avoid impairment to them or contamination from them during flooding.

§4.15.10. Elevation and construction standards

In all identified flood hazard areas where base flood elevations have been provided in the Flood Insurance Study or generated by a certified professional in accordance with §4.15.6.C, the following provisions shall apply:

A. Residential Construction

New construction or substantial improvement of any residential structure in Zones A1-30, AE, AH and A with detailed base flood elevations shall have the lowest floor, including basement, elevated at least 18 inches above the base flood level.

B. Non-Residential Construction

New construction or substantial improvement of any commercial, industrial, or nonresidential building shall have the lowest floor, including basement, elevated at least 18 inches above the base flood level. Buildings located in all A1-30, AE, and AH Zones may be floodproofed in lieu of being elevated provided that all areas of the building components below the elevation corresponding to the base flood elevation plus one foot are water tight with walls substantially impermeable to the passage of water, and use structural components having the capability of resisting hydrostatic and hydrodynamic loads and the effect of buoyancy. A registered professional engineer or architect shall certify that the standards of this §4.15.10 are satisfied. Such certification, including the specific elevation (in relation to mean sea level) to which such structures are floodproofed, shall be maintained by the zoning administrator).

C. Space Below the Lowest Floor

In Zones A, AE, AH, AO, and A1-A30, fully enclosed areas, of new construction or substantially improved structures, which are below the regulatory flood protection elevation shall:

1. Not be designed or used for human habitation, but shall only be used for parking of vehicles, building access, or limited storage of maintenance equipment used in connection with the premises. Access to the enclosed area shall be the minimum necessary to allow for parking of vehicles (garage door) or limited storage of maintenance equipment (standard exterior door), or entry to the living area (stairway or elevator).

2. Be constructed entirely of flood resistant materials below the regulatory flood protection elevation;

3. Include measures to automatically equalize hydrostatic flood forces on walls by allowing for the entry and exit of floodwaters. To meet this requirement, the openings must either be certified by a professional engineer or architect or meet the following minimum design criteria:

(a) Provide a minimum of two openings on different sides of each enclosed area subject to flooding.

(b) The total net area of all openings must be at least one square inch for each square foot of enclosed area subject to flooding.

(c) If a building has more than one enclosed area, each area must have openings to allow floodwaters to automatically enter and exit.

(d) The bottom of all required openings shall be no higher than one foot above the adjacent grade.

(e) Openings may be equipped with screens, louvers, or other opening coverings or devices, provided they permit the automatic flow of floodwaters in both directions.

(f) Foundation enclosures made of flexible skirting are not considered enclosures for regulatory purposes, and, therefore, do not require openings. Masonry or wood underpinning, regardless of structural status, is considered an enclosure and requires openings as outlined above.

D. Manufactured homes

All manufactured homes shall be prohibited within the city. No special exceptions or variances will be granted.

E. Recreational vehicles

All recreational vehicles shall be prohibited within any special flood hazard area. No special exceptions or variances will be granted.

§4.15.11. Subdivision standards

A. All subdivisions shall minimize flood damage;

B. All subdivisions proposals shall have public utilities and facilities such as sewer, gas, electrical and water systems located and constructed to minimize flood damage;

C. All subdivisions shall have adequate drainage provided to reduce exposure to flood hazards, and

D. Base flood elevation data shall be obtained from other sources or developed using detailed methodologies, hydraulic and hydrologic analysis, comparable to those contained in a Flood

Insurance Study for subdivision proposals and other proposed development proposals (including subdivisions) that exceed 50 lots or five acres, whichever is the lesser.

§4.15.12. Existing structures in floodplain areas

A structure or use of a structure or premises which lawfully existed before the enactment of these provisions, but which is not in conformity with these provisions, may be continued subject to the following conditions:

A. Existing structures in the floodway shall not be expanded or enlarged unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practices that the proposed expansion would not result in any increase in the base flood elevation.

B. Any modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use located in any floodplain areas to an extent or amount of less than 50 percent of its market value shall conform to the Virginia USBC and the appropriate provisions of these regulations.

C. The modification, alteration, repair, reconstruction, or improvement of any kind to a structure and/or use, regardless of its location in a floodplain area to an extent or amount of 50 percent or more of its market value shall be undertaken only in full compliance with these regulations and shall require the entire structure to conform to the Virginia USBC.

§4.15.13. Special exceptions

A. The board of zoning appeals may, by special exception, permit within the floodplain additional uses where such uses are not permitted uses specified in §4.15.6, provided that:

1. Such additional use is permitted in the underlying zoning district;
2. Special exceptions shall be granted only in accordance with the procedures and limitations established for special use permits in §6.7; and
3. The special exception granted represents the minimum variation necessary to afford relief.

B. In reviewing a special exception request, the board of zoning appeals shall consider the following additional factors:

1. The danger to life and property due to increased flood heights or velocities caused by encroachments. No special exception shall be granted for any proposed use, development, or activity within any floodway that would cause any increase in the 100-year flood elevation.
2. The compatibility of the proposed use with existing development and nearby development anticipated in the foreseeable future.
3. The relationship of the proposed use to the comprehensive plan and floodplain management program for the area.
4. For historic structures, a determination that the exception is the minimum necessary to preserve the historic character and design of the structure and would not preclude the structures continued designation as a historic structure.
5. The danger that materials may be swept on to other lands or downstream to the injury of others.

6. The proposed water supply and sanitation systems and the ability of these systems to prevent disease, contamination, and unsanitary conditions.
7. The susceptibility of the proposed facility and its contents to flood damage and the effect of such damage on the individual owners.
8. The importance of the services provided by the proposed facility to the community.
9. The requirements of the facility for a waterfront location.
10. The availability of alternative locations not subject to flooding for the proposed use.
11. The safety of access by ordinary and emergency vehicles to the property in time of flood.
12. The expected heights, velocity, duration, rate of rise, and sediment transport of the floodwaters expected at the site.

C. A special exception shall be granted only after the board of zoning appeals has determined that the granting of such would not (i) result in unacceptable or prohibited increases in flood heights, (ii) pose additional threats to public safety, (iii) require extraordinary public expense, (iv) create any nuisances, (v) cause fraud or victimization of the public, and (vi) conflict with local laws or ordinances. Special exceptions shall be granted only after the board of zoning appeals has determined that a special exception would be the minimum required to provide relief from any hardship to the applicant.

D. The board of zoning appeals shall notify, in writing, the applicant for a special exception request that the issuance of a special exception to construct a structure below the 100-year flood elevation (i) increases the risks to life and property and (ii) may result in increased premium rates for flood insurance.

E. A record shall be maintained of the above notification as well as all special exception actions, including justification for the issuance of the special exceptions. The annual or biennial report submitted to the FEMA shall note any special exceptions, which are issued during the period covered by the report.

F. A special exception shall meet the elevation and construction standards established in §4.15.10.

§4.15.14. Variances

A. Applications for a variance, pursuant to the requirements of §6.18, will be subject to the same considerations as a special exception, as set forth in §4.15.13.

B. The board of zoning appeals shall notify, in writing, the applicant for a variance request that the issuance of a variance to construct a structure below the 100-year flood elevation (i) increases the risks to life and property and (ii) may result in increased premium rates for flood insurance.

§4.15.15. Definitions

For the purposes of 4.15, the following words and phrases shall have the meanings respectively ascribed to them by 4.15 unless the context clearly indicates otherwise:

100-YEAR FLOODPLAIN: The Federal Emergency Management Agency designated one percent annual chance water surface elevation. For the purposes of this ordinance, the 100-year flood is the base flood.

A, A1-30, AND AE ZONES: Areas subject to inundation by the 1-percent-annual-chance flood event determined by detailed methods. Base flood elevations are shown. Mandatory flood insurance purchase requirements and floodplain management standards apply.

AH ZONE: Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually areas of ponding) where average depths are between one and three feet. Base flood elevations derived from detailed hydraulic analyses are shown in this zone. Mandatory flood insurance purchase requirements and floodplain management standards apply.

AO ZONE: Areas subject to inundation by 1-percent-annual-chance shallow flooding (usually sheet flow on sloping terrain) where average depths are between one and three feet. Average flood depths derived from detailed hydraulic analyses are shown in this zone. Mandatory flood insurance purchase requirements and floodplain management standards apply. Some AO Zones have been designated in areas with high flood velocities such as alluvial fans and washes. Communities are encouraged to adopt more restrictive requirements for these areas.

APPROXIMATED FLOODPLAIN DISTRICT: The floodplain area for which no detailed flood profiles or elevations are provided, but where a 100-year floodplain boundary has been approximated.

BASE FLOOD: The flood having a one percent chance of being equaled or exceeded in any given year.

BASE FLOOD ELEVATION (BFE): The FEMA designated one percent annual chance water surface elevation and the elevation determined per §4.15.10. The water surface elevation of the base flood in relation to the datum specified on the city's FIRM. For the purposes of these regulations, the base flood is the 100-year flood or 1 percent annual chance flood.

BASEMENT: Any area of the building having its floor sub-grade (below ground level) on all sides.

CONDITIONAL LETTER OF MAP REVISION (CLOMR): A formal review and comment as to whether a proposed flood protection project or other project complies with the minimum NFIP requirements for such projects with respect to delineation of special flood hazard areas. A CLOMR does not revise the effective Flood Insurance Rate Map or Flood Insurance Study.

DCR: Virginia Department of Conservation and Recreation.

DEVELOPMENT: Any man-made change to improved or unimproved real estate, including, but not limited to, buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials.

ELEVATION CERTIFICATE: An administrative tool of the National Flood Insurance Program which is to be used to provide elevation information necessary to ensure compliance with to community floodplain management ordinances, to determine the proper insurance premium rate, or support a request for a Letter of Map Amendment.

ENCROACHMENT: The advance or infringement of uses, plant growth, fill, excavation, buildings, permanent structures or development into a floodplain, which may impede or alter the flow capacity of a floodplain.

FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA): The federal agency under which the NFIP is administered. In March 2003, FEMA became part of the newly created U.S. Department of Homeland Security.

FLOOD OR FLOODING: A general or temporary condition of partial or complete inundation of normally dry land areas from the overflow of inland or tidal waters; the unusual and rapid accumulation or runoff of surface waters from any source. Mudflows which are proximately caused by such accumulation or runoff of surface waters and are akin to a river of liquid and flowing mud on the surfaces of normally dry land areas, as when earth is carried by a current of water and deposited along the path of the current. The collapse or subsidence of land along the shore of a lake or other body of water as a result of erosion or undermining caused by waves or currents of water exceeding anticipated cyclical levels or suddenly caused by an unusually high water level in a natural body of water, accompanied by a severe storm, or by an unanticipated force of nature such as flash flood or an abnormal tidal surge, or by some similarly unusual and unforeseeable event which results in the overflow of inland or tidal waters. .

FLOOD INSURANCE RATE MAP (FIRM): an official map of a community, on which FEMA has delineated both the special hazard areas and the risk premium zones applicable to the community. A FIRM that has been made available digitally is called a Digital Flood Insurance Rate Map (DFIRM).

FLOOD INSURANCE STUDY (FIS): A report by FEMA that examines, evaluates and determines flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation and determination of mudflow and/or flood-related erosion hazards.

FLOODPLAIN AREA: Any land area susceptible to being inundated by water from any source.

FLOODPLAIN DISTRICT: District designated as a special flood hazard area.

FLOODPLAIN ADMINISTRATOR: the individual appointed to administer and implement these regulations. The zoning administrator has been appointed as the floodplain administrator.

FLOODPROOFING: any combination of structural and non-structural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents.

FLOODWAY: The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than one foot.

FLOODWAY DISTRICT: The area within an AE Zone that is delineated, for purposes of this ordinance, using the criterion that certain areas within the floodplain must be capable of carrying the waters of the one percent annual chance flood without increasing the water surface elevation of that flood more than one foot at any point. See §4.15.6.A.

HIGHEST ADJACENT GRADE: the highest natural elevation of the ground surface prior to construction next to the proposed walls of a structure.

HISTORIC STRUCTURE: Any structure that is: (a) listed individually in the National Register of Historic Places (a listing maintained by the Department of Interior) or preliminarily determined by the Secretary of the Interior as meeting the requirements for individual listing on the National Register; (b) certified or preliminarily determined by the Secretary of the Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary to qualify as a registered historic district; (c) individually listed on a state inventory of historic places in states with historic preservation programs which have been approved by the Secretary of the Interior; or, (c) individually listed on a local inventory of historic places in communities with historic preservation programs that have been certified either; (d) by an approved state program as determined by the Secretary of the Interior; or (e) directly by the Secretary of the Interior in states without approved programs.

LETTER OF FINAL DETERMINATION (LFD): A letter FEMA sends to the chief executive officer of a community stating that a new or updated FIRM or DFIRM will become effective in six months.

LETTER OF MAP CHANGE (LOMC): A letter of map change is an official FEMA determination, by letter, that amends or revises an effective Flood Insurance Rate Map or Flood Insurance Study. Letters of map change include:

LETTER OF MAP AMENDMENT (LOMA): An amendment based on technical data showing that a property was incorrectly included in a designated special flood hazard area. A LOMA amends the current effective Flood Insurance Rate Map and establishes that land as defined by meets and bounds or structure is not located in a special flood hazard area.

LETTER OF MAP REVISION (LOMR): A revision based on technical data that may show changes to flood zones, flood elevations, floodplain and floodway delineations, and planimetric features. A letter of map revision based on fill (LOMR-F), is a determination that a structure or parcel of land has been elevated by fill above the base flood elevation and is, therefore, no longer exposed to flooding associated with the base flood. In order to qualify for this determination, the fill must have been permitted and placed in accordance with the community's floodplain management regulations.

LOCAL FLOOD HAZARD MAP – A map created by the city of Fairfax to identify and regulate local flood hazard or ponding areas that are not delineated on the Flood Insurance Rate Map.

LOWEST ADJACENT GRADE: the lowest natural elevation of the ground surface next to the walls of it structure.

LOWEST FLOOR: The lowest floor of the lowest enclosed area (including basement). An unfinished or flood-resistant enclosure, usable solely for parking of vehicles, building access or storage in an area other than a basement area is not considered a building's lowest floor; provided, that such enclosure is not built so as to render the structure in violation of the applicable non-elevation design requirements of 44 CFR 60.3.

MANUFACTURED HOME: A structure, transportable in one or more sections, which is built on a permanent chassis and is designed for use with or without a permanent foundation when connected to the required utilities. For floodplain management purposes the term "manufactured home" also includes park trailers, travel trailers, and other similar vehicles placed on a site for greater than 180 consecutive days, but does not include a recreational vehicle.

NEW CONSTRUCTION: For the purposes of determining insurance rates, structures for which the "start of construction" commenced on or after December 23, 1971, or after December 31, 1974, whichever is later, and includes any subsequent improvements to such structures. For floodplain management purposes, new construction means structures for which the start of construction commenced on or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures.

POST-FIRM STRUCTURES: A structure for which construction or substantial improvement occurred after December 31, 1974 or on or after December 23, 1971, whichever is later.

PRE-FIRM STRUCTURES: A structure for which construction or substantial improvement occurred on or before December 31, 1974 or before December 23, 1971.

RECREATIONAL VEHICLE: A vehicle which is: (a) built on a single chassis; (b) 400 square feet or less when measured at the largest horizontal projection; (c) designed to be self-propelled or permanently towable by a light duty truck; and (d) designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational camping, travel, or seasonal use.

REGULATORY FLOOD PROTECTION ELEVATION: See "base flood elevation".

SHALLOW FLOODING AREA: A special flood hazard area with base flood depths from one to three feet where a clearly defined channel does not exist, where the path of flooding is unpredictable and indeterminate, and where velocity flow may be evident. Such flooding is characterized by ponding or sheet flow.

SPECIAL FLOOD HAZARD AREA: The land in the floodplain subject to a one percent or greater chance of being flooded in any given year as determined in §4.15.6.

START OF CONSTRUCTION: The date the building permit was issued, provided the actual start of construction, repair, reconstruction, rehabilitation, addition, placement, substantial improvement or other improvement was within 180 days of the permit date. The actual start means either the first placement of permanent construction of a structure on a site, such as the pouring of slab or footings, the installation of piles, the construction of columns, or any work beyond the stage of excavation; or the placement of a manufactured home on a foundation. Permanent construction does not include land preparation, such as clearing, grading and filling; nor does it include the installation of streets and/or walkways; nor does it include excavation for a basement, footings, piers, or foundations or the erection of temporary forms; nor does it include the installation on the property of accessory buildings, such as garages or sheds not occupied as dwelling units or not part of the main structure. For a substantial improvement, the actual start of the construction means the first alteration of any wall, ceiling, floor, or other structural part of a building, whether or not that alteration affects the external dimensions of the building.

STRUCTURE: A walled and roofed building, including a gas or liquid storage tank that is principally above ground, as well as a manufactured home.

SUBSTANTIAL DAMAGE: Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

SUBSTANTIAL IMPROVEMENT: Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the start of construction of the improvement. This term includes structures that have incurred substantial damage regardless of the actual repair work performed. The term does not, however, include either: (a) any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions, or (b) any alteration of a historic structure, provided that the alteration will not preclude the structure’s continued designation as a historic structure. Historic structures undergoing repair or rehabilitation that would constitute a substantial improvement as defined above, must comply with all ordinance requirements that do not preclude the structure’s continued designation as a historic structure. Documentation that a specific ordinance requirement will cause removal of the structure from the National Register of Historic Places or the State Inventory of Historic places must be obtained from the Secretary of the Interior or the State Historic Preservation Officer. Any exemption from ordinance requirements will be the minimum necessary to preserve the historic character and design of the structure.

USACE: United States Army Corps of Engineers.

USBC: Virginia Uniform Statewide Building Code.

VADEQ: Virginia Department of Environmental Quality.

VIOLATION: the failure of a structure or other development to be fully compliant with the community's floodplain management regulations. A structure or other development without the elevation certificate, other certifications, or other evidence of compliance required in these regulations is presumed to be in violation until such time as that documentation is provided.

WATERCOURSE: A lake, river, creek, stream, wash, channel or other topographic feature on or over which waters flow at least periodically. Watercourse includes specifically designated areas in which substantial flood damage may occur.

§4.16. STORM DRAINAGE FACILITIES

§4.16.1. Purpose

A. The purpose of §4.16 to define those storm drainage facilities which must be provided by landowners to control rainfall runoff from and across their property in a manner not detrimental to other inhabitants of the city and to preserve, where possible, presently existing natural creek channels. It is the further purpose of §4.16 to minimize the adverse effects of stormwater runoff on downstream drainageways within the city.

B. Article 2.3 (§62.1-44.15:27) of Chapter 3.1 of Title 62.1 of the Code of Virginia establishes the requirement for localities to establish a stormwater management program. §4.16 is adopted pursuant to Chapter 3.1 of Title 62.1 of the Code of Virginia (§62.1-44.15:25 and §62.1-44.15:28 et seq.).

§4.16.2. Performance standards for facilities

Stormwater BMPs, on-site detention facilities, and on-site drainage facilities shall be designed and maintained in such a manner as to minimize economic and environmental costs to the city and its inhabitants in accordance with §4.16.7.

§4.16.3. Performance requirements

Performance requirements for stormwater BMPs, on-site detention facilities, and on-site drainage facilities shall be as specified in §4.16.8.

§4.16.4. Design, construction, inspection and maintenance requirements

Design, construction, inspection and maintenance requirements shall be as defined in the city storm drainage facility specifications as they may be hereafter promulgated by the city engineer and approved by the city council from time to time.

§4.16.5. Usage, improvement and preservation of creeks and channels

A. Natural creeks and drainage channels may be used where available to route stormwater runoff from the city.

B. Natural drainage systems will be improved where necessary in accordance with 9VAC25-870-66 of the Regulations. To the maximum degree possible, these improvements shall be made in such a manner as to preserve, enhance or restore the vegetation, including trees, along the creek line so that the aesthetic, environmental and ecological values of the vegetation are not lost to the community.

C. Land disturbances within resource protection areas or resource management areas may require a water quality impact assessment in accordance with §4.18.8.

Attachment 3.4

City of Fairfax – 2035 Comprehensive Plan

1805

City of Fairfax 2035 Comprehensive Plan

Adopted February 12, 2019

Last Amended June 23, 2020

City of Fairfax, Virginia
10455 Armstrong Street · Fairfax, VA 22030-3630
www.fairfaxva.gov

This is an exciting time for the City's Comprehensive Plan to be significantly revised — not only because it has been 15 years since such an extensive effort has been taken, but also because of the many opportunities happening right now that will impact our future.

Our region is undergoing a major economic shift. Federal spending as a portion of the overall regional economy continues to diminish. This greatly impacts the demand for federal workforce and contractors. Meanwhile, technology-based businesses are flourishing and have made numerous high-profile investments in the region.

The City and George Mason University, at our southern border, have the opportunity to work together to take advantage of this shift and be critical players in the new regional economy. In addition, there are many other opportunities in this plan to leverage the regional economy to benefit the community.

Commercial Redevelopment: Many of the City's commercial properties date to the 1950s and are no longer competitive to attract top-tier tenants. The land use plan provides new flexibility and clarity to encourage property owners to revitalize their properties to meet modern demands and remain competitive in the commercial market.

Housing and Neighborhoods: The City's older housing stock is increasingly being renovated and expanded to keep up with current trends in design and amenities to attract employees in the new economy. The Comprehensive Plan encourages new housing types to attract a wider array of residents and to create and maintain a supply of units that is more affordable.

Historic Resources: The long history of the City provides a unique identity that separates the City from the bulk of Northern Virginia, making it an ideal place to invest. This history will continue to be communicated through preservation of the numerous historic structures and landscapes and celebrated through events and festivals.

Multimodal Transportation: This Comprehensive Plan is supported by the City's recently completed Multimodal Transportation Plan. It envisions a more accessible City for cars, bikes, pedestrians and public transit alike, and accommodates anticipated innovative technologies in transportation. A number of new funding sources also make implementing these initiatives much more feasible than in the past.

Environment: The City will embrace new technologies and promote policies and regulations for a more sustainable future, both locally and globally. New measures will improve the quality of our streams through better stormwater management. The City will vigorously pursue best practices to reduce the volume of waste generated from commercial and residential properties.

Community Services: The City has always prided itself on providing the highest quality public services. Maintaining this stature requires continued investment and monitoring public service facilities for needed improvements, particularly as new technologies and innovations emerge.

The City Council, the Planning Commission, and all of the stakeholders who participated in the development of this plan look forward to seizing the opportunities that will influence the City during the next 15 to 20 years — from an advancing regional economy to new technologies and innovations to support services and environmental sustainability. Together, these opportunities will support a strong, sustainable economy for our vibrant 21st-century community.

Sincerely,

Mayor David L. Meyer

Councilmember Michael Demarco

Councilmember Jennifer Passey

Councilmember So Lim

Councilmember Jonathan Stehle

Councilmember Janice Miller

Councilmember Sang Yi

1 Introduction

The City of Fairfax ("the City") is unique in boasting the benefits of a closely knit community that is hard to find in the Metropolitan Washington region and the access and proximity to large-city amenities and activities. Residents enjoy neighborhoods with distinct character, an active arts scene, high-quality educational institutions for all ages, easy access to natural amenities, and exceptional City services and facilities. Employees and business owners appreciate its central location within Northern Virginia; ease of access and adjacency to major thoroughfares, and its proximity to major regional employers in the health, education, government, and legal sectors.

Nonetheless, the City is not immune to the internal and external elements that place considerable pressure on its identity and future. Its commercial and retail properties are aging and growing less competitive with nearby jurisdictions, raising questions about future development and tax burdens on City residents. Nearby localities feature newer, more in-demand housing stock to attract and retain residents. Region-wide issues of affordable housing, aging and stressed utility infrastructure, traffic congestion, and environmental concerns similarly impact the City and those who live and work here.

As the City's official policy guide for future development-related decisions, the 2035 Comprehensive Plan ("the Comprehensive Plan") provides direction to enhance the City's function, appearance, and livability based on its current conditions. It also seeks to provide the opportunity to examine the various forces affecting the City – such as redevelopment opportunities, economic competitiveness, and an increasingly strained transportation network – and propose innovative solutions that benefit City residents, workers, and visitors alike. As changes occur in and around the City, the Comprehensive Plan provides a framework for responding to and thriving as a result of these changes. Those who contributed to the Comprehensive Plan hope that readers find it a thoughtfully-crafted document that lends itself to enhancing quality of life and making the City a great place for everyone.

Background

The City was established as the Town of Providence in 1805 following the construction of the Fairfax County Courthouse at the rural crossroads of Little River Turnpike and Ox Road. The Town became a hub of commerce within a predominantly agricultural area removed from the growing City of Washington. In 1874, the Town adopted the name Fairfax.

The Town emerged as a more significant regional crossroads when US 50 and US 29 were created in 1926 as part of the original U.S. Highway System. These roadways supported the City's economic growth as businesses expended around the needs of travelers, and the industries serving the surrounding dairy farms. Federal housing programs following World War II catalyzed suburban development in the City, attracting veterans and their families and spurring rapid population growth. The Town was incorporated as the City of Fairfax in 1961. Further economic growth was fueled by the establishment of George Mason University along the City's southern border in 1964, the opening of Interstate 66 along the northern border in 1982, the extension of the Metrorail Orange Line from Washington to the nearby Vienna/Fairfax-GMU station in 1986, and continued overall growth of the region.

Today, the City is an independent jurisdiction of just over six square miles and a current population of around 24,000, located in the heart of Northern Virginia. The Metropolitan Washington Council of Governments (MWCOG) forecasts an increase of 3,400 households in the City by 2035, as shown in Figure 1. The City strives to strike a balance between maintaining the charm that residents currently enjoy and that makes it unique from surrounding communities while also guiding the growth and development projected for this metropolitan area.

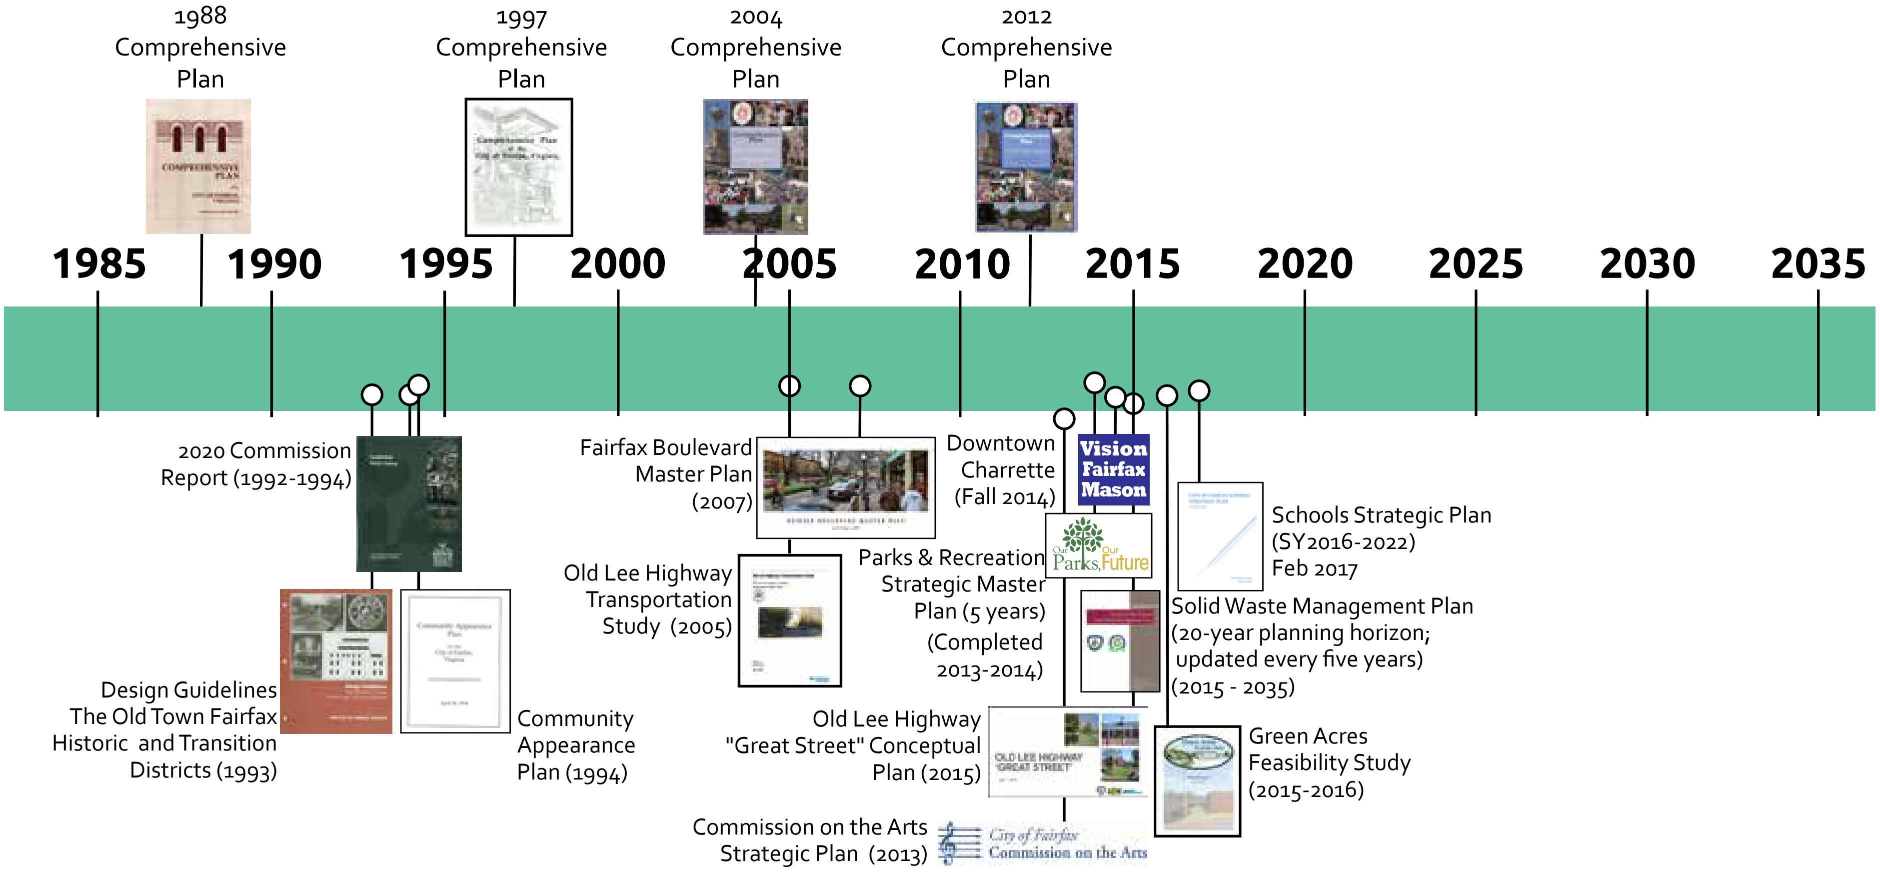
City of Fairfax
2035 Comprehensive Plan
FACT BOOK

November 2016
REVISED February 2017
REVISED April 2017
REVISED July 2017
REVISED April 2018

-DRAFT-

For more information about the City's population, check out the City of Fairfax Fact Book.

The first comprehensive development plan for the City was adopted in June 1968, with amendments in 1971 and 1973. New plans were adopted in 1975, 1982, and 1988, with amendments in 1983, 1991, 1993, and 1997. City Council adopted the Comprehensive Plan's last major rewrite in July 2004. During the Comprehensive Plan's 2008-2011 review, the Planning Commission amended the existing plan, which was adopted in 2012. In addition to the Comprehensive Plan updates, many individual studies and plans have been completed over the years as shown in the diagram below. This Comprehensive Plan incorporates and builds on many of the goals and strategies found in those studies as well as other plans and City policies not identified below.



Structure of the Comprehensive Plan

The Comprehensive Plan is a guide for the future growth of the City, focusing on community needs through 2035. Guidance and policy recommendations are provided through a vision, guiding principles, goals, outcomes, and actions, as described below.

- The **Vision** is the aspirational statement for the City in 2035;
- **Guiding Principles** are content-specific statements;
- **Goals** are general statements of the ideals toward which the City strives;
- **Outcomes** define what success looks like for each Goal; and
- **Actions** are the specific steps necessary to realize each Goal and Outcome.

The 14 Guiding Principles, as provided on pages 6-8, are categorized into five chapters: **Land Use, Multimodal Transportation, Environment and Sustainability, Economic Vitality, and Community Services**. Each topic is presented in a chapter of the Comprehensive Plan. Each chapter includes an introduction that provides background on the topic and a description of existing conditions, as well as opportunities and challenges facing the City that inform some of the policies suggested through the Comprehensive Plan. Additional background information, Goals, Outcomes, and Actions are then provided for each Guiding Principle. Goals, Outcomes, and Actions, can also be found in the stand-alone Implementation Guide, which will be revised on a regular basis to track the City's progress on meeting its Goals.

This Comprehensive Plan is supported by two appendices:

- **Appendix A – Chesapeake Bay Preservation Plan** identifies and characterizes the City's water resources and addresses the effects of land use planning and development on water quality in accordance with the Chesapeake Bay Preservation Act.
- **Appendix B - Transportation Practices and Policy** provides additional information on some of the more innovative practices discussed in the Multimodal Transportation Chapter.

Supporting maps, graphs and figures are provided throughout this document.

What is a Comprehensive Plan?

- Document describing a community's vision for how it wants to physically grow and develop in the near future (10 to 20 years)
- Provides guidance on land use, transportation, housing, economic development, environment, public facilities, parks, arts, and historic preservation
- Policy document for decision-making that informs zoning and budget decisions, i.e., the Capital Improvement Program (the five-year plan for physical improvements in the City – facilities, infrastructure, etc.)

VISION

In 2035, the City of Fairfax
has a strong, sustainable economy
that supports a vibrant 21st century community.

GUIDING PRINCIPLES

In 2035, Fairfax is a city with...

Land Use

...a close-knit community and a population that is diverse in its culture, demographics, and lifestyles, that capitalizes on its location in the center of the growing region and with easy access to the nation's capital.

...inviting neighborhoods, each with its own unique character.

Neighborhoods

Housing

...a choice of housing types that meet the needs of our community.

Economic Vitality

...an economy that cultivates and promotes business success and entrepreneurial opportunities for large, small, and independent businesses and capitalizes on national, regional and intellectual partnerships.

Commercial Corridors and Activity Centers

Photo Credit: Hord Coplan Macht

...flourishing centers of commercial and mixed-use activity that include an assortment of grocery stores, restaurants, cafes, entertainment venues, retail stores, offices, and housing.

Cultural Arts

...a thriving cultural arts program that supports a variety of special events, art spaces and performance venues.

Multimodal Transportation

...options for residents to easily, safely, and efficiently move within and between neighborhoods either by walking, bicycling, taking public transportation or driving.

Community Design and Historic Preservation

...architecture that contributes to a vibrant, creative place and complements our historic character.

Parks and Recreation

...inviting, well-maintained parks, trails, open spaces and multi-generational community centers.

Education

...world-class community schools and a best-in-class education from preschool to post-high school that prepares students to be productive, responsible members of society, capable of competing in the global economy and motivated to pursue life-long learning.

Sustainability Initiatives

...sustainable practices that preserve, conserve, reuse and recycle resources.

...a healthy ecosystem of naturally flowing streams, native plants, wildlife, contiguous natural habitat areas, and a healthy tree population.

Natural Environment

Government and Public Safety

...exceptional governmental, police and fire safety services.

Infrastructure and Utilities

...safe, well-maintained infrastructure and use of advanced technology.

Planning Process

Development of the Comprehensive Plan was based on a three-phase process beginning with information collection, followed by analysis and recommendations. Information collection included references to previous plans and studies that helped inform the Comprehensive Plan and input provided by members of the community, including residents, business owners, City Council, City boards and commissions, other stakeholders (George Mason University, Fairfax County, etc.), and City staff. During the information collection period, staff also developed the Fact Book, a summary of data on the City, from physical conditions to demographics and service analysis.

Based on the previous plans and studies referenced, input collected from the community, and data from the Fact Book, a series of goals and outcomes were developed for each of the content areas. These goals and outcomes were reviewed with the Planning Commission and City boards and commissions. The same process was followed to develop actions and metrics for the content areas. Goals, outcomes, actions and metrics for each content area encompass the recommendations of the Comprehensive Plan and provide the foundation for the overall document.

More specific data analysis was provided for the Land Use Strategies Guiding Principle, including a scenario analysis using Envision Tomorrow software. This provided a way to illustrate – with graphics and numbers – what the future could look like, given different development contexts, culminating in a public survey on potential development scenarios based on the results of the analysis. Along with the Scenario Analysis, survey results helped guide development of the Future Land Use Map.

Final revisions to the Comprehensive Plan were based on review by members of the community through public open houses, online forums, and Planning Commission and City Council meetings. The Comprehensive Plan was adopted by City Council on February 12, 2019 (R-19-03) after recommendation by the Planning Commission (PC-19-02).

The Multimodal Transportation Plan was prepared through a separate planning process parallel to this one, but with the intention of incorporating it into the Comprehensive Plan, with connections to land use, open space, housing, and economic development.

Community Outreach

Community outreach played a vital role in the development of the Comprehensive Plan. Early public involvement guided all aspects of the Comprehensive Plan including issue and opportunity identification, as well as development of the vision, goals, and objectives. Providing the opportunity for public input encourages citizens to be invested in the future of their community and helps ensure that recommendations developed as part of the Comprehensive Plan are implemented and sustained over time.

Staff employed a diverse set of traditional and non-traditional outreach tools and strategies to ensure all stakeholders had an opportunity to contribute throughout the process.

Community Surveys

The Center for Social Science Research (CSSR) at George Mason University worked with City staff to develop and administer a Community Survey to ask members of the community for feedback on issues of interest to formulate a vision, goals, and objectives for the Comprehensive Plan.

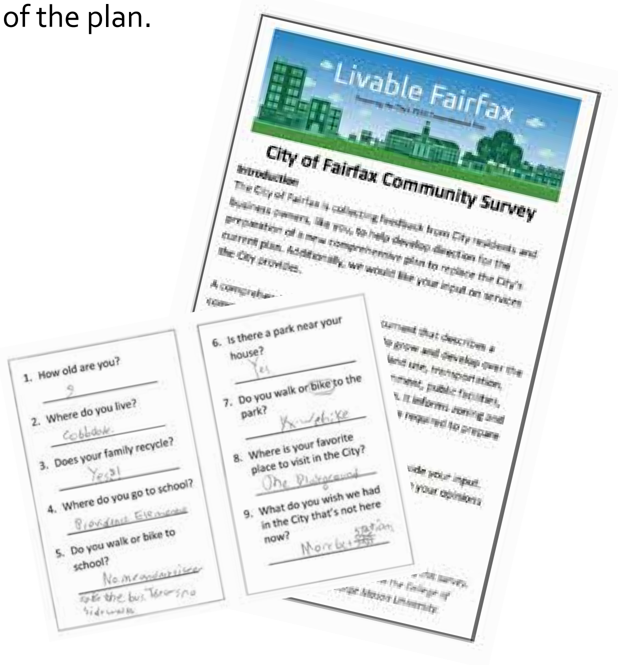
City residents and business owners were notified of the survey via postcards sent out in March 2016, which provided directions on how to take an online survey. Paper copies were also made available to those that requested them.

An overview of the results was presented at a public meeting on June 6 at the Sherwood Community Center, as well as at meetings of the City Council on June 14 and the Planning Commission on June 27, which were televised on Cityscreen-12. The full document detailing the process and analyzing the results was released on June 30, 2016.

CSSR sent out 9,943 postcards to City residences and businesses, and followed up with reminder calls. A total of 863 surveys were completed.

City staff also prepared a ten-question Kids' Survey that was distributed at Parks and Recreation events and to students at Daniels Run Elementary School, Providence Elementary School, Lanier Middle School, and Saint Leo the Great Catholic School. A total of 620 Kids' Surveys were completed. The ages of the students that completed the survey ranged from seven to thirteen.

Online Google surveys were also used to collect feedback on proposed future development scenarios, the future land use map, and drafts of the plan.



Livable Fairfax

City of Fairfax Community Survey

Introduction

The City of Fairfax is collecting feedback from City residents and business owners, like you, to help develop direction for the preparation of a new comprehensive plan to replace the City's current plan. Additionally, we would like your input on services the City provides.

1. How old are you? 9
2. Where do you live? Cobbdok
3. Does your family recycle? Yes!
4. Where do you go to school? Providence Elementary
5. Do you walk or bike to school? No me and my sister take the bus. There's no sidewalk
6. Is there a park near your house? Yes
7. Do you walk or bike to the park? Kind of bike
8. Where is your favorite place to visit in the City? The Playground
9. What do you wish we had in the City that's not here now? More bus station

Website and Social Media

Information about the Comprehensive Plan process, meetings, technical information, and opportunities to provide feedback were made available on the City's website. City staff created a page within the website devoted to the Comprehensive Plan, www.fairfaxva.gov/livablefairfax.

In addition to the website, City staff promoted meetings and information about the Comprehensive Plan through Facebook and Twitter. One of the many benefits of using social media for outreach is that it allowed staff to track how many people viewed what was shared and which posts performed the best.

Several of the presentations were shared live on Facebook and posted on the City's YouTube channel. Staff also created YouTube videos to advertise the community survey, which were shown on the City's government access television station, Cityscreen-12. Staff also created a welcome video for an open house to explain the comprehensive plan process.

Printed Media

To ensure all members of the community were aware of the comprehensive plan process and opportunities to participate, articles were regularly included in the CityScene, the City's newsletter published monthly and mailed to all City businesses and residents. Seventeen articles related to the Comprehensive Plan have been posted in the CityScene since April 2016.

To reach an even broader audience for targeted events, ads were purchased in regional newspapers, The Fairfax Times and Fairfax Connection.

Other printed communications include postcards mailed to all residents and businesses and informational fliers handed out at City events and displayed at City facilities.

CityScene Article

City Seeks Input on Vision for 2035 *Comprehensive Plan*

The City of Fairfax seeks community feedback on the draft vision statement for the 2035 *Comprehensive Plan*, culminating with a public comment period during the September 26 Planning Commission meeting. The *Comprehensive Plan* vision statement will provide guidance on how the city should grow and develop during the next 20 years. Information: 703-385-7930.

The draft vision statement is a series of statements related to each of the proposed content areas in the 2035 *Comprehensive Plan*: Land Use; Neighborhoods; Commercial Centers and Redevelopment Areas; Housing; Community Design and Historic Preservation; Transportation, Mobility and Connectivity; Natural Environment; Sustainability Initiatives; Business Attraction, Retention and Promotion; Education; Parks, Recreation and Cultural Arts; Public Safety; Infrastructure and Utilities; and Implementation Strategy and Performance Metrics.

The vision statement is intended to describe Fairfax's values, aspirations and shared image of what the community as a whole

Public Meetings

The Planning Commission began discussions on preparing the Comprehensive Plan on Monday, October 26, 2015. Members of the public were encouraged to attend any of the regularly scheduled Planning Commission meetings to share thoughts or concerns about the Comprehensive Plan, even if it was not explicitly being discussed as part of the agenda.

In addition to presentations to the Planning Commission, staff presented briefings and solicited feedback at the regular meetings of other boards and commissions including the City of Fairfax School Board, Board of Architectural Review, Community Appearance Committee, Commission on the Arts, Fairfax Renaissance Housing Corporation, Parks and Recreation Advisory Board, Historic Fairfax City Inc., Economic Development Authority, Commission for Women, and the Environmental Sustainability Committee. The Planning Commission also hosted joint work sessions at The Civil War Interpretive Center at Historic Blenheim with the various boards and commissions to discuss specific topics of interest, and joint work sessions with the City Council.

Community Events

Open Houses

In addition to regularly scheduled public meetings, staff hosted many open houses at locations throughout the City, including the Stacy C. Sherwood Community Center, Old Town Hall, Lanier Middle School, and City Hall.

Panel Discussion: Emerging Trends Shaping our Community

The City gathered a panel of experts and a moderator to talk about trends in housing, economic vitality, and community development as part of the effort to prepare the Comprehensive Plan. The discussion took place on Saturday, September 16, 2017 at the Sherwood Community Center.

The expert panel included Thomas Maskey, Jr., Principal of Potomac Development Group, who has dedicated 35 years to the development of retail shopping centers and is responsible for over 8 million square feet of development in the Washington, D.C. region, including landmark projects at Downtown Silver Spring, Washingtonian Center, Milestone Center, Fair Lakes Center, Fairfax Corner, Virginia Gateway, and National Harbor; Donald W. Knutson, President of the Knutson Companies, whose development projects include Downtown Brambleton and Crescent Place in Leesburg; and Michelle Krocker, Executive Director of the Northern Virginia Affordable Housing Alliance. The discussion was moderated by Lisa Nisenson, an affiliated researcher with George Mason University's Center for Real Estate Entrepreneurship who leads Alta Planning + Design's New Mobility Group.

City Events

City staff attended other events to engage and inform the public about the comprehensive planning process. Those events included:

- Chocolate Lovers Festival
- Scavenger Hunt on July 4
- Fall Festival
- Easter Egg Hunt
- Community Farmers Market
- Rock the Block
- Bike to Work Day

Schools

Staff worked with the City of Fairfax School Board, Superintendent, and School principals to involve the City's students in the comprehensive planning process early and often. In addition to the Kids' Survey that was covered previously, staff made several presentations and had discussions with the students at Daniels Run Elementary School, Providence Elementary School, Lanier Middle School, Fairfax High School, and George Mason University. At the end of the 2017-2018 school year, representatives from the City's schools and from George Mason University presented their thoughts on the draft goals to the Planning Commission at public meetings. All City school students grades K through 12 were also encouraged to share their vision of Fairfax in 2035 through an art contest.

Statutory Requirements

The comprehensive plan serves as a locality's primary decision-making document for land use and development. It establishes the intent and goals of the community to influence development in both the private and public sectors and should be relied upon as an initial source that directs users to appropriate reports or strategic plans where necessary.
